YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

	About the Documentation	xliii
	Documentation and Release Notes	xliii
	Using the Examples in This Manual	xliii
	Merging a Full Example	xliv
	Merging a Snippet	xliv
	Documentation Conventions	xlvi
	Documentation Feedback	xlvi
	Requesting Technical Support	xlvi
	Self-Help Online Tools and Resources	xlvi
	Creating a Service Request with JTAC	xlvi
Part 1	Ethernet Interfaces	
Chapter 1	Ethernet Interfaces Overview	3
	Ethernet Interfaces Overview	3
	MX Series Router Interface Identifiers	4
Chapter 2	Performing Initial Configuration for Ethernet Interfaces	5
	Example: Configuring Fast Ethernet Interfaces	5
	Example: Configuring Gigabit Ethernet Interfaces	6
	Configuring Ethernet Physical Interface Properties	6
	Configuring the Interface Speed on Ethernet Interfaces	8
	Channelizing Interfaces on PTX10003 Routers	12
	Configuring the Ingress Rate Limit	16
	Understanding Flow Control	17
	IEEE 802.3X Ethernet PAUSE	17
	Symmetric Flow Control	17
	Configuring Flow Control	18
	Configuring the Link Characteristics on Ethernet Interfaces	19
	Configuring MAC Address Filtering for Ethernet Interfaces	20
	Enabling Source Address Filtering	20
	Configuring MAC Address Filtering on PTX Series Packet Transport Routers	22
	MAC Address Accounting for Dynamically Learned Addresses on Aggregated Ethernet Interfaces Overview	23
	Configuring Ethernet Loopback Capability	24
	Ignoring Layer 3 Incomplete Errors	25
	Configuring Gratuitous ARP	26
	Adjusting the ARP Aging Timer	27
	Configuring Weighted Random Early Detection	28
	Configuring Multicast Statistics Collection on Ethernet Interfaces	28

	Displaying Internal Ethernet Interfaces for a Routing Matrix with a TX Matrix Plus Router	29
Chapter 3	Configuring the Management Ethernet Interface	33
	Management Ethernet Interface Overview	33
	Configuring a Consistent Management IP Address	34
	Configuring the MAC Address on the Management Ethernet Interface	35
Chapter 4	Enabling Passive Monitoring on Ethernet Interfaces	37
	Passive Monitoring on Ethernet Interfaces Overview	37
	Enabling Passive Monitoring on Ethernet Interfaces	39
Chapter 5	Configuring Aggregated Ethernet Interfaces for Increased Throughput and Link Redundancy	41
	Aggregated Ethernet Interfaces Overview	42
	Platform Support for Aggregated Ethernet Interfaces	42
	Enhanced LAG Support on MX Series Routers	44
	Enhanced LAG Support on PTX Series Routers	45
	Configuration Guidelines for Aggregated Ethernet Interfaces	45
	Configuring an Aggregated Ethernet Interface	48
	Understanding Ethernet Link Aggregation on ACX Series Routers	50
	Load Balancing	52
	LACP Monitoring	53
	Link Protection	54
	Configuring Link Protection for Aggregated Ethernet Interfaces	54
	Disabling Link Protection for Aggregated Ethernet Interfaces	54
	Understanding the Algorithm Used to Hash LAG Bundle	54
	Configuring Aggregated Ethernet Interfaces on PTX Series Packet Transport Routers	56
	Understanding Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles	58
	Aggregated Ethernet Bundle with Mixed Rates and Mixed Modes on T Series Routers	58
	Understanding Mixed Rates and Mixed Modes	58
	Platform Support Matrix for Mixed Aggregated Ethernet Bundles	59
	Guidelines to Follow When Configuring Aggregated Ethernet Bundles with Mixed Rates and Mixed Modes	60
	Aggregated Ethernet Bundles with Mixed Rates on MX Series Routers and PTX Series Routers	61
	Understanding Mixed Rates	61
	Platform Support Matrix for Mixed Aggregated Ethernet Bundles on MX Series Routers	62

Supported Features	63
Configuring Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles . . .	65
Configuring Mixed Rates and Mixed Modes on an Aggregated Ethernet Bundle on T Series Routers	66
Configuring Mixed Rates on Aggregated Ethernet Bundles on MX Series Routers	68
Example: Configuring Aggregated Ethernet Interfaces	69
Configuring Junos OS for Supporting Aggregated Devices	71
Configuring Virtual Links for Aggregated Devices	71
Configuring LACP Link Protection at the Chassis Level	72
Enabling LACP Link Protection	72
Configuring System Priority	73
Configuring the Maximum Links Limit	73
Configuring PPM on Junos Fusion	74
Configuring the Number of Aggregated Ethernet Interfaces on the Device	75
Configuring Aggregated Ethernet Link Speed	76
Configuring Aggregated Ethernet Minimum Links	79
Configuring Tagged Aggregated Ethernet Interfaces	80
Configuring Untagged Aggregated Ethernet Interfaces	80
Configuring LACP for Aggregated Ethernet Interfaces	81
Configuring the LACP Interval	83
Configuring LACP Link Protection	84
Enabling LACP Link Protection	85
Configuring LACP System Priority	86
Configuring LACP System Identifier	86
Configuring LACP administrative Key	87
Configuring LACP Port Priority	87
Configuring LACP Hold-Up Timer to Prevent Link Flapping on LAG Interfaces	87
Tracing LACP Operations	88
Sample Configuration for Configuring Aggregated Ethernet LACP on Tagged and Untagged Interfaces	89
Configuring Aggregated Ethernet Link Protection	90
Configuring Link Protection for Aggregated Ethernet Interfaces	91
Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces	91
Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link	91
Disabling Link Protection for Aggregated Ethernet Interfaces	92
Example: Configuring Aggregated Ethernet Link Protection	92
Configuring Shared Scheduling on Aggregated Ethernet Interfaces	93

Configuring Scheduler on Aggregated Ethernet Interfaces Without Link Protection	93
Configuring Symmetrical Load Balancing on an 802.3ad Link Aggregation Group on MX Series Routers	94
Symmetrical Load Balancing on an 802.3ad LAG on MX Series Routers Overview	94
Configuring Symmetric Load Balancing on an 802.3ad LAG on MX Series Routers	95
Configuring Symmetrical Load Balancing on Trio-Based MPCs	98
Example Configurations	99
Example Configurations of Chassis Wide Settings	99
Example Configurations of Per-Packet-Forwarding-Engine Settings	100
Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers	100
Examples: Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs on MX Series Routers	102
Configuring Symmetrical Hashing for family multiservice on Both Routers	102
Configuring Symmetrical Hashing for family inet on Both Routers	103
Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers	104
Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing	104
Understanding Aggregated Ethernet Load Balancing	107
Example: Configuring Aggregated Ethernet Load Balancing	109
Understanding Aggregated Ethernet Load Balancing	109
Example: Configuring Aggregated Ethernet Load Balancing	111
Load Balancing and Ethernet Link Aggregation Overview	125
Example: Configuring Load Balancing on a LAG Link	126
Configuring Load Balancing on a LAG Link	126
Stateful Load Balancing for Aggregated Ethernet Interfaces Using 5-Tuple Data	127
Guidelines for Configuring Stateful Load Balancing for Aggregated Ethernet Interfaces or LAG Bundles	129
Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces	130
Configuring Adaptive Load Balancing	131
Understanding Independent Micro BFD Sessions for LAG	133
Example: Configuring Independent Micro BFD Sessions for LAG	136
Configuring Multicast Statistics Collection on Aggregated Ethernet Interfaces	146
Deleting an Aggregated Ethernet Interface	147
Periodic Packet Management	148
Understanding Periodic Packet Management on MX Series Routers	148
Configuring Periodic Packet Management on MX Series Routers	149
Identifying Periodic Packet Management Mode	149
Enabling Centralized Periodic Packet Management	150
ITU-T Y.1731 ETH-LM, ETH-SLM, and ETH-DM on Aggregated Ethernet Interfaces Overview	151

	Guidelines for Configuring Performance Monitoring Functionalities on Aggregated Ethernet Interfaces	154
	Targeted Distribution of Static Logical interfaces Across Aggregated Ethernet Member Links	155
	Targeted Distribution of Static Logical interfaces Across Aggregated Ethernet Member Links Overview	155
	Example: Configuring Targeted Distribution for Accurate Policy Enforcement on Logical Interfaces Across Aggregated Ethernet Member Links	156
Chapter 6	Configuring Ethernet Automatic Protection Switching for High Availability	167
	Ethernet Automatic Protection Switching Overview	167
	Unidirectional and Bidirectional Switching	168
	Selective and Merging Selectors	168
	Revertive and Nonrevertive Switching	168
	Protection Switching Between VPWS Pseudowires	168
	CLI Configuration Statements	169
	Mapping of CCM Defects to APS Events	170
	Example: Configuring Protection Switching Between Psuedowires	171
Chapter 7	Configuring Ethernet Ring Protection Switching for High Availability	175
	Ethernet Ring Protection Switching Overview	175
	Understanding Ethernet Ring Protection Switching Functionality	176
	Acronyms	177
	Ring Nodes	177
	Ring Node States	177
	Default Logging of Basic State Transitions on EX Series Switches	178
	Logical Ring	178
	FDB Flush	178
	Traffic Blocking and Forwarding	179
	RPL Neighbor Node	179
	RAPS Message Blocking and Forwarding	179
	Dedicated Signaling Control Channel	181
	RAPS Message Termination	181
	Revertive and Non-revertive Modes	181
	Multiple Rings	181
	Node ID	181
	Ring ID	182
	Bridge Domains with the Ring Port (MX Series Routers Only)	182
	Wait-to-Block Timer	182
	Adding and Removing a Node	183
	Configuring Ethernet Ring Protection Switching	183
	Example: Ethernet Ring Protection Switching Configuration on MX Routers	184
Chapter 8	Configuring MAC Address Validation on Static Ethernet Interfaces	193
	MAC Address Validation on Static Ethernet Interfaces Overview	193
	Configuring MAC Address Validation on Static Ethernet Interfaces	194

Chapter 9	Configuring Point-to-Point Protocol over Ethernet	195
	PPPoE Overview	196
	PPPoE Interfaces	196
	Ethernet Interface	196
	PPPoE Stages	197
	PPPoE Discovery Stage	197
	PPPoE Session Stage	198
	Optional CHAP Authentication	198
	Configuring PPPoE	199
	Overview	200
	Setting the Appropriate Encapsulation on the PPPoE Interface	200
	Configuring PPPoE Encapsulation on an Ethernet Interface	201
	Configuring PPPoE Encapsulation on an ATM-over-ADSL Interface	201
	Configuring the PPPoE Underlying Interface	202
	Identifying the Access Concentrator	202
	Configuring the PPPoE Automatic Reconnect Wait Timer	202
	Configuring the PPPoE Service Name	203
	Configuring the PPPoE Server Mode	203
	Configuring the PPPoE Client Mode	203
	Configuring the PPPoE Source and Destination Addresses	204
	Deriving the PPPoE Source Address from a Specified Interface	204
	Configuring the PPPoE IP Address by Negotiation	204
	Configuring the Protocol MTU PPPoE	205
	Example: Configuring a PPPoE Server Interface on an M120 or M320 Router	205
	Disabling the Sending of PPPoE Keepalive Messages	206
	Verifying a PPPoE Configuration	206
	Tracing PPPoE Operations	207
	Configuring the PPPoE Trace Log Filename	208
	Configuring the Number and Size of PPPoE Log Files	208
	Configuring Access to the PPPoE Log File	209
	Configuring a Regular Expression for PPPoE Lines to Be Logged	209
	Configuring the PPPoE Tracing Flags	209
	Configuring the PPPoE Trace Log Filename	209
	Configuring the Number and Size of PPPoE Log Files	210
	Configuring Access to the PPPoE Log File	210
	Configuring a Regular Expression for PPPoE Lines to Be Logged	210
	Configuring the PPPoE Tracing Flags	211
	Configuring the Severity Level to Filter Which PPPoE Messages Are Logged	211
Chapter 10	Configuring Restricted and Unrestricted Proxy ARP	213
	Restricted and Unrestricted Proxy ARP Overview	213
	Restricted Proxy ARP	213
	Unrestricted Proxy ARP	213
	Topology Considerations for Unrestricted Proxy ARP	214
	Configuring Restricted and Unrestricted Proxy ARP	215

Chapter 11	Configuring Static ARP Table Entries	217
	Static ARP Table Entries Overview	217
	Configuring Static ARP Table Entries For Mapping IP Addresses to MAC Addresses	218
Chapter 12	Configuring TCC and Layer 2.5 Switching	221
	TCC and Layer 2.5 Switching Overview	221
	Configuring VLAN TCC Encapsulation	222
	Configuring Translation Cross-Connect Interface Switching	224
Chapter 13	Configuring Link Degrade Monitoring	227
	Link Degrade Monitoring Overview	227
	Supported Platforms	227
Chapter 14	Configuring Power-over-Ethernet on ACX Series	229
	Understanding PoE on ACX Series Universal Metro Routers	229
	ACX2000 PoE Specifications	229
	PoE Classes and Power Ratings	230
	PoE Options	231
	Example: Configuring PoE on ACX2000 Routers	231
	Example: Disabling a PoE Interface on ACX2000 Routers	236
	Troubleshooting PoE Interfaces on ACX2000 Universal Metro Routers	237
Part 2	Gigabit Ethernet Interfaces	
Chapter 15	Configuring 10-Gigabit Ethernet LAN/WAN PICs	241
	10-port 10-Gigabit Ethernet LAN/WAN PIC Overview	241
	12-port 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC Overview	245
	24-port 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC Overview	248
	Modes of Operation of 10-Gigabit Ethernet PICs	249
	Configuring Line-Rate Mode on 10-Gigabit Ethernet LAN/WAN PICs Supporting Oversubscription	250
	Configuring Control Queue Disable on a 10-port 10-Gigabit Ethernet LAN/WAN PIC	251
	Example: Handling Oversubscription on a 10-Gigabit Ethernet LAN/WAN PIC	254
	Configuring Mixed-Rate Mode Operation	255
	P2-10G-40G-QSFPP PIC Overview	256
	Understanding Dual Configuration on P2-10G-40G-QSFPP PIC	256
	Understanding Port Group	257
	Port Group in 10-Gigabit Ethernet Mode	258
	Port Group in 40-Gigabit Ethernet Mode	258
	Port Number Mapping When Port Groups Are Configured	258
	Port Numbering on P2-10G-40G-QSFPP PIC When Port Groups Are Not Configured	261
	10-Gigabit Ethernet Mode	263
	Framing Mode Overview	263
	Supported Features on LAN PHY and WAN PHY Framing Mode	264

	40-Gigabit Ethernet Mode	264
	Configuring the P2-10G-40G-QSFPP PIC	265
	Configuring the PIC in 10-Gigabit Ethernet Mode or in 40-Gigabit Ethernet Mode	265
	Configuring the PIC in 10-Gigabit Ethernet Mode to Operate in 40-Gigabit Ethernet Mode	265
	Configuring the PIC in 40-Gigabit Ethernet Mode to Operate in 10-Gigabit Ethernet Mode	266
	Configuring the PIC at Port Group Level	267
	Configuring Framing Mode on P2-10G-40G-QSFPP PIC	267
	Configuring LAN PHY or WAN PHY Framing Mode in 10-Gigabit Ethernet Mode	267
	Configuring LAN PHY Framing Mode in 40-Gigabit Ethernet Mode	268
	Example: Configuring the P2-10G-40G-QSFPP PIC	268
Chapter 16	Configuring 10-Gigabit Ethernet Framing	273
	10-Gigabit Ethernet Framing Overview	273
	Understanding WAN Framing for 10-Gigabit Ethernet Trio Interfaces	274
	Configuring 10-Gigabit Ethernet Framing	275
Chapter 17	Configuring 10-Gigabit Ethernet Notification of Link Down Alarm	277
	Gigabit Ethernet Notification of Link Down Alarm Overview	277
	10-Gigabit Ethernet Notification of Link Down for Optics Options Overview	277
	Configuring Gigabit Ethernet Notification of Link Down Alarm	278
	Configuring 10-Gigabit Ethernet Link Down Notification for Optics Options Alarm or Warning	278
Chapter 18	Configuring 40-Gigabit Ethernet PICs	279
	40-Gigabit Ethernet PIC Overview	279
	Configuring 40-Gigabit Ethernet PICs	281
Chapter 19	Configuring 100-Gigabit Ethernet PICs/MICs	283
	100-Gigabit Ethernet Interfaces Overview	283
	MX Series 100-Gigabit Ethernet Interfaces	283
	PTX Series 100-Gigabit Ethernet Interfaces	284
	T Series 100-Gigabit Ethernet Interfaces	285
	MPC3E MIC Overview	286
	100-Gigabit Ethernet Type 4 PIC with CFP Overview	287
	Configuring 100-Gigabit Ethernet Type 4 PIC With CFP	290
	Configuring VLAN Steering Mode for 100-Gigabit Ethernet Type 4 PIC with CFP	294
	100-Gigabit Ethernet Type 5 PIC with CFP Overview	296
	100-Gigabit Ethernet Interfaces Interoperability	299
	Interoperability of the MIC-3D-1X100GE-CFP MIC with PICs on Other Routers	299
	Interoperability of the MPC4E-3D-2CGE-8XGE MPC with PICs on Other Routers	299
	Interoperability of the P1-PTX-2-100GE-CFP PIC with PICs on Other Routers	299

Interoperability of the PD-ICE-CFP-FPC4 PIC with PICs or MICs on Other Routers	300
Interoperability Between the 100-Gigabit Ethernet PICs PD-ICE-CFP-FPC4 and PF-1CGE-CFP	301
Interoperability Between the 100-Gigabit Ethernet PICs PD-ICE-CFP-FPC4 and P1-PTX-2-100GE-CFP	302
Configuring the Interoperability Between the 100-Gigabit Ethernet PICs PF-1CGE-CFP and PD-ICE-CFP-FPC4	303
Configuring SA Multicast Bit Steering Mode on the 100-Gigabit Ethernet PIC PF-1CGE-CFP	303
Configuring Two 50-Gigabit Ethernet Physical Interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 as One Aggregated Ethernet Interface	304
Configuring the Interoperability Between the 100-Gigabit Ethernet PICs P1-PTX-2-100GE-CFP and PD-ICE-CFP-FPC4	306
Configuring SA Multicast Bit Steering Mode on 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP	306
Configuring Two 50-Gigabit Ethernet Physical Interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 as One Aggregated Ethernet Interface	307
Chapter 20 Configuring Rate Selectability	309
Understanding Rate Selectability	310
Rate Selectability on MPC7E-MRATE	311
Rate Selectability on MIC-MRATE	311
Rate Selectability on JNP10K-LC2101	312
Rate Selectability on MIC-MACSEC-20GE	312
Rate Selectability on MPC10E-15C-MRATE	313
Guidelines for Configuring Rate Selectability	314
Guidelines for Configuring Rate Selectability for JNP10K-LC2101	314
Understanding Interface Naming Convention for MPC7E-MRATE	315
Understanding Interface Naming Conventions for MIC-MRATE	316
Understanding Interface Naming Conventions for MX10003 MPC	320
Understanding Interface Naming Conventions for JNP10K-LC2101	321
Understanding Interface Naming Conventions for MPC10E-15C-MRATE MPC	323
Understanding Interface Naming Conventions for MPC10E-10C-MRATE MPC	325
Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription	327
Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC	330
Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router	332
Invalid Port Configuration	332
Configuring Active Ports on MX204 Router with Rate Selectability	333
Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-15C-MRATE	335

Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-10C-MRATE	337
Configuring Rate Selectability on MIC-MRATE to Enable Different Port Speeds	339
Configuring Rate Selectability on MIC-MRATE at MIC Level	339
Configuring Rate Selectability on MIC-MRATE at Port Level	341
Configuring Rate Selectability on MPC7E (Multi-Rate) to Enable Different Port Speeds	343
Configuring Rate Selectability at PIC Level	343
Configuring Rate Selectability at Port Level	345
MX10003 MPC Rate-Selectability Overview	348
Invalid Port Configuration	352
MX204 Router Rate-Selectability Overview	353
User-Configurable Rate Selectability of MX204 Routers	357
Maximum number of 10/40/100GE ports Configurable at PIC and Port Mode	358
Port Configuration - PIC Level	358
MPC10E-15C-MRATE Rate-Selectability Overview	360
User-Configurable Rate Selectability of MPC10E-15C-MRATE	362
MPC10E-10C-MRATE Rate-Selectability Overview	363
User-Configurable Rate Selectability of MPC10E-10C-MRATE	365
Configuring Rate Selectability on MX10003 MPC to Enable Different Port Speeds	365
Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level	366
Configuring Rate Selectability on MX10003 MPC at Port Level	368
Configuring Rate Selectability on MX204 to Enable Different Port Speeds	369
Configuring Rate Selectability on MX204 at PIC Level	370
Configuring Rate Selectability on MX204 at Port Level	372
Configuring Rate Selectability on JNP10K-2101 MPC to Enable Different Port Speeds	373
Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level	374
Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level	375
Configuring Rate Selectability on MPC10E-15C-MRATE to Enable Different Port Speeds	377
Configuring Rate Selectability on MPC10E-15C-MRATE at PIC Level	377
Configuring Rate Selectability on MPC10E-15C-MRATE at Port Level	379
Configuring Rate Selectability on MPC10E-10C-MRATE to Enable Different Port Speeds	380
Configuring Rate Selectability on MPC10E-10C-MRATE at PIC Level	381
Configuring Rate Selectability on MPC10E-10C-MRATE at Port Level	382
Understanding Interface Naming Conventions for MIC-MACSEC-20GE	384
Configuring Port Speed on Multi-Rate MICs	385
Configuring Port Speed	387
Understanding Interface Naming Conventions for MPC1	388
Understanding Interface Naming Conventions for MPC2	392

Chapter 21	Configuring Gigabit Ethernet OTN Options	399
	Gigabit Ethernet OTN Options	400
	10-Gigabit Ethernet OTN Options Configuration Overview	401
	Ethernet DWDM Interface Wavelength Overview	402
	Configuring the 10-Gigabit or 100-Gigabit Ethernet DWDM Interface	
	Wavelength	402
	Understanding the P1-PTX-24-10G-W-SFPP PIC	404
	Interface Features	405
	Layer 2 and Layer 3 Features	407
	OTN Alarms and Defects	407
	TCA Alarms	408
	Configuring OTN Interfaces on P1-PTX-24-10G-W-SFPP PIC	409
	100-Gigabit Ethernet OTN Options Configuration Overview	412
	Understanding the features of ACX6360	413
	Interface Features	414
	Section	?
	OTN Alarms and Defects	414
	TCA Alarms	415
	Interface Mapping and Modulation format for ACX6360	416
	Supported Optics Options on ACX6360 Routers	417
	Understanding Pre-FEC BER Monitoring and BER Thresholds	420
	Supported Forward Error Correction Modes on MX Series Routers	424
	Supported Forward Error Correction Modes on PTX Series Routers	425
	Supported Forward Error Correction Modes on ACX6360 Router	425
	Configuring 100-Gigabit DWDM OTN PICs	426
	Supported OTN Options on PTX Series Routers	429
	Supported OTN Options on MX Series Routers	436
	Supported OTN Options on ACX6360 Routers	444
	Understanding the P2-100GE-OTN PIC	449
	Interface Features	449
	Layer 2 and Layer 3 Features	451
	OTN Alarms and Defects	452
	TCA Alarms	452
	Configuring OTN Interfaces on P2-100GE-OTN PIC	453
	Understanding the MIC3-100G-DWDM MIC	457
	Interface Features	458
	Layer 2 and Layer 3 Features	459
	OTN Alarms and Defects	459
	Configuring OTN Interfaces on MIC3-100G-DWDM MIC	461
	Understanding the PTX-5-100G-WDM PIC	465
	Interface Features	466
	Layer 2 and Layer 3 Features	467
	OTN Alarms and Defects	467
	Configuring OTN Interfaces on PTX-5-100G-WDM PIC	469
	Understanding the PTX10K-LC1104 Line Card	474
	Software Features	474
	OTN Alarms and Defects	475
	Interface Mapping and Modulation format for PTX10K-LC1104 Line Card	476
	Supported OTN Options on PTX10008 and PTX10016 Series Routers	477

	Supported Optics Options on PTX10008 and PTX10016 Series Routers	483
	Configuring OTN Interface Options on PTX10K-LC1104	488
	Understanding ODU Path Delay Measurement on OTN Networks for Performance Monitoring	492
	Guidelines for Configuring Delay Measurement	493
	Enabling ODU Path Delay Measurement on OTN Networks for Performance Monitoring	494
	Disabling ODU Path Delay Measurement on OTN Networks for Performance Monitoring	496
Chapter 22	Configuring Gigabit Ethernet Accounting and Policing	499
	Capabilities of Gigabit Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs . .	499
	Configuring MAC Address Accounting	501
	MAC Address Accounting for Dynamically Learned Addresses on Aggregated Ethernet Interfaces Overview	502
	Accounting of the Layer 2 Overhead Attribute in Interface Statistics	503
	Guidelines for Configuring the Computation of Layer 2 Overhead in Interface Statistics	505
	Configuring Layer 2 Overhead Accounting in Interface Statistics	506
	Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level	506
	Verifying the Accounting of Layer 2 Overhead in Interface Statistics	507
	Configuring Gigabit Ethernet Policers	509
	Overview	510
	Configuring a Policer	510
	Specifying an Input Priority Map	511
	Specifying an Output Priority Map	512
	Applying a Policer	512
	Configuring MAC Address Filtering	514
	Example: Configuring Gigabit Ethernet Policers	514
	Configuring Gigabit Ethernet Two-Color and Tricolor Policers	516
	Overview	516
	Configuring a Policer	518
	Applying a Policer	518
	Example: Configuring and Applying a Policer	519
Chapter 23	Configuring Gigabit Ethernet Autonegotiation	521
	Gigabit Ethernet Autonegotiation Overview	521
	Configuring Gigabit Ethernet Autonegotiation	521
	Configuring Gigabit Ethernet Autonegotiation with Remote Fault	522
	Configuring Flow Control	522
	Configuring Autonegotiation Speed on MX Series Routers	522
	Displaying Autonegotiation Status	523
Part 3	Operation, Administration, and Management (OAM) for Ethernet Interfaces	
Chapter 24	Configuring IEEE 802.1ag OAM Connectivity-Fault Management	531
	Ethernet Operations, Administration, and Maintenance	532
	Ethernet OAM Connectivity Fault Management	533

IEEE 802.1ag OAM Connectivity Fault Management Overview	534
Connectivity Fault Management Key Elements	536
Best Practices for Configuring 802.1ag Ethernet OAM for VPLS	537
Junos OS Support for Performance Monitoring Compliant with Technical Specification MEF 36	539
Junos OS Support for Chassis ID TLV	540
Creating a Maintenance Domain	541
Configuring Maintenance Intermediate Points (MIPs)	542
Configuring Maintenance Association Intermediate Points in ACX Series	544
Configuring the Maintenance Domain Bridge Domain	545
Configuring the Maintenance Domain MIP Half Function	545
Configuring the Maintenance Association Intermediate Points with Bridge Domain	545
Configuring the Maintenance Association Intermediate Points with Circuit Cross-Connect	546
Configuring the Maintenance Association Intermediate Points with Bridge Domain when Maintenance Association End Point is Configured	546
Configuring the Maintenance Intermediate Points with Circuit Cross-Connect when Maintenance Association End Point is Configured	547
Creating a Maintenance Association	548
Continuity Check Protocol Parameters Overview	549
Configuring Continuity Check Protocol Parameters for Fault Detection	550
Configuring a MEP to Generate and Respond to CFM Protocol Messages	551
Configuring a Maintenance Association End Point (MEP)	552
Configuring a remote Maintenance Association End Point (MEP)	554
Configuring MEP Interfaces to Support Ethernet Frame Delay Measurements	556
Configuring Service Protection for VPWS over MPLS Using the MEP Interface	558
Configuring a CFM Action Profile to Specify CFM Actions for CFM Events	563
Configuring Linktrace Protocol in CFM	564
Configuring Ethernet Local Management Interface	565
Ethernet Local Management Interface Overview	565
Configuring the Ethernet Local Management Interface	567
Configuring an OAM Protocol (CFM)	567
Assigning the OAM Protocol to an EVC	568
Enabling E-LMI on an Interface and Mapping CE VLAN IDs to an EVC	568
Example E-LMI Configuration	569
Example Topology	569
Configuring PE1	570
Configuring PE2	571

Configuring Two UNIs Sharing the Same EVC	573
Configuring Port Status TLV and Interface Status TLV	574
TLVs Overview	574
Various TLVs for CFM PDUs	574
Support for Additional Optional TLVs	576
Port Status TLV	577
Interface Status TLV	579
MAC Status Defects	582
Configuring Remote MEP Action Profile Support	584
Monitoring a Remote MEP Action Profile	585
Configuring MAC Flush Message Processing in CET Mode	586
Configuring a Connection Protection TLV Action Profile	588
Example: Configuring an Action Profile Based on Connection Protection	
TLVs	589
Configuring M120 and MX Series Routers for CCC Encapsulated Packets	591
IEEE 802.1ag CFM OAM Support for CCC Encapsulated Packets	
Overview	591
CFM Features Supported on Layer 2 VPN Circuits	592
Configuring CFM for CCC Encapsulated Packets	592
Configuring Rate Limiting of Ethernet OAM Messages	593
Configuring Unified ISSU for 802.1ag CFM	596
Configuring Continuity Check Messages for Better Scalability	599
Configuring Faster Protection Switching for Point-to-Point Network	
Topologies	600
Configuring Faster Convergence for Dual-Homed Multipoint-to-Multipoint	
Network Topologies	602
Configuring a Primary VLAN ID for Increased Flexibility	603
Configuring a Remote Maintenance Association to Accept a Different ID	604
Enabling Enhanced Connectivity Fault Management Mode	605
Understanding CFM Monitoring between CE and PE Devices	606
Single Active Multi-homing Use Case using RDI bit	607
Active/Active Multihoming Use case using RDI bit	607
Example: Configuring Ethernet CFM on Physical Interfaces	608
Example: Configuring Ethernet CFM on Bridge Connections	610
Example: Configuring Ethernet CFM over VPLS	614
Chapter 25	
Configuring IEEE 802.3ah OAM Link-Fault Management	623
IEEE 802.3ah OAM Link-Fault Management Overview	624
Understanding Ethernet OAM Link Fault Management for ACX Series	
Routers	625
Configuring IEEE 802.3ah OAM Link-Fault Management	627
Configuring Ethernet 802.3ah OAM on PTX Series Packet Transport Routers ..	628
Enabling IEEE 802.3ah OAM Support	629
Configuring Link Discovery	630
Configuring the OAM PDU Interval	631
Configuring the OAM PDU Threshold	632
Configuring Threshold Values for Local Fault Events on an Interface	633
Disabling the Sending of Link Event TLVs	634
Detecting Remote Faults	634

	Enabling Dying Gasp Functionality	635
	Configuring an OAM Action Profile	636
	Specifying the Actions to Be Taken for Link-Fault Management Events	638
	Monitoring the Loss of Link Adjacency	639
	Monitoring Protocol Status	640
	Configuring Threshold Values for Fault Events in an Action Profile	641
	Applying an Action Profile	642
	Setting a Remote Interface into Loopback Mode	643
	Enabling Remote Loopback Support on the Local Interface	644
	Enabling Nonstop Routing for Ethernet Link Fault Management on Backup Routers	645
	Example: Configuring IEEE 802.3ah OAM Support on an Interface	648
	Example: Configuring IEEE 802.3ah OAM Support for an Interface on ACX Series	650
	Example: Configuring Ethernet LFM Between Provider Edge and Customer Edge	652
	Example: Configuring Ethernet LFM for CCC	653
	Example: Configuring Ethernet LFM for Aggregated Ethernet	655
	Example: Configuring Ethernet LFM with Loopback Support	657
Chapter 26	Configuring ITU-T Y.1731 Ethernet Service OAM	659
	Ethernet Frame Delay Measurements Overview	660
	ITU-T Y.1731 Frame Delay Measurement Feature	661
	Ethernet CFM	661
	Ethernet Frame Delay Measurement	662
	One-Way Ethernet Frame Delay Measurement	663
	1DM Transmission	663
	1DM Reception	663
	One-Way ETH-DM Statistics	663
	One-Way ETH-DM Frame Counts	663
	Synchronization of System Clocks	663
	Two-Way Ethernet Frame Delay Measurement	664
	DMM Transmission	664
	DMR Transmission	664
	DMR Reception	664
	Two-Way ETH-DM Statistics	665
	Two-Way ETH-DM Frame Counts	665
	Choosing Between One-Way and Two-Way ETH-DM	665
	Restrictions for Ethernet Frame Delay Measurement	665
	Ethernet Frame Loss Measurement Overview	666
	Service-Level Agreement Measurement	669
	On-Demand Mode for SLA Measurement	670
	Proactive Mode for SLA Measurement	671
	Ethernet Delay Measurements and Loss Measurement by Proactive Mode	672
	Ethernet Failure Notification Protocol Overview	672
	Ethernet Synthetic Loss Measurement Overview	673

Scenarios for Configuration of ETH-SLM	675
Upstream MEP in MPLS Tunnels	675
Downstream MEP in Ethernet Networks	675
Format of ETH-SLM Messages	676
SLM PDU Format	676
SLR PDU Format	677
Data Iterator TLV Format	677
Transmission of ETH-SLM Messages	678
Initiation and Transmission of SLM Requests	678
Reception of SLMs and Transmission of SLRs	679
Reception of SLRs	679
Computation of Frame Loss	679
Guidelines for Configuring ETH-SLM	680
Starting a Proactive ETH-SLM Session	681
Configuring MEP Interfaces	682
Configuring an Iterator Profile for ETH-SLM	683
Associating the Iterator Profile with MEPs for ETH-SLM	684
Starting an On-Demand ETH-SLM Session	686
Managing ETH-SLM Statistics and ETH-SLM Frame Counts	686
Displaying ETH-SLM Statistics Only	687
Displaying ETH-SLM Statistics and Frame Counts	687
Displaying ETH-SLM Frame Counts for MEPs by Enclosing CFM Entity . . .	688
Displaying ETH-SLM Frame Counts for MEPs by Interface or Domain Level	689
Clearing ETH-SLM Statistics and Frame Counts	690
Clearing Iterator Statistics	690
Troubleshooting Failures with ETH-SLM	691
Configuring an Iterator Profile	692
Verifying the Configuration of an Iterator Profile	695
Displaying the Configuration of an Iterator Profile for Two-way Delay Measurement	695
Displaying the Configuration of an Iterator Profile for Loss Measurement . .	696
Displaying the Configuration of a Remote MEP with an Iterator Profile . . .	696
Disabling an Iterator Profile	697
Managing Iterator Statistics	698
Displaying Iterator Statistics	698
Clearing Iterator Statistics	702
Configuring a Remote MEP with an Iterator Profile	703
Damping CFM performance Monitoring Traps and Notifications to Prevent Congestion of The NMS	705
Configuring Statistical Frame Loss Measurement for VPLS Connections	705
Guidelines for Configuring Routers to Support an ETH-DM Session	706
Configuration Requirements for ETH-DM	706
Configuration Options for ETH-DM	707
Guidelines for Starting an ETH-DM Session	707
ETH-DM Session Prerequisites	707
ETH-DM Session Parameters	708
Restrictions for an ETH-DM Session	709

Guidelines for Managing ETH-DM Statistics and ETH-DM Frame Counts	709
ETH-DM Statistics	710
ETH-DM Statistics Retrieval	711
ETH-DM Frame Counts	712
ETH-DM Frame Count Retrieval	712
Frame Counts Stored in CFM Databases	712
One-Way ETH-DM Frame Counts	713
Two-Way ETH-DM Frame Counts	713
Configuring Routers to Support an ETH-DM Session	714
Configuring MEP Interfaces	714
Ensuring That Distributed ppm Is Not Disabled	715
Enabling the Hardware-Assisted Timestamping Option	717
Configuring the Server-Side Processing Option	717
Starting an ETH-DM Session	718
Using the monitor ethernet delay-measurement Command	718
Starting a One-Way ETH-DM Session	719
Starting a Two-Way ETH-DM Session	720
Starting a One-Way ETH-DM Session	721
Starting a Two-Way ETH-DM Session	721
Managing ETH-DM Statistics and ETH-DM Frame Counts	722
Displaying ETH-DM Statistics Only	722
Displaying ETH-DM Statistics and Frame Counts	723
Displaying ETH-DM Frame Counts for MEPs by Enclosing CFM Entity	723
Displaying ETH-DM Frame Counts for MEPs by Interface or Domain Level	724
Clearing ETH-DM Statistics and Frame Counts	725
Displaying ETH-DM Statistics Only	725
Displaying ETH-DM Statistics and Frame Counts	726
Displaying ETH-DM Frame Counts for MEPs by Enclosing CFM Entity	726
Displaying ETH-DM Frame Counts for MEPs by Interface or Domain Level	727
Clearing ETH-DM Statistics and Frame Counts	728
Configuring MEP Interfaces	728
Ensuring That Distributed ppm Is Not Disabled	730
Enabling the Hardware-Assisted Timestamping Option	732
Enabling Inline Transmission of Continuity Check Messages for Maximum Scaling	733
Enabling Inline Mode Of Performance Monitoring To Achieve Maximum Scaling	734
Supported Inline CCM and Inline PM Scaling Values	736
Configuring Connectivity Fault Management for Interoperability During Unified In-Service Software Upgrades	738
Using the monitor ethernet delay-measurement Command	739
Managing ETH-LM Statistics	740
Displaying ETH-LM Statistics	740
Clearing ETH-LM Statistics	741
Managing Continuity Measurement Statistics	742
Displaying Continuity Measurement Statistics	742
Clearing Continuity Measurement Statistics	742
Configuring the Failure Notification Protocol	743

	Ethernet Alarm Indication Signal (ETH-AIS) Function Overview	744
	Understanding ETH-AIS in a Maintenance Domain	744
	Fault Detection in a Maintenance Domain	745
	Terms Defined	746
	Ethernet Alarm Indication Signal Overview	748
	Configuring ETH-AIS on a CFM MEP	749
	Configuring an Action Profile	750
	Configuring an Action to Be Taken When an AIS Alarm Is Detected	751
	Attaching the Action Profile to a CFM MEP	752
	Configuring Alarm Indication Signal on ACX Series Routers	754
	Example: Configuring One-Way Ethernet Frame Delay Measurements with Single-Tagged Interfaces	756
	Example: Configuring Two-Way Ethernet Frame Delay Measurements with Single-Tagged Interfaces	761
	Example: Measuring Ethernet Frame Loss for Single-Tagged LMM/LMR PDUs	765
	Example: Measuring Ethernet Frame Loss for Dual-Tagged LMM/LMR PDUs . .	778
	Triggering an Ethernet Frame Delay Measurements Session	790
	Viewing Ethernet Frame Delay Measurements Statistics	792
Chapter 27	Configuring Ethernet Ring Protection	795
	Ethernet Ring Protection	795
	Ethernet Ring Protection Using Ring Instances for Load Balancing	797
	Example: Configuring Ethernet Ring Protection for MX Series Routers	798
	Example Topology	798
	Router 1 (RPL Owner) Configuration	799
	Router 2 Configuration	801
	Router 3 Configuration	803
	Example: Configuring Load Balancing Within Ethernet Ring Protection for MX Series Routers	805
	Example: Viewing Ethernet Ring Protection Status—Normal Ring Operation . .	823
	Example: Viewing Ethernet Ring Protection Status—Ring Failure Condition . .	825
Chapter 28	CFM Action Profile to Bring Down a Group of Logical Interfaces	829
	CFM Action Profile to Bring Down a Group of Logical Interfaces Overview	829
	Benefits of Creating CFM Action Profile to Bring Down a Group of Logical Interfaces	830
	Configuring a CFM Action Profile to Bring Down a Group of Logical Interfaces . .	830
Part 4	Troubleshooting Information	
Chapter 29	Monitoring and Troubleshooting Ethernet Interfaces	837
	Configuring Interface Diagnostics Tools to Test the Physical Layer Connections	837
	Configuring Loopback Testing	837
	Configuring BERT Testing	839

Starting and Stopping a BERT Test	843
Verifying Link and Transceivers using Pseudo Random Binary Sequence (PRBS) Test	844
Verifying Link and Transceivers using Pseudo Random Binary Sequence (PRBS) Test	844
Guidelines to perform Bidirectional Diagnostics using Remote Loopback . .	846
Clearing the Interface Statistics	849
Checklist for Monitoring Fast Ethernet and Gigabit Ethernet Interfaces	850
Monitoring Fast Ethernet and Gigabit Ethernet Interfaces	851
Checklist for Monitoring Fast Ethernet and Gigabit Ethernet Interfaces . . .	851
Monitor Fast Ethernet and Gigabit Ethernet Interfaces	851
Display the Status of Fast Ethernet Interfaces	852
Display the Status of Gigabit Ethernet Interfaces	853
Display the Status of a Specific Fast Ethernet or Gigabit Ethernet Interface	854
Display Extensive Status Information for a Specific Fast Ethernet or Gigabit Ethernet Interface	855
Monitor Statistics for a Fast Ethernet or Gigabit Ethernet Interface . . .	858
Fiber-Optic Ethernet Interface Specifications	860
Performing Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces	861
Checklist for Using Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces	861
Diagnose a Suspected Hardware Problem with a Fast Ethernet or Gigabit Ethernet Interface	862
Create a Loopback	862
Create a Physical Loopback for a Fiber-Optic Interface	863
Create a Loopback Plug for an RJ-45 Ethernet Interface	863
Configure a Local Loopback	864
Verify That the Fast Ethernet or Gigabit Ethernet Interface Is Up	865
Configure a Static Address Resolution Protocol Table Entry	868
Clear Fast Ethernet or Gigabit Ethernet Interface Statistics	872
Ping the Fast Ethernet or Gigabit Ethernet Interface	873
Check for Fast Ethernet or Gigabit Ethernet Interface Error Statistics	874
Diagnose a Suspected Circuit Problem	876
Locating the Fast Ethernet and Gigabit Ethernet LINK Alarm and Counters . . .	876
Checklist for Locating Fast Ethernet and Gigabit Ethernet Alarms and Counters	876

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

Documentation Conventions

Table 1 on page xlv defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xlv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [community-ids]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	

GUI Conventions

Table 2: Text and Syntax Conventions (continued)

Convention	Description	Examples
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

Ethernet Interfaces Overview

Ethernet was developed in the early 1970s at the Xerox Palo Alto Research Center (PARC) as a data-link control layer protocol for interconnecting computers. It was first widely used at 10 megabits per second (Mbps) over coaxial cables and later over unshielded twisted pairs using 10Base-T. More recently, 100Base-TX (Fast Ethernet, 100 Mbps), Gigabit Ethernet (1 gigabit per second [Gbps]), 10-Gigabit Ethernet (10 Gbps), and 100-Gigabit Ethernet (100 Gbps) have become available.

Juniper Networks routers support the following types of Ethernet interfaces:

- Fast Ethernet
- Tri-Rate Ethernet copper
- Gigabit Ethernet
- Gigabit Ethernet intelligent queuing (IQ)
- Gigabit Ethernet IQ2 and IQ2-E
- 10-Gigabit Ethernet IQ2 and IQ2-E
- 10-Gigabit Ethernet
- 10-Gigabit Ethernet dense wavelength-division multiplexing (DWDM)
- 100-Gigabit Ethernet
- Management Ethernet interface, which is an out-of-band management interface within the router
- Internal Ethernet interface, which connects the Routing Engine to the packet forwarding components
- Aggregated Ethernet interface, a logical linkage of Fast Ethernet, Gigabit Ethernet, or 10-Gigabit Ethernet physical connections

MX Series Router Interface Identifiers

Juniper Networks MX Series 5G Universal Routing Platforms support several types of line cards, including Dense Port Concentrators (DPCs), Flexible Port Concentrators (FPCs) with associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) with associated Modular Interface Cards (MICs), or MICs. FPCs are populated with PICs for various interface types. DPCs and MPCs with associated MICs, and MICs support a variety of port configurations and combine the functions of FPCs and the PICs. The configuration syntax for each type of line card is the same: *type-fpc/pic/port*.

Ports are numbered from 0 through 9 for Gigabit Ethernet and Tri-Rate Ethernet copper interfaces. Port numbers are always 0 for 10-Gigabit Ethernet interfaces.

NOTE: In certain displays, the MX Series routers identify the Packet Forwarding Engine (PFE) rather than the PIC number. PFE 0 corresponds to PIC 0, PFE 1 corresponds to PIC 2, PFE 2 corresponds to PIC 1, and PFE 3 corresponds to PIC 3.

Example: Configuring Fast Ethernet Interfaces

The following configuration is sufficient to get a Fast Ethernet interface up and running. By default, IPv4 Fast Ethernet interfaces use Ethernet version 2 encapsulation.

```
[edit]  
user@host# set interfaces fe-5/2/1 unit 0 family inet address local-address
```

```
user@host# show
interfaces {
  fe-5/2/1 {
    unit 0 {
      family inet {
        address local-address;
      }
    }
  }
}
```

Related Documentation

- *Ethernet Interfaces Feature Guide for Routing Devices*

Example: Configuring Gigabit Ethernet Interfaces

The following configuration is sufficient to get a Gigabit Ethernet, Tri-Rate Ethernet copper, or 10-Gigabit Ethernet interface up and running. By default, IPv4 Gigabit Ethernet interfaces on MX Series, M Series, and T Series routers use 802.3 encapsulation.

```
[edit]
user@host# set interfaces ge-2/0/1 unit 0 family inet address local-address
user@host# show
interfaces {
  ge-2/0/1 {
    unit 0 {
      family inet {
        address local-address;
      }
    }
  }
}
```

The M160, M320, M120, T320, and T640 2-port Gigabit Ethernet PIC supports two independent Gigabit Ethernet links.

Each of the two interfaces on the PIC is named:

```
ge-fpc/pic/[0.1]
```

Each of these interfaces has functionality identical to the Gigabit Ethernet interface supported on the single-port PIC.

Related Documentation

- *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring Ethernet Physical Interface Properties

1. To configure Fast Ethernet-specific physical interface properties, include the **fastether-options** statement at the **[edit interfaces fe-fpc/pic/port]** hierarchy level:

```
[edit interfaces fe-fpc/pic/port]
user@host# set fastether-options;
```

NOTE: The `speed` statement applies to the management Ethernet interface (fxp0 or em0), the Fast Ethernet 12-port and 48-port Physical Interface Card (PIC) interfaces and the MX Series Tri-Rate Ethernet copper interfaces. The Fast Ethernet, fxp0, and em0 interfaces can be configured for 10 Mbps or 100 Mbps (10m | 100m). The MX Series Tri-Rate Ethernet copper interfaces can be configured for 10 Mbps, 100 Mbps, or 1 Gbps (10m | 100m | 1g). The 4-port and 8-port Fast Ethernet PICs support a speed of 100 Mbps only.

MX Series routers support Gigabit Ethernet automatic line sensing of MDI (Media Dependent Interface) and MDIX (Media Dependent Interface with Crossover) port connections. MDI is the Ethernet port connection typically used on network interface cards (NIC). MDIX is the standard Ethernet port wiring for hubs and switches. This feature allows MX Series routers to automatically detect MDI and MDIX connections and configure the router port accordingly. You can disable this feature by using the `no-auto-mdix` statement at the `[edit interfaces ge-fpc/pic/port]` hierarchy level.

NOTE: Junos OS supports Ethernet host addresses with no subnets. This enables you to configure an Ethernet interface as a host address (that is, with a network mask of /32), without requiring a subnet. Such interfaces can serve as OSPF point-to-point interfaces, and MPLS is also supported.

2. To configure physical interface properties specific to Gigabit Ethernet and 10-Gigabit Ethernet, include the `gigether-options` statement at the `[edit interfaces ge-fpc/pic/port]` or `[edit interfaces xe-fpc/pic/port]` hierarchy level:

```
[edit interfaces ge-fpc/pic/port]
user@host# set gigether-options ;
```

3. For 10-Gigabit Ethernet DWDM-specific physical interface properties, include the `optics-options` statement at the `[edit interfaces ge-fpc/pic/port]` hierarchy level:

```
[edit interfaces ge-fpc/pic/port]
user@ host# set optics-options;
```

To configure Gigabit Ethernet IQ-specific physical interface properties, include the `gigether-options` statement at the `[edit interfaces ge-fpc/pic/port]` hierarchy level. These statements are supported on 10-Gigabit Ethernet IQ2 and IQ2-E PIC. Some of these statements are also supported on Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

```
[edit interfaces ge-fpc/pic/port]
user@host# set gigether-options {
```

4. To configure 10-Gigabit Ethernet physical interface properties, include the **lan-phy** or **wan-phy** statement at the **[edit interfaces xe-fpc/pic/port framing]** hierarchy level.

```
[edit interfaces interface-name]
user@host# set framing;
```

5. To configure OAM 802.3ah support for Ethernet interfaces, include the **oam** statement at the **[edit protocols]** hierarchy level.

```
[edit protocols]
user@host# set oam;
```

6. To configure Gigabit Ethernet IQ-specific logical interface properties, include the **input-vlan-map**, **output-vlan-map**, **layer2-policer**, and **vlan-tags** statements at the **[edit interfaces interface-name unit logical-unit-number]** hierarchy level or **[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]**.

```
[edit interfaces interface-name unit logical-unit-number]
user#host# set input-vlan-map;
user@host# set output-vlan-map;
user#host# set layer2-policer{
user@host# set vlan-tags inner tpid.vlan-id outer tpid.vlan-id;
```

7. To configure aggregated Ethernet-specific physical interface properties, include the **aggregated-ether-options** statement at the **[edit interfaces aex]** hierarchy level:

```
[edit interfaces aex]
user@host# set aggregated-ether-options;
```

Configuring the Interface Speed on Ethernet Interfaces

For M Series and T Series Fast Ethernet 12-port and 48-port PIC interfaces, the management Ethernet interface (**fxp0** or **em0**), and the MX Series Tri-Rate Ethernet copper interfaces, you can explicitly set the interface speed. The Fast Ethernet, **fxp0**, and **em0** interfaces can be configured for 10 Mbps or 100 Mbps (**10m** | **100m**). The MX Series Tri-Rate Ethernet copper interfaces can be configured for 10 Mbps, 100 Mbps, or 1 Gbps

(10m | 100m | 1g). For information about management Ethernet interfaces and to determine the management Ethernet interface type for your router, see *Understanding Management Ethernet Interfaces and Supported Routing Engines by RouterMX Series* routers, with MX-DPC and Tri-Rate Copper SFPs, support 20x1 Copper to provide backwards compatibility with 100/10BASE-T and 1000BASE-T operation through an Serial Gigabit Media Independent Interface (SGMII) interface.

1. In configuration mode, go to the **[edit interfaces interface-name]** hierarchy level.

```
[edit ]
user@host# edit interfaces interface-name
```

2. To configure the speed, include the **speed** statement at the **[edit interfaces interface-name]** hierarchy level.

```
[edit interfaces interface-name]
user@host# set speed (10m | 100m | 1g | auto | auto-10m-100m);
```

NOTE:

- By default, the M Series and T Series routers management Ethernet interface autonegotiates whether to operate at 10 megabits per second (Mbps) or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the `no-concatenate` statement in the `[edit chassis]` configuration hierarchy.
- Starting with Junos OS Release 14.2 the `auto-10m-100m` option allows the fixed tri-speed port to auto negotiate with ports limited by 100m or 10m maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.,
- When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.
- If the link partner does not support autonegotiation, configure either Fast Ethernet port manually to match its link partner's speed and link mode. When the link mode is configured, autonegotiation is disabled.
- On MX Series routers with tri-rate copper SFP interfaces, if the port speed is negotiated to the configured value and the negotiated speed and interface speed do not match, the link will not be brought up.
- When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.
- Starting with Junos OS Release 11.4, half-duplex mode is not supported on Tri-Rate Ethernet copper interfaces. When you include the `speed` statement, you must include the `link-mode full-duplex` statement at the same hierarchy level.

Release History Table

Release	Description
14.2	Starting with Junos OS Release 14.2 the auto-10m-100m option allows the fixed tri-speed port to auto negotiate with ports limited by 100m or 10m maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.
11.4	Starting with Junos OS Release 11.4, half-duplex mode is not supported on Tri-Rate Ethernet copper interfaces. When you include the speed statement, you must include the link-mode full-duplex statement at the same hierarchy level.

Channelizing Interfaces on PTX10003 Routers

PTX10003 routers comes in two flavours — PTX10003-80C and PTX10003-160C. PTX10003-80C routers support four logical PICs, where each logical PIC has 10 ports, numbered 0 to 9. On PTX10003-80C router, there are 40 physical ports in total, which support QSFP28 ports. The QSFP28 ports support 100-Gigabit Ethernet interfaces, 40-Gigabit Ethernet interfaces, and 10-Gigabit Ethernet interfaces. Each port also supports QSFP28-DD optics which can support two 100-Gigabit Ethernet interfaces. Hence a total 80 100-Gigabit Ethernet interfaces is supported for PTX10003-80C.

PTX10003-160C routers support eight logical PICs, where each logical PIC has 10 ports, numbered 0 to 9. On PTX10003-160C router, there are 80 physical ports in total, which support QSFP28 ports. The QSFP28 ports support 100-Gigabit Ethernet interfaces, 40-Gigabit Ethernet interfaces, and 10-Gigabit Ethernet interfaces. Each port also supports QSFP28-DD optics which supports two 100-Gigabit Ethernet interfaces. Hence a total of 160 100-Gigabit Ethernet interfaces are supported for PTX10003-160C routers.

The PTX10003-80C and PTX10003-160C routers provide 40-Gbps QSFP+ ports that can be channelized. Channelization allows you to configure 40-Gbps QSFP+ ports to operate as four 10-Gigabit Ethernet (et) interfaces. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and routers. By default, the four 40-Gbps QSFP+ ports operate as 40-Gigabit Ethernet (et) ports. When a 40-Gigabit Ethernet (et) port is channelized to four 10-Gigabit Ethernet (et) ports, a colon is used to signify the four separate channels. For example, on a switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are et-0/1/2:0, et-0/1/2:1, et-0/1/2:2, and et-0/1/2:3.

When you channelize the 40-Gigabit Ethernet interfaces as 10-Gigabit Ethernet interfaces, the interface names appear in the et-fpc/pic/port:channel format, where channel can be a value of 0 through 3. To channelize the ports, manually configure the port speed using the **set chassis fpc slot-number port port-number speed speed** command, where the speed can be set to 10G. The ports do not support auto-channelization.

NOTE: On PTX10003-80C and PTX10003-160C standalone routers, the FPC value is always 0. Also, Virtual Chassis is not supported.

On a physical interface port, when port speed and sub-port-number is not configured, the interface (IFD) is automatically created. Following are the interface speed and optics supported:

- QSFP DD 200G optics supports two 100-Gigabit Ethernet mode
- QSFP28 optics supports 100-Gigabit Ethernet mode
- QSFP+ optics supports 40-Gigabit Ethernet mode or four 10-Gigabit Ethernet mode

On a physical interface, if user configures the port speed, the configured port speed and sub-channel number will override the inserted optics type. The Interface will be disabled if the inserted optics type does not match the user configured port speed.

NOTE: In each PIC, the port 4 and 9 are connected to two PFEs and hence these ports does not support 1x200G interface. It supports 2x100-Gigabit Ethernet (using QSFP28 DD) optics), 100-Gigabit Ethernet (using QSFP28 optics), 40-Gigabit Ethernet (using QSFP+ optics), or 4x10-Gigabit Ethernet (using QSFP+ optics) interfaces.

The following table lists the interface speed and interface name format supported on PTX10003-80C and PTX10003-160C router:

Optic Device	Interface Speed	Interface Name Format
QSFP DD 200G	2x100G	et-x/y/z:0
		et-x/y/z:0 et-x/y/z:1
QSFP28 100G	1x100G	et-x/y/z
QSFP+ 40G	1x40G	et-x/y/z
	4x10G	et-x/y/z:0
		et-x/y/z:1
		et-x/y/z:2
		et-x/y/z:3

The port speed can be configured on each of the optical port. Using the appropriate optics, you can channelize the speed of the ports to 10-Gbps, 40-Gbps, and 100-Gbps speeds. If no port speed is configured on a valid optical port, a default port speed of 2x100G is used.

NOTE:

- Speed can be configured at PIC or port-level.
- At port-level, channelize the ports by using the number-of-subports configuration statement.
- The port speed can be configured on each of the optical port. If no port speed configured on a valid optical port, a default port speed of (2x100G) is used if there is no optic transceiver is inserted in a physical port.

To know the port speed capability of a logical PIC, issue the **show chassis pic fpc-slot slot-number pic-slot slot-number** command.

The following steps describe how to channelize blocks of ports or individual ports.

1. To configure a block of 100-Gigabit Ethernet (et) ports to operate as 40-Gigabit Ethernet ports, specify a port range and channel speed:

```
[edit chassis fpc fpc-slot pic pic-slot]
user@router# set port-range port-range-low port-range-high speed speed
```

For example, to configure ports 48 through 51 on PIC 0 to operate as 40-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@router# set port-range 48-51 speed 40g
```

2. To configure an individual 40-Gigabit Ethernet (et) port to operate as 10-Gigabit Ethernet (et) ports, specify a port number and number of sub-ports:

```
[edit chassis fpc 0 pic 0]
user@router# set port port-number number-of-sub-ports number-of-sub-ports
```

For example, to configure port 48 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@router# set chassis fpc 0 pic 0 port 48 number-of-sub-ports 4
```

3. Review your configuration and issue the **commit** command.

```
[edit]
user@router# commit
commit complete
```

4. To return a range of ports from the 40-Gigabit Ethernet configuration to the default 100-Gigabit Ethernet configuration, delete the 40g statement:

```
[edit chassis fpc 0 pic 0]
user@router# delete port-range port-range-low port-range-high speed speed
```

For example, to return ports 48 through 51 from the 40-Gigabit Ethernet configuration to the default 100-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 0]
user@router# delete port-range 48-51 speed 40g
```

5. Review your configuration and issue the **commit** command.

```
[edit]
```

```
user@router# commit
commit complete
```

6. To return an individual 40-Gigabit Ethernet port to the default 100-Gigabit Ethernet configuration, delete the 40g statement:

```
[edit chassis fpc 0 pic 0]
user@router# delete port port-number speed speed
```

For example, to return port 48 from the 40-Gigabit Ethernet configuration to the default 100-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 0]
user@router# delete port 48 speed 40g
```

7. Review your configuration and issue the **commit** command.

```
[edit]
user@router# commit
commit complete
```

Configuring the Ingress Rate Limit

On Fast Ethernet 8-port, 12-port, and 48-port PIC interfaces only, you can apply port-based rate limiting to the ingress traffic that arrives at the PIC.

To configure an ingress rate limit on a Fast Ethernet 8-port, 12-port, or 48-port PIC interface, include the **ingress-rate-limit** statement at the **[edit interfaces *interface-name* fastether-options]** hierarchy level:

```
[edit interfaces interface-name fastether-options]
ingress-rate-limit rate;
```

rate can range in value from 1 through 100 Mbps.

- Related Documentation
- [ingress-rate-limit on page 1131](#)
 - [Ethernet Interfaces Overview on page 3](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Understanding Flow Control

Flow control supports lossless transmission by regulating traffic flows to avoid dropping frames during periods of congestion. Flow control stops and resumes the transmission of network traffic between two connected peer nodes on a full-duplex Ethernet physical link. Controlling the flow by pausing and restarting it prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

By default, all forms of flow control are enabled. You must explicitly enable flow control on interfaces to pause traffic.

The MX, T, and PTX Series routers support IEEE 802.3X Ethernet PAUSE method of flow control.

- [IEEE 802.3X Ethernet PAUSE on page 17](#)

IEEE 802.3X Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends Ethernet PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to Ethernet PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends an Ethernet PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the Ethernet PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives an Ethernet PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the Ethernet PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

In this scenario, if Node B sends an Ethernet PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

Symmetric Flow Control

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send Ethernet PAUSE messages and respond to them (flow control is enabled), or the interface cannot send Ethernet PAUSE messages or respond to them (flow control is disabled).

You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

When you enable symmetric flow control on an interface, the Ethernet PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any Ethernet PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to Ethernet PAUSE messages.)

- Related Documentation**
- [flow-control on page 1105](#)
 - [Configuring Flow Control on page 18](#)

Configuring Flow Control

By default, the router or switch imposes flow control to regulate the amount of traffic sent out on a Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interface. Flow control is not supported on the 4-port Fast Ethernet PIC. This is useful if the remote side of the connection is a Fast Ethernet or Gigabit Ethernet switch.

You can disable flow control if you want the router or switch to permit unrestricted traffic. To disable flow control, include the **no-flow-control** statement:

```
no-flow-control;
```

To explicitly reinstate flow control, include the **flow-control** statement:

```
flow-control;
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

- Related Documentation**
- [flow-control on page 1105](#)
 - [Ethernet Interfaces Overview on page 3](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring the Link Characteristics on Ethernet Interfaces

Full-duplex communication means that both ends of the communication can send and receive signals at the same time. *Half-duplex* is also bidirectional communication, but signals can flow in only one direction at a time.

By default, the router's management Ethernet interface, **fxp0** or **em0**, autonegotiates whether to operate in full-duplex or half-duplex mode. Fast Ethernet interfaces, can operate in either full-duplex or half-duplex mode, and all other interfaces can operate only in full-duplex mode. For Gigabit Ethernet and 10-Gigabit Ethernet, the link partner must also be set to full duplex.

NOTE: For M Series, MX Series, and most T Series routers, the management Ethernet interface is **fxp0**. For T1600 and T4000 routers configured in a routing matrix, and TX Matrix Plus routers, the management Ethernet interface is **em0**.

NOTE: Automated scripts that you have developed for standalone T1600 routers (T1600 routers that are not in a routing matrix) might contain references to the **fxp0** management Ethernet interface. Before reusing the scripts on T1600 routers in a routing matrix, edit the command lines that reference the **fxp0** management Ethernet interface so that the commands reference the **em0** management Ethernet interface instead.

NOTE: When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.

NOTE: When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.

NOTE: Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.

To explicitly configure an Ethernet interface to operate in either full-duplex or half-duplex mode, include the **link-mode** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
link-mode (full-duplex | half-duplex);
```

NOTE: Starting with Junos OS release 17.4R1 and later, the link-mode configuration is not supported for 10-Gigabit Ethernet interfaces.

Configuring MAC Address Filtering for Ethernet Interfaces

- [Enabling Source Address Filtering on page 20](#)

Enabling Source Address Filtering

On aggregated Ethernet interfaces, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can enable source address filtering to block all incoming packets from a specific MAC address.

To enable the filtering, include the **source-filtering** statement at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

NOTE: When you integrate a standalone T640 router into a routing matrix, the PIC media access control (MAC) addresses for the integrated T640 router are derived from a pool of MAC addresses maintained by the TX Matrix router. For each MAC address you specify in the configuration of a formerly standalone T640 router, you must specify the same MAC address in the configuration of the TX Matrix router.

Similarly, when you integrate a T1600 or T4000 router into a routing matrix, the PIC MAC addresses for the integrated T1600 or T4000 router are derived from a pool of MAC addresses maintained by the TX Matrix Plus router. For each MAC address you specify in the configuration of a formerly standalone T1600 or T4000 router, you must specify the same MAC address in the configuration of the TX Matrix Plus router.

When source address filtering is enabled, you can configure the interface to receive packets from specific MAC addresses. To do this, specify the MAC addresses in the **source-address-filter mac-address** statement at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

You can specify the MAC address as *nn:nn:nn:nn:nn:nn* or *nnnn.nnnn.nnnn*, where *n* is a hexadecimal number. You can configure up to 64 source addresses. To specify more than one address, include the **source-address-filter** statement multiple times.

NOTE: The **source-address-filter** statement is not supported on Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router); instead, include the **accept-source-mac** statement. For more information, see [“Configuring MAC Address Filtering” on page 514](#).

If the remote Ethernet card is changed, the interface cannot receive packets from the new card because it has a different MAC address.

Source address filtering does not work when Link Aggregation Control Protocol (LACP) is enabled. This behavior is not applicable to T series routers and PTX Series Packet Transport Routers. For more information about LACP, see [“Configuring LACP for Aggregated Ethernet Interfaces” on page 81](#).

NOTE: On untagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement at the [edit interfaces *ge-fpc/pic/port* gigether-options] hierarchy level and the **accept-source-mac** statement at the [edit interfaces *ge-fpc/pic/port* gigether-options unit *logical-unit-number*] hierarchy level simultaneously. If these statements are configured for the same interfaces at the same time, an error message is displayed.

On tagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement at the [edit interfaces [edit interfaces *ge-fpc/pic/port* gigether-options] hierarchy level and the **accept-source-mac** statement at the [edit interfaces *ge-fpc/pic/port* gigether-options unit *logical-unit-number*] hierarchy level with an identical MAC address specified in both filters. If these statements are configured for the same interfaces with an identical MAC address specified, an error message is displayed.

NOTE: The **source-address-filter** statement is not supported on MX Series routers with MPC4E (model numbers: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE); instead, include the **accept-source-mac** statement. For more information, see [“Configuring MAC Address Filtering” on page 514](#).

Configuring MAC Address Filtering on PTX Series Packet Transport Routers

This topic describes how to configure MAC filtering on PTX Series Packet Transport Routers. MAC filtering enables you to specify the MAC addresses from which the Ethernet interface can receive packets.

MAC filtering support on PTX Series Packet Transport Routers includes:

- MAC source and destination address filtering for each port.
- MAC source address filtering for each physical interface.
- MAC source address filtering for each logical interface.

When you filter logical and physical interfaces, you can specify up to 1000 MAC source addresses per port.

To configure MAC source address filtering for a physical interface, include the **source-filtering** and **source-address-filter** statements at the **[edit interfaces et-fpc/pic/port together-options]** hierarchy level:

```
[edit interfaces]
et-x/y/z {
  together-options {
    source-filtering;
    source-address-filter {
      mac-address;
    }
  }
}
```

The **source-address-filter** statement configures which MAC source addresses are filtered. The specified physical interface drops all packets from the MAC source addresses you specify. You can specify the MAC address as **nn:nn:nn:nn:nn:nn** where **n** is a decimal digit. To specify more than one address, include multiple **mac-address** options in the **source-address-filter** statement.

To configure MAC source address filtering for a logical interface, include the **accept-source-mac** statement at the **[edit interfaces et-fpc/pic/port unit logical-unit-number]** hierarchy level:

```
[edit interfaces]
et-x/y/z {
```

```

gigether-options {
  source-filtering;
}
unit logical-unit-number {
  accept-source-mac {
    mac-address mac-address;
  }
}
}

```

The **accept-source-mac** statement configures which MAC source addresses are accepted on the logical interface. You can specify the MAC address as *nn:nn:nn:nn:nn:nn* where *n* is a decimal digit. To specify more than one address, include multiple **mac-address mac-address** options in the **accept-source-mac** statement.

After an interface filter is configured, there is an accounting entry that is associated with the MAC address filter. Counters accumulate if there are packets with matching MAC source addresses. You can use the **show interfaces mac-database** Junos OS CLI command to view the address count.

Related Documentation

- [show interfaces mac-database on page 1640](#)

MAC Address Accounting for Dynamically Learned Addresses on Aggregated Ethernet Interfaces Overview

Junos OS supports the capability to compute MAC address statistics for dynamically learned static and destination MAC addresses on physical interfaces. Starting in Junos OS Release 15.1, Junos OS enables you to configure source MAC (SMAC) address and destination MAC (DMAC) address-based accounting for MAC addresses that are dynamically learned on aggregated Ethernet (ae-) interfaces in routed mode. When you include the **mac-learn-enable** statement at the **[edit interfaces aex aggregated-ether-options ethernet-switch-profile]** hierarchy level, dynamic learning of source and destination MAC addresses is enabled. By default, this capability is disabled. When dynamic learning of MAC addresses is enabled for AE interfaces in routed mode, the MAC-filter settings are updated for each of the child links of the AE bundle interface. This feature provides for both the configuration of the **mac-learn-enable** filter and the display of SMAC and DMAC based accounting information on the aggregated interface in the output of the **show interfaces mac-database interface-name mac-address mac-address** command.

When this functionality is enabled, source and destination MAC addresses-based accounting is supported on the routed interfaces on MX Series routers with DPCs and MPCs. Support for mixed mode LAG interfaces is also available. This feature supports MAC address accounting for AE interfaces in routed mode (for inet family). Destination MAC-based accounting is supported only for MAC addresses dynamically learned at the ingress interface, including each individual child or member link of the AE bundle. This behavior occurs because MPCs do not support destination MAC address learning. As a result, if a packet exits a child link without passing in the ingress direction through that link, destination MAC (DMAC) accounting for this packet occurs at the child link level

and this data is not available at the aggregate level. Dynamic learning of MAC addresses can be supported on only the AE interface or on selective individual member links. MAC learning support on the bundle depends on the capability of individual member links. If a link in the bundle does not contain the capability to support MAC learning or accounting, it is disabled on the AE bundle.

The MAC data for the aggregated bundle is displayed by collecting data from individual child links. This data is collected when the command to display the MAC database is triggered from the CLI. This method of data collection implies that based on the number of child links and the size of the MAC database, the time taken to display the database differs. This approach to obtain the current snapshot of the MAC database from the currently active child links is used instead of maintaining a database at the Routing Engine because of the dynamic nature of the MAC database and the overhead required to maintain the database information in synchronization with all the child Packet Forwarding Engines. A difference in the DMAC-based accounting for packets generated from the Routing Engine (packets sent in the host path). On DPCs, these packets are accounted in egress direction (Output Packet/Byte count), whereas on MPCs, these packets are not accounted because DMAC learning is not supported. This difference in behavior also occurs between child links on DPCs and MPCs. Because this feature to enable dynamic learning is related to collecting MAC database statistics from child links based on the command issued from the CLI, there is an impact on the time it takes to display the data on the console based on the size of the MAC database and the number of child-links spread across different FPCs. The limit on the maximum number of MAC addresses that can be learned from an interface does not apply to this dynamic learning of MAC addresses functionality.

Release History Table

Release	Description
15.1	Starting in Junos OS Release 15.1, Junos OS enables you to configure source MAC (SMAC) address and destination MAC (DMAC) address-based accounting for MAC addresses that are dynamically learned on aggregated Ethernet (ae-) interfaces in routed mode.

Related Documentation

- [mac-learn-enable on page 1177](#)

Configuring Ethernet Loopback Capability

By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system. To place an interface in loopback mode, include the **loopback** statement:

```
loopback;
```

NOTE: If you configure a local loopback on a 1-port 10-Gigabit IQ2 and IQ2-E PIC using the `loopback` statement at the [edit interfaces *interface-name* *gigether-options*] hierarchy level, the transmit-path stops working, causing the remote end to detect a link down.

To return to the default—that is, to disable loopback mode—delete the `loopback` statement from the configuration:

```
[edit]
user@host# delete interfaces fe-fpc/pic/port fastether-options loopback
```

To explicitly disable loopback mode, include the `no-loopback` statement:

```
no-loopback;
```

You can include the `loopback` and `no-loopback` statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

Related Documentation

- [Ethernet Interfaces Overview on page 3](#)
- [Interfaces Overview for Switches](#)
- [Ethernet Interfaces Feature Guide for Routing Devices](#)

Ignoring Layer 3 Incomplete Errors

By default, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces count Layer 3 incomplete errors. You can configure the interface to ignore Layer 3 incomplete errors.

To ignore Layer 3 incomplete errors, include the `ignore-l3-incompletes` statement:

```
ignore-l3-incompletes;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

- Related Documentation**
- [ignore-l3-incompletes on page 1128](#)
 - [Ethernet Interfaces Overview on page 3](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring Gratuitous ARP

Gratuitous Address Resolution Protocol (ARP) requests help detect duplicate IP addresses. A gratuitous ARP is a broadcast request for a router's own IP address. If a router or switch sends an ARP request for its own IP address and no ARP replies are received, the router- or switch-assigned IP address is not being used by other nodes. However, if a router or switch sends an ARP request for its own IP address and an ARP reply is received, the router- or switch-assigned IP address is already being used by another node.

Gratuitous ARP replies are reply packets sent to the broadcast MAC address with the target IP address set to be the same as the sender's IP address. When the router or switch receives a gratuitous ARP reply, the router or switch can insert an entry for that reply in the ARP cache. By default, updating the ARP cache on gratuitous ARP replies is disabled on the router or switch.

To enable updating of the ARP cache for gratuitous ARPs:

1. In configuration mode, go to the **[edit interfaces interface-name]** hierarchy level.

```
[edit]
user@host# edit interfaces interface-name
```

2. Include the **gratuitous-arp-reply** statement.

```
[edit interfaces interface-name]
user@host# set gratuitous-arp-reply
```

To restore the default behavior, that is, to disable updating of the ARP cache for gratuitous ARP, delete the **gratuitous-arp-reply** statement from the configuration:

```
[edit interfaces interface-name]
user@host# delete gratuitous-arp-reply;
```

By default, the router or switch responds to gratuitous ARP requests. However, on Ethernet interfaces, you can disable responses to gratuitous ARP requests.

To disable responses to gratuitous ARP requests:

1. In configuration mode, go to the **[edit interfaces interface-name]** hierarchy level.

```
[edit]
user@host# edit interfaces interface-name
```

2. Include the **no-gratuitous-arp-request** statement.

```
[edit interfaces interface-name]
user@host# set no-gratuitous-arp-request
```

To return to the default—that is, to respond to gratuitous ARP requests—delete the **no-gratuitous-arp-request** statement from the configuration:

```
[edit interfaces interface-name]
user@host# delete no-gratuitous-arp-request
```

Related Documentation

Adjusting the ARP Aging Timer

By default, the ARP aging timer is set at 20 minutes. In environments with many directly attached hosts, such as metro Ethernet environments, increasing the amount of time between ARP updates by configuring the ARP aging timer can improve performance in an event where having thousands of clients time out at the same time might impact packet forwarding performance. In environments where there are devices connected with lower ARP aging timers (less than 20 minutes), decreasing the ARP aging timer can improve performance by preventing the flooding of traffic toward next hops with expired ARP entries. In most environments, the default ARP aging timer value does not need to be adjusted.

To configure the system-wide ARP aging timer, include the **aging-timer** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]
user@host# aging-timer minutes
```

The aging timer range is from 1 through 240 minutes. The timer value you configure takes effect as ARP entries expire. In other words, each subsequent refreshed ARP entry receives the new timer value. The new timer value does not apply to ARP entries that exist at the time you commit the configuration.

For more information about statements you can configure at the **[edit system]** hierarchy level, see the *Junos OS Administration Library*.

Configuring Weighted Random Early Detection

On M7i, M10i, M40e, M320, M120, and T Series routers, the Ethernet IQ2 and IQ2-E PIC families extend CoS functionality by supporting network congestion avoidance with weighted random early detection (WRED).

- Related Documentation**
- For information on configuring WRED, see the *Class of Service Feature Guide (Routers and EX9200 Switches)*.
 - [Ethernet Interfaces Overview on page 3](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring Multicast Statistics Collection on Ethernet Interfaces

T Series and TX Matrix routers support multicast statistics collection on Ethernet interfaces in both ingress and egress directions. The multicast statistics functionality can be configured on a physical interface thus enabling multicast accounting for all the logical interfaces below the physical interface.

The multicast statistics information is displayed only when the interface is configured with the **multicast-statistics** statement, which is not enabled by default.

Multicast statistics collection requires at least one logical interface is configured with family inet and/or inet6; otherwise, the commit for **multicast-statistics** will fail.

The multicast in/out statistics can be obtained via interfaces statistics query through CLI and via MIB objects through SNMP query.

To configure multicast statistics:

1. Include the **multicast-statistics** statement at the **[edit interfaces interface-name]** hierarchy level.

An example of a multicast statistics configuration for a Ethernet interface follows:

```
[edit interfaces]
  ge-fpc/pic/port {
    multicast-statistics;
  }
```

To display multicast statistics, use the **show interfaces *interface-name* statistics detail** command.

- Related Documentation**
- *multicast-statistics*
 - [Configuring Multicast Statistics Collection on Aggregated Ethernet Interfaces on page 146](#)
 - [Ethernet Interfaces Overview on page 3](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Displaying Internal Ethernet Interfaces for a Routing Matrix with a TX Matrix Plus Router

The router internal Ethernet interface connects the Routing Engine with the router's packet forwarding components. The Junos OS automatically configures internal Ethernet interfaces. For TX Matrix Plus routers, the internal Ethernet interfaces are **ixgbe0** and **ixgbe1**. For T1600 routers configured in a routing matrix, the internal Ethernet interfaces are **bcm0** and **em1**. For more information about internal Ethernet interfaces, see *Understanding Internal Ethernet Interfaces*.

NOTE: Do not modify or remove the configuration for the internal Ethernet interface that the Junos OS automatically configures. If you do, the router will stop functioning.

The following example is a sequence of **show interfaces** commands issued in a Junos OS command-line interface (CLI) session with a TX Matrix Plus router in a routing matrix. In the example, the TX Matrix Plus router, which is also called the switch-fabric chassis (SFC), is known by the IP host name **host-sfc-0** and contains redundant Routing Engines. The commands display information about the management Ethernet interface and both internal Ethernet interfaces configured on the Routing Engine to which you are currently logged in:

```
user@host-sfc-0> show interfaces em0 terse
```

Interface	Admin	Link	Proto	Local	Remote
em0	up	up

The following example is a sequence of **show interfaces** commands issued in a CLI session with a T1600 router in a routing matrix. In the example, the T1600 router, which is also

called the line-card chassis (LCC), is known by the IP host name **host-sfc-0-lcc-2** and contains redundant Routing Engines.

This T1600 router is connected to the routing matrix through a connection in the TXP-SIB-F13 in slot 2 of the SCC. The commands display information about the management Ethernet interface and both internal Ethernet interfaces configured on the Routing Engine to which you are currently logged in:

NOTE: In a routing matrix, the **show interfaces** command displays information about the current router only. If you are logged in to the TX Matrix Plus router, the **show interfaces** command output does not include information about any of the attached T1600 routers. To display interface information about a specific T1600 router in the routing matrix, you must first log in to that router.

The previous example shows a CLI session with the TX Matrix Plus router. To display interface information about the T1600 router known as **host-sfc-0-lcc-2**, first use the **request routing-engine login** command to log in to that LCC.

```
user@host-sfc-0> request routing-engine login lcc 2
```

CHAPTER 3

Configuring the Management Ethernet Interface

- [Management Ethernet Interface Overview on page 33](#)
- [Configuring a Consistent Management IP Address on page 34](#)
- [Configuring the MAC Address on the Management Ethernet Interface on page 35](#)

Management Ethernet Interface Overview

The router's management Ethernet interface, **fxp0** or **em0**, is an out-of-band management interface that needs to be configured only if you want to connect to the router through the management port on the front of the router. You can configure an IP address and prefix length for this interface, which you commonly do when you first install the Junos OS:

```
[edit]
user@host# set interfaces (fxp0 | em0) unit 0 family inet address/prefix-length
[edit]
user@host# show
interfaces {
  (fxp0 | em0) {
    unit 0 {
      family inet {
        address/prefix-length;
      }
    }
  }
}
```

To determine which management interface type is supported on a router, locate the router and Routing Engine combination in *Supported Routing Engines by Router* and note its management Ethernet interface type, either **em0** or **fxp0**.

Related Documentation

- [Configuring a Consistent Management IP Address on page 34](#)

Configuring a Consistent Management IP Address

On routers with multiple Routing Engines, each Routing Engine is configured with a separate IP address for the management Ethernet interface. To access the master Routing Engine, you must know which Routing Engine is active and use the appropriate IP address.

Optionally, for consistent access to the master Routing Engine, you can configure an additional IP address and use this address for the management interface regardless of which Routing Engine is active. This additional IP address is active only on the management Ethernet interface for the master Routing Engine. During switchover, the address moves to the new master Routing Engine.

NOTE: For M Series, MX Series, and most T Series routers, the management Ethernet interface is `fxp0`. For TX Matrix Plus routers and T1600 or T4000 routers configured in a routing matrix, the management Ethernet interface is `em0`.

NOTE: Automated scripts that you have developed for standalone T1600 routers (T1600 routers that are not in a routing matrix) might contain references to the `fxp0` management Ethernet interface. Before reusing the scripts on T1600 routers in a routing matrix, edit the command lines that reference the `fxp0` management Ethernet interface so that the commands reference the `em0` management Ethernet interface instead.

To configure an additional IP address for the management Ethernet interface, include the **master-only** statement at the **[edit groups]** hierarchy level.

In the following example, IP address **10.17.40.131** is configured for both Routing Engines and includes a **master-only** statement. With this configuration, the **10.17.40.131** address is active only on the master Routing Engine. The address remains consistent regardless of which Routing Engine is active. IP address **10.17.40.132** is assigned to **fxp0** on **re0**, and address **10.17.40.133** is assigned to **fxp0** on **re1**.

```
[edit groups re0 interfaces fxp0]
unit 0 {
  family inet {
    address 10.17.40.131/25 {
      master-only;
    }
    address 10.17.40.132/25;
  }
}
[edit groups re1 interfaces fxp0]
unit 0 {
  family inet {
    address 10.17.40.131/25 {
      master-only;
```

```

    }
    address 10.17.40.133/25;
  }
}

```

This feature is available on all routers that include dual Routing Engines. On the TX Matrix router, this feature is applicable to the switch-card chassis (SCC) only.

**Related
Documentation**

- [Management Ethernet Interface Overview on page 33](#)
- [Configuring the MAC Address on the Management Ethernet Interface on page 35](#)
- *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring the MAC Address on the Management Ethernet Interface

By default, the router's management Ethernet interface uses as its MAC address the MAC address that is burned into the Ethernet card.

NOTE: For M Series, MX Series, and most T Series routers, the management Ethernet interface is `fxp0`. For TX Matrix Plus routers and T1600 routers configured in a routing matrix, and TX Matrix Plus routers with 3D SIBs, T1600 routers, and T4000 routers configured in a routing matrix, the management Ethernet interface is `em0`.

NOTE: Automated scripts that you have developed for standalone T1600 routers (T1600 routers that are not in a routing matrix) might contain references to the `fxp0` management Ethernet interface. Before reusing the scripts on T1600 routers in a routing matrix, edit the command lines that reference the `fxp0` management Ethernet interface so that the commands reference the `em0` management Ethernet interface instead.

To display the MAC address used by the router's management Ethernet interface, enter the **show interface `fxp0`** or **show interface `em0`** operational mode command.

To change the management Ethernet interface's MAC address, include the **mac** statement at the **[edit interfaces `fxp0`]** or **[edit interfaces `em0`]** hierarchy level:

```

[edit interfaces (fxp0 | em0)]
  mac mac-address;

```

Specify the MAC address as six hexadecimal bytes in one of the following formats: `nnnn.nnnn.nnnn` (for example, `0011.2233.4455`) or `nn:nn:nn:nn:nn:nn` (for example, `00:11:22:33:44:55`).

NOTE: If you integrate a standalone T640 router into a routing matrix, the PIC MAC addresses for the integrated T640 router are derived from a pool of MAC addresses maintained by the TX Matrix router. For each MAC address you specify in the configuration of a formerly standalone T640 router, you must specify the same MAC address in the configuration of the TX Matrix router.

Similarly, if you integrate a standalone T1600 router into a routing matrix, the PIC MAC addresses for the integrated T1600 router are derived from a pool of MAC addresses maintained by the TX Matrix Plus router. For each MAC address you specify in the configuration of a formerly standalone T1600 router, you must specify the same MAC address in the configuration of the TX Matrix Plus router.

CHAPTER 4

Enabling Passive Monitoring on Ethernet Interfaces

- [Passive Monitoring on Ethernet Interfaces Overview on page 37](#)
- [Enabling Passive Monitoring on Ethernet Interfaces on page 39](#)

Passive Monitoring on Ethernet Interfaces Overview

The Monitoring Services I and Monitoring Services II PICs are designed to enable IP services. You can monitor IPv4 traffic if you have a Monitoring Services PIC installed in the router with the following PICs:

- 10-port Gigabit Ethernet PIC with SFPs
- 4-port Gigabit Ethernet PIC with SFPs
- 2-port Gigabit Ethernet PIC with SFPs
- 1-port 10-Gigabit Ethernet PIC

NOTE: The PICs in the preceding list support only IPv4.

NOTE: Starting with Junos OS Release 9.5, I2.0 based M120 routers and I3.0 based M320 routers with the PICs in the preceding list support passive monitoring. Other M Series and T Series routers with the PICs listed above started supporting passive monitoring before Junos OS Release 7.3. Support for 1-port 10-Gigabit Ethernet PIC with XENPAK on I2.0-based M120 routers and I3.0-based M320 routers was added in Junos OS Release 9.5.

- 4-port 10-Gigabit Ethernet LAN/WAN PIC with XFP (T640, T1600, and T4000 Core Routers) (supported on both WAN-PHY and LAN-PHY modes for both IPv4 and IPv6 addresses)

The following interfaces support passive monitoring on the I3.0-based MX 240, MX 480, and MX 960 routers, starting with Junos OS Release 8.5:

- Type 2 MX FPCs
- Type 3 MX FPCs
- Gigabit Ethernet Enhanced DPC with SFP (DPCE-R-40GE-SFP)
- 4-port 10-Gigabit Ethernet Enhanced DPCs with XFP (DPCE-R-4XGE-XFP)

The following interfaces support passive monitoring on the Trio-based MX 240, MX 480, and MX 960 routers:

- 10-Gigabit Ethernet MPC with SFP+
- 30-Gigabit Ethernet MPC
- 60-Gigabit Ethernet MPC

Passive monitoring is also supported on MX 80 routers with 10-Gigabit Ethernet MPC with SFP+ and 30-Gigabit Ethernet MPC interfaces.

Interfaces configured on the following FPCs and PIC support IPv6 passive monitoring on the T640, T1600, and T4000 routers:

- Enhanced Scaling FPC2
- Enhanced Scaling FPC3
- Enhanced Scaling FPC4
- Enhanced Scaling FPC4.1
- Enhanced II FPC1 (T640 and T1600 routers)
- Enhanced II FPC2 (T640 and T1600 routers)
- Enhanced II FPC3 (T640 and T1600 routers)
- 4-port 10-Gigabit Ethernet LAN/WAN PIC with XFP (supported on both WAN-PHY and LAN-PHY modes for both IPv4 and IPv6 addresses)
- Gigabit Ethernet PIC with SFP
- 10-Gigabit Ethernet PIC with XENPAK (T640 and T1600 routers)
- SONET/SDH OC192/STM64 PICs with XFP (T1600 and T4000 routers)
- SONET/SDH OC48c/STM16 PIC with SFP
- SONET/SDH OC12/STM4 (Multi-Rate) PIC with SFP (T1600 router)
- Type 1 SONET/SDH OC3/STM1 (Multi-Rate) PIC with SFP (T1600 router)

NOTE: Unlike IPv4 passive monitoring, IPv6 passive monitoring is not supported on Monitoring Services PICs. You must configure port mirroring to forward the packets from the passive monitored ports to other interfaces.

Release History Table

Release	Description
9.5	Starting with Junos OS Release 9.5, I2.0 based M120 routers and I3.0 based M320 routers with the PICs in the preceding list support passive monitoring.

Related
Documentation

- *Ethernet Interfaces Feature Guide for Routing Devices*

Enabling Passive Monitoring on Ethernet Interfaces

When you configure an interface in passive monitoring mode, the Packet Forwarding Engine silently drops packets coming from that interface and destined to the router itself. Passive monitoring mode also stops the Routing Engine from transmitting any packet from that interface. Packets received from the monitored interface can be forwarded to monitoring interfaces. If you include the **passive-monitor-mode** statement in the configuration:

- Gigabit and Fast Ethernet interfaces can support both per-port passive monitoring and per-VLAN passive monitoring. The destination MAC filter on the receive port of the Ethernet interfaces is disabled.
- Ethernet encapsulation options are not allowed.
- Ethernet interfaces do not support the **stacked-vlan-tagging** statement for both IPv4 and IPv6 packets in passive monitor mode.

To enable packet flow monitoring on Ethernet interfaces:

1. In configuration mode, go to the **[edit interfaces interface-name]** hierarchy level.

```
[edit]
user@host# edit interfaces interface-name
```

2. Include the **passive-monitor-mode** statement.

```
[edit interfaces interface-name]
user@host# set passive-monitor-mode
```

For IPv4 monitoring services interfaces, enable packet flow monitoring by including the **family** statement at the **[edit interfaces mo-fpc/pic/port unit logical-unit-number]** hierarchy level, specifying the **inet** option:

1. In configuration mode, go to the **[edit interfaces mo-fpc/pic/port unit logical-unit-number]** hierarchy level.

```
[edit]
user@host# edit interfaces mo-fpc/pic/port unit logical-unit-number
```

2. Include the **passive-monitor-mode** statement.

```
[edit interfaces mo-fpc/pic/port unit logical-unit-number]
user@host# set family inet
```

For conformity with the cflowd record structure, you must include the **receive-options-packets** and **receive-ttl-exceeded** statements at the **[edit interfaces mo-fpc/pic/port unit logical-unit-number family inet]** hierarchy level:

1. In configuration mode, go to the **[edit interfaces mo-fpc/pic/port unit logical-unit-number family inet]** hierarchy level.

```
[edit]
user@host# edit interfaces mo-fpc/pic/port unit logical-unit-number family inet
```

2. Include the **receive-options-packets** and **receive-ttl-exceeded** statements.

```
[edit interfaces mo-fpc/pic/port unit logical-unit-number family inet]
user@host# set receive-options-packets
user@host# set receive-ttl-exceeded
```

IPv6 passive monitoring is not supported on monitoring services PICs. A user must configure port mirroring to forward the packets from the passive monitored ports to other interfaces.

For information on FPCs and PICs that support IPv6 passive monitoring on the T640, T1600, and T4000 routers, see "[Passive Monitoring on Ethernet Interfaces Overview](#)" on [page 37](#). Interfaces configured on these FPCs and PICs support IPv6 passive monitoring.

To configure port mirroring, include the **port-mirroring** statement at the **[edit forwarding-options]** hierarchy level.

For the monitoring services interface, you can configure multiservice physical interface properties. For more information, see *Configuring Multiservice Physical Interface Properties* and the *Junos OS Services Interfaces Library for Routing Devices*.

Aggregated Ethernet Interfaces Overview

Link aggregation of Ethernet interfaces is defined in the IEEE 802.3ad standard. The Junos OS implementation of 802.3ad balances traffic across the member links within an aggregated Ethernet bundle based on the Layer 3 information carried in the packet. This implementation uses the same load-balancing algorithm used for per-flow load balancing.

NOTE: For information about configuring circuit cross-connects over aggregated Ethernet, see *Circuit and Translational Cross-Connects Overview*.

For information about mixed rates and mixed modes on an aggregated Ethernet bundle, see [“Understanding Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles” on page 58](#).

Platform Support for Aggregated Ethernet Interfaces

You configure an aggregated Ethernet virtual link by specifying the link number as a physical device and then associating a set of ports that have the same speed and are in

full-duplex mode. The physical interfaces can be Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ, Gigabit Ethernet IQ2 and IQ2-E, or 10-Gigabit Ethernet IQ2 and IQ2-E. Generally, you cannot use a combination of these interfaces within the same aggregated link; however, you can combine Gigabit Ethernet and Gigabit Ethernet IQ interfaces in a single aggregated Ethernet bundle.

Starting with Junos OS Release 13.2, aggregated Ethernet supports the following mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

NOTE:

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

TIP:

Going forward:

- Aggregated Ethernet link with member links of different modes will be referred as *10-Gigabit Ethernet mixed mode aggregated Ethernet link*.
- Aggregated Ethernet link with member links of different rates will be referred as *mixed rate aggregated Ethernet link*.
- These aggregated Ethernet links will generically be referred as *mixed aggregated Ethernet links*.

Table 3 on page 44 lists the platforms and corresponding hardware components that support mixed aggregated Ethernet bundles.

Table 3: Platform Support Matrix for Mixed Aggregated Ethernet Bundles

Enhanced LAG Support on MX Series Routers

Starting in Junos OS Release 14.2, you can configure an enhanced link aggregation group (LAG) on MX Series routers. When you associate a physical interface with an aggregated Ethernet interface, the physical child links are also associated with the parent aggregated Ethernet interface to form a LAG.

In the absence of enhanced LAG support, one child next hop is created for each member link of an aggregated Ethernet interface for each VLAN interface. For example, an aggregate next hop for an aggregated Ethernet interface with 16 member links leads to the installation of 17 next hops per VLAN created. Thus the number of next hops supported on the routers with aggregated Ethernet interfaces is significantly reduced.

With the enhanced LAG support, when the `[edit chassis network-services enhanced-ip]` statement is configured, child next hops are not created for member links and, as a result, a higher number of next hops can be supported.

Note that the enhanced LAG feature is only supported when the router's network services is set to operate in the **enhanced-ip** mode. This feature is not supported when the router's network services is set to operate in the **enhanced-ethernet** mode.

Enhanced LAG Support on PTX Series Routers

Starting in Junos OS Release 18.1, Junos OS supports removal of child next hop usage for aggregated Ethernet Interfaces and clients on PTX Series routers with FPC3-PTX-U2 and FPC3-PTX-U3. Removal of child next hop usage helps reduce the memory and CPU resources required to support aggregated Ethernet Interfaces and improves the overall system performance and scaling numbers. This feature is enabled by default if the network services mode on the router is configured to **enhanced-mode**. You can disable this feature by using the **set chassis aggregated-devices disable-lag-enhanced**. You must reboot the router for the configuration to take effect.

Previously, each unicast next hop over aggregated Ethernet Interfaces resulted in creation of a number of children next hops as well. For an aggregated Ethernet Interface with 16 member links, addition of one unicast next hop over the aggregated Ethernet Interface results in installing total of 17 next hops. As a result, with aggregated Ethernet configuration, the number of next hops supported decreases in proportion to the number of aggregated Ethernet links.

NOTE: Child next hop optimizations are supported for aggregated Ethernet Interfaces, Interfaces that make use of aggregated Ethernet Interfaces, and for both unicast and multicast scenarios.

Configuration Guidelines for Aggregated Ethernet Interfaces

- Aggregated Ethernet interfaces can use interfaces from different FPCs, DPCs, PICs, or MPCs.
- All Juniper routers support at least eight physical interfaces per aggregated Ethernet bundle. See [maximum-links](#) configuration page for platform specific limits.
- On M Series and T Series routers, you can create a maximum of 1024 logical interfaces on an aggregated Ethernet interface.
- Simple filters are not supported for interfaces in aggregated Ethernet bundles:
 - On M Series routers, simple filters are supported in Gigabit Ethernet Enhanced Intelligent Queuing interfaces only, except when the interface is part of an aggregated Ethernet bundle.
 - On MX Series routers, simple filters are supported in Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only, except when the interface is part of an aggregated Ethernet bundle.

For more information about simple filters, see the *Class of Service Feature Guide (Routers and EX9200 Switches)*.

- On the aggregated Ethernet bundle, no IQ-specific capabilities such as MAC accounting, VLAN rewrites, and VLAN queuing are available. For more information about IQ-specific

capabilities, see [“Capabilities of Gigabit Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs” on page 499](#).

- Aggregated Ethernet interfaces can be either tagged or untagged, with LACP enabled or disabled. Aggregated Ethernet interfaces on MX Series routers support the configuration of **flexible-vlan-tagging** and **native-vlan-id** on dual-tagged frames, which consist of the following configuration statements:
 - **inner-tag-protocol-id**
 - **inner-vlan-id**
 - **pop-pop**
 - **pop-swap**
 - **push-push**
 - **swap-push**
 - **swap-swap**

In all cases, you must set the number of aggregated Ethernet interfaces on the chassis. You can also set the link speed and the minimum links in a bundle.

- When configuring mixed aggregated Ethernet bundles on T640, T1600, T4000, and TX Matrix Plus routers, consider the following:
 - A maximum of 16 member links can be configured to form a mixed aggregated Ethernet link.
 - Link Aggregation Control Protocol (LACP), aggregated Ethernet link protection, and LACP link protection are supported only on mixed aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC with CFP (PD-ICE-CFP-FPC4).
 - Traffic distribution is based on the hash calculated on the egress packet header. Hash range is fairly distributed according to member links' speed. This guarantees hash fairness but it does not guarantee fair traffic distribution depending on the rate of the egress streams.
 - Packets are dropped when the total throughput of the hash flow exiting a member link (or multiple hash flows exiting a single member link) exceeds the link speed of the member link. This can happen when egress member link changes because of a link failure and the hash flow switches to a member link of speed that is less than the total throughput of the hash flow.
 - Rate-based CoS components such as scheduler, shaper, and policer are not supported on mixed rate aggregated Ethernet links. However, the default CoS settings are supported by default on the mixed rate aggregated Ethernet links.
 - Load balancing is performed at the ingress Packet Forwarding Engine. Therefore, you must ensure that the egress traffic on the aggregated Ethernet link enters through the hardware platforms that support mixed aggregated Ethernet bundles. [Table 3 on page 44](#) lists the platforms and corresponding hardware components that support mixed aggregated Ethernet bundles.

- Mixed aggregated Ethernet links can interoperate with non-Juniper Networks aggregated Ethernet member links provided that mixed aggregated Ethernet load balancing is configured at egress.
- Load balancing of the egress traffic across the member links of a mixed rate aggregated Ethernet link is proportional to the rates of the member links.
- Egress multicast load balancing is not supported on mixed aggregated Ethernet interfaces.
- Changing the **edit interfaces aex aggregated-ether-options link-speed** configuration of a mixed aggregated Ethernet link, which is configured on the supported interfaces of on T640, T1600, T4000, and TX Matrix Plus routers, leads to aggregated Ethernet link flapping.
- When configuring a mixed aggregated Ethernet link on a 100-Gigabit Ethernet PIC with CFP (PD-ICE-CFP-FPC4), ensure that you add both the 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP to the aggregated Ethernet bundle. Moreover, both these 50-Gigabit Ethernet interfaces must be included in the same aggregated Ethernet bundle.
- When a mixed aggregated Ethernet link is configured on a 100-Gigabit Ethernet PIC with CFP, changing aggregated Ethernet link protection or LACP link protection configurations leads to aggregated Ethernet link flapping.
- For a single physical link event of an aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC with CFP, the packet loss performance value is twice the original value because of the *two* 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP.
- The **show interfaces aex** command displays the link speed of the aggregated Ethernet interface, which is the sum of the link speeds of all the active member links.
- Use the **show interfaces aggregate-interface extensive** and **show interfaces aggregate.logical-interface** commands to show the bandwidth of the aggregate. Also, the SNMP object identifier **ifSpeed/ifHighSpeed** shows the corresponding bandwidth on the aggregate logical interface if it is configured properly.

Release History Table

Release	Description
18.1	Starting in Junos OS Release 18.1, Junos OS supports removal of child next hop usage for aggregated Ethernet Interfaces and clients on PTX Series routers with FPC3-PTX-U2 and FPC3-PTX-U3.
14.2	Starting in Junos OS Release 14.2, you can configure an enhanced link aggregation group (LAG) on MX Series routers.
13.2	Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP.

Configuring an Aggregated Ethernet Interface

On Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces on M Series and T Series routers, you can associate a physical interface with an aggregated Ethernet interface.

NOTE: On a Junos Fusion, you can include extended ports (physical interface on a satellite device that provides a connection to servers or endpoints) or local ports in link aggregation groups (LAGs) and MC-LAGs, but not both. For information on extended ports, see *Understanding Junos Fusion Ports*.

To configure an aggregated Ethernet interface:

1. Specify that you want to configure the link aggregation group interface.

```
user@host# edit interfaces interface-name
```

2. Configure the aggregated Ethernet interface.

```
[edit interfaces interface-name]  
user@host# set (fastether-options | gigether-options) 802.3ad aex
```

You specify the interface instance number *x* to complete the link association; *x* can be from 0 through 127, for a total of 128 aggregated interfaces on M Series and T Series routers and can be from 1 through 480, for a total of 480 aggregated interfaces on MX Series routers. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. Aggregated interfaces are numbered from **ae0** through **ae4092**.

NOTE: On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.

You must also include a statement defining **aex** at the **[edit interfaces]** hierarchy level. You can optionally specify other physical properties that apply specifically to the aggregated Ethernet interfaces; for details, see [“Ethernet Interfaces Overview” on page 3](#), and for a sample configuration, see [“Example: Configuring Aggregated Ethernet Interfaces” on page 69](#).

NOTE: In general, aggregated Ethernet bundles support the features available on all supported interfaces that can become a member link within the bundle. As an exception, Gigabit Ethernet IQ features and some newer Gigabit Ethernet features are not supported in aggregated Ethernet bundles.

Gigabit Ethernet IQ and SFP interfaces can be member links, but IQ- and SFP-specific features are not supported on the aggregated Ethernet bundle even if all the member links individually support those features.

You need to configure the correct link speed for the aggregated Ethernet interface to eliminate any warning message.

NOTE: Before you commit an aggregated Ethernet configuration, ensure that link mode is not configured on any member interface of the aggregated Ethernet bundle; otherwise, the configuration commit check fails.

Understanding Ethernet Link Aggregation on ACX Series Routers

Ethernet link aggregation is mechanism for increasing the bandwidth linearly and improving the resiliency of Ethernet links by bundling or combining multiple full-duplex same-speed point-to-point Ethernet links into a single virtual link. The virtual link interface is referred to as link aggregation group (LAG) or aggregated Ethernet (AE) interface. The LAG balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. Another advantage of link aggregation is increased availability, because the LAG is composed of multiple member links. If one member link fails, the LAG continues to carry traffic over the remaining links.

NOTE: ACX Series routers support connectivity fault management (CFM) on aggregated Ethernet interfaces with continuity check interval of 100 milliseconds or higher.

NOTE: ACX5048 and ACX5096 routers support connectivity fault management (CFM) on aggregated Ethernet interfaces with continuity check interval of 1 second or higher.

NOTE: The Ethernet options configurations for ACX5048 and ACX5096 routers differ compared to other ACX Series routers. For more information, see *Layer 2 Next Generation Mode for ACX Series*.

On ACX Series routers, up to 128 AE interfaces can be created with each AE interface having up to 8 physical interfaces. AE interfaces can be created across PICs and fixed-ports on the chassis.

NOTE: On ACX5048 and ACX5096 routers, up to 64 AE interfaces can be created with each AE interface having up to 16 physical interfaces.

ACX Series routers do not support statistics for aggregated Ethernet interface. However, statistics can be retrieved for member interface.

To configure aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled “up”:

NOTE: By default only one link must be up for the bundle to be labeled “up”.

```
[edit interfaces]
user@host# set ae0 aggregated-ether-options minimum-links number (1 – 8)
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set ae0 aggregated-ether-options link-speed speed (10g | 1g | 100m)
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set ge-1/0/0 gigether-options 802.3ad ae0
user@host# set ge-1/0/1 gigether-options 802.3ad ae0
```

5. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set ae0 unit 0 family inet address ip-address
```

The above procedure creates an AE interface and they would be up and ready for running the services defined on AE logical interfaces.

AE interfaces can be VLAN-tagged or untagged. You can configure flexible-vlan-tagging, native-vlan-id, and dual-tagging on AE interfaces.

NOTE: Whenever there is a configuration change (AE interface to Gigabit Ethernet interfaces or vice versa), you need to remove the existing configuration, perform a commit, then add the new configuration and again commit the configuration.

To delete an aggregated Ethernet interface:

1. Delete the aggregated Ethernet configuration.

This step changes the interface state to down and removes the configuration statements related to aex.

```
[edit]
```

```
user@host#delete interfaces aex
```

2. Delete the interface from the device count.

```
[edit]
user@host#delete chassis aggregated-devices ethernet device-count
```

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled.

Load Balancing

JUNOS load-balances traffic across member links in an AE bundle based on the Layer 3 information in the packet. You can globally configure what fields are used for load-balancing for inet and MPLS

On ACX Series Routers, the inet family knobs are available at PIC level. You can configure inet family Layer 3 and Layer 4 fields to be used for load-balancing. For bridge family, Layer 2, layer 3 and Layer 4 fields to be used for load-balancing.

ACX Series routers also support load balancing across the member links using Layer 2 source MAC addresses, destination MAC addresses, or both. This can be configured at the **[edit forwarding-options hash-key family multiservice]** hierarchy level. Layer 2 source MAC addresses and destination MAC addresses are used as hash-keys for load balancing.

```
[edit]
forwarding-options {
  hash-key {
    family multiservice {
      destination-mac;
      source-mac;
    }
  }
}
```

NOTE:

- For IP Layer 2 packets, only IP fields are used for load balancing across member links. Source MAC address and destination MAC address are not be used for load balancing.
 - For non-IP Layer 2 packets, either Source MAC address or destination MAC address is used as hash-keys for load balancing.
 - If you want to hash based on layer 2 fields, then you need to configure multiservice.
 - If you want to hash based on layer 3 and layer 4 fields, then you need to configure family (inet | inet6)
-

LACP Monitoring

LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP is designed to achieve the following:

- Automatic addition and deletion of individual links to the aggregate bundle without user intervention
- Link monitoring to check whether both ends of the bundle are connected to the correct group

The Junos OS implementation of LACP provides link monitoring but not automatic addition and deletion of links.

LACP monitoring can be either distributed or centralized. The default is distributed and it can be overridden by configuring the centralized knob under LACP protocols. LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

By default, LACP does not initiate a LACP PDU exchange. LACP packets can be configured to exchange LACP PDUs at a rate of 1 packet per second, or a slower rate of 1 packet for 30 seconds.

The LACP mode can be active or passive. If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is turned off on aggregated Ethernet interfaces. If LACP is configured, it is in passive mode by default. To initiate transmission of LACP packets and response to LACP packets, you must configure LACP in active mode.

To enable LACP active mode, include the **lACP** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level, and specify the **active** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
  active;
}
```

NOTE: The LACP process exists in the system only if you configure the system in either active or passive LACP mode.

To restore the default behavior, include the **lACP** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level, and specify the **passive** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
```

```
passive;
}
```

Link Protection

Link protection can be configured on AE interfaces to provide 1:1 link resiliency using LACP. Primary and backup links can be configured within an AE bundle. The primary link is used for all transit traffic and host generated traffic. The backup link is used when the primary link fails.

Link protection is supported only when the AE bundles have no more than 2 member links, one primary and another backup. LACP works in revertive link-protection mode by default and can be configured to work in non-revertive mode.

NOTE: Link protection without LACP (static link protection on AE interfaces) is not supported on all ACX Series routers. Link protection works as expected with LACP configured on the AE bundle.

- [Configuring Link Protection for Aggregated Ethernet Interfaces on page 54](#)
- [Disabling Link Protection for Aggregated Ethernet Interfaces on page 54](#)

Configuring Link Protection for Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces support link protection to ensure QoS on the interface.

To configure link protection:

1. Configure the options for an aggregated Ethernet interface.

```
user@host# edit interfaces aex aggregated-ether-options
```

2. Configure the link protection mode.

```
[edit interfaces aex aggregated-ether-options]
user@host# set link-protection
```

Disabling Link Protection for Aggregated Ethernet Interfaces

To disable link protection, issue the **delete interface revert aex** configuration command.

```
user@host# delete interfaces aex aggregated-ether-options link-protection
```

Understanding the Algorithm Used to Hash LAG Bundle

ACX Series routers use a hashing algorithm to determine how to forward traffic over a link aggregation group (LAG) bundle.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. You can configure some of the fields that are used by the hashing algorithm.

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. The packet fields used by the hashing algorithm varies by the packet's EtherType and, in some instances, by the configuration on the router. The hashing algorithm recognizes the following EtherTypes:

- IPv4
- MPLS

Traffic that is not recognized as belonging to any of these EtherTypes is hashed based on the Layer 2 header. IP and MPLS traffic are also hashed based on the Layer 2 header when a user configures the hash mode as Layer 2 header.

You can configure some fields that are used by the hashing algorithm to make traffic forwarding decisions. You cannot, however, configure how certain values within a header are used by the hashing algorithm.

Note the following points regarding the hashing algorithm:

- The fields selected for hashing are based on the packet type only. The fields are not based on any other parameters, including forwarding decision (bridged or routed) or egress LAG bundle configuration (Layer 2 or Layer 3).
- The same fields are used for hashing unicast and multicast packets. Unicast and multicast packets are, however, hashed differently.

[Table 4 on page 55](#) describes the fields used for hashing by Layer 2 services. The table explains the default behavior and the configurable fields based on the type of traffic received on the Layer 2 service

Table 4: Hashing Behavior for Pseudowire (Layer 2 Circuit) and Bridging Services

Traffic Type	Default Hash Fields	Configurable Fields (Hash keys)
Layer 2	None	Source MAC Address Destination MAC Source MAC and Destination MAC

Table 4: Hashing Behavior for Pseudowire (Layer 2 Circuit) and Bridging Services (continued)

Traffic Type	Default Hash Fields	Configurable Fields (Hash keys)
IP	Source IP and Destination IP	Source MAC Address Destination MAC Source MAC and Destination MAC
MPLS	MPLS label 1 and MPLS label 2	Source MAC Address Destination MAC Source MAC and Destination MAC

[Table 5 on page 56](#) describes the fields used for hashing by Layer 3 services. The table explains the default behavior and the configurable fields based on the type of traffic received on the Layer 3 service

Table 5: Hashing Behavior for IP Services

Traffic Type	Default Hash Fields	Configurable Fields (Hash keys)

Configuring Aggregated Ethernet Interfaces on PTX Series Packet Transport Routers

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a link aggregation group (LAG) or bundle. Link aggregation can be used for point-to-point connections. It balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. Another advantage of link aggregation is increased availability because the LAG is composed of multiple member links. If one member link fails, the LAG continues to carry traffic over the remaining links.

This topic describes how to configure aggregated Ethernet interfaces on PTX Series Packet Transport Routers.

On PTX Series Packet Transport Routers, aggregated Ethernet support includes the following features:

- A consistent interface type (**et fpc/pic/port**) across all Ethernet interfaces.
- Ability to bundle multiple Ethernet interfaces

- Ability to bundle mixed-rate links on the same aggregated Ethernet interface
- Fault tolerance
- Load balancing between child links
- Advanced features including flexible VLAN tagging and Ethernet services encapsulation

Aggregated Ethernet interfaces can use interfaces from different FPCs or PICs. The following configuration is sufficient to get an aggregated Gigabit Ethernet interface up and running.

```
[edit chassis]
  aggregated-devices {
    ethernet {
      device-count 2;
    }
  }
```

```
[edit interfaces]
et-0/0/0 {
  gigether-options {
    802.3ad ae0;
  }
}
et-0/0/1 {
  gigether-options {
    802.3ad ae0;
  }
}
ae0 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 200.200.1.2/24;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 200.200.2.2/24;
    }
  }
}
```

Understanding Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles

You can configure the member links of an aggregated Ethernet bundle with any combination of rates— also known as mixed rates— on T Series, MX Series, and PTX Series routers. The bandwidth that is provided by an aggregated Ethernet bundle can be utilized completely and efficiently when the links are configured with different rates.

You can configure mixed modes on T Series routers. In a mixed-mode configuration, the member links of an aggregated Ethernet bundle are configured in LAN mode as well as in WAN mode for 10-Gigabit Ethernet interfaces. For information on the first Junos OS release that supports aggregated Ethernet bundles on the various Juniper Networks routers, see [Feature Explorer](#).

The following sections provide an overview about mixed rates and mixed modes on various platforms:

- [Aggregated Ethernet Bundle with Mixed Rates and Mixed Modes on T Series Routers on page 58](#)
- [Aggregated Ethernet Bundles with Mixed Rates on MX Series Routers and PTX Series Routers on page 61](#)

Aggregated Ethernet Bundle with Mixed Rates and Mixed Modes on T Series Routers

The following sections explain mixed rates and mixed modes on T Series routers:

- [Understanding Mixed Rates and Mixed Modes on page 58](#)
- [Platform Support Matrix for Mixed Aggregated Ethernet Bundles on page 59](#)
- [Guidelines to Follow When Configuring Aggregated Ethernet Bundles with Mixed Rates and Mixed Modes on page 60](#)

Understanding Mixed Rates and Mixed Modes

Starting with Junos OS Release 13.2, aggregated Ethernet supports the following mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

**NOTE:**

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well.

In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

Going forward:

- An aggregated Ethernet link with member links of different modes is referred to as *10-Gigabit Ethernet mixed-mode aggregated Ethernet link*.
- An aggregated Ethernet link with member links of different rates is referred to as *mixed-rate aggregated Ethernet link*.
- These aggregated Ethernet links will generically be referred to as *mixed aggregated Ethernet links*.

Platform Support Matrix for Mixed Aggregated Ethernet Bundles

Table 3 on page 44 lists the platforms and corresponding hardware components that support mixed aggregated Ethernet bundles.

Table 6: Platform Support Matrix for Mixed Aggregated Ethernet Bundles

Rate and Mode	Supported Platform	Supported FPCs	Supported PICs

Guidelines to Follow When Configuring Aggregated Ethernet Bundles with Mixed Rates and Mixed Modes

In addition to the configuration guidelines for aggregated Ethernet interfaces in [“Aggregated Ethernet Interfaces Overview” on page 42](#), you must consider the following as well when configuring mixed modes and mixed rates on aggregated Ethernet bundles on T640, T1600, T4000, and TX Matrix Plus routers:

- A maximum of 16 member links can be configured to form a mixed aggregated Ethernet link.
- Link Aggregation Control Protocol (LACP), aggregated Ethernet link protection, and LACP link protection are supported only on mixed aggregated Ethernet bundles configured on a 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Traffic distribution is based on the hash calculated on the egress packet header. Hash range is fairly distributed according to member links' speed. This guarantees hash fairness but it does not guarantee fair traffic distribution depending on the rate of the egress streams.
- Packets are dropped when the total throughput of the hash flow exiting a member link (or multiple hash flows exiting a single member link) exceeds the link speed of the member link. This can happen when egress member link changes because of a link failure and the hash flow switches to a member link of speed that is less than the total throughput of the hash flow.
- Rate-based CoS components such as scheduler, shaper, and policer are not supported on mixed-rate aggregated Ethernet links. However, the default CoS settings are supported by default on the mixed-rate aggregated Ethernet links.
- Load balancing is performed at the ingress Packet Forwarding Engine. Therefore, you must ensure that the egress traffic on the aggregated Ethernet link enters through the hardware platforms that support mixed aggregated Ethernet bundles. [Table 3 on page 44](#) lists the platforms and corresponding hardware components that support mixed aggregated Ethernet bundles.

- Mixed aggregated Ethernet links can interoperate with non-Juniper Networks aggregated Ethernet member links provided that mixed aggregated Ethernet load balancing is configured at egress.
- Load balancing of the egress traffic across the member links of a mixed-rate aggregated Ethernet link is proportional to the rates of the member links.
- Egress multicast load balancing is not supported on mixed aggregated Ethernet interfaces.
- Changing the **[edit interfaces aex aggregated-ether-options link-speed]** configuration of a mixed aggregated Ethernet link, which is configured on the supported interfaces of on T640, T1600, T4000, and TX Matrix Plus routers, leads to aggregated Ethernet link flapping.
- When configuring a mixed aggregated Ethernet link on a 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4), ensure that you add both the 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP to the aggregated Ethernet bundle. Moreover, both these 50-Gigabit Ethernet interfaces must be included in the same aggregated Ethernet bundle.
- When a mixed aggregated Ethernet link is configured on a 100-Gigabit Ethernet PIC with CFP, changing aggregated Ethernet link protection or LACP link protection configurations leads to aggregated Ethernet link flapping.
- For a single physical link event of an aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC with CFP, the packet loss performance value is twice the original value because of the *two* 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP.
- The **show interfaces aex** command displays the link speed of the aggregated Ethernet interface, which is the sum of the link speeds of all the active member links.

Aggregated Ethernet Bundles with Mixed Rates on MX Series Routers and PTX Series Routers

The following sections explain mixed rates on aggregated Ethernet bundles:

- [Understanding Mixed Rates on page 61](#)
- [Platform Support Matrix for Mixed Aggregated Ethernet Bundles on MX Series Routers on page 62](#)
- [Supported Features on page 63](#)

Understanding Mixed Rates

Starting with Junos OS Release 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers, thereby enabling you to configure the member links with any combination of rates— 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet— on an aggregated Ethernet bundle.

You must configure the **mixed** statement explicitly at the **[edit interfaces *interface-name* aggregated-ether-options link-speed]** hierarchy level to:

- Enable the mixed-rate configuration on all the aggregated Ethernet bundles on the egress side of the Modular Port Concentrators (MPCs).
- Enable the router to detect child links of different speed values in the aggregated Ethernet bundle.

You can also configure the minimum bandwidth on an aggregated Ethernet bundle when you configure mixed rate on that aggregated Ethernet bundle.

NOTE: The minimum-link statement cannot be configured with mixed rates.

Mixed rates cannot be configured for aggregated Ethernet bundles on the egress side of the Dense Port concentrators (DPCs).

When you configure mixed rate on a homogeneous aggregated Ethernet bundle— where all the links in the bundle are of the same speed— the aggregated Ethernet bundle goes down and then comes up with the mixed-rate configuration.

Platform Support Matrix for Mixed Aggregated Ethernet Bundles on MX Series Routers

Table 7 on page 62 lists the platforms and corresponding MPCs that support mixed aggregated Ethernet bundles on MX Series routers.

Table 7: Platform Support Matrix for Mixed Aggregated Ethernet Bundles on MX Series Routers

Supported MPCs	Supported Platform	Initial Release
16x10GE (MPC-3D-16XGE-SFPP)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1
MPC1E (MX-MPC1-3D; MX-MPC1E-3D; MX-MPC-1-3D-Q; MX-MPC1E-3D-Q)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1
MPC2E (MX-MPC2-3D; MX-MPC2E-3D; MX-MPC2-3D-Q; MX-MPC2E-3D-Q; MX-MPC2-3D-EQ; MX-MPC2E-3D-EQ; MX-MPC2-3D-P)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1
MPC3E (MX-MPC3E-3D)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1
MPC4E (MPC4E-3D-32XGE-SFPP and MPC4E-3D-2CGE-8XGE)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1
MPC5E (6x40GE+24x10GE; 6x40GE+24x10GEQ; 2x100GE+4x10GE; 2x100GE+4x10GEQ)	MX240, MX480, MX960, MX2010, and MX2020	14.2R1

Table 7: Platform Support Matrix for Mixed Aggregated Ethernet Bundles on MX Series Routers (continued)

Supported MPCs	Supported Platform	Initial Release
MPC6E (MX2K-MPC6E)	MX2010 and MX2020	14.2R1
MPC7E (Multi-Rate) (MPC7E-MRATE)	MX240, MX480, MX960, MX2010, and MX2020	15.1F4
MPC7E 10G (MPC7E-10G)	MX240, MX480, MX960, MX2010, and MX2020	15.1F5
MPC8E (MX2K-MPC8E)	MX2010 and MX2020	15.1F5
MPC9E (MX2K-MPC9E)	MX2010 and MX2020	15.1F5

Supported Features

The following features are supported on mixed-rate aggregated Ethernet bundles on MX Series routers and PTX Series Routers:

- Sixty-four links in a bundle.
- Load balancing of traffic in proportion to the member-link speed.
- Non link-protect mode. For more information, see [“Configuring Scheduler on Aggregated Ethernet Interfaces Without Link Protection” on page 93](#).
- LACP for slow and fast interval for periodic transmission of LACP packets.
- Port-based network access control (NAC).
- Scheduler parameters for aggregated interface member links in a scaled manner with the **member-link-scheduler scale** statement at the **[edit class-of-service interfaces]** hierarchy level.
- Layer 3 features only.
- Configuration of following statements as percentages only for mixed rates at the **[edit class-of-service schedulers *scheduler-name*]** hierarchy level:
 - **buffer-size**
 - **excess-rate**
 - **shaping-rate**
 - **transmit-rate**
- Configuration of the following statements for mixed rates at the **[edit class-of-service schedulers *scheduler-name*]** hierarchy level:
 - **drop-profile-map**
 - **excess-priority**

- **priority**
- **transmit-rate (rate-limit | exact)**
- The **shared-bandwidth-policer** statement at the **[edit firewall policer *policer-name*]** hierarchy level.
- The **scheduler-maps *map-name*** statement at the **[edit class-of-service]** hierarchy level.
- Unicast load balancing, where the load balancing happens on ingress-only selectors.
- Multicast load balancing
- Make-before-break (MBB) for multicast LDP (MLDP) and fast reroute (FRR).
- Source class usage (SCU) and destination class usage (DCU) accounting.
- Families **inet**, **inet6**, **mpls** and **iso**.
- Enhanced IP network services.
- LDP tunneling and OAM link fault management (LFM).

The following features are not supported on mixed-rate aggregated Ethernet bundles on MX Series routers and PTX Series routers:

- Adaptive load balancing
- Hierarchical schedulers on aggregated Ethernet bundles and the scheduling on logical interfaces (per-unit scheduling).
- Shaping rate, where traffic shaping is achieved by specifying the amount of bandwidth to be allocated to a logical interface.
- The **output-traffic-control-profile** statement at the **[edit class-of-service interfaces *interface-name*]** hierarchy level.
- Ingress queuing.
- Options that are configured with nonpercentage values at the **[edit class-of-service schedulers *scheduler-name*]** hierarchy level.
- The **member-link-scheduler replicate** statement at the **[edit class-of-service interfaces *interface-name*]** hierarchy level.
- Mixing LAN mode and WAN mode.
- Aggregated Ethernet link protection and link protection on a 1:1 model.
- LACP link protection.
- Layer 2 features.
- The **target-routing-instance (*routing-instance-name* | default)** statement at the **[edit access domain map *domain-map-name*]** hierarchy level.

Release History Table

Release	Description
14.2	Starting with Junos OS Release 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers, thereby enabling you to configure the member links with any combination of rates—10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet— on an aggregated Ethernet bundle.
13.2	Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well.

Related Documentation

- [Understanding the P2-100GE-OTN PIC on page 449](#)

Configuring Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles

The following sections explain how to configure mixed rates and mixed modes on various platforms:

- [Configuring Mixed Rates and Mixed Modes on an Aggregated Ethernet Bundle on T Series Routers on page 66](#)
- [Configuring Mixed Rates on Aggregated Ethernet Bundles on MX Series Routers on page 68](#)

Configuring Mixed Rates and Mixed Modes on an Aggregated Ethernet Bundle on T Series Routers

In releases before Junos OS Release 13.2, all interfaces that form an aggregated Ethernet bundle must have the same speed and must be in full-duplex mode. Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers. Following mixed rates and mixed modes are supported:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

NOTE:

- Member links of 50-Gigabit Ethernet can be configured using only the 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

To configure member links of an aggregated Ethernet bundles in mixed rate or mixed mode on T640, T1600, T4000, and TX Matrix Plus routers:

1. Go to **[edit chassis]** hierarchy level.

```
user@host# edit chassis
```

2. Configure the number of aggregated logical devices available to the router:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

3. Go to the **[edit interfaces]** hierarchy level.

```
user@host# top
user@host# edit interfaces
```

4. Configure the minimum number of links that are required for the aggregated Ethernet bundle to be labeled *up*:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

NOTE: By default, only one link needs to be up for the bundle to be labeled *up*.

5. Configure the **link-speed** statement and specify the **mixed** option for the **link-speed** statement to indicate the mixed-rate and mixed-mode support for the aggregated Ethernet bundle configuration.

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed mixed
```

NOTE: It is mandatory to configure the mixed option for aggregated Ethernet bundles for the PD-1CE-CFP-FPC4 PIC.

On aggregated Ethernet bundles in MX Series routers, when the mixed statement at the [edit interfaces aex aggregated-ether-options link-speed] hierarchy level is not configured, the mixed rate configuration is applied by default.

6. Configure the members links of the aggregated Ethernet bundle.

```
[edit interfaces]
user@host# set interface-name gigether-options 802.3ad aex
```

7. Configure an interface family and an IP address for the aggregated Ethernet bundle.

```
[edit interfaces]
user@host# set aex unit number family (inet | inet6 | mpls ) address address
```

8. Commit the configuration.

```
[edit interfaces]
user@host# commit
```

Configuring Mixed Rates on Aggregated Ethernet Bundles on MX Series Routers

Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers. You can now configure the member links with any combination of rates—10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet—on an aggregated Ethernet bundle.

To configure mixed rates on an aggregated Ethernet bundle on MX Series routers:

1. Go to the **[edit chassis]** hierarchy level.

```
user@host# edit chassis
```

2. Configure the number of aggregated logical devices available to the router.

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

3. Go to the **[edit interfaces]** hierarchy level.

```
user@host# top
user@host# edit interfaces
```

4. Configure the **link-speed** statement and specify the **mixed** option for the **link-speed** statement to indicate the mixed-rate support for the aggregated Ethernet bundle configuration.

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed mixed
```

5. Configure the members links of the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name gigether-options 802.3ad aex
```

6. Configure an interface family for the aggregated Ethernet bundle as **inet**, **inet6**, or **mpls**:

```
[edit interfaces]
user@host# set aex unit number family (inet | inet6 | mpls)
```

7. Configure the minimum bandwidth unit as **bps**, **gbps**, **kbps**, or **mbps** and the bandwidth value from 1 through 128,000.

```
[edit interfaces]
```

```

user@host# set aex aggregated-ether-options minimum-bandwidth bw-unit (bps |
gbps | kbps | mbps)
user@host# set aex aggregated-ether-options minimum-bandwidth bw-value value

```

8. Commit the configuration.

```

[edit interfaces]
user@host# commit

```

Release History Table

Release	Description
14.1R1	Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers.
13.2	Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers.
13.2	Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP.

Example: Configuring Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces can use interfaces from different FPCs, DPCs, or PICs. The following configuration is sufficient to get an aggregated Gigabit Ethernet interface up and running.

```

[edit chassis]
aggregated-devices {
  ethernet {
    device-count 15;
  }
}

```

```
[edit interfaces]
ge-1/3/0 {
  gigether-options {
    802.3ad ae0;
  }
}
ge-2/0/1 {
  gigether-options {
    802.3ad ae0;
  }
}
ae0 {
  aggregated-ether-options {
    link-speed 1g;
    minimum-links 1;
  }
}
vlan-tagging;
unit 0 {
  vlan-id 1;
  family inet {
    address 10.0.0.1/24;
  }
}
unit 1 {
  vlan-id 1024;
  family inet {
    address 10.0.0.2/24;
  }
}
unit 2 {
  vlan-id 1025;
  family inet {
    address 10.0.0.3/24;
  }
}
unit 3 {
  vlan-id 4094;
  family inet {
    address 10.0.0.4/24;
  }
}
}
```

Configuring Junos OS for Supporting Aggregated Devices

Junos OS supports the aggregation of physical devices into defined virtual links, such as the link aggregation of Ethernet interfaces defined by the IEEE 802.3ad standard.

Tasks for configuring aggregated devices are:

- [Configuring Virtual Links for Aggregated Devices on page 71](#)
- [Configuring LACP Link Protection at the Chassis Level on page 72](#)
- [Enabling LACP Link Protection on page 72](#)
- [Configuring System Priority on page 73](#)
- [Configuring the Maximum Links Limit on page 73](#)
- [Configuring PPM on Junos Fusion on page 74](#)

Configuring Virtual Links for Aggregated Devices

To define virtual links, you need to specify the associations between physical and logical devices within the **[edit interfaces]** hierarchy, and assign the correct number of logical devices by including the **device-count** statement at the **[edit chassis aggregated-devices ethernet]** and **[edit chassis aggregated-devices sonet]** hierarchy levels:

```
[edit chassis]
aggregated-devices {
  ethernet {
    device-count number;
  }
  sonet {
    device-count number;
  }
}
```

The aggregated interfaces are numbered from **ae0** through **ae4091**. The maximum number of aggregated interfaces supported by different routers is listed below:

- For PTX Series routers, you can configure a maximum of 128 aggregated interfaces.
- For M Series and T Series routers, you can configure a maximum of 128 aggregated interfaces (LAG bundles).
- In Junos release 14.2R2 and earlier, you can configure a maximum of 480 aggregated interfaces on MX Series routers.
- In Junos release 14.2R3 and later, you can configure a maximum of 1000 aggregated interfaces on MX240, MX480, and MX960 routers.
- In Junos release 14.2R3 and later, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.

- In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 480 aggregated interfaces on MX240, MX480, and MX960 routers.
- In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.

For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 64, numbered from **as0** through **as63**. In releases before Junos OS Release 13.2, the maximum was 16.

Configuring LACP Link Protection at the Chassis Level

Link Aggregation Control Protocol (LACP) is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled. LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP link protection enables you to force active and standby links within an aggregated Ethernet. You configure LACP link protection by using the **link-protection** and **system-priority** statements at either the chassis or interface level and by configuring port priority at the interface level using the **system-priority** statement. Configuring LACP parameters at the chassis level results in all aggregated Ethernet interfaces using the defined values unless overridden by the LACP configuration on a specific interface.

```
[edit chassis]
aggregated-devices {
  ethernet {
    lacp {
      link-protection {
        non-revertive;
      }
      system-priority priority;
    }
  }
}
```

NOTE: LACP link protection also uses port priority. You can configure port priority at the Ethernet interface [**gigether-options**] hierarchy level using the **port-priority** statement. If you choose not to configure port priority, LACP link protection uses the default value for port priority (127).

See Also

Enabling LACP Link Protection

To enable LACP link protection for aggregated Ethernet interfaces on the chassis, use the **link-protection** statement at the **[edit chassis aggregated-devices ethernet lacp]** hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
link-protection {
  non-revertive;
}
```

By default, LACP link protection reverts to a higher-priority (lower-numbered) link when that higher-priority link becomes operational or a link is added to the aggregator that is determined to be higher in priority. However, you can suppress link calculation by adding the **non-revertive** statement to the LACP link protection configuration. In nonrevertive mode, after a link is active and collecting and distributing packets, the subsequent addition of a higher-priority (better) link does not result in a switch, and the current link remains active.

BEST PRACTICE: (MX Series) In a highly scaled configuration over aggregated Ethernet, we recommend that you prevent the router from performing such a switch by including the **non-revertive** statement. Failure to do so may result in some traffic loss if a MIC on which a member interface is located reboots. Using the **non-revertive** statement for this purpose is not effective if both the primary and secondary interfaces are on the MIC that reboots.

CAUTION: If both ends of an aggregator have LACP link protection enabled, make sure to configure both ends of the aggregator to use the same mode. Mismatching LACP link protection modes can result in lost traffic.

Configuring System Priority

To configure LACP system priority for aggregated Ethernet interfaces on the chassis, use the **system-priority** statement at the **[edit chassis aggregated-devices ethernet lacp]** hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
system-priority priority;
```

The system priority is a 2-octet binary value that is part of the LACP system ID. The LACP system ID consists of the system priority as the two most-significant octets and the interface MAC address as the six least-significant octets. The system with the numerically lower value for system priority has the higher priority. By default, system priority is 127, with a range of 0 through 65,535.

Configuring the Maximum Links Limit

To configure the maximum links limit, use the **maximum-links** statement at the **[edit chassis aggregated-devices]** hierarchy level:

```
[edit chassis aggregated-devices]
maximum-links maximum-links-limit;
```

Configuring PPM on Junos Fusion

If you use Junos Fusion with Junos OS Release 14.2R3, you need to ensure that link aggregation (and STP) work properly by configuring timers for the periodic packet management (PPM) daemons on the aggregation and satellite devices. We recommend using the following timer values:

```
[edit routing-options ppm]
  redistribution-timer 120;
  tcp-keepalive-interval 3000;
  tcp-keepalive-idle 3000;
```

Starting in Junos OS Release 14.2R4, the timer values that ensure proper link aggregation and STP functions are configured by default if you use Junos Fusion with Junos OS.

Release History Table

Release	Description
15.1F5	In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 480 aggregated interfaces on MX240, MX480, and MX960 routers.
15.1F5	In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.
14.2R4	Starting in Junos OS Release 14.2R4, the timer values that ensure proper link aggregation and STP functions are configured by default if you use Junos Fusion with Junos OS.
14.2R3	In Junos release 14.2R3 and later, you can configure a maximum of 1000 aggregated interfaces on MX240, MX480, and MX960 routers.
14.2R3	In Junos release 14.2R3 and later, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.
14.2R3	If you use Junos Fusion with Junos OS Release 14.2R3, you need to ensure that link aggregation (and STP) work properly by configuring timers for the periodic packet management (PPM) daemons on the aggregation and satellite devices.
14.2R2	In Junos release 14.2R2 and earlier, you can configure a maximum of 480 aggregated interfaces on MX Series routers.
13.2	For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 64, numbered from as0 through as63 .

- [Configuring Aggregated Ethernet Interfaces on PTX Series Packet Transport Routers on page 56](#)
- [Configuring Aggregated SONET/SDH Interfaces](#)

Configuring the Number of Aggregated Ethernet Interfaces on the Device

By default, no aggregated Ethernet interfaces are created. You must set the number of aggregated Ethernet interfaces on the routing device before you can configure them.

For M Series and T Series routers you can configure a maximum of 128 aggregated interfaces (LAG bundles). On MX Series routers running Junos release 14.2R2 and earlier, you can configure a maximum of 480 aggregated interfaces. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. For MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces. In all cases the aggregated interfaces are numbered from **ae0** through **ae4092**.

NOTE: On a Junos Fusion Fabric, you can include extended ports (physical interface on a satellite device that provides a connection to servers or endpoints) or local ports in link aggregation groups (LAGs) and MC-LAGs, but not both. For information on extended ports, see *Understanding Junos Fusion Ports*.

For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 16, numbered from **as0** through **as15**.

1. Specify that you want to access the aggregated Ethernet configuration on the device.

```
user@host# edit chassis aggregated-devices ethernet
```

2. Set the number of aggregated Ethernet interfaces.

```
[edit chassis aggregated-devices ethernet]
user@host# set device-count number
```

You must also specify the constituent physical links by including the **802.3ad** statement at the **[edit interfaces *interface-name* fastether-options]** or **[edit interfaces *interface-name* gether-options]** hierarchy level.

Release History Table

Release	Description
14.2R2	For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. For MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.
13.2	For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 16, numbered from as0 through as15 .

Related Documentation

- For information about physical links, see [Configuring an Aggregated Ethernet Interface on page 48](#)
- For a sample configuration, see [Example: Configuring Aggregated Ethernet Interfaces on page 69](#)
- *Ethernet Interfaces Feature Guide for Routing Devices*
- For information about configuring aggregated devices, see the *Junos OS Administration Library*.

Configuring Aggregated Ethernet Link Speed

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. Generally, all interfaces that make up a bundle must have the same speed. If you include in the aggregated Ethernet interface an individual link that has a speed different from the speed that you specify in the **link-speed** parameter, an error message is logged. However, there are exceptions.

Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers. For example, these mixes are supported:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers.

Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.

**NOTE:**

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

To configure member links of mixed rates and mixed modes on T640, T1600, T4000, TX Matrix Plus, and PTX routers, you need to configure the **mixed** option for the `[edit interfaces aex aggregated-ether-options link-speed]` statement.

To set the required link speed:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```

2. Configure the link speed.

```
[edit interfaces interface-name aggregated-ether-options ]
user@host# set link-speed speed
```

speed can be in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet interfaces on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.

- **10g**—Links are 10 Gbps.
- **50g**—Links are 50 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

Release History Table

Release	Description
14.2	Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.
14.1	Starting with Junos OS Release 14.1R1 and 14.2, support for mixed rates on aggregated Ethernet bundles is extended to MX240, MX480, MX960, MX2010, and MX2020 routers.
13.2	Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers.
13.2	Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP.

- [Configuring Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles on page 65](#)
- *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring Aggregated Ethernet Minimum Links

On aggregated Ethernet interfaces, you can configure the minimum number of links that must be up for the bundle as a whole to be labeled **up**. By default, only one link must be up for the bundle to be labeled **up**.

To configure the minimum number of links:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```

2. Configure the minimum number of links.

```
[edit interfaces interface-name aggregated-ether-options]
user@host# set minimum-links number
```

On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, and EX 9200 switches, the valid range for **minimum-links *number*** is 1 through 16. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On MX Series routers, when Link Aggregation Control Protocol (LACP) is enabled on a link aggregation group (LAG) interface along with minimum links configuration, the bundle is considered to be up when the following two conditions are met:

- The specified minimum number of links are up.
- The links are in *collecting distributing* state—that is, collecting and distributing states are merged together to form a combined state (coupled control) for the aggregated port. Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.

If the number of links configured in an aggregated Ethernet interface is less than the minimum link value configured under the **aggregated-ether-options** statement, the configuration commit fails and an error message is displayed.

Configuring Tagged Aggregated Ethernet Interfaces

To specify aggregated Ethernet interfaces, include the **vlan-tagging** statement at the **[edit interfaces aex]** hierarchy level:

```
[edit interfaces aex]  
vlan-tagging;
```

You must also include the **vlan-id** statement:

```
vlan-id number;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

For more information about the **vlan-tagging** and **vlan-id** statements, see *802.1Q VLANs Overview*.

Related Documentation

- *vlan-id*
- *vlan-tagging*

Configuring Untagged Aggregated Ethernet Interfaces

Packet tagging provides a logical way to differentiate traffic on ports which support multiple virtual local area network (VLAN). While you must configure aggregated Ethernet interfaces to receive tagged traffic, you must also configure aggregated Ethernet interfaces that can receive untagged traffic.

To configure an aggregated Ethernet interface as untagged, remove the *vlan-tagging* statement at the **[edit interfaces aex]** hierarchy level and remove the **vlan-id** statement from the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

NOTE: You can configure only one logical interface (unit 0) on the port. The logical unit 0 is used to send and receive LACP or marker protocol data units (PDUs) to and from the individual links.

Table 8 on page 81 lists untagged aggregated Ethernet and LACP support by PIC and router.

Table 8: Untagged Aggregated Ethernet and LACP Support by PIC and Platform

PIC Type	M Series	LACP	T Series	LACP
4-port Fast Ethernet PIC Type 1	Yes	Yes	Yes	Yes
1-port Gigabit Ethernet PIC Type 1	Yes	Yes	Yes	Yes
2-port Gigabit Ethernet PIC Type 2	Yes	Yes	Yes	Yes
4-port Gigabit Ethernet PIC Type 2	Yes	Yes	Yes	Yes
1-port 10-Gigabit Ethernet M160	Yes	Yes	NA	NA
10-port Gigabit Ethernet PIC Type 3	Yes (M120, M320)	Yes	Yes	Yes
1-port 10-Gigabit Ethernet PIC Type 3	N/A	NA	Yes	Yes
8-port Gigabit Ethernet PIC Type 3	Yes	Yes	Yes	Yes

The 8-port Fast Ethernet PIC does not support untagged aggregated Ethernet or LACP.

Syslog messages are logged if you try to configure an untagged aggregated Ethernet interface using an unsupported PIC type.

Configuring LACP for Aggregated Ethernet Interfaces

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled.

NOTE: Starting with Junos OS Release 14.1, you can configure aggregated Ethernet interfaces with LACP on logical systems within an MX Series router.

For Multichassis Link Aggregation (MC-LAG), you must specify the **system-id** and **admin key**. MC-LAG peers use the same **system-id** while sending the LACP messages. The **system-id** can be configured on the MC-LAG network device and synchronized between peers for validation.

LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the aggregate bundle without user intervention
- Link monitoring to check whether both ends of the bundle are connected to the correct group

The Junos OS implementation of LACP provides link monitoring but not automatic addition and deletion of links.

The LACP mode can be active or passive. If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is turned off on aggregated Ethernet interfaces. If LACP is configured, it is in passive mode by default. To initiate transmission of LACP packets and response to LACP packets, you must configure LACP in active mode.

NOTE: LACP can link together multiple different physical interfaces, but only features that are supported across all of the linked devices will be supported in the resulting link aggregation group (LAG) bundle. For example, different PICs can support a different number of forwarding classes. If you use link aggregation to link together the ports of a PIC that supports up to 16 forwarding classes with a PIC that supports up to 8 forwarding classes, the resulting LAG bundle will only support up to 8 forwarding classes. Similarly, linking together a PIC that supports WRED with a PIC that does not support it will result in a LAG bundle that does not support WRED.

To enable LACP active mode, include the **lACP** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level, and specify the **active** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
  active;
}
```

NOTE: The LACP process exists in the system only if you configure the system in either active or passive LACP mode.

If you restart the Link Aggregation Control Protocol (LACP) process consecutively without adequate sleep or pause time between the successive restarts, the LACP links might flap. To avoid this problem, you must restart the LACP process only after the refresh time of the periodic packet management (PPM) process is completed.

To restore the default behavior, include the **lACP** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level, and specify the **passive** option:

```
[edit interfaces interface-name aggregated-ether-options]
lACP {
  passive;
}
```

Starting with Junos OS Release 12.2, you can also configure LACP to override the IEEE 802.3ad standard and to allow the standby link always to receive traffic. Overriding the default behavior facilitates subsecond failover.

To override the IEEE 802.3ad standard and facilitate subsecond failover, include the **fast-failover** statement at the **[edit interfaces *interface-name* aggregated-ether-options lACP]** hierarchy level.

When you configure the **accept-data** statement at the **[edit interfaces aeX aggregated-ether-options lACP]** hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

NOTE: When you use the **accept-data** statement at the **[edit interfaces aeX aggregated-ether-options lACP]** hierarchy level, this behavior occurs:

- By default, the **accept-data** statement is not configured when LACP is enabled.
- You can configure the **accept-data** statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the **accept-data** statement is configured.

For more information, see the following sections:

- [Configuring the LACP Interval on page 83](#)
- [Configuring LACP Link Protection on page 84](#)
- [Configuring LACP Hold-Up Timer to Prevent Link Flapping on LAG Interfaces on page 87](#)
- [Tracing LACP Operations on page 88](#)
- [Sample Configuration for Configuring Aggregated Ethernet LACP on Tagged and Untagged Interfaces on page 89](#)

Configuring the LACP Interval

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the **periodic** statement at the **[edit interfaces *interface-name* aggregated-ether-options lACP]** hierarchy level:

```
[edit interfaces interface-name aggregated-ether-options lacp]
periodic interval;
```

The interval can be fast (every second) or slow (every 30 seconds). You can configure different periodic rates on active and passive interfaces. When you configure the active and passive interfaces at different rates, the transmitter honors the receiver's rate.

NOTE: Starting with Junos OS Release 11.4, source address filtering does not work when LACP is enabled. This behavior is not applicable to T Series routers and PTX Series Packet Transport Routers. For more information about source address filtering, see [“Configuring MAC Address Filtering for Ethernet Interfaces” on page 20](#).

Percentage policers are not supported on aggregated Ethernet interfaces with the CCC protocol family configured. For more information about percentage policers, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

Generally, LACP is supported on all untagged aggregated Ethernet interfaces. For more information, see [“Configuring Untagged Aggregated Ethernet Interfaces” on page 80](#).

For M Series Multiservice Edge Routers with enhanced Flexible PIC Concentrators (FPCs) and T Series routers, LACP over VLAN-tagged aggregated Ethernet interfaces is supported. For 8-port, 12-port, and 48-port Fast Ethernet PICs, LACP over VLAN-tagged interfaces is not supported.

LACP Fast Periodic, which is achieved by configuring fast (every second) intervals for periodic transmission of LACP packets, is supported with graceful Routing Engine switchover (GRES) on MX Series routers only.

Configuring LACP Link Protection

To force active and standby links within an aggregated Ethernet, you can configure LACP link protection and system priority at the aggregated Ethernet interface level using the **link-protection** and **system-priority** statements. Configuring values at this level results in only the configured interfaces using the defined configuration. LACP interface configuration also enables you to override global (chassis) LACP settings.

LACP link protection also uses port priority. You can configure port priority at the Ethernet interface **[gigether-options]** hierarchy level using the **port-priority** statement. If you choose not to configure port priority, LACP link protection uses the default value for port priority (127).

**NOTE:**

- When using LACP link protection, you can configure only two member links to an aggregated Ethernet interface: one active and one standby.
- LACP link protection supports per-unit scheduling configuration on aggregated Ethernet interfaces.

- [Enabling LACP Link Protection on page 85](#)
- [Configuring LACP System Priority on page 86](#)
- [Configuring LACP System Identifier on page 86](#)
- [Configuring LACP administrative Key on page 87](#)
- [Configuring LACP Port Priority on page 87](#)

Enabling LACP Link Protection

To enable LACP link protection for an aggregated Ethernet interface, use the **link-protection** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
link-protection;
  disable;
  revertive;
  non-revertive;
}
```

By default, LACP link protection reverts to a higher-priority (lower-numbered) link when that higher-priority link becomes operational or a link is added to the aggregator that is determined to be higher in priority. However, you can suppress link calculation by adding the **non-revertive** statement to the LACP link protection configuration. In nonrevertive mode, once a link is active and collecting and distributing packets, the subsequent addition of a higher-priority (better) link does not result in a switch and the current link remains active.

If LACP link protection is configured to be nonrevertive at the global (**[edit chassis]** hierarchy) level, you can add the **revertive** statement to the LACP link protection configuration to override the nonrevertive setting for the interface. In revertive mode, the addition of a higher-priority link to the aggregator results in LACP performing a priority recalculation and switching from the current active link to the new active link.

CAUTION: If both ends of an aggregator have LACP link protection enabled, make sure to configure both ends of the aggregator to use the same mode. Mismatching LACP link protection modes can result in lost traffic.

We strongly recommend that you use LACP on both ends of the aggregator, when you connect an aggregated Ethernet interface with two member interfaces of MX Series routers to any other vendor device. Otherwise, the

vendor device (say a Layer 2 switch, or a router) will not be able to manage the traffic coming from the two link aggregated Ethernet bundle. As a result, you might observe the vendor device sending back the traffic to the backup member link of the aggregated Ethernet interface.

Currently, MX-MPC2-3D, MX-MPC2-3D-Q, MX-MPC2-3D-EQ, MX-MPC1-3D, MX-MPC1-3D-Q, and MPC-3D-16XGE-SFP do not drop traffic coming back to the backup link, whereas DPCE-R-Q-20GE-2XGE, DPCE-R-Q-20GE-SFP, DPCE-R-Q-40GE-SFP, DPCE-R-Q-4XGE-XFP, DPCE-X-Q-40GE-SFP, and DPCE-X-Q-4XGE-XFP drop traffic coming to the backup link.

Configuring LACP System Priority

To configure LACP system priority for aggregated Ethernet interfaces on the interface, use the **system-priority** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
system-priority;
```

The system priority is a 2-octet binary value that is part of the LACP system ID. The LACP system ID consists of the system priority as the two most-significant octets and the interface MAC address as the six least-significant octets. The system with the numerically lower value for system priority has the higher priority. By default, system priority is 127, with a range of 0 to 65,535.

Configuring LACP System Identifier

To configure the LACP system identifier for aggregated Ethernet interfaces, use the **system-id** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level:

```
[edit interfaces aeX aggregated-ether-options lacp]
system-id system-id;
```

Starting with Junos OS Release 13.3, you must not configure the LACP system identifier by using the **system-id system-id** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level to be all zeros (00:00:00:00:00:00). If you attempt to commit a configuration with the system identifier to be all zeros, an error occurs during the commit operation.

The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

Configuring LACP administrative Key

To configure an administrative key for LACP, include the **admin-key number** statement at the `[edit interfaces ae x aggregated-ether-options lacp]` hierarchy level:

```
[edit interfaces ae x aggregated-ether-options-lacp]
admin-key number;
```

NOTE: You must configure MC-LAG to configure the **admin-key** statement. For more information about MC-LAG, see *Configuring Multichassis Link Aggregation on MX Series Routers*.

Configuring LACP Port Priority

To configure LACP port priority for aggregated Ethernet interfaces, use the **port-priority** statement at the `[edit interfaces interface-name gigheter-options 802.3ad aeX lacp]` or `[edit interfaces interface-name fastether-options 802.3ad aeX lacp]` hierarchy levels:

```
[edit interfaces interface-name gigheter-options 802.3ad aeX lacp]
port-priority priority;
```

The port priority is a 2-octet field that is part of the LACP port ID. The LACP port ID consists of the port priority as the two most-significant octets and the port number as the two least-significant octets. The system with the numerically lower value for port priority has the higher priority. By default, port priority is 127, with a range of 0 to 65,535.

Port aggregation selection is made by each system based on the highest port priority and is assigned by the system with the highest priority. Ports are selected and assigned starting with the highest priority port of the highest priority system and working down in priority from there.

NOTE: Starting with Junos OS Release 9.3, port aggregation selection (discussed previously) is performed for the active link when LACP link protection is enabled. Without LACP link protection, port priority is not used in port aggregation selection.

Configuring LACP Hold-Up Timer to Prevent Link Flapping on LAG Interfaces

On link aggregation group (LAG) interfaces, when a member (child) link goes down, its state changes from current to expired. This link might flap from the current state to the expired state and back to current state when it receives intermittent LACP protocol data units (PDUs) and keepalive timeouts. Such flapping can adversely affect the traffic on the link.

To prevent excessive flapping of a LAG child link, you can configure a hold-up timer on the LAG interface that is applicable to all member links on that particular interface. To

hold up, in networking terms, means to prevent the transitioning of an interface from down to up for a specified time interval.

When configured, the hold-up timer is triggered when an LACP state machine tries to move to the current state from the expired or default state when it receives an LACP PDU. The hold-up timer is triggered only if the LACP state machine had acquired the current state at least once earlier. The timer is not triggered if LACP attempts to transition to the current state for the first time. LACP monitors the PDUs received on the child link but prevents the link from transitioning to current state. If no flapping is observed when the link receives the PDUs, the hold-up timer expires and triggers the member link to transition back to the current state. This transition is triggered as soon as the hold-up timer expires and not necessarily when the link receives a PDU.

To configure LACP hold-up timer for LAG interface, use the **hold-time up** statement at the **[edit interfaces aex aggregated-ether-options lacp]** hierarchy level.

NOTE:

- The hold-up timer keeps running even when the interface that receives the LACP PDU moves to the port disable state. The timer is then restarted if, before the timer expires, the interface comes up again and receives an LACP PDU from its neighbor. This ensures that the timer is maintained even during a quick physical port flap.
- When the following events occur, a hold-up timer is not triggered until the member link acquires the current state after the event:
 - LACP daemon restart
 - Deactivation and reactivation of child or aggregated Ethernet interface
 - Deletion and reconfiguration of child or aggregated Ethernet interface
 - System reboot
 - Routing Engine switchover

Tracing LACP Operations

To trace the operations of the LACP process, include the **traceoptions** statement at the **[edit protocols lacp]** hierarchy level:

```
[edit protocols lacp]
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Sample Configuration for Configuring Aggregated Ethernet LACP on Tagged and Untagged Interfaces

Following configurations are examples of configuring aggregated Ethernet LACP on VLAN-tagged and untagged interfaces:

LACP with VLAN-Tagged Aggregated Ethernet

```
[edit interfaces]
fe-5/0/1 {
  fastether-options {
    802.3ad ae0;
  }
}
ae0 {
  aggregated-ether-options {
    lacp {
      active;
    }
  }
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.1.1.2/24 {
        vrrp-group 0 {
          virtual-address 10.1.1.4;
          priority 200;
        }
      }
    }
  }
}
```

LACP with Untagged Aggregated Ethernet

```
[edit interfaces]
fe-5/0/1 {
  fastether-options {
    802.3ad ae0;
  }
}
ae0 {
  aggregated-ether-options {
    lacp {
      active;
    }
  }
  unit 0 {
    family inet {
      address 10.1.1.2/24 {
        vrrp-group 0 {
          virtual-address 10.1.1.4;
          priority 200;
        }
      }
    }
  }
}
```

```

    }
  }
}

```

Release History Table

Release	Description
14.1	Starting with Junos OS Release 14.1, you can configure aggregated Ethernet interfaces with LACP on logical systems within an MX Series router.
13.3	Starting with Junos OS Release 13.3, you must not configure the LACP system identifier by using the system-id system-id statement at the [edit interfaces aeX aggregated-ether-options lacp] hierarchy level to be all zeros (00:00:00:00:00:00).
12.2	Starting with Junos OS Release 12.2, you can also configure LACP to override the IEEE 802.3ad standard and to allow the standby link always to receive traffic. Overriding the default behavior facilitates subsecond failover.
11.4	Starting with Junos OS Release 11.4, source address filtering does not work when LACP is enabled.
9.3	Starting with Junos OS Release 9.3, port aggregation selection (discussed previously) is performed for the active link when LACP link protection is enabled.

Configuring Aggregated Ethernet Link Protection

You can configure link protection for aggregated Ethernet interfaces to provide QoS on the links during operation.

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable, egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

NOTE: Link protection is not supported on MX80.

- [Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces on page 91](#)

- [Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link on page 91](#)
- [Disabling Link Protection for Aggregated Ethernet Interfaces on page 92](#)

Configuring Link Protection for Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces support link protection to ensure QoS on the interface.

To configure link protection:

1. Specify that you want to configure the options for an aggregated Ethernet interface.

```
user@host# edit interfaces aex aggregated-ether-options
```

2. Configure the link protection mode.

```
[edit interfaces aex aggregated-ether-options]
user@host# set link-protection
```

- See Also**
- [Example: Configuring Aggregated Ethernet Link Protection on page 92](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces

To configure link protection, you must specify a primary and a secondary, or backup, link.

To configure a primary link and a backup link:

1. Configure the primary logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigheter-options) 802.3ad aex primary
```

2. Configure the backup logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigheter-options) 802.3ad aex backup
```

- See Also**
- [802.3ad on page 1014](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable,

egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

To manually control when traffic should be diverted back to the primary link from the designated backup link, enter the following operational command:

```
user@host> request interface revert aex
```

See Also • *Ethernet Interfaces Feature Guide for Routing Devices*

Disabling Link Protection for Aggregated Ethernet Interfaces

To disable link protection, issue the **delete interface revert aex** configuration command.

```
user@host# delete interfaces aex aggregated-ether-options link-protection
```

See Also • *Ethernet Interfaces Feature Guide for Routing Devices*

Example: Configuring Aggregated Ethernet Link Protection

The following configuration enables link protection on the **ae0** interface, and specifies the **ge-1/0/0** interface as the primary link and **ge-1/0/1** as the secondary link.

```
[edit interfaces]
ae0 {
  aggregated-ether-options {
    link-protection;
  }
}
[edit interfaces]
ge-1/0/0 {
  gigaether-options {
    802.3ad ae0 primary;
  }
}
[edit interfaces]
ge-1/0/1 {
  gigaether-options {
    802.3ad ae0 backup;
  }
}
```

Configuring Shared Scheduling on Aggregated Ethernet Interfaces

You can configure shared scheduling on aggregated Ethernet interfaces in link protection mode on Gigabit Ethernet Intelligent Queuing 2 (IQ2) and Ethernet Enhanced IQ2 (IQ2E) PICs on M320 routers.

To configure shared scheduling on aggregated Ethernet interfaces:

1. Specify that you want to configure the options for an aggregated Ethernet interface.

```
user@host# edit interfaces aex aggregated-ether-options
```

2. Configure the link protection mode.

```
[edit interfaces aex aggregated-ether-options]
user@host# set link-protection
```

3. Configure shared scheduling.

```
[edit interfaces aex aggregated-ether-options]
user@host# top
[edit]
user@host# edit interfaces aex shared-scheduler
```

Related Documentation

- [Configuring Aggregated Ethernet Link Protection on page 90](#)

Configuring Scheduler on Aggregated Ethernet Interfaces Without Link Protection

On aggregated Ethernet interfaces, you can configure scheduler in non-link-protect mode on the following platforms:

- MX-Series
- M120 and M320 with IQ2 PIC
- T-series platforms (T620 and T320) with IQ2 PIC

The scheduler functions supported are:

- Per unit scheduler
- Hierarchical scheduler
- Shaping at the physical interface

To configure the hierarchical scheduler on aggregated Ethernet interfaces in the non link-protect mode, include the **hierarchical-scheduler** statement at the **[edit interfaces aeX]** hierarchy level:

[edit interfaces aeX hierarchical-scheduler]

Prior to Junos OS Release 9.6, the hierarchical scheduler mode on these models required the **aggregated-ether-options** statement **link-protection** option. If a **link-protection** option is not specified, the scheduler is configured in non-link-protect mode.

To specify the member link bandwidth derivation based on the equal division model (**scale**) or the replication model (**replicate**) on aggregated Ethernet interfaces, include the **member-link-scheduler (scale | replicate)** option at the [edit class-of-service interfaces aeX] hierarchy level. The default setting is **scale**.

[edit class-of-service interfaces aeX member-link-scheduler (scale | replicate)]

NOTE: In link-protect mode, only one link is active at a time and the other link acts as the backup link, whereas in a non link-protect mode, all the links of the aggregate bundle are active at the same time. There is no backup link. If a link goes down or a new link is added to the bundle, traffic redistribution occurs.

Symmetrical Load Balancing on an 802.3ad LAG on MX Series Routers Overview

MX Series routers with Aggregated Ethernet PICs support symmetrical load balancing on an 802.3ad LAG. This feature is significant when two MX Series routers are connected transparently through deep packet inspection (DPI) devices over an LAG bundle. DPI devices keep track of flows and require information of a given flow in both forward and reverse directions. Without symmetrical load balancing on an 802.3ad LAG, the DPIs could misunderstand the flow, leading to traffic disruptions. By using this feature, a given flow of traffic (duplex) is ensured for the same devices in both directions.

Symmetrical load balancing on an 802.3ad LAG utilizes a mechanism of interchanging the source and destination addresses for a hash computation of fields, such as source address and destination address. The result of a hash computed on these fields is used to choose the link of the LAG. The hash-computation for the forward and reverse flow must be identical. This is achieved by swapping source fields with destination fields for the reverse flow. The swapped operation is referred to as *complement hash computation* or **symmetric-hash complement** and the regular (or unswapped) operation as *symmetric-hash computation* or **symmetric-hash**. The swappable fields are MAC address, IP address, and port.

Configuring Symmetric Load Balancing on an 802.3ad LAG on MX Series Routers

You can specify whether symmetric hash or complement hash is done for load-balancing traffic. To configure symmetric hash, use the **symmetric-hash** statement at the **[edit forwarding-options hash-key family inet]** hierarchy level. To configure symmetric hash complement, use the **symmetric-hash complement** statement and option at the **[edit forwarding-options hash-key family inet]** hierarchy level.

These operations can also be performed at the PIC level by specifying a *hash key*. To configure a hash key at the PIC level, use the **symmetric-hash** or **symmetric-hash complement** statement at the **[edit chassis hash-key family inet]** and **[edit chassis hash-key family multiservice]** hierarchy levels.

Consider the example in [Figure 1 on page 95](#).

Figure 1: Symmetric Load Balancing on an 802.3ad LAG on MX Series Routers

Router A is configured with symmetric hash and Router B is configured with symmetric hash complement. Thus, for a given flow *fx*, post hash computation is from Router A to Router B through i2. The reverse traffic for the same flow *fx* is from Router B to Router A through the same i2 device as its hashing (done after swapping source and destination fields) and returns the same link index; since it is performed on the interchanged source and destination addresses.

However, the link chosen may or may not correspond to what was attached to the DPI. In other words, the hashing result should point to the same links that are connected, so that the traffic flows through the same DPI devices in both directions. To make sure this happens, you need to also configure the counterpart ports (ports that are connected to same DPI-IN) with the identical link index. This is done when configuring a child-link into

the LAG bundle. This ensures that the link chosen for a given hash result is always the same on either router.

Note that any two links connected to each other should have the same link index and these link indices must be unique in a given bundle.

NOTE:

The following restrictions apply when configuring symmetric load balancing on an 802.3ad LAG on MX Series routers:

- The Packet Forwarding Engine (PFE) can be configured to hash the traffic in either symmetric or complement mode. A single PFE complex cannot work simultaneously in both operational modes and such a configuration can yield undesirable results.
- The per-PFE setting overrides the chassis-wide setting only for the family configured. For the other families, the PFE complex still inherits the chassis-wide setting (when configured) or the default setting.
- This feature supports VPLS, INET, and bridged traffic only.
- This feature cannot work in tandem with the `per-flow-hash-seed` load-balancing option. It requires that all the PFE complexes configured in complementary fashion share the same seed. A change in the seed between two counterpart PFE complexes may yield undesired results.

For additional information, see the *Junos OS VPNs Library for Routing Devices* and the *Junos OS Administration Library*.

Example Configuration Statements

To configure 802.3ad LAG parameters at the bundle level:

```
[edit interfaces]
g(x)e-fpc/pic/port {
  together-options {
    802.3ad {
      bundle;
      link-index number;
    }
  }
}
```

where the `link-index number` ranges from 0 through 15.

You can check the link index configured above using the `show interfaces` command:

```
[edit forwarding-options hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    [complement;]
```

```

    }
  }
  family multiservice {
    source-mac;
    destination-mac;
    payload {
      ip {
        layer-3 {
          source-ip-only | destination-ip-only;
        }
        layer-4;
      }
    }
    symmetric-hash {
      [complement;]
    }
  }
}

```

For load-balancing Layer 2 traffic based on Layer 3 fields, you can configure 802.3ad LAG parameters at a per PIC level. These configuration options are available under the chassis hierarchy as follows:

```

[edit chassis]
fpc X {
  pic Y {
    .
    .
    .
    hash-key {
      family inet {
        layer-3;
        layer-4;
        symmetric-hash {
          [complement;]
        }
      }
    }
    family multiservice {
      source-mac;
      destination-mac;
      payload {
        ip {
          layer-3 {
            source-ip-only | destination-ip-only;
          }
          layer-4;
        }
      }
      symmetric-hash {
        [complement;]
      }
    }
  }
}
.
.

```

```

    }
}

```

Configuring Symmetrical Load Balancing on Trio-Based MPCs

With some configuration differences, symmetrical load-balancing over an 802.3ad link aggregation group is supported on MX Series routers with Trio-based MPCs.

To achieve symmetrical load-balancing on Trio-Based MPCs, the following needs to be done:

- Compute a Symmetrical Hash

Both routers must compute the same hash value from the flow in the forward and reverse directions. On Trio-based platforms, the calculated hash value is independent of the direction of the flow, and hence is always symmetric in nature. For this reason, no specific configuration is needed to compute a symmetric hash value on Trio-based platforms.

However, it should be noted that the fields used to configure the hash should have identical include and exclude settings on both ends of the LAG.

- Configure Link Indexes

To allow both routers to choose the same link using the same hash value, the links within the LAG must be configured with the same link index on both routers. This can be achieved with the **link-index** statement.

- Enable Symmetric Load Balancing

To configure symmetric load balancing on Trio-based MPCs, include the **symmetric** statement at the **[edit forwarding-options enhanced-hash-key]** hierarchy level. This statement is applicable to Trio-based platforms only.

The **symmetric** statement can be used with any protocol family and enables symmetric load-balancing for all aggregated Ethernet bundles on the router. The statement needs to be enabled at both ends of the LAG. This statement is disabled by default.

- Achieve Symmetry for Bridged and Routed Traffic

In some deployments, the LAG bundle on which symmetry is desired is traversed by Layer 2 bridged traffic in the upstream direction and by IPv4 routed traffic in the downstream direction. In such cases, the computed hash is different in each direction because the Ethernet MAC addresses are taken into account for bridged packets. To overcome this, you can exclude source and destination MAC addresses from the enhanced-hash-key computation.

To exclude source and destination MAC addresses from the enhanced-hash-key computation, include the **no-mac-addresses** statement at the **[edit forwarding-options enhanced-hash-key family multiservice]** hierarchy level. This statement is disabled by default.

When symmetrical load balancing is enabled on Trio-based MPCs, keep in mind the following caveats:

- Traffic polarization is a phenomenon that occurs when using topologies that distribute traffic by using hashing of the same type. When routers are cascaded, traffic polarization can occur, and this can lead to unequal traffic distribution.

Traffic polarization occurs when LAGs are configured on cascaded routers. For example, in [Figure 2 on page 99](#), if a certain flow uses Link 1 of the aggregated Ethernet bundle between Device R1 and Device R2, the flow also uses Link 1 of the aggregated Ethernet bundle between Device R2 and Device R3.

Figure 2: Traffic Polarization on Cascaded Routers When Symmetrical Load Balancing is Enabled on Trio-based MPCs

This is unlike having a random link selection algorithm, where a flow might use Link 1 of the aggregated Ethernet bundle between Device R1 and Device R2, and Link 2 of the aggregated Ethernet bundle between Device R2 and Device R3.

- Symmetric load balancing is not applicable to per-prefix load-balancing where the hash is computed based on the route prefix.
- Symmetric load balancing is not applicable to MPLS or VPLS traffic, because in these scenarios the labels are not the same in both directions.

Example Configurations

- [Example Configurations of Chassis Wide Settings on page 99](#)
- [Example Configurations of Per-Packet-Forwarding-Engine Settings on page 100](#)

Example Configurations of Chassis Wide Settings

Router A

```
user@host> show configuration forwarding-options hash-key
family multiservice {
  payload {
    ip {
      layer-3;
    }
  }
  symmetric hash;
}
```

Router B

```
user@host> show configuration forwarding-options hash-key
family multiservice {
  payload {
    ip {
      layer-3;
    }
  }
  symmetric-hash {
    complement;
  }
}
```

```
}  
}
```

Example Configurations of Per-Packet-Forwarding-Engine Settings

Router A

```
user@host> show configuration chassis fpc 2 pic 2 hash-key  
family multiservice {  
  payload {  
    ip {  
      layer-3;  
    }  
  }  
  symmetric hash;  
}
```

Router B

```
user@host> show configuration chassis fpc 2 pic 3 hash-key  
family multiservice {  
  payload {  
    ip {  
      layer-3;  
    }  
  }  
  symmetric-hash {  
    complement;  
  }  
}
```

Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers

Symmetrical hashing for load balancing on an 802.3ad Link Aggregation Group (LAG) is useful when two MX Series routers (for example, Router A and Router B) are connected transparently through Deep Packet Inspection (DPI) devices over a LAG bundle. The DPI devices keep track of traffic flows in both the forward and reverse directions.

If symmetrical hashing is configured, the reverse flow of traffic is also directed through the same child link on the LAG and is bound to flow through the same DPI device. This enables proper accounting on the DPI of the traffic in both the forward and reverse flows.

If symmetrical hashing is not configured, a different child link on the LAG might be chosen for the reverse flow of traffic through a different DPI device. This results in incomplete information about the forward and reverse flows of traffic on the DPI device leading to incomplete accounting of the traffic by the DPI device.

Symmetrical hashing is computed based on fields like source address and destination address. You can configure symmetrical hashing both at the chassis level and the PIC level for load balancing based on Layer 2, Layer 3, and Layer 4 data unit fields for family inet (IPv4 protocol family) and multiservice (switch or bridge) traffic. Symmetrical hashing configured at the chassis level is applicable to the entire router, and is inherited by all its PICs and Packet Forwarding Engines. Configuring PIC-level symmetrical hashing provides you more granularity at the Packet Forwarding Engine level.

For the two routers connected through the DPI devices over a LAG bundle, you can configure **symmetric-hash** on one router and **symmetric-hash complement** on the remote-end router or vice-versa.

To configure symmetrical hashing at the chassis level, include the **symmetric-hash** or the **symmetric-hash complement** statements at the **[edit forwarding-options hash-key family]** hierarchy level. For information about configuring symmetrical hashing at the chassis level and configuring the link index, see the *Junos OS Network Interfaces Library for Routing Devices* and the *Junos OS VPNs Library for Routing Devices*.

NOTE: On MX Series DPCs, configuring symmetrical hashing at the PIC level refers to configuring symmetrical hashing at the Packet Forwarding Engine level.

To configure symmetrical hashing at the PIC level on the inbound traffic interface (where traffic enters the router), include the **symmetric-hash** or **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3 (source-ip-only | destination-ip-only);
      layer-4;
    }
  }
  symmetric-hash {
    complement;
  }
}
```

```
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    complement;
  }
}
```

**NOTE:**

- PIC-level symmetrical hashing overrides the chassis-level symmetrical hashing configured at the [edit chassis forwarding-options hash-key] hierarchy level.
- Symmetrical hashing for load balancing on 802.3ad Link Aggregation Groups is currently supported for the VPLS, INET and bridged traffic only.
- Hash key configuration on a PIC or Packet Forwarding Engine can be either in the “symmetric hash” or the “symmetric hash complement” mode, but not both at the same time.

Examples: Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs on MX Series Routers

NOTE: These examples are applicable only to the DPCs Supported on MX240, MX480, and MX960 Routers. For the list of DPCs supported, see *DPCs Supported on MX240, MX480, and MX960 Routers* in the Related Documentation section.

The following examples show how to configure symmetrical hashing at the PIC level for load balancing on MX Series routers:

- [Configuring Symmetrical Hashing for family multiservice on Both Routers on page 102](#)
- [Configuring Symmetrical Hashing for family inet on Both Routers on page 103](#)
- [Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers on page 104](#)

Configuring Symmetrical Hashing for family multiservice on Both Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the [edit chassis fpc slot-number pic pic-number hash-key family multiservice] hierarchy level:

```
[edit chassis fpc 2 pic 2 hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family multiservice]** hierarchy level:

```
[edit chassis fpc 0 pic 3 hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash {
    complement;
  }
}
```

Configuring Symmetrical Hashing for family inet on Both Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 0 pic 1 hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 1 pic 2 hash-key]
family inet {
  layer-3;
```

```
layer-4;
symmetric-hash {
  complement;
}
}
```

Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family multiservice]** hierarchy level:

```
[edit chassis fpc 1 pic 0 hash-key]
family multiservice {
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 0 pic 3 hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    complement;
  }
}
```

Related Documentation

- *DPCs Supported on MX240, MX480, and MX960 Routers*

Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing

The Junos OS supports configurations of 16, 32, or 64 equal-cost multipath (ECMP) next hops for RSVP and LDP LSPs on M10i routers with an Enhanced CFEB, M320, M120, MX Series, and T Series routers, and routing devices. For networks with high-volume traffic, this provides more flexibility to load-balance the traffic over as many as 64 LSPs.

To configure the maximum limit for ECMP next hops, include the **maximum-ecmp next-hops** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]  
maximum-ecmp next-hops;
```

You can configure a maximum ECMP next-hop limit of 16, 32, or 64 using this statement. The default limit is 16.

NOTE: MX Series routers with one or more Modular Port Concentrator (MPC) cards and with Junos OS 11.4 or earlier installed, support the configuration of the `maximum-ecmp` statement with only 16 next hops. You should *not* configure the `maximum-ecmp` statement with 32 or 64 next hops. When you commit the configuration with 32 or 64 next hops, the following warning message appears:

Error: Number of members in Unilist NH exceeds the maximum supported 16 on Trio.

The following types of routes support the ECMP maximum next-hop configuration for as many as 64 ECMP gateways:

- Static IPv4 and IPv6 routes with direct and indirect next-hop ECMPs
- LDP ingress and transit routes learned through associated IGP routes
- RSVP ECMP next hops created for LSPs
- OSPF IPv4 and IPv6 route ECMPs
- ISIS IPv4 and IPv6 route ECMPs
- EBGp IPv4 and IPv6 route ECMPs
- IBGP (resolving over IGP routes) IPv4 and IPv6 route ECMPs

The enhanced ECMP limit of up to 64 ECMP next hops is also applicable for Layer 3 VPNs, Layer 2 VPNs, Layer 2 circuits, and VPLS services that resolve over an MPLS route, because the available ECMP paths in the MPLS route can also be used by such traffic.

**NOTE:**

The following FPCs on M320, T640, and T1600 routers only support 16 ECMP next hops:

- (M320, T640, and T1600 routers only) Enhanced II FPC1
- (M320, T640, and T1600 routers only) Enhanced II FPC2
- (M320 and T640 routers only) Enhanced II FPC3
- (T640 and T1600 routers only) FPC2
- (T640 and T1600 routers only) FPC3

If a maximum ECMP next-hop limit of 32 or 64 is configured on an M320, T640, or T1600 router with any of these FPCs installed, the Packet Forwarding Engines on these FPCs use only the first 16 ECMP next hops. For Packet Forwarding Engines on FPCs that support only 16 ECMP next hops, the Junos OS generates a system log message if a maximum ECMP next-hop limit of 32 or 64 is configured. However, for Packet Forwarding Engines on other FPCs installed on the router, a maximum configured ECMP limit of 32 or 64 ECMP next hops is applicable.

NOTE: If RSVP LSPs are configured with bandwidth allocation, for ECMP next hops with more than 16 LSPs, traffic is not distributed optimally based on bandwidths configured. Some LSPs with smaller allocated bandwidths receive more traffic than the ones configured with higher bandwidths. Traffic distribution does not strictly comply with the configured bandwidth allocation. This caveat is applicable to the following routers:

- T1600 and T640 routers with Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, Enhanced Scaling FPC 4, and all Type 4 FPCs
- M320 routers with Enhanced III FPC1, Enhanced III FPC2, and Enhanced III FPC3
- MX Series routers with all types of FPCs and DPCs, excluding MPCs. This caveat is not applicable to MX Series routers with line cards based on the Junos Trio chipset.
- M120 routers with Type 1, Type 2, and Type 3 FPCs
- M10i routers with Enhanced CFEB

Next-hop cloning and permutations are disabled on T Series routers with Enhanced Scaling FPCs (Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, and Enhanced Scaling FPC 4) that support enhanced load-balancing capability. As a result, memory utilization is reduced for a highly scaled system with a high number of

next hops on ECMP or aggregated interfaces. Next-hop cloning and permutations are also disabled on T Series routers with Type-4 FPCs.

To view the details of the ECMP next hops, issue the **show route** command. The **show route summary** command also shows the current configuration for the maximum ECMP limit. To view details of the ECMP LDP paths, issue the **traceroute mpls ldp** command.

Understanding Aggregated Ethernet Load Balancing

The link aggregation feature is used to bundle several physical aggregated Ethernet interfaces to form one logical interface. One or more links are aggregated to form a virtual link or link aggregation group (LAG). The MAC client treats this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability.

In addition to these benefits, an aggregated Ethernet bundle is enhanced to provide load-balancing capabilities that ensure that the link utilization among the member links of the aggregated Ethernet bundle are fully and efficiently utilized.

The load-balancing feature allows a device to divide incoming and outgoing traffic along multiple paths or interfaces in order to reduce congestion in the network. Load balancing improves the utilization of various network paths and provides more effective network bandwidth.

Typically, the applications that use load balancing include:

- Aggregated Interfaces (Layer 2)

Aggregated Interfaces (also called AE for aggregated Ethernet, and AS for aggregated SONET) are a Layer 2 mechanism for load-balancing across multiple interfaces between two devices. Because this is a Layer 2 load-balancing mechanism, all of the individual component links must be between the same two devices on each end. Junos OS supports a non-signaled (static) configuration for Ethernet and SONET, as well as the 802.3ad standardized LACP protocol for negotiation over Ethernet links.

- Equal-Cost Multipath (ECMP) (Layer 3)

By default, when there are multiple equal-cost paths to the same destination for the active route, Junos OS uses a hash algorithm to choose one of the next-hop addresses to install in the forwarding table. Whenever the set of next hops for a destination changes in any way, the next-hop address is rechosen using the hash algorithm. There is also an option that allows multiple next-hop addresses to be installed in the forwarding table, known as per-packet load balancing.

ECMP load balancing can be:

- Across BGP paths (BGP multipath)
- Within a BGP path, across multiple LSPs

In complex Ethernet topologies, traffic imbalances occur due to increased traffic flow, and load balancing becomes challenging for some of the following reasons:

- Incorrect load balancing by aggregate next hops
- Incorrect packet hash computation
- Insufficient variance in the packet flow
- Incorrect pattern selection

As a result of traffic imbalance, the load is not well distributed causing congestion in certain links, whereas some other links are not efficiently utilized.

To overcome these challenges, Junos OS provides the following solutions for resolving the genuine traffic imbalance on aggregated Ethernet bundles (IEEE 802.3ad).

- Adaptive Load Balancing

Adaptive load balancing uses a feedback mechanism to correct a genuine traffic imbalance. To correct the imbalance weights, the bandwidth and packet stream of links are adapted to achieve efficient traffic distribution across the links in an AE bundle.

To configure adaptive load balancing, include the **adaptive** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: Adaptive load balancing is not supported if the VLAN ID is configured on the aggregated Ethernet interface. This limitation affects the PTX Series Packet Transport Routers and QFX10000 switches only.

To configure the tolerance value as a percentage, include the **tolerance** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure adaptive load balancing based on packets per second (instead of the default bits per second setting), include the **pps** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure the scan interval for the hash value based on the sample rate for the last two seconds, include the **scan-interval** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

NOTE: The **pps** and **scan-interval** optional keywords are supported on PTX Series Packet Transport Routers only.

- Per-Packet Random Spray Load Balancing

When the adaptive load-balancing option fails, per-packet random spray load balancing serves as a last resort. It ensures that the members of an AE bundle are equally loaded without taking bandwidth into consideration. Per packet causes packet reordering and hence is recommended only if the applications absorb reordering. Per-packet random

spray eliminates traffic imbalance that occurs as a result of software errors, except for packet hash.

To configure per-packet random spray load balancing, include the **per-packet** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: The Per-Packet option for load balancing is not supported on PTX Series Packet Transport Routers.

The aggregated Ethernet load-balancing solutions are mutually exclusive. When more than one of the load-balancing solutions is configured, the solution that is configured last overrides the previously configured one. You can verify the load-balancing solution being used by issuing the **show interfaces aex aggregated-ether-options load-balance** command.

- Aggregated Interfaces (Layer 2)

Aggregated Interfaces (also called AE for aggregated Ethernet, and AS for aggregated SONET) are a Layer 2 mechanism for load-balancing across multiple interfaces between two devices. Because this is a Layer 2 load-balancing mechanism, all of the individual component links must be between the same two devices on each end. Junos OS supports a non-signaled (static) configuration for Ethernet and SONET, as well as the 802.3ad standardized LACP protocol for negotiation over Ethernet links.

- Equal-Cost Multipath (ECMP) (Layer 3)

By default, when there are multiple equal-cost paths to the same destination for the active route, Junos OS uses a hash algorithm to choose one of the next-hop addresses to install in the forwarding table. Whenever the set of next hops for a destination changes in any way, the next-hop address is rechosen using the hash algorithm. There is also an option that allows multiple next-hop addresses to be installed in the forwarding table, known as per-packet load balancing.

ECMP load balancing can be:

- Across BGP paths (BGP multipath)
- Within a BGP path, across multiple LSPs

In complex Ethernet topologies, traffic imbalances occur due to increased traffic flow, and load balancing becomes challenging for some of the following reasons:

- Incorrect load balancing by aggregate next hops
- Incorrect packet hash computation
- Insufficient variance in the packet flow
- Incorrect pattern selection

As a result of traffic imbalance, the load is not well distributed causing congestion in certain links, whereas some other links are not efficiently utilized.

To overcome these challenges, Junos OS provides the following solutions for resolving the genuine traffic imbalance on aggregated Ethernet bundles (IEEE 802.3ad).

- Adaptive Load Balancing

Adaptive load balancing uses a feedback mechanism to correct a genuine traffic imbalance. To correct the imbalance weights, the bandwidth and packet stream of links are adapted to achieve efficient traffic distribution across the links in an AE bundle.

To configure adaptive load balancing, include the **adaptive** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: Adaptive load balancing is not supported if the VLAN ID is configured on the aggregated Ethernet interface. This limitation affects the PTX Series Packet Transport Routers and QFX10000 switches only.

To configure the tolerance value as a percentage, include the **tolerance** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure adaptive load balancing based on packets per second (instead of the default bits per second setting), include the **pps** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure the scan interval for the hash value based on the sample rate for the last two seconds, include the **scan-interval** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

NOTE: The **pps** and **scan-interval** optional keywords are supported on PTX Series Packet Transport Routers only.

- Per-Packet Random Spray Load Balancing

When the adaptive load-balancing option fails, per-packet random spray load balancing serves as a last resort. It ensures that the members of an AE bundle are equally loaded without taking bandwidth into consideration. Per packet causes packet reordering and hence is recommended only if the applications absorb reordering. Per-packet random spray eliminates traffic imbalance that occurs as a result of software errors, except for packet hash.

To configure per-packet random spray load balancing, include the **per-packet** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: The Per-Packet option for load balancing is not supported on PTX Series Packet Transport Routers.

The aggregated Ethernet load-balancing solutions are mutually exclusive. When more than one of the load-balancing solutions is configured, the solution that is configured last overrides the previously configured one. You can verify the load-balancing solution being used by issuing the **show interfaces aex aggregated-ether-options load-balance** command.

Example: Configuring Aggregated Ethernet Load Balancing

This example shows how to configure aggregated Ethernet load balancing.

- [Requirements on page 111](#)
- [Overview on page 112](#)
- [Configuration on page 114](#)
- [Verification on page 124](#)

Requirements

This example uses the following hardware and software components:

- Three MX Series routers with MIC and MPC interfaces or three PTX Series Packet Transport Routers with PIC and FPC interfaces
- Junos OS Release 13.3 or later running on all devices

Overview

Load balancing is required on the forwarding plane when there are multiple paths or interfaces available to the next hop router, and it is best if the incoming traffic is load balanced across all available paths for better link utilization.

Aggregated Ethernet bundle is a typical application that uses load balancing to balance traffic flows across the member links of the bundle (IEEE 802.3ad).

Starting with Junos OS Release 13.3, aggregated Ethernet load balancing is enhanced to provide two solutions for resolving genuine traffic imbalance on aggregated Ethernet bundles on MICs or MPCs of MX Series routers. Starting with Junos OS Release 14.1, aggregated Ethernet load balancing is enhanced to provide two solutions for resolving genuine traffic imbalance on aggregated Ethernet bundles on PICs or FPCs of PTX Series Packet Transport Routers.

The aggregated Ethernet load-balancing solutions are:

- **Adaptive**—Adaptive load balancing is used in scenarios where flow-based hashing is not sufficient to achieve a uniform load distribution. This load-balancing solution implements a real-time feedback and control mechanism to monitor and manage imbalances in network load.

The adaptive load-balancing solution corrects the traffic flow imbalance by modifying the selector entries, and periodically scanning the link utilization on each member link of the AE bundle to detect any deviations. When a deviation is detected, an adjustment event is triggered and fewer flows are mapped to the affected member link. As a result, the offered bandwidth of that member link goes down. This causes a continuous feedback loop, which over a period of time ensures that the same amount of byte rate is offered to all the member links, thus providing efficient traffic distribution across each member link in the AE bundle.

To configure adaptive load balancing, include the **adaptive** statement at the **[edit interfaces *aex* aggregated-ether-options load-balance]** hierarchy level.

NOTE: Adaptive load balancing is not supported if the VLAN ID is configured on the aggregated Ethernet interface. This limitation affects the PTX Series Packet Transport Routers only.

The **pps** option enables load balancing based on the packets-per-second rate. The default setting is bits-per-second load balancing.

The **scan-interval** value configures the length of time for scanning as a multiple of 30 seconds.

The **tolerance** value is the limit to the variance in the packet traffic flow to the aggregated Ethernet links in the bundle. You can specify a maximum of 100-percent variance. When the tolerance attribute is not configured, a default value of 20 percent is enabled for adaptive load balancing. A smaller tolerance value balances better bandwidth, but takes a longer convergence time.

NOTE: The `pps` and `scan-interval` optional keywords are supported on PTX Series Packet Transport Routers only.

- Per-packet random spray—When the adaptive load-balancing solution fails, per-packet random spray acts as a last resort. The per-packet random spray load-balancing solution helps to address traffic imbalance by randomly spraying the packets to the aggregate next hops. This ensures that all the member links of the AE bundle are equally loaded, resulting in packet reordering.

In addition, per-packet random spray identifies the ingress Packet Forwarding Engine that caused the traffic imbalance and eliminates traffic imbalance that occurs as a result of software errors, except for packet hash.

To configure per-packet random spray load balancing, include the **per-packet** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

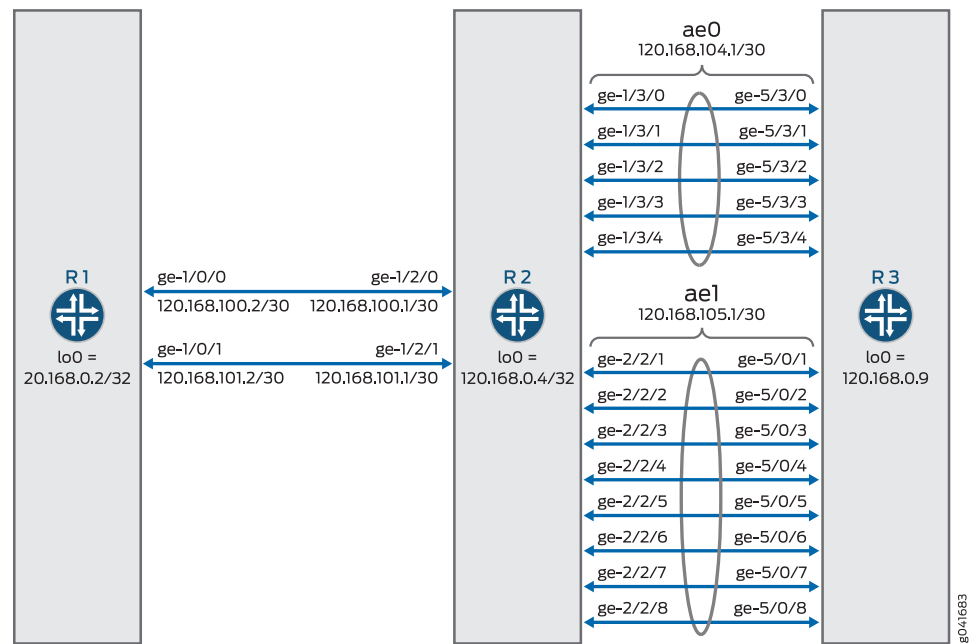

NOTE: The Per-Packet option for load balancing is not supported on the PTX Series Packet Transport Routers.

The aggregated Ethernet load-balancing solutions are mutually exclusive. When more than one of the load-balancing solutions is configured, the solution that is configured last overrides the previously configured one. You can verify the load-balancing solution being implemented by issuing the **show interfaces aex aggregated-ether-options load-balance** command.

Topology

In this topology, two aggregated Ethernet bundles - ae0 and ae1 - are configured on the links between the R2 and R3 routers.

Figure 3: Aggregated Ethernet Load Balancing

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Configuring Adaptive Load Balancing

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure the R2 router:

NOTE: Repeat this procedure for the other routers, after modifying the appropriate interface names, addresses, and any other parameters for each router.

1. Specify the number of aggregated Ethernet interfaces to be created.

```

[edit chassis]
user@R2# set aggregated-devices ethernet device-count 5

```

2. Configure the Gigabit Ethernet interface link connecting R2 to R1.

```

[edit interfaces]
user@R2# set ge-1/2/0 unit 0 family inet address 120.168.100.1/30
user@R2# set ge-1/2/0 unit 0 family iso
user@R2# set ge-1/2/0 unit 0 family mpls
user@R2# set ge-1/2/1 unit 0 family inet address 120.168.101.1/30
user@R2# set ge-1/2/1 unit 0 family iso
user@R2# set ge-1/2/1 unit 0 family mpls

```

```
user@R2# set lo0 unit 0 family inet address 120.168.0.4/32
user@R2# set lo0 unit 0 family iso address 49.0001.1201.6800.0004.00
```

3. Configure the five member links of the ae0 aggregated Ethernet bundle.

```
[edit interfaces]
user@R2# set ge-1/3/0 gigether-options 802.3ad ae0
user@R2# set ge-1/3/1 gigether-options 802.3ad ae0
user@R2# set ge-1/3/2 gigether-options 802.3ad ae0
user@R2# set ge-1/3/3 gigether-options 802.3ad ae0
user@R2# set ge-1/3/4 gigether-options 802.3ad ae0
```

4. Configure the eight member links of the ae1 aggregated Ethernet bundle.

```
[edit interfaces]
user@R2# set ge-2/2/1 gigether-options 802.3ad ae1
user@R2# set ge-2/2/2 gigether-options 802.3ad ae1
user@R2# set ge-2/2/3 gigether-options 802.3ad ae1
user@R2# set ge-2/2/4 gigether-options 802.3ad ae1
user@R2# set ge-2/2/5 gigether-options 802.3ad ae1
user@R2# set ge-2/2/6 gigether-options 802.3ad ae1
user@R2# set ge-2/2/7 gigether-options 802.3ad ae1
user@R2# set ge-2/2/8 gigether-options 802.3ad ae1
```

5. Enable aggregate Ethernet load balancing on ae0 of R2.

```
[edit interfaces]
user@R2# set ae0 aggregated-ether-options load-balance adaptive tolerance 10
```

6. Configure the link speed for the ae0 aggregated Ethernet bundle.

```
[edit interfaces]
user@R2# set ae0 aggregated-ether-options link-speed 1g
```

7. Configure LACP on the ae0 aggregated Ethernet bundle.

```
[edit interfaces]
user@R2# set ae0 aggregated-ether-options lacp active
```

8. Configure the interface parameters for the ae0 aggregated Ethernet bundle.

```
[edit interfaces]
user@R2# set ae0 unit 0 family inet address 120.168.104.1/30
user@R2# set ae0 unit 0 family iso
user@R2# set ae0 unit 0 family mpls
```

9. Enable aggregate Ethernet load balancing on ae1 of R2.

```
[edit interfaces]
```

```
user@R2# set ae1 aggregated-ether-options load-balance adaptive tolerance 10
```

10. Configure the link speed for the ae1 aggregated Ethernet bundle.

```
[edit interfaces]
```

```
user@R2# set ae1 aggregated-ether-options link-speed 1g
```

11. Configure LACP on the ae1 aggregated Ethernet bundle.

```
[edit interfaces]
```

```
user@R2# set ae1 aggregated-ether-options lacp active
```

12. Configure the interface parameters for the ae1 aggregated Ethernet bundle.

```
[edit interfaces]
```

```
user@R2# set ae1 unit 0 family inet address 120.168.105.1/30
```

```
user@R2# set ae1 unit 0 family iso
```

```
user@R2# set ae1 unit 0 family mpls
```

13. Disable selective aggregate Ethernet statistics.

```
[edit accounting-options]
```

```
user@R2# set selective-aggregate-interface-stats disable
```

14. Configure RSVP on all the interfaces of R2 and on the AE bundles.

```
[edit protocols]
```

```
user@R2# set rsvp interface ge-1/2/0.0
```

```
user@R2# set rsvp interface ge-1/2/1.0
```

```
user@R2# set rsvp interface ae0.0
```

```
user@R2# set rsvp interface ae1.0
```

15. Configure MPLS on all the interfaces of R2 and on the AE bundles.

```
[edit protocols]
```

```
user@R2# set mpls interface ge-1/2/0.0
```

```
user@R2# set mpls interface ge-1/2/1.0
```

```
user@R2# set mpls interface ae0.0
```

```
user@R2# set mpls interface ae1.0
```

16. Configure IS-IS on all the interfaces of R2 and on the AE bundles.

```
[edit protocols]
```

```
user@R2# set isis traffic-engineering family inet shortcuts
```

```
user@R2# set isis level 1 disable
```

```
user@R2# set isis interface ge-1/2/0.0
```

```
user@R2# set isis interface ge-1/2/1.0
user@R2# set isis interface ae0.0
user@R2# set isis interface ae1.0
user@R2# set isis interface lo0.0
```

Results

From configuration mode, confirm your configuration by entering the **show chassis**, **show interfaces**, **show accounting-options**, and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Load Balancing and Ethernet Link Aggregation Overview

You can create a link aggregation group (LAG) for a group of Ethernet ports. Layer 2 bridging traffic is load balanced across the member links of this group, making the configuration attractive for congestion concerns as well as for redundancy. You can configure up to 128 LAG bundles on M Series, and T Series routers, and 480 LAG bundles on MX Series routers and EX9200 switches. Each LAG bundle contains up to 16 links. (Platform support depends on the Junos OS release in your installation.)

By default, the hash key mechanism to load-balance frames across LAG interfaces is based on Layer 2 fields (such as frame source and destination address) as well as the input logical interface (unit). The default LAG algorithm is optimized for Layer 2 switching. Starting with Junos OS Release 10.1, you can also configure the load balancing hash key for Layer 2 traffic to use fields in the Layer 3 and Layer 4 headers using the **payload**

statement. However, note that the load-balancing behavior is platform-specific and based on appropriate hash-key configurations.

For more information, see “[Configuring Load Balancing on a LAG Link](#)” on [page 126](#). In a Layer 2 switch, one link is overutilized and other links are underutilized.

Release History Table

Release	Description
10.1	Starting with Junos OS Release 10.1, you can also configure the load balancing hash key for Layer 2 traffic to use fields in the Layer 3 and Layer 4 headers using the payload statement.

Related
Documentation

- *payload*

Example: Configuring Load Balancing on a LAG Link

This example configures the load-balancing hash key to use the source Layer 3 IP address option and Layer 4 header fields as well as the source and destination MAC addresses for load balancing on a link aggregation group (LAG) link:

```
[edit]
forwarding-options {
  hash-key {
    family multiservice {
      source-mac;
      destination-mac;
      payload {
        ip {
          layer-3 {
            source-ip-only;
          }
          layer-4;
        }
      }
    }
  }
}
```

NOTE: Any change in the hash key configuration requires a reboot of the FPC for the changes to take effect.

Configuring Load Balancing on a LAG Link

You can configure the load balancing hash key for Layer 2 traffic to use fields in the Layer 3 and Layer 4 headers inside the frame payload for load-balancing purposes using the **payload** statement. You can configure the statement to look at **layer-3** (and **source-ip-only**

or **destination-ip-only** packet header fields) or **layer-4** fields. You configure this statement at the **[edit forwarding-options hash-key family multiservice]** hierarchy level.

You can configure Layer 3 or Layer 4 options, or both. The **source-ip-only** or **destination-ip-only** options are mutually exclusive. The **layer-3-only** statement is not available on MX Series routers.

By default, Junos implementation of 802.3ad balances traffic across the member links within an aggregated Ethernet bundle based on the Layer 3 information carried in the packet.

For more information about link aggregation group (LAG) configuration, see the *Junos OS Network Interfaces Library for Routing Devices*.

Stateful Load Balancing for Aggregated Ethernet Interfaces Using 5-Tuple Data

When multiple flows are transmitted out of an aggregated Ethernet (**ae**) interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part. In Junos OS releases earlier than Release 13.2R1, on MX Series routers with Trio-based FPCs (MPCs), the selection of a member link of the **ae** interface bundle or the next-hop (or unilist of next-hops) for equal-cost multipath (ECMP) links is performed using a balanced mode next-hop selection methodology and an unbalanced mode of member link or next-hop selection methodology. The balanced mode of link selection uses 'n' bits in a precomputed hash value if it needs to select one of 2^n (2 raised to the power of n) next-hop in the unilist. The unbalanced mode of member-link or next-hop selection uses 8 bits in a precomputed hash to select an entry in a selector table, which is randomly done with the member link IDs of the link aggregation group (LAG) or **aebundle**.

The term balanced versus unbalanced indicates whether a selector table is used for load balancing mechanism or not. The LAG bundle uses the unbalanced mode (selector table balancing) to balance the traffic across member links. When the traffic flows are minimal, the following problems might occur with the unbalanced mode: The link selection logic utilizes only subset bits of the precomputed hash. Regardless of the efficiency of the hashing algorithm, it is only the compressed representation of a flow. Because the inter-flow variance is very low, the resultant hashes and the subset that are computed do not provide the necessary variability to effectively utilize all the LAG member links. An excessive amount of random nature exists in the hash computation and also in the selector table. As a result, the deviation from being an optimal load-balancing technique for each child link that is selected is higher when the number of flows is lower.

The deviation per child link is defined as

$$V_i = ((C_i - (M/N))/N)$$

where

- V_i denotes the deviation for that child link 'i'.
- i denotes the child link member/index.

- Ci represents the packets transmitted for that child link 'i'.
- M signifies the total packets transmitted on that LAG bundle.
- N denotes the number of child links in that LAG.

Because of these drawbacks, for smaller number of flows, or flows with less inter-flow variance, the link utilization is skewed, and a high probability of a few child links not being utilized entirely exists. Starting with Junos OS Release 13.2R1, the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows.

The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called *stateful load balancing* and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.

This mechanism works efficiently only for minimal number of flows (less than thousands of flows, approximately). For a larger number of flows (between 1000 and 10,000 flows), we recommend that distributed Trio-based load-balancing mechanism is used.

Consider a sample scenario in which 'n' links in the LAG are identified with link IDs of 0 through n-1. A hash table or a flow table is used to record the flows as and when they show up. The hashing key is constructed using the fields that uniquely identify a flow. The result of the lookup identifies the link_id that the flow is currently using. For each packet, the flow table based on the flow identifier is examined. If a match is found, it denotes a packet that belongs to a flow that is previously processed or detected. The link ID is associated with the flow. If a match is not found, it is the first packet that belongs to the flow. The link ID is used to select the link and the flow is inserted into the flow table.

To enable per-flow load balancing based on hash values, include the **per-flow** statement at the at the **[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]** hierarchy level. By default, Junos OS uses a hashing method based only on the destination address to elect a forwarding next hop when multiple equal-cost paths are available. All Packet Forwarding Engine slots are assigned the same hash value by default. To configure the load-balancing algorithm to dynamically rebalance the LAG using existing parameters, include the **rebalance interval** statement at the **[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]** hierarchy level. This parameter periodically load balances traffic by providing a synchronized rebalance switchover across all the ingress Packet Forwarding Engines (PFEs) over a rebalance interval. You can specify the interval as a value in the range of 1 through 1000 flows per minute. To configure the load type, include the **load-type (low | medium | high)** statement at the **[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]** hierarchy level.

The **stateful per-flow** option enables the load-balancing capability on AE bundles. The **rebalance** option clears the load balance state at specified intervals. The **load** option informs the Packet Forwarding Engine regarding the appropriate memory pattern to be used. If the number of flows that flow on this aggregated Ethernet interface is less (between 1 and 100 flows), then the **low** keyword can be used. Similarly for relatively higher flows (between 100 and 1000 flows), the **medium** keyword can be used and the **large** keyword can be used for the maximum flows (between 1000 and 10,000 flows). The approximate number of flows for effective load-balancing for each keyword is a derivative.

The **clear interfaces aeX unit logical-unit-number forwarding-options load-balance state** command clears the load balance state at the hardware level and enables rebalancing from the cleaned up, empty state. This clear state is triggered only when you use this command. The **clear interfaces aggregate forwarding-options load-balance state** command clears all the aggregate Ethernet interface load balancing states and re-creates them newly.

Guidelines for Configuring Stateful Load Balancing for Aggregated Ethernet Interfaces or LAG Bundles

Keep the following points in mind while configuring stateful load-balancing for aggregated Ethernet interfaces:

- When a child link is removed or added, a new aggregate selector is selected and traffic flows onto the new selector. Because the selector is empty, flows are filled in the selector. This behavior causes redistribution of flows because the old state is lost. This is the existing behavior without enabling stateful per-flow load-balancing.
- Stateful per-flow load-balancing functions on AE interfaces if the incoming traffic reaches the MPC1E, MPC2E, MPC3E-3D, MPC5E, and MPC6E line cards. Any other type of line card does not trigger this functionality. Appropriate CLI errors are displayed if the MPCs do not support this capability.

With the ingress line card as MPC and the egress line card as MPC or DPC, this feature works properly. Stateful load-balancing is not supported if the ingress line card is a DPC and the egress line card is a DPC or an MPC.

- This capability is not supported for multicast traffic (native/flood).
- Enabling the rebalance option or clearing the load balance state can cause packet reordering for active flows because different sets of links can be selected for traffic flows.
- Although the feature performance is high, it consumes significant amount of line card memory. Approximately, 4000 logical interfaces or 16 aggregated Ethernet logical interfaces can have this feature enabled on supported MPCs. However, when the Packet Forwarding Engine hardware memory is low, depending upon the available memory, it falls back to the default load balancing mechanism. A system logging message is generated in such a situation and sent to the Routing Engine. A restriction

on the number of AE interfaces that support stateful load-balancing does not exist; the limit is determined by the line cards.

- If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur. When a child link goes down or comes up, the load balancing behavior does not undergo changes on existing flows. This condition is to avoid packet reordering. New flows pick up the child link that come up. If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.

Release History Table

Release	Description
13.2R1	Starting with Junos OS Release 13.2R1, the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es.

Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces

The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called *stateful load balancing* and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.

To configure stateful load balancing on **ae** interface bundles:

1. Specify that you want to configure an aggregated Ethernet interface.

```
[edit]
user@R2# set interfaces aeX unit logical-unit-number
```

2. Specify that you want to configure stateful load-balancing.

```
[edit interfaces aeX unit logical-unit-number]
user@R2# edit forwarding-options load-balance-stateful
```

3. Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (**ae**) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es.

```
[edit interfaces aeX unit logical-unit-number load-balance-stateful]
user@R2# set per-flow
```

4. Configure periodic rebalancing of traffic flows of an aggregated Ethernet bundle by clearing the load balance state at a specified interval.

```
[edit interfaces aeX unit logical-unit-number load-balance-stateful]
user@R2# set rebalance interval
```

5. Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.

```
[edit interfaces aeX unit logical-unit-number load-balance-stateful]
user@R2# set load-type (low | medium | large)
```

6. Configure the address family and IP address for the **ae** interface.

```
[edit interfaces]
user@R2# set ae0 aggregated-ether-options load-balance adaptive tolerance 10
```

7. Configure the link speed for the ae0 aggregated Ethernet bundle.

```
[edit interfaces aeX unit logical-unit-number]
user@R2# set family family-name address address
```

Configuring Adaptive Load Balancing

This topic describes how to configure adaptive load balancing. Adaptive load balancing maintains efficient utilization of member link bandwidth for an aggregated Ethernet (AE) bundle. Adaptive load balancing uses a feedback mechanism to correct traffic load imbalance by adjusting the bandwidth and packet streams on links within an AE bundle.

Before you begin:

- Configure a set of interfaces with a protocol family and IP address. These interfaces can make up the membership for the AE bundle.
- Create an AE bundle by configuring a set of router interfaces as aggregated Ethernet and with a specific AE group identifier.

To configure adaptive load balancing for an AE bundles:

1. Enable adaptive load balancing on the AE bundle:

```
[edit interfaces ae-x aggregated-ether-options load-balance]
user@router# set adaptive
```

NOTE: To configure adaptive load balancing on aggregated Ethernet bundles with mixed link speeds, use the following statement:

```
user@router# set interfaces ae0 aggregated-ether-options link-speed
mixed load-balance adaptive
```

2. Configure the scan interval value for adaptive load balancing on the AE bundle. The scan interval value determines the length of the traffic scan by multiplying the integer value with a 30-second time period:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set scan-interval multiplier
```

3. Configure the tolerance percentage value. The tolerance value determines the allowed deviation in the traffic rates among the members of the AE bundle before the router triggers an adaptive load balancing update:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set tolerance percentage
```

4. (Optional) Enable packet-per-second-based adaptive load balancing on the AE bundle:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set pps
```

Understanding Independent Micro BFD Sessions for LAG

Starting with Junos OS Release 13.3, this feature is supported on the following PIC/FPC types:

- PC-1XGE-XENPAK (Type 3 FPC)
- PD-4XGE-XFP (Type 4 FPC)
- PD-5-10XGE-SFPP (Type 4 FPC)
- 24x10GE (LAN/WAN) SFPP, 12x10GE (LAN/WAN) SFPP, 1x100GE Type 5 PICs
- All MPCs on MX Series with Ethernet MICs
- FPC-PTX-P1-A on PTX5000 with 10-Gigabit Ethernet interfaces
- FPC2-PTX-P1A on PTX5000 with 10-Gigabit Ethernet interfaces in Junos OS Release 14.1 and later
- All FPCs on PTX Series with Ethernet interfaces in Junos OS Release 14.1R3 and later 14.1 releases, and Junos 14.2 and later

TIP: See *PTX Series PIC/FPC Compatibility* for a list of PICs that are supported on each PTX Series FPC.

NOTE: Micro-BFD configuration with interface addresses is not supported on PTX routers on FPC3 and QFX10000 line of switches.

The Bidirectional Forwarding Detection (BFD) protocol is a simple detection protocol that quickly detects failures in the forwarding paths. A link aggregation group (LAG) combines multiple links between devices that are in point-to-point connections, thereby increasing bandwidth, providing reliability, and allowing load balancing. To run a BFD session on LAG interfaces, configure an independent, asynchronous mode BFD session on every LAG member link in a LAG bundle. Instead of a single BFD session monitoring the status of the UDP port, independent micro BFD sessions monitor the status of individual member links.

The individual BFD sessions determine the Layer 2 and Layer 3 connectivity of each member link in the LAG. Once a BFD session is established on a particular link, the member links are attached to the LAG and the load balancer either by a static configuration or by the Link Aggregation Control Protocol (LACP). If the member links are attached to the LAG by a static configuration, the device control process acts as the client to the micro BFD session. When member links are attached to the LAG by the LACP, the LACP acts as the client to the micro BFD session.

When the micro BFD session is up, a LAG link is established and data is transmitted over that LAG link. If the micro BFD session on a member link is down, that particular member link is removed from the load balancer, and the LAG managers stop directing traffic to

that link. These micro BFD sessions are independent of each other despite having a single client that manages the LAG interface.

NOTE:

- Starting with Junos OS Release 13.3, IANA has allocated 01-00-5E-90-00-01 as the dedicated MAC address for micro BFD. Dedicated MAC mode is used by default for micro BFD sessions, in accordance with the latest draft for BFD over LAG.
- In Junos OS, MicroBFD control packets are always untagged by default. For L2 aggregated interfaces, the configuration must include vlan-tagging or flexible-vlan-tagging in the Aggregated Ethernet with BFD. Otherwise, the system will throw error while committing the configuration.

Micro BFD sessions run in the following modes:

- Distribution Mode—Micro BFD sessions are distributed by default at Layer 3.
- Non-Distribution Mode—You can configure the BFD session to run in this mode by including the **no-delegate-processing** statement under periodic packet management (PPM). In this mode, the packets are being sent or received by the Routing Engine at Layer 2.

A pair of routing devices in a LAG exchange BFD packets at a specified, regular interval. The routing device detects a neighbor failure when it stops receiving a reply after a specified interval. This allows the quick verification of member link connectivity with or without LACP. A UDP port distinguishes BFD over LAG packets from BFD over single-hop IP.

NOTE: IANA has allocated 6784 as the UDP destination port for micro BFD.

To enable failure detection for LAG networks for aggregated Ethernet interfaces:

- Include the **bfd-liveness-detection** statement in the configuration.
- Specify a hold-down interval value to set the minimum time that the BFD session must remain up before a state change notification is sent to the other members in the LAG network.
- Specify the minimum interval that indicates the time interval for transmitting and receiving data.
- Starting with Junos OS Release 14.1, specify the neighbor in a BFD session. In releases prior to Junos OS Release 16.1, you must configure the loopback address of the remote destination as the neighbor address. Beginning with Junos OS Release 16.1, you can also configure this feature with aggregated Ethernet interface address of the remote destination as the neighbor address.

CAUTION: Deactivate **bfd-liveness-detection** at the [edit interfaces aex aggregated-ether-options] hierarchy level or deactivate the aggregated Ethernet interface before changing the neighbor address from loopback IP address to aggregated Ethernet interface IP address. Modifying the local and neighbor address without deactivating **bfd-liveness-detection** or the aggregated Ethernet interface first might cause micro BFD sessions failure.

NOTE: Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD local-address against the interface or loopback IP address before the configuration commit. Junos OS performs this check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

NOTE: This feature works only when both the devices support BFD. If BFD is configured at one end of the LAG, this feature does not work.

For the IPv6 address family, disable duplicate address detection before configuring this feature with AE interface addresses. To disable duplicate address detection, include the **dad-disable** statement at the [edit interface aex unit y family inet6] hierarchy level.

Release History Table

Release	Description
16.1	Beginning with Junos OS Release 16.1, you can also configure this feature with aggregated Ethernet interface address of the remote destination as the neighbor address.
16.1	Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD local-address against the interface or loopback IP address before the configuration commit.
14.1	Starting with Junos OS Release 14.1, specify the neighbor in a BFD session. In releases prior to Junos OS Release 16.1, you must configure the loopback address of the remote destination as the neighbor address.
13.3	Starting with Junos OS Release 13.3, IANA has allocated 01-00-5E-90-00-01 as the dedicated MAC address for micro BFD.

Example: Configuring Independent Micro BFD Sessions for LAG

This example shows how to configure an independent micro BFD session for aggregated Ethernet interfaces.

- [Requirements on page 136](#)
- [Overview on page 136](#)
- [Configuration on page 137](#)
- [Verification on page 142](#)

Requirements

This example uses the following hardware and software components:

- MX Series routers with Junos Trio chipset
- T Series routers with Type 4 FPC or Type 5 FPC
 - BFD for LAG is supported on the following PIC types on T-Series:
 - PC-1XGE-XENPAK (Type 3 FPC),
 - PD-4XGE-XFP (Type 4 FPC),
 - PD-5-10XGE-SFP (Type 4 FPC),
 - 24x10GE (LAN/WAN) SFPP, 12x10GE (LAN/WAN) SFPP, 1x100GE Type 5 PICs
- PTX Series routers with 24x10GE (LAN/WAN) SFPP
- Junos OS Release 13.3 or later running on all devices

Overview

The example includes two routers that are directly connected. Configure two aggregated Ethernet interfaces, AE0 for IPv4 connectivity and AE1 for IPv6 connectivity. Configure micro BFD session on the AE0 bundle using IPv4 addresses as local and neighbor endpoints on both routers. Configure micro BFD session on the AE1 bundle using IPv6 addresses as local and neighbor endpoints on both routers. This example verifies that independent micro BFD sessions are active in the output.

Topology

Figure 4 on page 136 shows the sample topology.

Figure 4: Configuring an Independent Micro BFD Session for LAG

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

Router R0

```

set interfaces ge-1/0/1 unit 0 family inet address 20.20.20.1/30
set interfaces ge-1/0/1 unit 0 family inet6 address 3ffe::1:1/126
set interfaces xe-4/0/0 gigether-options 802.3ad ae0
set interfaces xe-4/0/1 gigether-options 802.3ad ae0

set interfaces ae1 aggregated-ether-options link-speed 10g
set interfaces ae1 aggregated-ether-options lacp passive
set interfaces ae1 unit 0 family inet6 address 5555::2/126
set routing-options static route 20.20.20.0/30 next-hop 10.0.0.1
set routing-options rib inet6.0 static route 3ffe::1/126 next-hop 5555::1

```

Configuring a Micro BFD Session for Aggregated Ethernet Interfaces

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see “*Using the CLI Editor in Configuration Mode*” in the *CLI User Guide*.

NOTE: Repeat this procedure for Router R1, modifying the appropriate interface names, addresses, and any other parameters for each router.

To configure a micro BFD session for aggregated Ethernet interfaces on Router R0:

1. Configure the physical interfaces.

```

[edit interfaces]
user@R0# set ge-1/0/1 unit 0 family inet address 20.20.20.1/30
user@R0# set ge-1/0/1 unit 0 family inet6 address 3ffe::1/126
user@R0# set xe-4/0/0 gigether-options 802.3ad ae0
user@R0# set xe-4/0/1 gigether-options 802.3ad ae0
user@R0# set xe-4/1/0 gigether-options 802.3ad ae1
user@R0# set xe-4/1/1 gigether-options 802.3ad ae1

```

2. Configure the loopback interface.

```
[edit interfaces]
user@R0# set lo0 unit 0 family inet address 10.255.106.107/32
user@R0# set lo0 unit 0 family inet6 address 201:DB8:251::aa:aa:1/128
```

3. Configure an IP address on the aggregated Ethernet interface ae0 with either IPv4 or IPv6 addresses, as per your network requirements.

```
[edit interfaces]
user@R0# set ae0 unit 0 family inet address 10.0.0.1/30
```

4. Set the routing option, create a static route, and set the next-hop address.

NOTE: You can configure either an IPv4 or IPv6 static route, depending on your network requirements.

```
[edit routing-options]
user@R0# set nonstop-routing
user@R0# set static route 30.30.30.0/30 next-hop 10.0.0.2
user@R0# set rib inet6.0 static route 3ffe::1:2/126 next-hop 5555::2
```

5. Configure the Link Aggregation Control Protocol (LACP).

```
[edit interfaces]
user@R0# set ae0 aggregated-ether-options lacp active
```

6. Configure BFD for the aggregated Ethernet interface ae0, and specify the minimum interval, local IP address, and the neighbor IP address.

```
[edit interfaces]
user@R0# set ae0 aggregated-ether-options bfd-liveness-detection
  minimum-interval 100
user@R0# set ae0 aggregated-ether-options bfd-liveness-detection multiplier 3
user@R0# set ae0 aggregated-ether-options bfd-liveness-detection neighbor
  10.255.106.102
user@R0# set ae0 aggregated-ether-options bfd-liveness-detection local-address
  10.255.106.107
user@R0# set ae0 aggregated-ether-options minimum-links 1
user@R0# set ae0 aggregated-ether-options link-speed 10g
```

7. Configure an IP address on the aggregated Ethernet interface ae1.
You can assign either IPv4 or IPv6 addresses as per your network requirements.

```
[edit interfaces]
user@R0# set ae1 unit 0 family inet6 address 5555::1/126
```

8. Configure BFD for the aggregated Ethernet interface ae1.

```
[edit interfaces]
user@R0# set ae1 aggregated-ether-options bfd-liveness-detection
  minimum-interval 100
user@R0# set ae1 aggregated-ether-options bfd-liveness-detection multiplier 3
user@R0# set ae1 aggregated-ether-options bfd-liveness-detection neighbor
  201:DB8:251::bb:bb:1
user@R0# set ae1 aggregated-ether-options bfd-liveness-detection local-address
  201:DB8:251::aa:aa:1
user@R0# set ae1 aggregated-ether-options minimum-links 1
user@R0# set ae1 aggregated-ether-options link-speed 10g
```

NOTE: Beginning with Junos OS Release 16.1, you can also configure this feature with the AE interface address as the local address in a micro BFD session.

Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD local-address against the interface or loopback IP address before the configuration commit. Junos OS performs this check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

9. Configure tracing options for BFD for troubleshooting.

```
[edit protocols]
user@R0# set bfd traceoptions file bfd
user@R0# set bfd traceoptions file size 100m
user@R0# set bfd traceoptions file files 10
user@R0# set bfd traceoptions flag all
```

Results

From configuration mode, enter the **show interfaces**, **show protocols**, and **show routing-options** commands and confirm your configuration. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0> show interfaces
traceoptions {
  flag bfd-events;
}
ge-1/0/1 {
  unit 0 {
    family inet {
      address 20.20.20.1/30;
    }
    family inet6 {
```

```
        address 3ffe::1:1/126;
    }
}
xe-4/0/0 {
    enable;
    gigether-options {
        802.3ad ae0;
    }
}
xe-4/0/1 {
    gigether-options {
        802.3ad ae0;
    }
}
xe-4/1/0 {
    enable;
    gigether-options {
        802.3ad ae1;
    }
}
xe-4/1/1 {
    gigether-options {
        802.3ad ae1;
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.255.106.107/32;
        }
        family inet6 {
            address 201:DB8:251::aa:aa:1/128;
        }
    }
}
ae0 {
    aggregated-ether-options {
        bfd-liveness-detection {
            minimum-interval 100;
            neighbor 10.255.106.102;
            local-address 10.255.106.107;
        }
        minimum-links 1;
        link-speed 10g;
        lacp {
            active;
        }
    }
    unit 0 {
        family inet {
            address 10.0.0.1/30;
        }
    }
}
```

```
ae1 {

    bfd-liveness-detection {
      minimum-interval 100;
      multiplier 3;
      neighbor 201:DB8:251::bb:bb:1;
      local-address 201:DB8:251::aa:aa:1;
    }
    minimum-links 1
    link-speed 10g;
  }
  unit 0 {
    family inet6 {
      address 5555::1/126;
    }
  }
}
```

```
user@R0> show protocols
bfd {
  traceoptions {
    file bfd size 100m files 10;
    flag all;
  }
}
```

```
user@R0> show routing-options
nonstop-routing ;
rib inet6.0 {
  static {
    route 3ffe:1:2/126 {
      next-hop 5555::2;
    }
  }
}
static {
  route 30.30.30.0/30 {
    next-hop 10.0.0.2;
  }
}
```

If you are done configuring the device, commit the configuration.

```
user@R0# commit
```

Verification

Confirm that the configuration is working properly.

- [Verifying That the Independent BFD Sessions Are Up on page 143](#)
- [Viewing Detailed BFD Events on page 145](#)

Verifying That the Independent BFD Sessions Are Up

Purpose Verify that the micro BFD sessions are up, and view details about the BFD sessions.

Action From operational mode, enter the **show bfd session extensive** command.

```
user@R0> show bfd session extensive
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.255.106.102	Up	xe-4/0/0	9.000	3.000	3

```
Client LACPD, TX interval 0.100, RX interval 0.100
Session up time 4d 23:13, previous down time 00:00:06
Local diagnostic None, remote diagnostic None
Remote heard, hears us, version 1
Replicated
Session type: Micro BFD
Min async interval 0.100, min slow interval 1.000
Adaptive async TX interval 0.100, RX interval 0.100
Local min TX interval 0.100, minimum RX interval 0.100, multiplier 3
Remote min TX interval 3.000, min RX interval 3.000, multiplier 3
Local discriminator 21, remote discriminator 75
Echo mode disabled/inactive
Remote is control-plane independent
Session ID: 0x0
```

Replicated
Session type: Micro BFD
Min async interval 0.100, min slow interval 1.000
Adaptive async TX interval 0.100, RX interval 0.100
Local min TX interval 1.000, minimum RX interval 0.100, multiplier 3
Remote min TX interval 3.000, min RX interval 3.000, multiplier 3
Local discriminator 16, remote discriminator 66
Echo mode disabled/inactive, no-absorb, no-refresh
Remote is control-plane independent
Session ID: 0x0

4 sessions, 4 clients
Cumulative transmit rate 2.0 pps, cumulative receive rate 1.7 pps

```

Meaning The Micro BFD field represents the independent micro BFD sessions running on the links in a LAG. The TX interval *item*, RX interval *item* output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under **bfd-liveness-detection** statement.

Viewing Detailed BFD Events

Purpose View the contents of the BFD trace file to assist in troubleshooting, if required.

Action From operational mode, enter the **file show /var/log/bfd** command.

```

user@R0> file show /var/log/bfd

Configuring Multicast Statistics Collection on Aggregated Ethernet Interfaces

T Series and TX Matrix routers support multicast statistics collection on aggregated Ethernet interfaces in both ingress and egress directions. The multicast statistics functionality can be configured on a physical interface thus enabling multicast accounting for all the logical interfaces below the physical interface.

The multicast statistics information is displayed only when the interface is configured with the **multicast-statistics** statement, which is not enabled by default.

Multicast statistics collection requires at least one logical interface is configured with family inet or inet6; otherwise, the commit for **multicast-statistics** will fail.

The multicast in/out statistics can be obtained via interfaces statistics query through CLI and via MIB objects through SNMP query.

To configure multicast statistics:

1. Include the **multicast-statistics** statement at the **[edit interfaces interface-name]** hierarchy level.

An example of a multicast statistics configuration for an aggregated Ethernet interface follows:

```
[edit interfaces]
ae0 {
    multicast-statistics;
}
```

To display multicast statistics, use the **show interfaces *interface-name* statistics detail** command.

- Related Documentation**
- *multicast-statistics*
 - [Configuring Multicast Statistics Collection on Ethernet Interfaces on page 28](#)
 - *Ethernet Interfaces Feature Guide for Routing Devices*

Deleting an Aggregated Ethernet Interface

There are two approaches to deleting an aggregated Ethernet interface:

- You can delete an aggregated Ethernet interface from the interface configuration. The Junos OS removes the configuration statements related to **aex** and sets this interface to down state.
- You can also permanently remove the aggregated Ethernet interface from the device configuration by deleting it from the device-count on the routing device.

To delete an aggregated Ethernet interface:

1. Delete the aggregated Ethernet configuration.

This step changes the interface state to down and removing the configuration statements related to **aex**.

```
[edit]
user@host# delete interfaces aex
```

2. Delete the interface from the device count.

```
[edit]
user@host# delete chassis aggregated-devices ethernet device-count
```

Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the router can more optimally direct their resources.

- [Configuring Periodic Packet Management on MX Series Routers on page 149](#)

Understanding Periodic Packet Management on MX Series Routers

Periodic packet management (PPM) for MX Series routers is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the router can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocols, and also for receiving packets on behalf of these client processes. To enable PPM to send and receive packets on their behalf, the clients establish adjacencies with PPM. When packets are not received from the client, the adjacency is marked as down and the client is informed.

PPM operates in two modes:

- **Centralized**—When PPM is operating in centralized mode, it runs on the Routing Engine only.
- **Distributed**—When PPM is operating in distributed mode, it runs on the Packet Forwarding Engine. Currently, Bidirectional Forwarding Detection (BFD), Link Aggregation Control Protocol (LACP), Link Fault Management (LFM), Connectivity Fault Management (CFM), and Virtual Router Redundancy Protocol (VRRP) operate in distributed mode, by default.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only. You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

Configuring Periodic Packet Management on MX Series Routers

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

This topic describes:

- [Identifying Periodic Packet Management Mode on page 149](#)
- [Enabling Centralized Periodic Packet Management on page 150](#)

Identifying Periodic Packet Management Mode

Before you configure periodic packet management, you must identify the mode of periodic packet management.

To identify the mode of periodic packet management:

1. From operational mode, enter the **show ppm adjacencies detail** command.

```
user@host> show ppm adjacencies detail
Protocol: OSPF2, Hold time: 40000, IFL-index: 359
Distributed: FALSE
OSPF source key: 88.1.1.2, OSPF area ID: 0.0.0.0
```

In the above example, the distributed field is false. So, the periodic packet management mode for the OSPF protocol is centralized or running on the Routing Engine only.

OR

From configuration mode, enter the **run show ppm adjacencies detail** command.

```
user@host# run show ppm adjacencies detail
Protocol: BFD, Hold time: 900, IFL-index: 359
Distributed: TRUE
BFD discriminator: 16, BFD routing table index: 0
```

In the above example, the distributed field is true. So, the periodic packet management mode for the BFD protocol is distributed to PFE.

2. From configuration mode, enter the **run show ppm adjacencies protocol *protocol-name* detail** command.

```
user@host# show ppm adjacencies protocol lacp detail
Protocol: LACP, Hold time: 3000, IFL-index: 361
Distributed: TRUE
Distribution handle: 30, Distribution address: fpc1
Adjacencies: 1, Remote adjacencies: 1
```

In the above example, the distributed field is true. So, the periodic packet management mode for the LACP protocol is distributed to PFE.

NOTE: You can also run the `show ppm adjacencies` command from the PFE shell. When you run the command from the PFE shell, the command displays all the process that are running in distributed mode.

Enabling Centralized Periodic Packet Management

After you identify the periodic packet management mode, you can enable centralized periodic packet management. When you enable centralized periodic packet management, the **ppm** process runs on the routing engine only. When you enable centralized periodic packet management, you have disabled distributed PPM. You can enable centralized periodic packet management for troubleshooting to identify if the protocol is having issues while running on distributed mode. If you do not face the issue while the protocol is running on centralized mode, you can narrow down the issue and identify if the issue is because of PFE failure.

BEST PRACTICE: We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

To enable centralized periodic packet management:

1. From configuration mode, enable centralized periodic packet management by specifying the **no-delegate-processing** statement at the `[edit]` hierarchy level.

```
[edit]
user@host# set routing-options ppm no-delegate-processing
```

2. Commit the configuration by using the **commit** statement.

```
[edit]
user@host# commit
```

3. Clear the current active protocol session on the device by using the **clear protocol-name session** command. For example, to clear the BFD session, use the following command.

```
[edit]
user@host# run clear bfd session
```

4. Verify the periodic packet management mode by using the **run show ppm adjacencies detail** command.

```
user@host# run show ppm adjacencies detail
```

```

Protocol: BFD, Hold time: 900, IFL-index: 359
Distributed: FALSE
BFD discriminator: 17, BFD routing table index: 0

```

In the output, the distributed field is false and so **ppm** is centralized.

ITU-T Y.1731 ETH-LM, ETH-SLM, and ETH-DM on Aggregated Ethernet Interfaces Overview

Starting with Junos OS Release 16.1R1, you can configure ITU-T Y.1731 standard-compliant Ethernet loss measurement (ETH-LM), Ethernet synthetic loss measurement (ETH-SLM), and Ethernet delay measurement (ETH-DM) capabilities on aggregated Ethernet (ae) interfaces. These ITU-T Y.1731 OAM services or performance monitoring techniques can be measured by on-demand mode (triggered through the CLI) or by proactive mode (triggered by the iterator application). These performance monitoring functionalities are supported on the following platforms:

- MX Series routers with 16-port 10-Gigabit Ethernet MPCs and Trio-based FPCs (MPCs), where the same level of support for the Ethernet services OAM mechanisms on non-aggregated Ethernet interfaces is available on AE interfaces
- MX2020 routers
- ETH-DM is supported on MPC3E and MPC4E modules with only software timestamping
- ETH-SLM is supported on MPC3E and MPC4E modules.

Also, connectivity fault management (CFM) sessions established on the AE interfaces can be distributed to the Packet Forwarding Engine, apart from being handled on the Routing engine. This capability to distribute CFM sessions is useful in both scaled topologies and graceful Routing Engine switchover (GRES) for CFM sessions.

Connectivity fault management (CFM) sessions operate in centralized mode over AE interfaces by default. Y.1731 performance monitoring (PM) is supported on centralized CFM sessions over AE interfaces. Also, distribution of CFM session over AE interfaces to line cards is supported from Junos OS Release 13.3. To enable the distribution of CFM sessions and to operate in centralized mode, include the **ppm delegate-processing** statement at the **[edit routing-options ppm]** hierarchy level. The mechanism that enables distribution of CFM sessions over AE interfaces provides the underlying infrastructure to support PM over AE interfaces. In addition, periodic packet management (PPM) handles time-sensitive periodic processing and performs such processes as sending process-specific packets and gathering statistics. With PPM processes running distributed on both the Routing Engine and the Packet Forwarding Engine, you can run performance monitoring processes on the Packet Forwarding Engine.

For Ethernet delay measurement, hardware-assisted timestamping is supported on AE interfaces, similar to the support that exists on non-AE interfaces. Only hardware-based timestamping is supported because it is performed in the received path of the protocol data unit (PDU) packets, whereas software-based timestamping needs to be performed on the transmitted path and is not supported. For software timestamping, ETH-DM PDUs need to be transmitted and received on the same line card (same member of the AE interface). All the received ETH-DM PDUs are always redirected to the anchor Packet Forwarding Engine. In the transmission path, if the interface on the anchor Packet Forwarding Engine goes down, then the OAM pdus are redirected to one of the subordinate or member FPCs. Therefore, the processing of ETH-DM PDUs always occurs at the CPU of the line card or module that hosts the anchor Packet Forwarding Engine. ETH-DM is supported on AE interfaces with CCC, bridge, virtual private LAN service (VPLS), and inet address families. ETH-DM is supported for both active-active and active-standby modes of AE interfaces. For one-way delay measurement (IDM), the system clocks of the initiator MEP that transmits a request frame and the responder MEP that receives a reply frame need to be synchronized.

For Ethernet loss measurement on AE interfaces, with the active-standby mode of the interfaces, transmission and reception of PDUs is always through the Packet Forwarding Engine that hosts the active link. For the active-standby mode of the AE interfaces, you can configure a maximum of only two member links. ETH-LM is supported only when all the active member or child links are on the same Packet Forwarding Engine. For the downstream maintenance endpoints (MEPs), ETH-LM is supported for CCC, VPLS, and bridge address families, and for upward MEPs, ETH-LM is supported only for CCC families. In the transmission path, with active-standby links of AE interfaces, whenever the active child link fails, if the standby link is non-local, the packets are redirected to the new active link. When this redirection occurs, the ETH-LM counters are reset. If the standby link is on same Packet Forwarding Engine as the active link, then the counters are not reset because the counters are read on the local Packet Forwarding Engine memory and to prevent the other end of the session to treat new Packet Forwarding Engine counters as losses owing to reset of the counters. In the received path, with active-standby links of AE interfaces, all the child links are programmed in the input list using next-hops to redirect the packets to the anchor FPC after copying the counters in the Packet Forwarding Engine. For Ethernet synthetic loss measurement (SLM), processing of SLM PDUs for requests and responses similar to other protocols from the line card CPU is implemented. All other computation and data are software-based. ETH-SLM is supported on AE interfaces for CCC, bridge, VPLS, and inet families.

NOTE: Starting with Junos OS Release 16.1, Ethernet loss measurement over an aggregated Ethernet (ae) interface is not supported when the enhanced LAG functionality is enabled on a router. The enhanced LAG capability is enabled by default when you configure enhanced IP services mode by including the `network-services enhanced-ip` statement at the `[edit chassis]` hierarchy level. For Ethernet loss measurement to work properly, you must disable the enhanced LAG functionality by entering the `set chassis aggregated-devices disable-lag-enhanced` statement. Also, CFM is not supported when enhanced LAG is enabled.

Starting with Junos OS Release 16.1, performance monitoring for connectivity fault management (by including the `performance-monitoring` statement and its substatements at the `[edit protocols oam ethernet connectivity-fault-management]` hierarchy level) is not supported when the network-to-network (NNI) or egress interface is an aggregated Ethernet interface with member links on DPCs.

Before you can start an ETH-DM, ETH-LM, or ETH-SLM measurement sessions across an aggregated Ethernet service, you must configure two MX Series routers to support these measurement sessions. On each router, configure two physical or logical AE interfaces connected by a VLAN by including the `interface ae-fpc/pic/port unit logical-unit-number vlan-id vlan-id` statement at the `[edit interfaces]` hierarchy level and on each router, attach the peer MEPs to the interfaces by including the `mep mep-id interface interface-name (protect | working)` statement at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name]` hierarchy level.

Release History Table

Release	Description
16.1R1	Starting with Junos OS Release 16.1R1, you can configure ITU-T Y.1731 standard-compliant Ethernet loss measurement (ETH-LM), Ethernet synthetic loss measurement (ETH-SLM), and Ethernet delay measurement (ETH-DM) capabilities on aggregated Ethernet (ae) interfaces.
16.1	Starting with Junos OS Release 16.1, Ethernet loss measurement over an aggregated Ethernet (ae) interface is not supported when the enhanced LAG functionality is enabled on a router.
16.1	Starting with Junos OS Release 16.1, performance monitoring for connectivity fault management (by including the performance-monitoring statement and its substatements at the <code>[edit protocols oam ethernet connectivity-fault-management]</code> hierarchy level) is not supported when the network-to-network (NNI) or egress interface is an aggregated Ethernet interface with member links on DPCs.

Guidelines for Configuring Performance Monitoring Functionalities on Aggregated Ethernet Interfaces

Keep the following points in mind while you configure ETH-LM, ETH-SLM, and ETH-DM capabilities on aggregated Ethernet (ae-) interfaces:

- The scaling limits and performance considerations for distributed periodic packet management (PPM) sessions. The scaling limits for distributed PPM sessions over aggregated Ethernet (AE) interfaces are identical to the maximum supported numbers for continuity check messages (CCM) over AE interfaces.
- SLA iterators always coexist with CCM sessions. Therefore, while configuring a scaled environment, you must account for CCM sessions should be accounted along with SLA iterators. The following table describes the maximum number of distributed PM sessions you can configure for different CCM intervals per line card and per router (system-wide value).
- A mixed operation of distributed and centralized modes for performance monitoring (PM) sessions is not supported on AE interfaces, if the interfaces that form the aggregated Ethernet bundle are in mixed mode.
- The limitations for performance monitoring (PM) capabilities for non-AE interfaces apply equally well for AE interfaces. For example, flapping of sessions resets the PM statistics.
- The limitations that exist with distributed PPM sessions are valid for performance monitoring capabilities over AE interfaces because measurements are always performed on CCM sessions.
- For ETH-LM over AE interfaces in an active-standby setup, if active and standby line cards are swapped, then the measurements during this window are ignored.
- For ETH-DM over AE interfaces, the additional time that is taken for packet transmission (packets are redirected to anchor in the received [Rx] direction and to the active child FPC in the transmitted [Tx] direction) is computed in the delay measurement.
- For ETH-LM over AE interfaces, in an active-standby setup, whenever the link failover from the active interface to the standby interface happens, the counters are reset.

Targeted Distribution of Static Logical interfaces Across Aggregated Ethernet Member Links

This document provides an overview of targeted distribution of static logical interfaces across aggregated Ethernet member links, and an example for configuring targeted distribution.

- [Targeted Distribution of Static Logical interfaces Across Aggregated Ethernet Member Links Overview on page 155](#)
- [Example: Configuring Targeted Distribution for Accurate Policy Enforcement on Logical Interfaces Across Aggregated Ethernet Member Links on page 156](#)

Targeted Distribution of Static Logical interfaces Across Aggregated Ethernet Member Links Overview

Targeted distribution provides a mechanism to direct traffic through specified links for an aggregated Ethernet bundle, and also assigns roles to member links to handle link failure scenarios.

The targeted distribution of static logical interfaces is also used to accurately enforce egress class-of-service (CoS) profiles. Without this feature, the enforcement of egress class-of-service profiles is distributed among the individual member interface schedulers, shapers, or policers instantiated in each Packet Forwarding Engine that hosts a member link. In the absence of targeted distribution of aggregated Ethernet bundles, traffic destined through a logical interface of a bundle can exit through any of the members based on the hashing algorithm. As a result, it is not possible to determine which link is used to forward traffic. Distributed egress policy enforcement relies on traffic load balancing, which might not be accurate all the time. With targeted distribution, logical interface traffic is directed to a certain member link or a number of member links. Targeted distribution ensures an accurate policy enforcement that is no longer distributed for a given logical interface.

NOTE: Irrespective of the family configured for the logical interface, the targeted distribution feature is applicable to both Layer 3 and Layer 2 interfaces.

You can form distribution lists consisting of member links of the aggregated Ethernet bundle and you can assign roles to these lists, such as primary, backup, and standby. A distribution list specified as primary ensures that traffic is load-balanced among all the links in the primary list. If all links within the primary list are up, traffic is forwarded on those links. If some of the links within a primary list fail, the remaining links carry traffic. If all links within the primary list go down, only then the links in the backup list start carrying traffic. If some of links within the backup list fail, the remaining links in the backup list carry traffic. If all the links within the primary list and the backup list go down, only then the links in the standby list start carrying traffic. When the primary member links come back online, they continue to carry traffic.

You can configure distribution lists for primary links and backup links. The remaining links are added to a defined standby list. You can make changes to the distribution lists and their roles by configuring them again. When targeted distribution lists are deleted, all links carry traffic. When you commit the configuration, the member links are assigned the specified roles irrespective of whether the links are up or down.

NOTE: The feature is supported only on MX Series routers with MPCs, and with the `enhanced-ip` configuration enabled.

The outbound traffic of a Layer 3 host is distributed among all the member links of an aggregated Ethernet bundle. Targeted distribution is implemented only for the transit traffic.

Example: Configuring Targeted Distribution for Accurate Policy Enforcement on Logical Interfaces Across Aggregated Ethernet Member Links

This example shows how to configure targeted distribution lists for aggregated Ethernet member links as primary, or backup. Member links are assigned membership to the distribution lists. Logical interfaces of the aggregated Ethernet are then assigned membership to the primary list and the backup list.

- [Requirements on page 156](#)
- [Overview on page 156](#)
- [Configuration on page 157](#)
- [Verification on page 160](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 16.1 and later releases
- One MX Series 5G Universal Routing Platform

Overview

Targeted distribution provides a mechanism to direct traffic through specified links of an aggregated Ethernet bundle, and also assigns roles to member links to handle link failure scenarios.

You can configure targeted distribution to load-balance the traffic between the aggregated Ethernet bundle member links. You can map a logical interface to a single link only for the outgoing traffic.

This example uses the **apply-groups** configuration for specifying the distribution lists for the logical interfaces of the aggregated Ethernet member links. You can use the `apply-groups` statement to inherit the Junos OS configuration statements from a configuration group. The `apply-groups` configuration statement in the example shows

the odd numbered member links of the aggregated Ethernet bundle being assigned the primary list dl2 and even numbered member links being assigned primary list dl1.

The aggregated Ethernet interface used in this example is ae10 with units 101, 102, 103, and 104. The Gigabit Ethernet interface, ge-0/0/3 is specified as distribution list dl1 and ge-0/0/4 as dl2. The logical interface unit numbers of the aggregated Ethernet bundle ending in an odd number are assigned to the distribution list *dl1* as the primary list, and those ending in an even number are assigned the distribution list *dl2* as the primary list.

To configure targeted distribution you must:

1. Create a global apply group.
2. Assign each member of the aggregated Ethernet interface to a different distribution list.
3. Attach the apply group to the aggregated Ethernet interface.
4. Create the logical interfaces. The apply group automatically assigns the distribution lists to each member of the aggregated Ethernet bundle as required.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
[edit groups GR-AE-ACCESS-DISTRIBUTION]
user@host# set interfaces <ae*> unit <*[1 3 5 7 9]> description "matched-odd"
    targeted-distribution primary-list dl2
user@host# set interfaces <ae*> unit <*[1 3 5 7 9]> description "matched-odd"
    targeted-distribution backup-list dl1
user@host# set interfaces <ae*> unit <*[0 2 4 6 8]> description "matched-even"
    targeted-distribution primary-list dl1
user@host# set interfaces <ae*> unit <*[0 2 4 6 8]> description "matched-even"
    targeted-distribution backup-list dl2
user@host# set interfaces ge-0/0/3 apply-groups-except INTF gigheter-options 802.3ad
    ae10 distribution-list dl1
user@host# set interfaces ge-0/0/4 apply-groups-except INTF gigheter-options 802.3ad
    ae10 distribution-list dl2
user@host# set interfaces <ae*> apply-groups GR-AE-ACCESS-DISTRIBUTION
user@host# set interfaces <ae*> flexible-vlan-tagging encapsulation
    flexible-ethernet-services unit 101 vlan-id 101 family inet address 10.1.0.1/16
user@host# set interfaces <ae*> flexible-vlan-tagging encapsulation
    flexible-ethernet-services unit 102 vlan-id 102 family inet address 10.2.0.1/16
user@host# set interfaces <ae*> flexible-vlan-tagging encapsulation
    flexible-ethernet-services unit 103 vlan-id 103 family inet address 10.3.0.1/16
user@host# set interfaces <ae*> flexible-vlan-tagging encapsulation
    flexible-ethernet-services unit 104 vlan-id 104 family inet address 10.4.0.1/16
```

To configure targeted distribution:

1. Create a global apply group and specify the primary list and the backup list.

```
[edit groups GR-AE-ACCESS-DISTRIBUTION]
user@host# set interfaces <ae*> unit <*[1 3 5 7 9]> description "matched-odd"
               targeted-distribution primary-list dl2
user@host# set interfaces <ae*> unit <*[1 3 5 7 9]> description "matched-odd"
               targeted-distribution backup-list dl1
user@host# set interfaces <ae*> unit <*[0 2 4 6 8]> description "matched-even"
               targeted-distribution primary-list dl1
user@host# set interfaces <ae*> unit <*[0 2 4 6 8]> description "matched-even"
               targeted-distribution backup-list dl2
```

2. Assign each member of the aggregated Ethernet bundle to a different distribution list.

```
[edit]
user@host# set interfaces ge-0/0/3 apply-groups-except INTF gigheter-options
               802.3ad ae10 distribution-list dl1
[edit]
user@host# set interfaces ge-0/0/4 apply-groups-except INTF gigheter-options
               802.3ad ae10 distribution-list dl2
```

3. Attach the defined apply group to the aggregated Ethernet interface.

```
[edit]
user@host# set interfaces ae10 apply-groups GR-AE-ACCESS-DISTRIBUTION
```

4. Create the logical interfaces and configure its provisions.

```
[edit]
user@host# set interfaces ae10 apply-groups GR-AE-ACCESS-DISTRIBUTION
user@host# set interfaces ae10 flexible-vlan-tagging encapsulation
               flexible-ethernet-services set unit 101 vlan-id 101 family inet address 10.1.0.1/16
user@host# set interfaces ae10 flexible-vlan-tagging encapsulation
               flexible-ethernet-services unit 102 vlan-id 102 family inet address 10.2.0.1/16
user@host# set interfaces ae10 flexible-vlan-tagging encapsulation
               flexible-ethernet-services unit 103 vlan-id 103 family inet address 10.3.0.1/16
user@host# set interfaces ae10 flexible-vlan-tagging encapsulation
               flexible-ethernet-services unit 104 vlan-id 104 family inet address 10.4.0.1/16
```

Results From configuration mode, confirm your configuration by using the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show groups GR-AE-ACCESS-DISTRIBUTION
interfaces {
  <ae*> {
    unit "<*[1 3 5 7 9]>" {
      description "matched odd";
      targeted-distribution {

}
}

```

Verification

Verifying Targeted Distribution of Logical Interfaces

Purpose Verify that the logical interfaces are assigned to the distribution lists.

Action To verify that the logical interfaces are assigned to the distribution lists, enter the **show interfaces detail or extensive** command.

The **show interfaces detail or extensive** command output shows the logical interfaces ending in an odd number being assigned to the distribution list, *dl1* (**ge-0/0/3**) and those ending in an even number being assigned distribution list, *dl2* (**ge-0/0/4**) by default. If there is a failure of either of those interfaces, the logical interfaces switch to the interfaces in the backup list or continue to use the active member interface. For example, on the aggregated Ethernet bundle, **ae10.101**, the primary interface shown is **ge-0/0/4** and on the aggregated Ethernet bundle **ae10.102**, the primary interface is **ge-0/0/3** and similarly for the other logical interfaces.

user@host# run show interfaces extensive ae10

```

Configuring Ethernet Automatic Protection Switching for High Availability

- [Ethernet Automatic Protection Switching Overview on page 167](#)

- [Example: Configuring Protection Switching Between Psuedowires on page 171](#)

Ethernet Automatic Protection Switching Overview

Ethernet automatic protection switching (APS) is a linear protection scheme designed to protect VLAN based Ethernet networks.

With Ethernet APS, a protected domain is configured with two paths, a working path and a protection path. Both working and protection paths can be monitored using an Operations Administration Management (OAM) protocol like Connectivity Fault Management (CFM). Normally, traffic is carried on the working path (that is, the working path is the active path), and the protection path is disabled. If the working path fails, its protection status is marked as degraded (DG) and APS switches the traffic to the protection path, then the protection path becomes the active path.

APS uses two modes of operation, linear 1+1 protection switching architecture and linear 1:1 protection switching architecture. The linear 1+1 protection switching architecture operates with either unidirectional or bidirectional switching. The linear 1:1 protection switching architecture operates with bidirectional switching.

In the linear 1+1 protection switching architecture, the normal traffic is copied and fed to both working and protection paths with a permanent bridge at the source of the protected domain. The traffic on the working and protection transport entities is transmitted simultaneously to the sink of the protected domain, where a selection between the working and protection transport entities is made.

In the linear 1:1 protection switching architecture, the normal traffic is transported on either the working path or on the protection path using a selector bridge at the source of the protection domain. The selector at the sink of the protected domain selects the entity that carries the normal traffic.

Unidirectional and Bidirectional Switching

Unidirectional switching utilizes fully independent selectors at each end of the protected domain. Bidirectional switching attempts to configure the two end points with the same bridge and selector settings, even for a unidirectional failure. Unidirectional switching can protect two unidirectional failures in opposite directions on different entities.

Selective and Merging Selectors

In the linear 1:1 protection switching architecture, where traffic is sent only on the active path, there are two different ways in which the egress direction (the direction out of the protected segment) data forwarding can act: selective selectors and merging selectors. A selective selector forwards only traffic that is received from both the paths regardless of which one is currently active. In other words, with a merging selector the selection of the currently active path only affects the ingress direction. Merging selectors minimize the traffic loss during a protection switch, but they do not guarantee the delivery of the data packets in order.

Revertive and Nonrevertive Switching

For revertive switching, traffic is restored to the working path after the conditions causing the switch have cleared.

For nonrevertive switching, traffic is allowed to remain on the protection path even after the conditions causing the switch have cleared.

NOTE: The configuration on both the provider edge (PE) routers have to be either in revertive mode or non-revertive mode.

Protection Switching Between VPWS Pseudowires

Figure 5: Connections Terminating on Single PE

In the scenario diagrammed in Figure 5 on page 168, a Virtual Private Wire Service (VPWS) is provisioned between customer sites A and B using a single pseudowire (layer 2 circuit) in the core network, and two Multiprotocol Label Switching (MPLS) Label Switched Paths (LSPs) are provisioned, one for the working path and the other one for the protection

path. CFM CCM will be used to monitor the status of each LSP. Provider edge routers PE1 and PE2 run G.8031 Ethernet APS to select one of the LSPs as the active path. Once the active path is elected at the source end of the protection group, PE1 forwards traffic from site A to the elected active path. At the sink end of the protection group, PE2 implements a merging selector, meaning it forwards the traffic coming from both the LSPs to the customer site B.

Figure 6: Connections Terminating on a Different PE

In the scenario represented in Figure 6 on page 169, a VPWS is provisioned between customer sites A and B using two pseudowires (layer 2 circuit) in the core network, one for the working path and the other for the protection path. CFM CCM will be used to monitor the status of each pseudowire.

Provider edge router PE1 and MTU run G.8031 Ethernet APS to select one of the pseudowires as the active path. Once the active path is elected at the source end of the protection group, PE1 forwards the traffic from site A to the elected active path. At the sink end of the protection group, MTU implements a merging selector, meaning it forwards the traffic coming from both the pseudowires to customer site B.

CLI Configuration Statements

```
[edit protocols protection-group]
ethernet-aps profile1{
  protocol g8031;
  revert-time seconds;
  hold-time 0-10000ms;
  local-request lockout;
}
```

revert-time- By default, protection logic restores the use of the working path once it recovers. The revert-time statement specifies how much time should elapse before the path for data should be switched from Protection to Working once recovery for Working has occurred. A revert-time of zero indicates no reversion. It will default to 300 sec (5 minutes) if not configured.

hold-time- Once a failure is detected, APS waits until this timer expires before initiating the protection switch. The range of the hold-time timer is 0 to 10,000 milliseconds. It will default to zero if not configured.

local-request- Configuring this value to lockout or force-switch will trigger lockout or force-switch operation on the protection groups using this profile.

 - [Example: Configuring Protection Switching Between Psuedowires on page 171](#)

Mapping of CCM Defects to APS Events

The continuity check message (CCM) engine marks the status of working and protected transport entities as either Down, Degraded, or Up.

Down—The monitored path is declared down if any of the following Multiple End Point (MEP) defects occur:

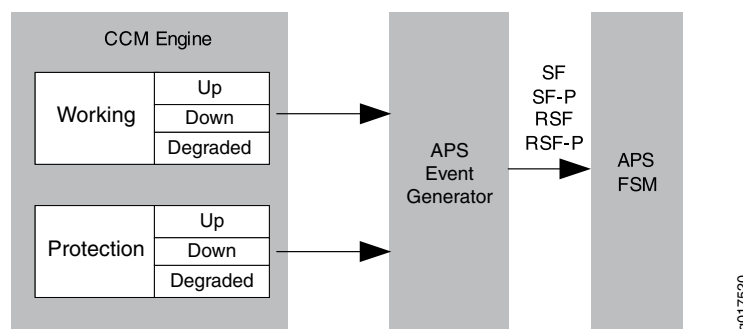

- Interface down
- CCM expiry
- RDI indicating signal failure

Degraded—The monitored path is declared degraded if any of the following MEP defects occur:

- FRR on
- FRR-ACK on

Up—The monitored path is declared up in the absence of any of the above events.

Figure 7: Understanding APS Events

As show in [Figure 7 on page 170](#), the APS event generator generates the following APS events based on the status of the working and protection paths:

- **SF**—Signal failure on working path
- **RSF**—Working path recovers from signal failure
- **SF-P**—Signal failure on protection path
- **RSF-P**—Protection path recovers from signal failure

Example: Configuring Protection Switching Between Psuedowires

- [Requirements on page 171](#)
- [Overview and Topology on page 171](#)
- [Configuration on page 171](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.2 or later
- 2 MX Series PE routers

Overview and Topology

The physical topology of the protection switching between psuedowires example is shown in [Figure 8 on page 171](#).

Figure 8: Topology of a Network Using VPWS Psuedowires

The following definitions describe the meaning of the device abbreviations used in [Figure 8 on page 171](#).

- Customer edge (CE) device—A device at the customer site that provides access to the service provider's VPN over a data link to one or more provider edge (PE) routers.
- Provider edge (PE) device—A device, or set of devices, at the edge of the provider network that presents the provider's view of the customer site.

Configuration

- Step-by-Step Procedure**
- To configure protection switching between psuedowires, perform these tasks:
1. Configure automatic protection switching.

```
protocols {
  protection-group {
    ethernet-aps {
      profile-1 {
        protocol g8031;
        hold-time 1000s;
        revert-time 5m;
      }
    }
  }
}
```

2. Configure the connectivity fault management.

```
ethernet {
  oam {
    connectivity-fault-management {
      maintenance-domain mdl {
        level 5;
      }
    }
  }
}
```

3. Configure the continuity check message for the working path.

```
maintenance-association W {
  protect maintenance-association P {
    aps-profile profile-1;
  }
  continuity-check {
    interval 1s;
  }
  mep 100 {
    interface ge-1/0/0.0 working;
    direction down;
    auto-discovery;
  }
}
```

4. Configure the continuity check message for the protection path.

```
maintenance-association P {
  continuity-check {
    interval 1s;
  }
  mep 100 {
    interface ge-1/0/0.0 protect;
    direction down;
    auto-discovery;
  }
}
```

Results Check the results of the configuration:

```

protocols {
  protection-group {
    ethernet-aps {
      profile-1 {
        protocol g8031;
        hold-time 1000s;
        revert-time 5m;
      }
    }
  }
}
ethernet {
  oam {
    connectivity-fault-management {
      maintenance-domain md1 {
        level 5;
        maintenance-association W {
          protect maintenance-association P {
            aps-profile profile-1;
          }
          continuity-check {
            interval 1s;
          }
          mep 100 {
            interface ge-1/0/0.0 working;
            direction down;
            auto-discovery;
          }
        }
        maintenance-association P {
          continuity-check {
            interval 1s;
          }
          mep 100 {
            interface ge-1/0/0.0 protect;
            direction down;
            auto-discovery;
          }
        }
      }
    }
  }
}

```

Ethernet Ring Protection Switching Overview

Ethernet ring protection switching (ERPS) helps achieve high reliability and network stability. Links in the ring will never form loops that fatally affect the network operation and services availability. The basic idea of an Ethernet ring is to use one specific link to protect the whole ring. This special link is called a *ring protection link (RPL)*. If no failure happens in other links of the ring, the RPL blocks the traffic and is not used. The RPL is controlled by a special node called an *RPL owner*. There is only one RPL owner in a ring. The RPL owner is responsible for blocking traffic over the RPL. Under ring failure conditions, the RPL owner is responsible for unblocking traffic over the RPL. A ring failure results in protection switching of the RPL traffic. An automatic protection switching (APS) protocol is used to coordinate the protection actions over the ring. Protection switching blocks traffic on the failed link and unblocks the traffic on the RPL. When the failure clears, revertive protection switching blocks traffic over the RPL and unblocks traffic on the link on which the failure is cleared.

NOTE: ERPS on AE interfaces is not supported on ACX Series routers except on ACX5000 Series routers.

The following standards provide detailed information on Ethernet ring protection switching:

- ITU-T Recommendation G.8032/Y.1344 version 1 and 2, *Ethernet Ring protection switching*. G.8032v1 supports a single ring topology and G.8032v2 supports multiple rings and ladder topology.

NOTE: EX2300 and EX3400 switches support G.8032v1 only.

- [ITU-T Y.1731, OAM functions and mechanisms for Ethernet-based networks](#)

For additional information on configuring Ethernet ring protection switching on EX Series switches, see *Example: Configuring Ethernet Ring Protection Switching on EX Series Switches*.

For additional information on configuring Ethernet ring protection switching on MX Series routers, see the *Layer 2 Configuration Guide* for a complete example of Ethernet rings and information about STP loop avoidance and prevention.

Acronyms

The following acronyms are used in the discussion about Ethernet ring protection switching (ERPS):

- MA—Maintenance association
- MEP—Maintenance association end point
- OAM—Operations, administration, and management (Ethernet ring protection switching uses connectivity fault management daemon)
- FDB—MAC forwarding database
- STP—Spanning Tree Protocol
- RAPS—Ring automatic protection switching
- WTB—Wait to block. Note that WTB is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting on EX2300 and EX3400 switches has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect on EX2300 and EX3400 switches.
- WTR—Wait to restore. Note that on EX2300 and EX3400 switches only, the WTR configuration must be 5-12 minutes.
- RPL—Ring protection link

Ring Nodes

Multiple nodes are used to form a ring. There are two different node types:

- Normal node—The node has no special role on the ring.
- RPL owner node—The node owns the RPL and blocks or unblocks traffic over the RPL.

Ring Node States

The following are the different states for each node of a specific ring:

- init—Not a participant of a specific ring.
- idle—No failure on the ring; the node is performing normally. For a normal node, traffic is unblocked on both ring ports. For the RPL owner or RPL neighbor, traffic is blocked on the ring port that connects to the RPL and unblocked on the other ring port.
- protection—A failure occurred on the ring. For a normal node, traffic is blocked on the ring port that connects to the failing link and unblocked on working ring ports. For the RPL owner, traffic is unblocked on both ring ports if they connect to non-failure links.
- pending—The node is recovering from failure or its state after a **clear** command is used to remove the previous manual command. When a protection group is configured, the node enters the pending state. When a node is in pending state, the WTR or WTB timer will be running. All nodes are in pending state till WTR or WTB timer expiry.

- **force switch**—A force switch is issued. When a force switch is issued on a node in the ring all nodes in the ring will move into the force switch state.

NOTE: EX2300 and EX3400 switches do not support force switch.

- **manual switch**—A manual switch is issued. When a manual switch is issued on a node in the ring all nodes in the ring will move into the manual switch state.

NOTE: EX2300 and EX3400 switches do not support manual switch.

There can be only one RPL owner for each ring. The user configuration must guarantee this, because the APS protocol cannot check this.

Default Logging of Basic State Transitions on EX Series Switches

Starting with Junos OS Release 14.1X53-D15, EX Series switches automatically log basic state transitions for the ERPS protocol. Starting with Junos OS Release 18.2R1, EX2300 and EX3400 switches automatically log basic state transitions for the ERPS protocol. No configuration is required to initiate this logging. Basic state transitions include ERPS interface transitions from up to down, and down to up; and ERPS state transitions from idle to protection, and protection to idle.

The basic state transitions are logged in a single file named **erp-default**, which resides in the **/var/log** directory of the switch. The maximum size of this file is 15 MB.

Default logging for ERPS can capture initial ERPS interface and state transitions, which can help you troubleshoot issues that occur early in the ERPS protocol startup process. However, if more robust logging is needed, you can enable traceoptions for ERPS by entering the **traceoptions** statement in the **[edit protocols protection-group]** hierarchy.

Be aware that for ERPS, only default logging or traceoptions can be active at a time on the switch. That is, default logging for ERPS is automatically enabled and if you enable traceoptions for ERPS, the switch automatically disables default logging. Conversely, if you disable traceoptions for ERPS, the switch automatically enables default logging.

Logical Ring

You can define multiple logical-ring instances on the same physical ring. The logical ring feature currently supports only the physical ring, which means that two adjacent nodes of a ring must be physically connected and the ring must operate on the physical interface, not the VLAN. Multiple ring instances are usually defined with trunk mode ring interfaces.

FDB Flush

When ring protection switching occurs, normally an *FDB flush* is executed. The Ethernet ring control module uses the same mechanism as the STP to trigger the FDB flush. The Ethernet ring control module controls the ring port physical interface's default STP index to execute the FDB flush.

NOTE: Optimized flushing is not supported on EX2300 and EX3400 switches.

Starting with Junos OS Release 14.2, the FDB flush depends on the RAPS messages received on the both the ports of the ring node.

Traffic Blocking and Forwarding

Ethernet ring control uses the same mechanism as the STP to control forwarding or discarding of user traffic. The Ethernet ring control module sets the ring port physical interface default STP index state to forwarding or discarding in order to control user traffic.

RPL Neighbor Node

Starting with Junos OS Release 14.2, ring protection link neighbor nodes are supported. An RPL neighbor node is adjacent to the RPL and is not the RPL owner. If a node is configured with one interface as the protection-link-end and no protection-link-owner is present in its configuration, the node is an RPL neighbor node.

NOTE: RPL neighbor node is not supported on EX2300 and EX3400 switches.

RAPS Message Blocking and Forwarding

The router or switch treats the ring automatic protection switching (RAPS) message the same as it treats user traffic for forwarding RAPS messages between two ring ports. The ring port physical interface default STP index state also controls forwarding RAPS messages between the two ring ports. Other than forwarding RAPS messages between the two ring ports, as shown in [Figure 9 on page 179](#), the system also needs to forward the RAPS message between the CPU (Ethernet ring control module) and the ring port. This type of forwarding does not depend on the ring port physical interfaces' STP index state. The RAPS message is always sent by the router or switch through the ring ports, as shown in [Figure 10 on page 179](#). A RAPS message received from a discarding ring port is sent to the Ethernet ring control module, but is not sent to the other ring port.

Figure 9: Protocol Packets from the Network to the Router

Figure 10: Protocol Packets from the Router or Switch to the Network

Juniper Networks switches and Juniper Networks routers use different methods to achieve these routes.

The switches use forwarding database entries to direct the RAPS messages. The forwarding database entry (keyed by the RAPS multicast address and VLAN) has a composite next hop associated with it—the composite next hop associates the two ring interfaces with the forwarding database entry and uses the split horizon feature to prevent sending the packet out on the interface that it is received on. This is an example of the forwarding database entry relating to the RAPS multicast MAC (a result of the **show ethernet-switching table detail** command):

```
VLAN: v1, Tag: 101, MAC: 01:19:a7:00:00:01, Interface: ERP
Interfaces:                               ge-0/0/9.0, ge-0/0/3.0
Type: Static
Action: Mirror
Nexthop index: 1333
```

The routers use an implicit filter to achieve ERP routes. Each implicit filter binds to a bridge domain. Therefore, the east ring port control channel and the west ring port control channel of a particular ring instance must be configured to the same bridge domain. For each ring port control channel, a filter term is generated to control RAPS message forwarding. The filter number is the same as the number of bridge domains that contain the ring control channels. If a bridge domain contains control channels from multiple rings, the filter related to this bridge domain will have multiple terms and each term will relate to a control channel. The filter has command parts and control-channel related parts, as follows:

- Common terms:

```
term 1: if [Ethernet type is not OAM Ethernet type (0x8902)]
        { accept packet }
```

- term 2: if [source MAC address belongs to this bridge]
 - { drop packet, our packet loop through the ring and come back to home}

```

*   term 3: if [destination is the RAPS PDU multicast address(0x01,0x19,0xa7,
              0x00,0x00,0x01)] AND[ring port STP status is DISCARDING]
              { send to CPU }

```

- Control channel related terms:

```

    if [destination is the RAPS PDU multicast
address(0x01,0x19,0xa7,0x00,0x00,
    0x01] AND[ring port STP status is FORWARDING] AND [Incoming
interface
    IFL equal to control channel IFL]
    { send packet to CPU and send to the other ring port }
    default term: accept packet.

```

Dedicated Signaling Control Channel

For each ring port, a dedicated signaling control channel with a dedicated VLAN ID must be configured. In Ethernet ring configuration, only this control logical interface is configured and the underlying physical interface is the physical ring port. Each ring requires that two control physical interfaces be configured. These two logical interfaces must be configured in a bridge domain for routers (or the same VLAN for switches) in order to forward RAPS protocol data units (PDUs) between the two ring control physical interfaces. If the router control channel logical interface is not a trunk port, only control logical interfaces will be configured in ring port configuration. If this router control channel logical interface is a trunk port, in addition to the control channel logical interfaces, a dedicated VLAN ID must be configured for routers. For switches, always specify either a VLAN name or VLAN ID for all links.

RAPS Message Termination

The RAPS message starts from the originating node, travels through the entire ring, and terminates in the originating node unless a failure is present in the ring. The originating node must drop the RAPS message if the source MAC address in the RAPS message belongs to itself. The source MAC address is the node's node ID.

Revertive and Non-revertive Modes

In revertive operation, once the condition causing a switch has cleared, traffic is blocked on the RPL and restored to the working transport entity. In nonrevertive operation, traffic is allowed to use the RPL if it has not failed, even after a switch condition has cleared.

NOTE: Non-revertive mode is not supported on EX2300 and EX3400 switches.

Multiple Rings

The Ethernet ring control module supports multiple rings in each node (two logical interfaces are part of each ring). The ring control module also supports the interconnection of multiple rings. Interconnection of two rings means that two rings might share the same link or share the same node. Ring interconnection is supported only using non-virtual-channel mode. Ring interconnection using virtual channel mode is not supported.

NOTE: Interconnection of multiple rings is not supported on EX2300 and EX3400 switches.

Node ID

For each node in the ring, a unique *node ID* identifies each node. The node ID is the node's MAC address.

For routers only, you can configure this node ID when configuring the ring on the node or automatically select an ID like STP does. In most cases, you will not configure this and the router will select a node ID, like STP does. It should be the manufacturing MAC address. The ring node ID should not be changed, even if you change the manufacturing MAC address. Any MAC address can be used if you make sure each node in the ring has a different node ID. The node ID on switches is selected automatically and is not configurable.

Ring ID

The ring ID is used to determine the value of the last octet of the MAC destination address field of the RAPS protocol data units (PDUs) generated by the ERP control process. The ring ID is also used to discard any RAPS PDU, received by this ERP control process with a non-matching ring ID. Ring ID values 1 through 239 are supported.

Bridge Domains with the Ring Port (MX Series Routers Only)

On the routers, the protection group is seen as an abstract logical port that can be configured to any bridge domain. Therefore, if you configure one ring port or its logical interface in a bridge domain, you must configure the other related ring port or its logical interface to the same bridge domain. The bridge domain that includes the ring port acts as any other bridge domain and supports the IRB Layer 3 interface.

Wait-to-Block Timer

The RPL owner node uses a delay timer before initiating an RPL block in revertive mode of operation or before reverting to IDLE state after clearing manual commands. The Wait-to-Block (WTB) timer is used when clearing **force switch** and **manual switch** commands. As multiple **force switch** commands are allowed to coexist in an Ethernet ring, the WTB timer ensures that clearing of a single **force switch** command does not trigger the re-blocking of the RPL. When clearing a **manual switch** command, the WTB timer prevents the formation of a closed loop due to a possible timing anomaly where the RPL Owner Node receives an outdated remote **manual switch** request during the recovery process.

When recovering from a **manual switch** command, the delay timer must be long enough to receive any latent remote **force switch**, signal failure, or **manual switch** commands. This delay timer is called the WTB timer and is defined to be 5 seconds longer than the guard timer. This delay timer is activated on the RPL Owner Node. When the WTB timer expires, the RPL Owner Node initiates the reversion process by transmitting an RAPS (NR, RB) message. The WTB timer is deactivated when any higher-priority request preempts it.

NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.

Adding and Removing a Node

Starting with Junos OS Release 14.2, you can add or remove a node between two nodes in an Ethernet ring. Nodes are added or removed using the **force switch** command.

NOTE: EX2300 and EX3400 switches do not support force switch.

Release History Table

Release	Description
18.2R1	Starting with Junos OS Release 18.2R1, EX2300 and EX3400 switches automatically log basic state transitions for the ERPS protocol.
14.2	Starting with Junos OS Release 14.2, the FDB flush depends on the RAPS messages received on the both the ports of the ring node.
14.2	Starting with Junos OS Release 14.2, ring protection link neighbor nodes are supported.
14.2	Starting with Junos OS Release 14.2, you can add or remove a node between two nodes in an Ethernet ring.
14.1X53-D15	Starting with Junos OS Release 14.1X53-D15, EX Series switches automatically log basic state transitions for the ERPS protocol.

Configuring Ethernet Ring Protection Switching

The inheritance model follows:

```

protection-group {
  ethernet-ring ring-name (
    node-id mac-address;
    ring-protection-link-owner;
    east-interface {
      control-channel channel-name {
        ring-protection-link-end;
      }
    }
    west-interface {
      node-id mac-address;
      control-channel channel-name {

```

```
    ring-protection-link-end;
  }
  data-channel {
    vlan number;
  }
  guard-interval number;
  restore-interval number;
}
```

For each ring, a protection group must be configured. There may be several rings in each node, so there should be multiple protection groups corresponding to the related Ethernet rings.

Three interval parameters (**restore-interval**, **guard-interval**, and **hold-interval**) can be configured at the protection group level. These configurations are global configurations and apply to all Ethernet rings if the Ethernet ring doesn't have a more specific configuration for these values. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

Example: Ethernet Ring Protection Switching Configuration on MX Routers

This example describes how to configure Ethernet ring protection switching on an MX Series router:

- [Requirements on page 184](#)
- [Ethernet Ring Overview and Topology on page 184](#)
- [Configuring a Three-Node Ring on page 185](#)

Requirements

This example uses the following hardware and software components:

- Router node 1 running Junos OS with two Gigabit Ethernet interfaces.
- Router node 2 running Junos OS with two Gigabit Ethernet interfaces.
- Router node 3 running Junos OS with two Gigabit Ethernet interfaces.

Ethernet Ring Overview and Topology

This section describes a configuration example for a three-node ring. The ring topology is shown in [Figure 11 on page 185](#).

Figure 11: Example of a Three-Node Ring Topology

The configuration in this section is only for the RAPS channel. The bridge domain for user traffic is the same as the normal bridge domain. The only exception is if a bridge domain includes a ring port, then it must also include the other ring port of the same ring.

Configuring a Three-Node Ring

To configure Ethernet Ring Protection Switching on a three-node ring, perform these tasks:

- [Configuring Ethernet Ring Protection Switching on a Three-Node Ring on page 185](#)

Configuring Ethernet Ring Protection Switching on a Three-Node Ring

Step-by-Step Procedure

```

1. interfaces {
    ge-1/0/1 {

Configuring MAC Address Validation on Static Ethernet Interfaces

- [MAC Address Validation on Static Ethernet Interfaces Overview on page 193](#)
- [Configuring MAC Address Validation on Static Ethernet Interfaces on page 194](#)

MAC Address Validation on Static Ethernet Interfaces Overview

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

MAC address validation is supported on AE, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces (with or without VLAN tagging) on MX Series routers only.

There are two types of MAC address validation that you can configure:

- **Loose**—Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not support the MAC address of the tuple

Continues to forward packets when the source address of the incoming packet does not match any of the trusted IP addresses.

- **Strict**—Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

Configuring MAC Address Validation on Static Ethernet Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address. MAC address validation is supported on AE, Fast Ethernet, Gigabit Ethernet, and 10–Gigabit Ethernet interfaces (with or without VLAN tagging) on MX Series routers only.

To configure MAC address validation on static Ethernet Interfaces:

1. In the configuration mode, at the **[edit]** hierarchy level, configure the static Ethernet interface.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the protocol family and the logical unit of the interface at the **[edit interfaces *interface-name*]** hierarchy level. While configuring the protocol family, specify **inet** as the protocol family.

```
[edit interfaces interface-name]
user@host# edit unit logical-unit-number family inet
```

3. Configure MAC address validation on the static Ethernet Interface. You can specify the type of MAC address validation you require. Possible values are: Strict and Loose. You can also specify the interface address.

```
[edit interfaces interface-name] unit logical-unit-number family inet
user@host# set mac-validate option address address
```

4. Configure the static ARP entry by specifying the IP address and the MAC address that are to be mapped. The IP address specified must be part of the subnet defined in the enclosing **address** statement. The MAC address must be specified as hexadecimal bytes in the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* format. For instance, you can use either **0011.2233.4455** or **00:11:22:33:44:55**.

```
[edit interfaces interface-name unit logical-unit-number family inet address
interface-address]
user@host# set arp ip-address mac mac-address
```

PPPoE Overview

The Point-to-Point Protocol over Ethernet (PPPoE) connects multiple hosts on an Ethernet LAN to a remote site through a single customer premises equipment (CPE) device. Hosts share a common digital subscriber line (DSL), a cable modem, or a wireless connection to the Internet.

To use PPPoE, you must configure the router as a PPPoE client, encapsulate PPP packets over Ethernet, and initiate a PPPoE session.

M120, M320, and MX Series routers can be configured as a PPPoE access concentrator server. To configure a PPPoE server on an M120, M320, or MX Series Ethernet logical interface, specify PPPoE encapsulation, include the **ppp** statement for the pseudo PPPoE physical interface, and include the **server** statement in the PPPoE options under the logical interface.

NOTE: PPPoE encapsulation is not supported on M120, M320, or MX Series routers on an ATM2 IQ interface.

Multiple hosts can be connected to the Services Router, and their data can be authenticated, encrypted, and compressed before the traffic is sent to the PPPoE session on the Services Router's Fast Ethernet or ATM-over-ADSL interface. PPPoE is easy to configure and enables services to be managed on a per-user basis rather than on a per-site basis.

This overview contains the following topics:

- [PPPoE Interfaces on page 196](#)
- [PPPoE Stages on page 197](#)
- [Optional CHAP Authentication on page 198](#)

PPPoE Interfaces

The PPPoE configuration is the same for both interfaces. The only difference is the encapsulation for the underlying interface to the access concentrator:

- If the interface is Fast Ethernet, use a PPPoE encapsulation.
- If the interface is ATM over ADSL, use a PPPoE over ATM encapsulation.

The PPPoE interface on M120 or M320 routers acting as a access concentrator can be a Gigabit Ethernet or 10-Gigabit Ethernet interface.

Ethernet Interface

The Services Router encapsulates each PPP frame in an Ethernet frame and transports the frames over an Ethernet loop. [Figure 12 on page 197](#) shows a typical PPPoE session between a Services Router and an access concentrator on the Ethernet loop.

Figure 12: PPPoE Session on an Ethernet Loop

PPPoE Stages

PPPoE has two stages, the discovery stage and the PPPoE session stage. In the discovery stage, the client discovers the access concentrator by identifying the Ethernet media access control (MAC) address of the access concentrator and establishing a PPPoE session ID. In the PPPoE session stage, the client and the access concentrator build a point-to-point connection over Ethernet, based on the information collected in the discovery stage.

NOTE: If you configure a specific access concentrator name on the client and the same access concentrator name server is available, then a PPPoE session is established. If there is a mismatch between the access concentrator names of the client and the server, the PPPoE session gets closed.

If you do not configure the access concentrator name, the PPPoE session starts using any available server in the network.

PPPoE Discovery Stage

A Services Router initiates the PPPoE discovery stage by broadcasting a PPPoE active discovery initiation (PADI) packet. To provide a point-to-point connection over Ethernet, each PPPoE session must learn the Ethernet MAC address of the access concentrator and establish a session with a unique session ID. Because the network might have more than one access concentrator, the discovery stage allows the client to communicate with all of them and select one.

NOTE: A Services Router cannot receive PPPoE packets from two different access concentrators on the same physical interface.

The PPPoE discovery stage consists of the following steps:

1. PPPoE active discovery initiation (PADI)—The client initiates a session by broadcasting a PADI packet on the LAN to request a service.
2. PPPoE active discovery offer (PADO)—Any access concentrator that can provide the service requested by the client in the PADI packet replies with a PADO packet that contains its own name, the unicast address of the client, and the service requested. An access concentrator can also use the PADO packet to offer other services to the client.

3. PPPoE active discovery request (PADR)—From the PADOs it receives, the client selects one access concentrator based on its name or the services offered and sends it a PADR packet to indicate the service or services needed.
4. PPPoE active discovery session-Confirmation (PADS)—When the selected access concentrator receives the PADR packet, it accepts or rejects the PPPoE session.
 - To accept the session, the access concentrator sends the client a PADS packet with a unique session ID for a PPPoE session and a service name that identifies the service under which it accepts the session.
 - To reject the session, the access concentrator sends the client a PADS packet with a service name error and resets the session ID to zero.

PPPoE Session Stage

The PPPoE session stage starts after the PPPoE discovery stage is over. The access concentrator can start the PPPoE session after it sends the PADS packet to the client, or the client can start the PPPoE session after it receives a PADS packet from the access concentrator. A Services Router supports multiple PPPoE sessions on each interface, but no more than 256 PPPoE sessions on all interfaces on the Services Router.

Each PPPoE session is uniquely identified by the Ethernet address of the peer and the session ID. After the PPPoE session is established, data is sent as in any other PPP encapsulation. The PPPoE information is encapsulated within an Ethernet frame and is sent to a unicast address. In this stage, both the client and the server must allocate resources for the PPPoE logical interface.

After a session is established, the client or the access concentrator can send a PPPoE active discovery termination (PADT) packet anytime to terminate the session. The PADT packet contains the destination address of the peer and the session ID of the session to be terminated. After this packet is sent, the session is closed to PPPoE traffic.

Optional CHAP Authentication

For interfaces with PPPoE encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP). When you enable CHAP on an interface, the interface can authenticate its peer and be authenticated by its peer.

If you configure an interface to handle incoming CHAP packets only (by including the **passive** statement at the `[edit interfaces interface-name ppp-options chap]` hierarchy level), the interface does not challenge its peer. However, if the interface is challenged, it responds to the challenge. If you do not include the **passive** statement, the interface always challenges its peer.

For more information about CHAP, see *Configuring the PPP Challenge Handshake Authentication Protocol*.

Overview

To configure PPPoE on an M120 or M320 Multiservice Edge Router or MX Series 5G Universal Routing Platform operating as an access concentrator, perform the following tasks:

1. Configure PPPoE encapsulation for an Ethernet interface.
2. Specify the logical Ethernet interface as the underlying interface for the PPPoE session.
3. Optionally, configure the maximum transmission unit (MTU) of the interface.
4. Configure the operational mode as server.
5. Configure the PPPoE interface address.
6. Configure the destination PPPoE interface address.
7. Optionally, configure the MTU size for the protocol family.
8. Starting in Junos OS Release 10.0, optionally, configure one or more PPPoE service name tables and the action taken for each service in the tables.
9. Starting in Junos OS Release 12.3, optionally, disable the sending of PADS messages that contain certain error tags.

NOTE: Starting in Junos OS Release 10.4, when you configure a static PPPoE logical interface, you must include the `pppoe-options` subhierarchy at the `[edit interfaces pp0 unit logical-unit-number]` hierarchy level or at the `[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number]` hierarchy level. If you omit the `pppoe-options` subhierarchy from the configuration, the commit operation fails.

Setting the Appropriate Encapsulation on the PPPoE Interface

For PPPoE on an Ethernet interface, you must configure encapsulation on the logical interface and use PPP over Ethernet encapsulation.

For PPPoE on an ATM-over-ADSL interface, you must configure encapsulation on both the physical and logical interfaces. To configure encapsulation on an ATM-over-ADSL physical interface, use Ethernet over ATM encapsulation. To configure encapsulation on an ATM-over-ADSL logical interface, use PPPoE over AAL5 LLC encapsulation. LLC encapsulation allows a single ATM virtual connection to transport multiple protocols.

NOTE: PPPoE encapsulation is not supported on an M120 or M320 router on an ATM2 IQ interface.

When you configure a point-to-point encapsulation such as PPP on a physical interface, the physical interface can have only one logical interface (only one **unit** statement) associated with it.

To configure physical interface properties, include the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
encapsulation ethernet-over-atm;
```

To configure logical interface encapsulation properties, include the **encapsulation** statement:

```
encapsulation ppp-over-ether;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

Perform the task appropriate for the interface on which you are using PPPoE. For more information on how to configure PPOE encapsulation on an ethernet interface and on an ATM-over-ADSL interface, see “[Configuring PPPoE Encapsulation on an Ethernet Interface](#)” on page 201 and “[Configuring PPPoE Encapsulation on an ATM-over-ADSL Interface](#)” on page 201.

Configuring PPPoE Encapsulation on an Ethernet Interface

Both the client and the server must be configured to support PPPoE. To configure PPPoE encapsulation on an Ethernet interface, include the **encapsulation** statement:

```
encapsulation ppp-over-ether;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *pp0* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *pp0* unit *logical-unit-number*]**

Configuring PPPoE Encapsulation on an ATM-over-ADSL Interface

To configure the PPPoE encapsulation on a ATM-over-ADSL interface, perform the following steps:

1. Include the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level, and specify **ethernet-over-atm**:

```
[edit interfaces pp0]  
encapsulation ethernet-over-atm;
```

2. Configure LLC encapsulation on the logical interface by including the **encapsulation** statement and specifying **ppp-over-ether-over-atm-llc**:

```
encapsulation ppp-over-ether-over-atm-llc;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces pp0 **unit** *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces pp0 **unit** *logical-unit-number*]

Configuring the PPPoE Underlying Interface

To configure the underlying Fast Ethernet, Gigabit Ethernet, 10-Gigabit Ethernet, or ATM interface, include the **underlying-interface** statement:

```
underlying-interface interface-name;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces pp0 **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces pp0 **unit** *logical-unit-number* **pppoe-options**]

Specify the logical Ethernet, Fast Ethernet, Gigabit Ethernet, 10-Gigabit Ethernet, or ATM interface as the underlying interface—for example, **at-0/0/1.0** (ATM VC), **fe-1/0/1.0** (Fast Ethernet interface), or **ge-2/0/0** (Gigabit Ethernet interface).

Identifying the Access Concentrator

When configuring a PPPoE client, identify the access concentrator by a unique name by including the **access-concentrator** statement:

```
access-concentrator name;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces pp0 **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces pp0 **unit** *logical-unit-number* **pppoe-options**]

Configuring the PPPoE Automatic Reconnect Wait Timer

By default, after a PPPoE session is terminated, the session attempts to reconnect immediately. When configuring a PPPoE client, you can specify how many seconds to wait before attempting to reconnect, by including the **auto-reconnect** statement:

```
auto-reconnect seconds;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]

You can configure the reconnection attempt to occur in 0 through 4,294,967,295 seconds after the session terminates.

Configuring the PPPoE Service Name

When configuring a PPPoE client, identify the type of service provided by the access concentrator—such as the name of the Internet service provider (ISP), class, or quality of service—by including the **service-name** statement:

```
service-name name;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]

Configuring the PPPoE Server Mode

When configuring a PPPoE server, identify the mode by including the **server** statement:

```
server;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]

Configuring the PPPoE Client Mode

When configuring a PPPoE client, identify the mode by including the **client** statement:

```
client;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]
- [edit logical-systems *logical-system-name* interfaces **pp0** **unit** *logical-unit-number* **pppoe-options**]

Configuring the PPPoE Source and Destination Addresses

When configuring a PPPoE client or server, assign source and destination addresses—for example, **192.168.1.1/32** and **192.168.1.2**. To assign the source and destination address, include the **address** and **destination** statements:

```
address address {  
    destination address;  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces pp0.0 family inet]
- [edit logical-systems *logical-system-name* interfaces pp0.0 family inet]

Deriving the PPPoE Source Address from a Specified Interface

For a router supporting PPPoE, you can derive the source address from a specified interface—for example, the loopback interface, **lo0.0**—and assign a destination address—for example, **192.168.1.2**. The specified interface must include a logical unit number and have a configured IP address. To derive the source address and assign the destination address, include the **unnumbered-address** and **destination** statements:

```
unnumbered-address interface-name destination address;  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces pp0.0 family inet]
- [edit logical-systems *logical-system-name* interfaces pp0.0 family inet]

Configuring the PPPoE IP Address by Negotiation

You can have the PPPoE client router obtain an IP address by negotiation with the remote end. This method might require the access concentrator to use a RADIUS authentication server. To obtain an IP address from the remote end by negotiation, include the **negotiate-address** statement:

```
negotiate-address;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces pp0.0 family (inet | inet6 | mpls)]
- [edit logical-systems *logical-system-name* interfaces pp0.0 family (inet | inet6 | mpls)]

Configuring the Protocol MTU PPPoE

You can configure the maximum transmission unit (MTU) size for the protocol family. Specify a range from 0 through 5012 bytes. Ensure that the size of the media MTU is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. To set the MTU, include the **mtu** statement:

```
mtu bytes;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces pp0.0 family (inet | inet6 | mpls)]
- [edit logical-systems *logical-system-name* interfaces pp0.0 family (inet | inet6 | mpls)]

You can modify the MTU size of the interface by including the **mtu bytes** statement at the [edit interfaces pp0] hierarchy level:

```
[edit interfaces pp0]
mtu bytes;
```

The default media MTU size used and the range of available sizes on a physical interface depends on the encapsulation used on that interface.

Example: Configuring a PPPoE Server Interface on an M120 or M320 Router

Configure a PPPoE server over a Gigabit Ethernet interface:

```
[edit interfaces]
ge-1/0/0 {
  vlan-tagging;
  unit 1 {
    encapsulation ppp-over-ether;
    vlan-id 10;
  }
}
pp0 {
  unit 0 {
    pppoe-options {
      underlying-interface ge-1/0/0.0;
      server;
    }
    ppp-options {
    }
    family inet {
      address 22.2.2.1/32 {
        destination 22.2.2.2;
      }
    }
  }
}
```

Release History Table

Release	Description
12.3	Starting in Junos OS Release 12.3, optionally, disable the sending of PADS messages that contain certain error tags.
10.4	Starting in Junos OS Release 10.4, when you configure a static PPPoE logical interface, you must include the pppoe-options subhierarchy at the [edit interfaces pp0 unit <i>logical-unit-number</i>] hierarchy level or at the [edit logical-systems <i>logical-system-name</i> interfaces pp0 unit <i>logical-unit-number</i>] hierarchy level.
10.0	Starting in Junos OS Release 10.0, optionally, configure one or more PPPoE service name tables and the action taken for each service in the tables.

Disabling the Sending of PPPoE Keepalive Messages

When configuring the client, you can disable the sending of keepalive messages on a logical interface by including the **no-keepalives** statement:

```
no-keepalives;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces pp0 unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces pp0 unit *logical-unit-number*]**

Verifying a PPPoE Configuration

Purpose You can use show commands to display and verify the PPPoE configuration.

Action To verify a PPPoE configuration, you can issue the following operational mode commands:

- **show interfaces at-*fpc/pic/port* extensive**
- **show interfaces pp0**
- **show pppoe interfaces**

Tracing PPPoE Operations

The Junos OS trace feature tracks PPPoE operations and records events in a log file. The error descriptions captured in the log file provide detailed information to help you solve problems.

By default, nothing is traced. When you enable the tracing operation, the default tracing behavior is as follows:

1. Important events are logged in a file called **pppoed** located in the **/var/log** directory. You cannot change the directory (**/var/log**) in which trace files are located.
2. When the file **pppoed** reaches 128 kilobytes (KB), it is renamed **pppoed.0**, then **pppoed.1**, and finally **pppoed.2**, until there are three trace files. Then the oldest trace file (**pppoed.2**) is overwritten.

You can optionally specify the number of trace files to be from 2 through 1000. You can also configure the maximum file size to be from 10 KB through 1 gigabyte (GB). (For more information about how log files are created, see the [System Log Explorer](#).)

By default, only the user who configures the tracing operation can access log files. You can optionally configure read-only access for all users.

To configure PPPoE tracing operations:

1. Specify that you want to configure tracing options.

```
[edit protocols pppoe]
user@host# edit traceoptions
```

2. (Optional) Configure the name for the file used for the trace output.
3. (Optional) Configure the number and size of the log files.
4. (Optional) Configure access to the log file.

5. (Optional) Configure a regular expression to filter logging events.
6. (Optional) Configure flags to filter the operations to be logged.

Optional PPPoE traceoptions operations are described in the following sections:

- [Configuring the PPPoE Trace Log Filename on page 208](#)
- [Configuring the Number and Size of PPPoE Log Files on page 208](#)
- [Configuring Access to the PPPoE Log File on page 209](#)
- [Configuring a Regular Expression for PPPoE Lines to Be Logged on page 209](#)
- [Configuring the PPPoE Tracing Flags on page 209](#)

Configuring the PPPoE Trace Log Filename

By default, the name of the file that records trace output for PPPoE is **pppoed**. You can specify a different name with the **file** option.

- See Also**
- [Tracing PPPoE Operations on page 207](#)
 - [traceoptions \(PPPoE\) on page 1304](#)

Configuring the Number and Size of PPPoE Log Files

You can optionally specify the number of compressed, archived trace log files to be from 2 through 1000. You can also configure the maximum file size to be from 10 KB through 1 gigabyte (GB); the default size is 128 kilobytes (KB).

The archived files are differentiated by a suffix in the format **.number.gz**. The newest archived file is **.0.gz** and the oldest archived file is **.(maximum number)-1.gz**. When the current trace log file reaches the maximum size, it is compressed and renamed, and any existing archived files are renamed. This process repeats until the maximum number of archived files is reached, at which point the oldest file is overwritten.

For example, you can set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation, **filename**, reaches 2 MB, **filename** is compressed and renamed **filename.0.gz**, and a new file called **filename** is created. When the new **filename** reaches 2 MB, **filename.0.gz** is renamed **filename.1.gz** and **filename** is compressed and renamed **filename.0.gz**. This process repeats until there are 20 trace files. Then the oldest file, **filename.19.gz**, is simply overwritten when the next oldest file, **filename.18.gz** is compressed and renamed to **filename.19.gz**.

Configuring Access to the PPPoE Log File

By default, only the user who configures the tracing operation can access the log files. You can enable all users to read the log file and you can explicitly set the default behavior of the log file.

- See Also**
- [Tracing PPPoE Operations on page 207](#)
 - [traceoptions \(PPPoE\) on page 1304](#)

Configuring a Regular Expression for PPPoE Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged events.

You can refine the output by including regular expressions to be matched.

- See Also**
- [Tracing PPPoE Operations on page 207](#)
 - [traceoptions \(PPPoE\) on page 1304](#)

Configuring the PPPoE Tracing Flags

By default, no events are logged. You can specify which events and operations are logged by specifying one or more tracing flags.

To configure the flags for the events to be logged, configure the flags:

- ```
[edit protocols pppoe traceoptions]
user@host# set flag authentication
```

## Configuring the PPPoE Tracing Flags

By default, no events are logged. You can specify which events and operations are logged by specifying one or more tracing flags.

To configure the flags for the events to be logged, configure the flags:

- `[edit protocols pppoe traceoptions]`  
`user@host# set flag authentication`

Related  
Documentation

- [Tracing PPPoE Operations on page 207](#)

## Configuring the Severity Level to Filter Which PPPoE Messages Are Logged

The messages associated with a logged event are categorized according to severity level. You can use the severity level to determine which messages are logged for the event type. The severity level that you configure depends on the issue that you are trying to resolve. In some cases you might be interested in seeing all messages relevant to the logged event, so you specify **all** or **verbose**. Either choice generates a large amount of output. You can specify a more restrictive severity level, such as **notice** or **info** to filter the messages. By default, the trace operation output includes only messages with a severity level of **error**.

To configure the type of messages to be logged:

- Configure the message severity level.

```
[edit protocols pppoe]
user@host# set level severity
```

## CHAPTER 10

# Configuring Restricted and Unrestricted Proxy ARP

- [Restricted and Unrestricted Proxy ARP Overview on page 213](#)
- [Configuring Restricted and Unrestricted Proxy ARP on page 215](#)

## Restricted and Unrestricted Proxy ARP Overview

---

By default, the Junos OS responds to an Address Resolution Protocol (ARP) request only if the destination address of the ARP request is local to the incoming interface.

For Ethernet Interfaces, you can configure the router or switches to proxy-reply to the ARP requests using the restricted or unrestricted proxy ARP configuration.

You might want to configure restricted or unrestricted proxy ARP for routers that act as provider edge (PE) devices in Ethernet Layer 2 LAN switching domains.

**NOTE:** From Junos OS Release 10.0 onward, Junos OS does not respond to proxy ARP requests with the default route 0.0.0.0. This behavior is in compliance with RFC 1027.

## Restricted Proxy ARP

Restricted proxy ARP enables the router or switch to respond to the ARP requests in which the physical networks of the source and target are not the same and the router or switch has an active route to the target address in the ARP request. The router does not reply if the target address is on the same subnet and the same interface as the ARP requestor.

## Unrestricted Proxy ARP

Unrestricted proxy ARP enables the router or switch to respond to any ARP request, on condition that the router has an active route to the destination address of the ARP request. The route is not limited to the incoming interface of the request, nor is it required to be a direct route.

**WARNING:** If you configure unrestricted proxy ARP, the proxy router replies to ARP requests for the target IP address on the same interface as the incoming ARP request. This behavior is appropriate for cable modem termination system (CMTS) environments, but might cause Layer 2 reachability problems if you enable unrestricted proxy ARP in other environments.

When an IP client broadcasts the ARP request across the Ethernet wire, the end node with the correct IP address responds to the ARP request and provides the correct MAC address. If the unrestricted proxy ARP feature is enabled, the router response is redundant and might fool the IP client into determining that the destination MAC address within its own subnet is the same as the address of the router.

**NOTE:** While the destination address can be remote, the source address of the ARP request must be on the same subnet as the interface upon which the ARP request is received. For security reasons, this rule applies to both unrestricted and restricted proxy ARP.

## Topology Considerations for Unrestricted Proxy ARP

In most situations, you should not configure the router or switch to perform unrestricted proxy ARP. Do so only for special situations, such as when cable modems are used. [Figure 13 on page 214](#) and [Figure 14 on page 215](#) show examples of situations in which you might want to configure unrestricted proxy ARP.

In [Figure 13 on page 214](#), the edge device is not running any IP protocols. In this case, you configure the core router to perform unrestricted proxy ARP. The edge device is the client of the proxy.

In [Figure 14 on page 215](#), the Broadband Remote Access Server (B-RAS) routers are not running any IP protocols. In this case, you configure unrestricted proxy ARP on the B-RAS interfaces. This allows the core device to behave as though it is directly connected to the end users.

**Figure 13: Edge Device Case for Unrestricted Proxy ARP**

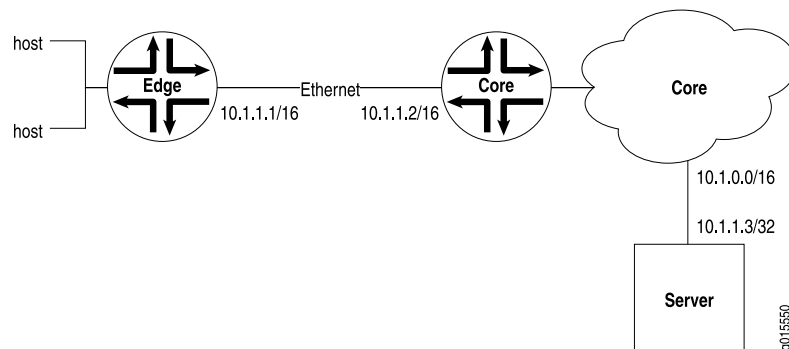

Figure 14: Core Device Case for Unrestricted Proxy ARP

#### Related Documentation

- [Ethernet Interfaces Feature Guide for Routing Devices](#)

## Configuring Restricted and Unrestricted Proxy ARP

To configure restricted or unrestricted proxy ARP, include the **proxy-arp** statement:

```
proxy-arp (restricted |unrestricted);
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* ]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

To return to the default—that is, to disable restricted or unrestricted proxy ARP—delete the **proxy-arp** statement from the configuration:

```
[edit]
user@host# delete interfaces interface-name unit logical-unit-number proxy-arp
```

You can track the number of restricted or unrestricted proxy ARP requests processed by the router or switch by issuing the **show system statistics arp** operational mode command.

.....

**NOTE:** When proxy ARP is enabled as default or unrestricted, the router or switch responds to any ARP request as long as the device has an active route to the target address of the ARP request. This gratuitous ARP behavior can result in an error when the receiving interface and target response interface are the same and the end device (for example, a client) performs a duplicate address check. To prevent this error, configure the router or switch interface with the `no-gratuitous-arp-reply` statement. See [“Configuring Gratuitous ARP” on page 26](#) for information about how to disable responses to gratuitous ARP requests.

.....

## CHAPTER 11

# Configuring Static ARP Table Entries

- [Static ARP Table Entries Overview on page 217](#)
- [Configuring Static ARP Table Entries For Mapping IP Addresses to MAC Addresses on page 218](#)

### Static ARP Table Entries Overview

---

For Fast Ethernet, Gigabit Ethernet, Tri-Rate Ethernet copper, and 10-Gigabit Ethernet interfaces, you can configure static ARP table entries, defining mappings between IP and MAC addresses.

#### **Related Documentation**

- *Ethernet Interfaces Feature Guide for Routing Devices*

## Configuring Static ARP Table Entries For Mapping IP Addresses to MAC Addresses

By default, the device responds to an Address Resolution Protocol (ARP) request only if the destination address of the ARP request is on the local network of the incoming interface. For Fast Ethernet or Gigabit Ethernet interfaces, you can configure static ARP entries that associate the IP addresses of nodes on the same Ethernet subnet with their media access control (MAC) addresses. These static ARP entries enable the device to respond to ARP requests even if the destination address of the ARP request is not local to the incoming Ethernet interface.

Also, unlike dynamically learned ARP entries, static ARP entries do not age out. You can also configure static ARP entries in a troubleshooting situation or if your device is unable to learn a MAC address dynamically.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the `family inet` statement. By including the `arp` statement at the `[edit interfaces interface-name unit logical-unit-number family inet policer]` hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

To configure static ARP entries:

1. In the configuration mode, at the `[edit]` hierarchy level, configure the router interface on which the ARP table entries for the router is configured.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the protocol family, the logical unit of the interface, and the interface address of the router interface at the `[edit interfaces interface-name]` hierarchy level. While configuring the protocol family, specify `inet` as the protocol family.

**NOTE:** When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the `unnumbered-address` statement at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level.

```
[edit interfaces interface-name]
user@host# edit unit logical-unit-number family inet address interface-address
```

3. Configure a static ARP entry by specifying the IP address and the MAC address that are to be mapped to each other. The IP address specified must be part of the subnet defined in the enclosing `address` statement. The MAC address must be specified as

hexadecimal bytes in the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* format. For instance, you can use either **0011.2233.4455** or **00:11:22:33:44:55**.

```
[edit interfaces interface-name unit logical-unit-number family inet address
interface-address
user@host# set arp ip-address mac mac-address
```

4. Configure another static ARP entry by specifying the IP address and the MAC address that are to be mapped to each other. You can also associate a multicast MAC address with a unicast IP address by including the **multicast-mac** option with the **arp** statement. You can optionally configure the router to respond to ARP requests for the specified IP address by using the **publish** option with the **arp** statement.

**NOTE:** For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

```
[edit interfaces interface-name unit logical-unit-number family inet address
interface-address
user@host# set arp ip-address multicast-mac mac-address publish
```

**NOTE:** The Junos OS supports the IPv6 static neighbor discovery cache entries, similar to the static ARP entries in IPv4.

# Configuring TCC and Layer 2.5 Switching

- [TCC and Layer 2.5 Switching Overview on page 221](#)
- [Configuring VLAN TCC Encapsulation on page 222](#)
- [Configuring Translation Cross-Connect Interface Switching on page 224](#)

## TCC and Layer 2.5 Switching Overview

Translational cross-connect (TCC) allows you to forward traffic between a variety of Layer 2 protocols or circuits. It is similar to its predecessor, CCC. However, while CCC requires the same Layer 2 encapsulations on both sides of a router (such as Point-to-Point Protocol [PPP] or Frame Relay-to-Frame Relay), TCC lets you connect different types of Layer 2 protocols interchangeably. With TCC, combinations such as PPP-to-ATM and Ethernet-to-Frame Relay cross-connections are possible. Also, TCC can be used to create Layer 2.5 VPNs and Layer 2.5 circuits.

Consider a sample topology ([Figure 15 on page 221](#)) in which you can configure a full-duplex Layer 2.5 translational cross-connect between Router A and Router C, using a Juniper Networks router, Router B, as the TCC interface. In this topology, Router B strips all PPP encapsulation data from frames arriving from Router A and adds ATM encapsulation data before the frames are sent to Router C. All Layer 2 negotiations are terminated at the interconnecting router (Router B).

*Figure 15: Sample Translation Cross-Connect Topology*

TCC functionality is different from standard Layer 2 switching. TCC only swaps Layer 2 headers. No other processing, such as header checksums, time-to-live (TTL) decrementing, or protocol handling, is performed. Currently, TCC is supported in IPv4, ISO, and MPLS.

Ethernet TCC is supported on interfaces that carry IPv4 traffic only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC and extended VLAN CCC are not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC and extended VLAN TCC are not supported.

- Related Documentation**
- [Configuring VLAN TCC Encapsulation on page 222](#)
  - [Configuring Translation Cross-Connect Interface Switching on page 224](#)
  - *Ethernet Interfaces Feature Guide for Routing Devices*

---

## Configuring VLAN TCC Encapsulation

VLAN TCC encapsulation allows circuits to have different media on either side of the forwarding path. VLAN TCC encapsulation supports TPID 0x8100 only. You must include configuration statements at the logical and physical interface hierarchy levels.

To configure VLAN TCC encapsulation, include the **encapsulation** statement and specify the **vlan-tcc** option:

```
[edit interfaces interface-name unit logical-unit-number]
encapsulation vlan-tcc;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* ]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Additionally, configure the logical interface by including the **proxy** and **remote** statements:

```
proxy {
 inet-address;
}
remote {
 (inet-address | mac-address);
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family tcc]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family tcc]

The proxy address is the IP address of the non-Ethernet TCC neighbor for which the TCC router is acting as a proxy.

The remote address is the IP or MAC address of the remote router. The **remote** statement provides ARP capability from the TCC switching router to the Ethernet neighbor. The MAC address is the physical Layer 2 address of the Ethernet neighbor.

When VLAN TCC encapsulation is configured on the logical interface, you also must specify flexible Ethernet services on the physical interface. To specify flexible Ethernet services, include the **encapsulation** statement at the [edit interfaces *interface-name*] hierarchy level and specify the **flexible-ethernet-services** option:

```
[edit interfaces interface-name]
encapsulation flexible-ethernet-services;
```

Extended VLAN TCC encapsulation supports TPIDs 0x8100 and 0x9901. Extended VLAN TCC is specified at the physical interface level. When configured, all units on that interface must use VLAN TCC encapsulation, and no explicit configuration is needed on logical interfaces.

One-port Gigabit Ethernet, 2-port Gigabit Ethernet, and 4-port Fast Ethernet PICs with VLAN tagging enabled can use VLAN TCC encapsulation. To configure the encapsulation on a physical interface, include the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level and specify the **extended-vlan-tcc** option:

```
[edit interfaces interface-name]
encapsulation extended-vlan-tcc;
```

For VLAN TCC encapsulation, all VLAN IDs from 1 through 1024 are valid. VLAN ID 0 is reserved for tagging the priority of frames.

Extended VLAN TCC is not supported on 4-port Gigabit Ethernet PICs.

#### Related Documentation

- [encapsulation on page 1074](#)
- [remote on page 1250](#)
- [proxy on page 1245](#)
- [TCC and Layer 2.5 Switching Overview on page 221](#)
- [Configuring Translation Cross-Connect Interface Switching on page 224](#)
- *Ethernet Interfaces Feature Guide for Routing Devices*

## Configuring Translation Cross-Connect Interface Switching

To configure a full-duplex Layer 2.5 translation cross-connect between two routers (A and C), you can configure a Juniper Networks router (Router B) as the TCC interface. Ethernet TCC encapsulation provides an Ethernet wide area circuit for interconnecting IP traffic. Consider the topology in [Figure 16 on page 224](#) where the Router A-to-Router B circuit is PPP, and the Router B-to-Router C circuit accepts packets carrying standard TPID values.

**Figure 16: Sample Topology of Layer 2.5 Translational Cross-Connect**

If traffic flows from Router A to Router C, the Junos OS strips all PPP encapsulation data from incoming packets and adds Ethernet encapsulation data before forwarding the packets. If traffic flows from Router C to Router A, the Junos OS strips all Ethernet encapsulation data from incoming packets and adds PPP encapsulation data before forwarding the packets.

To configure the router as the translational cross-connect interface:

1. In the configuration mode, at the **[edit]** hierarchy level, first configure the interface that is connected to Router A.

```
[edit]
user@host# edit interfaces interface-name
```

2. (Optional) Specify the description of the interface. For example, you could specify the interface name on Router A that is connected to this interface.

```
[edit interfaces interface-name]
user@host# set description description
```

3. Specify the encapsulation. If the Router A to Router B circuit is PPP, then specify **ppp-tcc** as the encapsulation. If the Router A to Router B circuit is frame relay, specify **frame-relay-tcc**.

```
[edit interfaces interface-name]
user@host# set encapsulation encapsulation-type
```

4. In the configuration mode, at the **[edit]** hierarchy level, first configure the interface that is connected to Router C.

```
[edit]
user@host# edit interfaces interface-name
```

5. (Optional) Specify the description of this interface. For example, you could specify the interface name on Router C that is connected to this interface.

```
[edit interfaces interface-name]
user@host# set description description
```

6. Specify the encapsulation. If the Router B to Router C circuit is Ethernet, then specify **ethernet-tcc** as the encapsulation. If the Router B to Router C circuit is ATM, specify **atm-tcc-vc-mux**.

```
[edit interfaces interface-name]
user@host# set encapsulation encapsulation-type
```

7. Specify the IP address or MAC address of the remote router to provide address resolution protocol (ARP) for the TCC router's Ethernet-based neighbor using the **remote** statement. You must specify the statement at the **[edit interfaces interface-name unit unit-number family tcc]** hierarchy level. You can specify the MAC address of the remote router instead of the IP address. The MAC address is the physical Layer 2 address of the Ethernet neighbor.

```
[edit interfaces interface-name]
user@host# set unit 0 family family remote inet-address ip-address
```

8. Specify the IP address of the non-Ethernet TCC neighbor for which the TCC router is acting as a proxy using the **proxy** statement. You must specify the statement at the **[edit interfaces interface-name unit unit-number family tcc]** hierarchy level.

```
[edit interfaces interface-name]
user@host# set unit 0 family family proxy inet-address ip-address
```

To verify the TCC connection, use the **show connections** command on TCC router.

# Configuring Link Degradе Monitoring

- [Link Degradе Monitoring Overview on page 227](#)

## Link Degradе Monitoring Overview

---

Link degradе monitoring enables you to monitor the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and take corrective action when the link quality degradеs beyond a certain level. You can configure this feature by applying the **link-degradе-monitor** statement at the **[edit interfaces *interface-name*]** hierarchy level. When configured on your device, this feature continuously monitors bit error rate (BER) value of the link and initiates a corrective action (media-based) when the BER value breaches a user-configured threshold. The feature can detect a BER value as low as  $10^{-13}$  through  $10^{-5}$ , helping you prevent or minimize packet drops in physical links.

You can configure autorecovery or manual recovery method for the degraded link. In the case of manual recovery, you need to use the **request interface link-degradе-recover *interface-name*** statement to recover the degraded link. If autorecovery is configured, automatic recovery of the degraded link is attempted at the user configured intervals, and when the link's BER value is within the configured limit, the link is recovered.

**NOTE:** Layer 2 and Layer 3 protocols already support physical link monitoring. So do Ethernet links through the Link Fault Signaling (LFS) protocol. However, these existing mechanisms cannot detect BER ranges that are very low (for example,  $10^{-13}$  through  $10^{-5}$ ).

## Supported Platforms

[Table 9 on page 228](#) lists the platform series and line cards that support link degradе monitoring.

Table 9: Line Cards that Support Link Degrade Monitoring

| Platform Series | MPC Line Cards Supported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | DPC Line Cards Supported                                                                                                                                                                                                                                                                                                                                                                       |

## Understanding PoE on ACX Series Universal Metro Routers

Power over Ethernet (PoE) is the implementation of the IEEE 802.3af and IEEE 802.3at standards that allows both data and electrical power to pass over a copper Ethernet LAN cable.

Juniper Networks provides PoE on ACX2000 Universal Metro Routers that allows power delivery up to 65 W per PoE port. PoE ports transfer electrical power and data to remote devices over standard twisted-pair cables in an Ethernet network. Using the PoE ports, you can plug in devices that require both network connectivity and electrical power, such as voice over IP (VoIP) and wireless LAN access points.

You can configure the ACX2000 Universal Metro Router to act as a power sourcing equipment (PSE), supplying power to powered devices that are connected on designated ports.

This topic contains the following sections: :

- [ACX2000 PoE Specifications on page 229](#)
- [PoE Classes and Power Ratings on page 230](#)
- [PoE Options on page 231](#)

## ACX2000 PoE Specifications

Table 10 on page 230 lists the PoE specifications for the ACX2000 routers.

*Table 10: PoE Specifications for the ACX2000 Routers*

| Specifications                    | For ACX2000 Universal Metro Routers                                                                                                                                                                                                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Maximum per port power limit      | 65 W                                                                                                                                                                                                                                                                                                               |
| Power management modes            | <ul style="list-style-type: none"> <li>• <b>class</b>—Power allocated for each interface can be configured.</li> <li>• <b>static</b>—Power allocated for interfaces is based on the class of powered device connected.</li> <li>• <b>high-power</b>—Power allocated for interfaces up to 65 W per port.</li> </ul> |

## PoE Classes and Power Ratings

A powered device is classified based on the maximum power that it draws across all input voltages and operational modes. When class-based power management mode is configured on the ACX2000 routers, power is allocated taking into account the maximum power ratings defined for the different classes of devices.

[Table 11 on page 230](#) lists the classes and their power ratings as specified by the IEEE standards.

*Table 11: ACX2000 Universal Metro Router PoE Specifications*

| Class | Usage    | Minimum Power Levels Output from PoE Port                                                       |
|-------|----------|-------------------------------------------------------------------------------------------------|
| 0     | Default  | 15.4 W                                                                                          |
| 1     | Optional | 4.0 W                                                                                           |
| 2     | Optional | 7.0 W                                                                                           |
| 3     | Optional | 15.4 W                                                                                          |
| 4     | Reserved | Class 4 power devices are eligible to receive power up to 30 W according to the IEEE standards. |

## PoE Options

For ACX2000 Universal Metro Routers that support PoE ports, the factory default configuration enables PoE on the PoE-capable ports, with default settings in effect. You might not have to do any additional configuration if the default settings work for you. [Table 12 on page 231](#) shows the PoE configuration options and their default settings for the PoE controller and for the PoE interfaces.

**Table 12: PoE Configuration Options and Default Settings**

| Option                                       | Default                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PoE Controller Options                       |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>guard-band</i></b>                     | 0 W                                   | Reserves up to 19 W power from the PoE power budget to be used in the case of a spike in PoE power consumption.                                                                                                                                                                                                                                                                                                                                              |
| <b><i>management</i></b>                     | static                                | <p>Sets the PoE power management mode for the router. The power management mode determines how power to a PoE interface is allocated:</p> <ul style="list-style-type: none"> <li>• <b>class</b>—Power allocated for each interface can be configured.</li> <li>• <b>static</b>—Power allocated for interfaces is based on the class of powered device connected.</li> <li>• <b>high-power</b>—Power allocated for interfaces up to 65 W per port.</li> </ul> |
| Interface Options                            |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>disable (Power over Ethernet)</i></b>  | Not included in default configuration | When included in the configuration, disables PoE on the interface. The interface maintains network connectivity but no longer supplies power to a connected powered device. Power is not allocated to the interface.                                                                                                                                                                                                                                         |
| <b><i>priority (Power over Ethernet)</i></b> | low                                   | Sets an interface's power priority to either <b>low</b> or <b>high</b> . If power is insufficient for all PoE interfaces, the PoE power to low-priority interfaces is shut down before power to high-priority interfaces is shut down. Among interfaces that have the same assigned priority, the power priority is determined by port number, with lower-numbered ports having higher priority.                                                             |
| <b><i>telemetries</i></b>                    | Not included in default configuration | When included in the configuration, enables the logging of power consumption records on an interface. Logging occurs every 5 minutes for 1 hour unless you specify a different value for <b><i>interval (Power over Ethernet)</i></b> or <b><i>duration</i></b> .                                                                                                                                                                                            |

  - [Example: Disabling a PoE Interface on ACX2000 Routers on page 236](#)

## Example: Configuring PoE on ACX2000 Routers

Power over Ethernet (PoE) ports supply electric power over the same ports that are used to connect network devices. These ports allow you to plug in devices that need both

network connectivity and electric power, such as voice over IP (VoIP) phones, wireless access points, and IP cameras.

This example shows how to configure PoE to deliver power up to 65 W on ACX2000 interfaces:

- [Requirements on page 232](#)
- [Overview on page 232](#)
- [Configuration on page 233](#)
- [Verification on page 235](#)

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 12.2 or later for ACX Series routers
- An ACX2000 router that supports PoE

Before you configure PoE, be sure you have:

- Performed the initial router configuration. See *ACX Series Autoinstallation Overview*, *Verifying Autoinstallation on ACX Series Universal Metro Routers*, and *Boot Sequence on Devices with Routing Engines* for details.

## Overview

This example consists of a router that has eight ports. Only two ports—ge-0/1/3 and ge-0/1/7—support PoE, which means they provide both network connectivity and electric power for powered devices such as VoIP telephones, wireless access points, and IP security cameras that require power up to 65 W. The remaining six ports provide only network connectivity. You use the standard ports to connect devices that have their own power sources, such as desktop and laptop computers, printers, and servers.

[Table 13 on page 232](#) details the topology used in this configuration example.

**Table 13: Components of the PoE Configuration**

| Property                                             | Settings                                                                                                                                                                        |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware                                             | ACX2000 router with 8 Gigabit Ethernet ports: Two PoE interfaces (ge-0/1/3 and ge-0/1/7) and 6 non-PoE interfaces (ge-0/1/0, ge-0/1/1, ge-0/1/2, ge-0/1/4, ge-0/1/5, ge-0/1/6). |
| VLAN name                                            | default                                                                                                                                                                         |
| Connection to a wireless access point (requires PoE) | ge-0/1/7                                                                                                                                                                        |
| Power port priority                                  | high                                                                                                                                                                            |
| Maximum power available to PoE port                  | 65 W                                                                                                                                                                            |

Table 13: Components of the PoE Configuration (continued)

| Property                                                                                                  | Settings                  |
|-----------------------------------------------------------------------------------------------------------|---------------------------|
| PoE management mode                                                                                       | high-power                |
| Direct connections to desktop PCs, file servers, integrated printer/fax/copier machines (no PoE required) | ge-0/1/0 through ge-0/1/2 |
| Unused ports (for future expansion)                                                                       | ge-0/1/4 through ge-0/1/6 |

## Configuration

To configure PoE on an ACX2000 router:

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set poe management high-power guard-band 19
set poe interface ge-0/1/3 priority high maximum-power 65 telemetries
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure PoE:

1. Set the PoE management mode to **high-power**.

```
[edit]
user@host# set poe management high-power
```

### NOTE:

- Set the PoE management mode to **high-power** only when the power requirement is more than 32 W and up to 65 W. If the power requirement is less than or equal to 32 W, then you do not need to set the PoE management mode to **high-power**.
- The default management mode is **static**. In this mode, the power sourcing equipment can deliver power up to 32 W.

2. Reserve power wattage in case of a spike in PoE consumption.

```
[edit]
user@host# set poe guard-band 19
```

3. Enable PoE.

```
[edit]
user@host# edit poe interface ge-0/1/3
```

4. Set the power port priority.

```
[edit poe interface ge-0/1/3]
user@host# set priority high
```

5. Set the maximum PoE power for a port.

```
[edit poe interface ge-0/1/3]
user@host# set maximum-power 65
```

**NOTE:** Set the maximum PoE power for a port only when the power requirement is more than 32 W and up to 65 W. If the power requirement is less than or equal to 32 W, then you do not need to configure the maximum PoE power.

6. Enable the logging of PoE power consumption.

```
[edit poe interface ge-0/1/3]
user@host# set telemetries
```

---

## Results

In configuration mode, confirm your configuration by entering the **show poe interface ge-0/1/3** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show poe interface ge-0/1/3
priority high;
maximum-power 65;
telemetries;
```

If you are done configuring the device, enter **commit** in configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the Status of PoE Interfaces on page 235](#)
- [Verifying the Telemetry Data \(History\) for the Specified Interface on page 235](#)
- [Verifying PoE Global Parameters on page 236](#)

### Verifying the Status of PoE Interfaces

**Purpose** Verify that the PoE interfaces are enabled and set to the desired priority settings.

**Action** In operational mode, enter the **show poe interface ge-0/1/3** command.

```
user@host> show poe interface ge-0/1/3

PoE interface status:
PoE interface : ge-0/1/3
Administrative status : Enabled
Operational status : Powered-up
Power limit on the interface : 65 W
Priority : High
Power consumed : 6.6 W
Class of power device : 0
```

**Meaning** The **show poe interface ge-0/1/3** command lists PoE interfaces configured on the ACX2000 router, with their status, priority, power consumption, and class.

### Verifying the Telemetry Data (History) for the Specified Interface

**Purpose** Verify the PoE interface's power consumption over a specified period.

**Action** In operational mode, enter the **show poe telemetries interface** command.

For all records:

```
user@host> show poe telemetries interface ge-0/1/3 all

Interface S1 No Timestamp Power Voltage
 1 Mon May 14 00:45:05 2012 14.2 W 53.9 V
 2 Mon May 14 00:44:04 2012 14.2 W 53.9 V
 3 Mon May 14 00:43:03 2012 14.2 W 53.9 V
```

For a specific number of records:

```
user@host> show poe telemetries interface ge-0/1/3 2

Interface S1 No Timestamp Power Voltage
 1 Mon May 14 00:45:05 2012 14.2 W 53.9 V
 2 Mon May 14 00:44:04 2012 14.2 W 53.9 V
```

**Meaning** The telemetry status displays the power consumption history for the specified interface, provided telemetry has been configured for that interface.

### Verifying PoE Global Parameters

---

**Purpose** Verify global parameters such as guard band, power limit, and power consumption.

**Action** In operational mode, enter the **show poe controller** command.

```
user@host> show poe controller
```

| Controller index | Maximum power | Power consumption | Guard band | Management | Status | Lldp Priority |
|------------------|---------------|-------------------|------------|------------|--------|---------------|
| 0                | 130.0 W       | 14.2 W            | 0 W        | high-power | UP     |               |

**Meaning** The **show poe controller** command lists the global parameters configured on the router.

## Example: Disabling a PoE Interface on ACX2000 Routers

---

This example shows how to disable PoE on all interfaces or on a specific interface.

- [Requirements on page 236](#)
- [Overview on page 236](#)
- [Configuration on page 237](#)
- [Verification on page 237](#)

### Requirements

Before you begin:

- Configure PoE on all interfaces. See [“Example: Configuring PoE on ACX2000 Routers” on page 231](#).

### Overview

In this example, you disable PoE on all interfaces and on a specific interface, which in this case is ge-0/1/3.

## Configuration

### Step-by-Step Procedure

- Disable PoE on all interfaces.

```
[edit]
user@host# set poe interface all disable
```

- Disable PoE on a specific interface.

```
[edit]
user@host# set poe interface ge-0/1/3 disable
```

## Verification

To verify the configuration is working properly, enter the **show poe interface** command.

```
user@host> show poe interface
```

| Interface | Admin status | Oper status | Max power | Priority | Power consumption | Class |
|-----------|--------------|-------------|-----------|----------|-------------------|-------|
| ge-0/1/3  | Disabled     | Disabled    | 32.0W     | Low      | 0.0W              | 0     |
| ge-0/1/7  | Disabled     | Disabled    | 32.0W     | Low      | 0.0W              | 0     |

```
user@host> show poe interface ge-0/1/3
```

```
PoE interface status:
PoE interface : ge-0/1/3
Administrative status : Disabled
Operational status : Disabled
Power limit on the interface : 32.0 W
Priority : Low
Power consumed : 0.0 W
Class of power device : 0
```

## Troubleshooting PoE Interfaces on ACX2000 Universal Metro Routers

**Problem**    **Description:** A Power over Ethernet (PoE) interface is not supplying power to the powered device.

**Solution**    Check for the items shown in [Table 14 on page 237](#).

*Table 14: Troubleshooting a PoE Interface*

| Items to Check            | Explanation                                                                    |
|---------------------------|--------------------------------------------------------------------------------|
| Is interface PoE enabled? | Only interfaces <b>ge-0/1/3</b> and <b>ge-0/1/7</b> can function as PoE ports. |

*Table 14: Troubleshooting a PoE Interface (continued)*

| Items to Check                                                                                               | Explanation                                                                                     |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Has PoE capability been disabled for that interface?                                                         | Use the <b>show poe interface</b> command to check PoE interface status.                        |
| Is the cable properly seated in the port socket?                                                             | Check the hardware.                                                                             |
| Does the powered device require more power than is available on the interface?                               | Use the <b>show poe interface</b> command to check the maximum power provided by the interface. |
| If the <b>telemetries</b> option has been enabled for the interface, check the history of power consumption. | Use the <b>show poe telemetries</b> command to display the history of power consumption.        |

## 10-port 10-Gigabit Ethernet LAN/WAN PIC Overview

---

This section describes the main features and caveats of the 10-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP) and specifies which routers support this PIC.

The 10-port 10-Gigabit Ethernet LAN/WAN PIC (PD-5-10XGE-SFPP) is supported on Juniper Networks T640 Core Routers, T1600 Core Routers, and T4000 Core Routers. It has the following features:

- Access to all 10-Gigabit Ethernet port counters through SNMP
- Intelligent handling of oversubscribed traffic in applications such as data centers and dense-core uplinks
- Line-rate operation for five 10-Gigabit Ethernet ports from each port group, or a total WAN bandwidth of 100 Gbps with Packet Forwarding Engine bandwidth of 50 Gbps
- Flexible encapsulation, source address and destination address media access control (MAC) filtering, source address MAC learning, MAC accounting, and MAC policing

- Interface encapsulations, such as the following:
  - **ethernet-ccc**—Ethernet cross-connect
  - **vlan-ccc**—802.1Q tagging for a cross-connect
  - **ethernet-tcc**—Ethernet translational cross-connect
  - **vlan-tcc**—Virtual LAN (VLAN) translational cross-connect
  - **extended-vlan-ccc**—Standard Tag Protocol Identifier (TPID) tagging for a cross-connect
  - **ethernet-vpls**—Ethernet virtual private LAN service
  - **vlan-vpls**—VLAN virtual private LAN service
  - **flexible-ethernet-services**—Allows per-unit Ethernet encapsulation configuration
- WAN PHY features, such as the following:
  - WAN PHY mode on a per-port basis
  - Insertion and detection of path trace messages
  - Ethernet WAN Interface Sublayer (WIS) object

**NOTE:** The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFP).

---

- Single, stacked, and flexible VLAN tagging modes
- Native VLAN configuration to allow untagged frames to be received on the tagged interfaces
- Maximum transmission unit (MTU) size of up to 9192 bytes for Ethernet frames
- Link aggregation group (LAG) on single chassis
- Interoperability with other 10-Gigabit Ethernet PICs in M Series and T Series routers in the LAN PHY and WAN PHY modes
- Interrupt-driven link-down detection mechanism
- Two-to-one oversubscription of traffic across a port group

Traffic from 10 ingress ports to the Packet Forwarding Engine traffic is statically mapped to one of the 5 egress ports. 10 Gbps of bandwidth toward the Packet Forwarding Engine is shared by two ingress ports (called a *port group*), thereby achieving two-to-one oversubscription. This scheme provides two-to-one oversubscription across a port group and not across the entire PIC.

- Four queues per physical interface on ingress and eight queues per physical interface on egress
- A separate control queue per physical interface to ensure that the control packets are not dropped during oversubscribed traffic. The control queue can be disabled in the CLI.
- Optical diagnostics
- Behavior aggregate (BA) classification (IPv4 DSCP, IPv6 DSCP, Inet precedence, IEEE 802.1P, IEEE 802.1AD, MPLS EXP) and fixed classification
- Weighted round-robin scheduling with two queue priorities (low and strict-high)
- Committed information rate and peak information rate shaping on a per-queue basis
- Excess information rate configuration for allocation of excess bandwidth
- IEEE 802.3ah Operation, Administration, and Maintenance (OAM)-related operations, such as the following:
  - Link fault management
  - Link discovery
  - Graceful Routing Engine Switchover
- IEEE 802.3ag Operation, Administration, and Maintenance (OAM)-related operations, such as the following:
  - Connectivity fault management (CFM)
  - Linktrace
  - Loopback
  - Graceful Routing Engine switchover (GRES)

The 10-port 10-Gigabit Ethernet LAN/WAN PIC has the following caveats:

- Source address and destination address MAC filtering takes place after oversubscription is handled.
- Oversubscription on the PIC operates across a port group of two ports and not at the PIC level.
- Queuing is not supported at the logical interface level.
- Committed information rate and peak information rate configurations are not supported at the physical interface level.
- There is limited packet buffering of 2 MB.
- Delay-bandwidth buffering configuration is not supported.
- Multifield classifiers are not supported at the PIC level.

The multifield classification can be done at the Packet Forwarding Engine using the firewall filters, which overrides the classification done at the PIC level. The multifield

classification at the Packet Forwarding Engine occurs after the PIC handles the oversubscribed traffic.

- Egress MAC policer statistics not supported.
- Byte counters are not supported at the queue level.
- Only TPID (0x8100) is supported.
- Line-timing mode is not supported.
- MAC-level Rx VLAN tagged frames counter is not supported.
- OAM unified in-service software upgrade (unified ISSU) is not supported.
- OAM remote loopback is not supported.

The 10-port 10-Gigabit Ethernet LAN/WAN PIC (PD-5-10XGE-SFPP) supports link aggregation. For bandwidth aggregation, load sharing, and link protection, LAG can be enabled. Once aggregated Ethernet is enabled, Link Aggregation Control Protocol (LACP) forms an aggregated bundle of member links.

Only features that are supported across all of the linked devices will be supported in the resulting LAG bundle. The following caveats apply to LAG bundles that involve 10-port 10-Gigabit Ethernet LAN/WAN PIC (PD-5-10XGE-SFPP) ports:

- Non-standard TPID for VLAN tagging is not supported, except for 0x8100.
- The number of user created IFLs is limited to 4065/PIC and 1022/port.
- Classifier tables are limited to 8 for each BA classifier type.
- Forwarding classes are limited to 8.
- The **guaranteed-rate** and **shaping-rate** statements are not supported at the IFD level.
- The **per-unit-scheduler** and **hierarchical-scheduler** statements are not supported.
- Only the **strict-high** and **low** levels of scheduling priorities are supported.
- The **excess-priority** configuration is not supported.
- The **buffer-size** configuration under **schedulers** is not supported.
- WRED is not supported.
- srTCM and trTCM are not supported.
- Shared scheduler mode is not supported.

[Table 15 on page 244](#) 10-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PD-5-10XGE-SFPP).

**Table 15: Capabilities of 10-Gigabit Ethernet LAN/WAN PICs**

| Capability             | Support |
|------------------------|---------|
| Maximum VLANs per PIC  | 4065    |
| Maximum VLANs per port | 1022    |

Table 15: Capabilities of 10-Gigabit Ethernet LAN/WAN PICs (continued)

| Capability              | Support                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------|
| MAC learning per port   | 960                                                                                                  |
| MAC accounting per port | 960                                                                                                  |
| MAC filtering per port  | 960 (64 filters per physical or logical interface)<br>960 filters across multiple logical interfaces |
| MAC policers            | 128 ingress Mac policers<br>128 egress Mac policers                                                  |
| Classifiers             | Eight classifiers per PIC for each BA classifier type                                                |

## Release History Table

| Release | Description                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2    | Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).   |
| 12.1R2  | Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). |

## 12-port 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC Overview

The 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC is a 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number, PF-12XGE-SFPP) on T4000 Core Routers.

The following features are supported on the 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC:

- Access to all 10-Gigabit Ethernet port counters through SNMP.
- Logical interface–level MAC filtering, accounting, policing, and learning for source media access control (MAC).
- Flexible encapsulation.
- Single, stacked, and flexible VLAN tagging modes.
- Native VLAN configuration to allow untagged frames to be received on the tagged interfaces.
- Maximum transmission unit (MTU) size of up to 9192 bytes for Ethernet frames.
- Link aggregation group (LAG) on single chassis.
- Interoperability with other 10-Gigabit Ethernet PICs on M Series and T Series routers in LAN PHY mode.
- Eight queues per physical interface on egress.
- Behavior aggregate (BA) classification (IPv4 DSCP, IPv6 DSCP, Inet precedence, IEEE 802.1P, IEEE 802.1AD, MPLS EXP) and fixed classification.
- Defining the VLAN rewrite operation to be applied to the incoming and outgoing frames on logical interfaces on this PIC.

**NOTE:** Only the Tag Protocol Identifier (TPID) 0x8100 is supported.

---

- Interface encapsulations, such as the following:
  - **untagged**—Default encapsulation, when other encapsulation is not configured.
    - You can configure only one logical interface (unit 0) on the port.
    - You cannot include the **vlan-id** statement in the configuration of the logical interface.
  - **vlan-tagging**—Enable VLAN tagging for all logical interfaces on the physical interface.
  - **stacked-vlan-tagging**—Enable stacked VLAN tagging for all logical interfaces on the physical interface.
  - **ethernet-ccc**—Ethernet cross-connect.
  - **ethernet-tcc**—Ethernet translational cross-connect.
  - **vlan-ccc**—802.1Q tagging for a cross-connect.
  - **vlan-tcc**—Virtual LAN (VLAN) translational cross-connect.
  - **extended-vlan-ccc**—Standard Tag Protocol Identifier (TPID) tagging for a cross-connect.
  - **extended-vlan-tcc**—Standard Tag Protocol Identifier (TPID) tagging for an Ethernet translational cross-connect.

- **ethernet-vpls**—Ethernet virtual private LAN service.
- **vlan-vpls**—VLAN virtual private LAN service.
- **flexible-ethernet-services**—Allows per-unit Ethernet encapsulation configuration.
- The following Layer 3 protocols are also supported:
  - IPv4
  - IPv6
  - MPLS
- WAN PHY features, such as the following:
  - WAN PHY mode on a per-port basis.
  - Insertion and detection of path trace messages.
  - Ethernet WAN Interface Sublayer (WIS) object.

**NOTE:** The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on T4000 routers with 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+.

The 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC does not support:

- MAC filtering, accounting, and policing for destination MAC at the logical interface level.

**NOTE:** Because destination MAC filtering is not supported, the hardware is configured to accept all the multicast packets. This enables the OSPF protocol to work.

- Premium MAC policers at the logical interface level.
- MAC filtering, accounting, and policing at the physical interface level.
- Multiple TPIDs

| Capability                          | Support                                                    |
|-------------------------------------|------------------------------------------------------------|
| Maximum logical interfaces per PIC  | 32,000                                                     |
| Maximum logical interfaces per port | For IPv4 the limit is 4093.<br>For IPv6 the limit is 1022. |
| Classifiers                         | Eight classifiers per PIC for each BA classifier type      |

## 24-port 10-Gigabit Ethernet LAN/WAN PIC on Type 5 FPC Overview

This section describes the main features and caveats of the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PF-24XGE-SFPP).

The following major software features are supported on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PF-24XGE-SFPP):

- Twenty-four 10-Gigabit Ethernet interfaces in two-to-one oversubscription of traffic in oversubscribed mode or 12 ports in line-rate mode. For more information about oversubscribed mode and line-rate mode, see the [“Configuring Line-Rate Mode on 10-Gigabit Ethernet LAN/WAN PICs Supporting Oversubscription” on page 250](#).
- Traffic is classified as control traffic or best-effort traffic with non-class-of-service-aware tail drops of best-effort traffic in oversubscribed mode.

The aggregate bandwidth of all the ports together is 120 Gbps. No hard partitioning of bandwidth is done—that is, if one port group is active, it can support 120 Gbps traffic. The bandwidth for best-effort traffic is shared among all the 24 ports.

Note that the preclassification is restricted to two traffic classes, and is not user-configurable.

- All Junos OS configuration commands supported on the existing 10-Gigabit Ethernet LAN/WAN PIC with SFP+.
- The output of the **show interfaces extensive** operational mode command now displays preclassification queue counters.
- Line-rate mode operation of the first 12 ports can be achieved by using the **[set chassis fpc fpc-number pic pic-number linerate-mode]** command. By default, the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ works in oversubscribed mode.
- LAN PHY mode and WAN PHY mode on a per-port basis. WAN PHY mode can be achieved by using the **[set interfaces interface-name framing wan-phy]** command.
- WAN PHY features, such as the following:
  - Insertion and detection of path trace messages.
  - Ethernet WAN Interface Sublayer (WIS) object.
- Aggregated Ethernet is supported only in line-rate mode.
- Link aggregation group (LAG) is supported only in line-rate mode.
- 4000 logical interfaces per physical interface and 32,000 logical interfaces per chassis.
- Access to all 10-Gigabit Ethernet port counters through SNMP.

**NOTE:** Graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) are now supported on T4000 routers.

- Configuring Line-Rate Mode on 10-Gigabit Ethernet LAN/WAN PICs Supporting Oversubscription on page 250

## Modes of Operation of 10-Gigabit Ethernet PICs

10-Gigabit Ethernet PICs operate in the following modes:

- Line-rate mode—By default, the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP) operates in line-rate mode.

In a 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP), 12 ports (ports 0–11) can operate in line-rate mode. To configure the PF-24XGE-SFPP PIC to operate in line-rate mode, include the **linerate-mode** statement at the **[edit chassis set fpc fpc-number pic pic-number]** hierarchy level.

- Oversubscribed mode—In this mode, all ports on the PIC are enabled with two-to-one oversubscription. In a PF-24XGE-SFPP PIC, by default, two-to-one oversubscription of traffic is achieved in oversubscribed mode—Traffic from 24 ingress ports to the Packet Forwarding Engine is statically mapped to one of the 12 egress ports. 10 Gbps of bandwidth traffic moving toward the Packet Forwarding Engine is shared by two ingress ports (called a port group), thereby achieving two-to-one oversubscription. This scheme provides two-to-one oversubscription across a port group and not across the entire PIC.

**NOTE:** PF-12XGE-SFPP PIC always operates at line rate.

- Mixed-rate mode or dual-rate mode—Dual-rate mode or mixed-rate mode for PF-24XGE-SFPP allows you to configure a mix of port speeds of 1 Gbps and 10 Gbps. However, on PF-12XGE-SFPP, note that you can configure port speeds of either 1 Gbps and 10 Gbps when the PIC is in line rate mode. You can enable mixed-rate mode and set port speeds with the **mixed-rate-mode** and **speed 1G |10G** statements respectively at the **[edit chassis fpc x pic y]** hierarchy level. You can disable mixed-rate mode with the **delete chassis fpc x pic y mixed-rate-mode** statement.

**NOTE:** To change the port speed from 10 Gbps to 1 Gbps on the PF-24XGE-SFPP and PF-12XGE-SFPP PICs, SFP optics is required.

## Configuring Line-Rate Mode on 10-Gigabit Ethernet LAN/WAN PICs Supporting Oversubscription

---

For 10-Gigabit Ethernet LAN/WAN PICs supporting oversubscription, oversubscribed Ethernet mode is set by default. To configure these PICs in line-rate mode, include the **linerate-mode** statement at the **[edit chassis set fpc *fpc-number* pic *pic-number*]** hierarchy level:

```
[edit chassis]
set fpc fpc-number pic pic-number linerate-mode;
```

To return to the default oversubscribed Ethernet mode, delete the **linerate-mode** statement at the **[edit chassis fpc *fpc-number* pic *pic-number*]** hierarchy level.

**NOTE:** When the mode of operation of a PIC is changed, the PIC is taken offline and then brought back online immediately.

The following 10-Gigabit Ethernet LAN/WAN PICs support line-rate mode:

- 10-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP)
- 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PF-24XGE-SFPP)

## Configuring Control Queue Disable on a 10-port 10-Gigabit Ethernet LAN/WAN PIC

On a 10-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), a control queue is used to queue all control packets received on an ingress port. This ensures that control protocol packets do not get dropped randomly when there is congestion due to oversubscription. The following control protocols are supported:

- OSPF
- OSPF3
- VRRP
- IGMP
- RSVP
- PIM
- BGP
- BFD
- LDP
- IS-IS
- RIP
- RIPV6
- LACP
- ARP
- IPv6 NDP
- Connectivity fault management (CFM)
- Link fault management (LFM)

These control packets can either terminate locally or transit through the router. The control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. Hence, if transit control traffic is taking too much bandwidth, then it can cause drops on locally terminating control traffic, as shown in [Figure 17 on page 251](#).

**Figure 17: Control Queue Rate Limiter Scenario**

If the end users generate a mass of malicious traffic for which the port number is 179 (BGP), the router dispatches that traffic to the ingress control queue. Further, if congestion

occurs in this ingress control queue due to this malicious traffic, the provider's network control packets may be affected.

In some applications, this can be perceived as a new vulnerability. To address this concern, you can disable the control queue feature. With the control queue feature disabled, you must take precautions to protect control traffic through other means, such as mapping control packets (using BA classification) to a queue that is marked strict-high or is configured with a high CIR.

You can disable the control queue for all ports on the PIC. To disable the control queue, use the **set chassis fpc *n* pic *n* no-pre-classifier** command. By default, the **no-pre-classifier** statement is not configured and the control queue is operational.

Deleting the **no-pre-classifier** statement re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

#### NOTE:

- This functionality is applicable both in OSE and line-rate modes.
- The control queue feature is enabled by default in both OSE and line-rate modes, which can be overridden by the user configuration.
- When the control queue is disabled, various **show queue** commands will show *control queue* in the output. However, all control queue counters are reported as zeros.
- Changing this configuration (enabling or disabling the control queue feature) results in the PIC being taken offline and brought back online.

Once the control queue is disabled, the Layer 2/Layer 3 control packets are subject to queue selection based on BA classification. However, some control protocol packets will not be classified using BA classification, because they might not have a VLAN, MPLS, or IP header. These are:

- Untagged ARP packets
- Untagged Layer 2 control packets such as LACP or Ethernet OAM
- Untagged IS-IS packets

When the control queue feature is disabled, untagged ARP, IS-IS, and other untagged Layer 2 control packets will go to the restricted queue corresponding to the forwarding class associated with queue 0, as shown in the following two examples.

#### Forwarding Untagged Layer2 Control Packets to Queue 3

With this configuration, the forwarding class (FC) associated with queue 0 is "be" (based on the **forwarding-class** statement configuration). "be" maps to restricted-queue number 3 (based on the "restricted-queue" configuration). Hence, with this particular configuration, untagged ARP, IS-IS, and other untagged Layer 2 control packets will go to ingress queue 3 (not to ingress queue 0).

```
[edit chassis]
forwarding-classes {
```

```

queue 0 be;
queue 1 af-low8;
queue 2 af-high;
queue 3 ef;
queue 4 ops_control;
queue 5 net_control;
queue 6 af-low10_12;
}
restricted-queues {
 forwarding-class ef queue-num 0;
 forwarding-class af-low8 queue-num 1;
 forwarding-class af-low10_12 queue-num 1;
 forwarding-class af-high queue-num 2;
 forwarding-class be queue-num 3;
}

```

#### Forwarding Untagged Layer2 Control Packets to Queue 3

With this configuration, the FC associated with queue 0 is "ef" (based on the **forwarding-class** statement configuration). "ef" maps to restricted-queue number 0 (based on the **restricted-queue** statement configuration). Hence, with this particular configuration, untagged ARP, IS-IS, and other untagged Layer 2 control packets would go to ingress queue 0.

For tagged ARP, IS-IS, or Layer2 control packets, users should configure an explicit dot1p/dot1ad classifier to make sure these packets are directed to the correct queue. Without an explicit dot1p/dot1ad classifier, tagged ARP, IS-IS, or Layer 2 control packets will go to the restricted-queue corresponding to the forwarding class associated with queue 0.

```

[edit chassis]
forwarding-classes {
 queue 0 ef; <<< ef and be are interchanged
 queue 1 af-low8;
 queue 2 af-high;
 queue 3 be; <<< ef and be are interchanged
 queue 4 ops_control;
 queue 5 net_control;
 queue 6 af-low10_12;
}
restricted-queues {
 forwarding-class ef queue-num 0;
 forwarding-class af-low8 queue-num 1;
 forwarding-class af-low10_12 queue-num 1;
 forwarding-class af-high queue-num 2;
 forwarding-class be queue-num 3;
}

```

## Example: Handling Oversubscription on a 10-Gigabit Ethernet LAN/WAN PIC

Table 16 on page 254 lists the scenarios of handling oversubscription on the 10-port 10-Gigabit Ethernet LAN/WAN PIC for different combinations of port groups and active ports on the PIC.

**Table 16: Handling Oversubscription on 10-Gigabit Ethernet LAN/WAN PICs**

| Number of Port Groups with Two Active Ports (A) | Number of Port Groups with One Active Port (B) | Total Number of Ports Used on PIC (C = A x 2 + B) | Status of Oversubscription and Throughput                                                                                                                                                                                                                                                 |
|-------------------------------------------------|------------------------------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                               | 1                                              | 1                                                 | Oversubscription is not active. Each port will receive 10 Gbps throughput.                                                                                                                                                                                                                |
| 0                                               | 2                                              | 2                                                 | Oversubscription is not active. Each port will receive 10 Gbps throughput.                                                                                                                                                                                                                |
| 0                                               | 5                                              | 5                                                 | Oversubscription is not active. Each port will receive 10 Gbps throughput.                                                                                                                                                                                                                |
| 1                                               | 0                                              | 2                                                 | Oversubscription is active. Each port will receive 5 Gbps throughput (with default shaper configuration).                                                                                                                                                                                 |
| 1                                               | 4                                              | 6                                                 | Oversubscription is active for the port group that has two active ports. Each port in this port group will receive 5 Gbps throughput (with default shaper configuration).<br><br>For the remaining four ports, oversubscription is not active. Each port will receive 10 Gbps throughput. |
| 3                                               | 0                                              | 6                                                 | Oversubscription is active. Each port will receive 5 Gbps throughput (with default shaper configuration).                                                                                                                                                                                 |
| 5                                               | 0                                              | 10                                                | Oversubscription is active on all 10 ports (5 port groups). Each port will receive 5 Gbps throughput (with default shaper configuration).                                                                                                                                                 |

### Related Documentation

- *Ethernet Interfaces Feature Guide for Routing Devices*

## Configuring Mixed-Rate Mode Operation

To configure mixed-rate mode operation for a PF-24XGE-SFPP PIC:

1. Navigate to the **[edit chassis]** hierarchy level.
2. On a T4000 router, configure the mixed-rate mode by including the **mixed-rate-mode** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number mixed-rate-mode
```

On an LCC in a routing matrix, configure the mixed-rate mode by including the **mixed-rate-mode** statement at the **[edit chassis lcc lcc number fpc slot-number pic pic-number]** hierarchy level.

```
[edit chassis]
user@host# set lcc lcc number fpc fpc-slot pic pic-number mixed-rate-mode
```

3. Specify the port and the port speed that need to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number speed 1G;
user@host# set fpc fpc-slot pic pic-number port port-number speed 10G;
user@host# set lcc lcc number fpc fpc-slot pic pic-number speed 1G;
user@host# set lcc lcc number fpc fpc-slot pic pic-number speed 10G;
```

**NOTE:** On a 12 port 10-Gigabit Ethernet PIC (PF-12XGE-SFPP), you can configure the port speed as 1G by including the **set fpc fpc-slot pic pic-number port port-number speed 1G** statement at the **[edit chassis]** hierarchy level.

**NOTE:** To change the port speed from 10 Gbps to 1 Gbps on PF-24XGE-SFPP and PF-12XGE-SFPP PICs, SFP optics is required.

To disable mixed-rate mode operation, include the **delete chassis fpc x pic y mixed-rate-mode** statement at the **[edit chassis]** hierarchy level.

## P2-10G-40G-QSFPP PIC Overview

---

Starting with Junos OS Release 14.1R2 and 14.2R1, the PTX5000 Packet Transport Router supports the P2-10G-40G-QSFPP PIC on the FPC2-PTX-P1A FPC.

All the ports on the P2-10G-40G-QSFPP PIC are plugged into quad small form-factor pluggable plus transceivers (QSFP+) that, in turn, are connected to fiber-optic cables that support both 10-Gigabit Ethernet standards and 40-Gigabit Ethernet standards, thereby enabling you to configure the PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode.

Starting from Junos OS Release 14.2R3 and 16.1R1, you can configure the ports on the PIC in 10-Gigabit Ethernet mode or 40-Gigabit Ethernet mode at the port group level.

The following sections describe the P2-10G-40G-QSFPP PIC and the various framing modes that are supported on it:

- [Understanding Dual Configuration on P2-10G-40G-QSFPP PIC on page 256](#)
- [Understanding Port Group on page 257](#)
- [Port Numbering on P2-10G-40G-QSFPP PIC When Port Groups Are Not Configured on page 261](#)
- [10-Gigabit Ethernet Mode on page 263](#)
- [40-Gigabit Ethernet Mode on page 264](#)

### Understanding Dual Configuration on P2-10G-40G-QSFPP PIC

All the ports on the P2-10G-40G-QSFPP PIC are QSFP+ based—that is, all the ports are connected to fiber-optic cables by means of QSFP+ transceivers.

The QSFP+ module—which includes the transceiver and the fiber-optic cable—supports the following standards on the P2-10G-40G-QSFPP PIC:

- 10-Gigabit Ethernet in LAN PHY framing mode (also known as native Ethernet mode) and WAN PHY framing mode.

Note that the ports follow a 4-level interface-naming convention—*et-fpc/pic/QSFP+port:channel* in this mode.

- 40-Gigabit Ethernet in LAN PHY framing mode.

Note that the ports follow a 3-level interface-naming convention—*et-fpc/pic/QSFP+port* in this mode.

**NOTE:** The P2-10G-40G-QSFPP PIC provides forty-eight 10-Gigabit Ethernet ports or twelve 40-Gigabit Ethernet ports. or .

---

The PIC can be configured either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode with the **set chassis fpc *fpc-number* pic *pic-number* pic-mode (10G | 40G)**

configuration command. By default, the PIC is configured in 10-Gigabit Ethernet LAN PHY framing mode.

#### NOTE:

If you want configure the PIC in 10-Gigabit Ethernet mode to operate in 40-Gigabit Ethernet mode, you must:

1. Delete all the interfaces in the PIC at the [edit interfaces] hierarchy level.
2. Configure the PIC to operate in 40-Gigabit Ethernet mode by using the `set chassis fpc fpc-slot pic pic-slot pic-mode 40G` configuration command and commit.

The PIC reboots and starts operating in the new mode.

The same procedure is applicable when you can configure the PIC in 40-Gigabit Ethernet PIC to operate in 10-Gigabit Ethernet mode. In this case, you must execute the `set chassis fpc fpc-slot pic pic-slot pic-mode 10G` configuration mode command.

To check the current diagnostics of the PIC, you must run the relevant operational mode CLI commands such as `show chassis hardware`, `show interfaces diagnostics optics interface-name`,

## Understanding Port Group

The FPC2-PTX-P1A FPC on PTX5000 routers can host two PICs and has eight Packet Forwarding Engines. The first four Packet Forwarding Engines on the FPC are associated with PIC 0 and the next four are associated with PIC 1.

All ports associated to one Packet Forwarding Engine compose a port group. Each PIC supports four Packet Forwarding Engines. Therefore, four port groups exist for each P2-10G-40G-QSFPP PIC.

Each Packet Forwarding Engine provides throughput of 120 Gbps.

### Points to Remember

Consider the following points when configuring the PIC at the port group level:

- You can configure the ports in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode at the port group level.
- You can configure the port speed only on the first port in the port group. That is, you must configure the port speed for the port group on the ports numbered 0, 3, 6, and 9—the first ports in the respective port groups. An error message is logged when you try to configure the speed on any other port in the port group and this configuration will not have any effect on the PIC.
- You can configure the port speed of a port group only when the value of the `pic-mode` statement at the [edit chassis fpc fpc-slot pic pic-slot pic-mode] is set to 10G or when the statement is not configured.

- You cannot configure different speeds for the ports in the same port group.
- You can configure different speeds for different port groups.

---

### Port Group in 10-Gigabit Ethernet Mode

Each Packet Forwarding Engine supports twelve 10-Gigabit Ethernet ports in LAN PHY or in WAN PHY framing mode.

Note that when a port group is configured from 10-Gigabit Ethernet mode to 40-Gigabit Ethernet mode, the ports with 4-level interface-naming convention are deleted and three 40-Gigabit Ethernet mode ports with 3-level interface-naming convention are created.

Note that when the configuration of a port group is changed from 10-Gigabit Ethernet mode to 40-Gigabit Ethernet mode, the configuration of the twelve 10-Gigabit Ethernet ports is deleted and the 4-level interface-naming convention of the ports is also lost. Instead, three 40-Gigabit Ethernet ports are configured and these ports adhere to the 3-level interface-naming convention

---

### Port Group in 40-Gigabit Ethernet Mode

Each Packet Forwarding Engine supports three 40-Gigabit Ethernet ports in LAN PHY framing mode.

Note that when the configuration of a port group is changed from 40-Gigabit Ethernet mode to 10-Gigabit Ethernet mode, the configuration of the three 40-Gigabit Ethernet ports is deleted and the 3-level interface-naming convention of the ports is also lost. Instead, twelve 10-Gigabit Ethernet ports are configured and these ports adhere to the 4-level interface-naming convention.

---

### Port Number Mapping When Port Groups Are Configured

[Table 17 on page 259](#) shows the port numbering in 40-Gigabit Ethernet mode and in 10-Gigabit Ethernet mode at the port group level.

Table 17: Port Number Mapping When Port Groups Are Configured

| QSFP+ Port Number | Port Numbering in 40-Gigabit Ethernet Mode | Port Numbering in 10-Gigabit Ethernet Mode |
|-------------------|--------------------------------------------|--------------------------------------------|
| 0 (0)             | et-1/1/0                                   | et-1/1/0:0                                 |
|                   |                                            | et-1/1/0:1                                 |
|                   |                                            | et-1/1/0:2                                 |
|                   |                                            | et-1/1/0:3                                 |
|                   | et-1/1/1                                   | et-1/1/1:0                                 |
|                   |                                            | et-1/1/1:1                                 |
|                   |                                            | et-1/1/1:2                                 |
|                   |                                            | et-1/1/1:3                                 |
|                   | et-1/1/2                                   | et-1/1/2:0                                 |
|                   |                                            | et-1/1/2:1                                 |
|                   |                                            | et-1/1/2:2                                 |
|                   |                                            | et-1/1/2:3                                 |
| 3(1)              | et-1/1/3                                   | et-1/1/3:0                                 |
|                   |                                            | et-1/1/3:1                                 |
|                   |                                            | et-1/1/3:2                                 |
|                   |                                            | et-1/1/3:3                                 |
|                   | et-1/1/4                                   | et-1/1/4:0                                 |
|                   |                                            | et-1/1/4:1                                 |
|                   |                                            | et-1/1/4:2                                 |
|                   |                                            | et-1/1/4:3                                 |
|                   | et-1/1/5                                   | et-1/1/5:0                                 |
|                   |                                            | et-1/1/5:1                                 |
|                   |                                            | et-1/1/5:2                                 |
|                   |                                            | et-1/1/5:3                                 |

Table 17: Port Number Mapping When Port Groups Are Configured (continued)

| QSFP+ Port Number | Port Numbering in 40-Gigabit Ethernet Mode | Port Numbering in 10-Gigabit Ethernet Mode |
|-------------------|--------------------------------------------|--------------------------------------------|
| 6(2)              | et-1/1/6                                   | et-1/1/6:0                                 |
|                   |                                            | et-1/1/6:1                                 |
|                   |                                            | et-1/1/6:2                                 |
|                   |                                            | et-1/1/6:3                                 |
|                   | et-1/1/7                                   | et-1/1/7:0                                 |
|                   |                                            | et-1/1/7:1                                 |
|                   |                                            | et-1/1/7:2                                 |
|                   |                                            | et-1/1/7:3                                 |
|                   | et-1/1/8                                   | et-1/1/8:0                                 |
|                   |                                            | et-1/1/8:1                                 |
|                   |                                            | et-1/1/8:2                                 |
|                   |                                            | et-1/1/8:3                                 |
| 6(2)              | et-1/1/6                                   | et-1/1/6:0                                 |
|                   |                                            | et-1/1/6:1                                 |
|                   |                                            | et-1/1/6:2                                 |
|                   |                                            | et-1/1/6:3                                 |
|                   | et-1/1/7                                   | et-1/1/7:0                                 |
|                   |                                            | et-1/1/7:1                                 |
|                   |                                            | et-1/1/7:2                                 |
|                   |                                            | et-1/1/7:3                                 |
|                   | et-1/1/8                                   | et-1/1/8:0                                 |
|                   |                                            | et-1/1/8:1                                 |
|                   |                                            | et-1/1/8:2                                 |
|                   |                                            | et-1/1/8:3                                 |

Table 17: Port Number Mapping When Port Groups Are Configured (continued)

| QSFP+ Port Number | Port Numbering in 40-Gigabit Ethernet Mode | Port Numbering in 10-Gigabit Ethernet Mode |
|-------------------|--------------------------------------------|--------------------------------------------|
| 9(3)              | et-1/1/9                                   | et-1/1/9:0                                 |
|                   |                                            | et-1/1/9:1                                 |
|                   |                                            | et-1/1/9:2                                 |
|                   |                                            | et-1/1/9:3                                 |
|                   | et-1/1/10                                  | et-1/1/10:0                                |
|                   |                                            | et-1/1/10:1                                |
|                   |                                            | et-1/1/10:2                                |
|                   |                                            | et-1/1/10:3                                |
|                   | et-1/1/11                                  | et-1/1/11:0                                |
|                   |                                            | et-1/1/11:1                                |
|                   |                                            | et-1/1/11:2                                |
|                   |                                            | et-1/1/11:3                                |

### Port Numbering on P2-10G-40G-QSFPP PIC When Port Groups Are Not Configured

Table 18 on page 261 shows the port numbering in 40-Gigabit Ethernet mode and in 10-Gigabit Ethernet mode when port groups are *not* configured on the P2-10G-40G-QSFPP PIC.

Table 18: Port Number Mapping When Port Groups Are Not Configured

| QSFP+ Port Number | Port Numbering in 40-Gigabit Ethernet Mode | Port Numbering in 10-Gigabit Ethernet Mode |
|-------------------|--------------------------------------------|--------------------------------------------|
| 0                 | et-1/1/0                                   | et-1/1/0:0                                 |
|                   |                                            | et-1/1/0:1                                 |
|                   |                                            | et-1/1/0:2                                 |
|                   |                                            | et-1/1/0:3                                 |
| 1                 | et-1/1/1                                   | et-1/1/1:0                                 |
|                   |                                            | et-1/1/1:1                                 |
|                   |                                            | et-1/1/1:2                                 |
|                   |                                            | et-1/1/1:3                                 |

Table 18: Port Number Mapping When Port Groups Are Not Configured (continued)

| QSFP+ Port Number | Port Numbering in 40-Gigabit Ethernet Mode | Port Numbering in 10-Gigabit Ethernet Mode |
|-------------------|--------------------------------------------|--------------------------------------------|
| 2                 | et-1/1/2                                   | et-1/1/2:0                                 |
|                   |                                            | et-1/1/2:1                                 |
|                   |                                            | et-1/1/2:2                                 |
|                   |                                            | et-1/1/2:3                                 |
| 3                 | et-1/1/3                                   | et-1/1/3:0                                 |
|                   |                                            | et-1/1/3:1                                 |
|                   |                                            | et-1/1/3:2                                 |
|                   |                                            | et-1/1/3:3                                 |
| 4                 | et-1/1/4                                   | et-1/1/4:0                                 |
|                   |                                            | et-1/1/4:1                                 |
|                   |                                            | et-1/1/4:2                                 |
|                   |                                            | et-1/1/4:3                                 |
| 5                 | et-1/1/5                                   | et-1/1/5:0                                 |
|                   |                                            | et-1/1/5:1                                 |
|                   |                                            | et-1/1/5:2                                 |
|                   |                                            | et-1/1/5:3                                 |
| 6                 | et-1/1/6                                   | et-1/1/6:0                                 |
|                   |                                            | et-1/1/6:1                                 |
|                   |                                            | et-1/1/6:2                                 |
|                   |                                            | et-1/1/6:3                                 |
| 7                 | et-1/1/7                                   | et-1/1/7:0                                 |
|                   |                                            | et-1/1/7:1                                 |
|                   |                                            | et-1/1/7:2                                 |
|                   |                                            | et-1/1/7:3                                 |
| 8                 | et-1/1/8                                   | et-1/1/8:0                                 |
|                   |                                            | et-1/1/8:1                                 |
|                   |                                            | et-1/1/8:2                                 |
|                   |                                            | et-1/1/8:3                                 |

Table 18: Port Number Mapping When Port Groups Are Not Configured (continued)

|                   |                                            | et-1/1/11:1                                |
|                   |                                            | et-1/1/11:2                                |
|                   |                                            | et-1/1/11:3                                |

## 10-Gigabit Ethernet Mode

A 10-Gigabit Ethernet interface can operate in 10-Gigabit Ethernet LAN PHY framing mode or in 10-Gigabit Ethernet WAN PHY framing mode.

You can configure a 10-Gigabit Ethernet interface at the **[edit interface *interface-name* framing-mode (lan-phy | wan-phy)]** hierarchy level to operate in 10-Gigabit Ethernet LAN PHY framing mode or in 10-Gigabit Ethernet WAN PHY framing mode.

Each P2-10G-40G-QSFPP PIC provides 48 physical interfaces. The interfaces are represented by the 4-level interface-naming convention—*et-fpc/pic/QSFP+ port:channel*, where the value of the *QSFP+ port* option ranges from 0 through 11 and the value of the *channel* option ranges from 0 through 3.

- [Framing Mode Overview on page 263](#)
- [Supported Features on LAN PHY and WAN PHY Framing Mode on page 264](#)

### Framing Mode Overview

When a P2-10G-40G-QSFPP PIC is configured in 10-Gigabit Ethernet framing mode, it can operate in one of the following framing modes:

- LAN PHY framing mode. Note that by default, the PIC is in 10-Gigabit Ethernet LAN PHY framing mode. You can configure loopback at the **[edit interfaces *interface-name* sonet-options loopback]** hierarchy level.

**NOTE:** The ports are set to LAN PHY framing mode by default when the **framing-mode** statement is not configured at the **[edit interfaces *interface-name*]** hierarchy level.

- WAN PHY framing mode

### Supported Features on LAN PHY and WAN PHY Framing Mode

The following features are supported in LAN PHY and WAN PHY framing mode when the PIC operates in 10-Gigabit Ethernet mode:

- The following are supported for WAN interface sublayer statistics, defects, and alarms when the PIC operates in WAN PHY framing mode:
  - GR 253 standard.
  - **show interfaces *interfaces-name* operational** mode command displays WAN interface sublayer statistics, defects and alarms.
  - Interrupt-driven notification for WAN interface sublayer defects.
  - Path trace and trigger options for WAN interface sublayer alarms.
  - Transmitting and receiving J1 (path trace) messages—J1 is a part of path overhead in a WAN interface sublayer frame.
- Line loopback and local loopback. Loopback is configured at the **[edit interfaces *interface-name* sonet-options loopback]** hierarchy level in WAN PHY framing mode.
- The defects PHY LOL (loss of light) and PHY PLL (loss of PLL lock) are detected and reported at the physical level in WAN PHY framing mode.

Fast reroute (FRR) in WAN PHY framing mode:

- Enable or disable preemptive fast reroute (FRR) options at the **[edit interfaces *interface-name* otn-options preemptive-fast-reroute]** hierarchy level.
- Configure thresholds and interval for the optical channel data unit (ODU) signal degradation (**odu-signal-degrade**) and the configurable pre-FEC bit error rate (BER) (**ber-threshold-signal-degrade**) at the **[edit interfaces *interface-name* otn-options odu-signal-degrade]** hierarchy level and the **[edit interfaces *interface-name* otn-options signal-degrade]** hierarchy level, respectively.

## 40-Gigabit Ethernet Mode

You can configure twelve 40-Gigabit Ethernet interfaces that operate in LAN PHY framing mode. The interfaces are represented by the 3-level interface-naming convention **et-fpc/pic/QSFP+ port**, where the value of the **QSFP+ port** variable ranges from 0 through 11.

## Release History Table

| Release | Description |

## Configuring the P2-10G-40G-QSFPP PIC

Starting with Junos OS Release 14.1R2, PTX5000 supports the P2-10G-40G-QSFPP PIC on the FPC2-PTX-PIA FPC. You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode..

The following tasks explain how to configure the P2-10G-40G-QSFPP PIC in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode and to configure the framing modes on it.

- [Configuring the PIC in 10-Gigabit Ethernet Mode or in 40-Gigabit Ethernet Mode on page 265](#)
- [Configuring the PIC in 10-Gigabit Ethernet Mode to Operate in 40-Gigabit Ethernet Mode on page 265](#)
- [Configuring the PIC in 40-Gigabit Ethernet Mode to Operate in 10-Gigabit Ethernet Mode on page 266](#)
- [Configuring the PIC at Port Group Level on page 267](#)
- [Configuring Framing Mode on P2-10G-40G-QSFPP PIC on page 267](#)

### Configuring the PIC in 10-Gigabit Ethernet Mode or in 40-Gigabit Ethernet Mode

To configure the P2-10G-40G-QSFPP PIC in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]
user@host# edit chassis
```

2. Configure the PIC in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode after specifying the required FPC slot and PIC slot. Note that all the PIC ports in a PIC are configured at once with this configuration command.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-slot pic-mode (10G | 40G)
```

### Configuring the PIC in 10-Gigabit Ethernet Mode to Operate in 40-Gigabit Ethernet Mode

To configure the P2-10G-40G-QSFPP PIC that is configured in 10-Gigabit Ethernet mode to operate in 40-Gigabit Ethernet mode:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level.

```
[edit]
user@host# edit interfaces
```

2. Delete all the interfaces in the PIC, commit, and then move to the top of the hierarchy level.

```
[edit interfaces]
user@host# delete interface-name
user@host# delete ...
user@host# commit
user@host# top
```

3. Configure the PIC to operate in 40-Gigabit Ethernet mode and commit.

```
[edit]
user@host# set chassis fpc fpc-slot pic pic-slot pic-mode 40G
user@host# commit
```

After the configuration is committed, the PIC reboots and starts operating in the 40-Gigabit Ethernet mode. You can now configure the parameters, such as encapsulation, framing mode, and so on, for the twelve 40-Gigabit Ethernet interfaces in the PIC as needed.

## Configuring the PIC in 40-Gigabit Ethernet Mode to Operate in 10-Gigabit Ethernet Mode

To configure the P2-10G-40G-QSFPP PIC that is configured in 40-Gigabit Ethernet mode to operate in 10-Gigabit Ethernet mode:

1. In configuration mode, go to the `[edit interfaces interfaces-name]` hierarchy level.

```
[edit]
user@host# edit interfaces interface-name
```

2. Delete all the interfaces in the PIC, commit, and then move to the top of the hierarchy level.

```
[edit interfaces]
user@host# delete interface-name
user@host# delete ...
user@host# commit
user@host# top
```

3. Configure the PIC to operate in 10-Gigabit Ethernet mode and commit.

```
[edit]
user@host# set chassis fpc fpc-slot pic pic-slot pic-mode 10G
user@host# commit
```

After the configuration is committed, the PIC reboots and starts operating in the 10-Gigabit Ethernet mode. You can now configure the parameters, such as encapsulation, framing mode, and so on, for the forty-eight 10-Gigabit Ethernet interfaces in the PIC as needed.

## Configuring the PIC at Port Group Level

### Before You Begin

Verify that the **pic-mode** statement at the **[edit chassis fpc fpc-slot pic pic-slot pic-mode]** is not configured or that its value is set to 10G.

To configure a port group in the P2-10G-40G-QSFPP PIC to operate in 10-Gigabit Ethernet mode or 40-Gigabit Ethernet mode:

1. In configuration mode, go to the **[edit chassis fpc fpc-slot pic pic-slot]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-slot
```

2. Configure the port number as 0, 3, 6, or 9 and the speed as 10G or 40G. Note that you can configure the port speed only on the first port in the port group. That is, configure the port speed only on the ports numbered 0, 3, 6, and 9. An error message is displayed when you try to configure the speed on any other port in the port group.

```
[edit chassis fpc fpc-slot pic pic-slot]
user@host# set port port-number speed (10G | 40G)
```

**NOTE:** A system log message is logged when you try to configure a different port speed on a port when the port group is operating at another speed.

## Configuring Framing Mode on P2-10G-40G-QSFPP PIC

You can configure LAN PHY, or WAN PHY framing mode when the PIC is operating in 10-Gigabit Ethernet mode. You can configure LAN PHY framing mode when the PIC is operating in 40-Gigabit Ethernet mode. The following tasks explain how to configure the various framing modes on the PIC:

- [Configuring LAN PHY or WAN PHY Framing Mode in 10-Gigabit Ethernet Mode on page 267](#)
- [Configuring LAN PHY Framing Mode in 40-Gigabit Ethernet Mode on page 268](#)

### Configuring LAN PHY or WAN PHY Framing Mode in 10-Gigabit Ethernet Mode

To configure the P2-10G-40G-QSFPP PIC in 10-Gigabit Ethernet mode to operate in LAN PHY framing mode or in WAN PHY framing mode, you must configure the framing mode individually on all the interfaces:

1. In configuration mode, go to the **[edit interfaces interfaces-name]** hierarchy level, where the interface name is in **et-fpc/pic/port:channel** format.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the framing mode as LAN PHY or WAN PHY and commit.

```
[edit interfaces interface-name]
user@host# set framing (lan-phy | wan-phy)
user@host# commit
```

For example, you can configure the framing mode as LAN PHY or WAN PHY on the et-1/1/1:0 interface.

### Configuring LAN PHY Framing Mode in 40-Gigabit Ethernet Mode

To configure the P2-10G-40G-QSFPP PIC in 40-Gigabit Ethernet mode to operate in LAN PHY framing mode:

1. In configuration mode, go to the `[edit interfaces interfaces-name]` hierarchy level, where the interface name is in `et-fpc/pic/port` format.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the framing mode as LAN PHY and commit.

```
[edit interfaces interface-name]
user@host# set framing (lan-phy)
user@host# commit
```

For example, you can configure the framing mode as LAN PHY on the et-2/2/2 interface.

#### Release History Table

| Release | Description                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------|
| 14.1R2  | Starting with Junos OS Release 14.1R2, PTX5000 supports the P2-10G-40G-QSFPP PIC on the FPC2-PTX-PIA FPC. |

#### Related Documentation

- [P2-10G-40G-QSFPP PIC Overview on page 256](#)

### Example: Configuring the P2-10G-40G-QSFPP PIC

- [Requirements on page 269](#)
- [Overview on page 269](#)
- [Configuration on page 269](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 14.1R2 or Junos OS Release 14.2 or later
- One PTX5000 router with P2-10G-40G-QSFPP PIC

## Overview

Starting with Junos OS Release 14.1R2 and 14.2R1, PTX5000 supports the P2-10G-40G-QSFPP PIC on the FPC2-PTX-P1A FPC.

All the ports on the P2-10G-40G-QSFPP PIC are QSFP+ based—that is, all the ports are connected to fiber-optic cables by means of QSFP+ transceivers. The P2-10G-40G-QSFPP PIC provides forty-eight 10-Gigabit Ethernet ports or twelve 40-Gigabit Ethernet ports.

The QSFP+ module—which includes the transceiver and the fiber-optic cable—supports the following standards on the P2-10G-40G-QSFPP PIC:

- 10-Gigabit Ethernet in LAN PHY framing mode (also known as native Ethernet mode) and WAN PHY framing mode.
- 40-Gigabit Ethernet in LAN PHY framing mode.

## Configuration

To configure the P2-10G-40G-QSFPP PIC to operate in 10-Gigabit Ethernet mode, and to set the framing mode and other options on an interface on this PIC, perform the following tasks:

- [Configuring the P2-10G-40G-QSFPP PIC in 10-Gigabit Ethernet Mode on page 269](#)
- [Configuring the Framing Mode on an Interface on page 270](#)
- [Configuring the Interface Options on page 270](#)
- [Verification on page 271](#)

### Configuring the P2-10G-40G-QSFPP PIC in 10-Gigabit Ethernet Mode

#### Step-by-Step Procedure

Configure the PIC in 10-Gigabit Ethernet mode.

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]
user@host# edit chassis
```

2. Configure the PIC in 10-Gigabit Ethernet mode after specifying the required FPC slot and PIC slot. Note that the PIC restarts after the configuration is committed and all the ports in the PIC come up in the 10-Gigabit Ethernet mode.

```
[edit chassis]
```

```
user@host# set fpc 1 pic 1 pic-mode 10G
```

---

### Configuring the Framing Mode on an Interface

---

**Step-by-Step Procedure** To configure an interface *et-1/1/1:0* in the P2-10G-40G-QSFP PIC to operate in LAN PHY framing mode:

1. In configuration mode, go to the **[edit interfaces et-1/1/1:0]** hierarchy level.

```
[edit]
user@host# edit interfaces et-1/1/1:0
```

2. Configure the framing mode for the interface as LAN PHY and commit.

```
[edit interfaces et-1/1/1:0]
user@host# set framing lan-phy
user@host# commit
```

Similarly, you can configure LAN PHY or WAN PHY framing mode for the other interfaces in the PIC.

---

### Configuring the Interface Options

---

**Step-by-Step Procedure** Configure the interface options for the interface *et-1/1/1:0* as needed. The following procedure configures a few interface-specific options.

1. In configuration mode, go to the **[edit interfaces et-1/1/1:0]** hierarchy level.

```
[edit]
user@host# edit interfaces et-1/1/1:0
```

2. Configure the encapsulation as ethernet-ccc.

```
[edit interfaces et-1/1/1:0]
user@host# set encapsulation ethernet-ccc
```

3. Configure the family as CCC for the logical interface 0.

```
[edit interfaces et-1/1/1:0]
user@host# set unit 0 family ccc
```

4. Enable flow control to regulate the flow of packets from the router to the remote side of the network connection.

```
[edit interfaces et-1/1/1:0 gigether-options]
user@host# set flow-control
```

5. Enable loopback mode for the interface, commit the configuration, and exit the configuration mode.

```
[edit interfaces et-1/1/1:0 gigether-options]
user@host# set loopback
user@host# commit
user@host# quit
```

## Verification

### Displaying Interface Details

**Purpose** To display interface-specific details of the et-1/1/1:0 interface.

**Action** Execute the **show interfaces et-1/1/1:0** operational command.

```
user@host# run show interfaces et-1/1/1:0
Interface index: 525, SNMP ifIndex: 522
 Link-level type: Ethernet, MTU: 1514, MRU: 0, LAN-PHY mode, Speed: 10Gbps, BPDU
 Error:
None, MAC-REWRITE Error: None, Loopback: None, Source filtering: Disabled,
 Flow control: Enabled
 Device flags : Present Running Down
 Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Current address: ac:4b:c8:f6:af:68, Hardware address: ac:4b:c8:f6:af:68
 Last flapped : 2014-07-25 02:23:56 PDT (02:16:07 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)
 Active alarms : LINK
 Active defects : LINK
 PCS statistics
 Bit errors Seconds
 Errored blocks 1
 Interface transmit statistics: Disabled
```

**Meaning** The interface details are displayed. Note that to display information for an interface in 10-Gigabit Ethernet mode for the P2-10G-40G-QSFPP PIC, you must use the *et-fpc/pic/port:channel* format.

## Release History Table

| Release | Description |

- [Configuring 10-Gigabit Ethernet Framing on page 275](#)

## 10-Gigabit Ethernet Framing Overview

---

The 10-Gigabit Ethernet interfaces support operation in two modes:

- 10GBASE-R, LAN Physical Layer Device (LAN PHY)
- 10GBASE-W, WAN Physical Layer Device (WAN PHY)

When the external interface is running in LAN PHY mode, it bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface. When the external interface is running in WAN PHY mode, it uses the WIS sublayer to transport 10-Gigabit Ethernet frames in an OC192c SONET payload.

WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000 and PTX Series Packet Transport routers only.

**NOTE:** The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).

Although the external interface provides a lower throughput when running in WAN PHY mode because of the extra SONET overhead, it can interoperate with SONET section or line level repeaters. This creates an advantage when the interface is used for long-distance, point-to-point 10-Gigabit Ethernet links. When the external interface is running in WAN PHY mode, some SONET options are supported. For information about SONET options supported on this interface, see *Configuring SONET Options for 10-Gigabit Ethernet Interfaces*.

**NOTE:** SONET or SDH framing mode configuration framing (`sdh | sonet`) is not applicable on the 10-Gigabit Ethernet ports. Configuring the `wan-phy` framing mode on the 10-Gigabit Ethernet ports allows the interface to accept SONET or SDH frames without further configuration.

#### Release History Table

| Release | Description                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12.2    | Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).   |
| 12.1R2  | Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). |

## Understanding WAN Framing for 10-Gigabit Ethernet Trio Interfaces

If you use the `wan-phy` statement option at the `[edit interfaces xe-fpc/pic/0 framing]` hierarchy level to configure Trio WAN mode framing for 10-Gigabit Ethernet interfaces, then the alarm behavior of the link, although in full compliance with the IEEE 802.3ae 10-Gigabit Ethernet standard, might not be as expected.

In particular:

- The interface does not distinguish between loss of light (LOL), loss of phase lock loop (PLL), or loss of signal (LOS). If a loss of PLL or LOS alarm occurs, then both PLL and LOS alarms are raised. LOL is also raised because there is no separate LOL indication from the hardware.
- The interface does not raise LOS, PLL, or LOL alarms when the fiber is disconnected from the interface port. You must remove the hardware to raise this alarm.
- The interface line-level alarm indicator signal (AIS-L) is not always raised in response to a loss of framing (LOF) defect alarm.
- If the AIS-L or path-level AIS (AIS-P) occurs, the interface path-level loss of code delineation (LCD-P) is not detected. LCD-P is seen during the path-level remote defect indicator (RDI-P) alarm.
- If an AIS-L alarm occurs, the AIS-P is not detected, but the LOP alarm is detected.

None of the alarm issues are misleading, but they make troubleshooting the root cause of problems more complex.

- Related Documentation**
- [framing on page 1114](#)
  - [Configuring 10-Gigabit Ethernet Framing on page 275](#)
  - [10-Gigabit Ethernet Framing Overview on page 273](#)
  - *Ethernet Interfaces Feature Guide for Routing Devices*

## Configuring 10-Gigabit Ethernet Framing

The 10-Gigabit Ethernet interfaces uses the interface type **xe-fpc/pic/port**. On single port devices, the port number is always zero.

The **xe-fpc/pic/port** interface inherits all the configuration commands that are used for gigabit Ethernet (**ge-fpc/pic/port**) interfaces.

To configure LAN PHY or WAN PHY operating mode, include the **framing** statement with the **lan-phy** or **wan-phy** option at the **[edit interfaces xe-fpc /pic/0 ]** hierarchy level.

```
[edit interfaces xe-fpc/pic/0 framing]
framing (lan-phy | wan-phy);
```

### NOTE:

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series Transport Routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.

To display interface information, use the operational mode command **show interfaces xe-fpc/pic/port extensive**.

---

**NOTE:**

- SONET or SDH framing mode configuration framing (sdh | sonet) is not applicable on the 10-Gigabit Ethernet ports. Configuring the wan-phy framing mode on the 10-Gigabit Ethernet ports allows the interface to accept SONET or SDH frames without further configuration.
  - If you configure the WAN PHY mode on an aggregated Ethernet interface, you must set the aggregated Ethernet link speed to OC192.
-

# Configuring 40-Gigabit Ethernet PICs

- [40-Gigabit Ethernet PIC Overview on page 279](#)
- [Configuring 40-Gigabit Ethernet PICs on page 281](#)

## 40-Gigabit Ethernet PIC Overview

---

The 40-Gigabit Ethernet PIC with CFP (PD-1XLE-CFP) is a 1-port 40-Gigabit Ethernet Type 4 PIC with C form-factor pluggable transceiver (CFP) optics supported on T640, T1600, and T4000 routers. The 40-Gigabit Ethernet PIC occupies FPC slot 0 or 1 in the Type 4 FPC and it is similar to any regular PIC such as the 4-port 10-Gigabit Ethernet LAN/WAN PIC with XFP (PD-4XGE-XFP) PIC. The CFP information appears under the PIC information in the show command output.

The 40-Gigabit Ethernet PIC with CFP supports flexible Ethernet services encapsulation and MAC accounting.

MAC learning, MAC policing, and Layer 2 rewrite features are not supported.

The 40-Gigabit Ethernet PIC with CFP supports the following features:

- Encapsulation protocols such as:
  - Layer 2 protocols
    - Ethernet CCC, Ethernet TCC, and Ethernet VPLS
    - VLAN CCC
    - Extended VLAN TCC
    - VLAN VPLS
    - Flexible Ethernet service
  - Layer 3 protocols
    - IPv4
    - IPv6

- MPLS
- CFP Multi-Source Agreement (MSA)-compliant management data input/output (MDIO) control features (transceiver dependent).
- Graceful Routing Engine switchover (GRES) (in all PIC and chassis configurations).
- Interface creation:
  - When the PIC is brought online, the router creates one interface, et-x/y/0, where x represents the FPC slot number and y represents PIC slot number. The physical interface represents internal Ethernet Packet Forwarding Engines.
  - The FPC slot number ranges from 0 through 7 in T640, T1600, and T4000 routers. The PIC slot numbers are 0 and 1.
  - Packet Forwarding Engine 0 is the physical interface 0, and Packet Forwarding Engine 1 is the physical interface 1.
- 802.3 link aggregation:
  - The configuration of the 40-Gigabit Ethernet PIC with CFP complies with that of the existing 1-Gigabit or 10-Gigabit Ethernet PIC and aggregated Ethernet interfaces.
  - An aggregate bundle that consists purely of 40-Gigabit Ethernet PICs supports a maximum of 40-Gigabit Ethernet links depending on the system implementation.

For Junos OS configuration information about this PIC, see [“Configuring 40-Gigabit Ethernet PICs” on page 281](#). For hardware compatibility information, see the *T1600 PICs Supported* topic in the *T1600 Core Router Hardware Guide* hardware guide and the *T640 PICs Supported* topic in the *T640 Core Router Hardware Guide* hardware guide, and the *T4000 PICs Supported* topic in the *T4000 Core Router Hardware Guide* hardware guide.

**Related  
Documentation**

- *T1600 PICs Supported*
- *T4000 PICs Supported*

## Configuring 40-Gigabit Ethernet PICs

You can configure the following features on the 40-Gigabit Ethernet PIC with CFP (PD-1XLE-CFP):

- Flexible Ethernet services encapsulation
- Source address MAC filtering
- Destination address MAC filtering
- MAC accounting for receive (Rx) and transmit (Tx)
- Multiple tag protocol ID (TPID) support
- Channels defined by two stacked VLAN tags
- Channels defined by **flex-vlan-tagging**
- IP service for stacked VLAN tags
- IP service for nonstandard TPID

The following features are not supported on the 40-Gigabit Ethernet PIC with CFP:

- MAC learning
- MAC policing
- Layer 2 rewrite

**NOTE:** Each 40-Gigabit Ethernet PIC with CFP creates a single et- physical interface in the Routing Engine and Packet Forwarding Engine.

The 40-Gigabit Ethernet PIC with CFP supports aggregated Ethernet configuration to achieve higher throughput capability, whereby the configuration is similar to the 1-Gigabit or 10-Gigabit aggregated Ethernet interface configuration. A maximum of 40-Gigabit Ethernet PIC links can be bundled into a single aggregated Ethernet configuration depending on the system implementation.

To configure the 40-Gigabit Ethernet PIC with CFP:

1. Perform the media configuration.

The command used to configure the media for the 40-Gigabit Ethernet PIC with CFP is the same as that for other Ethernet PICs, such as the 4-port 10-Gigabit Ethernet PIC.

2. Specify the logical interfaces.

A single physical interface is created when the 40-Gigabit Ethernet PIC with CFP is brought online (et-x/y/0, where x represents the FPC slot number and y represents the PIC slot number). For more information, see *Configuring Access Mode on a Logical Interface* and *Configuring a Logical Interface for Trunk Mode*.

3. Configure the 802.3 link aggregation.

- You must explicitly configure an aggregated interface on the 40-Gigabit Ethernet PIC with CFP that includes the 40-Gigabit Ethernet interfaces. For more information, see [“Configuring an Aggregated Ethernet Interface” on page 48](#).
- The configuration of the 40-Gigabit Ethernet PIC with CFP complies with the configuration of the 1-Gigabit Ethernet PIC, 10-Gigabit Ethernet PIC, and the aggregated Ethernet interfaces. In each aggregated bundle, Junos OS supports a maximum of 40-Gigabit Ethernet links. For more information, see [“Configuring an Aggregated Ethernet Interface” on page 48](#) and [“10-port 10-Gigabit Ethernet LAN/WAN PIC Overview” on page 241](#).

4. Configure the Packet Forwarding Engine features.

The 40-Gigabit Ethernet PIC with CFP supports all classification, firewall filters, queuing model, and rewrite functionality features of the Gigabit Ethernet PICs. To configure these parameters, see [“Configuring Gigabit Ethernet Policers” on page 509](#), [“Configuring MAC Address Filtering” on page 514](#), and *Stacking and Rewriting Gigabit Ethernet VLAN Tags Overview*.

## MPC3E MIC Overview

---

The MPC3E supports two separate slots for MICs. MICs provide the physical interface and are installed into the MPCs.

The MPC3E supports these MICs as field replaceable units (FRUs):

- *100-Gigabit Ethernet MIC with CFP* (model number MIC3-3D-1X100GE-CFP)
- *100-Gigabit Ethernet MIC with CXP* (model number MIC3-3D-1X100GE-CXP)
- *10-port 10-Gigabit Ethernet MIC with SFPP* (model number MIC3-3D-10XGE-SFPP)
- *2-port 40-Gigabit Ethernet MIC with QSFP+* (model number MIC3-3D-2X40GE-QSFP)

The MPC3E has two separate configurable MIC slots. Each MIC corresponds to a single PIC and the mapping between the MIC and PIC is 1 to 1 (one MIC is treated as one PIC). The MIC plugged into slot 0 corresponds to PIC 0 and the MIC plugged into slot 1 corresponds to PIC 2.

The MPC3E also supports these legacy MICs:

- *20-port Gigabit Ethernet MIC with SFP* (model number MIC-3D-20GE-SFP)
- *2-port 10-Gigabit Ethernet MICs with XFP* (model number MIC-3D-2XGE-XFP)

The 100-Gigabit Ethernet CFP MIC supports the IEEE standards—compliant 100BASE-LR4 interface, using the 100G CFP optical transceiver modules for connectivity. The 100-Gigabit Ethernet CXP MIC supports the 100BASE-SR10 interface, using 100-Gigabit CXP optical transceiver modules for connectivity. The 2-port 40-Gigabit Ethernet QSFP MIC supports the 40BASE-SR4 interface and uses quad small form-factor pluggable (QSFP) optical transceivers for connectivity. The 10-port 10-Gigabit Ethernet SFPP MIC uses SFP+ optical transceiver modules for connectivity.

For detailed information about each MIC, see *100-Gigabit Ethernet MIC with CFP*, *100-Gigabit Ethernet MIC with CXP*, *40-Gigabit Ethernet MIC with QSFP+*. For information about supported hardware and transceivers, see *MPC3E*.

The MPC3E supports these features:

- Optical diagnostics and related alarms
- Virtual Router Redundancy Protocol (VRRP) support
- IEEE 802.1Q virtual LANs (VLANs) support
- Synchronous Ethernet
- Remote monitoring (RMON) and Ethernet statistics (EtherStats)
- Source MAC learning
- MAC accounting and policing—Dynamic local address learning of source MAC addresses
- Flexible Ethernet encapsulation
- Multiple Tag Protocol Identifiers (TPIDs)

**NOTE:** The MPC3E supports Ethernet interfaces only. SONET interfaces are not supported.

For information about the supported and unsupported Junos OS features for this MPC, see “Protocols and Applications Supported by the MPC3E (MX-MPC3E)” in the [MX Series Interface Module Reference](#).

## 100-Gigabit Ethernet Type 4 PIC with CFP Overview

The 100-Gigabit Ethernet PIC (model number PD-1CE-CFP-FPC4) is a 1-port 100-Gigabit Ethernet Type 4 PIC with 100-gigabit small form-factor pluggable (CFP) transceiver. This PIC is available only as packaged in an assembly with the T1600-FPC4-ES FPC. The 100-Gigabit Ethernet PIC occupies PIC slots 0 and 1 in the T1600-FPC4-ES FPC. For information about supported transceivers and hardware, see [100-Gigabit Ethernet PIC with CFP \(T1600 Router\)](#).

The 100-Gigabit Ethernet PIC supports flexible encapsulation and MAC accounting.

MAC learning, MAC policing, and Layer 2 rewrite functionality are not supported.

The ingress flow can be filtered based on the VLAN source and destination addresses. Ingress frames can also be classified according to VLAN, stacked VLAN, source address, VLAN source address, and stacked VLAN source address. VLAN manipulation on egress frames are supported on both outer and inner VLAN tags.

The following features are supported:

- The following encapsulation protocols are supported:
  - Layer 2 protocols
    - Ethernet CCC, Ethernet TCC, Ethernet VPLS
    - VLAN CCC
    - Extended VLAN TCC
    - VLAN VPLS
    - Flexible Ethernet service

- Layer 3 protocols
  - IPv4
  - Ipv6
  - MPLS
- CFP MSA compliant MDIO control features (transceiver dependent).
- Graceful Routing Engine switchover (GRES) is supported in all PIC and chassis configurations.
- Interface creation:
  - When the PIC, is brought online, the router creates two 50 gigabit capable interfaces, **et-x/0/0:0** and **et-x/0/0:1**, where x represents the FPC slot number. Each physical interface represents two internal 50 gigabit Ethernet Packet Forwarding Engines. Two logical interfaces are configured under each physical interface.
  - Packet Forwarding Engine 0 is physical interface 0, Packet Forwarding Engine 1 is physical interface 1
- 802.3 link aggregation:

Same rate or same mode link aggregation:

  - Two logical interfaces are created for each 100-Gigabit Ethernet PIC. To utilize bandwidth beyond 50 gigabits per second, an aggregate interface must be explicitly configured on the 100-Gigabit Ethernet PIC that includes the two 50 gigabit interfaces.
  - Each 100 gigabit Ethernet aggregate consumes one of the router-wide aggregated Ethernet device pools. The number of 100-Gigabit Ethernet PICs cannot exceed the router-wide limit, which is 128 for Ethernet.
  - In each aggregate bundle, each 100-Gigabit Ethernet PIC consumes two members. Hence, an aggregate bundle that consists purely of 100-Gigabit Ethernet PICs supports a maximum of half of the software limit for the number of members. Therefore, with a maximum of 16 links, up to 8 100-Gigabit Ethernet links are supported.
  - Combining 100-Gigabit Ethernet PICs into aggregate interfaces with other Ethernet PICs is not permitted. However, other Ethernet PICs can also be configured within the same T1600 with 100-Gigabit Ethernet PICs, and used in separate aggregate interfaces.
  - Multiple (Juniper Networks) Type 4 100-Gigabit Ethernet PICs on a T1600 router can be combined into a static aggregated Ethernet bundle to connect to a different type of 100 gigabit Ethernet PIC on a remote router (Juniper Networks or other vendors). LACP is not supported in this configuration.

Mixed rate or mixed mode link aggregation:

- Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on 100-Gigabit Ethernet PIC.
- Static link protection and Link Aggregation Control Protocol (LACP) is supported on mixed aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC.
- When configuring a mixed aggregated Ethernet link on a 100-Gigabit Ethernet PIC, ensure that you add both the 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC to the aggregated Ethernet bundle. Moreover, both these 50-Gigabit Ethernet interfaces must be included in the same aggregated Ethernet bundle.
- For a single physical link event of an aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC, the packet loss performance value is twice the original value because of the *two* 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC.
- Software Packet Forwarding Engine—Supports all Gigabit Ethernet PIC classification, firewall filter, queuing model, and rewrite functionality.
- Egress traffic performance—Maximum egress throughput is 100 gigabits per second on the physical interface, with 50 gigabits per second on the two assigned logical interfaces.
- Ingress traffic performance—Maximum ingress throughput is 100 gigabits per second on the physical interface, with 50 gigabits per second on the two assigned logical interfaces. To achieve 100 gigabits per second ingress traffic performance, use one of the interoperability modes described below. For example, if VLAN steering mode is not used when connecting to a remote 100 gigabits per second interface (that is on a different 100 gigabits per second PIC on a Juniper Networks router or a different vendor's equipment), then all ingress traffic will try to use one of the 50 gigabits per second Packet Forwarding Engines, rather than be distributed among the two 50 gigabits per second Packet Forwarding Engines, resulting in a total of 50 gigabits per second ingress performance.
- Interoperability modes—The 100-Gigabit Ethernet PIC supports interoperability with through configuration in one of the following two forwarding option modes:
  - *SA multicast mode*—In this mode, the 100-Gigabit Ethernet PIC supports interconnection with other Juniper Networks 100-Gigabit Ethernet PICs (Model: PD-ICE-CFP) interfaces only.
  - *VLAN steering mode*—In this mode, the 100-Gigabit Ethernet Type 4 PIC with CFP supports interoperability with 100 gigabit Ethernet interfaces from other vendors only.

## Configuring 100-Gigabit Ethernet Type 4 PIC With CFP

---

You can configure the following features on the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4):

- Flexible Ethernet services encapsulation
- Source address MAC filtering
- Destination address MAC filtering
- MAC accounting in RX
- Channels defined by two stacked VLAN tags
- Channels defined by flex-vlan-tagging
- IP service for stacked VLAN tags
- Layer 2 rewrite

The following features are not supported on the 100-Gigabit Ethernet Type 4 PIC with CFP:

- Multiple TPID
- IP service for non-standard TPID
- MAC learning
- MAC policing

### NOTE:

- For the 100-Gigabit Ethernet Type 4 PIC with CFP, only the PICO online and offline CLI commands are supported. The PIC1 online and offline CLI commands are not supported.
  - Each 100-Gigabit Ethernet Type 4 PIC with CFP creates two et- physical interfaces, defined as 50-gigabit physical interfaces in the Routing Engine and Packet Forwarding Engine. By default, these are independent physical interfaces and are not configured as an aggregated Ethernet interface.
-

To configure a 100-Gigabit Ethernet Type 4 PIC with CFP:

1. Perform the media configuration:

The 100-Gigabit Ethernet Type 4 PIC with CFP features a 100 gigabit per second pipe. The media-related configuration commands for **et-x/0/0:0** and **et-x/0/0:1** must both be configured at the same time and configured with the same value, otherwise the commit operation fails.

When configuring to activate or deactivate the interface, if the interface contains the described media-related configuration, it must activate and deactivate both units 0 and 1 at the same time, otherwise the commit operation fails.

The following media configuration commands have the above described restriction:

- **# set interfaces et-x/0/0:1 disable**
- **# set interfaces et-x/0/0:1 gigether-options loopback**
- **# set interfaces et-x/0/0:1 mtu yyy**

Due to an MTU restriction, the vlan-tagging and flexible-vlan-tagging configuration on **et-x/0/0:0** and **et-x/0/0:1** must be same, otherwise the commit operation fails.

2. Specify the logical interfaces:

- a. Two physical interfaces are created when the 100-Gigabit Ethernet Type 4 PIC with CFP is brought online (**et-x/0/0:0** and **et-x/0/0:1**, where *x* represents the FPC slot number). Each physical interface represents two internal 50-gigabit Ethernet Packet Forwarding Engines.
- b. Two logical interfaces are configured under each physical interface: Packet Forwarding Engine 0 is physical interface 0 and Packet Forwarding Engine 1 is physical interface 1.

3. Configure the 802.3 link aggregation:

- a. The 100-Gigabit Ethernet PIC supports aggregated Ethernet configuration to achieve higher throughput capability, whereby configuration is similar to the 1G/10G aggregated Ethernet interface configuration.
- b. Two physical interfaces are created for each 100-Gigabit Ethernet Type 4 PIC with CFP. To utilize bandwidth beyond 50 gigabits, a same rate and same mode aggregated Ethernet interface must be explicitly configured on the 100-Gigabit Ethernet Type 4 PIC with CFP that includes these two 50-gigabit interfaces.
- c. Each 100-Gigabit Ethernet Type 4 PIC with CFP aggregate consumes one of the router-wide aggregated Ethernet device pools. In Junos OS with 100-Gigabit Ethernet PICs, you cannot exceed the router limit of 128 Ethernet PICs.
- d. In each aggregated bundle, each 100-Gigabit Ethernet Type 4 PIC with CFP consumes two aggregate members. Hence, an aggregated bundle consisting of only one 100-Gigabit Ethernet Type 4 PIC with CFP supports only up to half of the Junos OS limit for the number of members. The Junos OS supports a maximum of 16 links for up to 8 100-Gigabit Ethernet Type 4 PIC with CFP links.

---

**NOTE:**

The 100-Gigabit Ethernet Type 4 PIC with CFP has the following restrictions for same rate and same mode aggregated Ethernet configuration:

- Both physical interfaces belonging to the same 100-Gigabit Ethernet PIC must be included in the same aggregated Ethernet physical interfaces. The aggregation of the 100-Gigabit Ethernet PIC interface is always an even number of physical interfaces.
  - The 100-Gigabit Ethernet PIC physical interface cannot be configured in the aggregated interface with any other type of physical interface.
  - The maximum supported number of aggregated 100-Gigabit Ethernet PIC interfaces is half of the number that the Junos OS supports for 1G/10G aggregated Ethernet. For example, if Junos OS supports 16 ports of 10-gigabit Ethernet aggregation, it supports 8 ports of 100-Gigabit Ethernet PIC aggregation. This is because each port of the 100-Gigabit Ethernet PIC port using 2 physical interfaces (et-x/0/0:0 and et-x/0/0:1), where each physical interface represents 50 gigabits of traffic capacity.
- 

- e. Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on 100-Gigabit Ethernet PIC. When configuring a mixed aggregated Ethernet link on a 100-Gigabit Ethernet PIC, ensure that you add both the 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC to the aggregated Ethernet bundle. Moreover, both these 50-Gigabit Ethernet interfaces must be included in the same aggregated Ethernet bundle.

**NOTE:**

The 100-Gigabit Ethernet Type 4 PIC with CFP has the following restrictions for mixed rate and mixed mode aggregated Ethernet configuration:

- A maximum of 16 member links can be configured to form a mixed aggregated Ethernet link.
- Traffic distribution is based on the hash calculated on the egress packet header. Hash range is fairly distributed according to member links' speed. This guarantees hash fairness but it does not guarantee fair traffic distribution depending on the rate of the egress streams.
- Packets are dropped when the total throughput of the hash flow exiting a member link (or multiple hash flows exiting a single member link) exceeds the link speed of the member link. This can happen when egress member link changes because of a link failure and the hash flow switches to a member link of speed that is less than the total throughput of the hash flow.
- Rate-based CoS components such as scheduler, shaper, and policer are not supported on mixed rate aggregated Ethernet links. However, the default CoS settings are supported by default on the mixed rate aggregated Ethernet links.
- Load balancing is performed at the ingress Packet Forwarding Engine. Therefore, you must ensure that the egress traffic on the aggregated Ethernet link enters through the hardware platforms that support mixed aggregated Ethernet bundles.
- Mixed aggregated Ethernet links can interoperate with non-Juniper Networks aggregated Ethernet member links provided that mixed aggregated Ethernet load balancing is configured at egress.
- Load balancing of the egress traffic across the member links of a mixed rate aggregated Ethernet link is proportional to the rates of the member links.
- Egress multicast load balancing is not supported on mixed aggregated Ethernet interfaces.
- Changing the edit interfaces `aex aggregated-ether-options link-speed` configuration of a mixed aggregated Ethernet link, which is configured on the supported interfaces of on T640, T1600, T4000, and TX Matrix Plus routers, leads to aggregated Ethernet link flapping.
- When a mixed aggregated Ethernet link is configured on a 100-Gigabit Ethernet PIC, changing aggregated Ethernet link protection configurations leads to aggregated Ethernet link flapping.
- For a single physical link event of an aggregated Ethernet link configured on a 100-Gigabit Ethernet PIC, the packet loss performance value is twice the original value because of the *two* 50-Gigabit Ethernet interfaces of the 100-Gigabit Ethernet PIC with CFP.

- The **show interfaces aex** command displays the link speed of the aggregated Ethernet interface, which is the sum of the link speeds of all the active member links.

4. Configure the Packet Forwarding Engine features:

- The 100-Gigabit Ethernet Type 4 PIC with CFP supports all classification, firewall filters, queuing model, and rewrite functionality features of the Gigabit Ethernet PICs. To configure these parameters, see [“Configuring Gigabit Ethernet Policers” on page 509](#), [“Configuring MAC Address Filtering” on page 514](#), and *Stacking and Rewriting Gigabit Ethernet VLAN Tags Overview*.

**NOTE:** When using the **show interfaces extensive** command with a 100-Gigabit Ethernet Type 4 PIC with CFP, the “Filter statistics” section will not be displayed because the hardware does not include those counters.

Release History Table

| Release | Description                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------|
| 13.2    | Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on 100-Gigabit Ethernet PIC. |

## Configuring VLAN Steering Mode for 100-Gigabit Ethernet Type 4 PIC with CFP

In Junos OS Release 10.4 and later, you can configure the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-ICE-CFP-FPC4) to interoperate with routers using 100 gigabit Ethernet interfaces from other vendors by using the **forwarding-mode** statement with the **vlan-steering** option at the **[edit chassis fpc slot pic slot]** hierarchy level. On ingress, the router compares the outer VLAN ID against the user-defined VLAN ID and VLAN mask combination and steers the packet accordingly. You can program a custom VLAN ID and corresponding mask for PFE0.

General information on the VLAN steering mode:

- In VLAN steering mode, the SA multicast parameters are not used for packet steering.
- In SA multicast bit steering mode, the VLAN ID and VLAN masks are not used for packet steering.

- Configuration to set the packet distribution mode and VLAN steering rule is done through CLI commands. Both CLI commands result in a PIC reboot.
- There are three possible tag types of ingress packet:
  - Untagged ingress packet—The packet is sent to PFE1.
  - Ingress packet with one VLAN—The packet is forwarded to the corresponding PFE based on the VLAN ID.
  - Ingress packet with two VLANs—The packet is forwarded to the corresponding PFE based on the outer VLAN ID.
- If no VLAN rule is configured, all tagged packets are distributed to PFE0.
- VLAN rules describe how the router distributes packets. Two VLAN rules are provided by the CLI:
  - Odd-Even rule—Odd number VLAN IDs go to PFE1; even number of VLAN IDs go to PFE0.
  - Hi-Low rule—VLAN IDs 1 through 2047 go to PFE0; VLAN IDs 2048 through 4096 go to PFE1.
- When the 100-Gigabit Ethernet Type 4 PIC with CFP is configured in VLAN steering mode, it can be configured in a two physical interfaces mode or in aggregate Ethernet (AE) mode:
  - Two physical interfaces mode—When the PIC is in the two physical interfaces mode, it creates the physical interfaces **et-x/0/0:0** and **et-x/0/0:1**. Each physical interface can configure its own logical interface and VLAN. The CLI enforces the following restrictions at the commit time:
    - The VLAN ID configuration must comply with the selected VLAN rule.
    - The previous restriction implies that the same VLAN ID cannot be configured on both physical interfaces.
  - AE mode—When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one AE physical interface. The PIC egress traffic is based on an AE internal hash algorithm. The PIC ingress traffic steering is based on the customized VLAN ID rule. The CLI enforces the following restrictions at the commit time:
    - The PICs AE working in VLAN steering mode includes both links of that PIC, and only the links of that PIC.
    - The PIC AE working in SA multicast steering mode can include more than one 100-Gigabit Ethernet Type 4 PIC with CFP to achieve more than 100 gigabit Ethernet capacity.

To configure SA multicast mode, use the **set chassis fpc slot pic slot forwarding-mode sa-multicast** command.

**SA Multicast Mode** To configure SA multicast mode on a Juniper Networks 100-Gigabit Ethernet Type 4 PIC with CFP in FPC 0, PIC 0 for interconnection with another Juniper Networks 100-Gigabit Ethernet PIC, use the **set chassis fpc slot pic slot forwarding-mode sa-multicast** command. You can use the **show forwarding-mode** command to view the resulting configuration, as follows:

```
[edit chassis fpc slot pic slot]
user@host# show forwarding-mode
forwarding-mode {
 sa-multicast;
}
```

**VLAN Steering Mode** To configure the Juniper Networks 100-Gigabit Ethernet Type 4 PIC with CFP for VLAN steering mode for interoperability with a 100 gigabit Ethernet interface from another vendor's router, use the **set chassis fpc slot pic slot forwarding-mode vlan-steering** command with the **vlan-rule (high-low | odd-even)** statement. You can use the **show forwarding-mode** command to view the resulting configuration, as follows:

```
[edit chassis fpc slot pic slot]
user@host# show forwarding-mode
forwarding-mode {
 vlan-steering {
 vlan-rule odd-even;
 }
}
```

## 100-Gigabit Ethernet Type 5 PIC with CFP Overview

The 100-Gigabit Ethernet PIC is a 1-port 100-Gigabit Ethernet Type 5 PIC with C form-factor pluggable transceiver (CFP) with model number PF-1CGE-CFP.

The following features are supported on 100-Gigabit Ethernet Type 5 PIC with CFP:

- Access to all 100-Gigabit Ethernet port counters through SNMP.
- Logical interface-level MAC filtering, accounting, policing, and learning for source media access control (MAC).
- Channels defined by two stacked VLAN tags.
- Channels defined by **flex-vlan-tagging**.
- IP service for stacked VLAN tags.

- Defining the rewrite operation to be applied to the incoming and outgoing frames on logical interfaces on this PIC.

**NOTE:** Only the Tag Protocol Identifier (TPID) 0x8100 is supported.

- Interface encapsulations, such as the following:
  - **untagged**—Default encapsulation, when other encapsulation is not configured.
    - You can configure only one logical interface (unit 0) on the port.
    - You cannot include the **vlan-id** statement in the configuration of the logical interface.
  - **vlan-tagging**—Enable VLAN tagging for all logical interfaces on the physical interface.
  - **stacked-vlan-tagging**—Enable stacked VLAN tagging for all logical interfaces on the physical interface.
  - **ethernet-ccc**—Ethernet cross-connect.
  - **ethernet-tcc**—Ethernet translational cross-connect.
  - **vlan-ccc**—802.1Q tagging for a cross-connect.
  - **vlan-tcc**—Virtual LAN (VLAN) translational cross-connect.
  - **extended-vlan-ccc**—Standard TPID tagging for an Ethernet cross-connect.
  - **extended-vlan-tcc**—Standard TPID tagging for an Ethernet translational cross-connect.
  - **flexible-ethernet-services**—Allows per-unit Ethernet encapsulation configuration.
  - **ethernet-vpls**—Ethernet virtual private LAN service.
  - **vlan-vpls**—VLAN virtual private LAN service.
- The following Layer 3 protocols are also supported:
  - IPv4
  - IPv6
  - MPLS
- CFP Multi-Source Agreement (MSA) compliant Management Data Input/Output (MDIO) control features (transceiver dependent).
- 802.3 link aggregation:
  - The configuration of the 100-Gigabit Ethernet Type 5 PIC with CFP complies with that of the existing 1-Gigabit or 10-Gigabit Ethernet PIC and aggregated Ethernet interfaces.
- Interoperability mode—Interoperability with the 100-Gigabit Ethernet Type 4 PIC with CFP through configuration in **sa-multicast** forwarding mode.

- Juniper Networks enterprise-specific Ethernet Media Access Control (MAC) MIB
- The 100-Gigabit Ethernet Type 5 PIC with CFP supports all Gigabit Ethernet PIC classification, firewall filters, queuing model, and Layer 2 rewrite functionality features of the Gigabit Ethernet PICs. To configure these parameters, see [“Configuring Gigabit Ethernet Policers” on page 509](#), [“Configuring MAC Address Filtering” on page 514](#), and [Stacking and Rewriting Gigabit Ethernet VLAN Tags Overview](#).
- A Type 5 FPC can support up to two 100-Gigabit Ethernet PICs. Both the PICs (that is, PIC 0 and PIC 1) can be offline or online independently.

The following features are not supported on the 100-Gigabit Ethernet Type 5 PIC with CFP:

- MAC filtering, accounting, and policing for destination MAC at the logical interface level.

**NOTE:** Because destination MAC filtering is not supported, the hardware is configured to accept all the multicast packets. This configuration enables the OSPF protocol to work.

- Premium MAC policers at the logical interface level.
- MAC filtering, accounting, and policing at the physical interface level.
- Multiple TPIDs.
- IP service for nonstandard TPID.

[Table 22 on page 298](#) lists the capabilities of 100-Gigabit Ethernet Type 5 PIC with CFP.

**Table 22: Capabilities of 100-Gigabit Ethernet Type 5 PIC with CFP**

| Capability                          | Support                                                    |
|-------------------------------------|------------------------------------------------------------|
| Maximum logical interfaces per PIC  | 4093                                                       |
| Maximum logical interfaces per port | For IPv4 the limit is 4093.<br>For IPv6 the limit is 1022. |

## 100-Gigabit Ethernet Interfaces Interoperability

Juniper Networks Junos operating system (Junos OS) supports a variety of 100-Gigabit Ethernet interfaces. The 100-Gigabit Ethernet standard, introduced by IEEE 802.3ba-2010, enables transmission of Ethernet frames at the rate of 100 gigabits per second (Gbps). It is used for very high speed transmission of voice and data signals across the numerous world-wide fiber-optic networks.

Interface interoperability refers to the ability of an interface to interoperate with other router interfaces. You can enable interoperability between different 100-Gigabit Ethernet interfaces by performing specific configuration tasks. The following sections list the 100-Gigabit Ethernet interfaces, corresponding interoperable interfaces, and links to the interoperability tasks and reference information.

- [Interoperability of the MIC-3D-1X100GE-CFP MIC with PICs on Other Routers on page 299](#)

## Interoperability Between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP

You can enable interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP by:

- Enabling source address (SA) multicast bit steering mode on the 100-Gigabit Ethernet PIC PF-1CGE-CFP.
- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as one aggregated Ethernet physical interface.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the 100-Gigabit Ethernet PIC PF-1CGE-CFP. The 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 looks at the bit and forwards the packets to either Packet Forwarding Engine 0 or Packet Forwarding Engine 1. When the PIC sends out a packet, the multicast bit is set based on the egress Packet Forwarding Engine number (0 or 1).

The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

PD-1CE-CFP-FPC4 uses two 50 Gbps Packet Forwarding Engines to achieve 100 Gbps throughput. The 50-Gigabit Ethernet physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both the physical interfaces. You must configure the physical interfaces on PD-1CE-CFP-FPC4 in static link aggregation group (LAG) mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit aggregated interface is visible on the link connecting to the 100-Gigabit Ethernet PIC PF-1CGE-CFP instead of two independent 50-Gigabit Ethernet interfaces.

**NOTE:** If you try to enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP without configuring PD-1CE-CFP-FPC4 (with two 50-Gigabit Ethernet interfaces) in static LAG mode, then there are issues in forwarding or routing protocols. For example, if you create two untagged logical interfaces—one each on the two 50-Gigabit Ethernet interfaces—on PD-1CE-CFP-FPC4 and one untagged logical interface on PF-1CGE-CFP, then PF-1CGE-CFP does not learn about one of the 50-Gigabit Ethernet interfaces on PD-1CE-CFP-FPC4.

## Interoperability Between the 100-Gigabit Ethernet PICs PD-ICE-CFP-FPC4 and P1-PTX-2-100GE-CFP

---

You can enable interoperability between the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 and the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP by:

- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 as one aggregated Ethernet physical interface.
- Configuring source address (SA) multicast bit steering mode on the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP.

SA multicast bit steering mode uses the multicast bit in the source MAC address for packet steering.

**NOTE:** When SA multicast bit steering mode is configured on a PTX Series Packet Transport Router 100-Gigabit Ethernet port, VLANs are not supported for that port.

The 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 uses two 50-Gbps Packet Forwarding Engines to achieve 100-Gbps throughput. The 50-Gigabit Ethernet physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both the physical interfaces. You must configure the physical interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 in static link aggregation group (LAG) mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit aggregated interface is visible on the link connecting to the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP.

On the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4, ingress packets are forwarded to either Packet Forwarding Engine number 0 or 1 based on the SA multicast bit in the received packet. The SA multicast bit of egress packets is set based on whether the packet is forwarded from Packet Forwarding Engine number 0 or 1. As the default packet steering mode is SA multicast bit steering mode, no configuration is necessary to enable this mode.

On the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP, the SA multicast bit is ignored in ingress packets. When SA multicast bit steering mode is enabled, the SA multicast bit in the egress packets is set to 0 or 1 based on the flow hash value that is computed internally by the Packet Forwarding Engine complex for each packet. No CLI configuration is required to generate the flow hash value as this computation is done automatically. The flow hash algorithm uses fields in the packet header to compute the flow hash value. By default, the SA multicast bit is set to 0 in egress packets. You must configure SA multicast bit steering mode to enable interoperability with the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4.

**NOTE:** If you try to enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and P1-PTX-2-100GE-CFP without configuring PD-1CE-CFP-FPC4 (with two 50-Gigabit Ethernet interfaces) in static LAG mode, then there are issues in forwarding or routing protocols. For example, if you create two untagged logical interfaces—one each on the two 50-Gigabit Ethernet interfaces—on the PD-1CE-CFP-FPC4 and one untagged logical interface on the P1-PTX-2-100GE-CFP, then P1-PTX-2-100GE-CFP does not learn about one of the 50-Gigabit Ethernet interfaces on PD-1CE-CFP-FPC4.

### Configuring SA Multicast Bit Steering Mode on the 100-Gigabit Ethernet PIC PF-1CGE-CFP

To enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP, you need to enable source address (SA) multicast bit steering mode on PF-1CGE-CFP.

To configure SA multicast mode on PF-1CGE-CFP:

1. Specify the FPC and PIC information on the chassis.

```
[edit]
user@host# edit chassis fpc slot pic slot
```

For example:

```
[edit]
user@host# edit chassis fpc 1 pic 0
```

2. Configure the interoperation mode (SA multicast bit steering mode).

```
[edit chassis fpc slot pic slot]
user@host# set forwarding-mode sa-multicast
```

For example:

```
[edit fpc 1 pic 0]
user@host# set forwarding-mode sa-multicast
```

3. Verify the configuration.

```
[edit]
user@host# show chassis
 fpc 1 {
 pic 0 {
 forwarding-mode {
 sa-multicast;
 }
 }
 }
```

**NOTE:** The default packet steering mode for the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

## Configuring Two 50-Gigabit Ethernet Physical Interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as One Aggregated Ethernet Interface

To enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP or P1-PTX-2-100GE-CFP, you need to configure the two 50-Gigabit Ethernet physical interfaces on PD-1CE-CFP-FPC4 as one aggregated Ethernet physical interface. This ensures that a single 100-Gigabit aggregated interface is visible on the link connecting to PF-1CGE-CFP or P1-PTX-2-100GE-CFP instead of two independent 50-Gigabit Ethernet interfaces.

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces `et-fpc/pic/0:0` and `et-fpc/pic/0:1`, where *fpc* is the FPC slot number and *pic* is the PIC slot number. For example, to configure two physical interfaces for PIC slot 0 in FPC slot 5:

1. Specify the number of aggregated Ethernet interfaces to be created.

```
[edit chassis]
user@host# set aggregated devices ethernet device-count count
```

For example:

```
[edit chassis]
user@host# set aggregated devices ethernet device-count 1
```

2. Specify the members to be included within the aggregated Ethernet bundle.

```
[edit interfaces]
user@host# set interface-name gigether-options 802.3ad bundle
```

The following example shows how to configure two physical interfaces for PIC 0 on a T1600 router.

```
[edit interfaces]
user@host# set et-5/0/0:0 gigether-options 802.3ad ae0
user@host# set et-5/0/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the chassis.

```
[edit]
user@host# show chassis
 aggregated-devices {
 ethernet {
 device-count 1;
 }
 }
```

4. Verify the configuration at the interface.

```
[edit]
user@host# show interfaces
 et-5/0/0:0 {
 gigether-options {
 802.3ad ae0;
 }
 }
 et-5/0/0:1 {
 gigether-options {
 802.3ad ae0;
 }
 }
```

## Configuring the Interoperability Between the 100-Gigabit Ethernet PICs P1-PTX-2-100GE-CFP and PD-1CE-CFP-FPC4

You can enable interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and P1-PTX-2-100GE-CFP by performing the following tasks:

- [Configuring SA Multicast Bit Steering Mode on 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP on page 306](#)
- [Configuring Two 50-Gigabit Ethernet Physical Interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as One Aggregated Ethernet Interface on page 307](#)

### Configuring SA Multicast Bit Steering Mode on 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP

To enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and P1-PTX-2-100GE-CFP, you must enable source address (SA) multicast bit steering mode on P1-PTX-2-100GE-CFP.

**NOTE:** When you configure the SA multicast bit steering mode on the PTX Series PIC P1-PTX-2-100GE-CFP, we recommend that you do not configure the PIC ports as member links of an aggregated Ethernet interface because this prevents load balancing on the peering T Series PIC PD-1CE-CFP-FPC4. This T Series PIC must be in aggregated Ethernet mode to share bandwidth between its two 50-Gigabit Ethernet interfaces.

To configure SA multicast bit steering mode on the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP:

1. Specify the FPC, PIC, and port information on the chassis.

```
[edit]
user@host# edit chassis fpc slot pic slot port port-number
```

For example:

```
[edit]
user@host# edit chassis fpc 1 pic 0 port 0
```

2. Configure the interoperation mode (SA multicast bit steering mode).

```
[edit chassis fpc 1 pic 0]
user@host# set forwarding-mode sa-multicast
```

3. Verify the configuration.

```
[edit]
user@host# show chassis
 fpc 1 {
 pic 0 {
 port 0 {
 forwarding-mode {
 sa-multicast;
 }
 }
 }
 }
```

**NOTE:** As the default packet steering mode for the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 is SA multicast bit steering mode, no configuration is necessary to enable this mode.

### Configuring Two 50-Gigabit Ethernet Physical Interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as One Aggregated Ethernet Interface

To enable the interoperability between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and PF-1CGE-CFP or P1-PTX-2-100GE-CFP, you need to configure the two 50-Gigabit Ethernet physical interfaces on PD-1CE-CFP-FPC4 as one aggregated Ethernet physical interface. This ensures that a single 100-Gigabit aggregated interface is visible on the link connecting to PF-1CGE-CFP or P1-PTX-2-100GE-CFP instead of two independent 50-Gigabit Ethernet interfaces.

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces `et-fpc/pic/0:0` and `et-fpc/pic/0:1`, where *fpc* is the FPC slot number and *pic* is the PIC slot number. For example, to configure two physical interfaces for PIC slot 0 in FPC slot 5:

1. Specify the number of aggregated Ethernet interfaces to be created.

```
[edit chassis]
user@host# set aggregated devices ethernet device-count count
```

For example:

```
[edit chassis]
user@host# set aggregated devices ethernet device-count 1
```

2. Specify the members to be included within the aggregated Ethernet bundle.

```
[edit interfaces]
user@host# set interface-name gigether-options 802.3ad bundle
```

The following example shows how to configure two physical interfaces for PIC 0 on a T1600 router.

```
[edit interfaces]
user@host# set et-5/0/0:0 gigether-options 802.3ad ae0
user@host# set et-5/0/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the chassis.

```
[edit]
user@host# show chassis
 aggregated-devices {
 ethernet {
 device-count 1;
 }
 }
}
```

4. Verify the configuration at the interface.

```
[edit]
user@host# show interfaces
 et-5/0/0:0 {
 gigether-options {
 802.3ad ae0;
 }
 }
 et-5/0/0:1 {
 gigether-options {
 802.3ad ae0;
 }
 }
}
```

## Understanding Rate Selectability

The maximum amount of data that can be transmitted through a port at any given second either by a network device or by a component of the network device (such as a line card) is known as the port speed. Port speed is measured in kilobits per second (Kbps), gigabits per second (Gbps), and terabits per second (Tbps). If a port can be configured to multiple speeds, the port is known as a *rate-selectable* port. Because the port is part of a network device (router or switch) or a network component (such as MPC, MIC) the component is known as a rate-selectable component. For instance, if a Modular Port Concentrator (MPC) supports multiple speeds, it is known as a rate-selectable MPC. If a Modular Interface Card (MIC) supports multiple speeds, it is known as a rate-selectable MIC. The term *multi-rate* in the name of a component also indicates support for more than one speed.

Rate selectability enables you to configure the port speed either at the port level or at the PIC or MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC or PIC level. To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled.

When you configure rate selectability at the MIC or PIC level, all the ports of the MIC or PIC that support the configured speed operate at that speed. To prevent switch fabric interface oversubscription—for example, with the Switch Fabric Board SFB or SFB2— and to ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed. For instance, on a router with SFB, if you want only eight ports of the MIC to operate at 40 Gbps, you can configure the MIC to operate at 40 Gbps and enable the eight ports that you want to operate at that speed. The remaining ports of the MIC are automatically disabled. For example, on MPC8E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces and two 40-Gigabit Ethernet interfaces per MIC. All other interfaces are automatically disabled. Configuring rate selectability at the MIC level helps you configure the operating speed of the MIC easily.

**NOTE:** The total port speed of the MIC cannot exceed the forwarding capacity of the Packet Forwarding Engine.

---

Configuring rate selectability at the port level provides you the flexibility of operating the ports of the MIC at different supported speeds. For example, you can configure four 10-Gigabit Ethernet interfaces on port 0, one 40-Gigabit Ethernet interface on port 1, and one 100-Gigabit Ethernet interface on port 2.

**NOTE:** When you configure rate selectability at the port level, ensure that you plug in transceivers to the ports according to the speeds that you configure. For instance, use 4x duplex LC breakout transceivers to configure 10-Gigabit Ethernet interfaces, fiber-optic 40-gigabit QSFP+ transceivers to configure 40-Gigabit Ethernet interfaces, and fiber-optic 100-gigabit QSFP28 transceivers to configure 100-Gigabit Ethernet interfaces.

### Rate Selectability on MPC7E-MRATE

MPC7E (MPC7E-MRATE) is a fixed-configuration MPC and is supported on MX240, MX480, MX960, MX2010, and MX2020 routers. MPC7E-MRATE contains two built-in PICs, PIC 0 and PIC 1. Each PIC has six physical ports that support quad small form-factor pluggable plus (QSFP+) transceivers. The default port speed is 10 Gbps for all ports. Each of the six ports of PIC 0 and PIC 1 supports speeds of 10 Gbps and 40 Gbps. However, only ports 2 and 5 on both the PICs support 100 Gbps speed.

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

For information about the naming conventions for interfaces on MPC7E-MRATE MPC, see [“Understanding Interface Naming Convention for MPC7E-MRATE” on page 315](#).

### Rate Selectability on MIC-MRATE

MPC8E (MX2K-MPC8E) and MPC9E (MX2K-MPC9E) support two separate slots for MICs as field replaceable units (FRUs). Each of the MIC slots supports only one MIC—MIC-MRATE. MIC-MRATE consists of 12 physical ports that support QSFP+ transceivers and multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps. You can configure a port to operate in a specific speed based on your requirement. The default port speed is 10 Gbps for all ports. MIC-MRATE also supports breakout transceivers, which you can use to split a 40-Gigabit Ethernet port into four 10-Gigabit Ethernet ports. MIC-MRATE ports can be split into a maximum of 48 10-Gigabit Ethernet interfaces.

MPC8E has an aggregate forwarding capacity of 960 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. MPC9E has an aggregate forwarding capacity of 1600 Gbps and a forwarding capacity of 400 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC8E, the demand on each Packet Forwarding Engine must

be less than or equal to 240 Gbps and for MPC9E, the demand per Packet Forwarding Engine must be less than or equal to 400 Gbps.

On MPC8E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces and two 40-Gigabit Ethernet interfaces per MIC. All other interfaces are automatically disabled. On MPC9E with MIC-MRATE, you can configure eight ports as 100-Gigabit Ethernet interfaces and the other ports can be configured only as 40-Gigabit Ethernet Interfaces or 10-Gigabit Ethernet interfaces.

For information about the naming conventions for interfaces on MPC8E and MPC9E, see [“Understanding Interface Naming Conventions for MIC-MRATE” on page 316](#).

### Rate Selectability on JNP10K-LC2101

JNP10K-LC2101 is a fixed-configuration MPC and is supported on MX10008 routers. JNP10K-LC2101 contains six built-in PICs, PIC 0 to PIC 5. Each PIC has four physical ports that support quad small form-factor pluggable plus (QSFP+) transceivers. The default port speed is 10 Gbps for all ports. Each of the four ports of PIC 0 to PIC 5 supports speeds of 10 Gbps (using breakout cables), 40 Gbps, and 100 Gbps.

MX10008 routers support eight JNP10K-LC2101 MPCs. By default, each JNP10K-LC2101 MPC provides a maximum bandwidth of 1.44 Tbps. JNP10K-LC2101 has six Packet Forwarding Engines, each providing a maximum bandwidth of up to 240 Gbps, which cannot be oversubscribed. You can configure JNP10K-LC2101 to provide an increased bandwidth of 2.4 Tbps. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, by default, for JNP10K-LC2101, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps. However, if you have configured JNP10K-LC2101 to provide an increased bandwidth of 2.4 Tbps, the demand on each Packet Forwarding Engine must be less than or equal to 480 Gbps.

For information about the naming conventions for interfaces on JNP10K-LC2101 MPC, see [“Understanding Interface Naming Conventions for JNP10K-LC2101” on page 321](#).

### Rate Selectability on MIC-MACSEC-20GE

The MIC-MACSEC-20GE MIC provides 128-bit and 256-bit MACsec encryption on all the twenty 1GE and on the two 10GE ports in the following hardware configuration:

- Installed directly on the MX80 and MX104 routers
- Installed on MPC1, MPC2, MPC3, MPC2E, MPC3E, MPC2E-NG, and MPC3E-NG line cards on the MX240, MX480, and MX960 routers

By default, 128-bit MACsec encryption is supported.

The twenty 1-Gigabit Ethernet SFP ports distributes the ports across PIC0 and PIC1, that are logical PICs on the physical MIC. The two 10-Gigabit Ethernet SFP+ ports are physically located on PIC1. But, the 10-Gigabit interfaces are created by distributing the ports in either of the PICs. For information about the naming conventions for interfaces on MIC-MACSEC-20GE, see [“Understanding Interface Naming Conventions for MIC-MACSEC-20GE” on page 384](#).

**NOTE:**

- When the pic-mode is changed from 1-Gbps to 10-Gbps or vice versa, the Flexible PIC Concentrator (FPC) in MX240, MX480, MX960 routers and the Forwarding Engine Board (FEB) in MX80, MX104 routers undergoes an automatic bounce or reboot.
- When the MIC-MACSEC-20GE is operating in the 10-Gbps mode, all the other 1-Gbps ports are disabled.

## Rate Selectability on MPC10E-15C-MRATE

MPC10E-15C-MRATE (15x100G) is a fixed-configuration MPC for MX240, MX480, and MX960 routers, that is capable of delivering up to 1.5T per-slot bandwidth. It consists of three PFE complexes per MPC and each PFE is capable of delivering up to 500G throughput. It supports three PICs per MPC, one PIC per PFE. Each PIC hosts five QSFP28 (5xQSFP28) ports that supports 4x10-Gbps, 40-Gbps, and 100-Gbps speeds using QSFP+, QSFP28+ optics types. The 4x10-Gbps speed is supported using breakout cables. The MPC10E-15C-MRATE MPC can be plugged into the MX240, MX480, and MX960 routers only. MPC10E-15C-MRATE is not supported on the MX2000 or the MX10000 lines of routers.

For information about the naming conventions for interfaces on MPC10E-15C-MRATE, see [“Understanding Interface Naming Conventions for MPC10E-15C-MRATE MPC” on page 323](#).

## Guidelines for Configuring Rate Selectability

---

This topic describes the guidelines to consider when configuring rate selectability at the port level or the PIC or MIC level.

- If rate selectability is not configured, all ports of the MIC-MRATE MIC and MPC7E-MRATE MPC operate as four 10-Gigabit Ethernet interfaces by default. Therefore, when booting the MPC:
  - If rate selectability is not configured or if invalid port speeds are configured, an alarm is generated to indicate that the configuration is invalid. All the ports operate as four 10-Gigabit Ethernet interfaces.
  - If valid port speeds are configured, the PIC and MIC operate at the configured speed.
- When you change an existing port speed configuration at the port level, you must reset the MPC7E-MRATE PIC for the configuration to take effect.

Similarly, when you change an existing port speed configuration at the port level for MPC8E or MPC9E, you must reset the MIC for the configuration to take effect. You can use the **request chassis mic mic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)** command to reset the MIC and apply your configuration changes.

An alarm is generated indicating the change in port speed configuration.

- When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. For example, on the MPC7E-MRATE, if you configure the port speed of port 3 as 100 Gbps, it is an invalid configuration. MPC7E -MRATE supports 100 Gbps only on ports 2 and 5. The MPC continues to operate using the existing port speed configuration or the default port speed.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- When you configure rate selectability at the port level, only the configured ports are enabled. Other ports are disabled.

## Guidelines for Configuring Rate Selectability for JNP10K-LC2101

This topic describes the guidelines to consider when configuring rate selectability at the port level or the PIC level for JNP10K-LC2101:

- Each port on the JNP10K-LC2101 MPC supports speeds of 10 Gbps (using breakout cables), 40 Gbps, and 100 Gbps. However, JNP10K-LC2101 MPC does not support bandwidth oversubscription. So, when you configure the ports on all PICs, ensure that the demand on each Packet Forwarding Engine is less than or equal to its forwarding capacity. The default port speed for all PICs is 10G.
- When you change an existing port speed configuration at the port level, you must reset the PIC for the configuration to take effect. When you change an existing port speed configuration at the PIC level, the JNP10K-LC2101 automatically resets the PIC.

- When you change the number of active ports using the **number-of-ports** command, you must reset the PIC for the configuration to take effect. Interfaces are created only for active ports. Only the ports you configure are known as the active ports. The number of active ports enables you to handle bandwidth oversubscription.

**NOTE:** You cannot configure the number of active ports at the port level. If you attempt to configure the number of active ports at the port level, an error message is displayed.

- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. The MPC continues to operate using the existing port speed configuration or the default port speed.

## Understanding Interface Naming Convention for MPC7E-MRATE

MPC7E (MPC7E-MRATE) is a fixed-configuration MPC and contains two built-in PICs, PIC 0 and PIC 1. Each of the six ports of PIC 0 and PIC 1 support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps and can be configured as 10-Gigabit Ethernet and 40-Gigabit Ethernet interfaces. However, you can configure only ports 2 and 5 on both the PICs as 100-Gigabit Ethernet interfaces.

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **et-0/0/2** indicates either a 40-Gigabit Ethernet or a 100-Gigabit Ethernet interface configured on port 2 of PIC 0 of the MPC7E-MRATE MPC that is installed in the MPC slot 0. **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the MPC7E-MRATE MPC that is installed in the MPC slot 0.

[Table 27 on page 316](#) lists the naming conventions for interfaces on MPC7E-MRATE for MX240, MX480, MX960, MX2010, and MX2020 routers.

**Table 27: Interface Naming Convention for MPC7E-MRATE**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | <code>xe-x/0/0/[0-3]</code>   | <code>et-x/0/0</code>         | -                              |
|                          | <code>xe-x/0/1:[0-3]</code>   | <code>et-x/0/1</code>         | -                              |
|                          | <code>xe-x/0/2:[0-3]</code>   | <code>et-x/0/2</code>         | <code>et-x/0/2</code>          |
|                          | <code>xe-x/0/3:[0-3]</code>   | <code>et-x/0/3</code>         | -                              |
|                          | <code>xe-x/0/4:[0-3]</code>   | <code>et-x/0/4</code>         | -                              |
|                          | <code>xe-x/0/5:[0-3]</code>   | <code>et-x/0/5</code>         | <code>et-x/0/5</code>          |
| 1                        | <code>xe-x/1/0:[0-3]</code>   | <code>et-x/1/0</code>         | -                              |
|                          | <code>xe-x/1/1:[0-3]</code>   | <code>et-x/1/1</code>         | -                              |
|                          | <code>xe-x/1/2:[0-3]</code>   | <code>et-x/1/2</code>         | <code>et-x/1/2</code>          |
|                          | <code>xe-x/1/3:[0-3]</code>   | <code>et-x/1/3</code>         | -                              |
|                          | <code>xe-x/1/4:[0-3]</code>   | <code>et-x/1/4</code>         | -                              |
|                          | <code>xe-x/1/5:[0-3]</code>   | <code>et-x/1/5</code>         | <code>et-x/1/5</code>          |

## Understanding Interface Naming Conventions for MIC-MRATE

MIC-MRATE consists of twelve ports that support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps. MIC-MRATE is supported on MPC8E (MX2K-MPC8E) and MPC9E (MX2K-MPC9E) on MX2000 line of routers.

Starting with Junos OS Release 17.3R1, MIC-MRATE is supported on MX10003 MPC on MX10003 routers.

**NOTE:** By default, the MIC-MRATE ports are configured as 10-Gigabit Ethernet ports.

MPC8E has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. In Junos OS Release 16.1R1 and later, you can upgrade MPC8E to provide an increased bandwidth of 1600 Gbps (1.6 Tbps), by using an add-on license. After you configure the **bandwidth 1.6T** statement, MPC8E provides an increased bandwidth of 1.6 Tbps. The forwarding capacity is increased to 400 Gbps for each Packet Forwarding Engine.

MPC9E has a forwarding capacity of 400 Gbps for each Packet Forwarding Engine. Packet Forwarding Engine oversubscription is not supported. So, demand on each Packet Forwarding Engine should be less than or equal to its forwarding capacity. For MPC8E, demand on each Packet Forwarding Engine should be less than or equal to 240 Gbps and for MPC9E, demand on each Packet Forwarding Engine should be less than or equal to 400 Gbps.

**NOTE:** On MPC8E with MIC-MRATE, you can configure four ports as 100-Gigabit Ethernet interfaces. On MPC9E with MIC-MRATE and on MPC8E configured to operate at 1.6 Tbps by using an add-on license, you can configure eight ports as 100-Gigabit Ethernet interfaces.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MIC-MRATE MIC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the MIC-MRATE MIC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the MIC-MRATE MIC that is installed in the MPC slot 0. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit Ethernet interface configured on port 2 of MIC-MRATE MIC that is installed in the MPC slot 0.

[Table 28 on page 318](#) lists the naming conventions used for interfaces on MIC-MRATE when installed on slot 0 of MPC8E and MPC9E. [Table 29 on page 318](#) lists the naming conventions used for interfaces on MIC-MRATE when installed on slot 1 of MPC8E and MPC9E. MPC8E and MPC9E support two MIC-MRATE MICs each.

**NOTE:** The *x* in **et-x/0/0** and **xe-x/0/0:[0-3]** refers to the MPC slot number.

**Table 28: Interface Naming Convention for MIC-MRATE Installed on Slot 0 of MPC8E and MPC9E**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | xe-x/0/0:[0-3]                | et-x/0/0                      | et-x/0/0                       |
|                          | xe-x/0/1:[0-3]                | et-x/0/1                      | et-x/0/1                       |
|                          | xe-x/0/2:[0-3]                | et-x/0/2                      | et-x/0/2                       |
|                          | xe-x/0/3:[0-3]                | et-x/0/3                      | et-x/0/3                       |
|                          | xe-x/0/4:[0-3]                | et-x/0/4                      | -                              |
|                          | xe-x/0/5:[0-3]                | et-x/0/5                      | -                              |
| 1                        | xe-x/0/6:[0-3]                | et-x/0/6                      | et-x/0/6                       |
|                          | xe-x/0/7:[0-3]                | et-x/0/7                      | et-x/0/7                       |
|                          | xe-x/0/8:[0-3]                | et-x/0/8                      | et-x/0/8                       |
|                          | xe-x/0/9:[0-3]                | et-x/0/9                      | et-x/0/9                       |
|                          | xe-x/0/10:[0-3]               | et-x/0/10                     | -                              |
|                          | xe-x/0/11:[0-3]               | et-x/0/11                     | -                              |

**Table 29: Interface Naming Convention for MIC-MRATE Installed on Slot 1 of MPC8E and MPC9E**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 2                        | xe-x/1/0:[0-3]                | et-x/1/0                      | et-x/1/0                       |
|                          | xe-x/1/1:[0-3]                | et-x/1/1                      | et-x/1/1                       |
|                          | xe-x/1/2:[0-3]                | et-x/1/2                      | et-x/1/2                       |
|                          | xe-x/1/3:[0-3]                | et-x/1/3                      | et-x/1/3                       |
|                          | xe-x/1/4:[0-3]                | et-x/1/4                      | -                              |
|                          | xe-x/1/5:[0-3]                | et-x/1/5                      | -                              |

**Table 29: Interface Naming Convention for MIC-MRATE Installed on Slot 1 of MPC8E and MPC9E (continued)**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 3                        | xe-x/1/6:[0-3]                | et-x/1/6                      | et-x/1/6                       |
|                          | xe-x/1/7:[0-3]                | et-x/1/7                      | et-x/1/7                       |
|                          | xe-x/1/8:[0-3]                | et-x/1/8                      | et-x/1/8                       |
|                          | xe-x/1/9:[0-3]                | et-x/1/9                      | et-x/1/9                       |
|                          | xe-x/1/10:[0-3]               | et-x/1/10                     | -                              |
|                          | xe-x/1/11:[0-3]               | et-x/1/11                     | -                              |

Table 30 on page 319 lists the naming conventions used for interfaces on MIC-MRATE when installed on slot 0 of MX10003 MPC.

**Table 30: Interface Naming Convention for MIC-MRATE Installed on Slot 0 of Mx10003MPC**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | xe-x/0/0:[0-3]                | et-x/0/0                      | et-x/0/0                       |
|                          | xe-x/0/1:[0-3]                | et-x/0/1                      | et-x/0/1                       |
|                          | xe-x/0/2:[0-3]                | et-x/0/2                      | et-x/0/2                       |
|                          | xe-x/0/3:[0-3]                | et-x/0/3                      | et-x/0/3                       |
|                          | xe-x/0/4:[0-3]                | et-x/0/4                      | -                              |
|                          | xe-x/0/5:[0-3]                | et-x/0/5                      | -                              |
| 1                        | xe-x/0/6:[0-3]                | et-x/0/6                      | et-x/0/6                       |
|                          | xe-x/0/7:[0-3]                | et-x/0/7                      | et-x/0/7                       |
|                          | xe-x/0/8:[0-3]                | et-x/0/8                      | et-x/0/8                       |
|                          | xe-x/0/9:[0-3]                | et-x/0/9                      | et-x/0/9                       |
|                          | xe-x/0/10:[0-3]               | et-x/0/10                     | -                              |
|                          | xe-x/0/11:[0-3]               | et-x/0/11                     | -                              |

## Understanding Interface Naming Conventions for MX10003 MPC

The MX10003 MPC supports a Multi-Rate 12xQSFP28 Ethernet MIC (model numbers: JNP-MIC1 and JNP-MIC1-MACSEC) and the fixed-port PIC (6xQSFP).

Each of the 6 ports of the PIC supports 10-Gigabit Ethernet and 40-Gigabit Ethernet interfaces. Each of the 12 ports of the modular MIC supports 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces. All the ports of the modular MIC can be configured as 100-Gigabit Ethernet interfaces.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MX10003 MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the modular MIC that is installed in the MPC slot 1. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit Ethernet interface configured on port 2 of modular MIC that is installed in the MPC slot 1.

[Table 31 on page 320](#) lists the naming conventions used for interfaces on the fixed-port PIC when installed in slot 1 of the MX10003 MPC. [Table 32 on page 321](#) lists the naming conventions used for interfaces on the modular MIC when installed in slot 1 of the MPC.

**NOTE:** The *x* in **et-x/0/0** and **xe-x/0/0:[0-3]** refers to the MPC slot number.

**Table 31: Interface Naming Convention for the Fixed-Port PIC Installed in Slot 1 of MX10003 MPC**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | <b>xe-x/0/0:[0-3]</b>         | <b>et-x/0/0</b>               | —                              |
|                          | <b>xe-x/0/1:[0-3]</b>         | <b>et-x/0/1</b>               | —                              |
| 1                        | <b>xe-x/0/2:[0-3]</b>         | <b>et-x/0/2</b>               | —                              |
|                          | <b>xe-x/0/3:[0-3]</b>         | <b>et-x/0/3</b>               | —                              |
| 2                        | <b>xe-x/0/4:[0-3]</b>         | <b>et-x/0/4</b>               | —                              |
|                          | <b>xe-x/0/5:[0-3]</b>         | <b>et-x/0/5</b>               | —                              |

Table 32: Interface Naming Convention for Modular MIC Installed in Slot 1 of MX10003 MPC

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | xe-x/1/0:[0-3]                | et-x/1/0                      | et-x/1/0                       |
|                          | xe-x/1/1:[0-3]                | et-x/1/1                      | et-x/1/1                       |
|                          | xe-x/1/2:[0-3]                | et-x/1/2                      | et-x/1/2                       |
|                          | xe-x/1/3:[0-3]                | et-x/1/3                      | et-x/1/3                       |
| 1                        | xe-x/1/4:[0-3]                | et-x/1/4                      | et-x/1/4                       |
|                          | xe-x/1/5:[0-3]                | et-x/1/5                      | et-x/1/5                       |
|                          | xe-x/1/6:[0-3]                | et-x/1/6                      | et-x/1/6                       |
|                          | xe-x/1/7:[0-3]                | et-x/1/7                      | et-x/1/7                       |
| 2                        | xe-x/1/8:[0-3]                | et-x/1/8                      | et-x/1/8                       |
|                          | xe-x/1/9:[0-3]                | et-x/1/9                      | et-x/1/9                       |
|                          | xe-x/1/10:[0-3]               | et-x/1/10                     | et-x/1/10                      |
|                          | xe-x/1/11:[0-3]               | et-x/1/11                     | et-x/1/11                      |

## Understanding Interface Naming Conventions for JNP10K-LC2101

JNP10K-LC2101 is a fixed-configuration MPC and contains six built-in PICs, PIC 0 to PIC 5. Each PIC supports 4 ports. All ports support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps and can be configured as 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces.

JNP10K-LC2101 has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. JNP10K-LC2101 has six Packet Forwarding Engines. In Junos OS Release 18.2R1 and later, you can upgrade JNP10K-LC2101 to provide an increased bandwidth of 2400 Gbps (2.4Tbps), by using an add-on license. After you configure the **bandwidth 2.4T** statement, JNP10K-LC2101 provides an increased bandwidth of 2.4 Tbps. The forwarding capacity is increased to 400 Gbps for each Packet Forwarding Engine. Packet Forwarding

Engine oversubscription is not supported. So, demand on each Packet Forwarding Engine should be less than or equal to its forwarding capacity.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the JNP10K-LC2101 MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the JNP10K-LC2101 MPC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the JNP10K-LC2101 MPC that is installed in the MPC slot 0. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit Ethernet interface configured on port 2 of the JNP10K-LC2101 MPC that is installed in the MPC slot 0.

**NOTE:** Each Packet Forwarding Engine maps to a single built-in PIC on the JNP10K-LC2101.

Table 33 on page 322 lists the naming conventions used for interfaces on JNP10K-LC2101 for MX10008 routers. MX10008 routers support 8 JNP10K-LC2101 MPCs.

**NOTE:** The *x* in **et-x/0/0** and **xe-x/0/0:[0-3]** refers to the MPC slot number.

**Table 33: Interface Naming Convention for JNP10K-LC2101 MPC**

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 0                        | <b>xe-x/0/0:[0-3]</b>         | <b>et-x/0/0</b>               | <b>et-x/0/0</b>                |
|                          | <b>xe-x/0/1:[0-3]</b>         | <b>et-x/0/1</b>               | <b>et-x/0/1</b>                |
|                          | <b>xe-x/0/2:[0-3]</b>         | <b>et-x/0/2</b>               | <b>et-x/0/2</b>                |
|                          | <b>xe-x/0/3:[0-3]</b>         | <b>et-x/0/3</b>               | <b>et-x/0/3</b>                |
| 1                        | <b>xe-x/1/0:[0-3]</b>         | <b>et-x/1/0</b>               | <b>et-x/1/0</b>                |
|                          | <b>xe-x/1/1:[0-3]</b>         | <b>et-x/1/1</b>               | <b>et-x/1/1</b>                |
|                          | <b>xe-x/1/2:[0-3]</b>         | <b>et-x/1/2</b>               | <b>et-x/1/2</b>                |
|                          | <b>xe-x/1/3:[0-3]</b>         | <b>et-x/1/3</b>               | <b>et-x/1/3</b>                |

Table 33: Interface Naming Convention for JNP10K-LC2101 MPC (continued)

| Packet Forwarding Engine | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|--------------------------|-------------------------------|-------------------------------|--------------------------------|
| 2                        | xe-x/2/0:[0-3]                | et-x/2/0                      | et-x/2/0                       |

## Understanding Interface Naming Conventions for MPC10E-15C-MRATE MPC

Starting with Junos OS Release 19.1R1, the MPC10E-15C-MRATE (15x100G) is introduced for MX240, MX480, MX960 platforms, that is capable of delivering up to 1.5 terabits per-slot bandwidth. The MPC10E-15C-MRATE consists of three Packet Forwarding Engines (PFE) per MPC and each PFE is capable of delivering up to 500Gbps throughput. It supports three PICs per MPC, that is, one PIC per PFE, and five ports per PIC (that is,

fifteen ports per MPC). Each PIC contains 5xQSFP28 ports that supports 100-Gbps, 40-Gbps, and 10-Gbps speeds using QSFP28 and QSFP+ optics. The 10-Gbps speed is supported by using break out cables.

**NOTE:**

- MPC10E-15C-MRATE is only supported on MX240, MX480, MX960 routers and not on MX2000 series and MX10000 lines of routers.
- If you install the MPC10E-15C-MRATE, then the Switch Control Board MX-SCBE3 must be installed in the router in order for the MPC10E-15C-MRATE to come online.
- By default, the MPC10E-15C-MRATE ports are configured as 100-Gigabit Ethernet ports.

The interface names for the 10-Gigabit Ethernet interfaces uses the prefix xe- while the interface names for 40 and 100 interfaces uses the prefix et-. When multiple interfaces (or IFDs) are supported in a physical port, the colon (:) notation is used in the interface naming conventions (Example: 4x10GE interfaces). The colon (:) is used as a delimiter to differentiate the multiple interfaces (or IFDs) in a physical port.

By default, the 100-Gigabit Ethernet and 40-Gigabit Ethernet interfaces appear in the et-fpc/pic/port format. When the 40-Gigabit Ethernet interfaces are channelized as 10-Gigabit Ethernet interfaces, the interface names appear in the xe-fpc/pic/port:channel format, where channel can be a value of 0 through 3.

**NOTE:** In the interface naming convention et-x/y/z and xe-x/y/z:[0-3] :

- x refers to the FPC slot number.
- y refers to the PIC slot number. The valid range is 0 to 2.
- z refers to the physical port number. The valid range is 0 to 4.

**Table 34: Interface Naming Convention for MPC10E-15C-MRATE**

| PIC | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|-----|-------------------------------|-------------------------------|--------------------------------|
| 0   | xe-x/0/0:[0-3]                | et-x/0/0                      | et-x/0/0                       |
|     | xe-x/0/1:[0-3]                | et-x/0/1                      | et-x/0/1                       |
|     | xe-x/0/2:[0-3]                | et-x/0/2                      | et-x/0/2                       |

## Understanding Interface Naming Conventions for MPC10E-10C-MRATE MPC

Starting with Junos OS Release 19.2R1, the MPC10E-10C-MRATE (10x100G) is introduced for MX240, MX480, MX960 platforms, that is capable of delivering up to 1 terabits per-slot bandwidth. The MPC10E-10C-MRATE consists of two Packet Forwarding Engines (PFE) per MPC and each PFE is capable of delivering up to 500Gbps throughput. It supports two PICs per MPC, that is, one PIC per PFE, and five ports per PIC (that is, fifteen ports per MPC). Each PIC contains 5xQSFP28 ports that supports 100-Gbps, 40-Gbps, and 10-Gbps speeds using QSFP28 and QSFP+ optics. The 10-Gbps speed is supported by using break out cables.

**NOTE:**

- MPC10E-10C-MRATE is only supported on MX240, MX480, MX960 routers and not on MX2000 series and MX10000 lines of routers.
- If you install the MPC10E-10C-MRATE, then the Switch Control Board MX-SCBE3 must be installed in the router for the MPC10E-10C-MRATE to come online.
- By default, the MPC10E-10C-MRATE ports are configured as 100-Gigabit Ethernet ports.

The interface names for the 10-Gigabit Ethernet interfaces uses the prefix `xe-` while the interface names for 40 and 100 interfaces uses the prefix `et-`. When multiple interfaces (or IFDs) are supported in a physical port, the colon (:) notation is used in the interface naming conventions (Example: 4x10GE interfaces). The colon (:) is used as a delimiter to differentiate the multiple interfaces (or IFDs) in a physical port.

By default, the 100-Gigabit Ethernet and 40-Gigabit Ethernet interfaces appear in the `et-fpc/pic/port` format. When the 40-Gigabit Ethernet interfaces are channelized as 10-Gigabit Ethernet interfaces, the interface names appear in the `xe-fpc/pic/port:channel` format, where channel can be a value of 0 through 3.

**NOTE:** In the interface naming convention `et-x/y/z` and `xe-x/y/z:[0-3]` :

- `x` refers to the FPC slot number.
- `y` refers to the PIC slot number. The valid range is 0 to 1.
- `z` refers to the physical port number. The valid range is 0 to 4.

**Table 35: Interface Naming Convention for MPC10E-10C-MRATE**

| PIC | 10-Gigabit Ethernet Interface | 40-Gigabit Ethernet Interface | 100-Gigabit Ethernet Interface |
|-----|-------------------------------|-------------------------------|--------------------------------|
| 0   | <code>xe-x/0/0:[0-3]</code>   | <code>et-x/0/0</code>         | <code>et-x/0/0</code>          |
|     | <code>xe-x/0/1:[0-3]</code>   | <code>et-x/0/1</code>         | <code>et-x/0/1</code>          |
|     | <code>xe-x/0/2:[0-3]</code>   | <code>et-x/0/2</code>         | <code>et-x/0/2</code>          |
|     | <code>xe-x/0/3:[0-3]</code>   | <code>et-x/0/3</code>         | <code>et-x/0/3</code>          |
|     | <code>xe-x/0/4:[0-3]</code>   | <code>et-x/0/4</code>         | <code>et-x/0/4</code>          |

## Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, on MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

**NOTE:** By default, the MPC7E-MRATE ports are configured as 10-Gigabit Ethernet ports.

When you configure rate selectability at the MIC level, all the ports supporting that port speed are enabled by default. This can lead to fabric oversubscription in certain cases. To prevent fabric oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports**

**number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate selectability at the port level.

Table 36 on page 328 lists the active physical ports on MPC7E-MRATE.

**Table 36: Active Physical Ports on MPC7E-MRATE MPC for Configuring Rate Selectability at PIC Level**

| Ports Configured<br>(number-of-ports<br>Statement) | Active Physical Ports for Different Configured Speeds |                     |                      |
|----------------------------------------------------|-------------------------------------------------------|---------------------|----------------------|
|                                                    | 10-Gigabit Ethernet                                   | 40-Gigabit Ethernet | 100-Gigabit Ethernet |
| 1                                                  | 0                                                     | 0                   | 2                    |
| 2                                                  | 0, 1                                                  | 0, 1                | 2, 5                 |
| 3                                                  | 0, 1, 2                                               | 0, 1, 2             | 2, 5                 |
| 4                                                  | 0, 1, 2, 3                                            | 0, 1, 2, 3          | 2, 5                 |
| 5                                                  | 0, 1, 2, 3, 4                                         | 0, 1, 2, 3, 4       | 2, 5                 |
| 6                                                  | 0, 1, 2, 3, 4, 5                                      | 0, 1, 2, 3, 4, 5    | 2, 5                 |

MPC8E has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. MPC9E has a forwarding capacity of 400 Gbps for each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, on MPC8E, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps and on MPC9E, the demand on each Packet Forwarding Engine must be less than or equal to 400 Gbps.

**NOTE:** By default, the MIC-MRATE ports are configured as 10-Gigabit Ethernet ports.

Table 37 on page 328, Table 38 on page 329 list the active physical ports on MPC8E and MPC9E.

## Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC

When you configure rate selectability at the MIC level, all the ports supporting that port speed are enabled by default. This can lead to fabric oversubscription in certain cases. To prevent fabric oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports** **number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate selectability at the port level.

Starting in Junos OS Release 17.3R1, the MX10003 MPC supports rate selectability to prevent oversubscription of the Packet Forwarding Engine bandwidth.

[Table 39 on page 331](#) lists the active physical ports on MX10003 MPC for Configuring Rate Selectability at the MIC Level.

**Table 39: Active Physical Ports on the MX10003 MPC for configuring rate selectability at the MIC level**

## Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router

The maximum capacity of an MX204 router is 400 Gbps, which cannot be oversubscribed. In MX204, the network ports are available in two groups (referred to as PICs), with restrictions around the number and type of ports that can be configured without oversubscription.

Starting in Junos OS Release 17.4R1, the MX204 supports rate selectability to prevent oversubscription of the Packet Forwarding Engine bandwidth. The MX204 Packet Forwarding Engine has four 100-Gigabit Ethernet QSFP28 ports (referred to as PIC 0 ports) and eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). Each of the PIC 0 ports can be used as either a 100-Gigabit Ethernet QSFP28 port or a 40-Gigabit Ethernet QSFP28 port, or they can be configured as four 10-Gigabit Ethernet ports (using a breakout cable).

If you configure rate selectability at the PIC level, all the ports supporting that port speed are enabled by default. This can lead to oversubscription in certain cases. To prevent the oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

### NOTE:

- You cannot configure the number of active ports when you configure rate selectability at the port level.

## Invalid Port Configuration

You must try to avoid configuring ports that can lead to oversubscription.

Following is an example of an invalid configuration:

```
4x100GE + 8X10GE
```

If you try to commit an invalid configuration, the configuration gets committed, but the port is not activated. This is because Junos OS allows you to configure a port before a line card is inserted. You will get an error message in the output of the `show chassis alarms` command and also in the log messages.

**NOTE:** When you are in port configuration mode, all the ports are configured as 10-Gigabit Ethernet.

## Configuring Active Ports on MX204 Router with Rate Selectability

Table 41 on page 333 summarizes the active ports with *number-of-ports* configured but without any rate selectability configuration for an MX204 router. Because there is no rate selectability configured, the default speed is used in these cases.

**Table 41: Active Physical Ports on the MX204 Router for Configuring Rate Selectability at PIC level**

| PIC   | Number of Ports<br>( <i>number-of-ports</i> Statement) | Active Ports                          |                                       |                                        |

## Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-15C-MRATE

When you configure speed at the PIC level, all the ports supporting that port speed are enabled by default. This could lead to Packet Forwarding Engine (PFE) oversubscription. To prevent oversubscription, configure the number of active ports that operate at the configured speed by using the **number-of-ports number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate at the port level.

Starting in Junos OS Release 19.1R1, the MPC10E-15C-MRATE supports rate selectability to prevent oversubscription of the PFE bandwidth.

[Table 44 on page 335](#) summarizes the active ports with **number-of-ports** and without any rate selectability configuration for MPC10E-15C-MRATE. Because there is no rate selectability configured, the default mode and no **pic-mode** configuration is applied.

**Table 44: Active Ports with number-of-ports and without rate-selectability**

| Number of Active Ports | Active Ports with PIC level rate selectability |                     |                      |
|------------------------|------------------------------------------------|---------------------|----------------------|
|                        | 10-Gigabit Ethernet                            | 40-Gigabit Ethernet | 100-Gigabit Ethernet |
| 1                      | -                                              | -                   | 0                    |
| 2                      | -                                              | -                   | 0, 1                 |
| 3                      | -                                              | -                   | 0, 1, 2              |
| 4                      | -                                              | -                   | 0, 1, 2, 3           |
| 5                      | -                                              | -                   | 0, 1, 2, 3, 4        |

[Table 45 on page 335](#) list the active ports without **number-of-ports** and with rate selectability at PIC level for MPC10E-15C-MRATE.

**Table 45: Active Ports without number-of-ports and with speed configured at PIC level**

| PIC Type                | Active Ports with speed configured at PIC level |                     |                      |

## Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-10C-MRATE

When you configure speed at the PIC level, all the ports supporting that port speed are enabled by default. This could lead to Packet Forwarding Engine (PFE) oversubscription. To prevent oversubscription, configure the number of active ports that operate at the configured speed by using the **number-of-ports** *number-of-active-physical-ports* configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate at the port level.

Starting in Junos OS Release 19.2R1, the MPC10E-10C-MRATE supports rate selectability to prevent oversubscription of the PFE bandwidth.

[Table 44 on page 335](#) summarizes the active ports with **number-of-ports** and without any rate selectability configuration for MPC10E-10C-MRATE. Because there is no rate selectability configured, the default mode and no **pic-mode** configuration is applied.

**Table 47: Active Ports with number-of-ports and without rate-selectability**

| Number of Active Ports | Active Ports with PIC level rate selectability |                     |                      |
|------------------------|------------------------------------------------|---------------------|----------------------|
|                        | 10-Gigabit Ethernet                            | 40-Gigabit Ethernet | 100-Gigabit Ethernet |
| 1                      | -                                              | -                   | 0                    |
| 2                      | -                                              | -                   | 0, 1                 |
| 3                      | -                                              | -                   | 0, 1, 2              |
| 4                      | -                                              | -                   | 0, 1, 2, 3           |
| 5                      | -                                              | -                   | 0, 1, 2, 3, 4        |

[Table 45 on page 335](#) lists the active ports without **number-of-ports** and with rate selectability at PIC level for MPC10E-10C-MRATE.

**Table 48: Active Ports without number-of-ports and with speed configured at PIC level**

## Configuring Rate Selectability on MIC-MRATE to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the MIC level, use the **pic-mode** statement and specify the port speed. To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to specify the speed of individual ports. This topic describes how to configure port speeds at the port level and at the MIC level.

**NOTE:** The **pic** in the configuration commands refers to the MRATE MIC. To specify **pic-number**, specify the MRATE MIC slot. For instance, when you use the `edit chassis fpc fpc-slot-number pic pic-slot-number` statement, specify the MPC slot number and the MIC-MRATE slot number.

- [Configuring Rate Selectability on MIC-MRATE at MIC Level on page 339](#)
- [Configuring Rate Selectability on MIC-MRATE at Port Level on page 341](#)

### Configuring Rate Selectability on MIC-MRATE at MIC Level

To configure all ports to operate at the same speed, you configure rate selectability at the MIC level. The default port speed is 10 Gbps for all ports. When you configure rate selectability at the MIC level, all the ports of the MIC that support the configured speed operate at that speed. To prevent oversubscription and ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed by using the **number-of-ports number-of-active-physical-ports** statement. MIC-MRATE supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

For MPC8E, you can only configure 4 ports of the 12 MIC-MRATE ports with 100 Gbps port speed and the other ports are disabled. So, if you configure **100G** as the operating speed for ports 0, 1, 6, and 7, then the other ports are disabled on MPC8E. Similarly, when you configure the port speed as 100 Gbps at the MIC level on MPC9E, you can only configure 8 ports of the 12 MIC-MRATE ports to operate with that speed. So, if you

configure **100G** as the operating speed for ports 0, 1, 2, 3, 6, 7, 8, and 9, then the other ports are disabled on MPC9E. However, enabling port speed of 40 Gbps or 10 Gbps at the MIC level, enables all ports and sets the desired port speed on all ports.

To configure rate selectability at the MIC level:

1. In configuration mode, navigate to the **[edit chassis fpc *fpc-slot* pic *pic-number*]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 4 pic 0
```

2. Configure the **pic-mode *pic-speed*** statement to set the operating speed for the MIC. All ports of the MIC that support the configured speed operate at the configured speed. Values for the pic-speed option include: **10G**, **40G**, and **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on MPC7E-MRATE, MPC8E, and MPC9E see [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription” on page 327](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set number-of-ports 8
```

4. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
```

```
pic-mode 10G;
number-of-ports 8;
```

5. Commit your configuration changes.

In this example, you have configured 8 ports on MIC-MRATE with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MIC-MRATE at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the MIC at different supported speeds. For example, on MPC9E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces on ports 0, 1, 6, and 7 and two 40-Gigabit Ethernet interfaces on ports 3 and 8. You can use breakout transceivers to configure each 40-Gigabit Ethernet interfaces as four 10-Gigabit Ethernet interfaces.

**NOTE:** When you change the port speed at the port level, you must reset the MPC for the configuration to take effect. Because resetting the MPC takes several minutes and since it affects all the PFEs, you can choose to use the `request chassis mic mic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)` command to reset the MIC and apply your configuration changes. An alarm is generated indicating the change in port speed. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 4 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10G**, **40G**, or **100G** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set port 0 speed 100G
user@host# set port 1 speed 100G
user@host# set port 3 speed 40G
user@host# set port 6 speed 100G
user@host# set port 7 speed 100G
user@host# set port 8 speed 40g
```

**NOTE:** All the twelve ports of MIC-MRATE support 10-Gbps and 40-Gbps port speeds. On MPC8E with MIC-MRATE, you can configure 4 ports out of the twelve MIC-MRATE ports with a port speed of 100 Gbps. On MPC9E with MIC-MRATE, you can configure 8 ports out of the twelve MIC-MRATE ports with a port speed of 100 Gbps.

### 3. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
port 0 {
 speed 100g;
}
port 1 {
 speed 100g;
}
port 3 {
 speed 40g;
}
port 6 {
 speed 100g;
}
port 7 {
 speed 100g;
}
port 8 {
 speed 40g;
}
```

### 4. Commit your configuration changes.

In this example, you have configured 4 ports on MIC-MRATE with port speed of 100 Gbps and 2 ports with port speed of 40 Gbps. The total capacity per MIC, based on this configuration, is 480 Gbps. MIC-MRATE has two Packet Forwarding Engines. The forwarding capacity for each Packet Forwarding Engine is 400 Gbps for MPC9E and 240 Gbps for MPC8E. The configured value does not exceed the forwarding capacity and so is a valid configuration.

- [Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on page 327](#)
- [Understanding Rate Selectability on page 310](#)

## Configuring Rate Selectability on MPC7E (Multi-Rate) to Enable Different Port Speeds

Each of the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC supports port speeds of 10 Gbps and 40 Gbps. However, only ports 2 and 5 of both the PICs support port speed of 100 Gbps. Because the MPC7E-MRATE MPC is rate-selectable, you can choose to configure all supported ports of the MPC to operate at the same supported speed or configure all the ports at different supported speeds.

You configure rate selectability at the PIC level if you intend to operate all the ports of the MPC7E-MRATE MPC at the same speed. That is, you can choose to configure the PIC to operate at a supported speed, and then all the *supported ports* of the PIC operate at the configured speed. For example, if you choose to configure PIC 0 at 100-Gbps speed, only ports 2 and 5 of PIC 0 operate at 100-Gbps speed, while the other ports of the PIC are disabled. Similarly, if you choose to configure PIC 0 at 10-Gbps or 40-Gbps speed, all the ports of the PIC are enabled to operate at those speeds. Additionally, you can prevent oversubscription by specifying the number of active physical ports that operate at 10-Gbps, 40-Gbps, and 100-Gbps speeds.

You configure rate selectability at the port level if you intend to operate different ports of the MPC7E-MRATE MPC at different supported speeds. That is, you configure each port to operate at a supported speed.

**NOTE:** The MPC7E-MRATE MPC supports an aggregate bandwidth of 480 Gbps, and each of the two PICs supports a bandwidth limit of 240 Gbps. If the aggregate port capacity configured exceeds 240 Gbps per PIC, the configuration is not supported.

- [Configuring Rate Selectability at PIC Level on page 343](#)
- [Configuring Rate Selectability at Port Level on page 345](#)

### Configuring Rate Selectability at PIC Level

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 4 pic 0
```

2. Configure the **pic-mode** statement to set the operating speed for the PIC's ports. According to your requirements, you can choose from the options **10G**, **40G**, or **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of ports that operate at the mode configured in Step 2.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set number-of-ports 6
```

4. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 6;
```

5. Commit your configuration changes.

If the **number-of-ports** statement is *not* configured, all the ports that support the speed configured in Step 2 are enabled. That is, depending on that selection, ports 0 through 5 are enabled for speeds of 10-gigabit or 40-gigabit, while ports 2 and 5 are enabled for 100-gigabit. [Table 50 on page 344](#) lists the physical ports that are enabled when the **number-of-ports** statement is configured.

**Table 50: Active Physical Ports on MPC7E-MRATE MPC Based on the number-of-ports Configuration**

| Ports Configured<br>(number-of-ports<br>Statement) | Active Physical Ports for Different Configured Speeds |            |             |
|----------------------------------------------------|-------------------------------------------------------|------------|-------------|
|                                                    | 10-Gigabit                                            | 40-Gigabit | 100-Gigabit |
| 1                                                  | 0                                                     | 0          | 2           |
| 2                                                  | 0, 1                                                  | 0, 1       | 2, 5        |

Table 50: Active Physical Ports on MPC7E-MRATE MPC Based on the number-of-ports Configuration (continued)

| Ports Configured<br>(number-of-ports<br>Statement) | Active Physical Ports for Different Configured Speeds |                  |             |
|----------------------------------------------------|-------------------------------------------------------|------------------|-------------|
|                                                    | 10-Gigabit                                            | 40-Gigabit       | 100-Gigabit |
| 3                                                  | 0, 1, 2                                               | 0, 1, 2          | 2, 5        |
| 4                                                  | 0, 1, 2, 3                                            | 0, 1, 2, 3       | 2, 5        |
| 5                                                  | 0, 1, 2, 3, 4                                         | 0, 1, 2, 3, 4    | 2, 5        |
| 6                                                  | 0, 1, 2, 3, 4, 5                                      | 0, 1, 2, 3, 4, 5 | 2, 5        |

## Configuring Rate Selectability at Port Level

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 4 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10g**, **40g**, or **100g** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10g | 40g | 100g)
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set port 0 speed 10g
user@host# set port 1 speed 10g
user@host# set port 2 speed 100g
user@host# set port 3 speed 40g
```

**NOTE:** All the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC support 10-Gbps and 40-Gbps port speeds. However, only ports 2 and 5 of both the PICs support 100-Gbps speed.

3. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
port 0 {
 speed 10g;
}
port 1 {
 speed 10g;
}
port 2 {
 speed 100g;
}
port 3 {
 speed 40g;
}
```

4. Commit your configuration changes.

**NOTE:**

Note the following when configuring rate selectability on an MPC7E-MRATE MPC:

- If rate selectability is not configured, all ports of the MPC7E-MRATE MPC operate as four 10-Gigabit Ethernet interfaces by default. Therefore, when booting the MPC:
  - If rate selectability is not configured or if invalid port speeds are configured, each port operates as four 10-Gigabit Ethernet interfaces. An alarm is generated to indicate that the ports of the MPC7E-MRATE MPC are operating as four 10-Gigabit Ethernet interfaces.
  - If valid port speeds are configured, the MPC PICs operate at the configured speed.
- When you change an existing port speed configuration, you must reset the MPC for the configuration to take effect. Because resetting the MPC takes several minutes and as it affects all the Packet Forwarding Engines, you can choose to use the `request chassis pic pic-slot pic-slot-number fpc-slot fpc-slot-number (online | offline)` command to apply your configuration changes quickly. An alarm is generated indicating the change in port speed configuration.
- When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. The MPC continues to operate using the previously configured valid port speed configuration. However, if the MPC or PIC is restarted with the committed invalid port configuration, all ports of the MPC operate as four 10-Gigabit Ethernet interfaces by default.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- When you configure rate selectability at the port level, only the configured ports are enabled. Other ports are disabled.
- Logical interfaces can be created only on ports that are enabled.

## MX10003 MPC Rate-Selectability Overview

---

MX10003 MPC supports a Multi-Rate 12xQSFP28 Ethernet Modular Interface Card (MIC) and a fixed-port PIC (6xQSFP). The MX10003 Packet Forwarding Engine has 6x40GE QSFP ports on the fixed-port PIC and 12x100GE QSFP28 ports on the MIC. For more information see *MX10003 MPC (Multi-Rate)*. Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC or PIC level. For more information see [“Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level” on page 366](#). To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. For more information see [“Configuring Rate Selectability on MX10003 MPC at Port Level” on page 368](#).

The ports on the MX10003 MPC are called rate-selectable or multirate ports as they support multiple port speeds. You can choose to configure all supported ports of the fixed port PIC or the MIC to operate at the same speed or configure all the ports at different supported speeds. However, all the PIC or MIC ports do not support all the port speeds. For example, you can choose to configure:

- A port in 4x10GE mode using QSFP-4x10GE optics and 4x10GE breakout cables.
- A port in 40GE mode using QSFP optics.
- A port in 100GE mode using QSFP28 optics.
- A port in 1GE mode (for the ports that is already operating in 10GE mode only) using QSFP-4x10GE optics on fixed PIC and non-MacSEC MIC.

### NOTE:

- You can use the [port-checker tool](#) to check whether the combination of ports you want to use is valid or not.
  - You can use the [Hardware Compatibility Tool](#) to find information about the pluggable transceivers supported on MX10003 router.
- 

The MX10003 MPC supports three Packet Forwarding Engines. The forwarding capacity of each Packet Forwarding Engine is 400Gbps which cannot be oversubscribed.

The MIC supports 12 ports. Each Packet Forwarding Engine is mapped to 4 ports of the MIC. Port 0 through port 3 are mapped to PFE0, port 4 through port 7 are mapped to PFE1, and port 8 through port 11 are mapped to PFE2. The fixed-port PIC supports 6 ports. Each Packet Forwarding Engine is mapped to two ports of the fixed-port PIC. Port 0 and port 1 are mapped to PFE0, port 2 and port 3 are mapped to PFE1, and port 4 and port 5 are mapped to PFE2. You can use the command **show chassis pic fpc-slot slot-number pic-slot slot-number** to display Packet Forwarding Engine mapping information and port speed information.

Table 51 on page 349 summarizes the Packet Forwarding Engine mapping and the supported port speeds.

**Table 51: Rate Selectability of MX10003 MPC**

| PIC                    | Port Number | Port Speed Supported                                                                                                                                                                     |
|------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIC 0 (Fixed-port PIC) | 0–5         | 40-Gigabit Ethernet<br>4x10-Gigabit Ethernet<br>NOTE: You can configure one or all 10G port operating in 4X10-Gigabit Ethernet mode to operate in 1-Gigabit Ethernet mode.               |
| PIC 1 (Multi-Rate MIC) | 0–11        | 100-Gigabit Ethernet<br>40-Gigabit Ethernet<br>4x10-Gigabit Ethernet<br>NOTE: On non-MACsec MIC, you can configure one or all the 4X10-Gigabit Ethernet port to 1-Gigabit Ethernet mode. |

Starting with Junos OS Release 18.1R1, the non-MACsec MIC on the MX10003 routers support 1-Gigabit Ethernet mode also on 10-Gigabit Ethernet mode ports.

Each of the 100-Gigabit Ethernet or 40-Gigabit Ethernet port can be split to four 10-Gigabit Ethernet ports that can be configured to operate as 1-Gigabit Ethernet port. You can also use 4x10GE LR breakout optics (QSFP-4X10GE-LR) at the MX10003 end and 1-Gigabit Ethernet EX optics at the remote end. It is only optional to use Juniper optics (SFP-GE40KM) at the remote end, as any vendor's EX (not SX or LX) optics can be used. Refer to [Hardware Compatibility Tool](#) for the list of pluggable transceivers supported on MX10003 router.

On MX10003 routers, when the port operates in 10-Gbps speed, you can change the operating speed to 1Gbps using the configuration **speed 1G** as follows:

```
set interfaces interface-name gigether-options speed 1g
```

Refer *speed (Gigabit Ethernet interface)* for more details.

Once you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed, but the **show interface** command displays for the field **Physical interface** (that is, the interface name prefix) as **XE / \_ /** and the **Speed Configuration** (that is, operating port speed) as **1GE**. On fixed-port PIC and non-MACsec MIC, you can configure one or all 10-Gbps port operating in 4X10-Gbps speed to operate in 1-Gbps speed.

1-Gbps speed is only supported in non-autonegotiation mode.

## NOTE:

- Any interface operating at 10-Gigabit Ethernet mode can be independently converted to 1-Gigabit Ethernet mode. For example, in multi-rate connections through split cables, when one of the ports operates at 1GE mode, the other three ports can still be configured in 1GE or 10GE mode.
- The MACsec MIC does not support 1-Gbps speed.
- The rate selectability at PIC level and port level does not support 1-Gbps speed. But you can configure the port configured at 10-Gbps speed to operate at 1-Gbps speed using the *speed (Gigabit Ethernet interface)* configuration statement at Gigabit Ethernet interface level.
- The 1-Gbps operation mode is only supported in non-autonegotiation mode.
- ISSU is not supported for the interfaces that are configured with 1-Gigabit Ethernet mode. If ISSU upgrade is carried out in 1-Gigabit Ethernet mode, then the behavior is unexpected and traffic loss can be expected. Refer *request vmhost software in-service-upgrade* for more details.

To view the speed configured for the interface, execute the *show interfaces extensive* command. The **Speed Configuration** output parameter in the command output indicates the current operation speed of the interface. If the interface is configured with 1-Gbps speed, then **Speed Configuration** displays **1G**; if the interface is configured with 10-Gbps speed, **Speed Configuration** displays **AUTO**.

For example:

```
user@host>show interfaces xe-0/1/11:0 extensive
Physical interface: xe-0/1/11:0, Enabled, Physical link is Up
Interface index: 284, SNMP ifIndex: 609, Generation: 383
Link-level type: Ethernet, MTU: 9192, MRU: 9200, LAN-PHY mode, Speed: 10Gbps,

 BPDU Error: None, Loop Detect PDU Error: None, MAC-REWRITE Error: None,
 Loopback: None, Source filtering: Disabled, Flow control: Enabled,
 Speed Configuration: 1G
...
```

In this example, the **Speed Configuration** output parameter displays 1G, which means the operation speed of xe-0/1/11:0 interface is 1-Gbps speed.

MX10003 MPC has an aggregate forwarding capacity of 1.2 Tbps and a forwarding capacity of 400 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For more information see, [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC” on page 330](#). For instance, for MX10003 MPC, the demand on each Packet Forwarding Engine must be less than or equal to 400 Gbps.

For example, on the fixed-port PIC, if you configure the port speed on one ports as 40 Gbps or on two port as 40 Gbps, then you can configure the ports on the MIC in one of the following ways:

- Three 100-Gigabit Ethernet interfaces
- Two 100-Gigabit Ethernet and two 40-Gigabit Ethernet interfaces
- Two 100-Gigabit Ethernet and eight 10-Gigabit Ethernet interfaces

The same rule is applicable to all Packet Forwarding Engines independently.

**NOTE:** Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using *speed (Gigabit Ethernet interface)* configuration statement as follows:

**set interfaces *interface-name* gigether-options speed *lg***

Table 52 on page 351 summarizes the port mode configuration at the Packet Forwarding Engine level.

**Table 52: PFE Based Port Mode Configuration**

| Port Speed configuration on PIC1(Gbps) |       |       |       | Port speed configuration on PIC0(Gbps) |       |
|----------------------------------------|-------|-------|-------|----------------------------------------|-------|
| 100                                    | 100   | 100   | 100   | 0                                      | 0     |
| 100                                    | 100   | 100   | 10/40 | 0                                      | 0     |
| 100                                    | 100   | 100   | 0     | 10/40                                  | 10/40 |
| 100                                    | 100   | 10/40 | 10/40 | 10/40                                  | 10/40 |
| 100                                    | 10/40 | 10/40 | 10/40 | 10/40                                  | 10/40 |
| 10/40                                  | 10/40 | 10/40 | 0     | 10/40                                  | 10/40 |
| 10/40                                  | 10/40 | 10/40 | 10/40 | 0                                      | 0     |

Table 53 on page 351 summarizes the PIC mode configuration.

**Table 53: PIC Mode Configuration**

| Port Speed configuration on PIC1(Gbps) | Port speed configuration on PIC0(Gbps)   |
|----------------------------------------|------------------------------------------|
| 100                                    | 0<br>Configure the number of ports to 0. |
| 10                                     | 10                                       |
| 40                                     | 40                                       |

Note the following caveats while configuring rate selectability on the MX10003 MPC:

- By default, the MX10003 router comes up with the PIC mode where all the interface operates at the same speed of 10-Gbps. That is, by default, both the PICs (PIC 0 and PIC 1) operate at 10-Gbps speed. To use different port speeds, you must first switch to the port mode and then change the default speed.

To change the default speed, you must select a port and configure a different port speed on it and reset both the PICs for the configuration to take effect. For example, select 40GE or 100GE on PIC 1 and 10GE on PIC 0. For this configuration to take effect, you must reset both PICs.

- Regardless of the line card— MIC (PIC1) or fixed-port PIC (PIC0) installed —you must configure *both the PICs and all the associated ports*, under the **[edit chassis]** hierarchy. Configuring ports on only one of the PICs results in an invalid configuration.
- The port speed configuration on the fixed-port PIC and the MIC must be homogenous. However, at port level you can configure port speeds in heterogeneous mode. For more information, see *Configuring Rate Selectability on MX10003 MPC at Port Level*.

For example, if you want to configure the port speed as 10 Gbps, the port speed of the fixed-port PIC and the MIC should be configured to 10 Gbps. If you want to configure the port speed as 40 Gbps, the port speed of the fixed-port PIC and the MIC should be configured to 40 Gbps. However, if you choose to configure all ports of the MX10003 MPC to operate as 100-Gigabit Ethernet interfaces, the ports on the MIC have to be configured to 100 Gbps and the **number-of-ports number-of-active-physical-ports** statement on the fixed-port PIC must be set to 0.

- When you configure rate selectability at the port level, only the configured ports are active. Other ports are disabled.
- When you choose an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid.
- You cannot configure the ports which will oversubscribe the Packet Forwarding Engine. For example, a combination of eleven 100-Gigabit Ethernet interfaces on the MIC and ten 10-Gigabit Ethernet interfaces on the fixed-port PIC will result in an invalid configuration. If you try to commit an invalid configuration, the configuration will get committed. However, the port will not be activated. You can execute the **show chassis alarms** to display the error message.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.

## Invalid Port Configuration

You cannot configure the ports which will oversubscribe the Packet Forwarding Engine.

For example, a combination of eleven 100-Gigabit Ethernet interfaces on the MIC and ten 10-Gigabit Ethernet interfaces on the fixed-port PIC will result in an invalid configuration. If you try to commit an invalid configuration, the configuration will get committed. However, the port will not be activated. You can execute the **show chassis alarms** to display the error message. The valid configuration in this case would be eleven

100-Gigabit Ethernet interfaces on the MIC and eight 10-Gigabit Ethernet interfaces on the fixed-port PIC.

#### Release History Table

| Release | Description                                                                                                                                              |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18.1R1  | Starting with Junos OS Release 18.1R1, the non-MACsec MIC on the MX10003 routers support 1-Gigabit Ethernet mode also on 10-Gigabit Ethernet mode ports. |

- [Configuring Rate Selectability on MX10003 MPC to Enable Different Port Speeds on page 365](#)
- *speed (Gigabit Ethernet interface)*

## MX204 Router Rate-Selectability Overview

The maximum amount of data that can be transmitted through a port at any given second either by a network device or by a component of the network device (such as a line card) is known as the port speed. Port speed is measured in kilobits per second (Kbps), gigabits per second (Gbps), and terabits per second (Tbps). If a port can be configured to support both single and multiple speeds, the port is known as a rate-selectable port. Because the port is part of a network device (router or switch) or a network component (such as MPC, MIC) the component is known as a rate-selectable component. Rate selectability enables you to configure different port speeds at the port level or at the PIC level.

The MX204 has four rate-selectable ports (referred to as PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). On PIC 0 and PIC 1, you can configure the 10-Gigabit Ethernet port(s) to operate in 1-Gigabit Ethernet mode (using *speed (Gigabit Ethernet interface)* command). The four rate-selectable ports supports QSFP28/QSFP+ transceivers, whereas the eight 10-Gigabit Ethernet ports supports SFP+ transceivers. Knowing the exact details of the port speeds for the PICs helps you to choose the speeds to configure on the ports or on the PICs. You can view the port speeds of the PIC by executing **show chassis pic** command. For more information, see [MX204 Router Overview](#) and [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 332](#).

If your configuration does not comply to the following rules, it is an invalid configuration. In this case, the invalid configuration will not take in to effect and the router stays with the prior configuration:

- The MX204 routers contains one Packet Forwarding Engine that has a total of four 'MACs' (otherwise called as 'port groups'). Two MACs out of four are pre-configured

as 1x100GE each and cannot be changed. The other two MACs can be channelized as one of the following each – either one 100-Gigabit Ethernet ports, or three 40-Gigabit Ethernet ports (or one or more ports can be channelized down to 10-Gigabit Ethernet ports too), or 12 10-Gigabit Ethernet ports.

**NOTE:**

- One Gigabit Ethernet port can also be substituted for 10-Gigabit Ethernet ports.
  - You cannot use the same MAC (or 'port groups') on both PICs.
- 
- Two modes - PIC and port modes are supported and both PICs must be running in same mode:
    - PIC mode is the default mode that shares MAC across PICs, and all ports on both PICs run at the same speed. On MX204 routers contain 24 10-Gigabit Ethernet ports as all 4 ports on PIC 0 are channelized down to four 10-Gigabit Ethernet ports (16) and using all eight 10-Gigabit Ethernet ports on PIC 1.
    - Port mode allows you to run ports at different speeds.
    - You cannot spread or share MACs across PICs.

**NOTE:**

- By default, the MX204 router comes up with the PIC mode where all the interface operates at the same speed of 10-Gbps. that is, by default, both the PICs (PIC 0 and PIC 1) operate at 10-Gbps speed. To use different port speeds, you must first switch to the port mode and then change the default speed.

To change the default speed, you must select a port and configure a different port speed on it and reset both the PICs for the configuration to take effect. For example, select 40GE or 100GE on PIC 0 and 10GE on PIC 1. For this configuration to take effect, you must reset both PICs.

- Not all port combinations will work. So, it is recommended to use the [port-checker tool](#) to check whether the combination of ports you want to use is valid or not.
- You can use the [Hardware Compatibility Tool](#) to find information about the pluggable transceivers supported on MX204 router.

---

The MX204 router supports two types of rate selectability configuration options:

- PIC Level Configuration: To configure all ports to operate at the same speed, you configure rate selectability at the PIC level.
- Port Level Configuration: To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled.

To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the *pic-mode* statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the *speed* statement to specify the speed of individual ports.

The examples below show the sample CLI command output of the port speed capability of the 4-port PIC 0 with QSFP+ transceivers and the 8-port PIC 1 with SFP+ transceivers on the MX204 router.

```

user@host> show chassis pic fpc-slot 0 pic-slot 0
...
Port Speed Information:

 Port Capable Port Speeds
 0 4x10GE, 40GE, 100GE
 1 4x10GE, 40GE, 100GE
 2 4x10GE, 40GE, 100GE
 3 4x10GE, 40GE, 100GE
...
user@host> show chassis pic fpc-slot 0 pic-slot 1
...
Port Speed Information:

 Port Capable Port Speeds
 0 10GE
 1 10GE
 2 10GE
 3 10GE
 4 10GE
 5 10GE
 6 10GE
 7 10GE
...

```

Table 51 on page 349 summarizes the rate selectability of the MX204 routers.

**Table 54: Rate Selectability of MX204 Routers**

| PIC                                                                                                                                                         | Port Number | Port Speed Supported                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|----------------------------------------------------------------------|
| PIC 0                                                                                                                                                       | 0–3         | 100-Gigabit Ethernet<br>40-Gigabit Ethernet<br>4x10-Gigabit Ethernet |
| NOTE:                                                                                                                                                       |             |                                                                      |
| <ul style="list-style-type: none"> <li>Default port speed is 4x10 Gigabit Ethernet.</li> <li>Supports 1–Gbps speed on 10 Gigabit Ethernet ports.</li> </ul> |             |                                                                      |

Table 54: Rate Selectability of MX204 Routers (continued)

| PIC   | Port Number | Port Speed Supported                                                                        |
|-------|-------------|---------------------------------------------------------------------------------------------|
| PIC 1 | 0–7         | 10 Gigabit Ethernet<br><br><i>NOTE:</i> Supports 1–Gbps speed on 10 Gigabit Ethernet ports. |

Starting with Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also.

Each of the four 100-Gigabit Ethernet or 40-Gigabit Ethernet port can be split to four 10-Gigabit Ethernet ports that can be configured to operate as 1-Gigabit Ethernet port. You can also use 4x10GE LR breakout optics (QSFP-4X10GE-LR) at the MX204 end and 1-Gigabit Ethernet EX optics at the remote end. It is only optional to use Juniper optics (SFP-GE40KM) at the remote end, as any vendor's EX (not SX or LX) optics can be used. Refer to [Hardware Compatibility Tool](#) for the list of pluggable transceivers supported on MX204 router.

MX204 router also support 1-Gigabit Ethernet port on the fixed 10-Gigabit Ethernet SFP ports with 1GE SFPs in it.

On MX204 routers, when the port is operating in 10-Gbps speed, you can change the operating speed to 1Gbps using the configuration statement **Speed 1G** as follows:

```
set interfaces interface-name gigether-options speed 1g
```

Refer *speed (Gigabit Ethernet interface)* for more details.

Once you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed, but the **show interface** command displays for the field **Physical interface** (that is, the interface name prefix) as **XE /\_/\_** and the **Speed Configuration** (that is, operating port speed) as **1GE**.

On MRATE PIC, each channel per port can be configured individually as 1-Gigabit Ethernet port.

**NOTE:**

- The interface name prefix must be xe.
- The rate selectability at PIC level and port level does not support 1-Gbps speed. But you can configure the port configured at 10-Gbps speed to operate at 1-Gbps speed using the *speed (Gigabit Ethernet interface)* configuration statement at Gigabit Ethernet interface level.
- The 1-Gbps operation mode is supported with **speed 1g** configuration. For optics other than SFP-T, in 1G mode, the peer interfaces must be configured to non-autonegotiation mode.

To view the speed configured for the interface, execute the *show interfaces extensive* command. The **Speed Configuration** output parameter in the command output indicates the current operation speed of the interface. If the interface is configured with 1-Gbps speed, then **Speed Configuration** displays 1G; if the interface is configured with 10-Gbps speed, Speed Configuration displays AUTO.

For example:

```
user@host>show interfaces xe-0/1/11:0 extensive
Physical interface: xe-0/1/11:0, Enabled, Physical link is Up
Interface index: 284, SNMP ifIndex: 609, Generation: 383
Link-level type: Ethernet, MTU: 9192, MRU: 9200, LAN-PHY mode, Speed: 10Gbps,

 BPDU Error: None, Loop Detect PDU Error: None, MAC-REWRITE Error: None,
 Loopback: None, Source filtering: Disabled, Flow control: Enabled,
 Speed Configuration: 1G
...
```

In this example, the **Speed Configuration** output parameter displays 1G, which means the operation speed of xe-0/1/11:0 interface is 1-Gbps speed.

## User-Configurable Rate Selectability of MX204 Routers

You can also configure rate selectability on MX204 routers.

[Table 55 on page 357](#) summarizes the user-configurable rate selectability of MX204 routers.

**Table 55: Configurable Rate Selectability of MX204 Router**

| Port Speed Configuration on PIC 0 (Gbps) | Port Speed Configuration on PIC 1 (Gbps)        |
|------------------------------------------|-------------------------------------------------|
| 100                                      | 0<br>Configure the number of active ports to 0. |
| 10                                       | 10                                              |
| 40                                       | 0<br>Configure the number of active ports to 0. |

Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using *speed (Gigabit Ethernet interface)* configuration statement as follows:

**set interfaces *interface-name* gigether-options speed 1g**

**NOTE:** The MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the *number-of-ports* on PIC 1 must be configured to 0 only.

## Maximum number of 10/40/100GE ports Configurable at PIC and Port Mode

Following table summarizes the maximum number of 10/40/100 Gigabit Ethernet ports per PIC configurable at PIC and port levels:

**Table 56: Maximum number of 10/40/100 Gigabit Ethernet ports Configurable at PIC and Port Level**

| Maximum Ports               | Maximum Ports configurable at PIC Mode (on both PIC0 and PIC1)         | Maximum Ports Configurable at Port Mode (on both PIC0 and PIC1)   |
|-----------------------------|------------------------------------------------------------------------|-------------------------------------------------------------------|
| 10/1 Gigabit Ethernet Ports | 24<br><br>Which means 16 ports from PIC 0 and 8 Ports from PIC 1.      | 20<br><br>Which means 12 ports from PIC 0 and 8 Ports from PIC 1. |
| 40 Gigabit Ethernet Ports   | 4<br><br>Only 4 ports from PIC 0 as PIC 1 supports only 10 Gbps Speed. | 4                                                                 |
| 100 Gigabit Ethernet Ports  | 4<br><br>Only 4 ports from PIC 0 as PIC 1 supports only 10 Gbps Speed. | 4                                                                 |

## Port Configuration - PIC Level

On PIC 0, if each of the four ports is configured to operate at 100-Gbps speed, then you must configure all the 8 ports at PIC 1 to 0 (using *number-of-ports* statement). On PIC 0, if ports 0, 1, and 2 are set to 100-Gbps, and port 3 is set to 10-Gbps or 40-Gbps, then you should configure all the 8 ports at PIC 1 to 0 (using **number-of-port** statement), and so on as listed in the below table.

The following table only lists few valid combination of port speeds on PIC 0 and PIC1 of MX204 router. You are not limited to configure only the below mentioned example port configurations. For more valid port configuration values, refer [port-checker tool](#).

**Table 57: Port Configuration at PIC Level in MX204 Routers**

| Port Mode                                  |       |       |       |       |    |    |    |    |    |    |    |
|--------------------------------------------|-------|-------|-------|-------|----|----|----|----|----|----|----|
| PIC 0                                      |       |       |       | PIC 1 |    |    |    |    |    |    |    |
| 100                                        | 100   | 100   | 100   | 0     |    |    |    |    |    |    |    |
| Configure the number of active ports to 0. |       |       |       |       |    |    |    |    |    |    |    |
| 100                                        | 100   | 100   | 10/40 | 0     |    |    |    |    |    |    |    |
| Configure the number of active ports to 0. |       |       |       |       |    |    |    |    |    |    |    |
| 100                                        | 100   | 10/40 | 10/40 | 10    | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| 100                                        | 10/40 | 10/40 | 10/40 | 10    | 10 | 10 | 10 | 10 | 10 | 10 | 10 |

Table 57: Port Configuration at PIC Level in MX204 Routers (continued)

| Port Mode                                                |       |       |       |                                              |
|----------------------------------------------------------|-------|-------|-------|----------------------------------------------|
| PIC 0                                                    |       |       |       | PIC 1                                        |
| 10/40                                                    | 10/40 | 10/40 | 10/40 | 0                                            |
| Configure the number of ports to 0.                      |       |       |       |                                              |
| PIC Mode                                                 |       |       |       |                                              |
| PIC 0 (with four rate-selectable ports)                  |       |       |       | PIC 1 (with eight 10-Gigabit Ethernet ports) |
| 100                                                      | 100   | 100   | 100   | 0                                            |
| Configure the number of active ports to 0.               |       |       |       |                                              |
| 40                                                       | 40    | 40    | 40    | 0                                            |
| Configure the number of active ports to 0.               |       |       |       |                                              |
| 10                                                       | 10    | 10    | 10    | 10                                           |
| Configure all the eight 10-Gigabit Ethernet ports to 10. |       |       |       |                                              |

**NOTE:** Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using *speed (Gigabit Ethernet interface)* configuration statement as follows:

**set interfaces *interface-name* gigether-options speed *lg***

#### Release History Table

| Release | Description                                                                              |
|---------|------------------------------------------------------------------------------------------|
| 18.1R1  | Starting with Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also. |

## MPC10E-15C-MRATE Rate-Selectability Overview

---

MPC10E-15C-MRATE (15x100G) is a fixed-configuration Modular Port Concentrator (MPC) for MX240, MX480, and MX960 routers, that is capable of delivering up to 1.5T per-slot bandwidth. It consists of three PFE complexes per MPC and each PFE is capable of delivering up to 500G throughput. It supports three PICs per MPC, one PIC per PFE. Each PIC hosts five QSFP28 (5xQSFP28) ports that supports 4x10-Gbps, 40-Gbps, and 100-Gbps speeds using QSFP+, QSFP28 optics types. The 4x10-Gbps speed is supported using breakout cables.

For more information, see [“Configuring Rate Selectability on MPC10E-15C-MRATE at PIC Level” on page 366](#). To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. For more information, see [“Configuring Rate Selectability on MPC10E-15C-MRATE at Port Level” on page 368](#).

The ports on the MPC10E-15C-MRATE are called rate-selectable or multirate ports as they support multiple port speeds. You can choose to configure all ports in a PIC to operate at the same speed or configure all the ports at different supported speeds.

In MPC10E-15C-MRATE, you can choose to configure:

- A port in 4x10-Gigabit Ethernet mode using QSFP-4x10-Gigabit Ethernet optics and 4x10-Gigabit Ethernet breakout cables.
- A port in 40-Gigabit Ethernet mode using QSFP optics.
- A port in 100-Gigabit Ethernet mode using QSFP28 optics.

### NOTE:

- When you change the speed at PIC level, the PIC restarts automatically with the new configured speed.
  - When you change the speed of a particular port explicitly (by port-level speed configuration), then only that particular port is reset automatically and other ports in that PIC remain unaffected.
- 

The MPC10E-15C-MRATE supports three Packet Forwarding Engines (PFEs). The forwarding capacity of each Packet Forwarding Engine is 500Gbps which cannot be oversubscribed. The MPC10E-15C-MRATE supports 15 ports. Each PFE is mapped to 5 ports of the PIC. Use the command **show chassis pic fpc-slot slot-number pic-slot slot-number** to display PFE mapping information and port speed information.

[Table 51 on page 349](#) summarizes the Packet Forwarding Engine mapping and the supported port speeds.

Table 58: Rate Selectability of MPC10E-15C-MRATE

| PIC              | Port Number | Port Speed Supported                                                 | Remarks                                                                                                                                                                                      |
|------------------|-------------|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIC 0 (or PFE 0) | 0-4         | 40-Gigabit Ethernet<br>4x10-Gigabit Ethernet<br>100-Gigabit Ethernet | <ul style="list-style-type: none"> <li>4x10GE support using QSFP-4x10GE breakout optics.</li> <li>1x40GE support using QSFP optics.</li> <li>1x100GE support using QSFP28 optics.</li> </ul> |
| PIC 1 (or PFE 1) | 0-4         | 40-Gigabit Ethernet<br>4x10-Gigabit Ethernet<br>100-Gigabit Ethernet | <p><b>NOTE:</b> By default, all the active ports operate in 100-Gigabit Ethernet mode.</p>                                                                                                   |
| PIC 2 (or PFE 2) | 0-4         | 40-Gigabit Ethernet<br>4x10-Gigabit Ethernet<br>100-Gigabit Ethernet |                                                                                                                                                                                              |

To view the speed configured for the interface, execute the *show interfaces extensive* command. The **Speed** output parameter in the command output indicates the current operation speed of the interface.

For example:

```

user@host>show interfaces et-4/1/0 extensive
Physical interface: et-4/1/0, Enabled, Physical link is Up
 Interface index: 220, SNMP ifIndex: 539, Generation: 223
 Link-level type: Ethernet, MTU: 1514, MRU: 1522, Speed: 100Gbps, BPDU Error:
 None,
 Loop Detect PDU Error: None, Loopback: Disabled, Source filtering: Disabled,
 Flow control: Enabled
 Pad to minimum frame size: Disabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Schedulers : 0
 Hold-times : Up 0 ms, Down 0 ms
 Damping : half-life: 0 sec, max-suppress: 0 sec, reuse: 0, suppress:
 0, state: unsuppressed
 Current address: 00:ca:fe:91:00:01, Hardware address: f4:a7:39:a8:b5:7e
 Last flapped : 2019-01-03 13:17:40 PST (00:02:43 ago)
 Statistics last cleared: Never

...

```

In this example, the **Speed** output parameter displays **100Gbps**, which means the operation speed of et-4/1/0 interface is 100-Gbps.

Note the following important information while configuring rate selectability on the MPC10E-15C-MRATE:

- By default, the MPC10E-15C-MRATE comes up with the PIC mode where all the interface operates at the same speed of 100-Gbps. That is, by default, all the PICs (PIC 0, PIC 1, and PIC 2) operate at 100-Gbps speed.
- When you configure rate selectability at the port level, only the configured ports are created in that PIC. Other ports are not created.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Commit fails when you try to apply such configuration.

## User-Configurable Rate Selectability of MPC10E-15C-MRATE

You can also configure rate selectability on MPC10E-15C-MRATE.

[Table 59 on page 362](#) summarizes the user-configurable rate selectability of MPC10E-15C-MRATE.

**Table 59: Port speed capability of MPC10E-15C-MRATE**

| PIC                  | Configurable Port Profiles |     |      |                    |
|----------------------|----------------------------|-----|------|--------------------|
|                      | PIC level Profile          |     |      | Port level Profile |
|                      | 10G                        | 40G | 100G |                    |
| PIC 0 (5xQSFP28 PIC) | Yes                        | Yes | Yes  | Yes                |
| PIC 1 (5xQSFP28 PIC) | Yes                        | Yes | Yes  | Yes                |
| PIC 2 (5xQSFP28 PIC) | Yes                        | Yes | Yes  | Yes                |

**NOTE:** Different PICs in the MPC10E-15C-MRATE can operate at different speeds. That is, PIC speed at one PIC has no bearing on the other PICs in the MPC.

## MPC10E-10C-MRATE Rate-Selectability Overview

MPC10E-10C-MRATE (10x100G) is a fixed-configuration Modular Port Concentrator (MPC) for MX240, MX480, and MX960 routers, that is capable of delivering up to 1Tbps per-slot bandwidth. It consists of two Packet Forwarding Engine (PFE) complexes per MPC and each PFE is capable of delivering up to 500G throughput. It supports two PICs per MPC, one PIC per PFE. Each PIC hosts five QSFP28 (5xQSFP28) ports that supports 4x10-Gbps, 40-Gbps, and 100-Gbps speeds using QSFP+, QSFP28 optics types. The 4x10-Gbps speed is supported using breakout cables.

For more information, see [“Configuring Rate Selectability on MPC10E-10C-MRATE at PIC Level” on page 366](#). To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. For more information, see [“Configuring Rate Selectability on MPC10E-10C-MRATE at Port Level” on page 368](#).

The ports on the MPC10E-10C-MRATE are called rate-selectable or multirate ports as they support multiple port speeds. You can choose to configure all ports in a PIC to operate at the same speed or configure all the ports at different supported speeds.

In MPC10E-10C-MRATE, you can choose to configure:

- A port in 4x10-Gigabit Ethernet mode using QSFP-4x10-Gigabit Ethernet optics and 4x10-Gigabit Ethernet breakout cables.
- A port in 40-Gigabit Ethernet mode using QSFP optics.
- A port in 100-Gigabit Ethernet mode using QSFP28 optics.

### NOTE:

- When you change the speed at PIC level, the PIC restarts automatically with the new configured speed.
- When you change the speed of a particular port explicitly (by port-level speed configuration), then only that particular port is reset automatically and other ports in that PIC remain unaffected.

The MPC10E-10C-MRATE supports two Packet Forwarding Engines. The forwarding capacity of each Packet Forwarding Engine is 500Gbps which cannot be oversubscribed. The MPC10E-10C-MRATE supports 10 ports. Each PFE is mapped to 5 ports of the PIC. Use the command **show chassis pic fpc-slot slot-number pic-slot slot-number** to display PFE mapping information and port speed information.

[Table 51 on page 349](#) summarizes the Packet Forwarding Engine mapping and the supported port speeds.

Table 60: Rate Selectability of MPC10E-10C-MRATE

| PIC              | Port Number | Port Speed Supported  | Remarks                                                                                                                                                                                      |

| PIC 0 (or PFE 0) | 0-4         | 40-Gigabit Ethernet   | <ul style="list-style-type: none"> <li>4x10GE support using QSFP-4x10GE breakout optics.</li> <li>1x40GE support using QSFP optics.</li> <li>1x100GE support using QSFP28 optics.</li> </ul> |
|                  |             | 4x10-Gigabit Ethernet |                                                                                                                                                                                              |
|                  |             | 100-Gigabit Ethernet  |                                                                                                                                                                                              |
| PIC 1 (or PFE 1) | 0-4         | 40-Gigabit Ethernet   | <b>NOTE:</b> By default, all the active ports operate in 100-Gigabit Ethernet mode.                                                                                                          |
|                  |             | 4x10-Gigabit Ethernet |                                                                                                                                                                                              |
|                  |             | 100-Gigabit Ethernet  |                                                                                                                                                                                              |

To view the speed configured for the interface, execute the *show interfaces extensive* command. The **Speed** output parameter in the command output indicates the current operation speed of the interface.

For example:

```

user@host>show interfaces et-4/1/0 extensive
Physical interface: et-4/1/0, Enabled, Physical link is Up
 Interface index: 220, SNMP ifIndex: 539, Generation: 223
 Link-level type: Ethernet, MTU: 1514, MRU: 1522, Speed: 100Gbps, BPDU Error:
None,
 Loop Detect PDU Error: None, Loopback: Disabled, Source filtering: Disabled,
Flow control: Enabled
 Pad to minimum frame size: Disabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Link flags : None
 CoS queues : 8 supported, 8 maximum usable queues
 Schedulers : 0
 Hold-times : Up 0 ms, Down 0 ms
 Damping : half-life: 0 sec, max-suppress: 0 sec, reuse: 0, suppress:
0, state: unsuppressed
 Current address: 00:ca:fe:91:00:01, Hardware address: f4:a7:39:a8:b5:7e
 Last flapped : 2019-01-03 13:17:40 PST (00:02:43 ago)
 Statistics last cleared: Never

...

```

In this example, the **Speed** output parameter displays **100Gbps**, which means the operation speed of et-4/1/0 interface is 100-Gbps.

Note the following important information while configuring rate selectability on the MPC10E-10C-MRATE:

- By default, the MPC10E-10C-MRATE comes up with the PIC mode where all the interface operates at the same speed of 100-Gbps. That is, by default, all the PICs (PIC 0 and PIC 1) operate at 100-Gbps speed.
- When you configure rate selectability at the port level, only the configured ports are created in that PIC. Other ports are not created.

- You cannot configure rate selectability at the PIC level and the port level simultaneously. Commit fails when you try to apply such configuration.

## User-Configurable Rate Selectability of MPC10E-10C-MRATE

You can also configure rate selectability on MPC10E-10C-MRATE.

Table 59 on page 362 summarizes the user-configurable rate selectability of MPC10E-10C-MRATE.

**Table 61: Port speed capability of MPC10E-10C-MRATE**

| PIC                  | Configurable Port Profiles |     |      |                    |
|----------------------|----------------------------|-----|------|--------------------|
|                      | PIC level Profile          |     |      | Port level Profile |
|                      | 10G                        | 40G | 100G |                    |
| PIC 0 (5xQSFP28 PIC) | Yes                        | Yes | Yes  | Yes                |
| PIC 1 (5xQSFP28 PIC) | Yes                        | Yes | Yes  | Yes                |

**NOTE:** Different PICs in the MPC10E-10C-MRATE can operate at different speeds. That is, PIC speed at one PIC has no bearing on the other PICs in the MPC.

## Configuring Rate Selectability on MX10003 MPC to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, configure rate selectability at the MIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the MIC level, use the **pic-mode** statement and

specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to specify the speed of individual ports. This topic describes how to configure port speeds at the port level and at the MIC or PIC level.

**NOTE:** Regardless of the line card— MIC (PIC1) or fixed-port PIC (PIC0) installed—you must configure *both the PICs and all the associated ports*, under the [edit chassis] hierarchy. Configuring ports on only one of the PICs results in an invalid configuration.

- [Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level on page 366](#)
- [Configuring Rate Selectability on MX10003 MPC at Port Level on page 368](#)

## Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the MIC or PIC level. When you configure rate selectability at the MIC or PIC level, all the ports of the MIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports** *number-of-active-physical-ports* statement. The MX10003 MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the MIC/PIC level:

1. In configuration mode, navigate to the [edit chassis fpc fpc-slot pic pic-number] hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the **pic-mode** *pic-speed* statement to set the operating speed for the MIC. All ports of the MIC that support the configured speed operate at the configured speed. Values for the *pic-speed* option are 10G, 40G, and 100G.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MX10003 MPC, see [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC” on page 330](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 8
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 8;
```

5. Commit your configuration changes.

In this example, you have configured 8 ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MX10003 MPC at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

If you want to configure a port speed of 40 Gbps on the MIC and the fixed-port PIC, you can choose any of the following example configurations:

- Configure one port of the fixed-port PIC as a 40-Gigabit Ethernet interface and three ports of the MIC as 40-Gigabit Ethernet interfaces.
- Configure two ports of the fixed-port PIC as 40-Gigabit Ethernet interfaces and three ports of the MIC as 40-Gigabit Ethernet interfaces.
- Configure three ports of the MIC as 40-Gigabit Ethernet interfaces and two ports of the fixed-port PIC as 40-Gigabit Ethernet interfaces.
- Configure four ports of the MIC as 40-Gigabit Ethernet interfaces only.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. However, when you change the port speed at the port level, the PIC has to be reset by executing the `request chassis pic pic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)` command. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the 10G, 40G, and 100G speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 10G
user@host# set port 1 speed 10G
user@host# set port 3 speed 40G
```

3. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
port 0 {
 speed 10g;
}
port 1 {
 speed 10g;
}
port 3 {
 speed 40g;
}
```

4. Commit your configuration changes.

In this example, you have configured 2 ports with port speed of 10 Gbps and 1 port with port speed of 40 Gbps.

**NOTE:** Starting in Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also using the *speed* (*Gigabit Ethernet interface*) configuration statement at Gigabit Ethernet interface level. Refer to [“MX10003 MPC Rate-Selectability Overview” on page 348](#) for more details.

## Configuring Rate Selectability on MX204 to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the PIC level. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the *pic-mode* statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the *speed* statement to specify the

speed of individual ports. This topic describes how to configure port speeds at the port level and at the PIC level.

Note the following caveats while configuring rate selectability on the MX204 routers:

- If rate selectability is not configured, all ports of the MX204 router operate as 10-Gigabit Ethernet interfaces.
- In PIC mode, the MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the *number-of-ports* on PIC 1 must be configured to 0 only. For more information, see [“MX204 Router Rate-Selectability Overview” on page 353](#).
- The heterogeneous mode is supported only on port mode.
- When you configure rate selectability at the port level, only the configured ports are active. Other ports are disabled.
- When you choose an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- [Configuring Rate Selectability on MX204 at PIC Level on page 370](#)
- [Configuring Rate Selectability on MX204 at Port Level on page 372](#)

## Configuring Rate Selectability on MX204 at PIC Level

To configure all ports to operate at the same speed, you configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed by using the **number-of-ports** **number-of-active-physical-ports** statement. The MX204 has four rate-selectable ports (referred to as PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports).

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the **pic-mode *pic-speed*** statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the **pic-speed** option are **10G**, **40G**, and **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MX204 routers see [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 332](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 4
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 4;
```

5. Commit your configuration changes.

In this example, you have configured 4 ports on the PICO with port speed of 10 Gbps.

## Configuring Rate Selectability on MX204 at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** When you change the port speed at the port level, you must reset the PIC for the configuration to take effect. Resetting the PIC takes several minutes and affects all the Packet Forwarding Engines. To avoid this, use the `request chassis pic pic-slot pic-slot-number fpc-slot fpc-slot-number (offline | online)` command to reset the PIC and apply your configuration changes. An alarm is generated indicating the change in port speed. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10G**, **40G**, or **100G** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 100G
user@host# set port 1 speed 40G
user@host# set port 2 speed 40G
user@host# set port 3 speed 10G
```

3. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
```

```

port 0 {
 speed 100g;
}
port 1 {
 speed 40g;
}
port 2 {
 speed 40g;
}
port 3 {
 speed 10g;
}
}

```

4. Commit your configuration changes.

In this example, you have configured 2 ports on the PICO with port speed of 40 Gbps, 1 port with port speed of 10 Gbps, and 1 port with port speed of 100 Gbps.

**NOTE:** Starting in Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also using the *speed (Gigabit Ethernet interface)* configuration statement at Gigabit Ethernet interface level. Refer to [“MX10003 MPC Rate-Selectability Overview” on page 348](#) for more details.

## Configuring Rate Selectability on JNP10K-2101 MPC to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the PIC level. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the **pic-mode** statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to specify the

speed of individual ports. This topic describes how to configure port speeds at the port level and at the PIC level.

- [Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level on page 374](#)
- [Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level on page 375](#)

## Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports** *number-of-active-physical-ports* statement. The JNP10K-LC2101 MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 5 pic 2
```

2. Configure the **pic-mode** *pic-speed* statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the *pic-speed* option are 10G, 40G, and 100G.

**NOTE:** When you configure the **pic-mode** as 100 Gbps and the Packet Forwarding Engine bandwidth is 240 Gbps, only the first two ports support 100 Gbps. The other ports are disabled.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 5 pic 2]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 5 pic 2]
user@host# set number-of-ports 2
```

4. Verify the configuration.

```
[edit chassis fpc 5 pic 2]
user@host# show
pic-mode 10G;
number-of-ports 2;
```

5. Commit your configuration changes.

In this example, you have configured 2 ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. However, when you change the port speed at the port level, the PIC has to be reset by executing the `request chassis pic pic-slot pic-slot-number fpc-slot fpc-slot-number (offline | online)` command. For guidelines on configuring rate selectability for JNP10K-LC2101, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the 10G, 40G, and 100G speed options.

**NOTE:** If you configure the speed as 100 Gbps for 3 ports and the Packet Forwarding Engine bandwidth is 240 Gbps, an alarm is raised as it is an invalid configuration. The value of only the first two ports support 100 Gbps. The other ports are disabled.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 10G
user@host# set port 1 speed 10G
user@host# set port 3 speed 40G
```

3. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
port 0 {
 speed 10g;
}
port 1 {
 speed 10g;
}
port 3 {
 speed 40g;
}
```

4. Commit your configuration changes.

In this example, you have configured 2 ports with port speed of 10 Gbps and 1 port with port speed of 40 Gbps.

## Configuring Rate Selectability on MPC10E-15C-MRATE to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the PIC level:

- To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the **pic-mode** statement and specify the port **speed**.
- To configure different port speeds for each port in a PIC, configure rate selectability at the port level, in which case only the ports that are configured are created. To configure rate selectability at the port level, use the **speed** statement to specify the speed of individual ports.
- (Channelized mode) To specify the number of IFDs (or interfaces) that need to be created on a physical port for a specified speed, use the **number-of-sub-ports** configuration statement. For example, on a given port that supports 4x10GE mode, if the **number-of-sub-ports** is 2, then two IFDs are created, namely xe-x/y/z:0 and xe-x/y/z:1.

The **number-of-sub-ports** configuration statement can be used with rate selectability configuration at both PIC level and port level. The **number-of-sub-ports** configuration statement is effective only when the port speed is 10-Gbps. By default, four channels (or IFDs) is created for the 10-Gbps ports.

This topic describes how to configure port speeds at the port level and at the PIC level.

- [Configuring Rate Selectability on MPC10E-15C-MRATE at PIC Level on page 377](#)

### Configuring Rate Selectability on MPC10E-15C-MRATE at PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports** **number-of-active-physical-ports** statement. The MPC10E-15C-MRATE MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the **pic-mode *pic-speed*** statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the **pic-speed** option are 10G, 40G, and 100G.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MPC10E-15C-MRATE MPC, see [“Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-15C-MRATE” on page 335](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 4
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 4;
```

5. Commit your configuration changes.

In this example, you have configured four ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MPC10E-15C-MRATE at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the configured ports are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the 10G, 40G, and 100G speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 10G
user@host# set port 1 speed 10G
user@host# set port 3 speed 40G
```

3. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
port 0 {
 speed 10g;
}
port 1 {
 speed 10g;
}
```

```
port 3 {
 speed 40g;
}
```

4. Commit your configuration changes.

In this example, you have configured two ports with port speed of 10 Gbps and one port with port speed of 40 Gbps.

## Configuring Rate Selectability on MPC10E-10C-MRATE at PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports number-of-active-physical-ports** statement. The MPC10E-10C-MRATE MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the **pic-mode pic-speed** statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the **pic-speed** option are 10G, 40G, and 100G.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MPC10E-10C-MRATE MPC, see [“Supported Active Physical Ports for Rate Selectability to Prevent Oversubscription on MPC10E-10C-MRATE” on page 337](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 4
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 4;
```

5. Commit your configuration changes.

In this example, you have configured four ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MPC10E-10C-MRATE at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the configured ports are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 314](#).

To configure rate selectability at the port level:

## Understanding Interface Naming Conventions for MIC-MACSEC-20GE

By default, MIC-MACSEC-20GE operates in 1-Gigabit Ethernet mode. In this mode, the ports in the MIC are created as “ge” interfaces distributed across PIC0 and PIC1.

In 10-Gigabit Ethernet mode, the ports in the MIC will be created as “xe” interfaces one each on PIC 0 and PIC 1. In this mode, the 10G ports physically maps to the front panel port 8 and 9 on the second PIC of the MIC (that is marked on the front panel of the MIC).

**NOTE:** In the 10G mode, only the marked ports are operational and other physical ports are disabled.

**Table 62: Interface Naming Convention for MIC-MACSEC-20GE**

| PIC   | 1-Gigabit Ethernet Interface | 10-Gigabit Ethernet Interface |
|-------|------------------------------|-------------------------------|
| PIC 0 | <code>ge-x/0/[0-9]</code>    | <code>xe-x/0/0</code>         |
| PIC 1 | <code>ge-x/1/[0-9]</code>    | <code>xe-x/1/0</code>         |
| PIC 2 | <code>ge-x/2/[0-9]</code>    | <code>xe-x/2/0</code>         |
| PIC 3 | <code>ge-x/3/[0-9]</code>    | <code>xe-x/3/0</code>         |

You should use the **pic-mode 10G** configuration command to set the PIC to operate in 10G mode. Both the PICs on a MIC must be configured in the same pic-mode, otherwise the configuration does not take effect. A chassis alarm is raised indicating a mis-configuration. Any mis-configuration will cause the PICs to assume default pic-mode, that is, to be in 20x1GE where all ports are in 1GE port speed.

**NOTE:** The 10-Gbps-capable ports (ports 8 and 9) of the 2x10GE/20x1GE MIC-MACSEC-20GE may show the link status as up while the peer side is down. In this case, it is recommended to disable auto-negotiation and set the speed to 1-Gbps on the peer side to bring the link up on the peer side.

The MIC-MACSEC-20GE MIC also provides 128-bit and 256-bit MACsec encryption on all the twenty 1GE and on the two 10GE ports in the following hardware configuration:

- Installed directly on the MX80 and MX104 routers
- Installed on MPC1, MPC2, MPC3, MPC2E, MPC3E, MPC2E-NG, and MPC3E-NG line cards on the MX240, MX480, and MX960 routers

By default, 128-bit MACsec encryption is supported.

The twenty 1-Gigabit Ethernet SFP ports distributes the ports across PIC0 and PIC1, that are logical PICs on the physical MIC. The two 10-Gigabit Ethernet SFP+ ports are physically

located on PIC1. But, the 10-Gigabit interfaces are created by distributing the ports in either of the PICs.

**NOTE:**

- When the pic-mode is changed from 1-Gbps to 10-Gbps or vice versa, the Flexible PIC Concentrator (FPC) in MX240, MX480, MX960 routers and the Forwarding Engine Board (FEB) in MX80, MX104 routers undergoes an automatic bounce or a reboot.
- When the MIC-MACSEC-20GE is operating in the 10-Gbps mode, all the other 1-Gbps ports are disabled.

## Configuring Port Speed on Multi-Rate MICs

Configuring a port speed allows you to enable rate-selectability on a per-port basis. When you configure a speed on a per-port basis, you can use the same MIC hardware as you upgrade your network from OC3 to OC12 or OC48 speeds.

This feature is supported on MX Series routers with SONET/SDH OC3/STM1 (Multi-Rate) MICs (MIC-3D-8OC3OC12-4OC48-SFP and MIC-3D-4OC3OC12-1OC48-SFP), Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP (MIC-3D-8CHOC3-4CHOC12 and MIC-3D-4CHOC3-2CHOC12), and ATM MICs with SFP (MIC-3D-8OC3-2OC12-ATM).

To configure a port speed on the chassis for enabling rate-selectability on a per-port basis:

1. At the **[edit chassis]** hierarchy level in configuration mode, specify the port and the port speed that need to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number speed oc12-stm4 ;
user@host# set fpc fpc-slot pic pic-number port port-number speed oc3-stm1 ;
user@host# set fpc fpc-slot pic pic-number port port-number speed oc48-stm16 ;
```

**NOTE:** You can configure the `oc12-stm4`, `oc3-stm1`, and `oc48-stm16` port speed options for SONET/SDH OC3/STM1 (Multi-Rate) MICs. However, for Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP and ATM MICs, you can configure only the `oc12-stm4` and `oc3-stm1` port speed options.

(MX Series with MPCs and ATM MICs with SFP) To configure up to OC12 CBR bandwidth speed per virtual circuit (VC) on an ATM MIC with SFP (MIC-3D-8OC3-2OC12-ATM), specify `oc12-stm4` as the speed for the specified port. You can configure the `oc12-stm4` port speed option only for ports 0 and 4 on an ATM MIC. If you configure the `oc12-stm4` port speed option for port 0, then ports 1, 2, and 3 are disabled. Similarly, if you configure the `oc12-stm4` port speed for port 4, then ports 5, 6, and 7 are disabled.

For example:

```
[edit chassis]
user@host# set fpc 3 pic 0 port 0 speed oc12-stm4
```

2. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 3 {
 pic 0 {
 port 0 {
 speed oc12-stm4;
 }
 }
}
```

By default, rate-selectability is enabled on MX Series routers with SONET/SDH OC3/STM1 (Multi-Rate) MICs, Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP, and ATM MICs.

To disable rate-selectability on the 8-port SONET/SDH OC3/STM1 (Multi-Rate) MIC:

1. At the **[edit chassis]** hierarchy level in configuration mode, disable rate-selectability by using the **`no-multi-rate`** statement.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number no-multi-rate
```

For example:

```
[edit chassis]
```

```
user@host# set fpc 3 pic 0 no-multi-rate
```

**NOTE:**

- The `no-multi-rate` statement is supported only on MIC-3D-8OC3OC12-4OC48.
- The `no-multi-rate` statement enables the first four ports [0 – 3] exclusively at OC48/STM16 speed.
- The `no-multi-rate` statement disables the last four ports [4 – 7].

2. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 3 {
 pic 0 {
 no-multi-rate;
 }
}
```

**NOTE:** You can disable rate-selectability by using the `no-multi-rate` statement only on the 8-port SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP. The `no-multi-rate` statement has no effect on the 4-port SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP, or the ATM MIC.

## Configuring Port Speed

Starting with Junos OS Release 15.1, some PICs support multiple port speeds. This procedure describes how to configure the port speed for these types of PICs.

To configure a PIC's port speed:

1. Navigate to the `[edit chassis]` hierarchy level.
2. Enter the `port-speed` statement at the `[edit chassis fpc slot-number pic pic-number port port-number]` hierarchy level.

```
[edit chassis]
```

```
user@host# set fpc fpc-slot pic pic-number port port-number port-speed ;
```

- Specify the port speed that needs to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number port speed 10G;
user@host# set fpc fpc-slot pic pic-number port port-number port speed 40G;
user@host# set fpc fpc-slot pic pic-number port port-number port speed 100G;
```

Release History Table

| Release | Description                                                                  |
|---------|------------------------------------------------------------------------------|
| 15.1    | Starting with Junos OS Release 15.1, some PICs support multiple port speeds. |

## Understanding Interface Naming Conventions for MPC1

MPC1 facilitates configuration compatibility and enables you to replace an MX DPC with an MPC1 or MPC2 without requiring configuration change. The chassis daemon process (chassisd) creates physical interfaces for the tunnels only if it finds an associated tunnel bandwidth configuration.

The naming convention for virtual tunnels, for example is as follows:

*vt-mpc-slot/pic-slot/port-number*.

On MPC1, the PIC slot could be 0 or 1. Both the PIC slots are associated with the Packet Forwarding Engine PFE 0. [Table 63 on page 389](#) summarizes the MIC/PIC mapping for MPC1E and MPC1EQ.

Table 63: MIC/PIC Mapping for MPC1E and MPC1E-Q

| MIC Type | Number of PICs per MIC | MIC Slot | PIC         | Interfaces Name | PFE Mapping |
|----------|------------------------|----------|-------------|-----------------|-------------|
| 20x1GE   | 2                      | 0        | PIC0:10x1GE | ge-x/0/0        | PFE0        |
|          |                        |          |             | ge-x/0/1        |             |
|          |                        |          |             | ge-x/0/2        |             |
|          |                        |          |             | ge-x/0/3        |             |
|          |                        |          |             | ge-x/0/4        |             |
|          |                        |          |             | ge-x/0/5        |             |
|          |                        |          |             | ge-x/0/6        |             |
|          |                        |          |             | ge-x/0/7        |             |
|          |                        |          |             | ge-x/0/8        |             |
|          |                        |          |             | ge-x/0/9        |             |
|          |                        |          | PIC1:10x1GE | ge-x/1/0        |             |
|          |                        |          |             | ge-x/1/1        |             |
|          |                        |          |             | ge-x/1/2        |             |
|          |                        |          |             | ge-x/1/3        |             |
|          |                        |          |             | ge-x/1/4        |             |
|          |                        |          |             | ge-x/1/5        |             |
|          |                        |          |             | ge-x/1/6        |             |
|          |                        |          |             | ge-x/1/7        |             |
|          |                        |          |             | ge-x/1/8        |             |
|          |                        |          |             | ge-x/1/9        |             |
|          |                        | 1        | PIC2:10x1GE | ge-x/2/0        |             |
|          |                        |          |             | ge-x/2/1        |             |
|          |                        |          |             | ge-x/2/2        |             |

Table 63: MIC/PIC Mapping for MPC1E and MPC1E-Q (continued)

| MIC Type | Number of PICs per MIC | MIC Slot | PIC         | Interfaces Name | PFE Mapping |
|----------|------------------------|----------|-------------|-----------------|-------------|
|          |                        |          |             | ge-x/2/3        |             |
|          |                        |          |             | ge-x/2/4        |             |
|          |                        |          |             | ge-x/2/5        |             |
|          |                        |          |             | ge-x/2/6        |             |
|          |                        |          |             | ge-x/2/7        |             |
|          |                        |          |             | ge-x/2/8        |             |
|          |                        |          |             | ge-x/2/9        |             |
|          |                        |          | PIC3:10x1GE | ge-x/3/0        |             |
|          |                        |          |             | ge-x/3/1        |             |
|          |                        |          |             | ge-x/3/2        |             |
|          |                        |          |             | ge-x/3/3        |             |
|          |                        |          |             | ge-x/3/4        |             |
|          |                        |          |             | ge-x/3/5        |             |
|          |                        |          |             | ge-x/3/6        |             |
|          |                        |          |             | ge-x/3/7        |             |
|          |                        |          |             | ge-x/3/8        |             |
|          |                        |          |             | ge-x/3/9        |             |
| 2x10GE   | 2                      | 0        | PIC0:1x10GE | xe-x/0/0        | PFE0        |
|          |                        |          | PIC1:1x10GE | xe-x/1/0        |             |
|          |                        | 1        | PIC2:1x10GE | xe-x/2/0        |             |
|          |                        |          | PIC3:1x10GE | xe-x/3/0        |             |

Table 63: MIC/PIC Mapping for MPC1E and MPC1E-Q (continued)

| MIC Type | Number of PICs per MIC | MIC Slot | PIC         | Interfaces Name | PFE Mapping |
|----------|------------------------|----------|-------------|-----------------|-------------|
| 40x1GE   | 4                      | 0 and 1  | PIC0:10x1GE | ge-x/0/0        | PFE0        |
|          |                        |          |             | ge-x/0/1        |             |

## Understanding Interface Naming Conventions for MPC2

MPC2 facilitates configuration compatibility and enables you to replace an MX DPC with an MPC1 or MPC2 without requiring configuration change. The chassis daemon process (chassisd) creates physical interfaces for the tunnels only if it finds an associated tunnel bandwidth configuration.

The naming convention for virtual tunnels, for example is as follows:

*vt-mpc-slot/pic-slot/port-number.*

On MPC2, the pic-slot could be of the range 0 through 3. The logical pic slot 0 and slot 1 are associated with PFE 0 and logical MIC slot 2 and slot 3 are associated with PFE 1. [Table 64 on page 394](#) summarizes the MIC/PIC mapping for MPC2E, MPC2E-Q, and MPC2E-EQ.

Table 64: MIC/PIC Mapping for MPC2E, MPC2E-Q, and MPC2E-EQ

| MIC Type | Number of PICs per MIC | MIC Slot | PIC         | Interfaces Name | PFE Mapping |
|----------|------------------------|----------|-------------|-----------------|-------------|
| 20x1GE   | 2                      | 0        | PIC0:10x1GE | ge-x/0/0        | PFE0        |
|          |                        |          |             | ge-x/0/1        |             |

## Gigabit Ethernet OTN Options

---

The following example shows the configuration settings for Gigabit Ethernet OTN options:

```
[edit interfaces ge-fpc/pic/port]
otn-options {
 bytes (otn-options) transmit-payload-type value;
 fec (efec | gfec | gfec-sdfec | none);
 (is-ma | no-is-ma);
 (laser-enable | no-laser-enable);
 (line-loopback | no-line-loopback);
 (local-loopback | no-local-loopback);
 (odu-ttim-action-enable | no-odu-ttim-action-enable);
 (otu-ttim-action-enable | no-otu-ttim-action-enable);
 odu-delay-management {
 (bypass | no-bypass);
 (monitor-end-point | no-monitor-end-point);
 number-of-frames value;
 (no-start-measurement | start-measurement);
 }
 odu-signal-degrade {
 ber-threshold-clear value;
 ber-threshold-signal-degrade value;
 interval value;
 }
 (prbs | no-prbs);
 preemptive-fast-reroute {
 (backward-frr-enable | no-backward-frr-enable);
 (signal-degrade-monitor-enable | no-signal-degrade-monitor-enable);
 odu-backward-frr-enable | no-odu-backward-frr-enable;
 odu-signal-degrade-monitor-enable | no-odu-signal-degrade-monitor-enable;
 }
 rate {
 (fixed-stuff-bytes | no-fixed-stuff-bytes);
 oc192;
 otu4;
 (pass-through | no-pass-through);
 }
 signal-degrade {
 ber-threshold-clear value;
 ber-threshold-signal-degrade value;
 interval value;
 }
}
```

```
tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs
number);
transport-monitoring;
trigger trigger-identifier;
tti tti-identifier;
}
```

**NOTE:** The Gigabit Ethernet interface and the XENPAK interface support the read/write overhead bytes only for the APS/PPC (bytes 0 through 3).

You can use the following show commands to view the OTN configuration:

- **show interfaces extensive**—See the [CLI Explorer](#) for command details.
- **show chassis hardware**—See the [CLI Explorer](#) for command details.
- **show chassis pic**—See the [CLI Explorer](#) for command details.

## 10-Gigabit Ethernet OTN Options Configuration Overview

MX240, MX480, MX960, MX2010, MX2020, T320, T640, T1600, PTX3000, and PTX5000 routers support Optical Transport Network (OTN) interfaces, including the 10-Gigabit Ethernet DWDM OTN PIC, and provide ITU-T G.709 support. Use the **set otn-options** statement at the **[edit interfaces if-fpc/pic/port]** hierarchy level to configure the OTN options.

MX2020, MX2010, MX960, MX480, and MX240 routers support OTN interfaces on MPC5E and MPC6E. MPC5E-40G10G and MPC5EQ-10G40G support OTN on 10-Gigabit Ethernet interfaces but not on 40-Gigabit Ethernet interfaces. The OTN MIC MIC6-10G-OTN on MPC6E supports OTN on 10-Gigabit Ethernet interfaces on MX2020 and MX2010 routers. OTN support on the specified MX Series routers includes:

- International Telecommunications Union (ITU)-standard OTN performance monitoring and alarm management
- Transparent transport of 24 10-Gigabit Ethernet signals with optical channel data unit 2 (ODU2) and ODU2e framing on a per-port basis
- Pre-forward error correction (pre-FEC)-based bit error rate (BER). Fast reroute (FRR) uses the pre-FEC BER as an indication of the condition of an OTN link.

To configure the OTN options on the specified MX routers, use the **set otn-options** statement at the **[edit interfaces interfaceType-fpc/pic/port]** hierarchy level.

## Ethernet DWDM Interface Wavelength Overview

Dense wavelength-division multiplexing (DWDM) interfaces are supported on 10-Gigabit Ethernet DWDM PICs, MICs, and MPCs; the 10-Gigabit Ethernet LAN/WAN OTN PIC; and the 100-Gigabit Ethernet DWDM OTN PIC. When a tunable optic transceiver is available, you can configure the DWDM interfaces with full C-band International Telecommunication Union (ITU)-Grid tunable optics, as defined in the following specifications:

- *Intel TXN13600 Optical Transceiver I2C Interface and Customer EEPROM Preliminary Specification*, July 2004.
- *I2C Reference Document for 300-Pin MSA 10G and 40G Transponder*, Edition 4, August 04, 2003.

By default, the wavelength is 1550.12 nanometers (nm), which corresponds to 193.40 terahertz (THz).

## Configuring the 10-Gigabit or 100-Gigabit Ethernet DWDM Interface Wavelength

To configure the wavelength on 10-Gigabit Ethernet or 100-Gigabit Ethernet dense wavelength-division multiplexing (DWDM) and OTN interfaces, include the **wavelength** statement at the **[edit interfaces *interface-name* optics-options]** hierarchy level:

```
[edit interfaces interface-name optics-options]
wavelength nm;
```

To display the currently tuned wavelength and frequency for the interface, use the **show interfaces *interface-name* operational** mode command.

For interface diagnostics, issue the **show interfaces diagnostics optics *interface-name* operational** mode command.

[Table 65 on page 402](#) shows configurable wavelengths and the corresponding frequency for each configurable wavelength.

**Table 65: Wavelength-to-Frequency Conversion Matrix**

| Wavelength (nm) | Frequency (THz) | Wavelength (nm) | Frequency (THz) | Wavelength (nm) | Frequency (THz) |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 1528.38         | 196.15          | 1542.14         | 194.40          | 1556.15         | 192.65          |

## Understanding the P1-PTX-24-10G-W-SFPP PIC

Starting from Junos OS Release 14.2, a 24–port 10-Gigabit Ethernet OTN PIC—P1-PTX-24-10G-W-SFPP—is supported on the FPC-PTX-P1-A and FPC2-PTX-P1A FPCs in PTX5000 routers, and the FPC-SFF-PTX-P1-A and FPC-SFF-PTX-T FPCs in PTX3000 routers. The P1-PTX-24-10G-W-SFPP PIC provides twenty-four 10-Gigabit Ethernet interfaces, that are independently configurable in LAN PHY or WAN PHY framing mode or in optical channel transport unit in OTU2e, OTU1e, or OTU2 mode.

The following sections explain this PIC in detail:

- [Interface Features on page 405](#)
- [Layer 2 and Layer 3 Features on page 407](#)
- [OTN Alarms and Defects on page 407](#)
- [TCA Alarms on page 408](#)

## Interface Features

The following interface features are supported on the P1-PTX-24-10G-W-SFPP PIC:

- Twenty-four 10-Gigabit Ethernet interfaces, which are independently configurable in LAN PHY or WAN PHY mode or in OTU2e, OTU1e, or OTU2 signal mode. Each interface is terminated by means of a CFP2 transceiver.
- The interfaces are named with prefix *et*.
- Gigabit Ethernet local loopback.
- Link-level pause frames—You can halt the Ethernet interface from transmitting packets for a configured period of time.
- Interface hold timer and interface damping—You can set the **hold-time** statement (in milliseconds) to damp interface transitions.
- External clock.
- Nonstandard tag protocol identifier (TPID):
  - For each 10-Gigabit Ethernet port, you can configure up to eight TPIDs by using the **tag-protocol-id** statement at the **[edit interfaces interface-name together-options ethernet-switch-profile]** hierarchy level.
  - The **tag-protocol-id** statement can be configured only on the first port (port 0) of the PIC. If any other (nonzero) port has the **tag-protocol-id** configuration, the Routing Engine registers an error in the system log and the configuration is ignored.
  - The **tag-protocol-id** statement configured on port 0 of the PIC also applies to the rest of the ports on that PIC.
- Generic forward error correction (GFEC), ultra forward error correction (UFEC), enhanced forward error correction (EFEC), and no-FEC modes of operation are supported.
- Diagnostics tools:
  - Line loopback
  - Local loopback
- Fast reroute (FRR)—Based on configurable pre-FEC, bit error rate (BER) is supported and is configured using the **ber-threshold-signal-degrade** statement at the **[edit interfaces interface-name otn-options signal-degrade]** hierarchy level.
- *jnx-ifotn.mib* and *otn-mib* as defined in RFC 3591. Note that according to Junos OS security standard, configurable parameters are not supported through SNMP. Only the *get* operation is available through SNMP.
- FEC statistics—corrected errors and corrected error ratio.
- OTN payload pseudorandom binary sequence (PRBS) generation and checking by enabling or disabling PRBS with the **prbs** or **no-prbs** statement at the **[edit interfaces interface-name otn-options]** hierarchy level.

- At the physical interface level, **flexible-ethernet-service**, **ethernet-ccc**, and **ethernet-tcc** encapsulations are supported. For **flexible-ethernet-service** encapsulation, the logical level supports **enet2**, **vlan-ccc**, and **vlan-tcc** encapsulations.
- At the logical interface level **dix**, **vlan-ccc**, and **vlan-tcc** encapsulations are supported.
- SNMP management of the PIC based on RFC 3591, Definitions of Managed Objects for the Optical Interface Type:
  - Set functionality
  - Juniper Networks Black-Link MIB
  - IFOTN MIB
  - Optics MIB
  - FRU MIB
- 15-minute and 1-day performance monitoring and historic statistics.
  - Near-end and far-end performance monitoring
  - Threshold-crossing alerts
  - BER performance monitoring
  - FEC performance monitoring
  - Optical performance monitoring

The following features are not supported on the P1-PTX-24-10G-W-SFPP PIC:

- Source MAC learning for accounting
- MAC policing
- Physical interface-level encapsulations—**vlan-ccc**, **extended-vlan-ccc**, and **extended-vlan-tcc**
- Logical interface-level encapsulation—**vlan-vpls**
- VLAN rewrite for **ccc** encapsulation
- Per queue flow control
- Generic framing procedure-framed (GFP-F) mapping modes over OTN
- General communication channel (GCC)
- OTN interface-level Automatic Protection Switching (APS)
- Insertion, monitoring, and display of OTN header overhead byte
- Optical harness support
- Transport interface and state model (GR-1093)
- Trace tone support

## Layer 2 and Layer 3 Features

The following Layer 2 and Layer 3 features are supported on the P1-PTX-24-10G-W-SFPP PIC:

- MAC detect link up and link down based on local fault signal or remote fault signal.
- MAC statistics.
- Flow control.
- MAC oversized packet counters based on default MTU value or user-configured MTU value.
- Per-port destination address MAC filter.
- Per-port source address MAC filter.
- Per-physical interface source address MAC filter.
- Per logical interface source address MAC accounting.
- Maximum of 1000 source MAC filter per physical interface.
- Maximum of 32,000 filter terms to share across all filter features.
- Aggregated Ethernet supports 64 child links that can be configured using the **set chassis aggregated-devices maximum-links** configuration command.
- Maximum of 1024 logical interfaces on an aggregated Ethernet physical interface.
- Support for V LAN tagging, flexible VLAN tagging, and stacked VLAN tagging.
- LACP.
- Link protection.
- 802.3 ah OAM.
- 802.1 ag OAM.
- MPLS FRR.
- SNMP.
- Supports per-VLAN queuing (using Packet Forwarding Engine).

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the P1-PTX-24-10G-W-SFPP PIC:

- LOS—Loss Of Signal
- LOF—Loss Of Frame
- LOM—Loss Of Multiframe
- SSF—Server Signal Failure
- TSF—Trail Signal Fail

- OTU-FEC-DEG—Forward Error Correction Degraded
- OTU-FEC-EXE—Excessive Errors, FEC\_FAIL from the transponder
- OTU-AIS—Alarm Indication Signal or all ones signal
- OTU-BDI—Backward Defect Identification
- OTU-IAE—Incoming Alignment Error
- OTU-BIAE—Backward Incoming Alignment Error
- OTU-TTIM—Destination Access Point Identifier [DAPI], Source Access Point Identifier [SAPI], or both mismatch from expected to received
- OTU-SD—Signal Degrade
- OTU-SF—Signal Fail
- CSF—Client Signal Failure
- ODU-LCK—(ODU lock triggers for PM [path monitoring])
- ODU-AIS—(alarm indication signal or all ones signal)
- ODU-OCI—(open connection error)
- ODU-BDI—(backward defect indication)
- ODU-IAE—(incoming alignment error)
- ODU-DAPI-TTIM—DAPI or DAPI/SAPI mismatch from expected to receive
- ODU-SAPI-TTIM—SAPI or DAPI/SAPI mismatch from expected to receive
- ODU-BEI—Backward Error Indication
- ODU-SSF—Server Signal Fail
- ODU-TSF—Trail Signal Fail
- ODU-SD—Signal Degrade
- ODU-SF—Signal Fail
- OPU-PTM—Payload Type Mismatch

## TCA Alarms

Threshold-crossing alarms (TCA) are alarms that are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15 minute interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)
- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UAS)

## Configuring OTN Interfaces on P1-PTX-24-10G-W-SFPP PIC

Starting from Junos OS Release 14.2, a 24-port 10-Gigabit Ethernet OTN PIC—P1-PTX-24-10G-W-SFPP—is supported on the FPC-PTX-P1-A and FPC2-PTX-P1A FPCs in PTX5000 routers, and the FPC-SFF-PTX-P1-A and FPC-SFF-PTX-T FPCs in PTX3000 routers. To configure an OTN interface on the P1-PTX-24-10G-W-SFPP PIC, you must configure interface-specific options and the OTN-related options for the interface.

To configure the interface-specific options:

1. Go to the **[edit interface *interface-name*]** hierarchy level, where *interface-name* is in the *et-fpc/pic/port* format.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the VLAN tagging option on the OTN interface to enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

3. Configure the maximum transmission unit (MTU) size in bytes for the interface.

```
[edit interfaces interface-name]
user@host# set mtu bytes
```

4. Configure a VLAN ID for the interface.

```
[edit interfaces interface-name]
user@host# set vlan-id number
```

5. Configure the family for the interface.

```
[edit interfaces interface-name]
user@host# set family family-name
```

6. Configure an IP address for the interface.

```
[edit interfaces interface-name]
user@host# set address address
```

To configure the OTN-related options on the interface:

1. Go to the `[edit interface interface-name otn-options]` hierarchy level:

```
[edit interfaces interface-name]
user@host# edit otn-options
```

2. Enable the OTN mode as OTU2e, OTU1e, or OTU2 for the interface.

```
[edit interfaces interface-name otn-options]
user@host# set rate fixed-stuff-bytes|no-fixed-stuff-bytes|oc192
```

**NOTE:** `fixed-stuff-bytes` is for OTU2e rate, `no-fixed-stuff-bytes` is for OTU1e rate and `oc192` is for OTU2 rate. OTU2e and OTU1e rates are applicable for LAN PHY framing mode. OTU2 is applicable for WAN PHY framing mode. Framing mode is to set through the `set interfaces framing` configuration statement.

3. Enable the laser on the OTN interface. The laser is disabled by default for all OTN interfaces.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

4. Set an trail trace identifier for the source access point and for the destination access point for ODU and OTU on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set tti (odu-dapi | odu-expected-receive-dapi | odu-expected-receive-sapi
| odu-sapi | otu-dapi | otu-expected-receive-dapi | otu-expected-receive-sapi |
otu-sapi) tti-identifier
```

5. Ignore the trigger for the defect or set the hold time.

Configure the hold time for the defect trigger as:

- `up` with a value—Wait for the hold time delay before clearing the alarm when the defect is absent on the OTN interface.
- `down` with a value—Wait for the hold time delay before raising the alarm when the defect occurs for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set trigger (oc-lof | oc-lom | oc-los | oc-tsfc | odu-ais | odu-bdi | odu-bei |
odu-iae | odu-lck | odu-oci | odu-sd | odu-ttim | opu-ptim | otu-ais | otu-bdi |
otu-fec-deg | otu-fec-exe | otu-iae | otu-sd | otu-ttim) (hold-time (down value | up
value) | ignore)
```

6. Enable the threshold crossing alarms for the OTN interface along with the trigger for the defect.

```
[edit interfaces interface-name otn-options]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas | otu-tca-bbe
| otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca | threshold)
```

7. Set the OTN header bytes as a transmit payload type from 0 bytes through 255 bytes for the packets that are transmitted on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set bytes transmit-payload-type value
```

8. Configure the forward error correction (FEC) mode as Generic Forward Error Correction (GFEC), Enhanced Forward Error Correction (EFEC), Ultra Forward Error Correction (UFEC), or no-FEC (none) for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set fec (gfec | ufec | efec | none)
```

9. Enable a consequent action as listed in the ITU-T G.798 standard for ODU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set odu-ttim-action-enable
```

10. Enable a consequent action as listed in the ITU-T G.798 standard for OTU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set otu-ttim-action-enable
```

11. Configure the threshold value for signal degradation when an alarm needs to be raised. Configure the threshold value after signal degradation when the alarm needs to be cleared. When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
user@host# set ber-threshold-clear value
```

```
user@host# set interval value
```

12. Enable the following actions for the **preemptive-fast-reroute** statement:

- Backward FRR—Insert the local pre-FEC status into the transmitted OTN frames and monitor the received OTN frames for the pre-FEC status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set backward-frr-enable
```

- Monitoring of signal degradation of pre-FEC OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
```

## 100-Gigabit Ethernet OTN Options Configuration Overview

PTX Series routers support optical transport network (OTN) interfaces, including the 100-Gigabit DWDM OTN PIC, which supports:

- Transparent transport of two 100-Gigabit Ethernet signals with Optical Channel Transport Unit 4 (OTU4) framing.
- International Telecommunications Union (ITU)-standard OTN performance monitoring (PM) and alarm management.
- Dual polarization quadrature phase shift keying (DP-QPSK) modulation and soft-decision forward error correction (SD-FEC) for long haul and metro applications.
- Pre-forward error correction (pre-FEC)-based bit error rate (BER) monitoring. Pre-FEC BER monitoring uses the pre-FEC BER as an indication of the condition of an OTN link. See [“Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 420](#) for more information.

For more information about the 100-Gigabit DWDM OTN PIC, see *100-Gigabit DWDM OTN PIC* in the *PTX Series Interface Module Reference*.

PTX Series routers also support the 100-Gigabit Ethernet OTN PIC (P2-100GE-OTN), which provides four 100-Gigabit Ethernet interfaces, independently configurable in LAN PHY framing mode or in optical channel transport unit 4 (OTU4) mode. See [“Understanding the P2-100GE-OTN PIC” on page 449](#) for more information.

See [“Supported OTN Options on PTX Series Routers” on page 429](#) for a comparison of the features supported on PTX Series OTN PICs.

MX2020, MX2010, MX960, MX480, and MX240 routers support OTN interfaces on MPC5E and MPC6E. MPC5E-100G10G and MPC5EQ-100G10G support 100-Gigabit Ethernet OTN interfaces and 10-Gigabit Ethernet OTN interfaces on MX240, MX480, and MX960 routers. The OTN MIC MIC6-100G-CFP2 on MPC6E supports OTN on 100-Gigabit Ethernet interfaces on MX2020 and MX2010 routers. OTN support on the specified MX Series routers includes:

- International Telecommunications Union (ITU)-standard OTN performance monitoring (PM) and alarm management
- Transparent transport of two 100-Gigabit Ethernet signals with optical channel transport unit 4 (OTU4) framing.
- Generic forward error correction (Generic FEC)

To configure the OTN options for PTX Series routers and specific MX Series routers, use the **set otn-options** statement at the **[edit interfaces interfaceType-fpc/pic/port]** hierarchy level.

Use the **set optics-options** statement at the **[edit interfaces interfaceType-fpc/pic/port]** hierarchy level to configure the optics options.

Use the **show interfaces extensive**, **show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)**, and **show interfaces transport pm** commands to view optics and OTN PM information. To display the current time interval and clear the channel service unit (CSU) alarm and defect counters, use the **clear interfaces interval** command.

## Understanding the features of ACX6360

Starting in Junos OS Release 18.2R1, the ACX6360 routers with CFP2-DCO pluggable coherent optics, provide high density long haul OTN transport solution.

The following sections explain the features in detail:

- [Interface Features on page 414](#)
- [Section on page ?](#)

- [OTN Alarms and Defects on page 414](#)
- [TCA Alarms on page 415](#)

## Interface Features

The following interface features are supported on the ACX6360:

- Compliant with ITU G.709.
- Supports 8 CFP2 DCO optical modules.
- Supports minimum channel spacing of 6.25GHz.
- Ethernet pause frames—You can halt the Ethernet interface from transmitting packets for a configured period of time.
- Soft-decision forward error correction mode (SDFEC)—QPSK-100G, 8QAM-200G and 16QAM-200G modes of operation are supported.
- Diagnostics tools:
  - Line loopback
  - Local loopback
- Fast reroute (FRR)—Based on configurable pre-FEC or configurable Q threshold for signal degrade.
- SNMP management based on RFC 3591, Definitions of Managed Objects for the Optical Interface Type:
  - Black Link MIB—jnx-bl.mib
  - IFOTN MIB—jnx-ifotn.mib
  - Optics MIB—jnx-optics.mib
  - FRU MIB—jnx-fru.mib
- Threshold-crossing alerts
- BER performance monitoring
- FEC performance monitoring
- Optical performance monitoring

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the ACX6360 routers:

- SSF—Server Signal Failure
- TSF—Trail Signal Fail
- OTU-AIS—Alarm Indication Signal or all ones signal
- OTU-BDI—Backward Defect Identification
- OTU-IAE—Incoming Alignment Error

- OTU-BIAE—Backward Incoming Alignment Error
- OTU-TTIM—Destination Access Point Identifier [DAPI], Source Access Point Identifier [SAPI], or both mismatch from expected to received
- OTU-SD—Signal Degrade
- OTU-SSF—Server Signal Fail
- OTU-TSF—Trail Signal Fail
- PRE\_FEC\_SD
- FE\_PRE\_FEC\_SD
- ODU-LCK—(ODU lock triggers for PM [path monitoring])
- ODU-AIS—(alarm indication signal or all ones signal)
- ODU-OCI—(open connection error)
- ODU-BDI—(backward defect indication)
- ODU-IAE—(incoming alignment error)
- ODU-TTIM—DAPI or SAPI mismatch from expected to receive
- ODU-BEI—Backward Error Indication
- ODU-LTC—Loss of tandem connection
- ODU-SSF—Server Signal Fail
- ODU-TSF—Trail Signal Fail
- ODU-CSF—Client Signal Fail
- ODU-SD—Signal Degrade
- ODU-SF—Signal Fail
- OPU-PTM—Payload Type Mismatch

## TCA Alarms

Threshold-crossing alarms (TCA) are alarms that are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15 minute interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)
- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UAS)

- [Supported Optics Options on ACX6360 Routers on page 417](#)

## Interface Mapping and Modulation format for ACX6360

ACX6360 routers supports 8 CFP2-DCO optical modules. For each CFP2-DCO optical module, 1 *ot* interface is created. Hence, 8 *ot* interfaces are created for ACX6360 routers. ACX6360 routers support only 100GE *et* interfaces and up to 2 *et* interfaces can be mapped to 1 *ot* interface, depending on the configured CFP2-DCO rate- 100G or 200G.

The optical interface to *et* mapping is displayed in the following table:

| "ot-" interface | Modulation Format | Mapped "et" interface(s) |
|-----------------|-------------------|--------------------------|
| ot-0/1/0        | QPSK-100G         | et-0/1/0                 |
|                 | 8QAM-200G         | et-0/1/0                 |
|                 |                   | et-0/1/1                 |
|                 | 16QAM-200G        | et-0/1/0                 |
|                 |                   | et-0/1/1                 |
|                 |                   |                          |
| ot-0/1/1        | QPSK-100G         | et-0/1/2                 |
|                 | 8QAM-200G         | et-0/1/2                 |
|                 |                   | et-0/1/3                 |
|                 | 16QAM-200G        | et-0/1/2                 |
|                 |                   | et-0/1/3                 |
|                 |                   |                          |
| ot-0/1/2        | QPSK-100G         | et-0/1/4                 |
|                 | 8QAM-200G         | et-0/1/4                 |
|                 |                   | et-0/1/5                 |
|                 | 16QAM-200G        | et-0/1/4                 |
|                 |                   | et-0/1/5                 |
|                 |                   |                          |
| ot-0/1/3        | QPSK-100G         | et-0/1/6                 |
|                 | 8QAM-200G         | et-0/1/6                 |
|                 |                   | et-0/1/7                 |
|                 | 16QAM-200G        | et-0/1/6                 |
|                 |                   | et-0/1/7                 |
|                 |                   |                          |

| "ot-" interface | Modulation Format | Mapped "et" interface(s) |
|-----------------|-------------------|--------------------------|
| ot-0/1/4        | QPSK-100G         | et-0/1/8                 |
|                 | 8QAM-200G         | et-0/1/8                 |
|                 |                   | et-0/1/9                 |
|                 | 16QAM-200G        | et-0/1/8                 |
|                 |                   | et-0/1/9                 |
|                 |                   |                          |
| ot-0/1/5        | QPSK-100G         | et-0/1/10                |
|                 | 8QAM-200G         | et-0/1/10                |
|                 |                   | et-0/1/11                |
|                 | 16QAM-200G        | et-0/1/10                |
|                 |                   | et-0/1/11                |
|                 |                   |                          |
| ot-0/1/6        | QPSK-100G         | et-0/1/12                |
|                 | 8QAM-200G         | et-0/1/12                |
|                 |                   | et-0/1/13                |
|                 | 16QAM-200G        | et-0/1/12                |
|                 |                   | et-0/1/13                |
|                 |                   |                          |
| ot-0/1/7        | QPSK-100G         | et-0/1/14                |
|                 | 8QAM-200G         | et-0/1/14                |
|                 |                   | et-0/1/15                |
|                 | 16QAM-200G        | et-0/1/14                |

## Understanding Pre-FEC BER Monitoring and BER Thresholds

Optical transport network (OTN) interfaces on PTX Series Packet Transport Routers support monitoring the condition of an OTN link by using the pre-forward error correction (pre-FEC) bit error rate (BER). The following PICs support pre-FEC BER monitoring:

- P1-PTX-2-100G-WDM
- P2-100GE-OTN
- P1-PTX-24-10G-W-SFPP

Starting in Junos OS Release 18.3R1, Optical transport interfaces on ACX6360 Routers support monitoring the condition of an optical link by using the pre-forward error correction (pre-FEC) bit error rate (BER). Refer to [“Supported Forward Error Correction Modes on ACX6360 Router” on page 425](#) for more details.

The PICs use forward error correction (FEC) to correct bit errors in the received data. As long as the pre-FEC BER is below the FEC limit, all bit errors are successfully identified and corrected and, therefore, no packet loss occurs. The system monitors the pre-FEC BER on each port. This gives an early warning of link degradation. By configuring an appropriate pre-FEC BER threshold and interval, you enable the PIC to take preemptive action before the FEC limit is reached. If this pre-FEC BER threshold logic is combined with MPLS fast reroute, then packet loss can be minimized or prevented.

You must specify both the signal degradation threshold (**ber-threshold-signal-degrade**) and the interval (**interval**) for the interface. The threshold defines the BER criteria for a signal degrade condition and the interval defines the minimum duration over which the BER must exceed the threshold before an alarm is raised. The relationship between the threshold and the interval is illustrated in [Figure 18 on page 421](#). After an alarm is raised, if the BER returns to a level below the threshold clear value (**ber-threshold-clear**), the alarm is cleared.

**Figure 18: Pre-FEC BER Monitoring**

With pre-FEC BER monitoring enabled, when the configured pre-FEC BER signal degrade threshold is reached, the PIC stops forwarding packets to the remote interface and raises an interface alarm. Ingress packets continue to be processed. If pre-FEC BER monitoring is used with MPLS fast reroute or another link protection method, then traffic is rerouted to a different interface.

You can also configure backward fast reroute to insert the local pre-FEC status into transmitted OTN frames, notifying the remote interface of signal degradation. The remote interface can use the information to reroute traffic to a different interface. If you use pre-FEC BER monitoring together with backward fast reroute, then notification of signal

degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol.

Include the `signal-degrade-monitor-enable` and `backward-frr-enable` statements at the `[edit interfaces interface-name otn-options preemptive-fast-reroute]` hierarchy level to enable pre-FEC BER monitoring and backward fast reroute.

**NOTE:** When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the `signal-degrade-monitor-enable` and the `backward-frr-enable` statements.

You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used.

When a received signal degrade alarm is active and backward fast reroute is enabled, a specific flag is inserted into the transmitted OTN overhead. The remote PIC at the opposite end of the link monitors the OTN overhead, thus enabling both ends to initiate traffic rerouting in the event of a signal degrade condition. When the signal degrade condition is cleared, the OTN overhead flag is returned to a normal state.

The pre-FEC BER signal degrade threshold value defines a specific amount of system margin relative to the BER correction limit (or FEC limit) of the PIC's receive FEC decoder. Each PIC has a set FEC limit—it is intrinsic to the FEC decoder implementation.

**NOTE:** The examples below use  $Q^2$ -factor measurements (also known as Q-factor).  $Q^2$ -factor is expressed in units of decibels relative to a  $Q^2$ -factor of zero (dBQ).  $Q^2$ -factor enables you to describe system margin in linear terms in contrast to BER values, which are nonlinear in nature. After you determine the thresholds, you must convert the threshold values from  $Q^2$ -factor to BER to enter them in the CLI by using scientific notation. BER can be converted to  $Q^2$ -factor by using the following equation:

$$Q^2\text{-factor} = 20 * \log_{10} (\text{sqrt}(2) * \text{erfcinv}(2 * \text{BER}))$$

**TIP:** To convert between  $Q^2$ -factor and BER in a spreadsheet program, you can approximate the values by using the following formulas:

- To calculate  $Q^2$ -factor:

$$= 20 * \text{LOG10}(-\text{NORMSINV}(\text{BER}))$$

- To calculate BER:

$$= 1 - \text{NORMSDIST}(10^{(0.05 * Q^2\text{-factor})})$$

Table 67 on page 423 shows the relationship between the fixed FEC limit, the configurable signal degrade threshold, and the configurable clear threshold for different PICs. In this example, approximately 1 dBQ of system margin has been set between the FEC limit, signal degrade threshold, and clear threshold.

**Table 67: Example—Signal Degrade and Clear Threshold Values at 1 dBQ**

| PIC                  | FEC Type           | FEC Limit              |        | Signal Degrade Threshold |        | Clear Threshold        |        |
|----------------------|--------------------|------------------------|--------|--------------------------|--------|------------------------|--------|
|                      |                    | Q <sup>2</sup> -Factor | BER    | Q <sup>2</sup> -Factor   | BER    | Q <sup>2</sup> -Factor | BER    |
| P1-PTX-2-100G-WDM    | SD-FEC             | 6.7 dBQ                | 1.5E-2 | 7.7 dBQ                  | 7.5E-3 | 8.7 dBQ                | 3.0E-3 |
| P2-100GE-OTN         | G.709 GFEC         | 11.5 dBQ               | 8.0E-5 | 12.5 dBQ                 | 1.1E-5 | 13.5 dBQ               | 1.0E-6 |
| P1-PTX-24-10G-W-SFPP | G.975.1 1.4 (UFEC) | 9.1 dBQ                | 2.2E-3 | 10.1 dBQ                 | 6.9E-4 | 11.1 dBQ               | 1.6E-4 |
|                      | G.975.1 1.7 (EFEC) | 9.6 dBQ                | 1.3E-3 | 10.6 dBQ                 | 3.6E-4 | 11.6 dBQ               | 7.5E-5 |
|                      | G.709 GFEC         | 11.5 dBQ               | 8.0E-5 | 12.5 dBQ                 | 1.1E-5 | 13.5 dBQ               | 1.0E-6 |

To adjust the signal degrade threshold, you must first decide on a new system margin target and then calculate the respective BER value (using the equation to convert from Q<sup>2</sup>-factor to BER). Table 68 on page 423 shows the values if 3 dBQ of system margin relative to the FEC limit is required for the signal degrade threshold (while maintaining the clear threshold at 1 dBQ relative to the signal degrade threshold).

**NOTE:** The choice of system margin is subjective, as you might want to optimize your thresholds based on different link characteristics and fault tolerance and stability objectives. For guidance about configuring pre-FEC BER monitoring and BER thresholds, contact your Juniper Networks representative.

**Table 68: Example—Signal Degrade and Clear Thresholds After Configuration**

| PIC               | FEC Type   | FEC Limit              |        | Signal Degrade Threshold |        | Clear Threshold        |        |
|-------------------|------------|------------------------|--------|--------------------------|--------|------------------------|--------|
|                   |            | Q <sup>2</sup> -Factor | BER    | Q <sup>2</sup> -Factor   | BER    | Q <sup>2</sup> -Factor | BER    |
| P1-PTX-2-100G-WDM | SD-FEC     | 6.7 dBQ                | 1.5E-2 | 9.7 dBQ                  | 1.1E-3 | 10.7 dBQ               | 2.9E-4 |
| P2-100GE-OTN      | G.709 GFEC | 11.5 dBQ               | 8.0E-5 | 14.5 dBQ                 | 4.9E-8 | 15.5 dBQ               | 1.1E-9 |

Table 68: Example—Signal Degrade and Clear Thresholds After Configuration (continued)

| PIC                  | FEC Type           | FEC Limit              |        | Signal Degrade Threshold |        | Clear Threshold        |        |
|----------------------|--------------------|------------------------|--------|--------------------------|--------|------------------------|--------|
|                      |                    | Q <sup>2</sup> -Factor | BER    | Q <sup>2</sup> -Factor   | BER    | Q <sup>2</sup> -Factor | BER    |
| PI-PTX-24-10G-W-SFPP | G.975.1 1.4 (UFEC) | 9.1 dBQ                | 2.2E-3 | 12.1 dBQ                 | 2.8E-5 | 13.1 dBQ               | 3.1E-6 |
|                      | G.975.1 1.7 (EFEC) | 9.6 dBQ                | 1.3E-3 | 12.6 dBQ                 | 1.1E-5 | 13.6 dBQ               | 9.1E-7 |
|                      | G.709 GFEC         | 11.5 dBQ               | 8.0E-5 | 14.5 dBQ                 | 4.8E-8 | 15.5 dBQ               | 1.1E-9 |

Include the `ber-threshold-signal-degrade`, `ber-threshold-clear`, and `interval` statements at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level to configure the BER thresholds and time interval.

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

## Release History Table

| Release | Description                                                                                                                                                                                                        |

## Configuring 100-Gigabit DWDM OTN PICs

PTX Series routers support optical transport network (OTN) interfaces, including the 100-Gigabit DWDM OTN PIC (P1-PTX-2-100G-WDM). See [“100-Gigabit Ethernet OTN Options Configuration Overview” on page 412](#).

To configure the 100-Gigabit DWDM OTN PIC:

1. Configure the interface wavelength.

```
[edit interfaces interface-name optics-options]
user@host# set wavelength nm
```

See [wavelength](#).

**NOTE:** See *100-Gigabit DWDM OTN PIC Integrated Transceiver Optical Interface Specifications* for a list of wavelengths supported by the P1-PTX-2-100G-WDM PIC.

2. Enable the laser.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

3. (Optional) Set the tca.

```
[edit interfaces interface-name otn-options]
user@host# set tca tca-identifier (enable-tca | no-enable-tca) (threshold number |
threshold-24hrs number)
```

See [tca](#).

4. (Optional) Set the trace identifiers.

```
[edit interfaces interface-name otn-options]
user@host# set tti tti-identifier tti-identifier-name
```

See [tti](#).

5. (Optional) Specify defect triggers.

```
[edit interfaces interface-name otn-options]
user@host# set trigger trigger-identifier
```

See [trigger](#).

6. (Optional) Enable VLAN tagging. See *Enabling VLAN Tagging*.
7. (Optional) Set the media MTU. See *Configuring the Media MTU*.
8. (Optional) Set the unit VLAN ID, family `inet`, and IP address.

```
[edit interfaces interface-name]
user@host# set vlan-id number
user@host# set family inet
user@host# set address address
```

9. (Optional) Enable pre-FEC BER signal-degrade monitoring and backward fast reroute to monitor the pre-FEC BER status of the link and to insert the local pre-FEC status into transmitted OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
user@host# set backward-frr-enable
```

See [signal-degrade-monitor-enable](#) and [backward-frr-enable](#).

10. (Optional) Configure the bit error rate (BER) thresholds for signal degradation used for monitoring the pre-forward error correction (pre-FEC) status of the OTN link.

- a. Set the BER signal-degrade threshold.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
```

- b. Set the BER threshold to clear signal-degrade alarms.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-clear value
```

- c. Set the time interval for signal-degrade collection. After the BER threshold for signal-degrade is crossed for ten consecutive intervals, an alarm is raised. If the BER threshold for signal-degrade clear is crossed for ten consecutive intervals, the alarm is cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms \* 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set interval value
```

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

See [ber-threshold-signal-degrade](#), [ber-threshold-clear](#), and [interval](#).

**NOTE:** See “[Understanding Pre-FEC BER Monitoring and BER Thresholds](#)” on page 420 for more information about pre-FEC BER monitoring and determining BER threshold settings.

## Supported OTN Options on MX Series Routers

Table 73 on page 437 lists the statements that are supported on 100-Gigabit Ethernet MICs on MX Series routers at the `[edit interfaces interface-name otn-options]` hierarchy level. Note that the term NA denotes that the statement is not applicable for that particular component:

Table 73: Statements Supported on 100-Gigabit Ethernet MICs on MX Series Routers

## Supported OTN Options on ACX6360 Routers

Table 74 on page 444 lists the statements that are supported on ACX6360 routers at the `[edit interfaces interface-name otn-options]` hierarchy level. Note that the term *NA* denotes that the statement is not applicable for that particular component:

*Table 74: Statements Supported on ACX6360 Routers*

| Statement                                                                       | Options                                                                                               | Junos Version |

## Understanding the P2-100GE-OTN PIC

Starting with Junos OS Release 14.1R2 and 14.2, a 100-Gigabit Ethernet OTN PIC—P2-100GE-OTN—is supported on the FPC2-PTX-P1A FPC in PTX5000 routers. The P2-100GE-OTN PIC provides 4-port 100-Gigabit Ethernet interfaces, which are independently configurable in LAN PHY framing mode or in optical channel transport unit 4 (OTU4) mode. Each interface is terminated by means of a CFP2 transceiver. The FPC2-PTX-P1A FPC supports two P2-100GE-OTN PICs, in which each 100-Gigabit Ethernet port is mapped to a Packet Forwarding Engine in the FPC.

Starting from Junos OS Release 15.1, you can configure the interfaces on the P2-100GE-OTN PIC on PTX5000 routers, to be a part of the mixed rates and mixed mode aggregated Ethernet bundles.

For information about mixed rates, see [“Understanding Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles” on page 58](#).

Starting from Junos OS Release 15.1, you can configure port-based pseudowire class of service (CoS) classification which includes Layer 3 IPv4, IPv6, and MPLS classification for interfaces with ethernet-ccc encapsulation.

The following sections explain this PIC in detail:

- [Interface Features on page 449](#)
- [Layer 2 and Layer 3 Features on page 451](#)
- [OTN Alarms and Defects on page 452](#)
- [TCA Alarms on page 452](#)

### Interface Features

The following interface features are supported on a P2-100GE-OTN PIC:

- 4-port 100-Gigabit Ethernet interfaces, which are independently configurable in LAN PHY framing mode or in OTU4 signal mode. Each interface is terminated by means of a CFP2 transceiver.
- Each port maps to a single Packet Forwarding Engine in the FPC2-PTX-P1A FPC.
- The interfaces are named with prefix *et*.
- Gigabit Ethernet local loopback.
- Link-level pause frames—You can halt the Ethernet interface from transmitting packets for a configured period of time.
- Interface hold timer and interface damping—You can set the **hold-time** statement (in milliseconds) to damp interface transitions.
- External clock
- Nonstandard tag protocol identifier (TPID):

- For each 100-Gigabit Ethernet port, you can configure up to eight TPIDs by using the **tag-protocol-id** statement at the **[edit interfaces interface-name gige-ethernet-ethernet-switch-profile]** hierarchy level.
- The **tag-protocol-id** statement can be configured only on the first port (port 0) of the PIC. If any other (nonzero) port has the **tag-protocol-id** configuration, the Routing Engine registers an error in the system log and the configuration is ignored.
- The **tag-protocol-id** statement configured on port 0 of the PIC also applies to the rest of the ports on that PIC.
- The interface *Link Down* event always generates an interrupt; however, the interface *Link Up* event does not generate an interrupt. Therefore, the interface link-up event is detected during the 1-second PIC periodic polling process.
- Generic forward error correction (GFEC) (G.709) and no-FEC modes of operation.
- Diagnostics tools:
  - Line loopback
  - Local loopback
- Fast reroute (FRR)—Based on configurable pre-FEC, bit error rate (BER) is supported and is configured using the **ber-threshold-signal-degrade** statement at the **[edit interfaces interface-name otn-options signal-degrade]** hierarchy level.
- *jnx-ifotn.mib* and *otn-mib* as defined in RFC 3591. Note that according to Junos OS security standard, configurable parameters are not supported through SNMP. Only the *get* operation is available through SNMP.
- FEC statistics—corrected errors and corrected error ratio.
- OTN payload pseudorandom binary sequence (PRBS) generation and checking by enabling or disabling PRBS with the **prbs** or **no-prbs** statement at the **[edit interfaces interface-name otn-options]** hierarchy level.
- Optical channel data unit (ODU)-level delay measurement.
- At the physical interface level, **flexible-ethernet-service**, **ethernet-ccc**, and **ethernet-tcc** encapsulations are supported. For the **flexible-ethernet-service** encapsulation, the logical level supports **enet2**, **vlan-ccc**, and **vlan-tcc** encapsulations.
- At the logical interface level, **dix**, **vlan-ccc**, and **vlan-tcc** encapsulations are supported.
- Interoperability between 100-Gigabit Ethernet interfaces with CFP transceiver and 100-Gigabit Ethernet interfaces with CFP2 transceiver in LAN PHY framing mode and in OTU4 mode.

The following features are not supported on the P2-100GE-OTN PIC:

- Source MAC learning for accounting
- MAC policing
- Physical interface-level encapsulations—**vlan-ccc**, **extended-vlan-ccc**, and **extended-vlan-tcc**

- Logical interface-level encapsulation—**vlan-vpls**
- VLAN rewrite for **ccc** encapsulation
- Per-queue flow control
- Generic framing procedure-framed (GFP-F) mapping modes over OTN
- General communication channel (GCC)
- OTN interface-level Automatic Protection Switching (APS)
- Insertion, monitoring, and display of OTN header overhead byte
- Black link MIB for integration with transponders
- Optical harness support
- Transport interface and state model (GR-1093)
- Trace tone support
- 15-minute and 1-day performance monitoring counters and historic counters

## Layer 2 and Layer 3 Features

The following Layer 2 and Layer 3 features are supported on the P2-100GE-OTN PIC:

- MAC detect link up and link down based on local fault signal or remote fault signal.
- MAC statistics.
- Flow control.
- MAC oversized packet counters based on default MTU value or user-configured MTU value.
- Per-port destination address MAC filter.
- Per-port source address MAC filter.
- Per-physical interface source address MAC filter.
- Per-logical interface source address MAC accounting.
- Maximum of 1000 source MAC filter per physical interface.
- Maximum of 32,000 filter terms to share across all filter features.
- Aggregated Ethernet supports 64 child links that can be configured using the **set chassis aggregated-devices maximum-links** configuration command.
- Maximum of 1024 logical interfaces on an aggregated Ethernet physical interface.
- Support for VLAN tagging, flexible VLAN tagging, and stacked VLAN tagging.
- LACP.
- Link protection.
- 802.3 ah OAM.
- 802.1 ag OAM.

- MPLS FRR.
- SNMP.
- Supports per-VLAN queuing (using Packet Forwarding Engine).

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the P2-100GE-OTN PIC:

- LOS—Loss Of Signal
- LOF—Loss Of Frame
- LOM—Loss Of Multiframe
- OTU—Degrade
- OTU—AIS
- OTU—IAE
- OTU—BDI
- OTU—TTIM
- OTU—Signal Degrade
- OTU—Signal Fail
- ODU—Signal Fail
- OTU-FEC—Degrade
- OTU-FEC—Excessive errors
- ODU—Signal Degrade
- ODU—AIS
- ODU—BDI
- ODU—OCI
- ODU—LCK
- ODU—TTIM
- OPU—PTM

## TCA Alarms

Threshold-crossing alarms (TCA) are alarms that are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15 minute interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)

- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UAS)

## Release History Table

| Release | Description                                                                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1    | Starting from Junos OS Release 15.1, you can configure the interfaces on the P2-100GE-OTN PIC on PTX5000 routers, to be a part of the mixed rates and mixed mode aggregated Ethernet bundles.                                 |
| 15.1    | Starting from Junos OS Release 15.1, you can configure port-based pseudowire class of service (CoS) classification which includes Layer 3 IPv4, IPv6, and MPLS classification for interfaces with ethernet-ccc encapsulation. |

## Configuring OTN Interfaces on P2-100GE-OTN PIC

To configure an OTN interface on the P2-100GE-OTN PIC you must configure interface-specific options and OTN-related options for the interface.

To configure the interface-specific options:

1. Go to the **[edit interface *interface-name*]** hierarchy level, where *interface-name* is in the *et-fpc/pic/port* format.

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure VLAN tagging on the OTN interface to enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

3. Configure the maximum transmission unit (MTU) size in bytes for the interface.

```
[edit interfaces interface-name]
user@host# set mtu bytes
```

4. Configure a VLAN ID for the interface.

```
[edit interfaces interface-name]
user@host# set vlan-id number
```

5. Configure the family for the interface.

```
[edit interfaces interface-name]
user@host# set family family-name
```

6. Configure an IP address for the interface.

```
[edit interfaces interface-name]
user@host# set address address
```

To configure the OTN-related options on the interface:

1. Go to the `[edit interface interface-name otn-options]` hierarchy level:

```
[edit]
user@host# edit interfaces interface-name otn-options
```

2. Enable the laser on the OTN interface. The laser is disabled by default for all OTN interfaces.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

3. Set an trail trace identifier for the source access point and for the destination access point for ODU and OTU on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set tti (odu-dapi | odu-expected-receive-dapi | odu-expected-receive-sapi
| odu-sapi | otu-dapi | otu-expected-receive-dapi | otu-expected-receive-sapi |
otu-sapi) tti-identifier
```

4. Ignore the trigger for the defect or set the hold time.

Configure the hold time for the defect trigger as:

- *up* with a value—Wait for the hold time delay before clearing the alarm when the defect is absent on the OTN interface.
- *down* with a value—Wait for the hold time delay before raising the alarm when the defect occurs for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set trigger (oc-lof | oc-lom | oc-los | oc-tsfc | odu-ais | odu-bdi | odu-bei |
odu-iae | odu-lck | odu-oci | odu-sd | odu-ttim | opu-ptim | otu-ais | otu-bdi |
otu-fec-deg | otu-fec-exe | otu-iae | otu-sd | otu-ttim) (hold-time (down value | up
value) | ignore)
```

5. Enable the threshold crossing alarms for the OTN interface along with the trigger for the defect.

- In Junos OS Release 14.1R2 only:

```
[edit interfaces interface-name otn-options trigger]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas |
 otu-tca-bbe | otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca
 | threshold)
```

- In Junos OS Release 14.2 and later:

```
[edit interfaces interface-name otn-options]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas |
 otu-tca-bbe | otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca
 | threshold)
```

6. Set the OTN header bytes as a transmit payload type from 0 bytes through 255 bytes for the packets that are transmitted on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set bytes transmit-payload-type value
```

7. Configure the forward error correction (FEC) mode as Generic Forward Error Correction (GFEC) or none for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set fec (gfec | none)
```

8. Enable line loopback or local host loopback for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set line-loopback
user@host# set local-loopback
```

9. Enable an ODU locked maintenance signal on the OTN interface to send the signal pattern 01010101.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-lck
```

10. Enable an ODU open connection indication signal on the OTN interface to send to send the signal pattern 01100110.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-oci
```

11. Enable a consequent action as listed in the ITU-T G.798 standard for ODU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
```

```
user@host# set odu-ttim-action-enable
```

12. Enable a consequent action as listed in the ITU-T G.798 standard for OTU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set odu-ttim-action-enable
```

13. Configure the OTN payload pseudorandom binary sequence (PRBS) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set prbs
```

14. Configure OTN mode as OTU4 for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set rate otu4
```

15. Configure the threshold value for signal degradation when an alarm needs to be raised. Configure the threshold value after signal degradation when the alarm needs to be cleared. When you configure the interval along with the **ber-threshold-signal-degrade value** statement, the bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear value** statement, then BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
user@host# set ber-threshold-clear value
user@host# set interval value
```

16. Enable the following actions for the **preemptive-fast-reroute** statement:

- Backward FRR—Insert the local pre-FEC status into the transmitted OTN frames and monitor the received OTN frames for the pre-FEC status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set backward-frr-enable
```

- ODU backward FRR—Insert the ODU status into the transmitted OTN frames and monitor the received OTN frames for the ODU BER status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-backward-frr-enable
```

- Monitoring of signal degradation of pre-FEC OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
```

- Monitoring of signal degradation of ODU BER in the received OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-signal-degrade-monitor-enable
```

17. Configure the following options for ODU BER signal degradation on the OTN interface:

- Configure the threshold for signal degradation for ODU BER when an alarm needs to be raised.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-signal-degrade value
```

- Configure the threshold for ODU BER after signal degradation when the alarm needs to be cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-clear value
```

- When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the ODU bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then ODU BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set interval value
```

## Understanding the MIC3-100G-DWDM MIC

Starting from Junos OS Release 15.1F5, the 100-Gigabit DWDM OTN MIC—MIC3-100G-DWDM—is supported on MPC3E (MX-MPC3E-3D) and MPC3E NG (MPC3E-3D-NG) on the MX240, MX480, MX960, MX2010, and MX2020 routers. The MIC3-100G-DWDM MIC provides a single 100-Gigabit Ethernet interface port that supports DP-QPSK with coherent reception and OTU4 and OTU4 (v) framing modes.

The interfaces on MIC3-100G-DWDM MIC are named with prefix *et*. For more information, see *Interface Naming Overview*.

The following sections explain the features of this MIC in detail:

- [Interface Features on page 458](#)
- [Layer 2 and Layer 3 Features on page 459](#)
- [OTN Alarms and Defects on page 459](#)

## Interface Features

The following interface features are supported on the MIC3-100G-DWDM MIC:

- Single port 100-Gigabit Ethernet interface with OTU4 (v) framing, DP-QPSK modulation with coherent reception using a CFP2-ACO DWDM optical transceiver.
- Gigabit Ethernet local loopback.
- Diagnostics tools:
  - Line loopback
  - Local loopback
  - Optical Channel Data Unit (ODU) Open Connection Error
  - Optical Channel Data Unit (ODU) Lock Maintenance Signal
- Types of forward error corrections (FEC):
  - GFEC (generic forward error correction)
  - HGFECC (high gain forward error correction)
  - SDFEC (soft-decision forward error correction)
- The following MIB modules continue to be supported (and no new MIB is introduced):
  - MIB module to describe Black Link extension to RFC 3591 (jnxoptIfExtMibModule)
  - MIB module to manage the OTN interface (jnxIfOtnMib)
  - MIB module to manage the Optics interface (jnxIfOpticsMib)
  - MIB module to manage OTN FRUs (jnxFruMib)
- Interoperability with the 100-Gigabit DWDM OTN PIC (P1-PTX-2-100G-WDM) is not supported.
- Support for interoperability with other vendors' 100 Gigabit Ethernet interfaces.
- Source MAC learning for accounting
- MAC policing
- Physical interface-level encapsulations—**vlan-ccc**, **extended-vlan-ccc**, and **extended-vlan-tcc**
- Logical interface-level encapsulation—**vlan-vpls**
- VLAN rewrite for **ccc** encapsulation
- Per-queue flow control

- 15-minute and 1-day performance monitoring and historic statistics.
  - Near-end and far-end performance monitoring
  - Threshold-crossing alarms
  - BER performance monitoring
  - FEC performance monitoring
  - Optical performance monitoring
- Insertion, monitoring, and display of OTN header overhead
- Transport interface and state model (GR-1093)

## Layer 2 and Layer 3 Features

The following Layer 2 and Layer 3 features are supported on the MIC3-100G-DWDM MIC:

- Per-port destination address MAC filter.
- Per-port source address MAC filter.
- Per-physical interface source address MAC filter.
- Maximum of 1000 source MAC filter per physical interface.
- Maximum of 32,000 filter terms to share across all filter features.
- Flexible VLAN tagging.
- 802.3 ah OAM.
- 802.1 ag OAM.

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the MIC3-100G-DWDM MIC:

### Optical Channel(OC) Alarms and Defects

- OC-LOS—Loss Of Signal
- OC-LOF—Loss Of Frame
- OC-LOM—Loss Of Multiframe
- OC-Wavelength-Lock—Wavelength Lock

### Optical Channel Data Unit (ODU) Defects

- ODU-AIS—ODU Alarm Indication Signal
- ODU-BDI—ODU Backward Defect Indication
- ODU-BIAE—ODU Backward Incoming Alignment Error
- ODU-IAE—ODU Incoming Alignment Error
- ODU-LCK—ODU Locked

- ODU-LTC—ODU Loss of Tandem Connection
- ODU-OCI—ODU Open Connection Error
- ODU-SSF—ODU Server Signal Failure
- ODU-TSF—ODU Trail Signal Failure
- ODU-TTIM—ODU Trail Trace Identifier Mismatch

#### Optical Channel Transport Unit (OTU) Defects

- OTU-AIS—OTU Alarm Indication Signal
- OTU-BDI—OTU Backward Defect Indication
- OTU-BIAE—OTU Backward Incoming Alignment Error
- OTU-FEC-DEG—OTU Forward Error Correction Degrade
- OTU-FEC-EXCESS-FEC—OTU Forward Error Correction Excessive FEC Errors
- OTU-IAE—OTU Incoming Alignment Error
- OTU-SSF—OTU Server Signal Failure
- OTU-TSF—OTU Trail Signal Failure
- OTU-TTIM—OTU Trail Trace Identifier Mismatch

#### Threshold-Crossing Alarms

Threshold-crossing alarms (TCA) are alarms that are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15 minutes interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)
- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UES)

#### Release History Table

## Configuring OTN Interfaces on MIC3-100G-DWDM MIC

Starting from Junos OS Release 15.1F5, the 100-Gigabit DWDM OTN MIC—MIC3-100G-DWDM—is supported on MPC3E (MX-MPC3E-3D) and MPC3E NG (MPC3E-3D-NG) on the MX240, MX480, MX960, MX2010, and MX2020 routers. To configure an OTN interface on the MIC3-100G-DWDM MIC, you must configure interface-specific options and OTN-related options for the interface.

To configure the interface-specific options:

1. Configure VLAN tagging at the **[edit interface interface-name]** hierarchy level, where interface-name is in the **et-fpc/pic/port** format.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

2. Configure the maximum transmission unit (MTU) size in bytes for the interface.

```
[edit interfaces interface-name]
user@host# set mtu value
```

3. Configure a VLAN ID for the interface.

```
[edit interfaces interface-name]
user@host# set vlan-id number
```

4. Configure the family for the interface.

```
[edit interfaces interface-name]
user@host# set family family-name
```

5. Configure an IP address for the interface.

```
[edit interfaces interface-name]
user@host# set address address
```

To configure the optics-specific options on the interface:

1. Specify the optical transmit laser output power in dBm at the **[edit interface interface-name optics-options]** hierarchy level. The default transmit laser output value is 0 dBm.

```
[edit interfaces interface-name optics-options]
user@host# set tx-power value
```

2. Specify the wavelength of the optics in nanometers. For a list of wavelengths supported, see [wavelength](#).

```
[edit interfaces interface-name optics-options]
user@host# set wavelength nm
```

To configure the OTN-specific options on the interface:

1. At the [edit interfaces *interface-name* otn-options] enable the laser on the OTN interface. The laser is disabled by default for all OTN interfaces.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

2. Set an trail trace identifier for the source access point and for the destination access point for ODU and OTU on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set tti (odu-dapi | odu-expected-receive-dapi | odu-expected-receive-sapi
| odu-sapi | otu-dapi | otu-expected-receive-dapi | otu-expected-receive-sapi |
otu-sapi)
```

3. By default, triggers are ignored. Specify defect triggers and the set the trigger hold time for the trigger. Possible values for the trigger hold time are as follows: down—Delay before marking interface down when defect occurs (1..65534 milliseconds) and up—Delay before marking interface up when defect is absent (1..65534 milliseconds).

**NOTE:** The hold time value only impacts the alarm reporting time and does not mark an interface down when the defect occurs. To mark the interface up or down, you must also configure the physical interface hold time at the [edit interfaces *interface-name*] hierarchy level.

```
[edit interfaces interface-name otn-options]
user@host# set trigger (oc-lof | oc-lom | oc-los | oc-tsfc | odu-ais | odu-bdi | odu-bei |
odu-iae | odu-lck | odu-oci | odu-sd | odu-ttim | opu-ptim | otu-ais | otu-bdi |
otu-fec-deg | otu-fec-exe | otu-iae | otu-sd | otu-ttim) (hold-time (down value | up
value) | ignore)
```

4. Enable the threshold crossing alarms for the OTN interface along with the trigger for the defect.

```
[edit interfaces interface-name otn-options]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas | otu-tca-bbe
| otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca | threshold)
```

5. Set the OTN header bytes as a transmit payload type from 0 bytes through 255 bytes for the packets that are transmitted on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set bytes transmit-payload-type value
```

6. Configure the forward error correction (FEC) mode for the OTN interface. Possible values are: Generic Forward Error Correction (GFEC), or High Gain Forward Error Correction (HGFE) or Soft Decision Forward Error Correction (SDFEC). The default forward error correction mode is SDFEC.

```
[edit interfaces interface-name otn-options]
user@host# set fec (gfec | hgfec | sdfec)
```

7. Enable line loopback or local host loopback for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set line-loopback
user@host# set local-loopback
```

8. Enable an ODU locked maintenance signal on the OTN interface to send the signal pattern 01010101.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-lck
```

9. Enable an ODU open connection indication signal on the OTN interface to send to send the signal pattern 01100110.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-oci
```

10. Enable a consequent action as listed in the ITU-T G.798 standard for ODU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set odu-ttim-action-enable
```

11. Enable a consequent action as listed in the ITU-T G.798 standard for OTU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set out-ttim-action-enable
```

12. Configure the OTN payload pseudorandom binary sequence (PRBS) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set prbs
```

13. Configure the line rate or speed of the OTN signal to OTU4 (100Gbps) for the OTN interface.

**NOTE:** If you specify a value other than OTU4, the value is ignored. To verify the line rate, use the `show interfaces interface-name extensive` command.

```
[edit interfaces interface-name otn-options]
user@host# set rate otu4
```

14. Configure the threshold value for signal degradation when an alarm needs to be raised. Configure the threshold value after signal degradation when the alarm needs to be cleared. When you configure the interval along with the **ber-threshold-signal-degrade value** statement, the bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear value** statement, then BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
user@host# set ber-threshold-clear value
user@host# set interval value
```

15. Enable the following actions for the preemptive-fast-reroute statement:

- Backward FRR—Insert the local pre-FEC status into the transmitted OTN frames and monitor the received OTN frames for the pre-FEC status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set backward-frr-enable
```

- ODU backward FRR—Insert the ODU status into the transmitted OTN frames and monitor the received OTN frames for the ODU BER status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-backward-frr-enable
```

- Monitoring of signal degradation of pre-FEC OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
```

- Monitoring of signal degradation of ODU BER in the received OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
```

```
user@host# set odu-signal-degrade-monitor-enable
```

16. Configure the following options for ODU BER signal degradation on the OTN interface:

- Configure the threshold for signal degradation for ODU BER when an alarm needs to be raised.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-signal-degrade value
```

- Configure the threshold for ODU BER after signal degradation when the alarm needs to be cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-clear value
```

- When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the ODU bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then ODU BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set interval value
```

## Understanding the PTX-5-100G-WDM PIC

Starting with Junos OS Release 15.1F6, the 5-port 100-Gigabit DWDM OTN PIC—PTX-5-100G-WDM—is supported on the PTX3000 and the PTX5000 routers. The PTX-5-100G-WDM PIC provides five 100-Gigabit Ethernet interface ports that support dual-polarization quadrature phase shift keying (DP-QPSK) modulation with coherent reception and OTU4 and OTU4 (v) framing modes.

The interfaces on the PTX-5-100G-WDM PIC are named with the prefix *et*. For more information, see *Interface Naming Overview*.

**NOTE:** The 5-port 100-Gigabit DWDM OTN PIC is not directly interoperable with the 2-port 100-Gigabit DWDM OTN PIC (P1-PTX-2-100G-WDM), but they can both operate over the same DWDM line system.

The following sections explain the features of this PIC in detail:

- [Interface Features on page 466](#)
- [Layer 2 and Layer 3 Features on page 467](#)
- [OTN Alarms and Defects on page 467](#)

## Interface Features

The following interface features are supported on the PTX-5-100G-WDM PIC:

- Five-port 100-Gigabit Ethernet interface with OTU4 (v) framing and DP-QPSK modulation with coherent reception using a CFP2-ACO DWDM optical transceiver.
- Gigabit Ethernet local loopback.
- Diagnostics tools:
  - Line loopback
  - Local loopback
  - Optical Channel Data Unit (ODU) Open Connection Error
  - Optical Channel Data Unit (ODU) Lock Maintenance Signal
- Types of forward error corrections (FEC):
  - GFEC (generic forward error correction)

**NOTE:** GFEC mode is not supported on Junos OS Release 15.1F6. Junos OS Release 15.1F6-S1 supports GFEC mode. Contact customer support for the Junos OS Release 15.1F6-S1.

- SDFEC (soft-decision forward error correction)
- The following MIB features continue to be supported (and no new MIB is introduced):
  - MIB module to describe Black Link extension to RFC 3591 (jnxoptIfExtMibModule). The Black Link extension enables an optical transceiver of a vendor to introduce an optical signal over an optical network from another vendor.
  - MIB module to manage the OTN interface (jnxIfOtnMib)
  - MIB module to manage the Optics interface (jnxIfOpticsMib)
  - MIB module to manage OTN FRUs (jnxFruMib)
- Interoperability with other vendors' 100 Gigabit-Ethernet interfaces.
- Source MAC learning for accounting
- MAC policing
- Physical interface-level encapsulations—**vlan-ccc**, **extended-vlan-ccc**, and **extended-vlan-tcc**
- Logical interface-level encapsulation—**vlan-vpls**

- VLAN rewrite for **ccc** encapsulation
- Per-queue flow control
- 15-minute and 1-day performance monitoring and historic statistics.
  - Near-end and far-end performance monitoring
  - Threshold-crossing alarms
  - BER performance monitoring
  - FEC performance monitoring
  - Optical performance monitoring
- Insertion, monitoring, and display of OTN header overhead
- Transport interface and state model (GR-1093)

## Layer 2 and Layer 3 Features

The following Layer 2 and Layer 3 features are supported on the PTX-5-100G-WDM PIC:

- Per-port destination address MAC filter.
- Per-port source address MAC filter.
- Per-physical interface source address MAC filter.
- Maximum of 1000 source MAC filter per physical interface.
- Maximum of 32,000 filter terms to share across all filter features.
- Flexible VLAN tagging.
- 802.3 ah OAM.
- 802.1 ag OAM.

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the PTX-5-100G-WDM PIC:

### Optical Channel Alarms and Defects

- OC-LOS—Loss Of Signal
- OC-LOF—Loss Of Frame
- OC-LOM—Loss Of Multiframe
- OC-Wavelength-Lock—Wavelength Lock

### Optical Channel Data Unit (ODU) Defects

- ODU-AIS—ODU Alarm Indication Signal
- ODU-BDI—ODU Backward Defect Indication
- ODU-BIAE—ODU Backward Incoming Alignment Error

- ODU-IAE—ODU Incoming Alignment Error
- ODU-LCK—ODU Locked
- ODU-LTC—ODU Loss of Tandem Connection
- ODU-OCI—ODU Open Connection Error
- ODU-SSF—ODU Server Signal Failure
- ODU-TSF—ODU Trail Signal Failure
- ODU-TTIM—ODU Trail Trace Identifier Mismatch

#### Optical Channel Transport Unit (OTU) Defects

- OTU-AIS—OTU Alarm Indication Signal
- OTU-BDI—OTU Backward Defect Indication
- OTU-BIAE—OTU Backward Incoming Alignment Error
- OTU-FEC-DEG—OTU Forward Error Correction Degrade
- OTU-FEC-EXCESS-FEC—OTU Forward Error Correction Excessive FEC Errors
- OTU-IAE—OTU Incoming Alignment Error
- OTU-SSF—OTU Server Signal Failure
- OTU-TSF—OTU Trail Signal Failure
- OTU-TTIM—OTU Trail Trace Identifier Mismatch

#### Threshold Crossing Alarms

Threshold-crossing alarms (TCAs) are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15-minute interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)
- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UES)

## Configuring OTN Interfaces on PTX-5-100G-WDM PIC

Starting from Junos OS Release 15.1F6, the the 5-port 100-Gigabit DWDM OTN PIC—PTX-5-100G-WDM—is supported on the PTX3000 and the PTX5000 routers. To configure an OTN interface on the PTX-5-100G-WDM PIC, you must configure interface-specific options, optics-specific options and OTN-related options for the interface.

To configure the interface-specific options:

1. Configure VLAN tagging at the `[edit interface interface-name]` hierarchy level, where *interface-name* is in the `et-fpc/pic/port` format.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

2. Configure the maximum transmission unit (MTU) size in bytes for the interface. Possible values: 256 through 16,000.

```
[edit interfaces interface-name]
user@host# set mtu value
```

3. Set the unit VLAN ID, family and the IP address of the interface. Possible values for the VLAN ID: 1 through 4094. Specify the family as `inet`.

```
[edit interfaces interface-name unit 0]
user@host# set vlan-id number
user@host# set family family-name
user@host# set address address
```

To configure the optics-specific options on the interface:

1. Specify the optical transmit laser output power in dBm at the `[edit interface interface-name optics-options]` hierarchy level. The default transmit laser output value is 0 dBm.

```
[edit interfaces interface-name optics-options]
user@host# set tx-power value
```

2. Specify the wavelength of the optics in nanometers. For a list of wavelengths supported, see [wavelength](#).

```
[edit interfaces interface-name optics-options]
user@host# set wavelength nm
```

To configure the OTN-specific options on the interface:

1. At the [edit interfaces *interface-name* otn-options] hierarchy level, enable the laser on the OTN interface. The laser is disabled by default for all OTN interfaces.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

2. Set a trail trace identifier for the source access point and for the destination access point for ODU and OTU on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set tti (odu-dapi | odu-expected-receive-dapi | odu-expected-receive-sapi
| odu-sapi | otu-dapi | otu-expected-receive-dapi | otu-expected-receive-sapi |
otu-sapi)
```

3. Specify defect triggers and the set the trigger hold time for the trigger. By default, triggers are ignored. Possible values for the trigger hold time are as follows: down and up.
  - down—Delay before marking interface down when defect occurs (1 through 65534 milliseconds)
  - up—Delay before marking interface up when defect is absent (1 through 65534 milliseconds).

**NOTE:** The hold time value only impacts the alarm reporting time and does not mark an interface down when the defect occurs. To mark the interface up or down, you must also configure the physical interface hold time at the [edit interfaces *interface-name*] hierarchy level.

```
[edit interfaces interface-name otn-options]
user@host# set trigger (oc-lof | oc-lom | oc-los | oc-tsfc | odu-ais | odu-bdi | odu-bei |
odu-iae | odu-lck | odu-oci | odu-sd | odu-ttim | opu-ptim | otu-ais | otu-bdi |
otu-fec-deg | otu-fec-exe | otu-iae | otu-sd | otu-ttim) (hold-time (down value | up
value) | ignore)
```

4. Enable the threshold-crossing alarms (TCAs) for the OTN interface along with the trigger for the defect. Threshold-crossing alarms (TCAs) are activated when a certain configurable threshold—near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15-minute interval for parameters such as OTU and ODU.

```
[edit interfaces interface-name otn-options]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas | otu-tca-bbe
| otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca | threshold)
```

5. Set the OTN header bytes as a transmit payload type from 0 bytes through 255 bytes for the packets that are transmitted on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set bytes transmit-payload-type value
```

6. Configure the forward error correction (FEC) mode for the OTN interface. Possible values are: generic forward error correction (GFEC), or high-gain forward error correction (HG-FEC) or soft-decision forward error correction (SD-FEC). The default forward error correction mode is SD-FEC.

```
[edit interfaces interface-name otn-options]
user@host# set fec (gfec |hgfec | sdfec)
```

7. Enable line loopback or local host loopback for the OTN interface. Loopback testing enables you to verify the connectivity of a circuit. In line loopback, instead of transmitting the signal toward the far-end device, the signal is sent back to the originating router. In local loopback, the signal is transmitted to the channel service unit (CSU) and then to the far-end device.

```
[edit interfaces interface-name otn-options]
user@host# set line-loopback
user@host# set local-loopback
```

8. Enable an ODU locked maintenance signal on the OTN interface to send the signal pattern 01010101.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-lck
```

9. Enable an ODU open connection indication signal on the OTN interface to send the signal pattern 01100110.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-oci
```

10. Enable a consequent action as listed in the ITU-T G.798 standard for ODU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set odu-ttim-action-enable
```

11. Enable a consequent action as listed in the ITU-T G.798 standard for OTU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set out-ttim-action-enable
```

12. Configure the OTN payload pseudorandom binary sequence (PRBS) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set prbs
```

13. Configure the line rate or speed of the OTN signal to otu4 (100 Gbps) for the OTN interface.

**NOTE:** If you specify a value other than otu4, the value is ignored. To verify the line rate, use the `show interfaces interface-name extensive` command.

```
[edit interfaces interface-name otn-options]
user@host# set rate otu4
```

14. Configure the threshold value for signal degradation when an alarm needs to be raised. Configure the threshold value after signal degradation when the alarm needs to be cleared. When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
user@host# set ber-threshold-clear value
user@host# set interval value
```

15. Enable the following actions for the **preemptive-fast-reroute** statement:

- Backward FRR—Insert the local pre-FEC status into the transmitted OTN frames and monitor the received OTN frames for the pre-FEC status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set backward-frr-enable
```

- ODU backward FRR—Insert the ODU status into the transmitted OTN frames and monitor the received OTN frames for the ODU BER status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-backward-frr-enable
```

- Monitoring of signal degradation of pre-FEC OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
```

- Monitoring of signal degradation of ODU BER in the received OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-signal-degrade-monitor-enable
```

16. Configure the following options for ODU BER signal degradation on the OTN interface:

- Configure the threshold for signal degradation for ODU BER when an alarm needs to be raised.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-signal-degrade value
```

- Configure the threshold for ODU BER after signal degradation when the alarm needs to be cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-clear value
```

- When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the ODU bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then ODU BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set interval value
```

Release History Table

| Release | Description                                                                                                                                        |

## Understanding the PTX10K-LC1104 Line Card

---

The PTX10K-LC1104 line card provides up to 1.2 Tbps packet forwarding for cloud providers, service providers, and enterprises that need coherent dense wavelength-division multiplexing (DWDM) with MACsec security features.

The PTX10K-LC1104 line card is supported on Junos OS Release 18.3R1 and later.

The following sections explain the features of the PTX10K-LC1104 line card in detail:

- [Software Features on page 474](#)
- [OTN Alarms and Defects on page 475](#)

### Software Features

The following interface features are supported on the PTX10K-LC1104:

- Compliant with ITU G.709 and G.798
- Performance monitoring features such as alarms, threshold-crossing alarms, OTU/ODU error seconds, and FEC and bit error rate (BER) statistics.
- SNMP management of the MIC based on RFC 3591, Managed Objects for the Optical Interface Type, including the following:
  - Black Link MIB—jnx-bl.mib
  - IFOTN MIB—jnx-ifotn.mib
  - Optics MIB—jnx-optics.mib
  - FRU MIB—jnx-fru.mib
- User-configurable optics options:
  - Modulation format: 16QAM, 8QAM, QPSK
  - FEC mode (15% SDFEC or 25% SDFEC)
  - Differential and non-differential encoding modes
  - Transmit (TX) laser enable and disable
  - TX output power
  - Wavelength
  - Threshold crossing alarms (TCAs)
- IEEE 802.1ag OAM
- IEEE 802.3ah OAM
- IFINFO/IFMON
- IEEE 802.3ad link aggregation
- Flexible Ethernet services encapsulation

- Flexible VLAN tagging
- Source address MAC accounting per logical interface
- Source address MAC filter per port
- Source address MAC filter per logical interface
- Destination address MAC filter per port
- Up to 8000 logical interfaces shared across all ports on a single PFE

## OTN Alarms and Defects

The following OTN alarms and defects are supported on the PTX10K-LC1104 line card:

### Optical Channel(OC) Alarms and Defects

- OC-LOS—Loss Of Signal
- OC-LOF—Loss Of Frame
- OC-LOM—Loss Of Multiframe
- OC-Wavelength-Lock—Wavelength Lock

### Optical Channel Data Unit (ODU) Defects

- ODU-AIS—ODU Alarm Indication Signal
- ODU-BDI—ODU Backward Defect Indication
- ODU-IAE—ODU Incoming Alignment Error
- ODU-LCK—ODU Locked
- ODU-LTC—ODU Loss of Tandem Connection
- ODU-OCI—ODU Open Connection Error
- ODU-SSF—ODU Server Signal Failure
- ODU-TSF—ODU Trail Signal Failure
- ODU-TTIM—ODU Trail Trace Identifier Mismatch

### Optical Channel Transport Unit (OTU) Defects

- OTU-AIS—OTU Alarm Indication Signal
- OTU-BDI—OTU Backward Defect Indication
- OTU-BIAE—OTU Backward Incoming Alignment Error
- OTU-FEC-DEG—OTU Forward Error Correction Degrade
- OTU-FEC-EXCESS-FEC—OTU Forward Error Correction Excessive FEC Errors
- OTU-IAE—OTU Incoming Alignment Error
- OTU-SSF—OTU Server Signal Failure

- OTU-TSF—OTU Trail Signal Failure
- OTU-TTIM—OTU Trail Trace Identifier Mismatch

#### Threshold-Crossing Alarms

Threshold-crossing alarms (TCA) are alarms that are activated when a certain configurable threshold —near-end measurement threshold or far-end measurement threshold—is crossed and remains so until the end of the 15 minutes interval for parameters such as OTU and ODU. The following alarms are supported:

- Background block error threshold (BBE)
- Errored seconds threshold (ES)
- Severely errored seconds threshold (SES)
- Unavailable seconds threshold (UES)

## Interface Mapping and Modulation format for PTX10K-LC1104 Line Card

The PTX10K-LC1104 line card supports 3 optical modules and 2 ports per optical modules. 2 *ot* interfaces are created for an optical module. Hence, 6 *ot* interfaces are created for a line card. The optical interface to *et* interface mapping is shown in the following table:

| "ot-" interface | Modulation Format | Mapped "et" interface(s) |
|-----------------|-------------------|--------------------------|
| ot-0/0/0        | QPSK              | et-x/0/0                 |
|                 | 8QAM              | et-x/0/0                 |
|                 |                   | et-x/0/1                 |
|                 | 16QAM             | et-x/0/0                 |
|                 |                   | et-x/0/1                 |
|                 |                   |                          |
| ot-0/0/1        | QPSK              | et-x/0/2                 |
|                 | 8QAM              | et-x/0/1                 |
|                 |                   | et-x/0/2                 |
|                 | 16QAM             | et-x/0/2                 |
|                 |                   | et-x/0/3                 |
|                 |                   |                          |

| "ot-" interface | Modulation Format | Mapped "et" interface(s) |
|-----------------|-------------------|--------------------------|
| ot-0/0/2        | QPSK              | et-x/0/4                 |
|                 | 8QAM              | et-x/0/4                 |
|                 |                   | et-x/0/5                 |
|                 | 16QAM             | et-x/0/4                 |
|                 |                   | et-x/0/5                 |
|                 |                   |                          |
| ot-0/0/3        | QPSK              | et-x/0/6                 |
|                 | 8QAM              | et-x/0/5                 |
|                 |                   | et-x/0/6                 |
|                 | 16QAM             | et-x/0/6                 |
|                 |                   | et-x/0/7                 |
|                 |                   |                          |
| ot-0/0/4        | QPSK              | et-x/0/8                 |
|                 | 8QAM              | et-x/0/8                 |
|                 |                   | et-x/0/9                 |
|                 | 16QAM             | et-x/0/8                 |

## Supported OTN Options on PTX10008 and PTX10016 Series Routers

Table 66 on page 418 lists the statements that are supported on the PTX10K-LC1104 line card on PTX10008 and PTX10016 routers at the **[edit interfaces *interface-name* otn-options]** hierarchy level.

Table 75: Statements Supported on PTX10K-LC1104 line cards

| Statement                                                                       | Options                                                               | Release | Interfaces Supported (ot/et) |

## Supported Optics Options on PTX10008 and PTX10016 Series Routers

Table 76 on page 484 lists the statements that are supported on PTX10008 and PTX10016 Series routers at the `[edit interfaces interface-name optics-options]` hierarchy level.

Table 76: Statements Supported on PTX10008 and PTX10016 Series Routers

| Statement                                | Options                                                       | Release | Interfaces Supported |

|           | <code>otu-fec-exe</code><br>(hold-time (down   up)   ignore) | 18.3R1  |                      |
|           | <code>otu-iae</code><br>(hold-time (down   up)   ignore)     | 18.3R1  |                      |
|           | <code>otu-sd</code><br>(hold-time (down   up)   ignore)      | 18.3R1  |                      |
|           | <code>otu-ttim</code> (hold-time (down   up)   ignore)       | 18.3R1  |                      |

## Configuring OTN Interface Options on PTX10K-LC1104

The PTX10K-LC1104 line card provides up to 1.2 Tbps packet forwarding for cloud providers, service providers, and enterprises that need coherent dense wavelength-division multiplexing (DWDM) with MACsec security features. The PTX10K-LC1104 line card is supported on Junos OS Release 18.3R1 and later.

Each PTX10K-LC1104 has 6 physical interfaces (ot-x/x/x) that connect to one of three built-in flexible rate optical transponders. Each transponder connects four 100-Gigabit Ethernet logical interfaces (et-x/x/x) to one of three forwarding ASICs.

To configure the optics-specific options on the interface:

1. Specify the modulation format at the [edit interface *interface-name* optics-options] hierarchy level.

```
[edit interfaces interface-name optics-options]
user@host# set modulation-format (qpsk|8qam|16qam)
```

2. Specify encoding.

```
[edit interfaces interface-name optics-options]
user@host# set encoding (differential|non-differential)
```

3. Specify the optical transmit laser output power in dBm. The default transmit laser output value is 0 dBm.

```
[edit interfaces interface-name optics-options]
user@host# set tx-power value
```

4. Specify the wavelength of the optics in nanometers. For a list of wavelengths supported, see [wavelength](#).

```
[edit interfaces interface-name optics-options]
user@host# set wavelength nm
```

To configure the OTN-specific options on the interface:

1. At the [edit interfaces *interface-name* otn-options] enable the laser on the OTN interface. The laser is disabled by default for all OTN interfaces.

```
[edit interfaces interface-name otn-options]
user@host# set laser-enable
```

2. Set an trail trace identifier for the source access point and for the destination access point for ODU and OTU on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set tti (odu-dapi | odu-expected-receive-dapi | odu-expected-receive-sapi
| odu-sapi | otu-dapi | otu-expected-receive-dapi | otu-expected-receive-sapi |
otu-sapi)
```

3. By default, triggers are ignored. Specify defect triggers and the set the trigger hold time for the trigger. Possible values for the trigger hold time are as follows: down—Delay before marking interface down when defect occurs (1.65534 milliseconds) and up—Delay before marking interface up when defect is absent (1.65534 milliseconds).

**NOTE:** The hold time value only impacts the alarm reporting time and does not mark an interface down when the defect occurs. To mark the interface up or down, you must also configure the physical interface hold time at the [edit interfaces *interface-name*] hierarchy level.

```
[edit interfaces interface-name otn-options]
user@host# set trigger (oc-lof | oc-lom | oc-los | oc-tsfc | odu-ais | odu-bdi | odu-bei |
odu-iae | odu-lck | odu-oci | odu-sd | odu-ttim | opu-ptim | otu-ais | otu-bdi |
otu-fec-deg | otu-fec-exe | otu-iae | otu-sd | otu-ttim) (hold-time (down value | up
value) | ignore)
```

4. Enable the threshold crossing alarms for the OTN interface along with the trigger for the defect.

```
[edit interfaces interface-name otn-options]
user@host# set tca (odu-tca-bbe | odu-tca-es | odu-tca-ses | odu-tca-uas | otu-tca-bbe
| otu-tca-es | otu-tca-ses | otu-tca-uas) (enable-tca | no-enable-tca | threshold)
```

5. Set the OTN header bytes as a transmit payload type from 0 bytes through 255 bytes for the packets that are transmitted on the OTN interface.

```
[edit interfaces interface-name otn-options]
```

```
user@host# set bytes transmit-payload-type value
```

6. Configure the forward error correction (FEC) mode for the OTN interface. Possible values are: Generic Forward Error Correction (GFEC), or High Gain Forward Error Correction (HGFEC) or Soft Decision Forward Error Correction (SDFEC). The default forward error correction mode is SDFEC.

```
[edit interfaces interface-name otn-options]
user@host# set fec (gfec | hgfec | sdfec)
```

7. Enable line loopback or local host loopback for the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set line-loopback
user@host# set local-loopback
```

8. Enable an ODU locked maintenance signal on the OTN interface to send the signal pattern 01010101.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-lck
```

9. Enable an ODU open connection indication signal on the OTN interface to send to send the signal pattern 01100110.

```
[edit interfaces interface-name otn-options]
user@host# set insert-odu-oci
```

10. Enable a consequent action as listed in the ITU-T G.798 standard for ODU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set odu-ttim-action-enable
```

11. Enable a consequent action as listed in the ITU-T G.798 standard for OTU trail trace identifier mismatch (TTIM) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set out-ttim-action-enable
```

12. Configure the OTN payload pseudorandom binary sequence (PRBS) on the OTN interface.

```
[edit interfaces interface-name otn-options]
user@host# set prbs
```

13. Configure the line rate or speed of the OTN signal to OTU4 (100Gbps) for the OTN interface.

**NOTE:** If you specify a value other than OTU4, the value is ignored. To verify the line rate, use the `show interfaces interface-name` extensive command.

```
[edit interfaces interface-name otn-options]
user@host# set rate otu4
```

14. Configure the threshold value for signal degradation when an alarm needs to be raised. Configure the threshold value after signal degradation when the alarm needs to be cleared. When you configure the interval along with the **ber-threshold-signal-degrade value** statement, the bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear value** statement, then BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options signal-degrade]
user@host# set ber-threshold-signal-degrade value
user@host# set ber-threshold-clear value
user@host# set interval value
```

15. Enable the following actions for the preemptive-fast-reroute statement:

- Backward FRR—Insert the local pre-FEC status into the transmitted OTN frames and monitor the received OTN frames for the pre-FEC status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set backward-frr-enable
```

- ODU backward FRR—Insert the ODU status into the transmitted OTN frames and monitor the received OTN frames for the ODU BER status.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set odu-backward-frr-enable
```

- Monitoring of signal degradation of pre-FEC OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
user@host# set signal-degrade-monitor-enable
```

- Monitoring of signal degradation of ODU BER in the received OTN frames.

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
```

```
user@host# set odu-signal-degrade-monitor-enable
```

16. Configure the following options for ODU BER signal degradation on the OTN interface:

- Configure the threshold for signal degradation for ODU BER when an alarm needs to be raised.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-signal-degrade value
```

- Configure the threshold for ODU BER after signal degradation when the alarm needs to be cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set ber-threshold-clear value
```

- When you configure the interval along with the **ber-threshold-signal-degrade *value*** statement, the ODU bit error rate (BER) must stay above the signal degradation threshold for the configured interval after which the alarm is raised. When the interval is configured along with the **ber-threshold-clear *value*** statement, then ODU BER must stay below the clear threshold for the configured interval after which the alarm is cleared.

```
[edit interfaces interface-name otn-options odu-signal-degrade]
user@host# set interval value
```

## Understanding ODU Path Delay Measurement on OTN Networks for Performance Monitoring

---

Performance monitoring is an important requirement in any network, including the optical transport networks (OTN). The key parameters that impact performance are bit error rate (BER) and delay. Delays in data communication over a network impact the network latency. Network latency is the time taken for a packet of data to travel from a designated point to another designated point. If there are less delays, the network latency is low. You can measure latency by sending a packet and then receiving it as it is returned back to you; the time taken for the round-trip indicates the latency.

The optical channel data unit (ODU) path delay measurement offers in-service delay measurement. Delay (or latency) is measured by transmitting a known pattern (delay measurement pattern) in a selected bit of the delay measurement (**DM**) field and measuring the number of frames that are missed when the delay measurement pattern

is received at the transmitting end. For instance, if the transmitted delay measurement bit is **1111111100** and the received delay measurement bit is **111000000000**, the delay measurement starts at frame 2 and ends at frame 8. This can be detected by the change in value between the transmitted bit and the received bit.

|           |    |   |   |   |   |   |   |   |   |   |
|-----------|----|---|---|---|---|---|---|---|---|---|
| Frame#    | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| Tx DM bit | 1  | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 |   |
| Rx DM bit | 1  | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The result of the delay measurement is 6 frames (8 - 2).

## Guidelines for Configuring Delay Measurement

When you configure in-service delay measurement, we recommend that you follow certain guidelines to ensure that you obtain accurate delay measurement.

- Unidirectional delay measurement is not supported. The in-service delay measurement is specific to round-trip delay measurement and for optical channel data units only.
- Delay measurement on different framer for the MIC and PIC is different. So, the delay measurement values are different.
- Resiliency is not supported for path delay measurement.
- Links at the local and remote interfaces must be active before you configure delay measurement.
- Do not perform delay measurement tests when ODU maintenance signals are injected.
- Do not configure local loopback and network loopback with remote loopback because the loopback data is overwritten by the delay measurement pattern.

**NOTE:** If a link failure occurs after you begin measuring delay, delay measurement fails. You must re-enable measurement of delay on the local interface to measure delay.

## Enabling ODU Path Delay Measurement on OTN Networks for Performance Monitoring

Delay measurement is disabled by default. This topic explains the broad steps for measuring the optical channel data units (ODU) path delay on optical transport networks (OTN). First, enable remote loopback on the remote interface and commit the configuration. This enables the remote interface to loop back the delay measurement pattern to the local interface. Then, start delay measurement at the local interface and view the results.

**NOTE:** Do not enable remote loopback on both ends (local and remote). If you enable remote loopback on both interfaces, the delay measurement pattern is looped back continuously between the two interfaces.

Before you start measuring delay in the ODU path on OTN, complete the following tasks:

- Ensure that the links are active at the local and remote interfaces and alarms are not configured.
- Ensure that there is a delay of 10 seconds before enabling remote loopback. Also, ensure that there is a delay of 10 seconds after enabling remote loopback at the remote interface and before you start measuring delay.
- Ensure that the delay measurement tests are not performed when ODU maintenance signals are injected.
- Ensure that the local loopback and network loopback are also not specified because the looped-back data is overwritten by the delay measurement pattern.

**NOTE:** If link failure occurs after you begin measuring delay, delay measurement fails. You must re-enable measurement of delay on the local interface to measure delay.

To enable ODU path delay measurement, first enable remote loopback of the delay measurement pattern on the remote interface and then start measurement of the delay.

1. Enable remote loopback on the remote interface by including the **remote-loop-enable** statement at the **[edit]** hierarchy level.

```
[edit]
user@host# set interfaces interfacename otn-options odu-delay-management
remote-loop-enable
```

2. After enabling remote loopback, commit the configuration.

```
[edit]
user@host# commit
```

3. Start delay measurement on the local interface by including the **start-measurement** statement at the **[edit]** hierarchy level.

```
[edit]
user@host# set interface interfacename otn-options odu-delay-management
start-measurement
```

4. After enabling measurement of delay on the local interface, commit the configuration.

```
[edit]
user@host# commit
```

5. To view the delay measurement values, from the operational mode, enter the **show interfaces extensive** command.

```
user@host> show interfaces interfacename extensive
```

```
...
ODU Delay Management:
Start Measurement: True
Remote Loop Enable: False
Result: 0 micro seconds
...
```

## Disabling ODU Path Delay Measurement on OTN Networks for Performance Monitoring

Delay measurement is disabled by default. If you enabled optical channel data unit (ODU) path delay measurement by using the **remote-loop-enable** and **start-measurement** statements, you can use this procedure to disable delay measurement.

**NOTE:** You can also use the **delete** or **deactivate** command to disable remote loopback on the remote interface. For instance, you can use the **delete interfaces *interfacename* otn-options odu-delay-management remote-loop-enable** or **deactivate interface *interfacename* otn-options odu-delay-management remote-loop-enable** command to disable remote loopback on the remote interface.

To disable ODU path delay measurement, first disable remote loopback of the delay measurement pattern on the remote interface and then stop delay measurement:

1. Stop delay measurement on the local interface by including the **stop-measurement** statement at the **[edit]** hierarchy level.

```
[edit]
user@host# set interface interfacename otn-options odu-delay-management
stop-measurement
```

2. After you stop delay measurement on the local interface, commit the configuration.

```
[edit]
user@host# commit
```

3. Disable remote loopback on the remote interface by including the **no-remote-loop-enable** statement at the **[edit]** hierarchy level.

```
[edit]
user@host# set interfaces interfacename otn-options odu-delay-management
no-remote-loop-enable
```

4. After disabling remote loopback on the remote interface, commit the configuration.

```
[edit]
user@host# commit
```

5. To verify that remote loopback is disabled and delay is not measured, enter the **show interfaces extensive** command, from the operational mode.

```
user@host> show interfaces interfacename extensive
```

```
...
ODU Delay Management:
Start Measurement: False
Remote Loop Enable: False
Result: 0 micro seconds
...
```

### Capabilities of Gigabit Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs

For Gigabit Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can configure granular per-VLAN class-of-service (CoS) capabilities and extensive instrumentation and diagnostics on a per-VLAN and per-MAC address basis.

VLAN rewrite, tagging, and deleting enables you to use VLAN address space to support more customers and services.

VPLS allows you to provide a point-to-multipoint LAN between a set of sites in a VPN. Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) are combined with VPLS to deliver metro Ethernet service.

For Gigabit Ethernet IQ2 and IQ2-E and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, you can apply Layer 2 policing to logical interfaces in the egress or ingress direction. Layer 2 policers are configured at the **[edit firewall]** hierarchy level. You can also control the rate of traffic sent or received on an interface by configuring a policer overhead at the **[edit chassis fpc slot-number pic slot-number]** hierarchy level.

Table 77 on page 500 lists the capabilities of Gigabit Ethernet IQ PICs and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

**Table 77: Capabilities of Gigabit Ethernet IQ and Gigabit Ethernet with SFPs**

| Capability                                                              | Gigabit Ethernet IQ (SFP)  | Gigabit Ethernet (SFP) |
|-------------------------------------------------------------------------|----------------------------|------------------------|
| <b>Layer 2</b>                                                          |                            |                        |
| 802.3ad link aggregation                                                | Yes                        | Yes                    |
| Maximum VLANs per port                                                  | 384                        | 1023                   |
| Maximum transmission unit (MTU) size                                    | 9192                       | 9192                   |
| MAC learning                                                            | Yes                        | Yes                    |
| MAC accounting                                                          | Yes                        | Yes                    |
| MAC filtering                                                           | Yes                        | Yes                    |
| Destinations per port                                                   | 960                        | 960                    |
| Sources per port                                                        | 64                         | 64                     |
| Hierarchical MAC policers                                               | Yes, premium and aggregate | No, aggregate only     |
| Multiple TPID support and IP service for nonstandard TPIDs              | Yes                        | Yes                    |
| Multiple Ethernet encapsulations                                        | Yes                        | Yes                    |
| Dual VLAN tags                                                          | Yes                        | No                     |
| VLAN rewrite                                                            | Yes                        | No                     |
| <b>Layer 2 VPNs</b>                                                     |                            |                        |
| VLAN CCC                                                                | Yes                        | Yes                    |
| Port-based CCC                                                          | Yes                        | Yes                    |
| Extended VLAN CCC Virtual Metropolitan Area Network (VMAN) Tag Protocol | Yes                        | Yes                    |
| <b>CoS</b>                                                              |                            |                        |

## Configuring MAC Address Accounting

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, you can configure whether source and destination MAC addresses are dynamically learned.

To configure MAC address accounting on an individual Ethernet interface, include the **mac-learn-enable** statement at the **[edit interfaces *interface-name* gigether-options ethernet-switch-profile]** hierarchy level:

```
[edit interfaces interface-name gigether-options ethernet-switch-profile]
mac-learn-enable;
```

To configure MAC address accounting on an aggregated Ethernet interface, include the **mac-learn-enable** statement at the **[edit interfaces *aex* aggregated-ether-options ethernet-switch-profile]** hierarchy level:

```
[edit interfaces aex aggregated-ether-options ethernet-switch-profile]
mac-learn-enable;
```

To prohibit an interface from dynamically learning source and destination MAC addresses, do *not* include the **mac-learn-enable** statement.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete **mac-learn-enable** from the configuration.

**NOTE:** MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

## MAC Address Accounting for Dynamically Learned Addresses on Aggregated Ethernet Interfaces Overview

---

Junos OS supports the capability to compute MAC address statistics for dynamically learned static and destination MAC addresses on physical interfaces. Starting in Junos OS Release 15.1, Junos OS enables you to configure source MAC (SMAC) address and destination MAC (DMAC) address-based accounting for MAC addresses that are dynamically learned on aggregated Ethernet (ae-) interfaces in routed mode. When you include the **mac-learn-enable** statement at the **[edit interfaces aex aggregated-ether-options ethernet-switch-profile]** hierarchy level, dynamic learning of source and destination MAC addresses is enabled. By default, this capability is disabled. When dynamic learning of MAC addresses is enabled for AE interfaces in routed mode, the MAC-filter settings are updated for each of the child links of the AE bundle interface. This feature provides for both the configuration of the **mac-learn-enable** filter and the display of SMAC and DMAC based accounting information on the aggregated interface in the output of the **show interfaces mac-database interface-name mac-address mac-address** command.

When this functionality is enabled, source and destination MAC addresses-based accounting is supported on the routed interfaces on MX Series routers with DPCs and MPCs. Support for mixed mode LAG interfaces is also available. This feature supports MAC address accounting for AE interfaces in routed mode (for inet family). Destination MAC-based accounting is supported only for MAC addresses dynamically learned at the ingress interface, including each individual child or member link of the AE bundle. This behavior occurs because MPCs do not support destination MAC address learning. As a result, if a packet exits a child link without passing in the ingress direction through that link, destination MAC (DMAC) accounting for this packet occurs at the child link level and this data is not available at the aggregate level. Dynamic learning of MAC addresses can be supported on only the AE interface or on selective individual member links. MAC learning support on the bundle depends on the capability of individual member links. If a link in the bundle does not contain the capability to support MAC learning or accounting, it is disabled on the AE bundle.

The MAC data for the aggregated bundle is displayed by collecting data from individual child links. This data is collected when the command to display the MAC database is triggered from the CLI. This method of data collection implies that based on the number of child links and the size of the MAC database, the time taken to display the database differs. This approach to obtain the current snapshot of the MAC database from the currently active child links is used instead of maintaining a database at the Routing Engine because of the dynamic nature of the MAC database and the overhead required to maintain the database information in synchronization with all the child Packet Forwarding Engines. A difference in the DMAC-based accounting for packets generated from the Routing Engine (packets sent in the host path). On DPCs, these packets are accounted in egress direction (Output Packet/Byte count), whereas on MPCs, these packets are not accounted because DMAC learning is not supported. This difference in behavior also occurs between child links on DPCs and MPCs. Because this feature to enable dynamic learning is related to collecting MAC database statistics from child links based on the command issued from the CLI, there is an impact on the time it takes to display the data on the console based on the size of the MAC database and the number of child-links spread across different FPCs. The limit on the maximum number of MAC addresses that can be learned from an interface does not apply to this dynamic learning of MAC addresses functionality.

## Accounting of the Layer 2 Overhead Attribute in Interface Statistics

On MX Series and T Series routers, you can configure the logical interface statistics to include the Layer 2 overhead size (header and trailer bytes) for both ingress and egress interfaces. Both the transit and total statistical information are computed and displayed for each logical interface. This functionality is supported on 1-Gigabit, 10-Gigabit, 40-Gigabit, and 100-Gigabit Ethernet interfaces on Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs) on MX Series routers. Starting with Junos OS Release 13.2, configuring the logical interface statistics to include Layer 2 is supported on 10-Gigabit Ethernet interfaces on MX Series routers with MPC4E. Starting with Junos OS Release 13.3, **account-layer2-overhead** is not supported on MX Series routers with MPC3E (on both PIC and logical interface levels).

You can also configure the capability to compute the Layer 2 overhead bytes in interface statistics on Type-3, Type-4 and Type-5 Flexible Port Concentrators (FPCs) on T Series routers. To enable the Layer 2 overhead bytes to be counted in the interface statistics at the PIC level, you must use the **account-layer2-overhead** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level.

If you configure this capability, all the Layer 2 header details (Layer 2 header and cyclic redundancy check [CRC]) based on the Layer 2 encapsulation configured for an interface are calculated and displayed in the logical interface statistics for ingress and egress interfaces in the output of the **show interfaces *interface-name*** commands. For logical interfaces, the **Input bytes** and **Output bytes** fields under the Traffic statistics section in the output of the **show interfaces *interface-name* <detail | extensive>** command include the Layer 2 overhead of the packets. For logical interfaces, the Input rate and Output rate fields under the Traffic statistics section in the output of the **show interfaces *interface-name* <media | statistics>** command include the Layer 2 overhead of the packets. For logical interfaces, the values for the newly added **Egress account overhead** and **Ingress account overhead** fields display the Layer 2 overhead size for transmitted and received packets respectively.

The input and output octets at the logical interface configured on the PIC includes all the Layer 2 headers. All the logical interfaces on the PIC, including the ae and the non-ae interfaces, are processed for Layer 2 overhead accounting for the arriving and exiting packets. This method of operation impacts the transit statistics that are primarily used for subscriber accounting and billing purposes in customer networks.

[Table 78 on page 504](#) lists the adjustment bytes that are counted based on the encapsulation on the logical interface over the Ethernet interface, when you enable accounting of Layer 2 overhead in interface statistics at the PIC level. The values for the adjustment bytes that are listed for all types of encapsulation are the same for DPCs and MPCs, with the only exception being for the VLAN CCC adjustment value. On DPCs, the VLAN CCC adjustment value is –4 bytes and on MPCs, the VLAN CCC adjustment value is +4 bytes.

**Table 78: Adjustment Bytes for Logical Interfaces over Ethernet Interfaces**

| Encapsulation Type on Logical Interfaces    | Number of Adjustment Bytes | Description                  |
|---------------------------------------------|----------------------------|------------------------------|
| Ethernet DIXv2 (IP datagrams over Ethernet) | 18                         | Untagged (includes CRC)      |
| Ethernet DIXv2 (IP datagrams over Ethernet) | 22                         | Single-tagged (includes CRC) |
| Ethernet DIXv2 (IP datagrams over Ethernet) | 26                         | Double-tagged (includes CRC) |
| VLAN Bridge                                 | 4                          | CRC                          |
| VLAN CCC                                    | 4                          | CRC                          |
| VLAN TCC                                    | 18                         | Untagged (includes CRC)      |
| VLAN TCC                                    | 22                         | Single-tagged (includes CRC) |
| VLAN TCC                                    | 26                         | Double-tagged (includes CRC) |
| VLAN VPLS                                   | 4                          | CRC                          |

## Guidelines for Configuring the Computation of Layer 2 Overhead in Interface Statistics

Keep the following points in mind when you configure the computation of Layer 2 overhead in interface statistics:

- When you configure a native VLAN ID on a logical interface, the Layer 2 header adjustment for input statistics is different for tagged and untagged packets. For such interfaces, if you configure the setting to account for Layer 2 overhead, incorrect statistics might be displayed.
- An untagged packet is considered as a tagged packet and an additional 4 bytes are appended to the counter values displayed in the output of the **show interface** command.
- The computed statistics might not be completely accurate in scenarios where the packets are dropped after they have been included in the interface statistics, but before the packets reach the destination.
- Label-switched interface (LSI) statistics on the ingress direction of interfaces do not include the Layer 2 overhead bytes because this functionality of accounting Layer 2 overhead is not supported for such LSI interfaces.
- Layer 2 overhead accounting is not supported for inline service (si) interfaces.
- The total statistics of interfaces do not indicate the complete Layer 2 adjusted statistics. This behavior occurs because the total statistics count is the sum of transit and local statistics. Only the transit statistics are adjusted for Layer 2 and the local statistics are not adjusted for Layer 2.
- Statistics on ae interfaces are calculated in the same manner as non-ae interfaces.
- Adjustment bytes are applicable only for transit statistics that are displayed for logical interfaces.
- For physical interfaces, the adjustment bytes for transit traffic and the non-adjusted bytes for local or protocol-specific traffic are combined and displayed in the output of the **show interfaces** command. (Segregation is not possible.)
- Layer 2 overhead accounting can be enabled at both PIC level and logical interface level.
- When the **account-layer2-overhead** statement is configured, the Layer 2 overhead size in both input and output statistics is accounted for in Dense Port Concentrator (DPCs) and Modular Port Concentrator (MPCs).
- This **account-layer2-overhead** configuration now supports Layer 2 accounting for the Ethernet bridge encapsulation.
- The Layer 2 overhead bytes in interface statistics are saved across a unified ISSU or a graceful Routing Engine switchover (GRES) operation.

## Configuring Layer 2 Overhead Accounting in Interface Statistics

This topic contains sections that describe the configuration of Layer 2 overhead accounting for interface statistics at the PIC level and logical interface level.

Layer 2 overhead accounting can be enabled at both PIC level and logical interface level through configuration. By default, the physical interface and logical interface statistics do not account for Layer 2 overhead size (header and trailer) in both input and output statistics.

When the **account-layer2-overhead** statement is configured, the Layer 2 overhead size in both input and output statistics is accounted for in the Dense Port Concentrator (DPCs) and the Modular Port Concentrator (MPCs). This **account-layer2-overhead** configuration now supports Layer 2 accounting for the Ethernet bridge encapsulation.

- [Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level on page 506](#)

### Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level

You can configure the **account-layer2-overhead** statement at the **edit chassis fpc slot-number pic pic-number** hierarchy level to enable accounting of Layer 2 overhead bytes in the ingress and egress interface statistics at the PIC level.

**CAUTION:** If you modify the setting for accounting of Layer 2 overhead bytes at the PIC level, the PIC is rebooted, causing all of the physical and logical interfaces to be deleted and readded on the PIC. Due to this behavior, we recommend that you exercise caution while using this feature.

The computation method of Layer 2 overhead on different interface types is as follows:

- For Ethernet interfaces, all the Layer 2 headers are counted.

- For non-Ethernet interfaces, the Frame Relay, PPP, or Cisco HDLC headers are counted, while the bit or byte stuffing headers are excluded.

To enable accounting of Layer 2 overhead at the PIC level for ingress and egress traffic on interfaces:

1. Access a DPC or an MPC-occupied slot and the PIC where the interface is to be enabled.

```
[edit chassis]
user@host# edit fpc slot-number pic number
```

2. Specify the Layer 2 overhead value in bytes that is the octet adjustment per packet added to the total octet count for ingress and egress traffic on all the interfaces in the PIC.

```
[edit chassis fpc slot-number pic number]
user@host# set account-layer2-overhead
```

## Configuring Gigabit Ethernet Policers

- [Overview on page 510](#)
- [Configuring a Policer on page 510](#)
- [Specifying an Input Priority Map on page 511](#)
- [Specifying an Output Priority Map on page 512](#)

- [Applying a Policer on page 512](#)
- [Configuring MAC Address Filtering on page 514](#)
- [Example: Configuring Gigabit Ethernet Policers on page 514](#)

## Overview

On Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can define rate limits for premium and aggregate traffic received on the interface. These policers allow you to perform simple traffic policing without configuring a firewall filter. First you configure the Ethernet policer profile, next you classify ingress and egress traffic, then you can apply the policer to a logical interface.

For Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the policer rates you configure can be different than the rates on the Packet Forward Engine. The difference results from Layer 2 overhead. The PIC accounts for this difference.

### NOTE:

On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

For information on understanding Ethernet frame statistics, see the *MX Series Layer 2 Configuration Guide*.

## Configuring a Policer

To configure an Ethernet policer profile, include the **ethernet-policer-profile** statement at the **[edit interfaces *interface-name* gigether-options ethernet-switch-profile]** hierarchy level:

```
[edit interfaces interface-name gigether-options ethernet-switch-profile]
ethernet-policer-profile {
 policer cos-policer-name {
 aggregate {
 bandwidth-limit bps;
 burst-size-limit bytes;
 }
 premium {
 bandwidth-limit bps;
 burst-size-limit bytes;
 }
 }
}
```

```

 }
 }
}

```

In the Ethernet policer profile, the aggregate-priority policer is mandatory; the premium-priority policer is optional.

For aggregate and premium policers, you specify the bandwidth limit in bits per second. You can specify the value as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000). There is no absolute minimum value for bandwidth limit, but any value below 61,040 bps will result in an effective rate of 30,520 bps. The maximum bandwidth limit is 4.29 Gbps.

The maximum burst size controls the amount of traffic bursting allowed. To determine the burst-size limit, you can multiply the bandwidth of the interface on which you are applying the filter by the amount of time you allow a burst of traffic at that bandwidth to occur:

$$\text{burst size} = \text{bandwidth} \times \text{allowable time for burst traffic}$$

If you do not know the interface bandwidth, you can multiply the maximum MTU of the traffic on the interface by 10 to obtain a value. For example, the burst size for an MTU of 4700 would be 47,000 bytes. The burst size should be at least 10 interface MTUs. The maximum value for the burst-size limit is 100 MB.

## Specifying an Input Priority Map

An input priority map identifies ingress traffic with specified IEEE 802.1p priority values, and classifies that traffic as premium.

If you include a premium-priority policer, you can specify an input priority map by including the `ieee802.1p premium` statement at the `[edit interfaces interface-name gigether-options ethernet-policer-profile input-priority-map]` hierarchy level:

```
[edit interfaces interface-name gigether-options ethernet-policer-profile input-priority-map]
 ieee802.1p premium [values];

```

The priority values can be from 0 through 7. The remaining traffic is classified as nonpremium (or aggregate). For a configuration example, see [“Example: Configuring Gigabit Ethernet Policers” on page 514](#).

**NOTE:** On IQ2 and IQ2-E interfaces and MX Series interfaces, when a VLAN tag is pushed, the inner VLAN IEEE 802.1p bits are copied to the IEEE bits of the VLAN or VLANs being pushed. If the original packet is untagged, the IEEE bits of the VLAN or VLANs being pushed are set to 0.

## Specifying an Output Priority Map

An output priority map identifies egress traffic with specified queue classification and packet loss priority (PLP), and classifies that traffic as premium.

If you include a premium-priority policer, you can specify an output priority map by including the **classifier** statement at the **[edit interfaces *interface-name* gigether-options ethernet-policer-profile output-priority-map]** hierarchy level:

```
[edit interfaces interface-name gigether-options ethernet-policer-profile
 output-priority-map]
classifier {
 premium {
 forwarding-class class-name {
 loss-priority (high | low);
 }
 }
}
```

You can define a forwarding class, or you can use a predefined forwarding class.

[Table 79 on page 512](#) shows the predefined forwarding classes and their associated queue assignments.

**Table 79: Default Forwarding Classes**

| Forwarding Class Name | Queue   |
|-----------------------|---------|
| best-effort           | Queue 0 |
| expedited-forwarding  | Queue 1 |
| assured-forwarding    | Queue 2 |
| network-control       | Queue 3 |

For more information about CoS forwarding classes, see the *Class of Service Feature Guide (Routers and EX9200 Switches)*. For a configuration example, see [“Example: Configuring Gigabit Ethernet Policers” on page 514](#).

## Applying a Policer

On all MX Series Router interfaces, Gigabit Ethernet IQ, IQ2, and IQ2-E PICs, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can apply input and output policers that define rate limits for premium and aggregate traffic received on the logical interface. Aggregate policers are supported on Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

These policers allow you to perform simple traffic policing without configuring a firewall filter.

To apply policers to specific source MAC addresses, include the **accept-source-mac** statement:

```
accept-source-mac {
 mac-address mac-address {
 policer {
 input cos-policer-name;
 output cos-policer-name;
 }
 }
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* ]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

You can specify the MAC address as *nn:nn:nn:nn:nn:nn* or *nnnn.nnnn.nnnn*, where *n* is a hexadecimal number. You can configure up to 64 source addresses. To specify more than one address, include multiple **mac-address** statements in the logical interface configuration.

**NOTE:** On untagged Gigabit Ethernet interfaces you should not configure the **source-address-filter** statement at the [edit interfaces *ge-fpc/pic/port* *gigether-options*] hierarchy level and the **accept-source-mac** statement at the [edit interfaces *ge-fpc/pic/port* *gigether-options* unit *logical-unit-number*] hierarchy level simultaneously. If these statements are configured for the same interfaces at the same time, an error message is displayed.

On tagged Gigabit Ethernet interfaces you should not configure the **source-address-filter** statement at the [edit interfaces *ge-fpc/pic/port* *gigether-options*] hierarchy level and the **accept-source-mac** statement at the [edit interfaces *ge-fpc/pic/port* *gigether-options* unit *logical-unit-number*] hierarchy level with an identical MAC address specified in both filters. If these statements are configured for the same interfaces with an identical MAC address specified, an error message is displayed.

**NOTE:** If the remote Ethernet card is changed, the interface does not accept traffic from the new card because the new card has a different MAC address.

The MAC addresses you include in the configuration are entered into the router's MAC database. To view the router's MAC database, enter the **show interfaces mac-database** *interface-name* command:

```
user@host> show interfaces mac-database interface-name
```

In the **input** statement, list the name of one policer template to be evaluated when packets are received on the interface.

In the **output** statement, list the name of one policer template to be evaluated when packets are transmitted on the interface.

**NOTE:** On IQ2 and IQ2-E PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.

You can use the same policer one or more times.

If you apply both policers and firewall filters to an interface, input policers are evaluated before input firewall filters, and output policers are evaluated after output firewall filters.

## Configuring MAC Address Filtering

You cannot explicitly define traffic with specific source MAC addresses to be rejected; however, for Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet DPCs on MX Series routers, you can block all incoming packets that do not have a source address specified in the **accept-source-mac** statement. For more information about the **accept-source-mac** statement, see [“Applying a Policer” on page 512](#).

To enable this blocking, include the **source-filtering** statement at the **[edit interfaces interface-name gigether-options]** hierarchy level:

```
[edit interfaces interface-name gigether-options]
source-filtering;
```

For more information about the **source-filtering** statement, see [“Configuring MAC Address Filtering for Ethernet Interfaces” on page 20](#).

To accept traffic even though it does not have a source address specified in the **accept-source-mac** statement, include the **no-source-filtering** statement at the **[edit interfaces interface-name gigether-options]** hierarchy level:

```
[edit interfaces interface-name gigether-options]
no-source-filtering;
```

## Example: Configuring Gigabit Ethernet Policers

- [Example on page 515](#)
- [Example Configuration on page 515](#)

### Example

This example illustrates the following:

- Configure interface **ge-6/0/0** to treat priority values 2 and 3 as premium. On ingress, this means that IEEE 802.1p priority values **2** and **3** are treated as premium. On egress, it means traffic that is classified into queue 0 or 1 with PLP of low and queue 2 or 3 with PLP of high, is treated as premium.
- Define a policer that limits the premium bandwidth to 100 Mbps and burst size to 3 k, and the aggregate bandwidth to 200 Mbps and burst size to 3 k.
- Specify that frames received from the MAC address **00:01:02:03:04:05** and the VLAN ID **600** are subject to the policer on input and output. On input, this means frames received with the source MAC address **00:01:02:03:04:05** and the VLAN ID 600 are subject to the policer. On output, this means frames transmitted from the router with the destination MAC address **00:01:02:03:04:05** and the VLAN ID **600** are subject to the policer.

### Example Configuration

```
[edit interfaces]
ge-6/0/0 {
 gigether-options {
 ether-switch-profile {
 ether-policer-profile {
 input-priority-map {
 ieee-802.1p {
 premium [2 3];
 }
 }
 output-priority-map {
 classifier {
 premium {
 forwarding-class best-effort {
 loss-priority low;
 }
 forwarding-class expedited-forwarding {
 loss-priority low;
 }
 forwarding-class assured-forwarding {
 loss-priority high;
 }
 forwarding-class network-control {
 loss-priority high;
 }
 }
 }
 }
 }
 }
 }
 policer policer-1 {
 premium {
 bandwidth-limit 100m;
 burst-size-limit 3k;
 }
 }
}
```

```
 }
 aggregate {
 bandwidth-limit 200m;
 burst-size-limit 3k;
 }
}
}
}
}
unit 0 {
 accept-source-mac {
 mac-address 00:01:02:03:04:05 {
 policer {
 input policer-1;
 output policer-1;
 }
 }
 }
}
}
```

## Configuring Gigabit Ethernet Two-Color and Tricolor Policers

- [Overview on page 516](#)
- [Configuring a Policer on page 518](#)
- [Applying a Policer on page 518](#)
- [Example: Configuring and Applying a Policer on page 519](#)

### Overview

For Gigabit Ethernet and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces on M Series and T Series routers, you can configure two-color and tricolor marking policers and apply them to logical interfaces to prevent traffic on the interface from consuming bandwidth inappropriately.

Networks police traffic by limiting the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface and to partition a network into multiple priority levels or classes of service.

Policers require you to apply a burst size and bandwidth limit to the traffic flow, and set a consequence for packets that exceed these limits—usually a higher loss priority, so that packets exceeding the policer limits are discarded first.

Juniper Networks router architectures support three types of policer:

- Two-color policer—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit in some way, or simply discard them. A policer is most useful for metering traffic at the port (physical interface) level.
- Single-rate tricolor marking (single-rate TCM)—A single-rate tricolor marking policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).

Starting in Junos OS Release 13.1, traffic is classified into three categories: Green, Red, and Yellow. Following list describes the categories:

- Green—Burst size of the packets that arrive is less than the sum of the configured CIR and CBS.
- Red—Burst size of the packets that arrive is greater than the sum of the configured CIR and EBS.
- Yellow—Burst size of the packets that arrive is greater than the CBS but less than the EBS.

Single-rate TCM is most useful when a service is structured according to packet length and not peak arrival rate.

- Two-rate Tricolor Marking (two-rate TCM)—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and peak information rate (PIR), along with their associated burst sizes, the CBS and EBS.

Traffic is classified into the following three categories:

- Green—Burst size of the packets that arrive is less than the sum of the configured CIR and CBS.
- Red—Burst size of the packets that arrive is greater than the sum of the configured PIR and EBS.
- Yellow—Traffic does not belong to either the green or the red category.

Two-rate TCM is most useful when a service is structured according to arrival rates and not necessarily packet length.

**NOTE:** Unlike policing (described in “[Configuring Gigabit Ethernet Policers](#)” on page 509), configuring two-color policers and tricolor marking policers requires that you configure a firewall filter.

## Configuring a Policer

Two-color and tricolor marking policers are configured at the **[edit firewall]** hierarchy level.

A tricolor marking policer polices traffic on the basis of metering rates, including the CIR, the PIR, their associated burst sizes, and any policing actions configured for the traffic.

To configure tricolor policer marking, include the **three-color-policer** statement with options at the **[edit firewall]** hierarchy level:

```
[edit firewall]
three-color-policer name {
 action {
 loss-priority high {
 then discard;
 }
 }
 single-rate {
 (color-aware | color-blind);
 committed-information-rate bps;
 committed-burst-size bytes;
 excess-burst-size bytes;
 }
 two-rate {
 (color-aware | color-blind);
 committed-information-rate bps;
 committed-burst-size bytes;
 peak-information-rate bps;
 peak-burst-size bytes;
 }
}
```

For more information about configuring tricolor policer markings, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide* and the *Class of Service Feature Guide (Routers and EX9200 Switches)*.

## Applying a Policer

Apply a two-color policer or tricolor policer to a logical interface to prevent traffic on the interface from consuming bandwidth inappropriately. To apply two-color or tricolor policers, include the **layer2-policer** statement:

```
layer2-policer {
 input-policer policer-name;
 input-three-color policer-name;
 output-policer policer-name;
```

```

 policer-name;
}

```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Use the **input-policer** statement to apply a two-color policer to received packets on a logical interface and the **input-three-color** statement to apply a tricolor policer. Use the **output-policer** statement to apply a two-color policer to transmitted packets on a logical interface and the **output-three-color** statement to apply a tricolor policer. The specified policers must be configured at the [edit firewall] hierarchy level. For each interface, you can configure a three-color policer or two-color input policer or output policers—you cannot configure both a three-color policer and a two-color policer.

### Example: Configuring and Applying a Policer

Configure tricolor policers and apply them to an interface:

```

[edit firewall]
three-color-policer three-color-policer-color-blind {
 logical-interface-policer;
 two-rate {
 color-blind;
 committed-information-rate 1500000;
 committed-burst-size 150;
 peak-information-rate 3;
 peak-burst-size 300;
 }
}
three-color-policer three-color-policer-color-aware {
 logical-interface-policer;
 two-rate {
 color-aware;
 committed-information-rate 1500000;
 committed-burst-size 150;
 peak-information-rate 3;
 peak-burst-size 300;
 }
}
[edit interfaces ge-1/1/0]
unit 1 {
 layer2-policer {
 input-three-color three-color-policer-color-blind;
 output-three-color three-color-policer-color-aware;
 }
}

```

Configure a two-color policer and apply it to an interface:

```
[edit firewall]
policer two-color-policer {
 logical-interface-policer;
 if-exceeding {
 bandwidth-percent 90;
 burst-size-limit 300;
 }
 then loss-priority-high;
}
[edit interfaces ge-1/1/0]
unit 2 {
 layer2-policer {
 input-policer two-color-policer;
 output-policer two-color-policer;
 }
}
```

Release History Table

| Release | Description                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------|
| 13.1    | Starting in Junos OS Release 13.1, traffic is classified into three categories: Green, Red, and Yellow. |

## CHAPTER 23

# Configuring Gigabit Ethernet Autonegotiation

- [Gigabit Ethernet Autonegotiation Overview on page 521](#)
- [Configuring Gigabit Ethernet Autonegotiation on page 521](#)

## Gigabit Ethernet Autonegotiation Overview

---

Autonegotiation is enabled by default on all Gigabit Ethernet and Tri-Rate Ethernet copper interfaces. However, you can explicitly enable autonegotiation to configure remote fault options manually.

### NOTE:

- When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.
- On ACX Series Universal Metro Routers, when the autonegotiation is disabled, the speed has to be explicitly configured to 10–100 Mbps.
- On T4000 routers, the auto-negotiation command is ignored for interfaces other than Gigabit Ethernet.

## Configuring Gigabit Ethernet Autonegotiation

---

- [Configuring Gigabit Ethernet Autonegotiation with Remote Fault on page 522](#)
- [Configuring Flow Control on page 522](#)
- [Configuring Autonegotiation Speed on MX Series Routers on page 522](#)
- [Displaying Autonegotiation Status on page 523](#)

## Configuring Gigabit Ethernet Autonegotiation with Remote Fault

To configure explicit autonegotiation and remote fault, include the **auto-negotiation** statement and the **remote-fault** option at the **[edit interfaces ge-fpc/pic/port gether-options]** hierarchy level.

```
[edit interfaces ge-fpc/pic/port gether-options]
(auto-negotiation | no-auto-negotiation) remote-fault <local-interface-online |
local-interface-offline>
```

## Configuring Flow Control

To enable flow control, include the **flow-control** statement at the **[edit interfaces ge-fpc/pic>/port gether-options]** hierarchy level. For more information, see [“Configuring Flow Control” on page 18](#).

## Configuring Autonegotiation Speed on MX Series Routers

MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs support autonegotiation of speed. The autonegotiation specified interface speed is propagated to CoS, routing protocols, and other system components. Half-duplex mode is not supported.

MX Series routers with IQ2 PICs connected to other devices require matching auto-negotiation configurations for both the PIC and for the device in order to achieve link up.

To specify the autonegotiation speed, use the **speed (auto | 1Gbps | 100Mbps | 10Mbps | auto-10m-100m)** statement at the **[edit interfaces ge-fpc/pic/port]** hierarchy level.

To set port speed negotiation to a specific rate, set the port speed to **1Gbps**, **100Mbps**, or **10Mbps**. If the negotiated speed and the interface speed do not match, the link will not be brought up.

If you set the autonegotiation speed **auto** option, then the port speed is negotiated.

Starting from Junos OS Release 14.2, the **auto-10m-100m** option allows the fixed tri-speed port to auto negotiate with ports limited by **100m** or **10m** maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.

You can disable auto MDI/MDIX using the **no-auto-mdix** statement at the **[edit interfaces ge-fpc/pic/port gether-options]** hierarchy level.

Use the **show interfaces ge-fpc/pic/port brief** command to display the auto negotiation of speed and auto MDI/MDIX states.

**NOTE:** Starting in Junos OS Release 14.2, on MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the `auto-10m-100m` option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the `show interfaces` command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the `show interfaces` command only. The actual interface speed is 100 Mbps.

## Displaying Autonegotiation Status

To display Gigabit Ethernet interface details, including the autonegotiation status, use the operational mode command `show interfaces ge- fpc/pic/port extensive`.

Table 80 on page 523 and Table 81 on page 525 provide information about the autonegotiation status on local and remote routers with fiber interfaces. The status of the link and LED can vary depending on the level of autonegotiation set and the transmit and receive fiber status.

*Table 80: Mode and Autonegotiation Status (Local)*

| Transmit | Receive | Mode               | LED   | Link | Autonegotiation Status |
|----------|---------|--------------------|-------|------|------------------------|
| ON       | ON      | Default            | Green | UP   | Complete               |
| ON       | OFF     | Default            | Red   | DOWN |                        |
| OFF      | ON      | Default            | Red   | DOWN |                        |
| OFF      | OFF     | Default            | Red   | DOWN |                        |
| ON       | ON      | Default            | Red   | DOWN |                        |
| ON       | ON      | Default            | Green | UP   | No-autonegotiation     |
| ON       | OFF     | Default            | Red   | DOWN |                        |
| OFF      | OFF     | Default            | Red   | DOWN |                        |
| ON       | ON      | Default            | Green | UP   |                        |
| ON       | ON      | Default            | Red   | DOWN |                        |
| ON       | ON      | No-autonegotiation | Green | UP   | Incomplete             |
| ON       | OFF     | No-autonegotiation | Red   | DOWN |                        |

## Ethernet Operations, Administration, and Maintenance

This topic provides an overview to help you effectively configure Ethernet Operations, Administration, and Maintenance (OAM) on a network of Juniper Networks® MX Series 5G Universal Routing Platforms. For more information about configuring OAM parameters on Ethernet interfaces, see the *Junos OS Network Interfaces Library for Routing Devices*.

Ethernet OAM provides the tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual local area network (VLAN) identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports, or a virtual service such as pseudowire, and so on.
- Isolate faults over a flat (or single operator) network architecture or a nested or hierarchical (or multi-provider) network.

OAM can provide simple link-level information, provide performance statistics, or track end-to-end connectivity across the network. Simple link fault management (LFM) for Ethernet links is defined in IEEE 802.3ah.

IEEE 802.1ag OAM is supported on untagged, single tagged, and stacked VLAN interfaces.

Ethernet OAM functions are implemented as:

- Fault detection and notification (provided by continuity check messages)
- Path discovery (provided by the linktrace protocol)
- Fault isolation, verification, and recovery (isolation and verification are provided by a combination of protocols, while recovery is the function of protocols such as spanning tree)

The loopback protocol used in Ethernet OAM is modeled on the standard IP ping. After a fault is detected, the loopback protocol performs fault verification and isolation under the direction of a network operator.

The loopback is performed using request and response message pairs. A unicast loopback message is generated by a maintenance endpoint (MEP), and a loopback reply is generated by the destination maintenance intermediate point (MIP) or MEP.

The target MAC address is learned by the continuity check protocol or linktrace protocol. The loopback message's packet is always forwarded to a unique port by the originating MEP, as determined by a MAC table lookup or the MEP interface MAC address.

The target MIP or MEP generates a unicast loopback reply in response to the received loopback message. The loopback message follows the same path as a data packet, and intermediate bridges simply forward the packet to the destination MIP or MEP.

## Ethernet OAM Connectivity Fault Management

---

The most complete connectivity fault management (CFM) is defined in IEEE 802.1ag. This topic emphasizes the use of CFM in a Metro Ethernet environment.

The major features of CFM are:

- Fault monitoring using the continuity check protocol. This is a neighbor discovery and health check protocol that discovers and maintains adjacencies at the VLAN or link level.
- Path discovery and fault verification using the linktrace protocol. Similar to IP traceroute, this protocol maps the path taken to a destination MAC address through one or more bridged networks between the source and destination.
- Fault isolation using the loopback protocol. Similar to IP ping, this protocol works with the continuity check protocol during troubleshooting.

CFM partitions the service network into various administrative domains. For example, operators, providers, and customers might be part of different administrative domains.

Each administrative domain is mapped into one maintenance domain providing enough information to perform its own management, thus avoiding security breaches and making end-to-end monitoring possible. Each maintenance domain is associated with a maintenance domain level from 0 through 7. Level allocation is based on the network hierarchy, where outermost domains are assigned a higher level than the innermost domains.

Customer end points have the highest maintenance domain level. In a CFM maintenance domain, each service instance is called a maintenance association. A *maintenance association* can be thought as a full mesh of maintenance endpoints (MEPs) having similar characteristics. MEPs are active CFM entities generating and responding to CFM protocol messages.

There is also a maintenance intermediate point (MIP), which is a CFM entity similar to the MEP, but more passive (MIPs only respond to CFM messages).

MEPs can be *up MEPs* or *down MEPs*. A link can connect a MEP at level 5 to a MEP at level 7. The interface at level 5 is an up MEP (because the other end of the link is at MEP level 7), and the interface at level 7 is a down MEP (because the other end of the link is at MEP level 5).

In a Metro Ethernet network, CFM is commonly used at two levels:

- By the service provider to check the connectivity among its provider edge (PE) routers
- By the customer to check the connectivity among its customer edge (CE) routers

**NOTE:** The configured customer CFM level must be greater than service provider CFM level.

In many Metro Ethernet networks, CFM is used to monitor connectivity over a VPLS and bridge network.

**NOTE:** In ACX Series routers, OAM for VPLS is supported only on ACX5048, ACX5096, and ACX5448 routers.

## IEEE 802.1ag OAM Connectivity Fault Management Overview

Ethernet interfaces on M7i and M10i routers with the Enhanced CFEB (CFEB-E) and on M120, M320, MX Series, T Series, and PTX Series routers support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM). The goal of CFM is to monitor an Ethernet network that may comprise one or more service instances. Junos OS supports IEEE 802.1ag connectivity fault management.

**NOTE:** MX Series Virtual Chassis does not support distributed inline connectivity fault management.

ACX Series routers support CFM on aggregated Ethernet interfaces with continuity check interval of 100 milliseconds or higher.

In Junos OS Release 9.3 and later, CFM also supports aggregated Ethernet interfaces. Connectivity fault management (CFM) sessions operate in distributed mode and are

processed on the Flexible PIC Concentrator (FPC) on aggregated Ethernet interfaces. As a result, graceful Routing Engine switchover (GRES) is supported on aggregated Ethernet interfaces. In releases before Junos OS Release 13.3, CFM sessions operate in centralized mode and are processed on the Routing Engine. However, CFM sessions are not supported on aggregated Ethernet interfaces if the interfaces that form the aggregated Ethernet bundle are in mixed mode. CFM sessions with a continuity check message (CCM) interval of 10 milliseconds are not supported over aggregated Ethernet interfaces.

CFM sessions are distributed by default. All CFM sessions must operate in either only distributed or only centralized mode. A mixed operation of distributed and centralized modes for CFM sessions is not supported. To disable the distribution of CFM sessions on aggregated Ethernet interfaces and make the sessions operate in centralized mode, include the **no-aggregate-delegate-processing** statement at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

**NOTE:** As a requirement for Ethernet OAM 802.1ag to work, distributed periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine. You can only disable PPM on the Packet Forwarding Engine. To disable PPM on the PFE, include the **ppm no-delegate-processing** statement at the **[edit routing-options ppm]** hierarchy level.

**NOTE:**

- CFM sessions are supported on aggregated Ethernet interfaces if the interfaces that form the aggregated Ethernet bundle are in mixed mode when the **no-aggregate-delegate-processing** command is enabled.
- Starting in Junos OS Release 14.2, , for CFM sessions in centralized mode, we recommend that you configure a maximum of 40 CFM sessions with continuity check message (CCM) interval of 100 milliseconds (100 ms) or a maximum of 400 CFM sessions with CCM interval of 1 second (1 s). If CFM sessions are configured beyond this limit, CFM might not work as expected. You might observe issues when the state of multiple links change or when the line cards are restarted.

Note that these limits have been derived by considering a protocol data unit (PDU) load of 400 packets per second (pps) on the Routing Engine. This limit varies depending on the Routing Engine load. If the Routing Engine experiences heavy load, expect some variations to this limit.

Starting in Junos OS Release 10.3, on interfaces configured on Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs) on MX Series routers, CFM is not supported on untagged aggregated Ethernet member links. MPCs and MICs do support CFM on untagged and tagged aggregated Ethernet logical interfaces. Starting in Junos OS Release 12.3, CFM does not support Multichassis Link Aggregation (MC-LAG). Do not configure the **mc-ae** statement when you configure CFM.

Starting in Junos OS Release 11.3, on T Series and M320 routers, CFM is not supported on interfaces configured with CCC encapsulation. If you configure CFM, the system displays the following message: **“MEPs cannot be configured on ccc interface on this platform”**.

Network entities such as operators, providers, and customers may be part of different administrative domains. Each administrative domain is mapped into one maintenance domain. Maintenance domains are configured with different level values to keep them separate. Each domain provides enough information for the entities to perform their own management, perform end-to-end monitoring, and still avoid security breaches.

Starting in Junos OS Release 17.4, you can enable support for IEEE 802.1ag CFM on pseudowire service interfaces by configuring maintenance intermediate points (MIPs) on the pseudowire service interfaces. Pseudowire service interfaces support configuring of subscriber interfaces over MPLS pseudowire termination. Termination of subscriber interfaces over PW enables network operators to extend their MPLS domain from the Access/Aggregation network to the service edge and use uniform MPLS label provisioning for a larger portion of their network.

**NOTE:** The CFM MIP session is supported only on the pseudowire services interface and not on the pseudowire services tunnel interface.

IEEE 802.1ag OAM supports graceful Routing Engine switchover (GRES). IEEE 802.1ag OAM is supported on untagged, single tagged, and stacked VLAN interfaces.

## Connectivity Fault Management Key Elements

Figure 19 on page 536 shows the relationships among the customer, provider, and operator Ethernet bridges, maintenance domains, maintenance association end points (MEPs), and maintenance intermediate points (MIPs).

**Figure 19: Relationship Among MEPs, MIPs, and Maintenance Domain Levels**

**NOTE:** On ACX Series routers, the maintenance intermediate points (MIP) are supported only on the ACX5048 and ACX5096 routers.

A maintenance association is a set of MEPs configured with the same maintenance association identifier and maintenance domain level. Figure 20 on page 537 shows the hierarchical relationships between the Ethernet bridge, maintenance domains, maintenance associations, and MEPs.

*Figure 20: Relationship Among Bridges, Maintenance Domains, Maintenance Associations, and MEPs*

## Best Practices for Configuring 802.1ag Ethernet OAM for VPLS

**BEST PRACTICE:** The logical interfaces in a VPLS routing instance may have the same or different VLAN configurations. VLAN normalization is required to switch packets correctly among these interfaces. VLAN normalization is effectively VLAN translation wherein the VLAN tags of the received packet need to be translated if they are different than the normalized VLAN tags. Configuration is described starting in “IEEE 802.1ag OAM Connectivity Fault Management Overview” on page 534 and you should further observe the additional requirements described in this section.

For MX Series routers, the normalized VLAN is specified using one of the following configuration statements in the VPLS routing instance:

- `vlan-id vlan-number`
- `vlan-id none`
- `vlan-tags outer outer-vlan-number inner inner-vlan-number`

You must configure `vlan-maps` explicitly on all interfaces belonging to the routing instance.

The following forwarding path considerations must be observed:

- Packet receive path:

- This is the forwarding path for packets received on the interfaces.
- 802.1ag Ethernet OAM for VPLS uses implicit interface filters and forwarding table filters to flood, accept, and drop the CFM packets.
- Packet transmit path:
  - The JUNOS Software uses the router's hardware-based forwarding for CPU-generated packets.
  - For Down MEPs, the packets are transmitted on the interface on which the MEP is configured.
  - In MX series routers, for Up MEPs, the packet must be flooded to other interfaces in the VPLS routing instance. The router creates a flood route tied to a flood next hop (with all interfaces to flood) and then sources the packet to be forwarded with this flood route.
  - The router also uses implicit-based forwarding for CPU generated packets. The result is for the flood next hop tied to the flood route to be tied to the filter term. The filter term uses match criteria to correctly identify the host-generated packets.

Release History Table

| Release | Description                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.4R1  | Starting in Junos OS Release 17.4, you can enable support for IEEE 802.1ag CFM on pseudowire service interfaces by configuring maintenance intermediate points (MIPs) on the pseudowire service interfaces.                                                                                                              |
| 14.2    | Starting in Junos OS Release 14.2, , for CFM sessions in centralized mode, we recommend that you configure a maximum of 40 CFM sessions with continuity check message (CCM) interval of 100 milliseconds (100 ms) or a maximum of 400 CFM sessions with CCM interval of 1 second (1 s).                                  |
| 12.3    | Starting in Junos OS Release 12.3, CFM does not support Multichassis Link Aggregation (MC-LAG). Do not configure the <b>mc-ae</b> statement when you configure CFM.                                                                                                                                                      |
| 11.3    | Starting in Junos OS Release 11.3, on T Series and M320 routers, CFM is not supported on interfaces configured with CCC encapsulation.                                                                                                                                                                                   |
| 10.3    | Starting in Junos OS Release 10.3, on interfaces configured on Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs) on MX Series routers, CFM is not supported on untagged aggregated Ethernet member links. MPCs and MICs do support CFM on untagged and tagged aggregated Ethernet logical interfaces. |
| 9.3     | In Junos OS Release 9.3 and later, CFM also supports aggregated Ethernet interfaces.                                                                                                                                                                                                                                     |

## Junos OS Support for Performance Monitoring Compliant with Technical Specification MEF 36

---

Junos OS release 16.1R1 and later supports performance monitoring that is compliant with Technical Specification MEF 36. Technical Specification MEF 36 specifies the performance monitoring MIB. The performance monitoring MIB is required to manage service operations, administration, and maintenance (OAM) implementations that satisfy the Service OAM requirements and framework specified in MEF 17 and MEF 35, the management objects specified in MEF 7.1, and the performance monitoring functions defined in ITU-T Y.1731 and IEEE 802.1ag.

You can enable MEF-36-compliant performance monitoring by configuring the [measurement-interval](#) statement at the **[edit protocols oam ethernet cfm performance-monitoring]** hierarchy level.

When MEF-36-compliant performance monitoring is enabled:

- An SNMP get next request for a variable might not fetch the current value unless an SNMP walk is performed before performing the get next request. This limitation applies only to the current statistics for delay measurement, loss measurement, and synthetic loss measurement.
- The output for the field **Current delay measurement statistics** might display a measurement interval of 0 (zero) and an incorrect timestamp until the first cycle time has expired.
- Supported data TLV size for performance monitoring protocol data units (PDUs) is 1386 bytes when MEF-36-compliant performance monitoring is enabled. The TLV size is 1400 bytes in legacy mode.
- The maximum configurable value for the lower threshold bin is 4,294,967,294.

- Frame loss ratio (FLR) is excluded in loss measurements during period of unavailability for synthetic loss measurement only. In case of loss measurement, FLR is included even during period of unavailability.
- During a period of loss of continuity (adjacency down), although SOAM PDUs are not sent, FLR and availability calculations are not stopped. These calculations are performed with the assumption of 100% loss.
- The number of SOAM PDUs that are sent during the first measurement interval might be less than expected. This is because of a delay in detecting the adjacency state at the performance monitoring session level.
- The number of SOAM PDUs transmitted during a measurement interval for a cycle time of 100 ms might not be accurate. For example, in a measurement interval of two minutes with a cycle time 100 ms, the SOAM PDUs transmitted might be in the range of 1198–2000.

- [measurement-interval on page 986](#)

---

## Junos OS Support for Chassis ID TLV

---

In Release 16.1R2 and later, you can configure Junos OS to send the sender ID TLV along with the packets. The sender ID TLV is an optional TLV that is sent in continuity check messages (CCMs), loopback messages, and Link Trace Messages (LTMs), as specified in the IEEE 802.1ag standard. The sender ID TLV contains the chassis ID, which is the unique, CFM-based MAC address of the device, and the management IP address, which is an IPv4 or an IPv6 address.

The value of the **length** field in the TLV indicates whether or not the TLV contains the chassis ID information. The possible values for the **length** field are zero (**0**) or any valid number, which indicates the absence or presence of chassis ID information in the TLV, respectively.

You can enable Junos OS to send the sender ID TLV at the global level by using the **set protocols oam ethernet connectivity-fault-management sendid-tlv send-chassis-tlv** command. If the sender ID TLV is configured at the global level, then the default maintenance domain, maintenance association, and the maintenance association intermediate point (MIP) half function inherit this configuration.

You can also configure the sender ID TLV at the following hierarchy levels:

- **[edit protocols oam ethernet connectivity-fault-management].**
- **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *maintenance-domain-name* maintenance-association *maintenance-association-name* continuity-check].**

The sender ID TLV configuration at the maintenance-association level takes precedence over the global-level configuration.

**NOTE:** The sender ID TLV is supported only for 802.1ag PDUs and is not supported for performance monitoring protocol data units (PDUs).

Release History Table

| Release | Description                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------|
| 16.1    | In Release 16.1R2 and later, you can configure Junos OS to send the sender ID TLV along with the packets. |

## Creating a Maintenance Domain

To enable connectivity fault management (CFM) on an Ethernet interface, you must first configure a maintenance domain and specify the name of the maintenance domain. You can also specify the format of the name. For instance, if you specify the name format to be domain name service (DNS) format, you can specify the name of the maintenance domain as `www.juniper.net`. The default name format is ASCII character string.

**NOTE:** For logical interfaces, the maintenance domain name must be unique across logical systems. If you configure the same maintenance domain name across logical systems, then you receive the following error message: **error: configuration check-out failed.**

During the creation of the maintenance domain, you can also specify the maintenance domain level. The maintenance domain level indicates the nesting relationship between various maintenance domains. The maintenance domain level is embedded in each of the CFM frames.

To create a maintenance domain:

1. In configuration mode, create a maintenance domain by specifying the name and the name format at the `[edit protocols oam ethernet connectivity-fault-management]` hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain md-name name-format option
```

**NOTE:** If you configure the maintenance domain name length greater than 45 octet, then the following error message is displayed: **error: configuration check-out failed.**

2. Specify the maintenance domain level by specifying the value at the `[edit protocols oam ethernet connectivity-fault-management ]` hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain md-name level number
```

## Configuring Maintenance Intermediate Points (MIPs)

MX Series routers support maintenance intermediate points (MIPs) for the Ethernet OAM 802.1ag CFM protocol at a bridge-domain level. This enables you to define a maintenance domain for each default level. The MIPs names are created as **default-level-number** at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain]` hierarchy level. Use the **bridge-domain**, **instance**, **virtual-switch**, and **mip-half-function** MIP options to specify the MIP configuration.

Use the **show oam ethernet connectivity-fault-management mip (bridge-domain | instance-name | interface-name)** command to display the MIP configurations.

To configure the maintenance intermediate point (MIP):

1. Configure a bridge domain under a user-defined virtual switch by specifying the **virtual-switch** statement and the name of the user-defined virtual switch, at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name default-x]` hierarchy level.

**NOTE:** A bridge domain must be specified by name only if it is configured by including the `vlan-id` statement under the `virtual-switch` statement. If a bridge domain is configured with a range of VLAN IDs, then the VLAN IDs must be explicitly listed after the bridge domain name.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name default-x]
user@host# set virtual-switch virtual-switch-name bridge-domain bridge-domain-name
vlan-id value
```

**NOTE:** You can also configure the bridge domain for the default virtual switch by including the `bridge-domain` statement at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]` hierarchy level.

2. Configure the VPLS routing instance for the default maintenance domain.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name]
user@host# set instance instance-name
```

3. Configure the maintenance intermediate point (MIP) half function to divide the MIP functionality into two unidirectional segments to improve network coverage by increasing the number of MIPs that are monitored. The MIP half function also responds to loop-back and link-trace messages to identify faults.

**NOTE:** Whenever a MIP is configured and a bridge domain is mapped to multiple maintenance domains or maintenance associations, it is essential that the `mip-half-function` value for all maintenance domains and maintenance associations be the same.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name default-x]
user@host# set mip-half-function (none | default | explicit)
```

## Configuring Maintenance Association Intermediate Points in ACX Series

---

Maintenance Intermediate Point (MIP) provides monitoring capability of intermediate points for services such as Layer 2 bridging, Layer 2 circuit, and Layer 2 VPN. ACX5048 and ACX5096 routers support MIPs for the Ethernet OAM 802.1ag CFM protocol. Use the `bridge-domain`, `interface`, and `mip-half-function` MIP options to specify the MIP configuration.

.....  
**NOTE:** ACX5048 and ACX5096 routers do not support MIP configuration on VPLS services.  
.....

.....  
**NOTE:** ACX5448 router do not support MIP.  
.....

.....  
**NOTE:** Whenever a MIP is configured and a bridge domain is mapped to multiple maintenance domains or maintenance associations, it is essential that the `mip-half-function` value for all maintenance domains and maintenance associations be the same.  
.....

To display MIP configurations, use the **`show oam ethernet connectivity-fault-management mip (bridge-domain | instance-name | interface-name)`** command.

The following MIP configurations are supported in ACX5048 and ACX5096 routers:

- MIP with with bridge domain
- MIP with circuit cross-connect (CCC)

- MIP with bridge domain when maintenance association end point is configured
- MIP with CCC when maintenance association end point is configured

The following sections describe MIP configuration:

- [Configuring the Maintenance Domain Bridge Domain on page 545](#)
- [Configuring the Maintenance Domain MIP Half Function on page 545](#)
- [Configuring the Maintenance Association Intermediate Points with Bridge Domain on page 545](#)
- [Configuring the Maintenance Association Intermediate Points with Circuit Cross-Connect on page 546](#)
- [Configuring the Maintenance Association Intermediate Points with Bridge Domain when Maintenance Association End Point is Configured on page 546](#)
- [Configuring the Maintenance Intermediate Points with Circuit Cross-Connect when Maintenance Association End Point is Configured on page 547](#)

## Configuring the Maintenance Domain Bridge Domain

To configure the bridge domain, include the `vllans` statement at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain-name]` hierarchy level.

**NOTE:** The Layer 2 CLI configurations and show commands for ACX5048 and ACX5096 routers differ compared to other ACX Series routers. For more information, see *Layer 2 Next Generation Mode for ACX Series*.

## Configuring the Maintenance Domain MIP Half Function

MIP Half Function (MHF) divides MIP functionality into two unidirectional segments, improves visibility with minimal configuration, and improves network coverage by increasing the number of points that can be monitored. MHF extends monitoring capability by responding to loopback and linktrace messages to help isolate faults.

Whenever a MIP is configured and a bridge domain is mapped to multiple maintenance domains or maintenance associations, it is essential that the *MIP half function* value for all maintenance domains and maintenance associations be the same. To configure the MIP half function, include the `mip-half-function` statement at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain-name]` hierarchy level.

## Configuring the Maintenance Association Intermediate Points with Bridge Domain

In ACX5048 and ACX5096 routers, you can configure the MIP with bridge domain. The following is a sample to configure the MIP with bridge domain:

```
[edit protocols]
oam {
```

```

ethernet {
 connectivity-fault-management {
 maintenance-domain default-6 {
 vlan bd1;
 mip-half-function default;
 }
 }
}

```

### Configuring the Maintenance Association Intermediate Points with Circuit Cross-Connect

In ACX5048 and ACX5096 routers, you can configure the MIP with circuit cross-connect (CCC). The following is a sample to configure the MIP with CCC:

```

[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain default-6 {
 interface xe-0/0/42.0;
 mip-half-function default;
 }
 }
 }
}

```

### Configuring the Maintenance Association Intermediate Points with Bridge Domain when Maintenance Association End Point is Configured

In ACX5048 and ACX5096 routers, you can configure the MIP with bridge domain when a maintenance association end point (MEP) is configured. The following is a sample to configure the MIP with bridge domain when MEP is configured:

```

[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain md2 {
 level 5;
 mip-half-function default;
 maintenance-association ma2 {
 continuity-check {
 interval 1s;
 }
 mep 222 {
 interface xe-0/0/42.0;
 direction up;
 }
 }
 }
 }
 }
}

```

```
}
```

## Configuring the Maintenance Intermediate Points with Circuit Cross-Connect when Maintenance Association End Point is Configured

In ACX5048 and ACX5096 routers, you can configure the MIP with circuit cross-connect (CCC) when a maintenance association end point (MEP) is configured. The following is a sample to configure the MIP with CCC when MEP is configured:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain md2 {
 level 5;
 mip-half-function default;
 maintenance-association ma2 {
 continuity-check {
 interval 1s;
 }
 mep 222 {
 interface xe-0/0/42.0;
 direction up;
 }
 }
 }
 }
 }
}
```

## Creating a Maintenance Association

To create a maintenance association, include the **maintenance-association *ma-name*** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name*]** hierarchy level.

Maintenance association names can be in one of the following formats:

- As a plain ASCII character string
- As the VLAN identifier of the VLAN you primarily associate with the maintenance association
- As a two-octet identifier in the range from 0 through 65,535
- As a name in the format specified by RFC 2685

The default short name format is an ASCII character string.

To configure the maintenance association short name format, include the **short-name-format (character-string | vlan | 2octet | rfc-2685-vpn-id)** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name*]** hierarchy level.

## Continuity Check Protocol Parameters Overview

The continuity check protocol is used for fault detection by maintenance end points (MEPs) within a maintenance association. The MEP periodically sends continuity check multicast messages. The continuity check protocol packets use the ethertype value 0x8902 and the multicast destination MAC address 01:80:c2:00:00:32.

The following list describes the continuity check protocol parameters you can configure:

- **interval**—Frequency of the continuity check messages (CCM) i.e time between the transmission of the CCM messages. You can specify 10 minutes (**10m**), 1 minute (**1m**), 10 seconds (**10s**), 1 second (**1s**), 100 milliseconds (**100ms**), or 10 milliseconds (**10ms**). The default value is 1 minute. For instance, if you specify the interval as 1 minute, the MEP sends the continuity check messages every minute to the receiving MEP.

**NOTE:** For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can only disable PPM on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the `no-delegate-processing` statement at the `[edit routing-options ppm]` hierarchy level.

Continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).

- **hold-interval**—Frequency at which the MEP database can be flushed, if no updates occur. Receiving MEPs use the continuity check messages to build a MEP database of all MEPs in the maintenance association. The frequency is the number of minutes to wait before flushing the MEP database if no updates occur. The default value is 10 minutes.

**NOTE:** Hold timer based flushing is applicable only for autodiscovered remote MEPs and not for statically configured remote MEPs.

The hold interval logic runs a polling timer per CFM session level (not per remote MEP level) where the polling timer duration is equal to the configured hold time. When the polling timer expires, it deletes all the autodiscovered remote MEP entries which have been in the failed state for a time period equal to or greater than the configured hold time. If the remote MEP completes the hold time duration in the failed state, then flushing will not occur until the next polling timer expires. Hence remote MEP flushing may not happen exactly at the configured hold time.

- **loss-threshold**—Number of continuity check messages that can be lost before the router marks the MEP as down. The value can be from 3 to 256 protocol data units (PDUs). The default value is 3 PDUs.

## Configuring Continuity Check Protocol Parameters for Fault Detection

---

The continuity check protocol is used for fault detection by a maintenance association end point (MEP) within a maintenance association. A MEP periodically generates and responds to continuity check multicast messages. The continuity check protocol packets use the ethertype value 0x8902 and the multicast destination MAC address 01:80:c2:00:00:32. The receiving MEPs use the continuity check messages (CCMs) to build a MEP database of all MEPs in the maintenance association.

To configure continuity check protocol parameters:

1. Specify the time to wait in minutes before flushing the MEP database, if no updates occur, with a value from 1 minute through 30,240 minutes. The default value is 10 minutes.

**NOTE:** Flushing based on the hold timer is applicable only for autodiscovered remote MEPs and not for statically configured remote MEPs.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name continuity-check]
user@host# set hold-interval minutes
```

2. Specify the time to wait (duration) between the transmissions of CCMs. The duration can be one of the following values: 10 minutes (10m), 1 minute (1m), 10 seconds (10s),

1 second (1s), 100 milliseconds (100ms), or 10 milliseconds (10ms). The default value is 1 minute.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name continuity-check]
user@host# set interval duration
```

3. Specify the number of continuity check messages that can be lost before the router marks the MEP as down. The value can be from 3 to 256 protocol data units (PDUs). The default value is 3 PDUs.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name continuity-check]
user@host# set loss-threshold number
```

## Configuring a MEP to Generate and Respond to CFM Protocol Messages

A maintenance association end point (MEP) refers to the boundary of a domain. A MEP generates and responds to connectivity fault management (CFM) protocol messages. You can configure multiple up MEPs for a single combination of maintenance association ID and maintenance domain ID for interfaces belonging to a particular VPLS service or a bridge domain. You can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance association name to monitor services

provided by Virtual Private LAN service (VPLS), bridge domain, circuit cross-connect (CCC), or IPv4 domains.

For layer 2 VPNs routing instances (local switching) and EVPN routing instances, you can also configure multiple up MEPs for a single combination of maintenance association ID and maintenance domain ID on logical interfaces. The logical interface can be configured on different devices or on the same device. To support multiple up MEPs on two IFLs, enhanced IP network services must be configured for the chassis.

You can enable automatic discovery of a MEP. With automatic discovery a MEP is enabled to accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association. If automatic discovery is not enabled, the remote MEPs must be configured. If the remote MEP is not configured, the CCMs from the remote MEP are treated as errors.

Continuity measurement is provided by an existing continuity check protocol. The continuity for every remote MEP is measured as the percentage of time that remote MEP was operationally up over the total administratively enabled time. Here, the operational uptime is the total time during which the CCM adjacency is active for a particular remote MEP and the administrative enabled time is the total time during which the local MEP is active. You can also restart the continuity measurement by clearing the currently measured operational uptime and the administrative enabled time.

- [Configuring a remote Maintenance Association End Point \(MEP\) on page 554](#)

## Configuring a Maintenance Association End Point (MEP)

To configure a maintenance association end point:

1. Specify an ID for the MEP at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name*]**. You can specify any value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name]
user@host# set mep mep-id
```

2. Enable maintenance end point automatic discovery so the MEP can accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set auto-discovery
```

3. Specify the direction in which the CCM packets are transmitted for the MEP. You can specify up or down. If you specify the direction as up, CCMs are transmitted out of every logical interface that is part of the same bridging or VPLS instance except for the interface configured on the MEP. If you specify the direction as down, CCMs are transmitted only out of the interface configured on the MEP.

**NOTE:** Ports in the Spanning Tree Protocol (STP) blocking state do not block CFM packets destined to a down MEP. Ports in an STP blocking state without the continuity check protocol configured do block CFM packets.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set direction down
```

**NOTE:** Starting with Junos OS Release 12.3, for all interfaces configured on Modular Port Concentrators (MPCs) on MX Series 5G Universal Routing Platforms, you no longer need to configure the `no-control-word` statement for all Layer 2 VPNs and Layer 2 circuits over which you are running CFM MEPs. For all other interfaces on MX Series routers and on all other routers and switches, you must continue to configure the `no-control-word` statement at the `[edit routing-instances routing-instance-name protocols l2vpn]` or `[edit protocols l2circuit neighbor neighbor-id interface interface-name]` hierarchy level when you configure CFM MEPs. Otherwise, the CFM packets are not transmitted, and the `show oam ethernet connectivity-fault-management mep-database` command does not display any remote MEPs.

4. Specify the interface to which the MEP is attached. It can be a physical interface, logical interface, or trunk interface. On MX Series routers, the MEP can be attached to a specific VLAN of a trunk interface.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set interface interface-name
```

5. Specify the IEEE 802.1 priority bits that are used by continuity check and link trace messages. You can specify a value from through 7 as the priority.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set priority number
```

6. Specify the lowest priority defect that generates a fault alarm whenever CFM detects a defect. Possible values include: `all-defects`, `err-xcon`, `mac-rem-err-xcon`, `no-defect`, `rem-err-xcon`, and `xcon`.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set lowest-priority-defect mac-rem-err-xcon
```

- Specify the ID of the remote MEP at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name* mep *mep-id*]**. You can specify any value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-namemep mep-id]
user@host# set remote-mep mep-id
```

- See Also
- [auto-discovery on page 947](#)
  - [direction on page 963](#)
  - [lowest-priority-defect on page 982](#)
  - [priority on page 998](#)

## Configuring a remote Maintenance Association End Point (MEP)

To configure a remote maintenance association end point:

- Configure the remote MEP by specifying the MEP ID at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name* mep *mep-id*]**. You can specify any value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-namemep mep-id]
user@host# edit remote-mep mep-id
```

- Specify the name of the action profile to be used for the remote MEP by including the **action-profile *profile-name*** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name* mep *mep-id* remote-mep *remote-mep-id*]**. The profile must be defined at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-namemep mep-id remote-mep
 remote-mep-id]
user@host# set action-profile profile-name
```

- Configure the remote MEP to detect initial loss of connectivity. By default, the MEP does not generate loss-of-continuity (LOC) defect messages. When you configure the **detect-loc** statement, a loss-of-continuity (LOC) defect is detected if no continuity check message is received from the remote MEP within a period equal to 3.5 times the continuity check interval configured for the maintenance association. If a LOC defect is detected, a syslog error message is generated.

**NOTE:** When you configure connectivity-fault management (CFM) along with `detect-loc`, any action-profile configured to bring down the interface is executed if continuity check message is not received. However, the action-profile is not executed if you have not configured `detect-loc` and continuity check message is not received.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id remote-mep
 remote-mep-id]
user@host# set detect-loc
```

## Configuring MEP Interfaces to Support Ethernet Frame Delay Measurements

Ethernet frame delay measurement is a useful tool for providing performance statistics or supporting or challenging Service Level Agreements (SLAs). By default, Ethernet frame delay measurement uses software for timestamping and delay calculations. You can optionally use hardware timing to assist in this process and increase the accuracy of the delay measurement results. This assistance is available on the reception path.

Before you can perform Ethernet frame delay measurements on MX Series routers, you must have done the following:

- Configured Ethernet OAM and CFM correctly
- Prepared the measurement between two compatibly configured MX Series routers
- Enabled the distributed periodic packet management daemon (ppmd)
- Avoided trying to perform Ethernet frame delay measurement on aggregated Ethernet or pseudowire interfaces, which are not supported
- Made sure the hardware-assisted timestamping is supported if that feature is configured

At the end of this configuration, you create two MX Series routers that can perform and display Ethernet frame delay measurements on Ethernet interfaces using optional hardware timestamping. By default, Ethernet frame delay measurement uses software for timestamping and delay calculations. You can optionally use hardware timing to assist in this process and increase the accuracy of the delay measurement results. This assistance is available on the reception path.

To configure hardware-assisted timestamping:

1. To enable Ethernet frame delay measurement hardware assistance on the reception path, include the **hardware-assisted-timestamping** statement at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring]** hierarchy level:

```
[edit]
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 performance-monitoring {
 hardware-assisted-timestamping; # Enable timestamping in hardware.
 }
 }
 }
 }
}
```

2. Ethernet frame delay measurement requires that distributed PPMD is enabled. Before you can gather statistics for Ethernet frame delay measurement, you must make sure that PPMD is configured properly. Without distributed PPMD, delay measurement results are not valid.

To perform Ethernet frame delay measurement, make sure that the following configuration statement is *NOT* present:

```
[edit routing-options]
ppm {
 no-delegate-processing; # This turns distributed PPMD OFF.
}
```

## Configuring Service Protection for VPWS over MPLS Using the MEP Interface

You can enable service protection for a virtual private wire service (VPWS) over MPLS by specifying a working path or protect path on the MEP. Service protection provides end-to-end connection protection of the working path in the event of a failure.

To configure service protection, you must create two separate transport paths—a working path and a protect path. You can specify the working path and protect path by creating two maintenance associations. To associate the maintenance association with a path, you must configure the **interface** statement for the MEP within the maintenance association and specify the path as working or protect.

**NOTE:** If the path is not specified, the session monitors the active path.

Table 82 on page 558 describes the available service protection options.

Table 82: Service Protection Options

| Option         | Description                 |
|----------------|-----------------------------|
| <b>working</b> | Specifies the working path. |
| <b>protect</b> | Specifies the protect path. |

In this configuration, we enable service protection for the VPWS service. The CCM session is configured for the working path and references the CCM session configured for the protect path using the **protect-maintenance-association** statement. The name of the protect transport path for the maintenance association is configured and associated with the maintenance association for the working path.

To configure service protection for VPWS over MPLS:

1. In configuration mode, create a maintenance domain by specifying the name and the name format at the [edit protocols oam ethernet connectivity-fault-management ] hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain md-name name-format option
```

**NOTE:** If you configure the maintenance domain name length greater than 45 octet, then the following error message is displayed: error: configuration check-out failed.

2. Specify the maintenance domain level by specifying the value at the [edit protocols oam ethernet connectivity-fault-management ] hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenace-domain md-name level number
```

3. Create a maintenance association for the working path by specifying the name and the short name format at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name*]** hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name]
user@host# set maintenance-association test-ma short-name-format option
```

4. Specify the maintenance association name used for connection protection and the name of the automatic-protection-switching profile (aps-profile) at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name*]** hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name]
user@host# set protect-maintenance-association ma-name aps-profile
aps-profile-name
```

5. Specify the time to wait between transmissions of continuity check messages at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name* continuity-check ]** hierarchy level. The duration can be one of the following values: 10 minutes(10m), 1 minute(1m), 10 seconds(10s), 1 second(1s), 100 milliseconds(100ms), or 10 milliseconds(10ms). The default value is 1 minute.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name continuity-check]
user@host# set interval option
```

6. Specify an ID for the MEP at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name*]**. You can specify any value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name]
user@host# set mep mep-id
```

7. Enable maintenance end point automatic discovery so the MEP can accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set auto-discovery
```

8. Specify the direction in which the CCM packets are transmitted for the MEP. You can specify up or down. If you specify the direction as up, CCMs are transmitted out of every logical interface that is part of the same bridging or VPLS instance except for the interface configured on the MEP. If you specify the direction as down, CCMs are transmitted only out of the interface configured on the MEP.

**NOTE:** Ports in the Spanning Tree Protocol (STP) blocking state do not block CFM packets destined to a down MEP. Ports in an STP blocking state without the continuity check protocol configured do block CFM packets.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep-id]
user@host# set direction down
```

**NOTE:** Starting with Junos OS Release 12.3, for all interfaces configured on Modular Port Concentrators (MPCs) on MX Series 5G Universal Routing Platforms, you no longer need to configure the `no-control-word` statement for all Layer 2 VPNs and Layer 2 circuits over which you are running CFM MEPs. For all other interfaces on MX Series routers and on all other routers and switches, you must continue to configure the `no-control-word` statement at the `[edit routing-instances routing-instance-name protocols l2vpn]` or `[edit protocols l2circuit neighbor neighbor-id interface interface-name]` hierarchy level when you configure CFM MEPs. Otherwise, the CFM packets are not transmitted, and the `show oam ethernet connectivity-fault-management mep-database` command does not display any remote MEPs.

9. Specify the interface to which the MEP is attached. It can be a physical interface, logical interface, or trunk interface. On MX Series routers, the MEP can be attached to a specific VLAN of a trunk interface. Also, specify the transport path as working.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep-id]
user@host# set interface interface-name working
```

10. Create a maintenance association for the protection path by specifying the name and the short name format at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name]` hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name]
user@host# set maintenance-association ma-name short-name-format option
```

11. Specify the time to wait between transmissions of continuity check messages at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name continuity-check ]` hierarchy level. The duration can be one of the following values: 10 minutes(10m), 1 minute(1m), 10 seconds(10s), 1 second(1s), 100 milliseconds(100ms), or 10 milliseconds(10ms). The default value is 1 minute.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name continuity-check]
user@host# set interval option
```

12. Specify an ID for the MEP at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name]`. You can specify any value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name]
user@host# set mep mep-id
```

13. Enable maintenance end point automatic discovery so the MEP can accept continuity check messages (CCMs) from all remote MEPs of the same maintenance association.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set auto-discovery
```

14. Specify the direction in which the CCM packets are transmitted for the MEP. You can specify up or down. If you specify the direction as up, CCMs are transmitted out of every logical interface that is part of the same bridging or VPLS instance except for the interface configured on the MEP. If you specify the direction as down, CCMs are transmitted only out of the interface configured on the MEP.

**NOTE:** Ports in the Spanning Tree Protocol (STP) blocking state do not block CFM packets destined to a down MEP. Ports in an STP blocking state without the continuity check protocol configured do block CFM packets.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 domain-name maintenance-association ma-name mep mep-id]
user@host# set direction down
```

**NOTE:** Starting with Junos OS Release 12.3, for all interfaces configured on Modular Port Concentrators (MPCs) on MX Series 5G Universal Routing Platforms, you no longer need to configure the **no-control-word** statement for all Layer 2 VPNs and Layer 2 circuits over which you are running CFM MEPs. For all other interfaces on MX Series routers and on all other routers and switches, you must continue to configure the **no-control-word** statement at the [edit routing-instances *routing-instance-name* protocols l2vpn] or [edit protocols l2circuit neighbor *neighbor-id* interface *interface-name*] hierarchy level when you configure CFM MEPs. Otherwise, the CFM packets are not transmitted, and the **show oam ethernet connectivity-fault-management mep-database** command does not display any remote MEPs.

15. Specify the interface to which the MEP is attached. It can be a physical interface, logical interface, or trunk interface. On MX Series routers, the MEP can be attached to a specific VLAN of a trunk interface. Also, specify the transport path as working.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
domain-name maintenance-association ma-name mep mep-id]
user@host# set interface interface-name protect
```

## Configuring a CFM Action Profile to Specify CFM Actions for CFM Events

You can create a connectivity fault management (CFM) action profile to define event flags and thresholds to be monitored. You can also specify the action to be taken when any of the configured events occur. When the CFM events occur, the router performs the corresponding action based on your specification. You can configure one or more events in the action profile. Alternatively, you can configure an action profile and specify default actions when connectivity to a remote maintenance association endpoint (MEP) fails.

**NOTE:** You cannot configure multiple actions at this time. Only one action can be configured. This limitation affects both the `action` and `clear-action` statements.

To configure the CFM action profile:

1. In configuration mode, at the `[edit protocols oam ethernet connectivity-fault-management]` hierarchy level, specify the name of the action profile and the CFM event(s). You can configure more than one event in the action profile. Possible events include: `interface-status-tlv`, `port-status-tlv`, `adjacency-loss`, `RDI`.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set action-profile profile-name event [event1, event2, event3..]
```

2. Specify the action to be taken by the router when the event occurs. The action is triggered when the event occurs. If you have configured more than one event in the action profile, it is not necessary for all events to occur to trigger the action.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set action-profile profile-name action action
```

3. Specify the default action to be taken by the router when connectivity to a remote MEP fails. If no action is configured, no action is taken.

**NOTE:** Associating an action profile with the `interface-down` action on an up MEP CFM session running over a circuit cross-connect (CCC) interface (`l2circuit/l2vpn`) is not advisable and can result in a deadlock situation.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set action-profile profile-name default-actions action
```

## Configuring Linktrace Protocol in CFM

---

The linktrace protocol is used for path discovery between a pair of maintenance points. Linktrace messages are triggered by an administrator using the **traceroute** command to verify the path between a pair of MEPs under the same maintenance association. Linktrace messages can also be used to verify the path between an MEP and an MIP under the same maintenance domain. The linktrace protocol enables you to configure the time to wait for a response. If no response is received for a linktrace request message, the request and response entries are deleted after the interval expires. You can also configure the number of linktrace reply entries to be stored for the corresponding linktrace request.

The operation of IEEE 802.1ag linktrace request and response messages is similar to the operation of Layer 3 **traceroute** commands. For more information about the **traceroute** command, see the *Junos OS Administration Library*.

To configure the linktrace protocol:

1. Configure the time to wait for a linktrace response at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level. You can specify the value in minutes or seconds. The default value is 10 minutes.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set linktrace age time
```

2. Configure the number of linktrace reply entries to be stored per linktrace request. You can specify a value from 1 through 500. The default value is 100.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set linktrace path-database-size path-database-size
```

## Configuring Ethernet Local Management Interface

- [Ethernet Local Management Interface Overview on page 565](#)
- [Configuring the Ethernet Local Management Interface on page 567](#)
- [Example E-LMI Configuration on page 569](#)

### Ethernet Local Management Interface Overview

Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces support the Ethernet Local Management Interface (E-LMI).

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

The E-LMI specification is available at the Metro Ethernet Forum. E-LMI procedures and protocols are used for enabling automatic configuration of the customer edge (CE) to support Metro Ethernet services. The E-LMI protocol also provides user-to-network interface (UNI) and Ethernet virtual connection (EVC) status information to the CE. The UNI and EVC information enables automatic configuration of CE operation based on the Metro Ethernet configuration.

The E-LMI protocol operates between the CE device and the provider edge (PE) device. It runs only on the PE-CE link and notifies the CE of connectivity status and configuration parameters of Ethernet services available on the CE port. The scope of the E-LMI protocol is shown in [Figure 21 on page 565](#).

*Figure 21: Scope of the E-LMI Protocol*

The E-LMI implementation on ACX and MX Series routers includes only the PE side of the E-LMI protocol.

E-LMI interoperates with an OAM protocol, such as Connectivity Fault Management (CFM), that runs within the provider network to collect OAM status. CFM runs at the provider maintenance level (UNI-N to UNI-N with up MEPs at the UNI). E-LMI relies on the CFM for end-to-end status of EVCs across CFM domains (SVLAN domain or VPLS).

The E-LMI protocol relays the following information:

- Notification to the CE of the addition/deletion of an EVC (active, not active, or partially active)
- Notification to the CE of the availability state of a configured EVC
- Communication of UNI and EVC attributes to the CE:
  - UNI attributes:
    - UNI identifier (a user-configured name for UNI)
    - CE-VLAN ID/EVC map type (all-to-one bundling, service multiplexing with bundling, or no bundling)
    - Bandwidth profile is not supported (including the following features):
      - CM (coupling mode)
      - CF (color flag)
      - CIR (committed Information rate)
      - CBR (committed burst size)
      - EIR (excess information rate)
      - EBS (excess burst size)
  - EVC attributes:
    - EVC reference ID
    - EVC status type (active, not active, or partially active)
    - EVC type (point-to-point or multipoint-to-multipoint)
    - EVC ID (a user-configured name for EVC)
    - Bandwidth profile (not supported)
  - CE-VLAN ID/EVC map

E-LMI on MX Series routers supports the following EVC types:

- Q-in-Q SVLAN (point-to-point or multipoint-to-multipoint)—Requires an end-to-end CFM session between UNI-Ns to monitor the EVS status.
- VPLS (BGP or LDP) (point-to-point or multipoint-to-multipoint)—Either VPLS pseudowire status or end-to-end CFM sessions between UNI-Ns can be used to monitor EVC status.

- L2 circuit/L2VPN (point-to-point)—Either VPLS pseudowire status or end-to-end CFM sessions between UNI-Ns can be used to monitor EVC status.

**NOTE:** l2-circuit and l2vpn are not supported.

The E-LMI protocol on ACX Series routers supports Layer 2 circuit and Layer 2 VPN EVC types and enables link-loss forwarding for pseudowire (Layer 2 circuit and Layer 2 VPN) services as follows:

- Interworking between the connectivity fault management (CFM) protocol and the E-LMI protocol for Layer 2 circuit and Layer 2 VPN.
  - End-to-end CFM session between UNIs to monitor EVC status.
  - In the case of pseudowire redundancy, CFM can be used to monitor active and backup pseudowire sessions. The EVC status is declared as down to CE devices only when both the active and backup pseudowire sessions go down.
- Interworking between remote defect indication (RDI) and E-LMI for Layer 2 circuit and Layer 2 VPN.
  - If a maintenance association end point (MEP) receives an RDI bit set in a continuity check message (CCM) frame, and if RDI fault detection is enabled in the EVC configuration at `[edit protocols oam ethernet evcs evc-id evc-protocol cfm management-domain name management-association name faults rdi]`, then the pseudowire is declared as down to CE routers through E-LMI.
- If an end-to-end CFM session does not exist between UNIs, the pseudowire (Layer 2 circuit or Layer 2 VPN) up and down state triggers an asynchronous EVC state change message to CE routers through E-LMI.

**NOTE:** ACX Series routers do not support E-LMI for Layer 2 services (bridging).

## Configuring the Ethernet Local Management Interface

To configure E-LMI, perform the following steps:

- [Configuring an OAM Protocol \(CFM\) on page 567](#)
- [Assigning the OAM Protocol to an EVC on page 568](#)
- [Enabling E-LMI on an Interface and Mapping CE VLAN IDs to an EVC on page 568](#)

### Configuring an OAM Protocol (CFM)

For information on configuring the OAM protocol (CFM), see “[IEEE 802.1ag OAM Connectivity Fault Management Overview](#)” on page 534.

### Assigning the OAM Protocol to an EVC

To configure an EVC, you must specify a name for the EVC using the **evc***evc-id* statement at the **[edit protocols oam ethernet]** hierarchy level. You can set the EVC protocol for monitoring EVC statistics to **cfm** or **vpls** using the **evc-protocol** statement and its options at the **[edit protocols oam ethernet evcs]** hierarchy level.

You can set the number of remote UNIs in the EVC using the **remote-uni-count** *number* statement at the **[edit protocols oam ethernet evcs evcs-protocol]** hierarchy level. The **remote-uni-count** defaults to 1. Configuring a value greater than 1 makes the EVC multipoint-to-multipoint. If you enter a value greater than the actual number of endpoints, the EVC status will display as partially active even if all endpoints are up. If you enter a **remote-uni-count** less than the actual number of endpoints, the status will display as active, even if all endpoints are not up.

You can configure an EVC by including the **evcs** statement at the **[edit protocols oam ethernet]** hierarchy level:

```
[edit protocols oam ethernet]
evcs evc-id {
 evc-protocol (cfm (management-domain name management-association name) | vpls
 (routing-instance name)) {
 remote-uni-count <number>; # Optional, defaults to 1
 multipoint-to-multipoint;
 # Optional, defaults to point-to-point if remote-uni-count is 1
 }
}
```

### Enabling E-LMI on an Interface and Mapping CE VLAN IDs to an EVC

To configure E-LMI, include the **lmi** statement at the **[edit protocols oam ethernet]** hierarchy level:

```
[edit protocols oam ethernet]
lmi {
 polling-verification-timer value;
 # Polling verification timer (T392), defaults to 15 seconds
 status-counter count; # Status counter (N393), defaults to 4
 interface name {
 evc evc-id {
 default-evc;
 vlan-list [vlan-ids];
 }
 evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
 polling-verification-time value; # Optional, defaults to global value
 status-counter count; # Optional, defaults to global value
 uni-id value; # Optional, defaults to interface-name
 }
}
```

You can set the status counter to count consecutive errors using the **status-counter count** statement at the **[edit protocols oam ethernet lmi]** hierarchy level. The status counter is used to determine if E-LMI is operational or not. The default value is 4.

You can set the **polling-verification-timer value** statement at the **[edit protocols oam ethernet lmi]** hierarchy level. The default value is 15 seconds.

You can enable an interface and set its options for use with E-LMI using the **interface name** statement at the **[edit protocols oam ethernet lmi]** hierarchy level. Only **ge**, **xe**, and **ae** interfaces are supported. You can use the interface **uni-id** option to specify a name for the UNI. If **uni-id** is not configured, it defaults to the name variable of **interface name**.

You can specify the CE-VLAN ID/EVC map type using the **evc-map-type type** interface option. The options are **all-to-one-bundling**, **bundling**, or **service-multiplexing**. Service multiplexing is with no bundling. The default type is **all-to-one-bundling**.

To specify the EVC that an interface uses, use the **evc evc-id** statement at the **[edit protocols oam ethernet lmi interface name]** hierarchy level. You can specify an interface as the default EVC interface using the **default-evc** statement at the **[edit protocols oam ethernet lmi interface name evc evc-id]** hierarchy level. All VLANs that are not mapped to any other EVCs are mapped to this EVC. Only one EVC can be configured as the default.

You can map a list of VLANs to an EVC using the **vlan-list vlan-id-list** statement at the **[edit protocols oam ethernet lmi interface name evc evc-id]** hierarchy level.

## Example E-LMI Configuration

- [Example Topology on page 569](#)
- [Configuring PE1 on page 570](#)
- [Configuring PE2 on page 571](#)
- [Configuring Two UNIs Sharing the Same EVC on page 573](#)

## Example Topology

Figure 22 on page 569 illustrates the E-LMI configuration for a point-to-point EVC (SVLAN) monitored by CFM. In this example, VLANs 1 through 2048 are mapped to **evc1** (SVLAN 100) and 2049 through 4096 are mapped to **evc2** (SVLAN 200). Two CFM sessions are created to monitor these EVCs.

### TLVs Overview

Type, Length, and Value (TLVs) are described in the IEEE 802.1ag standard for CFM as a method of encoding variable-length and/or optional information in a PDU. TLVs are not aligned to any particular word or octet boundary. TLVs follow each other with no padding between them.

[Table 83 on page 574](#) shows the TLV format and indicates if it is required or optional.

**Table 83: Format of TLVs**

| Parameter | Octet (sequence) | Description                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type      | 1                | Required. If 0, no Length or Value fields follow. If not 0, at least the Length field follows the Type field.                                                                                                            |
| Length    | 2–3              | Required if the Type field is not 0. Not present if the Type field is 0. The 16 bits of the Length field indicate the size, in octets, of the Value field. 0 in the Length field indicates that there is no Value field. |
| Value     | 4                | Length specified by the Length field. Optional. Not present if the Type field is 0 or if the Length field is 0.                                                                                                          |

### Various TLVs for CFM PDUs

[Table 84 on page 574](#) shows a set of TLVs defined by IEEE 802.1ag for various CFM PDU types. Each TLV can be identified by the unique value assigned to its type field. Some type field values are reserved.

**Table 84: Type Field Values for Various TLVs for CFM PDUs**

| TLV or Organization | Type Field |
|---------------------|------------|
| End TLV             | 0          |
| Sender ID TLV       | 1          |
| Port Status TLV     | 2          |

*Table 84: Type Field Values for Various TLVs for CFM PDUs (continued)*

| TLV or Organization       | Type Field |
|---------------------------|------------|
| Data TLV                  | 3          |
| Interface Status TLV      | 4          |
| Reply Ingress TLV         | 5          |
| Reply Egress TLV          | 6          |
| LTM Egress Identifier TLV | 7          |
| LTR Egress Identifier TLV | 8          |
| Reserved for IEEE 802.1   | 9 to 30    |
| Organization-Specific TLV | 31         |
| Defined by ITU-T Y.1731   | 32 to 63   |
| Reserved for IEEE 802.1   | 64 to 255  |

Not every TLV is applicable for all types of CFM PDUs.

- TLVs applicable for continuity check message (CCM):
  - End TLV
  - Sender ID TLV
  - Port Status TLV
  - Interface Status TLV
  - Organization-Specific TLV
- TLVs applicable for loopback message (LBM):
  - End TLV
  - Sender ID TLV
  - Data TLV
  - Organization-Specific TLV
- TLVs applicable for loopback reply (LBR):
  - End TLV
  - Sender ID TLV
  - Data TLV
  - Organization-Specific TLV

- TLVs applicable for linktrace message (LTM):
  - End TLV
  - LTM Egress Identifier TLV
  - Sender ID TLV
  - Organization-Specific TLV
- TLVs applicable for linktrace reply (LTR):
  - End TLV
  - LTR Egress Identifier TLV
  - Reply Ingress TLV
  - Reply Egress TLV
  - Sender ID TLV
  - Organization-Specific TLV

The following TLVs are currently supported in the applicable CFM PDUs:

- End TLV
- Reply Ingress TLV
- Reply Egress TLV
- LTR Egress Identifier TLV
- LTM Egress Identifier TLV
- Data TLV

## Support for Additional Optional TLVs

The following additional optional TLVs are supported:

- Port Status TLV
- Interface Status TLV

MX Series routers support configuration of port status TLV and interface status TLV. Configuring the Port Status TLV allows the operator to control the transmission of the Port Status TLV in CFM PDUs.

**NOTE:** Although Port Status TLV configuration statements are visible in the CLI on M120 and M320 routers, Port Status TLV cannot be configured on these systems. Port Status TLV can be enabled on a MEP interface only if it is a bridge logical interface, which is not possible on these systems.

For configuration information, see the following sections:

- [Port Status TLV on page 577](#)
- [Interface Status TLV on page 579](#)

### Port Status TLV

The Port Status TLV indicates the ability of the bridge port on which the transmitting MEP resides to pass ordinary data, regardless of the status of the MAC. The value of this TLV is driven by the MEP variable **enableRmepDefect**, as shown in [Table 86 on page 577](#). The format of this TLV is shown in [Table 85 on page 577](#).

Any change in the Port Status TLVs value triggers one extra transmission of that bridge ports MEP CCMs.

**Table 85: Port Status TLV Format**

| Parameter                                         | Octet (Sequence) |
|---------------------------------------------------|------------------|
| Type = 2                                          | 1                |
| Length                                            | 2–3              |
| Value (See <a href="#">Table 86 on page 577</a> ) | 4                |

**Table 86: Port Status TLV Values**

| Mnemonic  | Ordinary Data Passing Freely Through the Port | Value |
|-----------|-----------------------------------------------|-------|
| psBlocked | No: <b>enableRmepDefect</b> = false           | 1     |
| psUp      | Yes: <b>enableRmepDefect</b> = true           | 2     |

The MEP variable **enableRmepDefect** is a boolean variable indicating whether frames on the service instance monitored by the maintenance associations if this MEP are enabled to pass through this bridge port by the Spanning Tree Protocol and VLAN topology management. It is set to TRUE if:

- The bridge port is set in a state where the traffic can pass through it.
- The bridge port is running multiple instances of the spanning tree.
- The MEP interface is not associated with a bridging domain.

### Configuring Port Status TLV

Junos OS provides configuration support for the Port Status TLV, allowing you to control the transmission of this TLV in CCM PDUs. The Junos OS provides this configuration at the continuity-check level. By default, the CCM does not include the Port Status TLV. To configure the Port Status TLV, use the **port-status-tlv** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *identifier* maintenance-association *identifier* continuity-check]** hierarchy level.

**NOTE:** Port Status TLV configuration is not mandated by IEEE 802.1ag. The Junos OS provides it in order to give more flexibility to the operator; however it receives and processes CCMs with a Port Status TLV, regardless of this configuration.

An example of the configuration statements follows:

```
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain identifier {
 level number;
 maintenance-association identifier {
 continuity-check {
 interval number,
 loss-threshold number;
 hold-interval number;
 port-status-tlv; # Sets Port Status TLV
 }
 }
 }
 }
 }
 }
}
```

You cannot enable Port Status TLV transmission in the following two cases:

- If the MEP interface under the maintenance-association is not of type bridge.
- If the MEP is configured on a physical interface.

#### ***Displaying the Received Port Status TLV***

The Junos OS saves the last received Port Status TLV from a remote MEP. If the received Port Status value does not correspond to one of the standard values listed in [Table 86 on page 577](#), then the **show** command displays it as "unknown." You can display the last saved received Port Status TLV using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5 local-mep 2001 remote-mep 1001
```

```
Maintenance domain name: md5, Format: string, Level: 5
Maintenance association name: ma5, Format: string
Continuity-check status: enabled, Interval: 100ms, Loss-threshold: 3 frames
MEP identifier: 2001, Direction: down, MAC address: 00:19:e2:b2:81:4a
Auto-discovery: enabled, Priority: 0
Interface status TLV: up, Port status TLV: up
Interface name: ge-2/0/0.0, Interface status: Active, Link status: Up
```

```

Remote MEP identifier: 1001, State: ok
MAC address: 00:19:e2:b0:74:00, Type: Learned
Interface: ge-2/0/0.0
Last flapped: Never
Remote defect indication: false
Port status TLV: none # RX PORT STATUS
Interface status TLV: none

```

### Displaying the Transmitted Port Status TLV

The Junos OS saves the last transmitted Port Status TLV from a local MEP. If the transmission of the Port Status TLV has not been enabled, then the **show** command displays "none." You can display the last saved transmitted Port Status TLV using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5 local-mep 2001 remote-mep 1001
Maintenance domain name: md5, Format: string, Level: 5
Maintenance association name: ma5, Format: string
Continuity-check status: enabled, Interval: 100ms, Loss-threshold: 3 frames
MEP identifier: 2001, Direction: down, MAC address: 00:19:e2:b2:81:4a
Auto-discovery: enabled, Priority: 0
Interface status TLV: up, Port status TLV: up # TX PORT STATUS
Interface name: ge-2/0/0.0, Interface status: Active, Link status: Up

Remote MEP identifier: 1001, State: ok
MAC address: 00:19:e2:b0:74:00, Type: Learned
Interface: ge-2/0/0.0
Last flapped: Never
Remote defect indication: false
Port status TLV: none
Interface status TLV: none

```

### Interface Status TLV

The Interface Status TLV indicates the status of the interface on which the MEP transmitting the CCM is configured, or the next-lower interface in the IETF RFC 2863 IF-MIB. The format of this TLV is shown in [Table 87 on page 579](#). The enumerated values are shown in [Table 88 on page 580](#).

**Table 87: Interface Status TLV Format**

| Parameter                                         | Octet (Sequence) |
|---------------------------------------------------|------------------|
| Type = 4                                          | 1                |
| Length                                            | 2–3              |
| Value (See <a href="#">Table 88 on page 580</a> ) | 4                |

Table 88: Interface Status TLV Values

| Mnemonic         | Interface Status | Value |
|------------------|------------------|-------|
| isUp             | up               | 1     |
| isDown           | down             | 2     |
| isTesting        | testing          | 3     |
| isUnknown        | unknown          | 4     |
| isDormant        | dormant          | 5     |
| isNotPresent     | notPresent       | 6     |
| isLowerLayerDown | lowerLayerDown   | 7     |

**NOTE:** When the operational status of a logical interface changes from the down state (status value of 2) to the lower layer down state (status value of 7) and vice versa, the LinkDown SNMP trap is not generated. For example, if you configure an aggregated Ethernet interface bundle with a VLAN tag and add a physical interface that is in the operationally down state to the bundle, the operational status of the aggregated Ethernet logical interface bundle at that point is lower layer down (7). If you take the MIC associated with the interface offline, the LinkDown trap is not generated when the logical interface shifts from the lower layer down state to the down state.

Similarly, consider another sample scenario in which an physical interface is added to an aggregated Ethernet bundle that has VLAN tagging and the aggregated Ethernet logical interface is disabled. When the logical interface is disabled, the operational status of the logical interface changes to down. If you disable the physical interface that is part of the aggregated Ethernet bundle, the operational status of the aggregated Ethernet logical interface remains down. If you reenables the aggregated Ethernet logical interface, the operational status of it changes from down to lower layer down. The LinkDown SNMP trap is not generated at this point.

### Configuring Interface Status TLV

The Junos OS provides configuration support for the Interface Status TLV, thereby allowing operators to control the transmission of this TLV in CCM PDUs through configuration at the continuity-check level.

**NOTE:** This configuration is not mandated by IEEE 802.1ag; rather it is provided to give more flexibility to the operator. The Junos OS receives and processes CCMs with the Interface Status TLV, regardless of this configuration.

The interface status TLV configuration is shown below:

```
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain identifier {
 level number;
 maintenance-association identifier {
 continuity-check {
 interval number;
 loss-threshold number;
 hold-interval number;
 interface-status-tlv; # Sets the interface status TLV
 }
 }
 }
 }
 }
 }
}
```

**NOTE:** The Junos OS supports transmission of only three out of seven possible values for the Interface Status TLV. The supported values are 1, 2, and 7. However, the Junos OS is capable of receiving any value for the Interface Status TLV.

### Displaying the Received Interface Status TLV

The Junos OS saves the last received Interface Status TLV from the remote MEP. If the received Interface Status value does not correspond to one of the standard values listed in [Table 87 on page 579](#), then the **show** command displays "unknown."

You can display this last saved Interface Status TLV using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5 local-mep 2001 remote-mep 1001
```

```
Maintenance domain name: md5, Format: string, Level: 5
Maintenance association name: ma5, Format: string
Continuity-check status: enabled, Interval: 100ms, Loss-threshold: 3 frames
MEP identifier: 2001, Direction: down, MAC address: 00:19:e2:b2:81:4a
Auto-discovery: enabled, Priority: 0
Interface status TLV: up, Port status TLV: up
Interface name: ge-2/0/0.0, Interface status: Active, Link status: Up

Remote MEP identifier: 1001, State: ok
MAC address: 00:19:e2:b0:74:00, Type: Learned
Interface: ge-2/0/0.0
Last flapped: Never
```

```

Remote defect indication: false
Port status TLV: none
Interface status TLV: none # displays the Interface Status TLV state

```

### *Displaying the Transmitted Interface Status TLV*

The Junos OS saves the last transmitted Interface Status TLV from a local MEP. If the transmission of Interface Status TLV has not been enabled, then the **show** command displays "none."

You can display the last transmitted Interface Status TLV using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5 local-mep 2001 remote-mep 1001

```

```

Maintenance domain name: md5, Format: string, Level: 5
Maintenance association name: ma5, Format: string
Continuity-check status: enabled, Interval: 100ms, Loss-threshold: 3 frames
MEP identifier: 2001, Direction: down, MAC address: 00:19:e2:b2:81:4a
Auto-discovery: enabled, Priority: 0
Interface status TLV: up, Port status TLV: up
Interface name: ge-2/0/0.0, Interface status: Active, Link status: Up

Remote MEP identifier: 1001, State: ok
MAC address: 00:19:e2:b0:74:00, Type: Learned
Interface: ge-2/0/0.0
Last flapped: Never
Remote defect indication: false
Port status TLV: none
Interface status TLV: none

```

## MAC Status Defects

The Junos OS provides MAC status defect information, indicating that one or more of the remote MEPs is reporting a failure in its Port Status TLV or Interface Status TLV. It indicates "yes" if either some remote MEP is reporting that its interface is not isUp (for example, at least one remote MEPs interface is unavailable), or if all remote MEPs are reporting a Port Status TLV that contains some value other than psUp (for example, all remote MEPs Bridge Ports are not forwarding data). There are two **show** commands you can use to view the MAC Status Defects indication.

Use the **mep-database** command to display MAC status defects:

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md6 maintenance-association ma6

```

```

Maintenance domain name: md6, Format: string, Level: 6
Maintenance association name: ma6, Format: string
Continuity-check status: enabled, Interval: 1s, Loss-threshold: 3 frames
MEP identifier: 500, Direction: down, MAC address: 00:05:85:73:7b:39

```

```

Auto-discovery: enabled, Priority: 0
Interface status TLV: up, Port status TLV: up
Interface name: xe-5/0/0.0, Interface status: Active, Link status: Up
Defects:
 Remote MEP not receiving CCM : no
 Erroneous CCM received : no
 Cross-connect CCM received : no
 RDI sent by some MEP : no
 Some remote MEP's MAC in error state : yes # MAC Status Defects yes/no
Statistics:

```

## Configuring Remote MEP Action Profile Support

Based on values of **interface-status-tlv** and **port-status-tlv** in the received CCM packets, a specific action, such as **interface-down**, can be taken using the **action-profile** options. Multiple action profiles can be configured on the router, but only one action profile can be assigned to a remote MEP.

The action profile can be configured with at least one event to trigger the action; but the action will be triggered if any one of these events occurs. It is not necessary for all of the configured events to occur to trigger **action**.

An action-profile can be applied only at the remote MEP level.

The following example shows an action profile configuration with explanatory comments added:

```

[edit protocols oam ethernet connectivity-fault-management]
action-profile tlv-action {
 event {
 # If interface status tlv with value specified in the config is received
 interface-status-tlv down|lower-layer-down;
 # If port status tlv with value specified in the config is received
 port-status-tlv blocked;
 # If connectivity is lost to the peer */
 adjacency-loss;
 }
 action {
 # Bring the interface down */
 interface-down;
 }
 default-actions interface-down;
}
domains
maintenance-domain identifier {
 # maintenance domain level (0-7)
 level number;
 # association
 maintenance-association identifier {

```

```

mep identifier {
 interface ge-x/y/z.w;
 remote-mep identifier {
 # Apply the action-profile for the remote MEP
 action-profile tlv-action;
 }
}
}
}

```

## Monitoring a Remote MEP Action Profile

You can use the **show oam ethernet connectivity-fault-management mep-database** command to view the action profile status of a remote MEP, as in the following example:

**show oam ethernet connectivity-fault-management mep-database remote-mep**  
(Action Profile Event)

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5 remote-mep 200

Maintenance domain name: md5, Format: string, Level: 5
Maintenance association name: ma5, Format: string
Continuity-check status: enabled, Interval: 1s, Loss-threshold: 3 frames
MEP identifier: 100, Direction: down, MAC address: 00:05:85:73:e8:ad
Auto-discovery: enabled, Priority: 0
Interface status TLV: none, Port status TLV: none # last status TLVs transmitted
by the router
Interface name: ge-1/0/8.0, Interface status: Active, Link status: Up

Remote MEP identifier: 200, State: ok # displays the remote MEP name and state

MAC address: 00:05:85:73:96:1f, Type: Configured
Interface: ge-1/0/8.0
Last flapped: Never
Remote defect indication: false
Port status TLV: none
Interface status TLV: lower-layer-down
Action profile: juniper # displays remote MEP's action profile identifier
 Last event: Interface-status-tlv lower-layer-down # last remote MEP event

 # to trigger action
Action: Interface-down, Time: 2009-03-27 14:25:10 PDT (00:00:02 ago)
 # action occurrence time

```

## Configuring MAC Flush Message Processing in CET Mode

---

In carrier Ethernet transport (CET) mode, MX Series routers are used as provider edge (PE) routers, and Nokia Siemens Networks A2200 Carrier Ethernet Switches (referred to as E-domain devices) that run standard-based protocols are used in the access side. On the MX Series routers, VPLS pseudowires are configured dynamically through label distribution protocol (LDP). On the E-domain devices, topology changes are detected through connectivity fault management (CFM) sessions running between the E-domain devices and the MX Series PE routers. The MX Series PE routers can bring the carrier Ethernet interface down if there is CFM connectivity loss. This triggers a local MAC flush as well as a targeted label distribution protocol (T-LDP) MAC flush notification that gets sent towards the remote MX Series PEs to trigger MAC flush on them.

In CET inter-op mode, MX Series routers need to interoperate with the Nokia Siemens Networks Ax100 Carrier Ethernet access devices (referred to as A-domain devices) that run legacy protocols. Nokia Siemens Networks A4100 and A8100 devices act as an intermediate between the MX Series PE routers and A-domain devices. These intermediate devices perform interworking function (IWF) procedures so that operations administration management (OAM) sessions can be run between MX Series routers and A-domain devices. There are no VPLS pseudowires between the MX Series PE routers and the Nokia Siemens Networks A4100 and A8100 intermediate devices, so there is no LDP protocol running between the PE routers to send topology change notifications. In order to communicate topology changes, MX Series routers can trigger a MAC flush and propagate it in the core. MX Series routers can use action profiles based upon the connection protection type length value (TLV) event. The action profile brings down the carrier edge logical interface in MX Series PE routers, which will trigger a local MAC flush and also propagate the topology change to the core using LDP notification.

For VPLS there is no end-to-end connectivity monitored. The access rings are independently monitored by running CFM down multiple end points (MEPs) on the working and protection paths for each of the services between the E-domain devices and the MX Series PE routers, and between the A-domain devices and the MX Series PE routers the IWF hosted by the Nokia Siemens Networks A-4100 devices. When there is a connectivity failure on the working path, the Nokia Siemens Networks Ax200 devices perform a switchover to the protection path, triggering a topology change notification (in the form of TLVs carried in CCM) to be sent on the active path.

Figure 23: CET inter-op Dual Homed Topology

Figure 23 on page 587 describes the dual homed topology on MX Series PE routers connected to the A-domain. When an A-domain device triggers a switchover, it starts switching the service traffic to the new active path. This change is communicated in the HELLO protocol data units (PDUs) sent by that A-domain device on the working and protection paths. When the IWF in A4100 receives these HELLO PDUs, it converts them to standard CCM messages and also inserts a connection protection TLV. The “Protection-in-use” field of the connection protection TLV is encoded with the currently active path, and is included in the CCM message. CCM messages are received by the MX Series PE routers through the VLAN spoke in A4100. In the above dual homed scenario, one MX Series PE router monitors the working path, and the other MX Series PE router monitors the protection path.

A MAC flush occurs when the CFM session that is monitoring the working path detects that the service traffic has moved to the protection path or when the CFM session that is monitoring the protection path detects that the service traffic has moved to the working path.

Figure 24: CET inter-op Dual Attached Topology

Figure 24 on page 588 describes the dual attached topology on MX Series PE routers connected to the A-domain. The MAC flush mechanism used in this case is also the same as the one used for the A-domain in the dual homed scenario (Figure 1). However in this case both the CFM sessions are hosted by only one MX Series PE router. When Ax100 in the A-domain detects topology changes, the MX Series PE router receives the connection protection TLV in the CCM message for the working and protection paths with the value of “Protection-in-use” indicating which path is the active one. Based upon the event that is generated for the CFM session, the MX Series PE router will bring down the appropriate interface which will trigger a local MAC flush.

## Configuring a Connection Protection TLV Action Profile

An action profile can be configured to perform the **interface-down** action based on the values of **connection-protection-tlv** in the received CCM packets.

The following example shows an action profile configuration with explanatory comments added:

```
[edit protocols oam ethernet connectivity-fault-management]
action-profile <tlv-action> {
 event {
 # If a connection protection TLV with a "Protection-in-use" value of SET is received */
 connection-protection-tlv <using-protection-path>;
 # If a connection protection TLV with a "Protection-in-use" value of RESET is received
 */
 connection-protection-tlv <using-working-path>;
 }
 action {
 # Bring the interface down */
 interface-down;
 }
}
```

## Example: Configuring an Action Profile Based on Connection Protection TLVs

This example shows how to configure an action profile based on the connection protection TLV for the purposes of triggering MAC flushes based on topology changes in a CET network.

- [Requirements on page 589](#)
- [Overview and Topology on page 589](#)
- [Configuration on page 590](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.2 or later
- A MX series PE router

### Overview and Topology

The physical topology of a CET network using MX series PE routers is shown in [Figure 25 on page 590](#)

Figure 25: Topology of CET network

The following definitions describe the meaning of the device abbreviation and terms used in [Figure 25 on page 590](#).

- Provider edge (PE) device—A device, or set of devices, at the edge of the provider network that presents the provider's view of the customer site.
- E-domain—Nokia Siemens Networks Carrier Ethernet Switches that run standard based protocols and are used in the access side.
- A-domain—Nokia Siemens Networks Carrier Ethernet Switches that run legacy protocols.

## Configuration

**Step-by-Step Procedure** To configure an action profile based on the connection protection TLV, perform these tasks:

1. Configure an action profile

```
[edit protocols oam ethernet connectivity-fault-management]
action-profile <tlv-action> {
 event {
```

2. If the connection protection TLV is received with a "Protection-in-use" value of SET, then the connection protection TLV should use the protection path

```
connection-protection-tlv <using-protection-path>;
```

3. If the connection protection TLV is received with a "Protection-in-use" value of RESET, then the connection protection TLV should use the working path

```
connection-protection-tlv <using-working-path>;
```

```
}
```

4. Configure the action profile to bring the interface down

```
action {
 /* Bring the interface down */
 interface-down;
}
}
```

**Results** Check the results of the configuration

```
[edit protocols oam ethernet connectivity-fault-management]
action-profile <tlv-action> {
 event {
 connection-protection-tlv <using-protection-path>;
 connection-protection-tlv <using-working-path>;
 }
 action {
 interface-down;
 }
}
```

## Configuring M120 and MX Series Routers for CCC Encapsulated Packets

- [IEEE 802.1ag CFM OAM Support for CCC Encapsulated Packets Overview on page 591](#)
- [CFM Features Supported on Layer 2 VPN Circuits on page 592](#)
- [Configuring CFM for CCC Encapsulated Packets on page 592](#)

### IEEE 802.1ag CFM OAM Support for CCC Encapsulated Packets Overview

Layer 2 virtual private network (L2VPN) is a type of virtual private network service used to transport customer's private Layer 2 traffic (for example, Ethernet, ATM or Frame Relay) over the service provider's shared IP/MPLS infrastructure. The service provider edge (PE) router must have an interface with circuit cross-connect (CCC) encapsulation to switch the customer edge (CE) traffic to the public network.

The IEEE 802.1ag Ethernet Connectivity Fault Management (CFM) is an OAM standard used to perform fault detection, isolation, and verification on virtual bridge LANs. M120 and MX Series routers provide CFM support for bridge/VPLS/routed interfaces and support 802.1ag Ethernet OAM for CCC encapsulated packets.

## CFM Features Supported on Layer 2 VPN Circuits

CFM features supported on L2VPN circuits are as follows:

- Creation of up/down MEPs at any level on the CE-facing logical interfaces.
- Creation of MIPs at any level on the CE-facing logical interfaces.
- Support for continuity check, loopback, and linkrace protocol.
- Support for the Y1731 Ethernet Delay measurement protocol.
- Support for action profiles to bring the CE-facing logical interfaces down when loss of connectivity is detected.

Figure 26: Layer 2 VPN Topology

To monitor the L2VPN circuit, a CFM up MEP (Level 6 in Figure 26 on page 592) can be configured on the CE-facing logical interfaces of provider edge routers PE1 and PE2. To monitor the CE-PE attachment circuit, a CFM down MEP can be configured on the customer logical interfaces of CE1-PE1 and CE2-PE2 (Level 0 in Figure 26 on page 592).

## Configuring CFM for CCC Encapsulated Packets

The only change from the existing CLI configuration is the introduction of a new command to create a MIP on the CE-facing interface of the PE router.

```
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 # Define a maintenance domains for each default level.
 #; These names are specified as DEFAULT_level_number
 maintenance-domain DEFAULT_x {
 # L2VPN CE interface
 interface (ge | xe)-fpc/pic/port.domain;
 }
 {
 level number;
 maintenance-association identifier {
 mep mep-id {
 direction (up | down);
 # L2 VPN CE interface on which encapsulation family CCC is configured.
 interface (ge | xe)-fpc/pic/port.domain;
 auto-discovery;
 priority number;
 }
 }
 }
 }
 }
 }
}
```

```

 }
 }
}
}
}

```

  - *Ethernet Interfaces Feature Guide for Routing Devices*

## Configuring Rate Limiting of Ethernet OAM Messages

The M320 with Enhanced III FPC, M120, M7i, M10 with CFEB, and MX Series routers support rate limiting of Ethernet OAM messages. Depending on the connectivity fault management (CFM) configuration, CFM packets are discarded, sent to the CPU for processing, or flooded to other bridge interfaces. This feature allows the router to intercept incoming CFM packets for prevention of DoS attacks.

You can apply rate limiting of Ethernet OAM messages at either of two CFM policing levels, as follows:

- Global-level CFM policing—uses a policer at the global level to police the CFM traffic belonging to all the sessions.
- Session-level CFM policing—uses a policer created to police the CFM traffic belonging to one session.

To configure global-level CFM policing, include the **policer** statement and its options at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

To configure session-level CFM policing, include the **policer** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* level *number* maintenance-association *ma-name*]** hierarchy level.

The following example shows a CFM policer used for rate-limiting CFM:

```
[edit]
firewall {
 policer cfm-policer {
 if-exceeding {
 bandwidth-limit 8k;
 burst-size-limit 2k;
 }
 then discard;
 }
}
```

#### Case 1: Global-Level CFM Policing

This example shows a global level policer, at the CFM level, for rate-limiting CFM. The **continuity-check *cfm-policer*** statement at the global **[edit protocols oam ethernet connectivity-fault-management policer]** hierarchy level specifies the policer to use for policing all continuity check packets of the CFM traffic belonging to all sessions. The **other *cfm-policer1*** statement at the **[edit protocols oam ethernet connectivity-fault-management policer]** hierarchy level specifies the policer to use for policing all non-continuity check packets of the CFM traffic belonging to all sessions. The **all *cfm-policer2*** statement specifies to police all CFM packets with the specified policer *cfm-policer2*. If the **all *policer-name*** option is used, then the user cannot specify the previous **continuity-check** and **other** options.

```
[edit protocols oam ethernet]
connectivity-fault-management {
 policer {
 continuity-check cfm-policer;
 other cfm-policer1 ;
 all cfm-policer2;
 }
}
```

#### Case 2: Session-Level CFM Policing

This example shows a session-level CFM policer used for rate-limiting CFM. The **policer** statement at the session **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name*]** hierarchy level specifies the policer to use for policing only continuity check packets of the CFM traffic belonging to the specified session. The **other *cfm-policer1*** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name*]** hierarchy level specifies the policer to use for policing all non-continuity check packets of the CFM traffic belonging to this session only. The **all *cfm-policer2*** statement specifies to police all CFM packets with the specified policer *cfm-policer2*. If the **all *policer-name*** option is used, then the user cannot specify the previous **continuity-check** and **other** options.

```
[edit protocols oam ethernet]
connectivity-fault-management {
 maintenance-domain md {
```

```

level number;
maintenance-association ma {
 continuity-check {
 interval 1s;
 }
 policer {
 continuity-check cfm-policer;
 other cfm-policer1;
 all cfm-policer2;
 }
}
mep 1 {
 interface ge-3/3/0.0;
 direction up;
 auto-discovery;
}
}
}

```

In the case of global CFM policing, the same policer is shared across multiple CFM sessions. In per-session CFM policing, a separate policer must be created to rate-limit packets specific to that session.

**NOTE:**

Service-level policer configuration for any two CFM sessions on the same interface at different levels must satisfy the following constraints if the direction of the sessions is the same:

- If one session is configured with `policer all`, then the other session cannot have a `policer all` or `policer other` configuration.
- If one session is configured with `policer other`, then the other session cannot have a `policer all` or `policer other` configuration.

A commit error will occur if such a configuration is committed.

**NOTE:** Policers with PBB and MIPs are not supported.

## Configuring Unified ISSU for 802.1ag CFM

A unified in-service software upgrade (ISSU) enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic. Unified ISSU is automatically enabled for the Connectivity Fault Management (CFM) protocols and interoperates between local and remote maintenance endpoints (MEPs).

The Junos OS provides support for unified ISSU using the loss threshold type length value (TLV), which is automatically enabled for CFM. TLVs are described in the IEEE 802.1ag standard for CFM as a method of encoding variable-length and optional information in a protocol data unit (PDU). The loss threshold TLV indicates the loss threshold value of a remote MEP. The loss threshold TLV is transmitted as part of the CFM continuity check messages.

**NOTE:** Starting in Junos OS Release 15.1, configuring ISSU with CFM (802.1ag) is supported only on MX and PTX routers that support TLV. Interoperation with other vendors is not supported.

During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote MEP to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value.

An overview of CFM is described starting in [“IEEE 802.1ag OAM Connectivity Fault Management Overview” on page 534](#), and you should further observe the additional requirements described in this topic.

[Table 89 on page 596](#) shows the Loss Threshold TLV format.

**Table 89: Loss Threshold TLV Format**

| Parameter | Octet (sequence) | Description                                                                                                             |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------|
| Type=31   | 1                | Required. Required. If 0, no Length or Value fields follow. If not 0, at least the Length field follows the Type field. |

Table 89: Loss Threshold TLV Format (continued)

| Parameter | Octet (sequence) | Description                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Length=12 | 2                | Required if the Type field is not 0. Not present if the Type field is 0. The 16 bits of the Length field indicate the size, in octets, of the Value field. 0 in the Length field indicates that there is no Value field. |
| OUI       | 3                | Optional. Organization unique identifier (OUI), which is controlled by the IEEE and is typically the first three bytes of a MAC address (Juniper OUI 0x009069).                                                          |
| Subtype   | 1                | Optional. Organizationally defined subtype.                                                                                                                                                                              |
| Value     | 4                | Optional. Loss threshold value.                                                                                                                                                                                          |
| Flag      | 4                | Optional. Bit0 (identifies an ISSU is in progress)<br>Bit1-31 (reserved)                                                                                                                                                 |

Junos OS provides configuration support for the **convey-loss-threshold** statement, allowing you to control the transmission of the loss threshold TLV in continuity check messages PDUs. The **convey-loss-threshold** statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the **convey-loss-threshold** statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress. The Junos OS provides this configuration at the continuity-check level. By default, continuity check messages do not include the loss threshold TLV.

To configure the convey loss threshold, use the **convey-loss-threshold** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *identifier* maintenance-association *identifier* continuity-check]** hierarchy level.

For the remote MEP, the loss threshold TLV is transmitted only during the unified ISSU if the **convey-loss-threshold** statement is not configured. The remote MEP switches back to the default loss threshold if no loss threshold TLV is received or the TLV has a default threshold value of 3.

An example of the ISSU configuration statements follows:

```
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain identifier {
 level number;
 maintenance-association identifier {
 continuity-check {
 convey-loss-threshold;
 interval number;
 loss-threshold number;
 hold-interval number;
 }
 }
 }
 }
 }
 }
}
```

```

 }
 }
}

```

The Junos OS saves the last received loss threshold TLV from the remote MEP. You can display the last saved loss threshold TLV that is received by the remote MEP, using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md3 maintenance-association ma5 local-mep 2 remote-mep 1

Maintenance domain name: md3, Format: string, Level: 3
Maintenance association name: ma3, Format: string
Continuity-check status: enabled, Interval: 1s, Loss-threshold: 3 frames
MEP identifier: 2, Direction: up, MAC address: 00:19:e2:b0:76:be
Auto-discovery: enabled, Priority: 0
Interface status TLV: none, Port status TLV: none
Connection Protection TLV: yes
 Prefer me: no, Protection in use: no, FRR Flag: no
Interface name: xe-4/1/1.0, Interface status: Active, Link status: Up
Loss Threshold TLV:
 Loss Threshold: 3 , Flag: 0x0

Remote MEP identifier: 1, State: ok
MAC address: 00:1f:12:b7:ce:79, Type: Learned
Interface: xe-4/1/1.0
Last flapped: Never
Continuity: 100%, Admin-enable duration: 45sec, Oper-down duration: 0sec
Effective loss threshold: 3 frames
Remote defect indication: false
Port status TLV: none
Interface status TLV: none
Connection Protection TLV:
 Prefer me: no, Protection in use: no, FRR Flag: no
Loss Threshold TLV: #Displays last received value
 Loss Threshold: 3 , Flag: 0x0

```

The Junos OS saves the last transmitted loss threshold TLV from a local MEP. You can display the last transmitted loss threshold TLV and the effective loss (operational) threshold for the remote MEP, using the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *identifier* maintenance-association *identifier* local-mep *identifier* remote-mep *identifier*** command, as in the following example:

```

user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md3 maintenance-association ma5 local-mep 2 remote-mep 1

Maintenance domain name: md3, Format: string, Level: 3
Maintenance association name: ma3, Format: string
Continuity-check status: enabled, Interval: 1s, Loss-threshold: 3 frames
MEP identifier: 2, Direction: up, MAC address: 00:19:e2:b0:76:be

```

```

Auto-discovery: enabled, Priority: 0
Interface status TLV: none, Port status TLV: none
Connection Protection TLV: yes
 Prefer me: no, Protection in use: no, FRR Flag: no
Interface name: xe-4/1/1.0, Interface status: Active, Link status: Up
 Loss Threshold TLV: #Displays last transmitted value
 Loss Threshold: 3 , Flag: 0x0

Remote MEP identifier: 1, State: ok
MAC address: 00:1f:12:b7:ce:79, Type: Learned
Interface: xe-4/1/1.0
Last flapped: Never
Continuity: 100%, Admin-enable duration: 45sec, Oper-down duration: 0sec
Effective loss threshold: 3 frames #Displays operational threshold
Remote defect indication: falsePort status TLV: none
Interface status TLV: none
Connection Protection TLV:
 Prefer me: no, Protection in use: no, FRR Flag: no
Loss Threshold TLV:
 Loss Threshold: 3 , Flag: 0x0

```

## Configuring Continuity Check Messages for Better Scalability

This topic describes how to configure CCM for better scalability. Junos OS provides enhancements to trigger faster protection-switching and convergence in the event of failures in Ethernet domains for Carrier Ethernet services. These enhancements can be used when CE devices in the Ethernet domain detect faster service failures and propagates the information in the interface-status TLV of the continuity-check messages (CCMs). When CCMs are received, PE devices can perform certain actions which facilitates faster protection-switching and convergence.

To configure CCM for better scalability:

- You can apply an action profile to provide faster protection switching for point-to-point network topologies with local switching configured. See [“Configuring Faster Protection Switching for Point-to-Point Network Topologies” on page 600](#).
- You can apply an action profile to provide faster convergence for dual-homed multipoint-to-multipoint network topologies. See [“Configuring Faster Convergence for Dual-Homed Multipoint-to-Multipoint Network Topologies” on page 602](#).

- You can assign a primary virtual LAN (VLAN) ID in the maintenance association for increased flexibility in the number of tags. See [“Configuring a Primary VLAN ID for Increased Flexibility” on page 603](#).
- You can configure a maintenance association to accept a different maintenance association identifier (ID) from a neighbor by including a **remote-maintenance-association** statement. See [“Configuring a Remote Maintenance Association to Accept a Different ID” on page 604](#).

## Configuring Faster Protection Switching for Point-to-Point Network Topologies

You can apply an action profile to provide faster protection switching for point-to-point network topologies with local switching configured. In a normal state, CCM sessions are configured on the working and protect interfaces. The CCM packets transmitted contain an interface-status TLV with the value up on the working interface and value down on the protect interface. When a link fails on the working interface, the protect interface starts receiving the interface-status TLV as up. With the profile configuration, if the interface-status TLV received on the protect interface is up, the working interface is automatically marked as **interface-down**.

To configure the **interface-status-tlv** down event, include the **interface-status-tlv down** statement at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* event]** hierarchy level.

To configure **interface-down** as the action profile's action, include the **interface-down** statement at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* action]** hierarchy level.

To configure **interface-down *peer-interface*** as the clear-action, include **interface-down *peer-interface*** at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* clear-action]** hierarchy level.

```
[edit protocols oam]
ethernet {
 connectivity-fault-management {
 action-profile p1 {
 event {
 interface-status-tlv down;
 }
 action {
 interface-down;
```

```

 }
 clear-action {
 interface-down peer-interface;
 }
}
}
}

```

In this action profile configuration, when the interface-status TLV is received as up, the *peer-interface* is marked as down.

The *peer-interface* is configured in the **protect-maintenance-association** statement. Consider the following example using the **protect-maintenance-association** statement in the configuration:

```

[edit protocols oam]
ethernet {
 connectivity-fault-management {
 action-profile p1 {
 event {
 adjacency-loss;
 }
 action {
 interface-down;
 }
 clear-action {
 interface-down peer-interface;
 }
 }
 }
 maintenance-domain nsn {
 level 5;
 maintenance-association ma1 {
 protect-maintenance-association ma2;
 continuity-check {
 interval 100ms;
 connection-protection-tlv;
 }
 mep 100 {
 interface ge-1/1/0.0;
 direction down;
 auto-discovery;
 }
 }
 maintenance-association ma2 {
 continuity-check {
 interval 100ms;
 connection-protection-tlv;
 }
 mep 101 {
 interface ge-1/2/0.0;
 direction down;
 auto-discovery;
 }
 }
 remote-mep 100
 }
}

```

```

 action-profile p1;
 }
}
}
}

```

- [IEEE 802.1ag OAM Connectivity Fault Management Overview on page 534](#)
- [Configuring a CFM Action Profile to Specify CFM Actions for CFM Events on page 563](#)

## Configuring Faster Convergence for Dual-Homed Multipoint-to-Multipoint Network Topologies

You can apply an action profile to provide faster convergence for dual-homed multipoint-to-multipoint network topologies. If a multipoint-to-multipoint Ethernet service uses MAC-based forwarding and stale MAC addresses exist in the learning tables, this can result in traffic black holes in the network where incoming traffic is silently discarded, without informing the source that the data did not reach its intended recipient. With the profile configuration, if the interface-status TLV received on the protect interface is up, then the interface-status TLV on the working interface is marked as down and the PE device for the protect interface propagates a remote MAC-flush message to the PE devices in the virtual private LAN service (VPLS) by using TLDP-MAC-FLUSH. The MAC flush avoids traffic blackholing due to stale mac-db entries.

To configure the **interface-status-tlv down** event, include the **interface-status-tlv down** statement at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* event]** hierarchy level.

To configure **propagate-remote-flush** as the action profile's action, include the **propagate-remote-flush** statement at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* action]** hierarchy level.

To configure **propagate-remote-flush** as the clear-action, include the **propagate-remote-flush** statement at the **[edit protocols oam ethernet connectivity-fault-management action-profile *profile-name* clear-action]** hierarchy level.

```

[edit protocols oam]
ethernet {
 connectivity-fault-management {
 action-profile test {
 event {
 interface-status-tlv down;
 }
 action {
 propagate-remote-mac-flush;
 }
 clear-action {
 propagate-remote-mac-flush;
 }
 }
 }
}

```

```

 }
 }
}

```

In this action profile configuration, when the incoming CCM packet contains the interface-status TLV with value down, the **propagate-remote-mac-flush** action is triggered for the action-profile.

#### Related Documentation

- [Configuring a CFM Action Profile to Specify CFM Actions for CFM Events on page 563](#)

## Configuring a Primary VLAN ID for Increased Flexibility

You can assign a primary virtual LAN (VLAN) ID in the maintenance association for increased flexibility in the number of tags. When a **vlan-range** or **vlan-id-list** is configured on an interface, the service OAM must run on one of the VLANs. The VLAN assigned for service monitoring is considered the primary VLAN. If a **primary-vid** is not configured, Junos OS assigns the first VLAN from the **vlan-range** or **vlan-id-list**. In earlier releases, Junos OS assigned VLAN 4095.

To configure a primary VLAN ID, you can specify the **primary-vid** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name*]** hierarchy level:

```

[edit protocols oam ethernet connectivity-fault-management]
maintenance domain md3 {
 level 3;
 maintenance-association ma3 {
 primary-vid 2000;
 continuity-check {
 interval 10ms;
 connection-protection-tlv;
 }
 mep 2 {
 interface ge-2/2/0.0;
 direction up;
 auto-discovery;
 }
 }
}

```

#### Related Documentation

- [IEEE 802.1ag OAM Connectivity Fault Management Overview on page 534](#)
- [connection-protection-tlv](#)
- [Creating a Maintenance Association on page 548](#)
- [connectivity-fault-management on page 1055](#)

## Configuring a Remote Maintenance Association to Accept a Different ID

You can configure a maintenance association to accept a different maintenance association identifier (ID) from a neighbor by including a **remote-maintenance-association** statement. The 802.1ag CCM sessions expect the same maintenance association identifier from its neighbors. If there is a maintenance association identifier mismatch, the PDUs are marked as error PDUs. If a **remote-maintenance-association** statement is configured, a different maintenance association identifier is accepted and the 802.1ag CCM sessions do not mark the CCM PDUs as error PDUs when the maintenance-association name is the same as the name specified in the **remote-maintenance-association** statement.

To configure a remote maintenance association, include the **remote-maintenance-association** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name*]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management]
maintenance domain md3 {
 level 1;
 maintenance-association ma3 {
 remote-maintenance-association fix-ma;
 continuity-check {
 interval 10ms;
 connection-protection-tlv;
 }
 mep 2 {
 interface ge-2/2/0.0;
 direction up;
 auto-discovery;
 }
 }
}
```

Using this configuration, interoperability is improved for CCMs with low-end CE devices supporting fixed maintenance association identifier configurations.

## Enabling Enhanced Connectivity Fault Management Mode

You can enable enhanced connectivity fault management (CFM) mode to enable effective Ethernet OAM deployment in scaling networks. On enabling enhanced CFM mode, Junos OS supports 32,000 maintenance association end points (MEPs) and maintenance intermediate points (MIPs) each per chassis for bridge, VPLS, L2VPN, and CCC domains. In previous releases, Junos OS supports 8,000 MEPs and 8000 MIPS per chassis. If you do not enable enhanced CFM, Junos OS continues to support existing number of MIPs and MEPs per chassis.

**NOTE:** To support enhanced CFM mode, configure the network services mode on the router as **enhanced-ip**. If the network services mode is not **enhanced-ip**, and you have enabled enhanced CFM, the following warning message is displayed:

```
[edit protocols oam ethernet]
'connectivity-fault-management'
enhanced ip is not effective please configure enhanced ip and give router reboot
```

To enable enhanced CFM mode, perform the following steps:

1. In configuration mode, go to the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
```

2. Enable effective Ethernet OAM deployment by enabling enhanced CFM mode.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set enhanced-cfm-mode
```

3. Commit the mode change. A warning message is displayed asking you to restart CFM. If you do not restart CFM, CFM is automatically restarted by Junos OS.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host # commit
[edit protocols oam ethernet]
'connectivity fault management'
CFM mode change is catastrophic. cfmd will be restarted
commit complete
```

4. To verify if the enhanced CFM mode has been configured, use the **show oam ethernet connectivity-fault-management state** command.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# run show oam ethernet connectivity-fault-management
```

```

enhanced-cfm-mode;
traceoptions {
 file cfmd.log size 1g;
}

## Understanding CFM Monitoring between CE and PE Devices

You can enable connectivity fault management (CFM) monitoring between provider edge devices and customer edge devices when the customer edge device is not a Juniper device. When the interface is down, CFM propagates the status of the interface in the CC messages. The CC message informs the customer edge device that the provider edge device is down.

You can configure CFM monitoring using either of the following two options:

- **Interface Status TLV (Type, Length, and Value)**—You can enable connectivity fault management (CFM) monitoring between provider edge devices and customer edge devices when the customer edge device is not a Juniper device by using Interface Status TLV. When the interface is down, CFM propagates the status of the interface using interface status TLV. The Interface Status TLV indicates the status of the interface on which the MEP transmitting the CCM is configured, or the next-lower interface in the IETF RFC 2863 IF-MIB. Thus, the customer edge device is aware that the provider edge device is down. To configure CFM monitoring using Interface Status TLV, use the **interface-status-tlv** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain maintenance-association maintenance-association continuity-check]** hierarchy level. This is the standard option.
- **RDI (Remote Defect Indication)**—Starting in Junos OS Release 17.3R1, you can enable connectivity fault management (CFM) monitoring between provider edge devices and customer edge devices when the customer edge device is not a Juniper device by using the remote defect indication (RDI) bit. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down. The RDI bit is cleared when the service is back up. To configure CFM monitoring using the RDI bit, use the **interface-status-send-rdi** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain**

*maintenance-domain**maintenance-association**maintenance-association* continuity-check hierarchy level. This option is required if the customer edge device does not support Interface Status TLV.

**NOTE:** When the interface is set to CCC down and you have configured RDI, then RDI bit is sent. CFM does not monitor the status of the interface. If CCC down is set when the interface is not standby, RDI bit is sent with the CC messages if you have configured RDI.

### Single Active Multi-homing Use Case using RDI bit

Consider the following topology where there are two provider edge devices (PE1 and PE2) as well as two customer edge devices (CE1 and CE2). PE1 is in active state while PE2 is in standby state. CFM down MEP is configured between the PE and CE. CFM detects that the CCC down and because CFM down MEP is configured, the CC messages generated have the RDI bit. The CC messages from PE2 to CE2 have the RDI bit set to indicate the blocked state. When PE2 becomes active, CCM down is cleared and the RDI bit is cleared from the subsequent CC messages.

### Active/Active Multihoming Use case using RDI bit

Consider the topology where there are two provider edge devices (PE1 and PE2) and two customer edge devices (CE1 and CE2). PE1 is in active state while PE2 is in standby state. If CFM down MEP is not configured between the PE and CE to monitor the link connectivity, the CC messages generated do not have the RDI bit. CFM down MEP is configured between the PE and CE. CFM detects that the CCC down and because CFM down MEP is configured, the CC messages generated have the RDI bit. The CC messages from PE2 to CE2 have the RDI bit set to indicate the blocked state. When PE2 becomes active, CCM down is cleared and the RDI bit is cleared from the subsequent CC messages.

## Example: Configuring Ethernet CFM on Physical Interfaces

This example shows the configuration of Ethernet connectivity fault management (CFM) on physical interfaces.

- [Requirements on page 608](#)
- [Overview on page 608](#)
- [Configuration on page 608](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later.

### Overview

CFM can be used to monitor the physical link between two routers. This functionality is similar to that supported by the IEEE 802.3ah LFM protocol.

In Junos OS Release 9.3 and later, CFM also supports aggregated Ethernet interfaces. On interfaces configured on Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs) on MX Series routers, CFM is not supported on untagged aggregated Ethernet member links. MPCs and MICs do support CFM on untagged and tagged aggregated Ethernet logical interfaces.

**NOTE:** The configurations in this example are only partial examples of complete and functional router configurations. Do not copy these configurations and use them directly on an actual system.

### Configuration

In the following example, two routers (Router 1 and Router 2) are connected by a point-to-point Gigabit Ethernet link. The link between these two routers is monitored using CFM. This is shown in [Figure 27 on page 608](#). The single boundary is a “down mep” in CFM terminology.

**Figure 27: Ethernet CFM on Physical Interfaces**

To configure Ethernet CFM on physical interfaces, perform these tasks:

**Router 1** Configure the interface and CFM:

```
[edit]
interfaces ge-1/0/1 {
 unit 0 {
 family inet;
 }
}

protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain private {
 level 0;
 maintenance-association private-ma {
 continuity-check {
 interval 1s;
 }
 mep 100 {
 interface ge-1/0/1;
 direction down;
 auto-discovery;
 }
 }
 }
 }
 }
 }
}
```

The configuration on Router 2 mirrors that on Router 1, with the exception of the *mep-id*.

**Router 2** Configure the interface and CFM:

```
[edit]
interfaces ge-0/2/5 {
 unit 0 {
 family inet;
 }
}

protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain private {
 level 0;
 maintenance-association private-ma {
 continuity-check {
 interval 1s;
 }
 mep 200 {
```

```
interface ge-0/2/5;
 direction down;
 auto-discovery;
}
}
}
}
}
}
```

To verify that the physical interface is configured correctly for CFM, use the **show interface** command. To verify the CFM configuration, use one or more of the **show oam ethernet connectivity-fault-management** commands listed in the [CLI Explorer](#).

## Example: Configuring Ethernet CFM on Bridge Connections

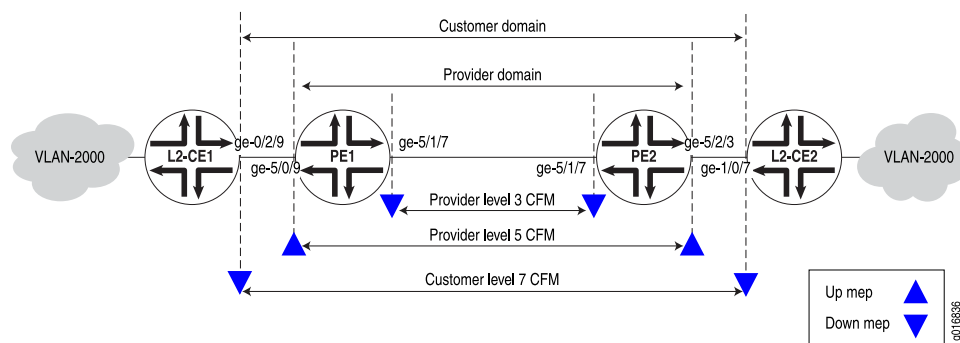

In this example, both the customer and service provider are running Ethernet CFM over a simple bridge network. The network is shown in [Figure 28 on page 611](#). The customer has configured Ethernet CFM on MX Series routers L2-CE1 and L2-CE2. The service provider has configured Ethernet CFM on MX Series routers PE1 and PE2.

**NOTE:** The configurations in this example are only partial examples of complete and functional router configurations. Do not copy these configurations and use them directly on an actual system.

The service provider is using CFM level 3 for the link between PE1 and PE2 and level 5 from one CE facing port to the other. The customer is using CFM level 7. The boundaries are marked with “up mep” and “down mep” CFM terminology in the figure.

## Example: Configuring Ethernet CFM over VPLS

---

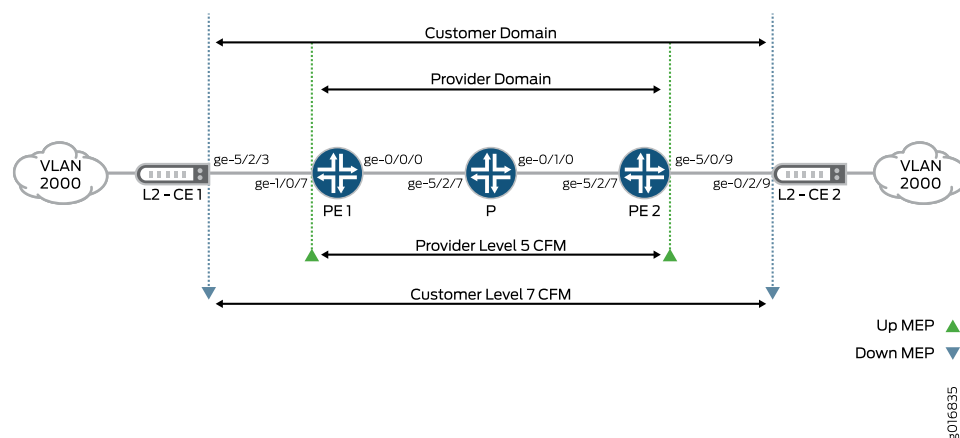

In this example, both the customer and service provider are running Ethernet CFM over a VPLS and a multiprotocol label switching (MPLS) network. The network is shown in [Figure 29 on page 615](#). The customer has configured Ethernet CFM on MX Series routers L2-CE1 and L2-CE2. The service provider has configured Ethernet CFM on MX Series routers PE1, P, and PE2.

**NOTE:** The configurations in this example are only partial examples of complete and functional router configurations. Do not copy these configurations and use them directly on an actual system.

The service provider is using CFM level 5 and the customer is using CFM level 7. The boundaries are marked with “up mep” and “down mep” CFM terminology in the figure.

Figure 29: Ethernet OAM with VPLS

**NOTE:** The logical interfaces in a VPLS routing instance might have the same or different VLAN configurations. VLAN normalization is required to switch packets correctly among these interfaces. Normalization supports automatic mapping of VLANs and performs operations on VLAN tags to achieve the desired translation. See *Configuring a Normalized VLAN for Translation or Tagging*.

**NOTE:**

The following forwarding path considerations must be observed:

- Packet receive path:
  - This is the forwarding path for packets received on the interfaces.
  - 802.1ag Ethernet OAM for VPLS uses implicit interface filters and forwarding table filters to flood, accept, and drop the CFM packets.
- Packet transmit path:
  - Junos OS uses the router's hardware-based forwarding for CPU-generated packets.
  - For down MEPs, the packets are transmitted on the interface on which the MEP is configured.
  - In MX series routers, for up MEPs, the packets must be flooded to other interfaces in the VPLS routing instance. The router creates a flood route tied to a flood next hop (with all interfaces to flood) and then sources the packets to be forwarded with this flood route.

The following are the configurations of the VPLS and CFM on the service provider routers.

## IEEE 802.3ah OAM Link-Fault Management Overview

---

Ethernet interfaces capable of running at 100 Mbps or faster on EX Series switches, PTX Series, MX Series, M Series (except M5 and M10 routers), and T Series routers support the IEEE 802.3ah standard for Operation, Administration, and Management (OAM). You can configure IEEE 802.3ah OAM on Ethernet point-to-point direct links or links across Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities as Ethernet moves from being solely an enterprise technology to being a WAN and access technology, as well as being backward-compatible with existing Ethernet technology. Junos OS supports IEEE 802.3ah link-fault management.

The features of link-fault management are:

- Discovery
- Link monitoring
- Remote fault detection
- Remote loopback

Starting in Junos OS Release 17.3R1, the Ethernet link fault management daemon (lfmd) runs on the backup Routing Engine as well when graceful Routing Engine switchover (GRES) is configured.

The following features are not supported:

- Ethernet running on top of a Layer 2 protocol, such as Ethernet over ATM, is not supported in OAM configurations.
- Remote loopback is not supported on the 10-Gigabit Ethernet LAN/WAN PIC with SFP+.
- The remote loopback feature mentioned in section 57.2.11 of IEEE 802.3ah is not supported on T4000 routers.

---

**NOTE:** Aggregated Ethernet member links will now use the physical MAC address as the source MAC address in 802.3ah OAM packets.

---

## Understanding Ethernet OAM Link Fault Management for ACX Series Routers

The Juniper Networks Junos operating system (Junos OS) for Juniper Networks ACX Series routers allows the Ethernet interfaces on these routers to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities even as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward compatible with the existing Ethernet technology.

Ethernet OAM provides tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual LAN identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports or a virtual service such as a pseudowire.
- Isolate faults over a flat (or single-operator) network architecture or nested or hierarchical (or multiprovider) networks.

The following OAM LFM features are supported on ACX Series routers:

- Discovery and Link Monitoring

The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. You can specify the discovery mode used for IEEE 802.3ah OAM support. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in the process. The router performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

You can specify the number of OAM PDUs that an interface can skip before the link between peers is considered down.

- Remote Fault Detection

Remote fault detection uses flags and events. Flags are used to convey the following:

- **Link Fault** means a loss of signal
- **Dying Gasp** means an unrecoverable condition such as a power failure. In this condition, the local peer informs the remote peer about the failure state. When the remote peer receives a dying-gasp PDU, it takes an action corresponding to the action profile configured with the **link-adjacency-loss** event.

**NOTE:** ACX5096 and ACX5048 routers do not support dying-gasp.

---

ACX Series routers can generate and receive dying-gasp packets. When LFM is configured on an interface, a dying-gasp PDU is generated for the interface on the following failure conditions:

- Power failure
- Packet Forwarding Engine panic or a crash
- **Critical Event** means an unspecified vendor-specific critical event.

You can specify the interval at which OAM PDUs are sent for fault detection.

**NOTE:** ACX Series routers support the receipt of dying-gasp packets, but cannot generate them.

- Remote Loopback Mode

Remote loopback mode ensures link quality between the router and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a PAUSE frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

If a remote data terminal equipment (DTE) supports remote loopback mode, Junos OS can place the remote DTE into loopback mode. When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs and PAUSE frames are looped back. No changes are made to the frames. OAM PDUs continue to be sent and processed.

## Configuring IEEE 802.3ah OAM Link-Fault Management

You can configure threshold values for fault events that trigger the sending of link event TLVs when the values exceed the threshold. To set threshold values for fault events on an interface, include the **event-thresholds** statement at the **[edit protocols oam ethernet link-fault-management interface]** hierarchy level.

You can also configure OAM threshold values within an action profile and apply the action profile to multiple interfaces. To create an action profile, include the **action-profile** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level.

You can configure Ethernet OAM either on an aggregate interface or on each of its member links. However, we recommend that you configure Ethernet OAM on the aggregate interface, and this will internally enable Ethernet OAM on the member links.

To view OAM statistics, use the **show oam ethernet link-fault-management** operational mode command. To clear OAM statistics, use the **clear oam ethernet link-fault-management statistics** operational mode command. To clear link-fault management state information and restart the link discovery process on Ethernet interfaces, use the **clear oam ethernet link-fault-management state** operational mode command. For more information about these commands, see the [CLI Explorer](#).

## Configuring Ethernet 802.3ah OAM on PTX Series Packet Transport Routers

The IEEE 802.3ah standard for Operation, Administration, and Management (OAM) provides a specification for *Ethernet in the first mile (EFM)* connectivity. EFM defines how Ethernet can be transmitted over new media types using new Ethernet physical layer (PHY) interfaces. You can configure IEEE 802.3ah OAM on Ethernet point-to-point direct links or links across Ethernet repeaters. The IEEE 802.3ah OAM standard meets the requirement for OAM capabilities as Ethernet moves from being solely an enterprise technology to being a WAN and access technology, as well as being backward-compatible with existing Ethernet technology.

For Ethernet interfaces capable of running at 100 Mbps or faster, the IEEE 802.3ah OAM standard is supported on numerous Juniper Networks routers and switches. This topic describes configuration support for IEEE 802.3ah OAM features on PTX Series Packet Transport Routers.

Beginning in Junos OS Release 12.1, PTX Series routers support the following IEEE 802.3ah OAM features at the physical interface level:

- Discovery and link monitoring
- Fault signaling and detection
- Periodic packet management (PPM) processing

- Action profile support
- Graceful Routing Engine switchover (GRES)

To configure 802.3ah OAM support for Ethernet interfaces, include the **oam** statement at the **[edit protocols]** hierarchy level:

```
oam {
 ethernet {
 link-fault-management {
 interfaces {
 interface-name {
 pdu-interval interval;
 link-discovery (active | passive);
 pdu-threshold count;
 }
 }
 }
 }
}
```

- [Configuring an OAM Action Profile on page 636](#)

## Enabling IEEE 802.3ah OAM Support

To enable IEEE 802.3ah OAM support, include the **interface** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level:

```
[edit protocols oam ethernet link-fault-management interface interface-name]
```

When you enable IEEE 802.3ah OAM on a physical interface, the discovery process is automatically triggered.

---

## Configuring Link Discovery

When the IEEE 802.3ah OAM protocol is enabled on a physical interface, the discovery process is automatically triggered. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard.

You can specify the discovery mode used for IEEE 802.3ah OAM support. The discovery process is triggered automatically when OAM IEEE 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

To configure the discovery mode, include the **link-discovery** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
link-discovery (active | passive);
```

In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery.

## Configuring the OAM PDU Interval

Periodic OAM PDUs are sent to perform link monitoring.

You can specify the periodic OAM PDU sending interval for fault detection.

To configure the sending interval, include the **pdu-interval** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
pdu-interval interval;
```

The periodic OAM PDU interval range is from 100 through 1000 milliseconds. The default sending interval is 1000 milliseconds.

---

## Configuring the OAM PDU Threshold

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

To configure the number of PDUs that can be missed from the peer, include the **pdu-threshold** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
pdu-threshold threshold-value;
```

The threshold value range is from 3 through 10. The default is three PDUs.

## Configuring Threshold Values for Local Fault Events on an Interface

You can configure threshold values on an interface for the local errors that trigger the sending of link event TLVs.

To set the error threshold values for sending event TLVs, include the **frame-error**, **frame-period**, **frame-period-summary**, and **symbol-period** statements at the `[edit protocols oam ethernet link-fault-management interface interface-name event-thresholds]` hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
event-thresholds {
 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
}
```

### Related Documentation

## Disabling the Sending of Link Event TLVs

---

You can disable the sending of link event TLVs.

To disable the monitoring and sending of PDUs containing link event TLVs in periodic PDUs, include the **no-allow-link-events** statement at the **[edit protocols oam ethernet link-fault-management interface *interface-name* negotiation-options]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name
 negotiation-options]
no-allow-link-events;
```

## Detecting Remote Faults

---

Fault detection is either based on flags or fault event type, length, and values (TLVs) received in OAM protocol data units (PDUs). Flags that trigger a link fault are:

- Critical Event

- Dying Gasp
- Link Fault

The link event TLVs are sent by the remote DTE by means of event notification PDUs. Link event TLVs are:

- Errored Symbol Period Event
- Errored Frame Event
- Errored Frame Period Event
- Errored Frame Seconds Summary Event

## Enabling Dying Gasp Functionality

Dying gasp means an unrecoverable condition such as a power failure. In this condition, the local peer informs the remote peer about the failure state. When the remote peer receives a dying-gasp PDU, it takes an action corresponding to the action profile configured with the **link-adjacency-loss** event. Dying gasp helps to avoid file system corruption.

**NOTE:** ACX5096 and ACX5048 routers do not support dying-gasp.

ACX Series routers can generate and receive dying-gasp packets. When LFM is configured on an interface, a dying-gasp PDU is generated for the interface on the following failure conditions:

- Power failure
- Packet Forwarding Engine panic or a crash

ACX Series routers support the following CLI statements to enable dying-gasp functionality:

- **dgasp-int**—Enables dying-gasp functionality.
- **dgasp-usb**—Resets USB port during dying-gasp event.

The **dgasp-int** and **dgasp-usb** CLI statements are added under the **[edit system]** hierarchy to enable dying-gasp functionality.

To enable dying-gasp functionality, you need to configure the **dgasp-int** and **dgasp-usb** CLI statements as shown below:

```
root@host% cli
root@host> configure
Entering configuration mode

[edit]
root@host# set system dgasp-int

[edit]
root@host# set system dgasp-usb

[edit]
root@host# commit

commit complete

[edit]
root@host# show system
dgasp-int;
dgasp-usb;
```

The dying-gasp functionality is disabled by default.

**Related Documentation**

- [Understanding Ethernet OAM Link Fault Management for ACX Series Routers on page 625](#)

---

## Configuring an OAM Action Profile

You can create an action profile to define event fault flags and thresholds and the action to be taken. You can then apply the action profile to one or more interfaces.

To configure an action profile, include the **action-profile** statement at the **[edit protocols oam ethernet link-fault-management]** hierarchy level:

```
action-profile profile-name {
```

```

action {
 syslog;
 link-down;
 send-critical-event;
}
event {
 link-adjacency-loss;
 link-event-rate {
 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
 }
 protocol-down;
}
}

```

**NOTE:** Starting from Junos OS Release 14.2, whenever link-fault management (LFM) with an action profile is configured to mark the interface as down (by including the link-down statement at the [edit protocols oam ethernet link-fault-management] hierarchy level), the port is placed in the blocked state (STP state). In such a state of the interface, data traffic is not transmitted out on that interface. Because the connectivity-fault management (CFM) downstream maintenance MEPs come up on blocked ports, the CFM sessions come up properly. However, the interface is down and the interface status TLV does not contain the correct status. Only if you configure the port status TLV, the actual status of the port is reflected. The interface status TLV does not carry the actual state of the port.

Release History Table

| Release | Description                         |
|---------|-------------------------------------|
| 14.2    | Starting from Junos OS Release 14.2 |

---

## Specifying the Actions to Be Taken for Link-Fault Management Events

You can specify the action to be taken by the system when the configured link-fault event occurs. Multiple action profiles can be applied to a single interface. For each action-profile, at least one event and one action must be specified. The actions are taken only when all of the events in the action profile are true. If more than one action is specified, all the actions are executed.

You might want to set a lower threshold for a specific action such as logging the error and set a higher threshold for another action such as sending a critical event TLV.

To specify the action, include the **action** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management action-profile profile-name]
event {
 link-adjacency-loss;
 protocol-down;
}
action {
 syslog;
 link-down;
 send-critical-event;
}
```

To create a system log entry when the link-fault event occurs, include the **syslog** statement.

To administratively disable the link when the link-fault event occurs, include the **link-down** statement.

To send IEEE 802.3ah link event TLVs in the OAM PDU when a link-fault event occurs, include the **send-critical-event** statement.

**NOTE:** If multiple actions are specified in the action profile, all of the actions are executed in no particular order.

---

## Monitoring the Loss of Link Adjacency

You can specify actions be taken when link adjacency is lost. When link adjacency is lost, the system takes the action defined in the **action** statement of the action profile.

To configure the system to take action when link adjacency is lost, include the **link-adjacency-loss** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management action-profile profile-name]
link-adjacency-loss;
```

## Monitoring Protocol Status

The CCC-DOWN flag is associated with a circuit cross-connect (CCC) connection, Layer 2 circuit, and Layer 2 VPN, which send the CCC-DOWN status to the kernel. The CCC-DOWN flag indicates that the CCC is down. The CCC-DOWN status is sent to the kernel when the CCC connection, Layer 2 circuit, or Layer 2 VPN is down. This in turn, brings down the CE-facing PE interface associated with the CCC connection, Layer 2 circuit, or Layer 2 VPN.

When the CCC-DOWN flag is signaled to the IEEE 802.3ah protocol, the system takes the action defined in the **action** statement of the action profile. For additional information about Layer 2 circuits, see the Junos OS Layer 2 Circuits Feature Guide, Junos OS VPNs Configuration Guide.

To monitor the IEEE 802.3ah protocol, on the CE-facing PE interface, include the **protocol-down** statement at the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level:

1. In configuration mode, go to the **[edit protocols oam ethernet link-fault-management action-profile *profile-name* event]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet link-fault-management action-profile
profile-name event
```

2. Include the **protocol-down** statement.

```
[edit protocols oam ethernet link-fault-management action-profile profile-name event]
user@host# set protocol-down
```

**NOTE:** If multiple events are specified in the action profile, all the events must occur before the specified action is taken.

## Configuring Threshold Values for Fault Events in an Action Profile

You can configure link event thresholds for received error events that trigger the action specified in the **action** statement. You can then apply the action profile to one or more interfaces.

To configure link event thresholds, include the **link-event-rate** statement at the **[edit protocols oam ethernet link-fault-management action-profile profile-name event]** hierarchy level:

```
link-event-rate {
 frame-error count;
```

```
frame-period count;
frame-period-summary count;
symbol-period count;
}
```

**Related  
Documentation**

---

## Applying an Action Profile

You can apply an action profile to one or more interfaces.

To apply an action profile to an interface, include the **apply-action-profile** statement at the **[edit protocols oam ethernet link-fault-management action-profile interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 apply-action-profile profile-name;
```

---

## Setting a Remote Interface into Loopback Mode

You can configure the software to set the remote DTE into loopback mode on the following interfaces:

- IQ2 and IQ2-E Gigabit Ethernet interfaces
- Ethernet interfaces on the MX Series routers or EX Series switches

Junos OS can place a remote DTE into loopback mode (if remote-loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote-loopback request and puts the interface into remote-loopback mode. When the interface is in remote-loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent to the management plane and processed.

To configure remote loopback, include the **remote-loopback** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name*]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name]
 remote-loopback;
```

To take the remote DTE out of loopback mode, remove the **remote-loopback** statement from the configuration.

---

## Enabling Remote Loopback Support on the Local Interface

---

You can allow a remote DTE to set a local interface into remote loopback mode on IQ2 and IQ2-E Gigabit Ethernet interfaces and all Ethernet interfaces on the MX Series routers and EX Series switches. When a remote-loopback request is sent by a remote DTE, the Junos OS places the local interface into loopback mode. When an interface is in loopback mode, all frames except OAM PDUs are looped back without any changes to the frames. OAM PDUs continue to be sent to the management plane and processed. By default, the remote loopback feature is not enabled.

To enable remote loopback, include the **allow-remote-loopback** statement at the **[edit protocol oam ethernet link-fault-management interface *interface-name* negotiation-options]** hierarchy level:

```
[edit protocol oam ethernet link-fault-management interface interface-name
 negotiation-options]
allow-remote-loopback;
```

**NOTE:** Activation of OAM remote loopback may result in data frame loss.

---

## Enabling Nonstop Routing for Ethernet Link Fault Management on Backup Routers

Starting in Junos OS Release 17.3R1, the Ethernet link fault management daemon (lfmd) runs on the backup Routing Engine as well when graceful Routing Engine switchover (GRES) is configured. When the lfmd daemon runs on the backup Routing Engine as well, the link fault management states are kept in sync and so minimal effort is required by the lfmd daemon post switch over.

To enable Nonstop routing for Ethernet LFM on backup routers:

1. Enable graceful Routing Engine switchover. By default, GRES is disabled. To enable GRES, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. By default, Nonstop routing is disabled. When you enable GRES, NSR is enabled.

```
[edit chassis redundancy]
user@host# set graceful-switchover
```

2. Synchronize the Routing Engine configuration. To synchronize the master Routing Engine configuration with the backup, include the **synchronize** statement at the **[edit system]** hierarchy level.

```
[edit system]
user@host# set commit synchronize
```

3. After enabling nonstop routing, commit the configuration.

```
[edit routing options]
user@host# commit
```

4. To verify if nonstop routing is enabled on the backup router, at the operational mode, use the **show oam ethernet link-fault-management** command on the master router and then the backup router. Because you have enabled synchronization, the output of the master router and the backup router is identical. However, the statistics maintained by the master router are not synchronized with the backup router..

```

### Example: Configuring IEEE 802.3ah OAM Support on an Interface

Configure 802.3ah OAM support on a 10-Gigabit Ethernet interface:

```

[edit]
protocols {
 oam {
 ethernet {
 link-fault-management {

```

```

interface xe-0/0/0 {
 link-discovery active;
 pdu-interval 800;
 pdu-threshold 4;
 remote-loopback;
 negotiation-options {
 allow-remote-loopback;
 }
 event-thresholds {
 frame-error 30;
 frame-period 50;
 frame-period summary 40;
 symbol-period 20;
 }
}
}
}
}
}
}
}

```

## Example: Configuring IEEE 802.3ah OAM Support for an Interface on ACX Series

Junos OS for ACX Series routers allows the Ethernet interfaces on these routers to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM on a Gigabit Ethernet interface.

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2 or later for ACX Series routers.
- An ACX1000 or ACX2000 router.

### Overview and Topology

In this example, you configure a 10-Gigabit Ethernet interface on an ACX Series router with 802.3ah OAM support, which includes: link discovery, protocol data units (PDUs), remote loopback, negotiation, and event thresholds.

### Configuring IEEE 802.3ah OAM on an ACX Series Router

**CLI Quick Configuration** To quickly configure IEEE 802.3ah Ethernet OAM, copy the following commands and paste them into the CLI:

```
edit
edit protocols oam ethernet link-fault-management
set interface xe-0/0/0 link-discovery active pdu-interval 800 pdu-threshold 4
 remote-loopback negotiation-options allow-remote-loopback
set interface xe-0/0/0 event-thresholds frame-error 30 frame-period 50
 frame-period-summary 40 symbol-period 20
```

**Step-by-Step Procedure** To configure IEEE 802.3ah OAM support on an interface:

1. Enable IEEE 802.3ah OAM support on an interface:

```
[edit protocols oam ethernet link-fault-management]
```

```
user@router1# set interface (OAM Link-Fault Management) xe-0/0/0
```

2. Specify that the interface initiates the discovery process by setting the link discovery mode to **active**:

```
user@router# set interface xe-0/0/0 link-discovery active
```

3. Set the periodic OAM PDU-sending interval (in milliseconds) to 800:

```
user@router# set interface xe-0/0/0 pdu-interval 800
```

4. Define the number of OAM PDUs to miss before an error is logged as 4:

```
user@router# set interface xe-0/0/0 pdu-threshold 4
```

5. Configure the remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes:

```
user@router# set interface xe-0/0/0 remote-loopback
```

6. Configure remote loopback support for the local interface:

```
user@router# set interface xe-0/0/0 negotiation-options allow-remote-loopback
```

7. Set the threshold count for sending frame error events to 30:

```
user@router# set interface xe-0/0/0 event-thresholds frame-error 30
```

8. Set the threshold count for sending frame period error events to 50:

```
user@router# set interface xe-0/0/0 event-thresholds frame-period 50
```

9. Configure the threshold count for sending frame period summary error events to 40:

```
user@router# set interface xe-0/0/0 event-thresholds frame-period-summary 40
```

10. Set the threshold count for sending symbol period events to 20:

```
user@router# set interface xe-0/0/0 event-thresholds symbol-period 20
```

**Results** Check the results of the configuration:

```
[edit]
user@router# show
```

```
[edit]
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface xe-0/0/0 {
 link-discovery active;
 pdu-interval 800;
 pdu-threshold 4;
 remote-loopback;
 negotiation-options {
 allow-remote-loopback;
 }
 }
 }
 }
 }
}
```

```

event-thresholds {
 frame-error 30;
 frame-period 50;
 frame-period-summary 40;
 symbol-period 20;
}
}
}
}
}
}

```

### Example: Configuring Ethernet LFM Between Provider Edge and Customer Edge

In this example, LFM is enabled on an IP link between the provider edge (PE) and customer edge (CE) interfaces. If the link goes down, the fault will be detected by LFM and the interfaces on both sides will be marked **Link-Layer-Down**. This results in notifications to various subsystems (for example, routing) which will take appropriate action.

The link running LFM is shown in [Figure 30 on page 652](#).

**Figure 30: Ethernet LFM Between Provider Edge and Customer Edge**

To configure Ethernet LFM on an IP link between PE and CE interfaces:

1. Configure LFM on the PE router:

```

[edit]
interfaces ge-1/1/0 {
 unit 0 {
 family inet {
 address 11.11.1.1/24;
 }
 }
}
protocols {

```

```

oam {
 ethernet {
 link-fault-management {
 interface ge-1/1/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 }
 }
 }
}

```

2. Configure LFM on the CE router:

```

[edit]
interfaces ge-1/1/0 {
 unit 0 {
 family inet {
 address 11.11.11.2/24;
 }
 }
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-1/1/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 }
 }
 }
 }
}

```

#### Related Documentation

- [Ethernet Interfaces Feature Guide for Routing Devices](#)
- [IEEE 802.3ah OAM Link-Fault Management Overview on page 624](#)
- [Example: Configuring Ethernet LFM for CCC on page 653](#)
- [Example: Configuring Ethernet LFM for Aggregated Ethernet on page 655](#)
- [Example: Configuring Ethernet LFM with Loopback Support on page 657](#)

### Example: Configuring Ethernet LFM for CCC

In this example, LFM is configured between two PEs (PE1 and PE2) connected using CCC. With LFM in place, a link fault will be detected immediately, instead of depending on routing protocols to find the fault on end-to-end CCC connection. This also helps in detecting the exact failed link instead of only finding that the end-to-end CCC connectivity

has failed. Also, because LFM runs at the link-layer level, it does not need a IP address to operate and so can be used where bidirectional fault detection (BFD) cannot.

The links running LFM are shown in [Figure 31 on page 654](#)

**Figure 31: Ethernet LFM for CCC**

To configure Ethernet LFM between two PEs connected using CCC:

1. Configure LFM on the PE1 router with CCC:

```
[edit]
interfaces ge-1/1/0 {
 encapsulation ethernet-ccc;
 unit 0;
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-1/1/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 }
 }
 }
 }
}
```

2. Configure LFM on the PE2 router with CCC:

```
[edit]
interfaces ge-1/0/0 {
 encapsulation ethernet-ccc;
 unit 0;
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-1/0/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 }
 }
 }
 }
}
```

}

## Example: Configuring Ethernet LFM for Aggregated Ethernet

In this example, LFM is configured on an aggregated Ethernet interface (AE0) between Router 1 and Router 2. When configured on aggregated Ethernet, LFM runs on all the individual member links. LFM is enabled or disabled on the member links as they are added or deleted from the aggregation group. The status of individual links is used to determine the status of the aggregated interface.

The use of LFM with aggregated Ethernet is shown in [Figure 32 on page 655](#).

**Figure 32: Ethernet LFM for Aggregated Ethernet**

To configure LFM on an aggregated Ethernet interface between two routers:

1. Configure LFM on Router 1 for AE0:

```
[edit]
chassis {
 aggregated-devices {
 ethernet {
 device-count 1;
 }
 }
}
interfaces ge-1/0/1 {
 gigether-options {
 802.3ad ae0;
 }
}
interfaces ge-2/0/0 {
 gigether-options {
 802.3ad ae0;
 }
}
```

```
}
interfaces ae0 {
 unit 0 {
 family inet {
 address 11.11.11.2/24;
 }
 }
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ae0;
 }
 }
 }
}
```

2. Configure LFM on Router 2 for AEO:

```
[edit]
chassis {
 aggregated-devices {
 ethernet {
 device-count 1;
 }
 }
}
interfaces ge-1/0/0 {
 gigether-options {
 802.3ad ae0;
 }
}
interfaces ge-5/0/0 {
 gigether-options {
 802.3ad ae0;
 }
}
interfaces ae0 {
 unit 0 {
 family inet {
 address 11.11.11.1/24;
 }
 }
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ae0;
 }
 }
 }
}
```

}

## Example: Configuring Ethernet LFM with Loopback Support

In this example, LFM is configured between provider edge (PE) router and the customer edge (CE) router. The PE router can put the CE router in remote loopback mode. This allows the PE to have all the traffic sent to the CE router looped back for diagnostics purposes, as shown in [Figure 33 on page 657](#).

*Figure 33: Ethernet LFM with Loopback Support*

To configure LFM between a PE router and a CE router:

1. Configure LFM loopback on the PE router:

```
[edit]
interfaces ge-1/0/0 {
 unit 0 {
 family inet {
 address 11.11.11/24;
 }
 }
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-1/0/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 remote-loopback;
 }
 }
 }
 }
}
```

```
}
```

2. Configure LFM loopback on the CE router:

```
[edit]
interfaces ge-1/1/0 {
 unit 0 {
 family inet {
 address 11.11.11.2/24;
 }
 }
}
protocols {
 oam {
 ethernet {
 link-fault-management {
 interface ge-1/1/0 {
 pdu-interval 1000;
 pdu-threshold 5;
 negotiation-options {
 allow-remote-loopback;
 }
 }
 }
 }
 }
}
```

**NOTE:** If the negotiation options `allow-remote-loopback` statement on the CE router is deleted before removing the CE router from remote loopback mode, traffic flow between the PE router and CE router is affected. Hence, delete the `remote-loopback` statement on the PE router before deleting the `negotiation-options allow-remote-loopback` statement on the CE router.

## Ethernet Frame Delay Measurements Overview

- [ITU-T Y.1731 Frame Delay Measurement Feature on page 661](#)
- [One-Way Ethernet Frame Delay Measurement on page 663](#)

- [Two-Way Ethernet Frame Delay Measurement on page 664](#)
- [Choosing Between One-Way and Two-Way ETH-DM on page 665](#)
- [Restrictions for Ethernet Frame Delay Measurement on page 665](#)

## ITU-T Y.1731 Frame Delay Measurement Feature

The IEEE 802.3-2005 standard for Ethernet Operations, Administration, and Maintenance (OAM) defines a set of link fault management mechanisms to detect and report link faults on a single point-to-point Ethernet LAN.

Junos OS supports key OAM standards that provide for automated end-to-end management and monitoring of Ethernet service by service providers:

- *IEEE Standard 802.1ag*, also known as “Connectivity Fault Management (CFM).”
- *ITU-T Recommendation Y.1731*, which uses different terminology than IEEE 802.1ag and defines Ethernet service OAM features for fault monitoring, diagnostics, and performance monitoring.

These capabilities allow operators to offer binding service-level agreements (SLAs) and generate new revenues from rate- and performance-guaranteed service packages that are tailored to the specific needs of their customers.

ACX Series routers support proactive and on-demand modes.

**NOTE:** ACX5048 and ACX5096 routers support only software-based time stamping for delay measurement.

## Ethernet CFM

The IEEE 802.1ag standard for connectivity fault management (CFM) defines mechanisms to provide for end-to-end Ethernet service assurance over any path, whether a single link or multiple links spanning networks composed of multiple LANs.

For Ethernet interfaces on M320, MX Series, and T Series routers, Junos OS supports the following key elements of the Ethernet CFM standard:

- Fault monitoring using the IEEE 802.1ag Ethernet OAM Continuity Check protocol
- Path discovery and fault verification using the IEEE 802.1ag Ethernet OAM Linktrace protocol
- Fault isolation using the IEEE 802.1ag Ethernet OAM Loopback protocol

In a CFM environment, network entities such as network operators, service providers, and customers may be part of different administrative domains. Each administrative domain is mapped into one maintenance domain. Maintenance domains are configured with different level values to keep them separate. Each domain provides enough information for the entities to perform their own management and end-to-end monitoring, and still avoid security breaches.

Figure 34 on page 662 shows the relationships among the customer, provider, and operator Ethernet bridges, maintenance domains, maintenance association end points (MEPs), and maintenance intermediate points (MIPs).

**Figure 34: Relationship of MEPs, MIPs, and Maintenance Domain Levels**

**NOTE:** On ACX Series routers, the maintenance intermediate points (MIP) is supported only on the ACX5048 and ACX5096 routers.

## Ethernet Frame Delay Measurement

Two key objectives of OAM functionality are to measure quality-of-service attributes such as frame delay and frame delay variation (also known as "frame jitter"). Such measurements can enable you to identify network problems before customers are impacted by network defects.

Junos OS supports Ethernet frame delay measurement between MEPs configured on Ethernet physical or logical interfaces on MX Series routers. Ethernet frame delay measurement provides fine control to operators for triggering delay measurement on a given service and can be used to monitor SLAs. Ethernet frame delay measurement also collects other useful information, such as worst and best case delays, average delay, and average delay variation. The Junos OS implementation of Ethernet frame delay measurement (ETH-DM) is fully compliant with the ITU-T Recommendation Y.1731, *OAM Functions and Mechanisms for Ethernet-based Networks*. The recommendation defines OAM mechanisms for operating and maintaining the network at the Ethernet service layer, which is called the "ETH layer" in ITU-T terminology.

MX Series routers with modular port concentrators (MPCs) and 10-Gigabit Ethernet MPCs with SFP+ support ITU-T Y.1731 functionality on VPLS for frame-delay and delay-variation.

**NOTE:** MX Series Virtual Chassis does not support Ethernet frame delay measurement (DM).

## One-Way Ethernet Frame Delay Measurement

In one-way ETH-DM mode, a series of frame delay and frame delay variation values are calculated based on the time elapsed between the time a measurement frame is sent from the initiator MEP at one router and the time when the frame is received at the receiver MEP at the other router.

**NOTE:** ACX Series routers do not support one-way Ethernet frame delay measurement.

### 1DM Transmission

When you start a one-way frame delay measurement, the router sends 1DM frames—frames that carry the protocol data unit (PDU) for a one-way delay measurement—from the initiator MEP to the receiver MEP at the rate and for the number of frames you specify. The router marks each 1DM frame as drop-ineligible and inserts a timestamp of the transmission time into the frame.

### 1DM Reception

When an MEP receives a 1DM frame, the router that contains the receiver MEP measures the one-way delay for that frame (the difference between the time the frame was received and the timestamp contained in the frame itself) and the delay variation (the difference between the current and previous delay values).

### One-Way ETH-DM Statistics

The router that contains the receiver MEP stores each set of one-way delay statistics in the ETH-DM database. The ETH-DM database collects up to 100 sets of statistics for any given CFM session (pair of peer MEPs). You can access these statistics at any time by displaying the ETH-DM database contents.

### One-Way ETH-DM Frame Counts

Each router counts the number of one-way ETH-DM frames sent and received:

- For an initiator MEP, the router counts the number of 1DM frames sent.
- For a receiver MEP, the router counts the number of valid 1DM frames received and the number of invalid 1DM frames received.

Each router stores ETH-DM frame counts in the CFM database. The CFM database stores CFM session statistics and, for interfaces that support ETH-DM, any ETH-DM frame counts. You can access the frame counts at any time by displaying CFM database information for Ethernet interfaces assigned to MEPs or for MEPs in CFM sessions.

### Synchronization of System Clocks

The accuracy of one-way delay calculations depends on close synchronization of the system clocks at the initiator MEP and receiver MEP.

The accuracy of one-way delay variation is not dependent on system clock synchronization. Because delay variation is simply the difference between consecutive one-way delay values, the out-of-phase period is eliminated from the frame jitter values.

**NOTE:** For a given one-way Ethernet frame delay measurement, frame delay and frame delay variation values are available only on the router that contains the receiver MEP.

## Two-Way Ethernet Frame Delay Measurement

In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.

### DMM Transmission

When you start a two-way frame delay measurement, the router sends delay measurement message (DMM) frames— frames that carry the PDU for a two-way ETH-DM request—from the initiator MEP to the responder MEP at the rate and for the number of frames you specify. The router marks each DMM frame as drop-ineligible and inserts a timestamp of the transmission time into the frame.

### DMR Transmission

When an MEP receives a DMM frame, the responder MEP responds with a delay measurement reply (DMR) frame, which carries ETH-DM reply information and a copy of the timestamp contained in the DMM frame.

### DMR Reception

When an MEP receives a valid DMR, the router that contains the MEP measures the two-way delay for that frame based on the following sequence of timestamps:

1.  $TI_{TxDMM}$
2.  $TR_{Rx DMM}$
3.  $TR_{Tx DMR}$
4.  $TI_{Rx DMR}$

A two-way frame delay is calculated as follows:

$$[TI_{Rx DMR} - TI_{Tx DMM}] - [TR_{Tx DMR} - TR_{Rx DMM}]$$

The calculation show that frame delay is the difference between the time at which the initiator MEP sends a DMM frame and the time at which the initiator MEP receives the associated DMR frame from the responder MEP, minus the time elapsed at the responder MEP.

The delay variation is the difference between the current and previous delay values.

### Two-Way ETH-DM Statistics

The router that contains the initiator MEP stores each set of two-way delay statistics in the ETH-DM database. The ETH-DM database collects up to 100 sets of statistics for any given CFM session (pair of peer MEPs). You can access these statistics at any time by displaying the ETH-DM database contents.

### Two-Way ETH-DM Frame Counts

Each router counts the number of two-way ETH-DM frames sent and received:

- For an initiator MEP, the router counts the number DMM frames transmitted, the number of valid DMR frames received, and the number of invalid DMR frames received.
- For a responder MEP, the router counts the number of DMR frames sent.

Each router stores ETH-DM frame counts in the CFM database. The CFM database stores CFM session statistics and, for interfaces that support ETH-DM, any ETH-DM frame counts. You can access the frame counts at any time by displaying CFM database information for Ethernet interfaces assigned to MEPs or for MEPs in CFM sessions.

**NOTE:** For a given two-way Ethernet frame delay measurement, frame delay and frame delay variation values are available only at the router that contains the initiator MEP.

## Choosing Between One-Way and Two-Way ETH-DM

One-way frame delay measurement requires that the system clocks at the initiator MEP and receiver MEP are closely synchronized. Two-way frame delay measurement does not require synchronization of the two systems. If it is not practical for the clocks to be synchronized, two-way frame delay measurements are more accurate.

When two systems are physically close to each other, their one-way delay values are very high compared to their two-way delay values. One-way delay measurement requires that the timing for the two systems be synchronized at a very granular level, and MX Series routers currently do not support this granular synchronization.

## Restrictions for Ethernet Frame Delay Measurement

The following restrictions apply to the Ethernet frame delay measurement feature:

- The ETH-DM feature is not supported on label-switched interface (LSI) pseudowires.  
The ETH-DM feature is supported on aggregated Ethernet interfaces.
- Hardware-assisted timestamping for ETH-DM frames in the reception path is only supported for MEP interfaces on Enhanced DPCs and Enhanced Queuing DPCs in MX Series routers. For information about hardware-assisted timestamping, see [“Guidelines for Configuring Routers to Support an ETH-DM Session” on page 706](#) and [“Enabling the Hardware-Assisted Timestamping Option” on page 717](#).

- Ethernet frame delay measurements can be triggered only when the distributed periodic packet management daemon (**ppm**) is enabled. For more information about this limitation, see [“Guidelines for Configuring Routers to Support an ETH-DM Session” on page 706](#) and [“Ensuring That Distributed ppm Is Not Disabled” on page 715](#).
- You can monitor only one session at a time to the same remote MEP or MAC address. For more information about starting an ETH-DM session, see [“Starting an ETH-DM Session” on page 718](#).
- ETH-DM statistics are collected at only one of the two peer routers in the ETH-DM session. For a one-way ETH-DM session, you can display frame ETH-DM statistics at the receiver MEP only, using ETH-DM-specific **show** commands. For a two-way ETH-DM session, you can display frame delay statistics at the initiator MEP only, using the same ETH-DM-specific **show** commands. For more information, see [“Managing ETH-DM Statistics and ETH-DM Frame Counts” on page 722](#).
- ETH-DM frame counts are collected at both MEPs and are stored in the respective CFM databases.
- If graceful Routing Engine switchover (GRES) occurs, any collected ETH-DM statistics are lost, and ETH-DM frame counts are reset to zeroes. Therefore, the collection of ETH-DM statistics and ETH-DM frame counters has to be restarted, after the switchover is complete. GRES enables a router with dual Routing Engines to switch from a master Routing Engine to a backup Routing Engine without interruption to packet forwarding. For more information, see the *High Availability Feature Guide*.
- Accuracy of frame delay statistics is compromised when the system is changing (such as from reconfiguration). We recommend performing Ethernet frame delay measurements on a stable system.

## Ethernet Frame Loss Measurement Overview

The key objectives of the OAM functionality are to measure quality-of-service attributes such as frame delay, frame delay variation (also known as “frame jitter”), and frame loss. Such measurements enable you to identify network problems before customers are impacted by network defects. For more information about Ethernet frame delay measurement, see [“Ethernet Frame Delay Measurements Overview” on page 660](#).

Junos OS supports Ethernet frame loss measurement (ETH-LM) between maintenance association end points (MEPs) configured on Ethernet physical or logical interfaces on MX Series routers and is presently supported only for VPWS service. ETH-LM is used by

operators to collect counter values applicable for ingress and egress service frames. These counters maintain a count of transmitted and received data frames between a pair of MEPs. Ethernet frame loss measurement is performed by sending frames with ETH-LM information to a peer MEP and similarly receiving frames with ETH-LM information from the peer MEP. This type of frame loss measurement is also known as single-ended Ethernet loss measurement.

**NOTE:** MX Series Virtual Chassis does not support Ethernet frame loss measurement (ETH-LM).

ETH-LM supports the following frame loss measurements:

- Near-end frame loss measurement—Measurement of frame loss associated with ingress data frames.
- Far-end frame loss measurement—Measurement of frame loss associated with egress data frames.

**NOTE:** The proactive and dual-ended loss measurement functionality of ITU-T Y1731 is not supported on the ACX Series routers.

The ETH-LM feature is supported on aggregated Ethernet interfaces.

**NOTE:** Starting Junos OS Release 16.1, the Ethernet loss measurement (ETH-LM) results are inaccurate when connectivity fault management (CFM) and performance monitoring (PM) PDUs received locally at a maintenance endpoint (MEP) as classified as belonging to the yellow class or a packet loss priority (PLP) of medium-high. This problem of incorrect results is specific to Ethernet loss measurement for CFM sessions of down MEPs. The Ethernet loss measurement statistics are inaccurate in the following scenarios:

- Ethernet loss measurement is working on a CFM session for a MEP in down state
- CFM PDUs received on the logical interface of the down MEP are classified by the classifier as yellow or medium-high PLP
- A packet is identified as yellow when the input classifier marks the PLP as medium-high.

The problem of discrepancies with Ethernet loss measurement results is not observed when you configure Ethernet loss measurement in colorless mode. To avoid this problem of inaccurate loss measurement results, provision all local CFM PDUs as green or with the PLP as high.

**NOTE:** Starting with Junos OS Release 16.1, performance monitoring for connectivity fault management (by including the **performance-monitoring** statement and its substatements at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level) is not supported when the network-to-network (NNI) or egress interface is an aggregated Ethernet interface with member links on DPCs.

Release History Table

| Release | Description                                                                                                                                                                                                                                                                                                                                                                                                    |

## Service-Level Agreement Measurement

Service-level agreement (SLA) measurement is the process of monitoring the bandwidth, delay, delay variation (jitter), continuity, and availability of a service (E-Line or E-LAN). It enables you to identify network problems before customers are impacted by network defects.

### NOTE:

The Ethernet VPN services can be classified into:

- Peer-to-peer-services (E-Line services)—The E-Line services are offered using MPLS-based Layer 2 VPN virtual private wire service (VPWS).
- Multipoint-to-multipoint services (E-LAN services)—The E-LAN services are offered using MPLS-based virtual private LAN service (VPLS).

For more information, see the *Junos VPNs Configuration Guide*.

In Junos OS, SLA measurements are classified into:

- On-demand mode—In on-demand mode, the measurements are triggered through the CLI. For more information, see [“On-Demand Mode for SLA Measurement” on page 670](#).
- Proactive mode—In proactive mode, the measurements are triggered by an iterator application. For more information, see [“Proactive Mode for SLA Measurement” on page 671](#).

For more information about frame delay measurement, see [“Ethernet Frame Delay Measurements Overview” on page 660](#). For more information about frame loss measurement, see [“Ethernet Frame Loss Measurement Overview” on page 666](#). Note that Ethernet frame delay measurement and Ethernet frame loss measurement are not supported on the `ae` interface.

### Related Documentation

- [Proactive Mode for SLA Measurement on page 671](#).
- [On-Demand Mode for SLA Measurement on page 670](#).

## On-Demand Mode for SLA Measurement

---

In on-demand mode, the measurements are triggered by the user through the CLI.

When the user triggers the delay measurement through the CLI, the delay measurement request that is generated is as per the frame formats specified by the ITU-T Y.1731 standard. For two-way delay measurement, the server-side processing can be delegated to the Packet Forwarding Engine to prevent overloading on the Routing Engine. For more information, see [“Configuring Routers to Support an ETH-DM Session” on page 714](#). When the server-side processing is delegated to the Packet Forwarding Engine, the delay measurement message (DMM) frame **receive** counters and delay measurement reply (DMR) frame **transmit** counters are not displayed by the **show** command.

When the user triggers the loss measurement through the CLI, the router sends the packets in standard format along with the loss measurement TLV. By default, the **session-id-tlv** argument is included in the packet to allow concurrent loss measurement sessions from same local MEP. You can also disable the session ID TLV by using the **no-session-id-tlv** argument.

Single-ended ETH-LM is used for on-demand operation, administration, and maintenance purposes. An MEP sends frames with ETH-LM request information to its peer MEP and receives frames with ETH-LM reply information from its peer MEP to carry out loss measurements. The protocol data unit (PDU) used for a single-ended ETH-LM request is referred to as a loss measurement message (LMM) and the PDU used for a single-ended ETH-LM reply is referred to as a loss measurement reply (LMR).

- [Configuring Routers to Support an ETH-DM Session on page 714](#).

## Proactive Mode for SLA Measurement

In proactive mode, SLA measurements are triggered by an iterator application. An iterator is designed to periodically transmit SLA measurement packets in form of ITU-Y.1731-compliant frames for two-way delay measurement or loss measurement on MX Series routers. This mode differs from on-demand SLA measurement, which is user initiated. The iterator sends periodic delay or loss measurement request packets for each of the connections registered to it. Iterators make sure that measurement cycles do not occur at the same time for the same connection to avoid CPU overload. Junos OS supports proactive mode for VPWS. For an iterator to form a remote adjacency and to become functionally operational, the continuity check message (CCM) must be active between the local and remote MEP configurations of the connectivity fault management (CFM). Any change in the iterator adjacency parameters resets the existing iterator statistics and restarts the iterator. Here, the term adjacency refers to a pairing of two endpoints (either connected directly or virtually) with relevant information for mutual understanding, which is used for subsequent processing. For example, the iterator adjacency refers to the iterator association between the two endpoints of the MEPs.

For every DPC or MPC, only 30 iterator instances for a cycle time value of 10 milliseconds (ms) are supported. In Junos OS, 255 iterator profile configurations and 2000 remote MEP associations are supported.

Iterators with cycle time value less than 100 ms are supported only for infinite iterators, whereas the iterators with cycle time value greater than 100 ms are supported for both finite and infinite iterators. Infinite iterators are iterators that run infinitely until the iterator is disabled or deactivated manually.

**NOTE:** ACX5048 and ACX5096 routers supports iterator cycle time of only 1 second and above.

A VPWS service configured on a router is monitored for SLA measurements by registering the connection (here, the connection is a pair of remote and local MEPs) on an iterator and then initiating periodic SLA measurement frame transmission on those connections. The end-to-end service is identified through a maintenance association end point (MEP) configured at both ends.

For two-way delay measurement and loss measurement, an iterator sends a request message for the connection in the list (if any) and then sends a request message for the connection that was polled in the former iteration cycle. The back-to-back request messages for the SLA measurement frames and their responses help in computing delay variation and loss measurement.

The Y.1731 frame transmission for a service attached to an iterator continues endlessly unless intervened and stopped by an operator or until the iteration-count condition is met. To stop the iterator from sending out any more proactive SLA measurement frames, the operator must perform one of the following tasks:

- Enable the **deactivate sla-iterator-profile** statement at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance association *ma-name* mep *mep-id* remote-mep *mep-id*]** hierarchy level. For more information, see [“Verifying the Configuration of an Iterator Profile” on page 695](#).
- Provision a **disable** statement under the corresponding iterator profile at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles *profile-name*]** hierarchy level. For more information, see [“Configuring an Iterator Profile” on page 692](#).

## Ethernet Delay Measurements and Loss Measurement by Proactive Mode

In two-way delay measurement, the delay measurement message (DMM) frame is triggered through an iterator application. The DMM frame carries an iterator type, length, and value (TLV) in addition to the fields described in standard frame format and the server copies the iterator TLV from the DMM frame to the delay measurement reply (DMR) frame.

In one-way delay variation computation using the two-way delay measurement method, the delay variation computation is based on the timestamps that are present in the DMR frame (and not the IDM frame). Therefore, there is no need for client-side and server-side clocks to be in sync. Assuming that the difference in their clocks remains constant, the one-way delay variation results are expected to be fairly accurate. This method also eliminates the need to send separate IDM frames just for the one-way delay variation measurement purpose.

In proactive mode for loss measurement, the router sends packets in standard format along with loss measurement TLV and iterator TLV.

## Ethernet Failure Notification Protocol Overview

The Failure Notification Protocol (FNP) is a failure notification mechanism that detects failures in Point-to-Point Ethernet transport networks on MX Series routers. If a node link

fails, FNP detects the failure and sends out FNP messages to the adjacent nodes that a circuit is down. Upon receiving the FNP message, nodes can redirect traffic to the protection circuit.

**NOTE:** FNP is supported on E-Line services only.

An E-Line service provides a secure Point-to-Point Ethernet connectivity between two user network interfaces (UNIs). E-Line services are a protected service and each service has a working circuit and protection circuit. CFM is used to monitor the working and protect paths. CCM intervals result in failover time in hundreds of milliseconds or a few seconds. FNP provides service circuit failure detection and propagation in less than 50ms and provide 50ms failover for E-Line services.

The MX router acts as a PE node and handles the FNP messages received on the management VLAN and the FNP messages received on both the Ethernet interfaces and PWs created for the management VPLS. MX-series routers do not initiate FNP messages and responds only to FNP messages generated by devices in the Ethernet Access network. FNP can be enabled only on logical interfaces that are part of a VPLS routing instance, and no physical interfaces in that VPLS routing instance should have CCM configured. FNP can be enabled only on one logical interface per physical interface.

All E-Line services are configured as layer 2 circuits with edge protection. A VLAN associated with the working circuit or protection circuit must map to a logical interface. No trunk port or access port is supported in the ring link for VLANs used by E-LINE services. FNP does not control the logical interface associated with protection circuit. Only E-Line service whose termination point is not in an MX node is controlled by FNP.

FNP supports graceful restart and the Graceful Routing Engine switchover (GRES) features.

## Ethernet Synthetic Loss Measurement Overview

Ethernet synthetic loss measurement (ETH-SLM) is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic. Each maintenance association end point (MEP) performs frame loss measurements, which contribute to unavailable time.

A near-end frame loss specifies frame loss associated with ingress data frames and a far-end frame loss specifies frame loss associated with egress data frames. Both near-end and far-end frame loss measurements contribute to near-end severely errored seconds and far-end severely errored seconds that are used in combination to determine unavailable time. ETH-SLM is performed using synthetic loss message (SLM) and synthetic loss reply (SLR) frames. ETH-SLM facilitates each MEP to perform near-end and far-end synthetic frame loss measurements by using synthetic frames because a bidirectional service is defined as unavailable if either of the two directions is determined to be unavailable.

There are the two types of frame loss measurement, defined by the ITU-T Y.1731 standards, ETH-LM and ETH-SLM. Junos OS supports only single-ended ETH-SLM. In single-ended ETH-SLM, each MEP sends frames with the ETH-SLM request information to its peer MEP and receives frames with ETH-SLM reply information from its peer MEP to perform synthetic loss measurements. Single-ended ETH-SLM is used for proactive or on-demand OAM to perform synthetic loss measurements applicable to point-to-point Ethernet connection. This method allows a MEP to initiate and report far-end and near-end loss measurements associated with a pair of MEPs that are part of the same maintenance entity group (MEG).

**NOTE:** MX Series Virtual Chassis does not support Ethernet synthetic loss measurement (ETH-SLM).

---

Single-ended ETH-SLM is used to perform on-demand or proactive tests by initiating a finite amount of ETH-SLM frames to one or multiple MEP peers and receiving the ETH-SLM reply from the peers. The ETH-SLM frames contain the ETH-SLM information that is used to measure and report both near-end and far-end synthetic loss measurements. Service-level agreement (SLA) measurement is the process of monitoring the bandwidth, delay, delay variation (jitter), continuity, and availability of a service. It enables you to identify network problems before customers are impacted by network defects. In proactive mode, SLA measurements are triggered by an iterator application. An iterator is designed to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for synthetic frame loss measurement. This mode differs from on-demand SLA measurement, which is user initiated. In on-demand mode, the measurements are triggered by the user through the CLI. When the user triggers the ETH-SLM through the CLI, the SLM request that is generated is as per the frame formats specified by the ITU-T Y.1731 standard.

**NOTE:** ACX5048 and ACX5096 routers support ETH-SLM for Layer 2 services.

## Scenarios for Configuration of ETH-SLM

ETH-SLM measures near-end and far-end frame loss between two MEPs that are part of the same MEG level. You can configure ETH-SLM to measure synthetic loss for both upward-facing or upstream MEP and downward-facing or downstream MEP. This section describes the following scenarios for the operation of ETH-SLM:

### Upstream MEP in MPLS Tunnels

Consider a scenario in which a MEP is configured between the user network interfaces (UNIs) of two MX Series routers, MX1 and MX2, in the upstream direction. MX1 and MX2 are connected over an MPLS core network. ETH-SLM measurements are performed between the upstream MEP in the path linking the two routers. Both MX1 and MX2 can initiate on-demand or proactive ETH-SLM, which can measure both far-end and near-end loss at MX1 and MX2, respectively. The two UNIs are connected using MPLS-based Layer 2 VPN virtual private wire service (VPWS).

### Downstream MEP in Ethernet Networks

Consider a scenario in which a MEP is configured between two MX Series routers, MX1 and MX2, on the Ethernet interfaces in the downstream direction. MX1 and MX2 are connected in an Ethernet topology and downstream MEP is configured toward the Ethernet network. ETH-SLM measurements are performed between the downstream MEP in the path linking the two routers. ETH-SLM can be measured in the path between these two routers.

Consider another scenario in which a MEP is configured in the downstream direction and service protection for a VPWS over MPLS is enabled by specifying a working path or protect path on the MEP. Service protection provides end-to-end connection protection of the working path in the event of a failure. To configure service protection, you must create two separate transport paths—a working path and a protect path. You can specify the working path and protect path by creating two maintenance associations. To associate the maintenance association with a path, you must configure the MEP interface in the maintenance association and specify the path as working or protect.

In a sample topology, an MX Series router, MX1, is connected to two other MX Series routers, MX2 and MX3, over an MPLS core. The connectivity fault management (CFM) session between MX1 and MX2 is the working path on the MEP and the CFM session between MX1 and MX3 is the protect path on the MEP. MX2 and MX3 are, in turn, connected on Ethernet interfaces to MX4 in the access network. Downstream MEP is configured between MX1 and MX4 that passes through MX2 (working CFM session) and also between MX1 and MX4 that passes through MX3 (protected CFM session). ETH-SLM

is performed between these downstream MEPs. In both the downstream MEPs, the configuration is performed on MX1 and MX4 UNIs, similar to upstream MEP.

## Format of ETH-SLM Messages

Synthetic loss messages (SLMs) support single-ended Ethernet synthetic loss measurement (ETH-SLM) requests. This topic contains the following sections that describe the formats of the SLM protocol data units (PDUs), SLR PDUs, and the data iterator type length value (TLV).

### SLM PDU Format

The SLM PDU format is used by a MEP to transmit SLM information. The following components are contained in SLM PDUs:

- **Source MEP ID**—Source MEP ID is a 2-octet field where the last 13 least significant bits are used to identify the MEP transmitting the SLM frame. MEP ID is unique within the MEG.
- **Test ID**—Test ID is a 4-octet field set by the transmitting MEP and is used to identify a test when multiple tests run simultaneously between MEPs (including both concurrent on-demand and proactive tests).
- **TxFCf**—TxFCf is a 4-octet field that carries the number of SLM frames transmitted by the MEP toward its peer MEP.

The following are the fields in an SLM PDU:

- **MEG Level**—Configured maintenance domain level in the range 0–7.
- **Version**—0.
- **OpCode**—Identifies an OAM PDU type. For SLM, it is 55.
- **Flags**—Set to all zeros.
- **TLV Offset**—16.
- **Source MEP ID**—A 2-octet field used to identify the MEP transmitting the SLM frame. In this 2-octet field, the last 13 least significant bits are used to identify the MEP transmitting the SLM frame. MEP ID is unique within the MEG.

- RESV—Reserved fields are set to all zeros.
- Test ID—A 4-octet field set by the transmitting MEP and used to identify a test when multiple tests run simultaneously between MEPs (including both concurrent on-demand and proactive tests).
- TxFCf—A 4-octet field that carries the number of SLM frames transmitted by the MEP toward its peer MEP.
- Optional TLV—A data TLV may be included in any SLM transmitted. For the purpose of ETH-SLM, the value part of data TLV is unspecified.
- End TLV—All zeros octet value.

## SLR PDU Format

The synthetic loss reply (SLR) PDU format is used by a MEP to transmit SLR information. The following are the fields in an SLR PDU:

- MEG Level—A 3-bit field the value of which is copied from the last received SLM PDU.
- Version—A 5-bit field the value of which is copied from the last received SLM PDU.
- OpCode—Identifies an OAM PDU type. For SLR, it is set as 54.
- Flags—A 1-octet field copied from the SLM PDU.
- TLV Offset—A 1-octet field copied from the SLM PDU.
- Source MEP ID—A 2-octet field copied from the SLM PDU.
- Responder MEP ID—A 2-octet field used to identify the MEP transmitting the SLR frame.
- Test ID—A 4-octet field copied from the SLM PDU.
- TxFCf—A 4-octet field copied from the SLM PDU.
- TxFCb—A 4 octet field. This value represents the number of SLR frames transmitted for this test ID.
- Optional TLV—The value is copied from the SLM PDU, if present.
- End TLV—A 1-octet field copied from the SLM PDU.

## Data Iterator TLV Format

The data iterator TLV specifies the data TLV portion of the Y.1731 data frame. The MEP uses a data TLV when the MEP is configured to measure delay and delay variation for different frame sizes. The following are the fields in a data TLV:

- Type—Identifies the TLV type; value for this TLV type is Data (3).
- Length—Identifies the size, in octets, of the Value field containing the data pattern. The maximum value of the Length field is 1440.
- Data pattern—An  $n$ -octet ( $n$  denotes length) arbitrary bit pattern. The receiver ignores it.

## Transmission of ETH-SLM Messages

The ETH-SLM functionality can process multiple synthetic loss message (SLM) requests simultaneously between a pair of MEPs. The session can be a proactive or an on-demand SLM session. Each SLM request is identified uniquely by a test ID.

A MEP can send SLM requests or respond to SLM requests. A response to an SLM request is called a synthetic loss reply (SLR). After a MEP determines an SLM request by using the test ID, the MEP calculates the far-end and near-end frame loss on the basis of the information in the SLM message or the SLM protocol data unit (PDU).

A MEP maintains the following local counters for each test ID and for each peer MEP being monitored in a maintenance entity for which loss measurements are to be performed:

- TxFCI—Number of synthetic frames transmitted toward the peer MEP for a test ID. A source MEP increments this number for successive transmission of synthetic frames with ETH-SLM request information while a destination or receiving MEP increments this value for successive transmission of synthetic frames with the SLR information.
- RxFCI—Number of synthetic frames received from the peer MEP for a test ID. A source MEP increments this number for successive reception of synthetic frames with SLR information while a destination or receiving MEP increments it for successive reception of synthetic frames with ETH-SLM request information.

The following sections describe the phases of processing of SLM PDUs to determine synthetic frame loss:

### Initiation and Transmission of SLM Requests

A MEP periodically transmits an SLM request with the OpCode field set as 55. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFCI is sent in the packet.

No synchronization is required of the test ID value between initiating and responding MEPs because the test ID is configured at the initiating MEP, and the responding MEP uses the test ID it receives from the initiating MEP. Because ETH-SLM is a sampling

technique, it is less precise than counting the service frames. Also, the accuracy of measurement depends on the number of SLM frames used or the period for transmitting SLM frames.

## Reception of SLMs and Transmission of SLRs

After the destination MEP receives a valid SLM frame from the source MEP, an SLR frame is generated and transmitted to the requesting or source MEP. The SLR frame is valid if the MEG level and the destination MAC address match the receiving MEP's MAC address. All the fields in the SLM PDUs are copied from the SLM request except for the following fields:

- The source MAC address is copied to the destination MAC address and the source address contains the MEP's MAC address.
- The value of the OpCode field is changed from SLM to SLR (54).
- The responder MEP ID is populated with the MEP's MEP ID.
- TxFCb is saved with the value of the local counter RxFCI at the time of SLR frame transmission.
- An SLR frame is generated every time an SLM frame is received; therefore, RxFCI in the responder is equal to the number of SLM frames received and also equal to the number of SLR frames sent. At the responder or receiving MEP, RxFCI equals TxFCI.

## Reception of SLRs

After an SLM frame (with a given TxFCf value) is transmitted, a MEP expects to receive a corresponding SLR frame (carrying the same TxTCf value) within the timeout value from its peer MEP. SLR frames that are received after the timeout value (5 seconds) are discarded. With the information contained in SLR frames, a MEP determines the frame loss for the specified measurement period. The measurement period is a time interval during which the number of SLM frames transmitted is statistically adequate to make a measurement at a given accuracy. A MEP uses the following values to determine near-end and far-end frame loss during the measurement period:

- Last received SLR frame's TxFCf and TxFCb values and the local counter RxFCI value at the end of the measurement period. These values are represented as TxFCf[tc], TxFCb[tc], and RxFCI[tc], where tc is the end time of the measurement period.
- SLR frame's TxFCf and TxFCb values of the first received SLR frame after the test starts and local counter RxFCI at the beginning of the measurement period. These values are represented as TxFCf[tp], TxFCb[tp], and RxFCI[tp], where tp is the start time of the measurement period.

For each SLR packet that is received, the local RxFCI counter is incremented at the sending or source MEP.

## Computation of Frame Loss

Synthetic frame loss is calculated at the end of the measurement period on the basis of the value of the local counters and the information from the last frame received. The

last received frames contains the TxFCf and TxFCb values. The local counter contains the RxFCI value. Using these values, frame loss is determined using the following formula:

Frame loss (far-end) = TxFCf – TxFCb

Frame loss (near-end) = TxFCb – RxFCI

## Guidelines for Configuring ETH-SLM

Keep the following points in mind when you configure the ETH-SLM functionality:

- The monitoring application for Ethernet OAM is initiated in the master Routing Engine. When a stateful switchover process occurs, the monitoring application is disabled. For on-demand ETH-SLM, graceful Routing Engine switchover (GRES) support is not applicable. For proactive ETH-SLM, the service-level agreement (SLA) iterators are restored during a stateful switchover process. If the adjacencies do not time out, the ETH-SLM statistics are preserved and proactive ETH-SLM supports GRES.
- ETH-SLM is initiated only when the MEP session is up. Unified in-service software upgrade (ISSU) support for ETH-SLM depends on the unified ISSU support for CFM. For CFM, unified ISSU is supported using the loss threshold TLV to avoid CFM connectivity loss during the upgrade. The receiving or the destination MEP increases the threshold time during the termination of sessions. If you start a unified ISSU operation when on-demand ETH-SLM is in progress, the SLM request and reply messages are lost at the local Packet Forwarding Engine.

When an on-demand ETH-SLM is requested, if the local source MEP undergoes a unified ISSU, a message is displayed stating that the MEP is undergoing a unified ISSU. If the remote MEP is undergoing a unified ISSU (detected through the loss threshold TLV), a message is displayed stating that the remote MEP is undergoing a unified ISSU. Also, if it is not possible to identify whether unified ISSU is in progress on a remote MEP, the SLM packets are lost at the system where unified ISSU is in progress and the loss calculation results do not provide a valid cause for the loss. Unified ISSU is not supported for both on-demand and proactive ETH-SLM.

- The maximum number of SLA iterator profiles that can be configured in the system is 255.

- ETH-SLM is not supported for virtual private LAN service (VPLS) (point-to-multipoint measurements are not supported). The ETH-SLM frames are not generated with multicast class 1 destination address. Similarly, ETH-SLM does not respond to ETH-SLM requests with multicast DA. ETH-SLM for VPLS for point-to-point Ethernet connection is supported using directed unicast destination MAC addresses, although point-to-multipoint topologies are not supported.
- A unicast destination address may be used in provisioned environments for point-to-point connections. However, it requires that the unicast destination address of the downstream MEP must have been configured on the MEP transmitting an alarm indication signal (AIS).
- ETH-SLM is not supported on downstream MEPs on label-switched interfaces (LSIs).
- ETH-SLM is supported on aggregated Ethernet (ae) interfaces
- The number of ETH-SLM sessions for proactive ETH-SLM that can be supported is limited to the total number of iterators that can be supported in the system. This limitation includes the iterator support for other measurement types such as loss, statistical frame loss, and two-way delay. A new iterator type, SLM, is added to support ETH-SLM. The total number of SLA iterators that you can configure in the system is equal to the total number of iterations supported in the system.
- For on-demand SLM, the minimum period between two SLM requests is 100 milliseconds.
- For proactive SLM, the minimum period between two SLM requests is 10 milliseconds for distributed mode and 100 milliseconds for non-distributed mode.
- ETH-SLM frames are always marked as drop-ineligible in compliance with the ITU-T Y.1731 standard.

- [Troubleshooting Failures with ETH-SLM on page 691](#)

---

## Starting a Proactive ETH-SLM Session

To start a proactive Ethernet synthetic loss measurement (ETH-SLM) session, you must configure the Ethernet interfaces on maintenance association end points (MEPs) on which packets transmitted with synthetic frame loss need to be analyzed. You must then

create an iterator profile to transmit service-level agreement (SLA) measurement packets for ETH-SLM and associate the local and remote MEPs with the profile.

- [Configuring MEP Interfaces on page 682](#)
- [Configuring an Iterator Profile for ETH-SLM on page 683](#)
- [Associating the Iterator Profile with MEPs for ETH-SLM on page 684](#)

## Configuring MEP Interfaces

Before you can start an Ethernet synthetic frame loss measurement session across an Ethernet service, you must configure two ACX Series routers to support ETH-SLM.

To configure an Ethernet interface on an ACX Series router to support ETH-SLM:

1. On each router, configure two physical or logical Ethernet interfaces connected by a VLAN. The following configuration is typical for single-tagged logical interfaces:

```
[edit interfaces]
interface {
 ethernet-interface-name {
 vlan-tagging;
 unit logical-unit-number {
 vlan-id vlan-id; # Both interfaces on this VLAN
 }
 }
}
```

Both interfaces will use the same VLAN ID.

2. On each router, attach peer MEPs to the two interfaces. The following configuration is typical:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain md-name { # On both routers
 level number;
 maintenance-association ma-name { # On both routers
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 mep mep-id { # Attach to VLAN interface
 auto-discovery;
 direction (up | down);
 interface interface-name;
 priority number;
 }
 }
 }
 }
 }
}
```

```
}
```

## Configuring an Iterator Profile for ETH-SLM

You can create an iterator profile with its parameters to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for synthetic loss measurement.

**NOTE:** ACX5048 and ACX5096 routers supports iterator cycle time of only 1 second and above.

To create an iterator profile:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
performance-monitoring
```

2. Configure the SLA measurement monitoring iterator:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# edit sla-iterator-profiles
```

3. Configure an iterator profile—for example, i1:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles]
user@host# set i1
```

4. (Optional) Configure the cycle time, which is the amount of time (in milliseconds) between back-to-back transmission of SLA frames for one connection, with a value from 10 through 3,600,000. The default value is 1000 ms.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set cycle-time cycle-time-value
```

5. (Optional) Configure the iteration period, which indicates the maximum number of cycles per iteration (the number of connections registered to an iterator cannot exceed this value), with a value from 1 through 2000. The default value is 2000.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set iteration-period iteration-period-value
```

6. Configure the measurement type as synthetic loss measurement.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set measurement-type slm
```

7. Configure the **disable** statement to stop the iterator (that is, disable the iterator profile).

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set disable
```

8. Verify the configuration.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles]
user@host# show i1
 cycle-time cycle-time-value;
 iteration-period iteration-period-value;
 measurement-type slm;
```

## Associating the Iterator Profile with MEPs for ETH-SLM

You can associate a remote maintenance association end point (MEP) with more than one iterator profile.

To configure a remote MEP with an iterator profile:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit protocols oam ethernet connectivity-fault-management
maintenance-domain md-name maintenance-association ma-name mep mep-id
```

2. Configure the remote MEP ID with a value from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name mep mep-id]
user@host# set remote-mep remote-mep-id
```

3. Set the iterator profile.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name mep mep-id remote-mep
remote-mep-id]
user@host# set sla-iterator-profile profile-name
```

4. (Optional) Set the size of the data TLV portion of the Y.1731 data frame with a value from 1 through 1400 bytes. The default value is 1.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set data-tlv-size size
```

5. (Optional) Set the iteration count, which indicates the number of iterations for which this connection should partake in the iterator for acquiring SLA measurements, with a value from 1 through 65,535. The default value is 0 (that is, infinite iterations).

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set iteration-count count-value
```

6. (Optional) Set the priority, which is the **vlan-pcp** value that is sent in the Y.1731 data frames, with a value from 0 through 7. The default value is 0.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set priority priority-value
```

7. Verify the configuration.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep
 remote-mep-id]
user@host# show
sla-iterator-profile profile-name {
 data-tlv-size size;
 iteration-count count-value;
 priority priority-value;
}
```

## Starting an On-Demand ETH-SLM Session

To start an on-demand Ethernet synthetic loss measurement (ETH-SLM) session, type the **monitor ethernet synthetic-loss-measurement one-way** command in operational mode, and specify the peer MEP by its MAC address or by its MEP identifier.

For example:

```
user@host> monitor ethernet synthetic-loss-measurement 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10
```

```
ETH-SLM request to 00:05:85:73:39:4a, interface ge-1/0/0.0
```

```
Synthetic Loss measurement statistics:
```

```
SLM packets sent : 100
SLR packets received : 100
Accumulated SLM statistics:
Local TXFC1 value : 100
Local RXFC1 value : 100
Last Received SLR frame TXFCf(tc) : 100
Last Received SLR frame TXFCb(tc) : 100
SLM Frame Loss:
Frame Loss (far-end) : 0 (0.00 %)
Frame Loss (near-end) : 0 (0.00 %)
```

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl + C to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

- [Clearing Iterator Statistics on page 690](#)

## Displaying ETH-SLM Statistics Only

**Purpose** Display on-demand ETH-SLM statistics.

By default, the **show oam ethernet connectivity-fault-management synthetic-loss-statistics** command displays on-demand ETH-SLM statistics for MEPs in the specified CFM maintenance association within the specified CFM maintenance domain.

**Action** • To display the on-demand ETH-SLM statistics collected for MEPs belonging to maintenance association **ma1** within maintenance domain **md1**:

```
user@host> show oam ethernet connectivity-fault-management synthetic-loss-statistics
maintenance-domain md1 maintenance-association ma1
```

• To display the on-demand ETH-SLM statistics collected for ETH-SLM sessions for the local MEP **201** belonging to maintenance association **ma2** within maintenance domain **md2**:

```
user@host> show oam ethernet connectivity-fault-management synthetic-loss-statistics
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

• To display the on-demand ETH-SLM statistics collected for ETH-SLM sessions from local MEPs belonging to maintenance association **ma3** within maintenance domain **md3** to the remote MEP **302**:

```
user@host> show oam ethernet connectivity-fault-management synthetic-loss-statistics
maintenance-domain md3 maintenance-association ma3 remote-mep 302
```

**Meaning** The output displays on-demand ETH-SLM statistics for MEPs in the specified maintenance association within the specified maintenance domain. For details about the output of this command and the descriptions of the output fields, see **show oam ethernet connectivity-fault-management synthetic-loss-statistics**.

**See Also** • **show oam ethernet connectivity-fault-management synthetic-loss-statistics**

## Displaying ETH-SLM Statistics and Frame Counts

**Purpose** Display on-demand ETH-SLM statistics and ETH-SLM frame counts.

By default, the **show oam ethernet connectivity-fault-management mep-statistics** command displays on-demand ETH-SLM statistics and frame counts for MEPs in the specified CFM maintenance association within the specified CFM maintenance domain.

- Action**
- To display the on-demand ETH-SLM statistics and ETH-SLM frame counts for MEPs in maintenance association **ma1** within maintenance domain **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md1 maintenance-association ma1
```

- To display the on-demand ETH-SLM statistics and ETH-SLM frame counts for the local MEP **201** in maintenance association **ma2** within maintenance domain **md2**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

- To display the on-demand ETH-SLM statistics and ETH-SLM frame counts for the local MEP in maintenance association **ma3** within maintenance domain **md3** that participates in an ETH-SLM session with the remote MEP **302**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain ma3 maintenance-association ma3 remote-mep 302
```

**Meaning** The output displays on-demand ETH-SLM statistics and ETH-SLM frame counts for MEPs in the specified maintenance association within the specified maintenance domain. For details about the output of this command and the descriptions of the output fields, see **show oam ethernet connectivity-fault-management mep-statistics**.

**See Also**

- **show oam ethernet connectivity-fault-management mep-statistics**

## Displaying ETH-SLM Frame Counts for MEPs by Enclosing CFM Entity

**Purpose** Display on-demand ETH-SLM frame counts for CFM maintenance association end points (MEPs).

By default, the **show oam ethernet connectivity-fault-management mep-database** command displays CFM database information for MEPs in the specified CFM maintenance association within the specified CFM maintenance domain.

**NOTE:** At the router attached to the initiator MEP for a one-way session, or at the router attached to the receiver MEP for a two-way session, you can only display the ETH-SLM frame counts and not the MEP database details.

- Action**
- To display CFM database information (including ETH-SLM frame counts) for all MEPs in MA **ma1** within maintenance domain **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain ma1 maintenance-association ma1
```

- To display CFM database information (including ETH-SLM frame counts) only for the local MEP 201 in MA **ma1** within maintenance domain **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

- To display CFM database information (including ETH-SLM frame counts) only for the remote MEP 302 in MA **ma3** within maintenance domain **md3**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain ma3 maintenance-association ma3 remote-mep 302
```

**Meaning** The output displays ETH-SLM frame counts for MEPs within a particular maintenance domain, or for a specific local or remote MEP. For details about the output of this command and the descriptions of the output fields, see **show oam ethernet connectivity-fault-management mep-database**.

**See Also** • **show oam ethernet connectivity-fault-management mep-database**

## Displaying ETH-SLM Frame Counts for MEPs by Interface or Domain Level

**Purpose** Display on-demand ETH-SLM frame counts for CFM maintenance association end points (MEPs).

By default, the **show oam ethernet connectivity-fault-management interfaces** command displays CFM database information for MEPs attached to CFM-enabled Ethernet interfaces on the router or at a maintenance domain level. For Ethernet interfaces that support ETH-SLM, any frame counts are also displayed when you specify the **detail** or **extensive** command option.

**NOTE:** At the router attached to the initiator MEP, you can only display the ETH-SLM frame counts and not the MEP database details.

**Action** • To display CFM database information (including ETH-SLM frame counts) for all MEPs attached to CFM-enabled Ethernet interfaces on the router:

```
user@host> show oam ethernet connectivity-fault-management interfaces detail
```

- To display CFM database information (including ETH-SLM frame counts) only for the MEPs attached to CFM-enabled router interface **ge-5/2/9.0**:

```
user@host> show oam ethernet connectivity-fault-management interfaces ge-5/2/9.0 detail
```

- To display CFM database information (including ETH-SLM frame counts) only for MEPs enclosed within CFM maintenance domains at level **6**:

```
user@host> show oam ethernet connectivity-fault-management interfaces level 6 detail
```

**Meaning** The output displays ETH-SLM frame counts for MEPs for the specified interface. For details about the output of this command and the descriptions of the output fields, see **show oam ethernet connectivity-fault-management interfaces**.

**See Also** • **show oam ethernet connectivity-fault-management interfaces**

## Clearing ETH-SLM Statistics and Frame Counts

**Purpose** Clear the on-demand ETH-SLM statistics and ETH-SLM frame counts.

By default, statistics and frame counts are deleted for all MEPs attached to CFM-enabled interfaces on the router. However, you can filter the scope of the command by specifying an interface name.

**Action** • To clear the on-demand ETH-SLM statistics and ETH-SLM frame counts for all MEPs attached to CFM-enabled interfaces on the router:

```
user@host> clear oam ethernet connectivity-fault-management synthetic-loss-measurement
```

• To clear the on-demand ETH-SLM statistics and ETH-SLM frame counts only for MEPs attached to the logical interface **ge-0/5/9.0**:

```
user@host> clear oam ethernet connectivity-fault-management synthetic-loss-measurement
ge-0/5/9.0
```

## Clearing Iterator Statistics

**Purpose** Clear the existing iterator statistics and proactive ETH-SLM counters.

Multiple iterators can be associated with remote MEP. However, by default, only one result pertaining to one iterator profile can be cleared.

**Action** • To clear the iterator statistics for remote MEP 1 and iterator profile i1 with MEPs belonging to the maintenance association **ma1** within the maintenance domain **default-1**:

```
user@host> clear oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i1 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```

• To clear the iterator statistics for remote MEP 1 and iterator profile i2 with MEPs belonging to the maintenance association **ma1** within the maintenance domain **default-1**:

```
user@host> clear oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i2 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```

## Troubleshooting Failures with ETH-SLM

**Problem** **Description:** The Ethernet synthetic loss measurement (ETH-SLM) application is not working properly for calculation of frame loss using synthetic frames instead of data traffic

**Solution** Perform the following steps to analyze and debug any problems with the ETH-SLM functionality.

1. Ensure that ETH-SLM is configured (either proactive or on-demand) to initiate SLM frames. Verify the configuration settings.
2. Examine any failures that might have occurred in the CFM session for which the ETH-SLM feature is enabled. The CFM session must be in the up state for the ETH-SLM functionality to work correctly. Use the **show oam ethernet connectivity-fault-management mep-database maintenance-domain *md-name* maintenance-association *ma-name* local-mep *mep-id* remote-mep *remote-mep-id*** command to verify whether the CFM session is in the up state.
3. If the MEP sessions are active, use the appropriate show command to verify the ETH-SLM statistics and to analyze if ETH-SLM frames are transmitted or received.
4. If the transmission of ETH-SLM frames does not happen correctly after you attempt all of the preceding troubleshooting steps, enable the tracing operations for Ethernet CFM by including the **traceoptions** statement at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

```
[edit protocols oam ethernet connectivity-fault-management]
traceoptions {
 file <filename> <files number> <match regular-expression> microsecond-stamp>>
 <size size> <world-readable | no-world-readable>;
```

```
flag flag;
no-remote-trace;
}
```

## Configuring an Iterator Profile

You can create an iterator profile with its parameters to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for delay measurement or loss measurement.

To create an iterator profile:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
performance-monitoring
```

2. Configure the SLA measurement monitoring iterator:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# edit sla-iterator-profiles
```

3. Configure an iterator profile—for example, i1:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles]
user@host# set i1
```

4. (Optional) Configure the cycle time, which is the amount of time (in milliseconds) between back-to-back transmission of SLA frames for one connection, with values from 10 through 3,600,000. The default value is 1000 ms.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set cycle-time cycle-time-value
```

5. (Optional) Configure the iteration period, which indicates the maximum number of cycles per iteration (the number of connections registered to an iterator cannot exceed this value), with values from 1 through 2000. The default value is 2000.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set iteration-period iteration-period-value
```

6. Configure the measurement type as loss measurement, statistical frame-loss measurement, or two-way delay measurement.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set measurement-type (loss | statistical-frame-loss | two-way-delay)
```

7. (Optional) Configure the calculation weight for delay with values from 1 through 65,535. The default value is 1 (applicable only for two-way delay measurement).

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set calculation-weight delay delay-value
```

8. (Optional) Configure the calculation weight for delay variation with values from 1 through 65,535. The default value is 1 (applicable only for two-way delay measurement).

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set calculation-weight delay-variation delay-variation-value
```

9. (Optional) Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. The range is from 1 through 4294967295 microseconds.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set avg-fd-twoway-threshold avg-fd-twoway-threshold-value
```

10. (Optional) Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When

the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. The range is from 1 through 4294967295 microseconds.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set avg-ifdv-twoway-threshold avg-ifdv-twoway-threshold-value
```

11. (Optional) Configure the threshold value for average frame loss ratio, in milli-percent, in the upward or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. The range is from 1 through 100000 milli-percent.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set avg-flr-forward-threshold avg-flr-forward-threshold-value
```

12. (Optional) Configure the threshold value for average frame loss ratio, in milli-percent, in the backward or downstream direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average backward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. The range is from 1 through 100000 milli-percent.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set avg-flr-backward-threshold avg-flr-backward-threshold-value
```

13. Configure the **disable** statement to stop the iterator (that is, disable the iterator profile).

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles i1]
user@host# set disable
```

14. Verify the configuration.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles]
user@host# show i1
 cycle-time cycle-time-value;
 iteration-period iteration-period-value;
 measurement-type (loss | two-way-delay);
 avg-fd-twoway-threshold avg-fd-twoway-threshold-value;
 avg-ifdv-twoway-threshold avg-ifdv-twoway-threshold-value;
 avg-flr-forward-threshold avg-flr-forward-threshold-value;
 avg-flr-backward-threshold avg-flr-backward-threshold-value;
 calculation-weight {
 delay delay-weight;
 delay-variation delay-variation-weight;
 }
```

```
calculation-weight {
 delay delay-weight;
 delay-variation delay-variation-weight;
}
```

  - [Verifying the Configuration of an Iterator Profile on page 695](#)
  - [Managing Iterator Statistics on page 698](#)

## Verifying the Configuration of an Iterator Profile

The following topics illustrate the configuration of an iterator profile for a two-way delay measurement, for loss measurement, and for a remote maintenance association end point (MEP). The topics also illustrate disabling an iterator profile with the **disable** statement for two-way measurement and deactivating an iterator profile with the **deactivate** command for a remote MEP.

- [Displaying the Configuration of an Iterator Profile for Two-way Delay Measurement on page 695](#)
- [Displaying the Configuration of an Iterator Profile for Loss Measurement on page 696](#)
- [Displaying the Configuration of a Remote MEP with an Iterator Profile on page 696](#)
- [Disabling an Iterator Profile on page 697](#)

## Displaying the Configuration of an Iterator Profile for Two-way Delay Measurement

**Purpose** Display the configuration of an iterator profile for two-way delay measurement as configured in the “[Configuring an Iterator Profile](#)” on [page 692](#) topic with the following values:

- **profile-name**—*i1*
- **cycle-time**—**1000** milliseconds
- **iteration-period**—**2000** cycles per second
- **delay**—**1**
- **delay-variation**—**1**:

**Action** To display information about the iterator profile, run the **show** command at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
 sla-iterator-profiles]
user@host# show
```

```
il {
 cycle-time 1000;
 iteration-period 2000;
 measurement-type two-way-delay;
 calculation-weight {
 delay 1;
 delay-variation 1;
 }
}
```

**Meaning** The configuration for an iterator profile for two-way measurement is displayed as expected with set values.

### Displaying the Configuration of an Iterator Profile for Loss Measurement

**Purpose** Display the configuration of an iterator profile for loss measurement as configured in the [“Configuring an Iterator Profile” on page 692](#) topic with the following values:

- **profile-name—12**
- **cycle-time—1000** milliseconds
- **iteration-period—2000** cycles per second

**Action** To display information about the iterator profile, run the **show** command at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
sla-iterator-profiles]
user@host# show
12 {
 cycle-time 1000;
 iteration-period 2000;
 measurement-type loss;
}
```

**Meaning** The configuration for an iterator profile for loss measurement is displayed as expected with set values.

### Displaying the Configuration of a Remote MEP with an Iterator Profile

**Purpose** Display the configuration of a remoteMEP as configured in the [“Configuring a Remote MEP with an Iterator Profile” on page 703](#) topic with the following values:

- **profile-name—i3**
- **maintenance-domain—default-1**
- **maintenance-association—1**

- **short-name-format—2octet**
- **mep—1**
- **remote-mep—1**
- **data-tlv-size—1**
- **iteration-count—1**
- **priority—1**

**Action** To display information about the remote MEP, run the **show** command at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain default-1 maintenance association ma1 mep 1 remote-mep 1]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 default-1 maintenance association 1 short-name-format 2octet mep 1 remote-mep 1]
user@host# show
sla-iterator-profile i3 {
 data-tlv-size 1;
 iteration-count 1;
 priority 1;
}
```

**Meaning** The configuration for a remote MEP for two-way measurement is displayed as expected with set values.

## Disabling an Iterator Profile

**Purpose** To disable an iterator profile for two-way delay measurement and for a remote MEP.

**Action**

- To disable an iterator profile (for example, i1) with the **disable** configuration command for two-way measurement at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles i1]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring
 sla-iterator-profiles i1]
user@host# disable
```

- To disable an iterator profile for a remote MEP (for example, i2) with the **deactivate** configuration command at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain default-1 maintenance association ma1 mep 1 remote-mep 1]** hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 default-1 maintenance association ma1 mep 1 remote-mep 1]
user@host# deactivate sla-iterator-profile i2
```

- Related Documentation**
- [Proactive Mode for SLA Measurement on page 671](#)

## Managing Iterator Statistics

- [Displaying Iterator Statistics on page 698](#)
- [Clearing Iterator Statistics on page 702](#)

### Displaying Iterator Statistics

**Purpose** Retrieve and display iterator statistics.

Multiple iterators can be associated with a remote MEP. However, by default, only one result pertaining to one iterator profile is displayed.

- Action**
- To display the iterator statistics for remote MEP **1** and iterator profile **i1** with MEPs belonging to the maintenance association **ma1** and within the maintenance domain **default-1** (here, the iterator profile **i1** is configured for two-way delay measurement):

```
user@host> show oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i1 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```

```
Iterator statistics:
Maintenance domain: md6, Level: 6
Maintenance association: ma6, Local MEP id: 1000
Remote MEP id: 103, Remote MAC address: 00:90:69:0a:43:92
Iterator name: i1, Iterator Id: 1
Iterator cycle time: 10ms, Iteration period: 1 cycles
Iterator status: running, Infinite iterations: true
Counter reset time: 2010-03-19 20:42:39 PDT (2d 18:24 ago)
Reset reason: Adjacency flap

Iterator delay measurement statistics:
Delay weight: 1, Delay variation weight: 1
DMM sent : 23898520
DMM skipped for threshold hit : 11000
DMM skipped for threshold hit window : 0
DMR received : 23851165
DMR out of sequence : 1142
DMR received with invalid time stamps : 36540
Average two-way delay : 129 usec
Average two-way delay variation : 15 usec
Average one-way forward delay variation : 22 usec
Average one-way backward delay variation : 22 usec
Weighted average two-way delay : 134 usec
Weighted average two-way delay variation : 8 usec
Weighted average one-way forward delay variation : 6 usec
Weighted average one-way backward delay variation : 2 usec
```

Output fields are listed in the approximate order in which they appear.

*Table 90: Displaying Iterator Statistics for Ethernet Delay Measurement Output Fields*

| Output Field Name                    | Output Field Description                                                                                     |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Maintenance domain                   | Maintenance domain name.                                                                                     |
| Level                                | Maintenance domain level configured.                                                                         |
| Maintenance association              | Maintenance association name.                                                                                |
| Local MEP id                         | Numeric identifier of the local MEP.                                                                         |
| Remote MEP id                        | Numeric identifier of the remote MEP.                                                                        |
| Remote MAC address                   | Unicast MAC address of the remote MEP.                                                                       |
| Iterator name                        | Name of iterator.                                                                                            |
| Iterator Id                          | Numeric identifier of the iterator.                                                                          |
| Iterator cycle time                  | Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection |
| Iteration period                     | Maximum number of cycles per iteration                                                                       |
| Iterator status                      | Current status of iterator whether running or stopped.                                                       |
| Infinite iterations                  | Status of iteration as infinite or finite.                                                                   |
| Counter reset time                   | Date and time when the counter was reset.                                                                    |
| Reset reason                         | Reason to reset counter.                                                                                     |
| Delay weight                         | Calculation weight of delay.                                                                                 |
| Delay variation weight               | Calculation weight of delay variation.                                                                       |
| DMM sent                             | Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.                             |
| DMM skipped for threshold hit        | Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.                      |
| DMM skipped for threshold hit window | Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.      |
| DMR received                         | Number of delay measurement reply (DMR) frames received.                                                     |
| DMR out of sequence                  | Total number of DMR out of sequence packets received.                                                        |

Table 90: Displaying Iterator Statistics for Ethernet Delay Measurement Output Fields (continued)

| Output Field Name                                 | Output Field Description                                                                        |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------|
| DMR received with invalid time stamps             | Total number of DMR frames received with invalid timestamps.                                    |
| Average two-way delay                             | Average two-way frame delay for the statistics displayed.                                       |
| Average two-way delay variation                   | Average two-way "frame jitter" for the statistics displayed.                                    |
| Average one-way forward delay variation           | Average one-way forward delay variation for the statistics displayed in microseconds.           |
| Average one-way backward delay variation          | Average one-way backward delay variation for the statistics displayed in microseconds.          |
| Weighted average two-way delay                    | Weighted average two-way delay for the statistics displayed in microseconds.                    |
| Weighted average two-way delay variation          | Weighted average two-way delay variation for the statistics displayed in microseconds.          |
| Weighted average one-way forward delay variation  | Weighted average one-way forward delay variation for the statistics displayed in microseconds.  |
| Weighted average one-way backward delay variation | Weighted average one-way backward delay variation for the statistics displayed in microseconds. |

- To display the iterator statistics for remote MEP 1 and iterator profile i2 with MEPs belonging to the maintenance association ma1 and within the maintenance domain default-1 (here, the iterator profile i1 is configured for loss measurement):

```
user@host> show oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i2 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```

```
Iterator statistics:
Maintenance domain: md6, Level: 6
Maintenance association: ma6, Local MEP id: 1000
Remote MEP id: 103, Remote MAC address: 00:90:69:0a:43:92
Iterator name: i2, Iterator Id: 2
Iterator cycle time: 1000ms, Iteration period: 2000 cycles
Iterator status: running, Infinite iterations: true
Counter reset time: 2010-03-19 20:42:39 PDT (2d 18:25 ago)
Reset reason: Adjacency flap
```

```
Iterator loss measurement statistics:
LMM sent : 238970
LMM skipped for threshold hit : 60
LMM skipped for threshold hit window : 0
LMR received : 238766
LMR out of sequence : 43
```

```

Accumulated transmit statistics:
Near-end (CIR) : 0
Far-end (CIR) : 0
Near-end (EIR) : 0
Far-end (EIR) : 0

Accumulated loss statistics:
Near-end (CIR) : 0 (0.00%)
Far-end (CIR) : 0 (0.00%)
Near-end (EIR) : 0 (0.00%)
Far-end (EIR) : 0 (0.00%)

Last loss measurement statistics:
Near-end (CIR) : 0
Far-end (CIR) : 0
Near-end (EIR) : 0
Far-end (EIR) : 0

```

Output fields are listed in the approximate order in which they appear.

**Table 91: Displaying Iterator Statistics for Ethernet Loss Measurement Output Fields**

| Output Field Name       | Output Field Description                                                                                     |
|-------------------------|--------------------------------------------------------------------------------------------------------------|
| Maintenance domain      | Maintenance domain name.                                                                                     |
| Level                   | Maintenance domain level configured.                                                                         |
| Maintenance association | Maintenance association name.                                                                                |
| Local MEP id            | Numeric identifier of the local MEP.                                                                         |
| RemoteMEP identifier    | Numeric identifier of the remote MEP.                                                                        |
| Remote MAC address      | Unicast MAC address of the remote MEP.                                                                       |
| Iterator name           | Name of iterator.                                                                                            |
| Iterator Id             | Numeric identifier of the iterator.                                                                          |
| Iterator cycle time     | Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection |
| Iteration period        | Maximum number of cycles per iteration                                                                       |
| Iterator status         | Current status of iterator whether running or stopped.                                                       |
| Infinite iterations     | Status of iteration as infinite or finite.                                                                   |
| Counter reset time      | Date and time when the counter was reset.                                                                    |
| Reset reason            | Reason to reset counter.                                                                                     |
| LMM sent                | Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.                    |

Table 91: Displaying Iterator Statistics for Ethernet Loss Measurement Output Fields (continued)

| Output Field Name                    | Output Field Description                                                                                |
|--------------------------------------|---------------------------------------------------------------------------------------------------------|
| LMM skipped for threshold hit        | Number of LMM frames sent to the peer MEP in this session skipped during threshold hit.                 |
| LMM skipped for threshold hit window | Number of LMM frames sent to the peer MEP in this session skipped during the last threshold hit window. |
| LMR received                         | Number of LMRs frames received.                                                                         |
| LMR out of sequence                  | Total number of LMR out of sequence packets received.                                                   |
| Near-end (CIR)                       | Frame loss associated with ingress data frames for the statistics displayed.                            |
| Far-end (CIR)                        | Frame loss associated with egress data frames for the statistics displayed.                             |
| Near-end (EIR)                       | Frame loss associated with ingress data frames for the statistics displayed.                            |
| Far-end (EIR)                        | Frame loss associated with egress data frames for the statistics displayed.                             |

## Clearing Iterator Statistics

**Purpose** Clear iterator statistics.

Multiple iterators can be associated with remote MEP. However, by default, only one result pertaining to one iterator profile can be cleared.

- Action**
- To clear the iterator statistics for remote MEP 1 and iterator profile i1 with MEPs belonging to the maintenance association **ma1** and within the maintenance domain **default-1**:
 

```
user@host> clear oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i1 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```
  - To clear the iterator statistics for remote MEP 1 and iterator profile i2 with MEPs belonging to the maintenance association **ma1** and within the maintenance domain **default-1**:

```
user@host> clear oam ethernet connectivity-fault-management sla-iterator-statistics
sla-iterator i2 maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 1
```

## Configuring a Remote MEP with an Iterator Profile

You can associate a remote maintenance association end point (MEP) with more than one iterator profile.

To configure a remote MEP with an iterator profile:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit protocols oam ethernet connectivity-fault-management
maintenance-domain md-name maintenance-association ma-name mep mep-id
```

2. Configure the remote MEP with values from 1 through 8191.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name mep mep-id]
user@host# set remote-mep remote-mep-id
```

3. Set the iterator profile.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name mep mep-id remote-mep
remote-mep-id]
user@host# set sla-iterator-profile profile-name
```

4. (Optional) Set the size of the data TLV portion of the Y.1731 data frame with values from 1 through 1400 bytes. The default value is 1.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set data-tlv-size size
```

5. (Optional) Set the iteration count, which indicates the number of iterations for which this connection should partake in the iterator for acquiring SLA measurements, with values from 1 through 65,535. The default value is 0 (that is, infinite iterations).

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set iteration-count count-value
```

6. (Optional) Set the priority, which is the **vlan-pcp** value that is sent in the Y.1731 data frames, with values from 0 through 7. The default value is 0.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id
 sla-iterator-profile profile-name]
user@host# set priority priority-value
```

7. Verify the configuration.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep
 remote-mep-id]
user@host# show
sla-iterator-profile profile-name {
 data-tlv-size size;
 iteration-count count-value;
 priority priority-value;
}
```

## Damping CFM performance Monitoring Traps and Notifications to Prevent Congestion of The NMS

You can dampen the performance monitoring threshold-crossing traps and notifications that are generated every time a threshold-crossing event occurs to prevent congestion of the network management system (NMS).

Damping limits the number of `jnxSoamPmThresholdCrossingAlarm` traps sent to the NMS by summarizing the flap occurrences over a period of time, known as the flap trap timer, and sends a single `jnxSoamPmThresholdFlapAlarm` notification to the NMS. You can configure the duration of the flap trap timer to any value from 1 through 360 seconds.

The `jnxSoamPmThresholdFlapAlarm` notification is generated and sent when the following conditions are met:

- At least one flap has occurred when the flap timer has expired.
- You changed the value of the flap trap timer, which caused the timer to stop.

You can enable damping at the global level for the iterator or you can enable damping at the individual threshold type of the iterator. For instance, to enable damping at the global level, for the iterator, use the following command: **`set protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name flap-trap-monitor`**. To enable damping at a specific threshold type, for the **`avg-fd-twoway-threshold`**, use the following command: **`set protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name avg-fdv-twoway-threshold flap-trap-monitor`**.

You can also disable damping.

## Configuring Statistical Frame Loss Measurement for VPLS Connections

Using proactive statistical frame loss measurement, you can monitor VPLS connections on MX Series routers. Statistical frame loss measurement allows you to monitor the quality of Ethernet connections for service level agreements (SLAs). Point-to-point and multipoint-to-multipoint connections configured on MX Series routers can be monitored by registering the connection on an iterator and initiating periodic SLA measurement of frame transmissions on the connections.

Iterators periodically transmit SLA measurement packets using ITU-Y.1731 compliant frames. The iterator sends periodic measurement packets for each of the connections registered to it. These measurement cycles are transmitted in such a way as to not overlap, reducing the processing demands placed on the CPU. The measurement packets are exchanged between the source user network interface (UNI) port and the destination UNI port, providing a sequence of timed performance measurements for each UNI pair. The Frame Loss Ratio (FLR) and connection availability can be computed from these measurements using statistics.

The following steps outline how to configure statistical frame loss measurement for VPLS connections:

1. To configure proactive ETH-DM measurement for a VPLS connection, see [“Guidelines for Configuring Routers to Support an ETH-DM Session” on page 706](#).
2. To enable statistical loss measurement for a VPLS connection, configure an iterator for the VPLS connection using the `sla-iterator-profiles` statement at the `[edit protocols oam ethernet connectivity-fault-management performance-monitoring]` hierarchy level. For detailed instructions, see [“Configuring an Iterator Profile” on page 692](#).
3. As part of the iterator configuration, include the `statistical-frame-loss` option for the `measurement-type` statement at the `[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles profile-name]` hierarchy level.
4. Once you have enabled the iterator, you can display the statistical frame loss for a VPLS connection by issuing the `show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator identifier maintenance-domain name maintenance-association name local-mep identifier remote-mep identifier` command.

## Guidelines for Configuring Routers to Support an ETH-DM Session

Keep the following guidelines in mind when configuring routers to support an Ethernet frame delay measurement (ETH-DM) session:

- [Configuration Requirements for ETH-DM on page 706](#)
- [Configuration Options for ETH-DM on page 707](#)

### Configuration Requirements for ETH-DM

You can obtain ETH-DM information for a link that meets the following requirements:

- The measurements can be performed between peer maintenance association endpoints (MEPs) on two routers.
- The two MEPs must be configured on two Ethernet physical interfaces or on two Ethernet logical interfaces. For more information, see [“Configuring a MEP to Generate and Respond to CFM Protocol Messages” on page 551](#).
- The two MEPs must be configured—on their respective routers—under the same maintenance association (MA) identifier. For more information, see [“Creating a Maintenance Association” on page 548](#).

- On both routers, the MA must be associated with the same maintenance domain (MD) name. For more information, see [“Creating a Maintenance Domain” on page 541](#).
- On both routers, periodic packet management (PPM) must be running on the Routing Engine and Packet Forwarding Engine, which is the default configuration. You can disable PPM on the Packet Forwarding Engine only. However, the Ethernet frame delay measurement feature requires that distributed PPM remain enabled on the Packet Forwarding Engine of both routers. For more information about **ppm**, see the *Junos OS Routing Protocols Library*.
- If the PPM process (**ppm**) is disabled on the Packet Forwarding Engine, you must re-enable it. Re-enabling distributed **ppm** entails restarting the **ethernet-connectivity-fault-management** process, which causes all connectivity fault management (CFM) sessions to re-establish. For more information about CFM sessions, see [“Configuring Ethernet Local Management Interface” on page 565](#).

**NOTE:** The Ethernet frame delay measurement feature is supported only for MEPs configured on Ethernet physical or logical interfaces on DPCs in MX Series routers. The ETH-DM feature is not supported on aggregated Ethernet interfaces or LSI pseudowires.

## Configuration Options for ETH-DM

By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.

- [Configuring Routers to Support an ETH-DM Session on page 714](#)

## Guidelines for Starting an ETH-DM Session

Keep the following guidelines in mind when preparing to start an Ethernet frame delay measurement (ETH-DM) session:

- [ETH-DM Session Prerequisites on page 707](#)
- [ETH-DM Session Parameters on page 708](#)
- [Restrictions for an ETH-DM Session on page 709](#)

## ETH-DM Session Prerequisites

Before you can start an ETH-DM session, you must configure two MX Series routers to support ETH-DM by defining the two CFM-enabled physical or logical Ethernet interfaces on each router. This entails creating and configuring CFM maintenance domains, maintenance associations, and maintenance association end points on each router. For

more information about enabling CFM on an Ethernet interface, see [“Creating a Maintenance Domain” on page 541](#).

**NOTE:** The Ethernet frame delay measurement feature is supported only for maintenance association end points configured on Ethernet physical or logical interfaces on DPCs in MX Series routers. The ETH-DM feature is not supported on aggregated Ethernet interfaces or LSI pseudowires.

For specific information about configuring routers to support ETH-DM, see [“Guidelines for Configuring Routers to Support an ETH-DM Session” on page 706](#) and [“Configuring Routers to Support an ETH-DM Session” on page 714](#).

## ETH-DM Session Parameters

You can initiate a one-way or two-way ETH-DM session by entering the **monitor ethernet delay-measurement** operational command at a router that contains one end of the service for which you want to measure frame delay. The command options specify the ETH-DM session in terms of the CFM elements:

- The type of ETH-DM measurement (one-way or two-way) to be performed.
- The Ethernet service for which the ETH-DM measurement is to be performed:
  - CFM maintenance domain—Name of the existing maintenance domain (MD) for which you want to measure Ethernet frame delays. For more information, see [“Creating a Maintenance Domain” on page 541](#).
  - CFM maintenance association—Name of an existing maintenance association (MA) within the maintenance domain. For more information, see [“Creating a Maintenance Association” on page 548](#).
  - Remote CFM maintenance association end point—The unicast MAC address or the numeric identifier of the remote maintenance association end point (MEP)—the physical or logical interface on the remote router that resides in the specified MD and is named in the specified MA—with which to perform the ETH-DM session. For more information, see [“Configuring a MEP to Generate and Respond to CFM Protocol Messages” on page 551](#).
- Optional specifications:
  - Count—You can specify the number of ETH-DM requests to send for this frame delay measurement session. The range is from 1 through 65,535 frames. The default value is 10 frames.

**NOTE:** Although you can trigger frame delay collection for up to 65,535 ETH-DM requests at a time, a router stores only the last 100 frame delay statistics per CFM session (pair of peer MEPs).

- Frame interval—You can specify the number of seconds to elapse between ETH-DM frame transmittals. The default value is 1 second.

For more detailed information about the parameters you can specify to start an ETH-DM session, see the **monitor ethernet delay-measurement** operational command description in the [CLI Explorer](#).

## Restrictions for an ETH-DM Session

The following restrictions apply to an ETH-DM session:

- You cannot run multiple simultaneous ETH-DM sessions with the same remote MEP or MAC address.
- For a given ETH-DM session, you can collect frame delay information for a maximum of 65,535 frames.
- For a given CFM session (pair of peer MEPs), the ETH-DM database stores a maximum of 100 statistics, with the older statistics being “aged out” as newer statistics are collected for that pair of MEPs.
  - For one-way delay measurements collected within the same CFM session, the 100 most recent ETH-DM statistics can be retrieved at any point of time at the router on which the receiver MEP is defined.
  - For two-way delay measurements collected within the same CFM session, the 100 most recent ETH-DM statistics can be retrieved at any point of time at the router on which the initiator MEP is defined.

Depending on the number of frames exchanged in the individual ETH-DM sessions, the ETH-DM database can contain statistics collected through multiple ETH-DM sessions.

- If graceful Routing Engine switchover (GRES) occurs, any collected ETH-DM statistics are lost, and ETH-DM frame counts are reset to zeroes. GRES enables a router with dual Routing Engines to switch from a master Routing Engine to a backup Routing Engine without interruption to packet forwarding. For more information, see the *High Availability Feature Guide*.
- Accuracy of frame delay data is compromised when the system is changing (such as from reconfiguration). We recommend performing Ethernet frame delay measurements on a stable system.

- [ETH-DM Frame Count Retrieval on page 712](#)

## ETH-DM Statistics

Ethernet frame delay statistics are the frame delay and frame delay variation values determined by the exchange of frames containing ETH-DM protocol data units (PDUs).

- For a one-way ETH-DM session, statistics are collected in an ETH-DM database at the router that contains the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, including the exchange of one-way delay PDU frames, see [“Ethernet Frame Delay Measurements Overview” on page 660](#).
- For a two-way ETH-DM session, statistics are collected in an ETH-DM database at the router that contains the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, including the exchange of two-way delay PDU frames, see [“Ethernet Frame Delay Measurements Overview” on page 660](#).

A CFM database stores CFM-related statistics and—for Ethernet interfaces that support ETH-DM—the 100 most recently collected ETH-DM statistics for that pair of MEPs. You can view ETH-DM statistics by using the **delay-statistics** or **mep-statistics** form of the **show oam ethernet connectivity-fault-management** command to display the CFM statistics for the MEP that collects the ETH-DM statistics you want to view.

[Table 92 on page 710](#) describes the ETH-DM statistics calculated in an ETH-DM session.

**Table 92: ETH-DM Statistics**

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Best-case delay</b> <sup>†</sup>         | <p>When you start a two-way frame delay measurement, the CLI output includes a runtime display of the lowest two-way frame delay value among the statistics collected for the ETH-DM session only.</p> <p>When you display ETH-DM statistics using a <b>show</b> command, the <b>Best case delay</b> field displays the lowest one-way and two-way frame delays among all ETH-DM statistics collected at the CFM session level.</p>                                                                                                                                                                                                                                                                                                                                |
| <b>Worst-case delay</b> <sup>†</sup>        | <p>When you start a two-way frame delay measurement, the CLI output includes a runtime display of the highest two-way frame delay value among the statistics collected for the ETH-DM session only.</p> <p>When you display ETH-DM statistics using a <b>show</b> command, the <b>Worst case delay</b> field displays the highest one-way and two-way frame delays among all statistics collected at the CFM session level.</p>                                                                                                                                                                                                                                                                                                                                    |

<sup>†</sup>When you start a one-way frame delay measurement, the CLI output displays **NA** ("not available") for this field. One-way ETH-DM statistics are collected at the remote (receiver) MEP. Statistics for a given one-way ETH-DM session are available only by displaying CFM statistics for the receiver MEP.

## ETH-DM Statistics Retrieval

At the receiver MEP for a one-way session, or at the initiator MEP for a two-way session, you can display all ETH-DM statistics collected at a CFM session level by using the following operational commands:

- **show oam ethernet connectivity-fault-management delay-statistics maintenance-domain *md-name* maintenance-association *ma-name* <local-mep *mep-id*> <remote-mep *mep-id*> <count *count*>**

- **show oam ethernet connectivity-fault-management mep-statistics**  
**maintenance-domain** *md-name* **maintenance-association** *ma-name* **<local-mep** *mep-id* **>**  
**<remote-mep** *mep-id* **>** **<count** *count* **>**

## ETH-DM Frame Counts

The number of ETH-DM PDU frames exchanged in a ETH-DM session are stored in the CFM database on each router.

Table 93 on page 712 describes the ETH-DM frame counts collected in an ETH-DM session.

*Table 93: ETH-DM Frame Counts*

| Field Name                   | Field Description                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>1DMs sent</b>             | Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.<br>Stored in the CFM database of the MEP initiating a one-way frame delay measurement. |
| <b>Valid 1DMs received</b>   | Number of valid 1DM frames received.<br>Stored in the CFM database of the MEP receiving a one-way frame delay measurement.                                                        |
| <b>Invalid 1DMs received</b> | Number of invalid 1DM frames received.<br>Stored in the CFM database of the MEP receiving a one-way frame delay measurement.                                                      |
| <b>DMMs sent</b>             | Number of delay measurement message (DMM) PDU frames sent to the peer MEP in this session.<br>Stored in the CFM database of the MEP initiating a two-way frame delay measurement. |
| <b>DMRs sent</b>             | Number of delay measurement reply (DMR) frames sent (in response to a received DMM).<br>Stored in the CFM database of the MEP responding to a two-way frame delay measurement.    |
| <b>Valid DMRs received</b>   | Number of valid DMR frames received.<br>Stored in the CFM database of the MEP initiating a two-way frame delay measurement.                                                       |
| <b>Invalid DMRs received</b> | Number of invalid DMR frames received.<br>Stored in the CFM database of the MEP initiating a two-way frame delay measurement.                                                     |

## ETH-DM Frame Count Retrieval

Each router counts the number of ETH-DM frames sent or received and stores the counts in a CFM database.

### Frame Counts Stored in CFM Databases

You can display ETH-DM frame counts for MEPs assigned to specified Ethernet interfaces or for specified MEPs in CFM sessions by using the following operational commands:

- **show oam ethernet connectivity-fault-management interfaces** (**detail** | **extensive**)

- **show oam ethernet connectivity-fault-management mep-database maintenance-domain** *md-name* **maintenance-association** *ma-name* **<local-mep** *mep-id* **>** **<remote-mep** *mep-id* **>**

### One-Way ETH-DM Frame Counts

For a one-way ETH-DM session, delay statistics are collected at the receiver MEP only, but frame counts are collected at both MEPs. As indicated in [Table 93 on page 712](#), one-way ETH-DM frame counts are tallied from the perspective of each router in the session:

- At the initiator MEP, the router counts the number of IDM frames sent.
- At the receiver MEP, the router counts the number of valid IDM frames received and the number of invalid IDM frames received.

You can also view one-way ETH-DM frame counts—for a receiver MEP—by using the **show oam ethernet connectivity-fault-management mep-statistics** command to display one-way statistics and frame counts together.

### Two-Way ETH-DM Frame Counts

For a two-way ETH-DM session, delay statistics are collected at the initiator MEP only, but frame counts are collected at both MEPs. As indicated in [Table 93 on page 712](#), two-way ETH-DM frame counts are tallied from the perspective of each router in the session:

- At the initiator MEP, the router counts the number of DMM frames sent, valid DMR frames received, and invalid DMR frames received.
- At the responder MEP, the router counts the number of DMR frames sent.

You can also view two-way ETH-DM frame counts—for an initiator MEP—by using the **show oam ethernet connectivity-fault-management mep-statistics** command to display two-way statistics and frame counts together.

## Configuring Routers to Support an ETH-DM Session

- [Configuring MEP Interfaces on page 714](#)
- [Ensuring That Distributed ppm Is Not Disabled on page 715](#)
- [Enabling the Hardware-Assisted Timestamping Option on page 717](#)
- [Configuring the Server-Side Processing Option on page 717](#)

### Configuring MEP Interfaces

Before you can start an Ethernet frame delay measurement session across an Ethernet service, you must configure two MX Series routers to support ETH-DM.

To configure an Ethernet interface on a MX Series router to support ETH-DM:

1. On each router, configure two physical or logical Ethernet interfaces connected by a VLAN. The following configuration is typical for single-tagged logical interfaces:

```
[edit interfaces]
interface {
 ethernet-interface-name {
 vlan-tagging;
 unit logical-unit-number {
 vlan-id vlan-id; # Both interfaces on this VLAN
 }
 }
}
```

Both interfaces will use the same VLAN ID.

2. On each router, attach peer MEPs to the two interfaces. The following configuration is typical:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain md-name { # On both routers
 level number;
 maintenance-association ma-name { # On both routers
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 mep mep-id { # Attach to VLAN interface
 auto-discovery;
 direction (up | down);
 interface interface-name;
 priority number;
 }
 }
 }
 }
 }
}
```

```

 }
 }
}

```

  - [Guidelines for Configuring Routers to Support an ETH-DM Session on page 706](#)

## Ensuring That Distributed ppm Is Not Disabled

By default, the router's period packet management process (**ppm**) runs sessions distributed to the Packet Forwarding Engine in addition to the Routing Engine. This process is responsible for periodic transmission of packets on behalf of its various client processes, such as Bidirectional Forwarding Detection (BFD), and it also receives packets on behalf of client processes.

In addition, **ppm** handles time-sensitive periodic processing and performs such processes as sending process-specific packets and gathering statistics. With **ppm** processes running distributed on both the Routing Engine and the Packet Forwarding Engine, you can run such processes as BFD on the Packet Forwarding Engine.

### Distributed ppm Required for ETH-DM

Ethernet frame delay measurement requires that **ppm** remains distributed to the Packet Forwarding Engine. If **ppm** is not distributed to the Packet Forwarding Engines of both routers, ETH-DM PDU frame timestamps and ETH-DM statistics are not valid.

Before you start ETH-DM, you must verify that the following configuration statement is *NOT* present:

```

[edit]
routing-options {
 ppm {
 no-delegate-processing;
 }
}

```

If distributed **ppm** processing is disabled (as shown in the stanza above) on either router, you must re-enable it in order to use the ETH-DM feature.

### Procedure to Ensure that Distributed ppm is Not Disabled

To ensure that distributed **ppm** is not disabled on a router:

1. Display the packet processing management (PPM) configuration to determine whether distributed **ppm** is disabled.
  - In the following example, distributed **ppm** is enabled on the router. In this case, you do not need to modify the router configuration:

```

[edit]

```

```
user@host# show routing-options
ppm;
```

- In the following example, distributed **ppm** is disabled on the router. In this case, you must proceed to Step 2 to modify the router configuration:

```
[edit]
user@host# show routing-options
ppm {
 no-delegate-processing;
}
```

2. Modify the router configuration to re-enable distributed **ppm** and restart the Ethernet OAM Connectivity Fault Management process *ONLY IF* distributed **ppm** is disabled (as determined in the previous step).

- a. Before continuing, make any necessary preparations for the possible loss of connectivity on the router.

Restarting the **ethernet-connectivity-fault-management** process has the following effect on your network:

- All connectivity fault management (CFM) sessions re-establish.
- All ETH-DM requests on the router terminate.
- All ETH-DM statistics and frame counts reset to 0.

- b. Modify the router configuration to re-enable distributed **ppm**. For example:

```
[edit]
user@host# delete routing-options ppm no-delegate-processing
```

- c. Commit the updated router configuration. For example:

```
[edit]
user@host# commit and-quit
commit complete
exiting configuration mode
```

- d. To restart the Ethernet OAM Connectivity-Fault-Management process, enter the **restart ethernet-connectivity-fault-management <gracefully | immediately | soft>** operational mode command. For example:

```
user@host> restart ethernet-connectivity-fault-management
Connectivity fault management process started, pid 9893
```

Connectivity fault management (CFM) sessions operate in centralized mode over AE interfaces by default. Y.1731 performance monitoring (PM) is supported on centralized CFM sessions over AE interfaces. Also, distribution of CFM session over AE interfaces to line cards is supported from Junos OS Release 13.3. To enable the distribution of CFM

sessions and to operate in centralized mode, include the **ppm delegate-processing** statement at the **[edit routing-options ppm]** hierarchy level. The mechanism that enables distribution of CFM sessions over AE interfaces provides the underlying infrastructure to support PM over AE interfaces. In addition, periodic packet management (PPM) handles time-sensitive periodic processing and performs such processes as sending process-specific packets and gathering statistics. With PPM processes running distributed on both the Routing Engine and the Packet Forwarding Engine, you can run performance monitoring processes on the Packet Forwarding Engine.

## Enabling the Hardware-Assisted Timestamping Option

By default, Ethernet frame delay measurement uses software for timestamping transmitted and received ETH-DM frames. For Ethernet interfaces, you can optionally use hardware timing to assist in the timestamping of received ETH-DM frames to increase the accuracy of delay measurements.

Enabling hardware-assisted timestamping of received frames can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction.

To enable Ethernet frame delay measurement hardware assistance on the reception path, include the **hardware-assisted-timestamping** statement at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring]** hierarchy level:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 performance-monitoring {
 hardware-assisted-timestamping;
 }
 }
 }
}
```

  - [Guidelines for Configuring Routers to Support an ETH-DM Session on page 706](#)

## Configuring the Server-Side Processing Option

You can delegate the server-side processing (for both two-way delay measurement and loss measurement) to the Packet Forwarding Engine to prevent overloading on the Routing Engine. By default, the server-side processing is done by the Routing Engine.

To configure the server-side processing option:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit protocols oam ethernet connectivity-fault-management
performance-monitoring
```

2. Configure the server-side processing option.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# set delegate-server-processing
```

3. Verify the configuration.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# show
performance-monitoring {
 delegate-server-processing;
}
```

---

## Starting an ETH-DM Session

- [Using the monitor ethernet delay-measurement Command on page 718](#)
- [Starting a One-Way ETH-DM Session on page 719](#)
- [Starting a Two-Way ETH-DM Session on page 720](#)

### Using the monitor ethernet delay-measurement Command

After you have configured two MX Series routers to support ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM), you can initiate a one-way or two-way Ethernet frame delay measurement session from the CFM maintenance association end point (MEP) on one of the routers to the peer MEP on the other router.

To start an ETH-DM session between the specified local MEP and the specified remote MEP, enter the **monitor ethernet delay-measurement** command at operational mode. The syntax of the command is as follows:

```
monitor ethernet delay-measurement
```

```
(one-way | two-way)
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<wait interval-seconds>
<priority 802.1p value>
<size>
<no-session-id-tlv>
<xml>
```

For a one-way frame delay measurement, the command displays a runtime display of the number of 1DM frames sent from the initiator MEP during that ETH-DM session. One-way frame delay and frame delay variation measurements from an ETH-DM session are collected in a CFM database at the router that contains the receiver MEP. You can retrieve ETH-DM statistics from a CFM database at a later time.

For a two-way frame delay measurement, the command displays two-way frame delay and frame delay variation values for each round-trip frame exchange during that ETH-DM session, as well as a runtime display of useful summary information about the session: average delay, average delay variation, best-case delay, and worst-case delay. Two-way frame delay and frame delay variation values measurements from an ETH-DM session are collected in a CFM database at the router that contains the initiator MEP. You can retrieve ETH-DM statistics from a CFM database at a later time.

**NOTE:** Although you can trigger frame delay collection for up to 65,535 ETH-DM requests at a time, a router stores only the last 100 frame delay statistics per CFM session (pair of peer MEPs).

For a complete description of the **monitor ethernet delay-measurement** operational command, see the [CLI Explorer](#).

**See Also** • [monitor ethernet delay-measurement on page 1347](#)

## Starting a One-Way ETH-DM Session

To start a one-way Ethernet frame delay measurement session, enter the **monitor ethernet delay-measurement one-way** command from operational mode, and specify the peer MEP by its MAC address or by its MEP identifier.

For example:

```
user@host> monitor ethernet delay-measurement one-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10
```

```
One-way ETH-DM request to 00:05:85:73:39:4a, Interface xe-5/0/0.0
1DM Frames sent : 10
--- Delay measurement statistics ---
Packets transmitted: 10
```

Average delay: NA, Average delay variation: NA  
Best case delay: NA, Worst case delay: NA

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl + C to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

See Also • [monitor ethernet delay-measurement on page 1347](#)

## Starting a Two-Way ETH-DM Session

To start a two-way Ethernet frame delay measurement session, enter the **monitor ethernet delay-measurement two-way** command from operational mode, and specify the peer MEP by its MAC address or by its MEP identifier.

For example:

```
user@host> monitor ethernet delay-measurement two-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10
```

```
Two-way ETH-DM request to 00:05:85:73:39:4a, Interface xe-5/0/0.0
DMR received from 00:05:85:73:39:4a Delay: 100 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 8 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 111 usec Delay variation: 19 usec
DMR received from 00:05:85:73:39:4a Delay: 110 usec Delay variation: 1 usec
DMR received from 00:05:85:73:39:4a Delay: 119 usec Delay variation: 9 usec
DMR received from 00:05:85:73:39:4a Delay: 122 usec Delay variation: 3 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 30 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 108 usec Delay variation: 16 usec
```

```
--- Delay measurement statistics ---
Packets transmitted: 10, Valid packets received: 10
Average delay: 103 usec, Average delay variation: 8 usec
Best case delay: 92 usec, Worst case delay: 122 usec
```

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl + C to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

## Starting a One-Way ETH-DM Session

To start a one-way Ethernet frame delay measurement session, enter the **monitor ethernet delay-measurement one-way** command from operational mode, and specify the peer MEP by its MAC address or by its MEP identifier.

For example:

```
user@host> monitor ethernet delay-measurement one-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10

One-way ETH-DM request to 00:05:85:73:39:4a, Interface xe-5/0/0.0
1DM Frames sent : 10
--- Delay measurement statistics ---
Packets transmitted: 10
Average delay: NA, Average delay variation: NA
Best case delay: NA, Worst case delay: NA
```

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl + C to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

## Starting a Two-Way ETH-DM Session

To start a two-way Ethernet frame delay measurement session, enter the **monitor ethernet delay-measurement two-way** command from operational mode, and specify the peer MEP by its MAC address or by its MEP identifier.

For example:

```
user@host> monitor ethernet delay-measurement two-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10

Two-way ETH-DM request to 00:05:85:73:39:4a, Interface xe-5/0/0.0
DMR received from 00:05:85:73:39:4a Delay: 100 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 8 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 111 usec Delay variation: 19 usec
DMR received from 00:05:85:73:39:4a Delay: 110 usec Delay variation: 1 usec
DMR received from 00:05:85:73:39:4a Delay: 119 usec Delay variation: 9 usec
DMR received from 00:05:85:73:39:4a Delay: 122 usec Delay variation: 3 usec
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 30 usec
```

```
DMR received from 00:05:85:73:39:4a Delay: 92 usec Delay variation: 0 usec
DMR received from 00:05:85:73:39:4a Delay: 108 usec Delay variation: 16 usec

--- Delay measurement statistics ---
Packets transmitted: 10, Valid packets received: 10
Average delay: 103 usec, Average delay variation: 8 usec
Best case delay: 92 usec, Worst case delay: 122 usec
```

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl + C to explicitly quit the monitor ethernet delay-measurement command and return to the CLI command prompt.

### Displaying ETH-DM Statistics Only

**Purpose** Display ETH-DM statistics.

By default, the **show oam ethernet connectivity-fault-management delay-statistics** command displays ETH-DM statistics for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

**Action** • To display the ETH-DM statistics collected for MEPs belonging to MA **ma1** and within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain ma1 maintenance-association ma1
```

• To display the ETH-DM statistics collected for ETH-DM sessions for the local MEP **201** belonging to MA **ma2** and within MD **md2**:

```
user@host> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

• To display the ETH-DM statistics collected for ETH-DM sessions from local MEPs belonging to MA **ma3** and within MD **md3** to remote MEP **302**:

```
user@host> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain md3 maintenance-association ma3 remote-mep 302
```

See Also • [show oam ethernet connectivity-fault-management delay-statistics on page 1671](#)

## Displaying ETH-DM Statistics and Frame Counts

**Purpose** Display ETH-DM statistics and ETH-DM frame counts.

By default, the **show oam ethernet connectivity-fault-management mep-statistics** command displays ETH-DM statistics and frame counts for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

**Action** • To display the ETH-DM statistics and ETH-DM frame counts for MEPs in MA **ma1** and within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md1 maintenance-association ma1
```

• To display the ETH-DM statistics and ETH-DM frame counts for the local MEP **201** in MA **ma2** and within MD **md2**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

• To display the ETH-DM statistics and ETH-DM frame counts for the local MEP in MD **md3** and within MA **ma3** that participates in an ETH-DM session with the remote MEP **302**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain ma3 maintenance-association ma3 remote-mep 302
```

See Also • [show oam ethernet connectivity-fault-management mep-statistics on page 1709](#)

## Displaying ETH-DM Frame Counts for MEPs by Enclosing CFM Entity

**Purpose** Display ETH-DM frame counts for CFM maintenance association end points (MEPs).

By default, the **show oam ethernet connectivity-fault-management mep-database** command displays CFM database information for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

**NOTE:** At the router attached to the initiator MEP for a one-way session, or at the router attached to the receiver MEP for a two-way session, you can only display ETH-DM frame counts.

- Action**
- To display CFM database information (including ETH-DM frame counts) for all MEPs in MA **ma1** within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain ma1 maintenance-association ma1
```

- To display CFM database information (including ETH-DM frame counts) only for local MEP **201** in MA **ma1** within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md2 maintenance-association ma2 local-mep 201
```

- To display CFM database information (including ETH-DM frame counts) only for remote MEP **302** in MD **md3** within MA **ma3**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain ma3 maintenance-association ma3 remote-mep 302
```

- See Also**
- [show oam ethernet connectivity-fault-management mep-database on page 1697](#)

## Displaying ETH-DM Frame Counts for MEPs by Interface or Domain Level

- Purpose**
- Display ETH-DM frame counts for CFM maintenance association end points (MEPs).

By default, the **show oam ethernet connectivity-fault-management interfaces** command displays CFM database information for MEPs attached to CFM-enabled Ethernet interfaces on the router or at a maintenance domain level. For Ethernet interfaces that support ETH-DM, any frame counts are also displayed when you specify the **detail** or **extensive** command option.

**NOTE:** At the router attached to the initiator MEP for a one-way session, or at the router attached to the receiver MEP for a two-way session, you can only display ETH-DM frame counts.

- Action**
- To display CFM database information (including ETH-DM frame counts) for all MEPs attached to CFM-enabled Ethernet interfaces on the router:

```
user@host> show oam ethernet connectivity-fault-management interfaces detail
```

- To display CFM database information (including ETH-DM frame counts) only for the MEPs attached to CFM-enabled router interface **ge-5/2/9.0**:

```
user@host> show oam ethernet connectivity-fault-management interfaces ge-5/2/9.0 detail
```

- To display CFM database information (including ETH-DM frame counts) only for MEPs enclosed within CFM maintenance domains (MDs) at level **6**:

```
user@host> show oam ethernet connectivity-fault-management interfaces level 6 detail
```

**See Also** • [show oam ethernet connectivity-fault-management interfaces on page 1679](#)

## Clearing ETH-DM Statistics and Frame Counts

**Purpose** Clear the ETH-DM statistics and ETH-DM frame counts.

By default, statistics and frame counts are deleted for all MEPs attached to CFM-enabled interfaces on the router. However, you can filter the scope of the command by specifying an interface name.

**Action** • To clear the ETH-DM statistics and ETH-DM frame counts for all MEPs attached to CFM-enabled interfaces on the router:

```
user@host> clear oam ethernet connectivity-fault-management statistics
```

• To clear the ETH-DM statistics and ETH-DM frame counts only for MEPs attached to the logical interface **ge-0/5.9.0**:

```
user@host> clear oam ethernet connectivity-fault-management statistics ge-0/5/9.0
```

**See Also** • [Managing ETH-DM Statistics and ETH-DM Frame Counts on page 722](#)

## Configuring MEP Interfaces

---

Before you can start an Ethernet frame delay measurement session across an Ethernet service, you must configure two MX Series routers to support ETH-DM.

To configure an Ethernet interface on a MX Series router to support ETH-DM:

1. On each router, configure two physical or logical Ethernet interfaces connected by a VLAN. The following configuration is typical for single-tagged logical interfaces:

```
[edit interfaces]
interface {
 ethernet-interface-name {
 vlan-tagging;
 unit logical-unit-number {
 vlan-id vlan-id; # Both interfaces on this VLAN
 }
 }
}
```

Both interfaces will use the same VLAN ID.

2. On each router, attach peer MEPs to the two interfaces. The following configuration is typical:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 maintenance-domain md-name { # On both routers
 level number;
 maintenance-association ma-name { # On both routers
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 mep mep-id { # Attach to VLAN interface
 auto-discovery;
 direction (up | down);
 interface interface-name;
 priority number;
 }
 }
 }
 }
 }
}
```

## Ensuring That Distributed ppm Is Not Disabled

By default, the router's period packet management process (**ppm**) runs sessions distributed to the Packet Forwarding Engine in addition to the Routing Engine. This process is responsible for periodic transmission of packets on behalf of its various client processes, such as Bidirectional Forwarding Detection (BFD), and it also receives packets on behalf of client processes.

In addition, **ppm** handles time-sensitive periodic processing and performs such processes as sending process-specific packets and gathering statistics. With **ppm** processes running distributed on both the Routing Engine and the Packet Forwarding Engine, you can run such processes as BFD on the Packet Forwarding Engine.

### Distributed ppm Required for ETH-DM

Ethernet frame delay measurement requires that **ppm** remains distributed to the Packet Forwarding Engine. If **ppm** is not distributed to the Packet Forwarding Engines of both routers, ETH-DM PDU frame timestamps and ETH-DM statistics are not valid.

Before you start ETH-DM, you must verify that the following configuration statement is *NOT* present:

```
[edit]
routing-options {
 ppm {
 no-delegate-processing;
 }
}
```

If distributed **ppm** processing is disabled (as shown in the stanza above) on either router, you must re-enable it in order to use the ETH-DM feature.

### Procedure to Ensure that Distributed ppm is Not Disabled

To ensure that distributed **ppm** is not disabled on a router:

1. Display the packet processing management (PPM) configuration to determine whether distributed **ppm** is disabled.
  - In the following example, distributed **ppm** is enabled on the router. In this case, you do not need to modify the router configuration:

```
[edit]
user@host# show routing-options
ppm;
```

- In the following example, distributed **ppm** is disabled on the router. In this case, you must proceed to Step 2 to modify the router configuration:

```
[edit]
user@host show routing-options
ppm {
```

```
no-delegate-processing;
}
```

2. Modify the router configuration to re-enable distributed **ppm** and restart the Ethernet OAM Connectivity Fault Management process *ONLY IF* distributed **ppm** is disabled (as determined in the previous step).

- a. Before continuing, make any necessary preparations for the possible loss of connectivity on the router.

Restarting the **ethernet-connectivity-fault-management** process has the following effect on your network:

- All connectivity fault management (CFM) sessions re-establish.
- All ETH-DM requests on the router terminate.
- All ETH-DM statistics and frame counts reset to 0.

- b. Modify the router configuration to re-enable distributed **ppm**. For example:

```
[edit]
user@host# delete routing-options ppm no-delegate-processing
```

- c. Commit the updated router configuration. For example:

```
[edit]
user@host# commit and-quit
commit complete
exiting configuration mode
```

- d. To restart the Ethernet OAM Connectivity-Fault-Management process, enter the **restart ethernet-connectivity-fault-management <gracefully | immediately | soft>** operational mode command. For example:

```
user@host> restart ethernet-connectivity-fault-management
Connectivity fault management process started, pid 9893
```

Connectivity fault management (CFM) sessions operate in centralized mode over AE interfaces by default. Y.1731 performance monitoring (PM) is supported on centralized CFM sessions over AE interfaces. Also, distribution of CFM session over AE interfaces to line cards is supported from Junos OS Release 13.3. To enable the distribution of CFM sessions and to operate in centralized mode, include the **ppm delegate-processing** statement at the **[edit routing-options ppm]** hierarchy level. The mechanism that enables distribution of CFM sessions over AE interfaces provides the underlying infrastructure to support PM over AE interfaces. In addition, periodic packet management (PPM) handles time-sensitive periodic processing and performs such processes as sending process-specific packets and gathering statistics. With PPM processes running distributed on both the Routing Engine and the Packet Forwarding Engine, you can run performance monitoring processes on the Packet Forwarding Engine.

---

## Enabling the Hardware-Assisted Timestamping Option

---

By default, Ethernet frame delay measurement uses software for timestamping transmitted and received ETH-DM frames. For Ethernet interfaces, you can optionally use hardware timing to assist in the timestamping of received ETH-DM frames to increase the accuracy of delay measurements.

Enabling hardware-assisted timestamping of received frames can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction.

To enable Ethernet frame delay measurement hardware assistance on the reception path, include the **hardware-assisted-timestamping** statement at the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring]** hierarchy level:

```
[edit protocols]
oam {
 ethernet {
 connectivity-fault-management {
 performance-monitoring {
 hardware-assisted-timestamping;
 }
 }
 }
}
```

## Enabling Inline Transmission of Continuity Check Messages for Maximum Scaling

Scaling is the ability of a system to handle increasing amounts of work and to continue to function well. Scaling can refer to increasing capacity and the ability to handle increasing workload, number of subscribers or sessions, hardware components, and so on. Continuity check protocol is used for fault detection within a maintenance association. The maintenance association end points (MEPs) send continuity check messages (CCMs) periodically. The time between the transmissions of CCMs is known as the interval. The receiving MEP maintains a database of all MEPs in the maintenance association.

By default, CCMs are transmitted by the CPU of a line card, such as a Modular Port Concentrator (MPC). If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, then we recommend that you delegate transmission of CCMs to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as inline keepalives or Inline-KA. Inline transmission enables the system to handle more connectivity fault management (CFM) sessions per line card. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.

To enable inline transmission of CCMs, perform the following steps:

1. In configuration mode, go to the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
performance-monitoring
```

2. Delegate transmission of CCMs to hardware by enabling hardware-assisted keepalives.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# set hardware-assisted-keepalives enable
```

**NOTE:** Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the **deactivate** command and then reactivate the CFM session using the **activate** command.

To disable inline transmission, use the **hardware-assisted-keepalives disable** statement. After disabling inline transmission, you must reboot the router for the changes to take effect.

## Enabling Inline Mode Of Performance Monitoring To Achieve Maximum Scaling

---

Performance monitoring is useful for studying the traffic pattern in a network over a period of time. It helps to identify network problems before you are impacted by network defects.

By default, performance monitoring packets are handled by the CPU of a line-card, such as Modular Port Concentrator (MPC). Enabling inline mode of performance monitoring delegates the processing of the protocol data units (PDUs) to the forwarding ASIC (that is, to the hardware). By enabling inline mode of performance monitoring, the load on the CPU of the line-card is reduced and you can configure an increased number of performance monitoring sessions and achieve maximum scaling for service OAM performance monitoring sessions. On MX Series routers, you can configure inline mode of performance monitoring only if the network services mode on the router is configured to **enhanced-ip** and enhanced connectivity fault management (**enhanced-cfm-mode**) is configured.

By enabling inline mode of performance monitoring, you can achieve maximum scaling for performance monitoring sessions. To achieve maximum scaling for performance monitoring sessions, you must enable scaling of continuity check messages (CCMs) sessions. To enable scaling of CCM sessions, enable inline transmission of continuity check messages. For more information on inline transmission of continuity check messages, see [“Enabling Inline Transmission of Continuity Check Messages for Maximum Scaling” on page 733](#). To view the supported scaling values for CCM and PM, see [“Supported Inline CCM and Inline PM Scaling Values” on page 736](#).

Inline mode of performance monitoring is supported only for proactive mode of frame delay measurement (Two-way Delay Measurements) and synthetic loss measurements (SLM) sessions. Performance monitoring functions configured using the iterator profile (CFM) are referred to as proactive performance monitoring. Inline mode of performance monitoring for frame loss measurement using service frames (LM) is not supported.

**NOTE:** MPC3E (MX-MPC3E-3D) and MPC4E (MPC4E-3D-32XGE-SFPP and MPC4E-3D-2CGE-8XGE) do not support inline mode of performance monitoring. User-defined Data TLV is not supported if you have configured inline mode of performance monitoring. Also, only 12 history records per PM sessions are supported.

We recommend that you enable inline mode of performance monitoring before you configure the performance monitoring sessions as the change may interfere with the existing performance monitoring sessions.

To enable inline mode of performance monitoring, perform the following steps:

1. In configuration mode, go to the **[edit chassis]** hierarchy level and configure the network services mode of the router. The network service mode of the router must be configured as **enhanced ip** to enable enhanced connectivity fault management (CFM) mode.

**NOTE:** If the network services mode is not enhanced-ip, and you have enabled enhanced CFM, the following warning message is displayed:

```
[edit protocols oam ethernet]
'connectivity-fault-management'
enhanced ip is not effective please configure enhanced ip and give router
reboot
```

```
[edit chassis]
user@host# set network-services enhanced-ip
```

2. In configuration mode, go to the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level and enable enhanced connectivity fault management mode by using the **enhanced-cfm-mode** option.

```
[edit]
user@host# set protocols oam ethernet connectivity-fault-management
enhanced-cfm-mode
```

3. In configuration mode, go to the **[edit protocols oam ethernet connectivity-fault-management performance-monitoring]** hierarchy level. Configure the enhanced iterator profile by using the **enhanced-sla-iterator** option and specify the measurement interval by using the **measurement-interval** option.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
performance-monitoring enhanced-sla-iterator measurement-interval value
```

4. Enable inline performance monitoring.

**NOTE:** You can enable inline mode of performance monitoring for both the originator and the responder of the service OAM performance monitoring sessions by using the **hardware-assisted-pm** command.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# set hardware-assisted-pm
```

5. (Optional) Enable inline transmission of CCMs to enable better scaling if inline transmission of CCMs is not automatically enabled.

**NOTE:** You can achieve better scaling if both inline performance monitoring and inline transmission of CCMs is enabled.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# set hardware-assisted-keepalives enable
```

6. Commit the configuration.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# commit
```

#### Related Documentation

## Supported Inline CCM and Inline PM Scaling Values

This topic lists the scaling values for inline mode of performance monitoring and inline transmission of continuity check messages. The scaling values are based on the different cycle-time interval values. Each table lists the maximum number of connectivity fault management (CFM) sessions and performance monitoring (PM) sessions per line card and per chassis when you configure inline CCM, enhanced CFM, and enhanced PM by using the **hardware-assisted-keepalives**, **enhanced-cfm-mode**, and **hardware-assisted-pm** options.

**NOTE:** The scaling values do not consider the load from other protocols in the system and so the actual realized scaling values for line card and chassis vary depending on other protocol configurations and scaling in the system. We recommend that you configure DDoS for CFM. Limit the number of CFM packets, that are sent to the CPU of the line card, to 3000. Limiting the number of packets safeguards the CPU from scaled CFM configurations of various CFM protocol events.

[Table 94 on page 736](#) lists the maximum number of connectivity fault management (CFM) sessions and performance monitoring (PM) sessions per line card and per chassis when you configure both the CCM interval and the PM interval as 1 second.

**Table 94: Scaling Values for CFM and PM (CCM Interval: 1 sec and PM Interval: 1 sec )**

| CFM Line Card Scale | PM Line Card Scale | CFM Chassis Scale | PM Chassis Scale |
|---------------------|--------------------|-------------------|------------------|
| 4000                | 4500               | 16000             | 16000            |
| 6000                | 3750               | 16000             | 16000            |

**Table 94: Scaling Values for CFM and PM (CCM Interval: 1 sec and PM Interval: 1 sec ) (continued)**

| CFM Line Card Scale | PM Line Card Scale | CFM Chassis Scale | PM Chassis Scale |
|---------------------|--------------------|-------------------|------------------|
| 7000                | 3375               | 16000             | 16000            |
| 8000                | 3000               | 16000             | 16000            |

[Table 95 on page 737](#) lists the maximum number of connectivity fault management (CFM) sessions and performance monitoring (PM) sessions per line card and per chassis when you configure the CCM interval as 1 second and the PM interval as 100 milliseconds.

**Table 95: Scaling Values for CFM and PM (CCM Interval: 1 sec and PM interval: 100 ms )**

| CFM Line Card Scale | PM Line Card Scale | CFM Chassis Scale | PM Chassis Scale |
|---------------------|--------------------|-------------------|------------------|
| 4000                | 450                | 12000             | 4000             |
| 6000                | 375                | 12000             | 4000             |
| 7000                | 337                | 12000             | 4000             |
| 8000                | 300                | 12000             | 4000             |

[Table 96 on page 737](#) lists the maximum number of connectivity fault management (CFM) sessions and performance monitoring (PM) sessions per line card and per chassis when you configure the CCM interval as 100 milliseconds and the PM interval as 1 second.

**Table 96: Scaling Values for CFM and PM (CCM Interval: 100 ms and PM interval: 1 sec )**

| CFM Line Card Scale | PM Line Card Scale | CFM Chassis Scale | PM Chassis Scale |

## Configuring Connectivity Fault Management for Interoperability During Unified In-Service Software Upgrades

Starting in Release 17.1, Junos OS connectivity fault management (CFM), during a unified in-service software upgrade (ISSU), works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit continuity check message (CCM) PDUs during the unified ISSU. Connectivity fault management continues to operate.

This feature requires the following conditions be met:

- Packet Forwarding Engine keepalives must be enabled to provide inline transmission of CCMs. The feature does not work when the CCMs are transmitted by the CPU of a line card, which is the default transmission method.
- The interval between CCMs must be 1 second.

CFM interoperability during a unified ISSU is supported on the following MPCs: MPC1, MPC2, MPC2-NG, MPC3-NG, MPC5, and MPC6.

To enable CFM interoperability with third-party devices across a unified ISSU:

1. Enable inline keepalives.

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
user@host# set hardware-assisted-keepalives enable
```

2. Set the CCM interval to 1 second.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name continuity-check]
user@host# set interval 1s
```

## Release History Table

| Release | Description                                                                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.1    | Starting in Release 17.1, Junos OS connectivity fault management (CFM), during a unified in-service software upgrade (ISSU), works when the peer device is not a Juniper Networks router. |

## Using the monitor ethernet delay-measurement Command

After you have configured two MX Series routers to support ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM), you can initiate a one-way or two-way Ethernet frame delay measurement session from the CFM maintenance association end point (MEP) on one of the routers to the peer MEP on the other router.

To start an ETH-DM session between the specified local MEP and the specified remote MEP, enter the **monitor ethernet delay-measurement** command at operational mode. The syntax of the command is as follows:

```
monitor ethernet delay-measurement
(one-way | two-way)
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<wait interval-seconds>
<priority 802.1p value>
<size>
<no-session-id-tlv>
<xml>
```

For a one-way frame delay measurement, the command displays a runtime display of the number of IDM frames sent from the initiator MEP during that ETH-DM session. One-way frame delay and frame delay variation measurements from an ETH-DM session are collected in a CFM database at the router that contains the receiver MEP. You can retrieve ETH-DM statistics from a CFM database at a later time.

For a two-way frame delay measurement, the command displays two-way frame delay and frame delay variation values for each round-trip frame exchange during that ETH-DM session, as well as a runtime display of useful summary information about the session: average delay, average delay variation, best-case delay, and worst-case delay. Two-way frame delay and frame delay variation values measurements from an ETH-DM session are collected in a CFM database at the router that contains the initiator MEP. You can retrieve ETH-DM statistics from a CFM database at a later time.

**NOTE:** Although you can trigger frame delay collection for up to 65,535 ETH-DM requests at a time, a router stores only the last 100 frame delay statistics per CFM session (pair of peer MEPs).

For a complete description of the **monitor ethernet delay-measurement** operational command, see the [CLI Explorer](#).

**Related Documentation**

- [monitor ethernet delay-measurement on page 1347](#)

---

## Managing ETH-LM Statistics

---

- [Displaying ETH-LM Statistics on page 740](#)
- [Clearing ETH-LM Statistics on page 741](#)

### Displaying ETH-LM Statistics

**Purpose** Display the ETH-LM statistics.

By default, the **show oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command displays ETH-LM statistics for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

The following list consists of the CFM-related operational mode commands that have been enhanced to display ETH-LM statistics:

- The **show oam ethernet connectivity-fault-management interfaces detail** command is enhanced to display ETH-DM and ETH-LM statistics for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).
- The **show oam ethernet connectivity-fault-management mep-statistics** command is enhanced to display ETH-DM and ETH-LM statistics and frame counts for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).
- The **show oam ethernet connectivity-fault-management mep-database** command is enhanced to display ETH-DM and ETH-LM frame counters for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

**Action**

- To display the ETH-LM statistics for all MEPs attached to CFM-enabled interfaces on the router:

```
user@host> show oam ethernet connectivity-fault-management loss-statistics
```

- To display the ETH-DM statistics collected for MEPs belonging to MA **ma1** and within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain md1 maintenance-association ma1
```

- To display the ETH-DM statistics and ETH-DM frame counts for MEPs in MA **ma1** and within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md1 maintenance-association ma1
```

- To display CFM database information (including ETH-DM frame counts) for all MEPs in MA **ma1** within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md1 maintenance-association ma1
```

- See Also**
- [clear oam ethernet connectivity-fault-management loss-statistics on page 1339](#)
  - [show oam ethernet connectivity-fault-management delay-statistics on page 1671](#)
  - [show oam ethernet connectivity-fault-management interfaces on page 1679 \(detail | extensive\)](#)
  - [show oam ethernet connectivity-fault-management mep-statistics on page 1709](#)
  - [show oam ethernet connectivity-fault-management mep-database on page 1697](#)
  - [show oam ethernet connectivity-fault-management loss-statistics on page 1693](#)
  - *Ethernet Interfaces Feature Guide for Routing Devices*

## Clearing ETH-LM Statistics

**Purpose** Clear the ETH-LM statistics.

By default, statistics are deleted for all MEPs attached to CFM-enabled interfaces on the router. However, you can filter the scope of the command by specifying an interface name.

- Action**
- To clear the ETH-LM statistics for all MEPs attached to CFM-enabled interfaces on the router:

```
user@host> clear oam ethernet connectivity-fault-management loss-statistics
```

- See Also**
- [clear oam ethernet connectivity-fault-management loss-statistics on page 1339](#)
  - *Ethernet Interfaces Feature Guide for Routing Devices*

- Related Documentation**

## Managing Continuity Measurement Statistics

---

- [Displaying Continuity Measurement Statistics on page 742](#)
- [Clearing Continuity Measurement Statistics on page 742](#)

### Displaying Continuity Measurement Statistics

**Purpose** Display continuity measurement.

The **show oam ethernet connectivity-fault-management delay-statistics maintenance-domain md1 maintenance-association ma1** command is enhanced to display continuity measurement statistics for MEPs in the specified CFM maintenance association (MA) within the specified CFM maintenance domain (MD).

**Action**

- To display the ETH-DM statistics collected for MEPs belonging to MA **ma1** and within MD **md1**:

```
user@host> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain md1 maintenance-association ma1
```

**See Also**

- [show oam ethernet connectivity-fault-management delay-statistics on page 1671](#)
- *Ethernet Interfaces Feature Guide for Routing Devices*

### Clearing Continuity Measurement Statistics

**Purpose** Clear the continuity measurement statistics

By default, statistics are deleted for all MEPs attached to CFM-enabled interfaces on the router. However, you can filter the scope of the command by specifying an interface name.

**Action**

- To clear the continuity measurement statistics for all MEPs attached to CFM-enabled interfaces on the router:

```
user@host> clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain md-name maintenance-association ma-name local-mep local-mep-id
remote-mep remote-mep-id
```

**See Also**

- [clear oam ethernet connectivity-fault-management continuity-measurement on page 1337](#)

  - [show oam ethernet connectivity-fault-management delay-statistics on page 1671](#)

## Configuring the Failure Notification Protocol

This topic describes how to configure the Ethernet Operations, Administration, and Maintenance (OAM) Failure Notification Protocol (FNP) on MX Series routers. The FNP detects link failures in a Carrier Ethernet network and broadcasts FNP messages when a failure occurs to all nodes affected by the link failure. To configure FNP functionality, include the **fnp** statement at the **[edit protocols oam ethernet]** hierarchy level:

```
[edit protocols oam]
ethernet {
 fnp {
 interval <100ms | 1s | 10s | 1m | 10m>;
 loss-threshold number
 interface interface name {
 domain-id domain-id
 }
 }
}
```

The **interval** statement specifies the time between the transmission of FNP messages. You can specify 10 minutes (10m), 1 minute (1m), 10 seconds (10s), 1 second (1s), and 100 milliseconds (100ms). The **loss-threshold** statement specifies how many FNP messages can be lost before the FNP message is considered aged out and flushed. You must include the **interface *interface-name*** statement with the **domain-id *domain-id*** statement. The **domain-id** statement specifies a domain ID for the route. FNP messages can be received and processed on MX Series routers, but generating FNP messages is not supported.

The **show oam ethernet fnp interface**, **show oam ethernet fnp status**, and **show oam ethernet fnp messages** operational commands display the configured information.

FNP can be enabled only on logical interfaces that are part of a VPLS routing instance, and none of the logical interfaces in the VPLS routing instance should have CCM configured. FNP can be enabled on only one logical interface per physical interface.

## Ethernet Alarm Indication Signal (ETH-AIS) Function Overview

---

Ethernet alarm indication signal (ETH-AIS) function enables a service provider deploying an Ethernet service to determine whether a connectivity fault exists at the provider's domain level or at a level below. When the fault occurs at the provider's domain level, the service provider addresses the fault, and when the fault occurs at a level below, the provider can either ignore the fault or contact the relevant authorities to address the fault.

The following sections explain ETH-AIS, few use cases which determine when to generate and propagate ETH-AIS packets, and associated terms in detail:

- [Understanding ETH-AIS in a Maintenance Domain on page 744](#)
- [Fault Detection in a Maintenance Domain on page 745](#)
- [Terms Defined on page 746](#)

### Understanding ETH-AIS in a Maintenance Domain

ITU-T developed Y.1731 as a recommendation for Operation, Administration, and Maintenance (OAM) functions and mechanisms for Ethernet-based networks, including OAM functions such as ETH-AIS, Ethernet locked signal (ETH-LCK), Ethernet test signal (ETH-Test), Ethernet automatic protection switching (ETH-APS), Ethernet maintenance communication channel (ETH-MCC), Ethernet experimental OAM (ETH-EXP), Ethernet vendor-specific OAM (ETH-VSP), and performance monitoring. For information about maintenance domain and related terms, see ["Terms Defined" on page 746](#).

According to the Y.1731 standards, a server MEP is a combined function of the server layer termination function and the server Ethernet services layer adaptation function. The server MEP notifies the Ethernet services (ETH) layer MEPs when it detects a failure. The server layer termination function then runs the OAM mechanisms specific to the server layer and the alarms are suppressed at the server layer by ETH-AIS.

Note that ETH-AIS is not applicable to Spanning Tree Protocol (STP) networks.

ETH-AIS enables you to suppress alarms when a fault condition is detected. Using ETH-AIS, a service provider can differentiate between faults at different levels.

ETH-AIS provides many advantages that include:

- Service providers need not raise alarms if there are lower-level failures.
- Service providers can provide a refund to their subscribers or avail a refund from their Internet provider based on service unavailability.

MX Series routers support ITU-T Y.1731 ETH-AIS to provide fault management for service providers who provide carrier Ethernet services using IEEE 802.1ag standard.

**NOTE:** MX Series Virtual Chassis does not support Ethernet alarm indication signal (ETH-AIS).

---

## Fault Detection in a Maintenance Domain

In the scenario depicted in Figure 1 on page xyz, you have a service provider level and a customer level. Two service providers—*Operator-1* and *Operator-2*—are considered for illustration purposes. Assume that a fault occurs in Operator-1 maintenance domain-level that has MEP-A and MEP-B at its maintenance domain-level boundaries. To notify the faults to a network management system and to avoid notification of alarms from the customer level for the same fault, MEP-A and MEP-B transmit an alarm indication signal (AIS) on opposite directions, thereby signaling the higher levels and the Operator-2 network about the fault, so that the alarms are suppressed.

Signaling is achieved through transmission and propagation of AIS protocol data units (PDUs). You must enable AIS explicitly on all the MEPs at the service provider level. A MEP that is configured to issue frames with ETH-AIS information is generally at the server layer and continues to transmit periodic frames with ETH-AIS information until the defect condition is cleared. When a client MEP receives the ETH-AIS frames, it suppresses loss-of-continuity alarms associated with its peer MEPs.

Note that in the absence of AIS, a client MEP resumes generating loss-of-continuity alarms when it detects the loss-of-continuity defect conditions from its server layer.

For point-to-point Ethernet services layer connectivity, a MEP has only one peer MEP. Therefore, there is no ambiguity regarding the peer MEP for which the MEP should suppress alarms when it receives the ETH-AIS information.

For multipoint Ethernet services layer connectivity, a MEP that receives ETH-AIS information cannot determine the exact MEP that encountered the fault and, therefore, cannot isolate the exact peer MEP to suppress the alarms. To avoid this scenario, Y.1731 recommends suppressing alarms for all peer MEPs in the same domain level irrespective of connectivity status in a multipoint Ethernet services layer connectivity setup.

Table 98 on page 745 lists the operational mode commands that you can use in a maintenance domain to check the various parameters pertaining to a MEP.

**Table 98: Operational Mode Commands**

| To Check                                                            | Operational Mode Commands                                                             |

## Terms Defined

- AIS transmission—A MEP upon detecting a defect condition transmits AIS frames in a direction opposite to its peer MEPs. The periodicity of AIS frames transmission is on the basis of the AIS transmission period. An AIS transmission period of 1 second is recommended. The first AIS frame must always be transmitted immediately following the detection of a defect condition.
- AIS reception—Upon receiving an AIS frame, a MEP examines it to ensure that the frame's maintenance domain level is the same as its own maintenance domain level. The *period* field in the frame indicates the period at which the AIS frames can be expected. When a MEP receives an AIS frame, it detects the defect condition. After detection, when no AIS frames are received within an interval of 3.5 times—the AIS transmission period indicated in the AIS frames received—the MEP clears the AIS defect condition. When the AIS condition is cleared and defects still exist, then the MEPs continue to report alarms.
- AIS PDU format—The fields of the AIS PDU format are:

- MEG Level—Also called the maintenance domain level, it is a 3-bit field that is used to carry the maintenance domain level of the client MEG.
- Version—Value is always 0.
- OpCode—Value for this PDU type is AIS (33).

- d. **Flags**—The first five bits are reserved and are set to 0. The 3-bit information element carried in the three least significant bits are referred to as the period that contains the value of AIS transmission periodicity as illustrated in [Table 99 on page 747](#):

**Table 99: AIS Transmission Periodicity**

| Flags [3:1] | Period Value  | Comments              |
|-------------|---------------|-----------------------|
| 000-011     | Invalid value | Invalid value for AIS |
| 100         | 1s            | 1 frame per second    |
| 101         | Invalid value | Invalid value for AIS |
| 110         | 1 min         | 1 frame per minute    |
| 111         | Invalid value | Invalid value for AIS |

- e. **TLV offset**—Set to 0.

- f. **End TLV**—All-zeroes octet value.

- **Server layer and client layer**—These layers are part of the ITU-T Recommendation G.805 transport network functional model. This model is based on the concept of layering within a transport network. A transport network is divided into several independent transport layer networks that have a client-server association between adjacent layer networks.
- **Maintenance domain**—To enable connectivity fault management (CFM) on an Ethernet interface, maintenance domains, maintenance associations, and maintenance end points (MEPs) are created and configured in a network. You can configure up to eight maintenance domain levels in a network. Each maintenance domain level is a part of the network where the connectivity issues can be monitored and corrected. Provider domain and customer domain are some examples for maintenance domains. Each maintenance domain has a maintenance association. Each maintenance association includes MEPs and maintenance intermediate points (MIPs) in that domain. The MEPs are located at the boundary of the domain and the MIPs are located within the domain. MEPs generate and transmit continuity check messages (CCMs) at configured intervals to the entire maintenance association to check the connectivity in the network.
- **Ethernet services (ETH) layer**—A layer in the metro Ethernet network model, where this layer is responsible for the OAM services that are required to support the Ethernet services in the network.

## Ethernet Alarm Indication Signal Overview

---

ACX Series routers support ITU-T Y.1731 Ethernet Alarm Indication Signal function (ETH-AIS) to provide fault management for service providers. ETH-AIS enables you to suppress alarms when a fault condition is detected. Using ETH-AIS, an administrator can differentiate between faults at customer level or faults at provider level.

The advantage of ETH-AIS is:

- Customers need not raise alarms due to lower level failures.
- Customers can get refund based on service unavailability.

When a fault condition is detected, a maintenance end point (MEP) generates ETH-AIS packets to the configured client levels for a specified duration until the fault condition is cleared. Any MEP configured to generate ETH-AIS packets signals to a level higher than its own. A MEP receiving ETH-AIS recognizes that the fault is at a lower level and then suppresses alarms at current level.

ACX Series routers support ETH-AIS PDU generation for server MEPs based on the following defect conditions:

- Loss of connectivity (physical link loss detection)
- Layer 2 circuit or Layer 2 VPN down

Alarm indication signaling is done through the transmission and propagation of ETH-AIS PDUs. ETH-AIS should be enabled on MEPs. A MEP which is configured to issue packets with ETH-AIS information is generally of server layer and continues to transmit periodic packets with ETH-AIS information until the defect condition is cleared. CFM MEPs, upon receiving ETH-AIS PDUs, suppresses loss of continuity alarms associated with its peer MEPs. A MEP resumes loss of continuity alarm generation upon detecting loss of continuity defect conditions in the absence of an ETH-AIS condition.

For point-to-point Ethernet connectivity, a MEP has only a single peer MEP. Therefore, a MEP suppress alarms on its peer MEP when it receives the ETH-AIS information.

For multi-point Ethernet connectivity, a MEP which receives ETH-AIS information cannot determine the exact MEP encountered a fault condition and therefore it will not be able to isolate the exact peer MEP for alarm suppression. ITU-T Y.1731 recommends suppressing alarms for all peer MEPs irrespective of the connectivity status.

**AIS transmission**—A MEP upon detecting a defect condition transmits ETH-AIS PDUs in a direction opposite to its peer MEPs. The transmission of ETH-AIS PDUs is based on a configured ETH-AIS transmission period. An ETH-AIS transmission period of 1 second is recommended. The first ETH-AIS PDU must be transmitted immediately following the detection of a defect condition.

**AIS reception**—A MEP upon receiving ETH-AIS PDUs examines it to ensure that its maintenance domain (MD) level corresponds to the same MD level. Upon receiving an ETH-AIS PDU, the MEP detects a defect condition. Following the detection of a defect condition, if there are no ETH-AIS PDUs received within an interval of 3.5 times the

ETH-AIS transmission period indicated in the ETH-AIS PDUs received earlier, the MEP clears the defect condition. After the fault condition is cleared, MEPs continue to report alarms.

**NOTE:** ACX Series routers do not support ITU-T Y.1731 ETH-AIS for layer 2 services (bridging).

The following are the limitations for server MEP

- Triggering of ETH-AIS messages over services (Layer 2 circuit and Layer 2 VPN) by the link-loss server MEP is done on a best-effort manner. This is because the transmission of ETH-AIS messages is independent of the service status and there is no guarantee for delivering the ETH-AIS messages before service goes down.
- Pseudowire protection with CFM-MEP session is not monitored by the server-MEP because an entity to monitor pseudowire protection already exists for the service (Layer 2 circuit and Layer 2 VPN).

## Configuring ETH-AIS on a CFM MEP

MX Series routers support ITU-T Y.1731 Ethernet alarm indication signal (ETH-AIS) function to provide fault management for service providers. ETH-AIS enables the service provider to suppress alarms when a fault condition is detected.

The following points are to be noted when ETH-AIS is configured in a maintenance domain:

- Transmitting or receiving of AIS on a MEP does not override the **lowest-priority-defect** statement configured at the `[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name mep mep-id]` hierarchy level. Therefore, alarms are reported according to the defect priority configured.
- Alarms are reported even when the higher domain levels exchange CCMs at a faster rate than the lower domain levels.
- Maintenance association intermediate point (MIP) is transparent to ETH-AIS frames—that is, the MIPs do not perform any action in response to ETH-AIS frames.
- When the service provider requests the MEP to generate an AIS for a lower level or for the same level, the request is rejected.

- AIS generation is stopped when the MEP clears the remote MEP within the maintenance association.
- When the **auto-discovery** statement is enabled for a MEP, the remote MEP information is cleared after the configured hold interval expires.

The following tasks explain how to enable ETH-AIS in a maintenance domain, configure an action to be taken when a defect is detected, and to attach the action profile to a CFM MEP:

1. [Configuring an Action Profile on page 750](#)
2. [Configuring an Action to Be Taken When an AIS Alarm Is Detected on page 751](#)
3. [Attaching the Action Profile to a CFM MEP on page 752](#)

## Configuring an Action Profile

To configure an action profile for ETH-AIS:

1. Go to the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
```

2. Configure an action profile to use when one or more remote MEPs are down.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# edit action-profile action-profile-name
```

3. Configure an event that needs to be monitored.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
action-profile-name]
user@host# edit event
```

4. Configure the defect condition that generates an alarm indication signal.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
action-profile-name event]
user@host# edit ais-trigger-condition
```

5. Configure the **adjacency-loss** statement to inform the operator when the physical connectivity is lost between the peer MEPs.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
action-profile-name event ais-trigger-condition]
user@host# set adjacency-loss
```

6. Configure the **all-defects** statement to inform the operator that all possible defects must be considered to raise the alarm indication signal.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name event ais-trigger-condition]
user@host# set all-defects
```

7. Configure the **cross-connect-ccm** statement to inform the operator when cross-connect continuity check messages (CCMs) are received by the MEP and to raise an alarm indication signal in response.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name event ais-trigger-condition]
user@host# set cross-connect-ccm
```

8. Configure the **erroneous-ccm** statement to inform the operator when CCMs with unexpected MEP ID or maintenance domain level are received by the MEP and an AIS alarm is raised in response.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name event ais-trigger-condition]
user@host# set erroneous-ccm
```

9. Configure the **receive-ais** statement to inform the operator that an AIS message has been received from the peer MEP in its own maintenance level.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name event ais-trigger-condition]
user@host# set receive-ais
```

## Configuring an Action to Be Taken When an AIS Alarm Is Detected

Configure an action to be taken when an AIS alarm is detected.

1. Go to the **[edit protocols oam ethernet connectivity-fault-management action-profile action-profile-name action]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name action
```

2. Configure the **log-and-generate-ais** statement to log the event that generated the AIS message.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name action]
user@host# edit log-and-generate-ais
```

3. Configure the interval between AIS messages that are to be received by the MEP as 1 minute or 1 second.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name action log-and-generate-ais]
user@host# set interval (1m | 1s)
```

4. Configure the server maintenance domain level range of the MEP from 1 through 7.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name action log-and-generate-ais]
user@host# set level level
```

5. Configure the 802.1p priority of the AIS packet from 1 through 7.

```
[edit protocols oam ethernet connectivity-fault-management action-profile
 action-profile-name action log-and-generate-ais]
user@host# set priority level
```

## Attaching the Action Profile to a CFM MEP

After configuring an event and an action to be monitored in an action profile, you must attach the action profile to a CFM MEP.

1. Go to the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level.

```
[edit]
user@host# edit protocols oam ethernet connectivity-fault-management
```

2. Configure the maintenance domain with a name.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# edit maintenance-domain md-name
```

3. Configure the maintenance domain with a client maintenance entity group (MEG) level or maintenance association level—the level which the client layer maintenance association intermediate point (MIPs) and the MEPs exist—from 0 through 7.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name]
user@host# edit level level
```

**NOTE:** You cannot configure a maintenance domain level that is lower than or equal to the maintenance association level that it is associated with.

4. Configure the maintenance association.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name]
user@host# edit maintenance-association ma-name
```

5. Configure the continuity check that is performed on all the MEPs in a domain level by sending CCMs with an interval between two CCMs—100 milliseconds, 10 milliseconds, 1 second, 10 seconds, 1 minute, or 10 minutes—and the number of CCMs that are to be lost before marking a MEP as down.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name]
user@host# set continuity-check interval (100ms | 10m | 10ms | 1m | 1s)
user@host# set continuity-check loss-threshold value
```

6. Configure the MEP with an identifier from 1 through 8192.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name]
user@host# set mep mep-id
```

7. Attach the configured action profile to the MEP.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id]
user@host# set action-profile action-profile-name
```

8. Configure the interface of the MEP over which the CCMs are transmitted.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id]
user@host# set interface interface-name
```

9. Configure the direction for the CCMs to travel to the next MEP as up or down.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id]
user@host# set direction (down | up)
```

10. Configure the 802.1p priority for the CCMs and link-trace packet from 0 through 7.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id]
user@host# set priority priority-value
```

- Related Documentation**
- [Ethernet Alarm Indication Signal \(ETH-AIS\) Function Overview on page 744](#)

## Configuring Alarm Indication Signal on ACX Series Routers

ACX Series routers support ITU-T Y.1731 Ethernet Alarm Indication Signal function (ETH-AIS) to provide fault management for service providers. ETH-AIS enables you to suppress alarms when a fault condition is detected.

To support ETH-AIS transmission, the following configuration information is required by a CFM MEP:

- Client Maintenance Entity Group level—Maintenance Entity Group (MEG) level at which the immediate client layer Maintenance Domain Intermediate Points (MIPs) and Maintenance Association End Points (MEPs) exist.
- ETH-AIS transmission period—Determines the ETH-AIS PDU transmission interval.
- Priority—Determines the priority of packets with ETH-AIS information. This is optional.

To configure ETH-AIS in CFM MEP, you need to:

- Configure an action profile with ETH-AIS action
- Attach the action profile to the CFM MEP

To configure an action profile with ETH-AIS action, include the following statements at the [edit protocols oam ethernet connectivity-fault-management] hierarchy level:

```
[edit protocols oam ethernet connectivity-fault-management]
action-profile action-profile-name {
 event {
 adjacency-loss;
 all-defects;
 cross-connect-ccm;
 errored-ccm;
 receive-ais;
 }
 action {
 log-and-generate-ais {
 level [1-7];
 interval 1s | 1m ;
 priority [0-7];
 }
 log-ais;
 }
}
```

To attach an action profile to a CFM MEP, include the following statements at the [edit protocols oam ethernet connectivity-fault-management] hierarchy level:

```
maintenance-domain maintenance-domain-name {
 level level-number;
 maintenance-association maintenance-domain-name {
```

```

continuity-check {
 interval 1s;
 loss-threshold 3;
}
mep mep-id {
 interface interface-name;
 direction up | down;
 priority priority-value;
 action-profile action-profile-name;
}
}
}

```

**NOTE:** You cannot configure a maintenance domain level that is lower than or equal to the level that it is associated with.

To support ETH-AIS transmission, the following configuration information required by a server MEP:

- Server MEP definition—Defines the association of server MEP identifier to the server layer.
  - For Layer 2 circuit and Layer 2 VPN, the logical interface connected to a customer network (UNI) would be the identifier for the server layer that needs to be monitored by the server MEP.
  - For physical link loss detection, the physical interface under Ethernet protocol would be the identifier for the server layer that needs to be monitored by the server MEP.
- Association of server MEP defect—Defines the association of server MEP defects to ETH-AIS action.
- Association action profile and server MEP—Defines the binding of server MEP and action profile.

To configure ETH-AIS in server MEP, you need to:

- Create an action profile with ETH-AIS action for server MEP defects.
- Attach the action profile to a server MEP

To create an action profile, include the following statements at the [edit protocols oam ethernet connectivity-fault-management] hierarchy level:

```

[edit protocols oam ethernet connectivity-fault-management]
action-profile action-profile-name {
 event {
 server-mep-defects {
 link-loss-defect;
 l2circuit-defect;
 l2vpn-defect;
 }
 }
}

```

```

action {
 log-and-generate-ais {
 level 1...n;
 interval 1 second | 1 minute;
 priority dot1p [range 0-7];
 }
}

```

To attach an action profile to a server MEP, include the following statement at the [edit protocols oam ethernet connectivity-fault-management] hierarchy level:

```

[edit protocols oam ethernet connectivity-fault-management]
server-mep mep-identifier {
 protocol l2circuit | l2vpn | ethernet {
 interface interface-name;
 }
 action-profile action-profile-name;
}

```

## Example: Configuring One-Way Ethernet Frame Delay Measurements with Single-Tagged Interfaces

This example uses two MX Series routers: **MX-1** and **MX-2**. The configuration creates a CFM down MEP session on a VLAN-tagged logical interface connecting the two (**ge-5/2/9** on Router **MX-1** and **ge-0/2/5** on Router **MX-2**).

**NOTE:** These are not complete router configurations.

Configuration on Router **MX-1**:

```

[edit]
interfaces {
 ge-5/2/9 {
 vlan-tagging;
 unit 0 {
 vlan-id 512;
 }
 }
}
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 traceoptions {
 file eoam_cfm.log size 1g files 2 world-readable;
 flag all;
 }
 }
 }
 }
}

```

```

 }
 linktrace {
 path-database-size 255;
 age 10s;
 }
 maintenance-domain md6 {
 level 6;
 maintenance-association ma6 {
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 mep 201 {
 interface ge-5/2/9.0;
 direction down;
 auto-discovery;
 }
 }
 }
}
}
}
}
}
}
}
}

```

Configuration on Router **MX-2**:

```

[edit]
interfaces {
 ge-0/2/5 {
 vlan-tagging;
 unit 0 {
 vlan-id 512;
 }
 }
}
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 traceoptions {
 file eoam_cfm.log size 1g files 2 world-readable;
 flag all;
 }
 linktrace {
 path-database-size 255;
 age 10s;
 }
 }
 maintenance-domain md6 {
 level 6;
 maintenance-association ma6 {
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 }
 }
 }
 }
}

```

```

mep 101 {
 interface ge-0/2/5.0;
 direction down;
 auto-discovery;
}
}
}
}
}
}
}
}
}
}

```

From Router **MX-2**, start a one-way delay measurement to Router **MX-1**.

```

user@MX-2> monitor ethernet delay-measurement one-way mep 201 maintenance-domain md6
maintenance-association ma6 count 10

```

```

One-way ETH-DM request to 00:90:69:0a:43:94, Interface ge-0/2/5.0
1DM Frames sent : 10
--- Delay measurement statistics ---
Packets transmitted: 10
Average delay: NA, Average delay variation: NA
Best case delay: NA, Worst case delay: NA

```

The counters are displayed as part of the local MEP database on Router **MX-2**.

```

user@MX-2> show oam ethernet connectivity-fault-management mep-database
maintenance-domain md6 maintenance-domain ma6

```

```

Maintenance domain name: md6, Format: string, Level: 6

```

**NOTE:** When two systems are close to each other, their one-way delay values are very high compared to their two-way delay values. This is because one-way delay measurement requires the timing for the two systems to be synchronized at a very granular level and MX Series routers do not support this granular synchronization. However, two-way delay measurement does not require synchronized timing, making two-way delay measurements more accurate.

### Example: Configuring Two-Way Ethernet Frame Delay Measurements with Single-Tagged Interfaces

This example uses two MX Series routers: **MX-1** and **MX-2**. The configuration creates a CFM down MEP session on a VLAN-tagged logical interface connecting the two (**ge-5/2/9** on Router **MX-1** and **ge-0/2/5** on Router **MX-2**).

**NOTE:** These are not complete router configurations.

Configuration on Router **MX-1**:

```
[edit]
interfaces {
 ge-5/2/9 {
 vlan-tagging;
 unit 0 {
 vlan-id 512;
 }
 }
}
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 traceoptions {
 file eoam_cfm.log size 1g files 2 world-readable;
```

```

 flag all;
 }
 linktrace {
 path-database-size 255;
 age 10s;
 }
 maintenance-domain md6 {
 level 6;
 maintenance-association ma6 {
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 mep 201 {
 interface ge-5/2/9.0;
 direction down;
 auto-discovery;
 }
 }
 }
}
}
}
}
}
}
}
}

```

Configuration on Router **MX-2**:

```

[edit]
interfaces {
 ge-0/2/5 {
 vlan-tagging;
 unit 0 {
 vlan-id 512;
 }
 }
}
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 traceoptions {
 file eoam_cfm.log size 1g files 2 world-readable;
 flag all;
 }
 }
 linktrace {
 path-database-size 255;
 age 10s;
 }
 maintenance-domain md6 {
 level 6;
 maintenance-association ma6 {
 continuity-check {
 interval 100ms;
 hold-interval 1;
 }
 }
 }
 }
 }
}

```

```

 }
 mep 101 {
 interface ge-0/2/5.0;
 direction down;
 auto-discovery;
 }
}
}
}
}
}
}
}
}
}
}

```

From Router **MX-1**, start a two-way delay measurement to Router **MX-2**.

```

user@MX-1> monitor ethernet delay-measurement two-way mep 101 maintenance-domain md6
maintenance-association ma6 count 10

```

```

### Example: Measuring Ethernet Frame Loss for Single-Tagged LMM/LMR PDUs

This example illustrates how to configure Ethernet frame loss measurement (ETH-LM) for single-tagged Loss Measurement Message (LMM)/Loss Measurement Reply (LMR)

protocol data units (PDUs). By configuring ETH-LM, you can measure the Ethernet frame loss that occur in your network.

- Requirements on page 766
- Overview and Topology on page 766
- Configuration on page 767
- Verification on page 776

## Requirements

This example uses the following hardware and software components:

- Two MX Series 5G Universal Routing Platforms with Rev-B Dense Port Concentrators (DPCs)
- Junos OS Release 14.2 or later

## Overview and Topology

Junos OS supports Ethernet frame loss measurement (ETH-LM) between maintenance association end points (MEPs) configured on Ethernet physical or logical interfaces on Rev-B Dense Port Concentrators (DPCs) in MX Series routers. Additionally, the Y.1731 functionality supports ETH-LM only for an end-to-end connection that uses Virtual Private Wire Service (VPWS). This example illustrates how to configure ETH-LM for single-tagged LMM/LMR PDUs with input and output VLAN map configured as **swap**.

Figure 35 on page 766 shows the topology used in this example. VPWS service is configured between two MX Series routers, MX-PE1 and MX PE2.

Figure 35: VPWS Service Configured Between Two MX Series Routers

MX-PE1 router has two Ethernet interfaces, **ge-5/0/4** and **ge-5/1/9**. Virtual LAN (VLAN) is configured on **ge-5/0/4** and MPLS is configured on the **ge-5/1/9** interface. The **ge-5/0/4.11** interface is used to configure the Layer 2 virtual circuit with MX-PE2 router. The UP MEP, **mep 2**, is attached to the **ge-5/0/4.11** interface. The three-color policer firewall filter is also configured for the MX-PE1 router.

Similarly, MX-PE2 router has two Ethernet interfaces, **ge-8/0/8** and **ge-8/0/9**. Virtual LAN (VLAN) is configured on **ge-8/0/8** and MPLS is configured on the **ge-8/0/9** interface. The **ge-8/0/8.11** interface is used to configure the Layer 2 virtual circuit with MX-PE1 router. The UP MEP, **mep1**, is attached to the **ge-8/0/8.11** interface. The three-color policer firewall filter is also configured for the MX-PE2 router.

## Configuration

- [Configuring Router PE1 on page 768](#)
- [Configuring Router PE2 on page 772](#)

**CLI Quick Configuration** To quickly configure ETH-LM for single-tagged LMM/LMR PDUs, copy the following commands, remove any line breaks, and then paste the commands into the CLI of each device.

On Router PE1:

```

### Configuring Router PE1

#### Step-by-Step Procedure

To configure Router PE1:

1. Configure the interfaces.

```
[edit]
user@PE1# edit interfaces
[edit interfaces]
user@PE1# set ge-5/0/4 encapsulation flexible-ethernet-services
user@PE1# set ge-5/0/4 unit 11 encapsulation vlan-ccc
```

```

user@PE1# set ge-5/0/4 unit 11 layer2-policer input-three-color abc
user@PE1# set ge-5/0/4 unit 11 family ccc
user@PE1# set ge-5/1/9 enable
user@PE1# set ge-5/1/9 unit 0 family inet address 12.1.1.1/24
user@PE1# set ge-5/1/9 unit 0 family mpls
user@PE1# set lo0 unit 0 family inet address 4.4.4.4/32

```

2. Configure the VLAN.

```

[edit interfaces]
user@PE1# set ge-5/0/4 flexible-vlan-tagging
user@PE1# set ge-5/0/4 unit 11 vlan-id 2000
user@PE1# set ge-5/0/4 unit 11 input-vlan-map swap
user@PE1# set ge-5/0/4 unit 11 input-vlan-map vlan-id 4094
user@PE1# set ge-5/0/4 unit 11 output-vlan-map swap

```

3. Configure the router identifier to identify the routing device.

```

[edit]
user@PE1# edit routing-options
[edit routing-options]
user@PE1# set router-id 4.4.4.4

```

4. Configure MPLS, OSPF, and LDP protocols.

```

[edit]
user@PE1# edit protocols
[edit protocols]
user@PE1# set mpls interface all
user@PE1# set mpls interface fxp0.0 disable
user@PE1# set ospf area 0.0.0.0 interface all
user@PE1# set ospf area 0.0.0.0 interface fxp0.0 disable
user@PE1# set ldp interface all
user@PE1# set ldp interface fxp0.0 disable

```

5. Configure the Layer 2 circuit.

```

[edit protocols]
user@PE1# set l2circuit neighbor 3.3.3.3 interface ge-5/0/4.11 virtual-circuit-id 1003
user@PE1# set l2circuit neighbor 3.3.3.3 interface ge-5/0/4.11 no-control-word

```

6. Configure the MEP.

```

[edit protocols]
user@PE1# set oam ethernet connectivity-fault-management
performance-monitoring delegate-server-processing
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md level 4

```

```

user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma continuity-check interval 1s
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 interface ge-5/0/4.11
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 direction up
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 remote-mep 1

```

7. Configure the firewall.

```

[edit]
user@PE1# edit firewall
[edit firewall]
user@PE1# set three-color-policer abc logical-interface-policer
user@PE1# set three-color-policer abc two-rate color-blind
user@PE1# set three-color-policer abc two-rate committed-information-rate 10m
user@PE1# set three-color-policer abc two-rate committed-burst-size 1500
user@PE1# set three-color-policer abc two-rate peak-information-rate 20m
user@PE1# set three-color-policer abc two-rate peak-burst-size 15k

```

8. Commit the configuration.

```

[edit]
user@PE1# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, and **show firewall** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

## Configuring Router PE2

**Step-by-Step Procedure** To configure Router PE2:

1. Configure the interfaces.

```

[edit]
user@PE2# edit interfaces
[edit interfaces]
user@PE2# set ge-8/0/8 encapsulation flexible-ethernet-services
user@PE2# set ge-8/0/8 unit 11 encapsulation vlan-ccc
user@PE2# set ge-8/0/8 unit 11 layer2-policer input-three-color abc
user@PE2# set ge-8/0/8 unit 11 family ccc
user@PE2# set ge-8/0/9 enable
user@PE2# set ge-8/0/9 unit 0 family inet address 12.1.1.1/24

```

```

user@PE2# set ge-8/0/9 unit 0 family mpls
user@PE2# set ae0 unit 0 family inet
user@PE2# set lo0 unit 0 family inet address 3.3.3.3/32

```

2. Configure the VLAN.

```

[edit interfaces]
user@PE2# set ge-8/0/8 flexible-vlan-tagging
user@PE2# set ge-8/0/8 unit 11 vlan-id 2000
user@PE2# set ge-8/0/8 unit 11 input-vlan-map swap
user@PE2# set ge-8/0/8 unit 11 input-vlan-map vlan-id 4094
user@PE2# set ge-8/0/8 unit 11 output-vlan-map swap

```

3. Configure the router identifier to identify the routing device.

```

[edit]
user@PE2# edit routing-options
[edit routing-options]
user@PE2# set router-id 3.3.3.3

```

4. Configure MPLS, OSPF, and LDP protocols.

```

[edit]
user@PE2# edit protocols
[edit protocols]
user@PE2# set mpls interface all
user@PE2# set mpls interface fxp0.0 disable
user@PE2# set ospf area 0.0.0.0 interface all
user@PE2# set ospf area 0.0.0.0 interface fxp0.0 disable
user@PE2# set ldp interface all
user@PE2# set ldp interface fxp0.0 disable

```

5. Configure the Layer 2 circuit.

```

[edit protocols]
user@PE2# set l2circuit neighbor 4.4.4.4 interface ge-8/0/8.11 virtual-circuit-id
1003
user@PE2# set l2circuit neighbor 3.3.3.3 interface ge-8/0/8.11 no-control-word

```

6. Configure the MEP.

```

[edit protocols]
user@PE2# set oam ethernet connectivity-fault-management maintenance-domain
md level 4
user@PE2# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma continuity-check interval 1s
user@PE2# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 1 interface ge-8/0/8.11

```

```

user@PE2# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 1 direction up
user@PE2# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 1 remote-mep 2

```

7. Configure the firewall.

```

[edit]
user@PE2# edit firewall
[edit firewall]
user@PE2# set three-color-policer abc logical-interface-policer
user@PE2# set three-color-policer abc two-rate color-blind
user@PE2# set three-color-policer abc two-rate committed-information-rate 10m
user@PE2# set three-color-policer abc two-rate committed-burst-size 1500
user@PE2# set three-color-policer abc two-rate peak-information-rate 20m
user@PE2# set three-color-policer abc two-rate peak-burst-size 15k

```

8. Commit the configuration.

```

[edit]
user@PE2# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, and **show firewall** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

## Verification

To start monitoring the Ethernet frame loss, issue the **monitor ethernet loss-measurement maintenance-domain md maintenance-association ma mep 1** command. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPS. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command. You can also issue the **show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11** command to display ETH-LM statistics.

- [Viewing ETH-LM on page 776](#)

### Viewing ETH-LM

**Purpose** View the ETH-LM statistics.

**Action** From operational mode, enter the **show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11** command.

```
user@PE1> show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11
```

```
Interface name: ge-5/0/4.11 , Interface status: Active, Link status: Up
Maintenance domain name: md, Format: string, Level: 4
Maintenance association name: ma, Format: string
Continuity-check status: enabled, Interval: 1s, Loss-threshold: 3 frames
Interface status TLV: none, Port status TLV: none
Connection Protection TLV: no
MEP identifier: 2, Direction: up, MAC address: 00:24:dc:9b:96:76
MEP status: running
Defects:
 Remote MEP not receiving CCM : no
 Erroneous CCM received : no
 Cross-connect CCM received : no
 RDI sent by some MEP : no

```

**Meaning** The Ethernet interface details and statistics are displayed. This output indicates that the **ge-5/0/4.11** interface is active and its link status is **up**. Its maintenance domain name is **md** and its level is **4**. The MEP identifier of the **ge-5/0/4.11** interface is indicated as **2** and its direction is **up**. Under the statistics section, the output indicates that **10** LMMs were sent and **10** valid LMRs were received by the interface.

## Example: Measuring Ethernet Frame Loss for Dual-Tagged LMM/LMR PDUs

This example illustrates how to configure Ethernet frame loss measurement (ETH-LM) for dual-tagged Loss Measurement Message (LMM)/Loss Measurement Reply (LMR) protocol data units (PDUs). By configuring ETH-LM, you can measure the Ethernet frame loss that occur in your network.

- [Requirements on page 778](#)
- [Overview and Topology on page 778](#)
- [Configuration on page 779](#)
- [Verification on page 789](#)

### Requirements

This example uses the following hardware and software components:

- Two MX Series 5G Universal Routing Platforms with Rev-B Dense Port Concentrators (DPCs)
- Junos OS Release 14.2 or later

### Overview and Topology

Junos OS supports Ethernet frame loss measurement (ETH-LM) between maintenance association end points (MEPs) configured on Ethernet physical or logical interfaces on Rev-B Dense Port Concentrators (DPCs) in MX Series routers. Additionally, the Y.1731 functionality supports ETH-LM only for an end-to-end connection that uses Virtual Private Wire Service (VPWS). This example illustrates how to configure ETH-LM for dual tagged LMM/LMR PDUs with input and output VLAN map configured as **swap-swap**.

[Figure 36 on page 779](#) shows the topology used in this example. VPWS service is configured between two MX Series routers, MX-PE1 and MX-PE2.

Figure 36: VPWS Service Configured Between Two MX Series Routers

8042702

MX-PE1 router has two Ethernet interfaces, **ge-5/0/4** and **ge-5/1/9**. Virtual LAN (VLAN) is configured on **ge-5/0/4** and MPLS is configured on the **ge-5/1/9** interface. The **ge-5/0/4.11** interface is used to configure the Layer 2 virtual circuit with MX-PE2 router. The UP MEP, **mep 2**, is attached to the **ge-5/0/4.11** interface. The three-color policer firewall filter is also configured for the MX-PE1 router.

Similarly, MX-PE2 router has two Ethernet interfaces, **ge-8/0/8** and **ge-8/0/9**. Virtual LAN (VLAN) is configured on **ge-8/0/8** and MPLS is configured on the **ge-8/0/9** interface. The **ge-8/0/8.11** interface is used to configure the Layer 2 virtual circuit with MX-PE1 router. The UP MEP, **mep 1**, is attached to the **ge-8/0/8.11** interface. The three-color policer firewall filter is also configured for the MX-PE2 router.

## Configuration

### Configuring Router PE1

**Step-by-Step Procedure** To configure Router PE1:

1. Configure the interfaces.

```

[edit]
user@PE1# edit interfaces
[edit interfaces]
user@PE1# set ge-5/0/4 encapsulation flexible-ethernet-services
user@PE1# set ge-5/0/4 unit 11 encapsulation vlan-ccc
user@PE1# set ge-5/0/4 unit 11 layer2-policer input-three-color abc
user@PE1# set ge-5/0/4 unit 11 family ccc
user@PE1# set ge-5/1/9 enable
user@PE1# set ge-5/1/9 unit 0 family inet address 12.1.1.1/24
user@PE1# set ge-5/1/9 unit 0 family mpls
user@PE1# set lo0 unit 0 family inet address 4.4.4.4/32

```

2. Configure the VLAN.

```

[edit interfaces]
user@PE1# set ge-5/0/4 flexible-vlan-tagging
user@PE1# set ge-5/0/4 unit 11 vlan-tags outer 2000 inner 1000
user@PE1# set ge-5/0/4 unit 11 input-vlan-map swap-swap
user@PE1# set ge-5/0/4 unit 11 input-vlan-map vlan-id 4094
user@PE1# set ge-5/0/4 unit 11 input-vlan-map inner-vlan-id 4093
user@PE1# set ge-5/0/4 unit 11 output-vlan-map swap-swap

```

3. Configure the router identifier to identify the routing device.

```

[edit]
user@PE1# edit routing-options
[edit routing-options]
user@PE1# set router-id 4.4.4.4

```

4. Configure MPLS, OSPF, and LDP protocols.

```
[edit]
user@PE1# edit protocols
[edit protocols]
user@PE1# set mpls interface all
user@PE1# set mpls interface fxp0.0 disable
user@PE1# set ospf area 0.0.0.0 interface all
user@PE1# set ospf area 0.0.0.0 interface fxp0.0 disable
user@PE1# set ldp interface all
user@PE1# set ldp interface fxp0.0 disable
```

5. Configure the Layer 2 circuit.

```
[edit protocols]
user@PE1# set l2circuit neighbor 3.3.3.3 interface ge-5/0/4.11 virtual-circuit-id 1003
user@PE1# set l2circuit neighbor 3.3.3.3 interface ge-5/0/4.11 no-control-word
```

6. Configure the MEP.

```
[edit protocols]
user@PE1# set oam ethernet connectivity-fault-management
performance-monitoring delegate-server-processing
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md level 4
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma continuity-check interval 1s
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 interface ge-5/0/4.11
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 direction up
user@PE1# set oam ethernet connectivity-fault-management maintenance-domain
md maintenance-association ma mep 2 remote-mep 1
```

7. Configure the firewall.

```
[edit]
user@PE1# edit firewall
[edit firewall]
user@PE1# set three-color-policer abc logical-interface-policer
user@PE1# set three-color-policer abc two-rate color-blind
user@PE1# set three-color-policer abc two-rate committed-information-rate 10m
user@PE1# set three-color-policer abc two-rate committed-burst-size 1500
user@PE1# set three-color-policer abc two-rate peak-information-rate 20m
user@PE1# set three-color-policer abc two-rate peak-burst-size 15k
```

8. Commit the configuration.

```
[edit]
user@PE1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show routing-options**, and **show firewall** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

## Configuring Router PE2

### Step-by-Step Procedure

To configure Router PE2:

1. Configure the interfaces.

```

[edit]
user@PE2# edit interfaces
[edit interfaces]
user@PE2# set ge-8/0/8 encapsulation flexible-ethernet-services
user@PE2# set ge-8/0/8 unit 11 encapsulation vlan-ccc
user@PE2# set ge-8/0/8 unit 11 layer2-policer input-three-color abc
user@PE2# set ge-8/0/8 unit 11 family ccc
user@PE2# set ge-8/0/9 enable
user@PE2# set ge-8/0/9 unit 0 family inet address 12.1.1.1/24
user@PE2# set ge-8/0/9 unit 0 family mpls
user@PE2# set ae0 unit 0 family inet
user@PE2# set lo0 unit 0 family inet address 3.3.3.3/32

```

2. Configure the VLAN.

```

[edit interfaces]
user@PE2# set ge-8/0/8 flexible-vlan-tagging
user@PE2# set ge-8/0/8 unit 11 vlan-tags outer 2000 inner 1000
user@PE2# set ge-8/0/8 unit 11 input-vlan-map swap-swap
user@PE2# set ge-8/0/8 unit 11 input-vlan-map vlan-id 4094
user@PE2# set ge-8/0/8 unit 11 input-vlan-map inner-vlan-id 4093
user@PE2# set ge-8/0/8 unit 11 output-vlan-map swap-swap

```

3. Configure the router identifier to identify the routing device.

```

[edit]
user@PE2# edit routing-options
[edit routing-options]
user@PE2# set router-id 3.3.3.3

```

4. Configure MPLS, OSPF, and LDP protocols.

```

[edit]
user@PE2# edit protocols
[edit protocols]

```

```

user@PE2# set mpls interface all
user@PE2# set mpls interface fxp0.0 disable
user@PE2# set ospf area 0.0.0.0 interface all
user@PE2# set ospf area 0.0.0.0 interface fxp0.0 disable
user@PE2# set ldp interface all
user@PE2# set ldp interface fxp0.0 disable

```

5. Configure the Layer 2 circuit.

```

[edit protocols]

## Verification

To start the Ethernet frame loss measurement session, issue the **monitor ethernet loss-measurement maintenance-domain md maintenance-association ma mep1** command. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command. You can also issue the **show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11** command to display ETH-LM statistics.

- [Viewing ETH-LM on page 789](#)

### Viewing ETH-LM

**Purpose** View the ETH-LM statistics.

**Action** From operational mode, enter the **show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11** command.

```
user@PE1> show oam ethernet connectivity-fault-management interfaces detail ge-5/0/4.11
```

```

## Triggering an Ethernet Frame Delay Measurements Session

Before Ethernet frame delay measurement statistics can be displayed, they must be collected. To trigger Ethernet frame delay measurement, use the **monitor ethernet delay-measurement (one-way | two-way) (remote-mac-address | mep identifier) maintenance-domain name maintenance-association ma-id [count count] [wait time]** operational command.

The fields for this command are described in [Table 100 on page 791](#).

Table 100: Monitor Ethernet Delay Command Parameters

| Parameter                            | Parameter Range            | Description                                                                                                                                         |
|--------------------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>one-way</b> or <b>two-way</b>     | NA                         | Perform a one-way or two-way (round-trip) delay measurement.                                                                                        |
| <b>remote-mac-address</b>            | Unicast MAC address        | Send delay measurement frames to the destination unicast MAC address (use the format xx:xx:xx:xx:xx:xx). Multicast MAC addresses are not supported. |
| <b>mep identifier</b>                | 1–8191                     | The MEP identifier to use for the measurement. The discovered MAC address for this MEP identifier is used.                                          |
| <b>maintenance-domain name</b>       | Existing MD name           | Specifies an existing maintenance domain (MD) to use for the measurement.                                                                           |
| <b>maintenance-association ma-id</b> | Existing MA identifier     | Specifies an existing maintenance association (MA) identifier to use for the measurement.                                                           |
| <b>count count</b>                   | 1–65535 (default: 10)      | (Optional) Specifies the number of Ethernet frame delay frames to send. The default is 10.                                                          |
| <b>wait time</b>                     | 1–255 seconds (default: 1) | (Optional) Specifies the number of seconds to wait between frames. The default is 1 second.                                                         |

If you attempt to monitor delays to a nonexistent MAC address, you must exit the application manually using ^C:

```
user@host> monitor ethernet delay-measurement two-way 00:11:22:33:44:55
Two-way ETH-DM request to 00:11:22:33:44:55, Interface ge-5/2/9.0
^C
--- Delay measurement statistics ---
Packets transmitted: 10, Valid packets received: 0
Average delay: 0 usec, Average delay variation: 0 usec
Best case delay: 0 usec, Worst case delay: 0 usec
```

## Viewing Ethernet Frame Delay Measurements Statistics

Once Ethernet frame delay measurement statistics have been collected, they can be displayed.

To retrieve the last 100 Ethernet frame delay measurement statistics per remote MEP or per CFM session, two types of **show** commands are provided:

- For all OAM frame counters and Ethernet frame delay measurement statistics
- For Ethernet frame delay measurement statistics only

To retrieve all Ethernet frame delay measurement statistics for a given session, use the **show oam ethernet connectivity-fault-management mep-statistics maintenance-domain *name* maintenance-association *name* [local-mep *identifier*] [remote-mep *identifier*] [count *count*]** command.

To retrieve only Ethernet frame delay measurement statistics for a given session, use the **show oam ethernet connectivity-fault-management delay-statistics maintenance-domain *name* maintenance-association *name* [local-mep *identifier*] [remote-mep *identifier*] [count *count*]** command.

**NOTE:** The only difference in the two commands is the use of the **mep-statistics** and **delay-statistics** keyword.

The fields for these commands are described in [Table 101 on page 792](#).

**Table 101: Show Ethernet Delay Command Parameters**

| Parameter                                   | Parameter Range        | Description                                                                                                     |
|---------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>maintenance-domain <i>name</i></b>       | Existing MD name       | Specifies an existing maintenance domain (MD) to use.                                                           |
| <b>maintenance-association <i>ma-id</i></b> | Existing MA identifier | Specifies an existing maintenance association (MA) identifier to use.                                           |
| <b>local-mep <i>identifier</i></b>          | 1–8191                 | When a MEP has been specified, display statistics only for the local MEP.                                       |
| <b>remote-mep <i>identifier</i></b>         | 1–8191                 | When a MEP has been specified, display statistics only for the discovered MEP.                                  |
| <b>count <i>count</i></b>                   | 1–100 (default:100)    | The number of entries to display in the results table. By default, all 100 entries are displayed if they exist. |

**NOTE:** For each MEP, you will see frame counters for sent and received Ethernet frame delay measurement frames whenever MEP statistics are displayed.

## Ethernet Ring Protection

---

Link failure is often an unavoidable part of networking. However, there are methods of improving the reliability of a router or bridge network even when link failures occur. For example, SONET/SDH seal-healing rings are frequently used to add a level of robustness to router networks. This ring protection switching is now extended to Ethernet links. You can configure Ethernet ring protection for a series of two or more systems so that if one link fails, traffic is rerouted around the failure on the ring.

The basic idea of Ethernet ring protection is to use one specific link to protect the whole ring. This special link is the ring protection link (RPL). When all links are up and running, the RPL blocks traffic and remains idle. The RPL itself is controlled by the designated RPL owner node. There is only one RPL owner node on the ring and the RPL owner node is responsible for blocking the RPL interface under normal operating conditions. However, if a link failure occurs on the ring, the RPL owner node is responsible for unblocking the RPL interface and protection—switching the traffic on the alternate path around the ring. An Ethernet ring automatic protection switching (R-APS) messaging protocol coordinates the protection activities of all nodes on the ring. The APS blocks traffic over the failed link and unblocks traffic over the RPL.

When the failed link is repaired, the traffic reverts to its normal pattern. That is, the RPL owner blocks the RPL link and unblocks traffic over the cleared link.

Two or more nodes form a ring. Links between the nodes form a chain, with the last node also connecting the first. Every ring node therefore has two ports related to the ring, one in each direction. In this chapter, these directions are referred to as east and west.

Every node on the ring is one of two types:

- RPL owner node—This node owns the RPL and blocks or unblocks the RPL as conditions require. This node initiates the R-APS message.
- Normal node—All other nodes on the ring (that is, those that are not the RPL owner node) operate as normal nodes and have no special role on the ring.

In addition to roles, each node on the Ethernet ring can be in one of several states:

- Init—The node is not yet participating in the ring.
- Idle—The node is performing normally (there is no link failure on the ring). In this state, traffic is unblocked on both ring ports, except for the RPL owner node, which blocks the RPL port (the other RPL owner port is unblocked).
- Protection—When a failure occurs on the ring, a normal node will have traffic blocked on the ring port that connects to the failed link. The RPL owner, if it is not at one end of the failed link, will then unblock the RPL port so both ports are active.

**NOTE:** The R-APS protocol does not detect the number of RPL owner nodes configured on the ring. You must configure only one RPL and RPL owner per ring or protection switching will not work properly.

---

Ethernet ring protection only works when one link on the ring fails. Multiple link failures will break the ring and cause protection switching to fail.

Several restrictions apply to Ethernet ring protection:

- The Ethernet ring protection configured as a single instance only works at the physical level (adjacent nodes must be directly connected). The ring protection operates at the interface (port) level and not at the VLAN level.
- Manual (command-based) switching to protection mode is not supported.
- Nonrevertive switching is not supported. When the link failure is cleared, traffic always returns to normal operation.
- The interconnection of multiple rings for protection purposes is not supported.

You can configure Ethernet ring protection to optimize traffic load-balancing by using multiple ring instances. For more information about multiple ring instances, see [“Ethernet Ring Protection Using Ring Instances for Load Balancing” on page 797](#)

## Ethernet Ring Protection Using Ring Instances for Load Balancing

Juniper Network MX Series 5G Universal Routing Platforms support Ethernet ring protection (ERP) to help achieve high reliability and network stability. ERP is used in router or bridge networks to protect against link failure. A single-ring topology is configured that uses one specific link called a ring protection link (RPL) to protect the whole ring. When all links are up and running, the RPL blocks traffic and remains idle. However, if a link fails, the RPL routes traffic to bypass the failure on the ring.

**NOTE:** To learn how ERP works in a single-ring topology, see [“Ethernet Ring Protection” on page 795](#).

MX Series routers now support ERP ring instances. Whereas traffic in a single-ring topology follows the same path, traffic within ring instances allows some traffic to pass through one path while other traffic can follow a different path. Dividing traffic in this way supports traffic load balancing in the physical ring.

Ring instances are like traffic channels that contain different sets of virtual LANS (VLANs). A ring instance is responsible for the protection of a subset of VLANs that transport traffic over the physical ring. When ring instances are configured for the ring, each ring instance should have its own RPL owner, an east and a west interface, and a ring protection link end.

Each ring instance has a control channel and a specific data channel. A data channel is a group of bridge domain VLAN IDs. All VLAN IDs within the same ring interface share the same data-forwarding properties controlled by the ERP. If no data channel is defined in the ring configuration, ERP will only operate on the physical link instead of as a ring instance using logical links.

When operating ERP in a topology with other protocols, the following considerations should be observed:

- If a physical interface is part of an Ethernet ring, it cannot be configured for Spanning Tree Protocol (STP) or Multiple Spanning Tree Protocol (MSTP).
- ERP and Per-VLAN Spanning Tree (PVST) can be configured on the same topology as long as PVST doesn't share the same VLAN with any Ethernet ring instance configured on the physical port.
- If ERP is configured only as a physical ring instance (a ring without a data channel) in a topology also configured for PVST, ERP checks the PVST configuration on two ring interfaces and automatically creates a data channel excluding VLANs used by PVST.

- [Example: Configuring Ethernet Ring Protection for MX Series Routers on page 798](#)

## Example: Configuring Ethernet Ring Protection for MX Series Routers

This example configures Ethernet ring protection for three MX Series router nodes:

- [Example Topology on page 798](#)
- [Router 1 \(RPL Owner\) Configuration on page 799](#)
- [Router 2 Configuration on page 801](#)
- [Router 3 Configuration on page 803](#)

### Example Topology

The links connecting the three MX Series routers are shown in [Figure 37 on page 798](#).

*Figure 37: Ethernet Ring Protection Example Nodes*

This example uses the following topology details for Ethernet ring protection:

- Router 1 is the RPL owner. The node identification for Router 1 is MAC address **00:01:01:00:00:01**.
- The RPL link is **ge-1/0/1.1** (this is also the R-APS messaging control channel).
- Traffic flows among the nodes in the configured bridge domains. (That is, only the control channels are configured.)
- Router 1's east control channel interface is **ge-1/0/1.1** (the RPL) and the west control channel interface is **ge-1/2/4.1**. The protection group is **pg101**.

- Router 2's east control channel interface is **ge-1/0/2.1** (the RPL) and the west control channel interface is **ge-1/2/1.1**. The protection group is **pg102**.
- Router 3's east control channel interface is **ge-1/0/3.1** (the RPL) and the west control channel interface is **ge-1/0/4.1**. The protection group is **pg103**.

**NOTE:** Although not strictly required for physical ring protection, this example configures Ethernet OAM with MEPs.

## Router 1 (RPL Owner) Configuration

To configure Router 1 (the RPL owner):

1. Configure the interfaces:

```
[edit]
interfaces {
 ge-1/0/1 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 ge-1/2/4 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 irb {
 unit 0 {
 family inet {
 address address 192.1.1.11/24;
 }
 }
 }
}
```

2. Configure the bridge domain:

```
[edit]
bridge-domains {
 bd1 {
 domain-type bridge;
 vlan-id 100;
 interface ge-1/2/4.1;
 interface ge-1/0/1.1;
 routing-interface irb.0;
 }
}
```

```
}
}
```

3. Configure the Ethernet ring protection group:

```
[edit]
protocols {
 protection-group {
 ethernet-ring pg101 {
 node-id 00:01:01:00:00:01;
 ring-protection-link-owner;
 east-interface {
 control-channel ge-1/0/1.1;
 }
 ring-protection-link-end;
 west-interface {
 control-channel ge-1/2/4.1;
 }
 }
 }
}
```

4. Configure Ethernet OAM:

```
[edit]
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 action-profile rmep-defaults {
 default-action {
 interface-down;
 }
 }
 }
 maintenance-domain d1 {
 level 0;
 maintenance-association 100 {
 mep 1 {
 interface ge-1/0/1;
 }
 remote-mep 2 {
 action-profile rmep-defaults;
 }
 }
 }
 maintenance-domain d2 {
 level 0;
 maintenance-association 100 {
 mep 1 {
 interface ge-1/2/4;
 }
 remote-mep 2 {
 action-profile rmep-defaults;
 }
 }
 }
 }
 }
}
```

```

 }
 }
}
}
}

```

## Router 2 Configuration

To configure Router 2:

1. Configure the interfaces:

```

[edit]
interfaces {
 ge-1/0/2 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 ge-1/2/1 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 irb {
 unit 0 {
 family inet {
 address address 192.1.1.22/24;
 }
 }
 }
}

```

2. Configure the bridge domain:

```

[edit]
bridge-domains {
 bd1 {
 domain-type bridge;
 vlan-id 100;
 interface ge-1/2/1.1;
 interface ge-1/0/2.1;
 routing-interface irb.0;
 }
}

```

3. Configure the Ethernet protection group:

```
[edit]
protocols {
 protection-group {
 ethernet-ring pg102 {
 node-id 00:22:22:22:22:22;
 east-interface {
 control-channel ge-1/0/2.1;
 }
 west-interface {
 control-channel ge-1/2/1.1;
 }
 }
 }
}
```

#### 4. Configure Ethernet OAM:

```
[edit]
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 action-profile rmep-defaults {
 default-action {
 interface-down;
 }
 }
 }
 maintenance-domain d1 {
 level 0;
 maintenance-association 100 {
 mep 2 {
 interface ge-1/2/1;
 remote-mep 1 {
 action-profile rmep-defaults;
 }
 }
 }
 }
 maintenance-domain d3 {
 level 0;
 maintenance-association 100 {
 mep 1 {
 interface ge-1/0/2;
 remote-mep 2 {
 action-profile rmep-defaults;
 }
 }
 }
 }
 }
 }
}
```

## Router 3 Configuration

To configure Router 3:

1. Configure the interfaces:

```
[edit]
interfaces {
 ge-1/0/4 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 ge-1/0/3 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 1 {
 encapsulation vlan-bridge;
 vlan-id 100;
 }
 }
 irb {
 unit 0 {
 family inet {
 address 192.1.1.33/24;
 }
 }
 }
}
```

2. Configure the bridge domain:

```
[edit]
bridge-domains {
 bd1 {
 domain-type bridge;
 vlan-id 100;
 interface ge-1/0/4.1;
 interface ge-1/0/3.1;
 routing-interface irb.0;
 }
}
```

3. Configure the Ethernet protection group:

```
[edit]
protocols {
 protection-group {
 ethernet-ring pg103 {
 node-id 00:33:33:33:33:33;
 east-interface {
```

```

 control-channel ge-1/0/3.1;
 }
 west-interface {
 control-channel ge-1/0/4.1;
 }
}
}
}
}

```

#### 4. Configure Ethernet OAM:

```

[edit]
protocols {
 oam {
 ethernet {
 connectivity-fault-management {
 action-profile rmep-defaults {
 default-action {
 interface-down;
 }
 }
 }
 maintenance-domain d2 {
 level 0;
 maintenance-association 100 {
 mep 2 {
 interface ge-1/0/4;
 remote-mep 1 {
 action-profile rmep-defaults;
 }
 }
 }
 }
 maintenance-domain d3 {
 level 0;
 maintenance-association 100 {
 mep 2 {
 interface ge-1/0/3;
 remote-mep 1 {
 action-profile rmep-defaults;
 }
 }
 }
 }
 }
 }
}
}
}
}
}
}
}
}
}

```

## Example: Configuring Load Balancing Within Ethernet Ring Protection for MX Series Routers

MX Series routers support Ethernet ring protection (ERP) to help achieve high reliability and network stability. ERP is used in router or bridge networks to protect against link failure. A single-ring topology is configured that uses one specific link called a ring protection link (RPL) to protect the whole ring. When all links are up and running, the RPL blocks traffic and remains idle. However, if a link fails, the RPL routes traffic to bypass the failure on the ring.

MX Series routers now support ERP ring instances. Whereas traffic in a ring topology follows the same path, traffic within a ring instance uses data channels to allow some traffic to pass through one path while other traffic can follow a different one. Dividing traffic in this way supports traffic load-balancing in the ring.

This example describes how to use ERP with ring instances to load-balance traffic while still providing network protection from link failure:

- [Requirements on page 805](#)
- [Overview and Topology on page 805](#)
- [Configuration on page 808](#)
- [Verification on page 817](#)

### Requirements

This example uses the following hardware and software components:

- Two MX Series routers acting as core switches
- One MX Series router acting as an aggregation switch
- Junos OS Release 10.2 or later for MX Series routers

### Overview and Topology

[Figure 38 on page 806](#) displays the topology for this example. The topology contains three MX Series routers. CS1 and CS2 act as core routers in the topology, and AS1 acts as an aggregation switch. Each router has two ring instances, ring-1 and ring-2. All nodes on the ring coordinate protection activities by exchanging messages through the Ethernet ring automatic protection switching (R-APS) messaging protocol. Each ring instance has an RPL owner. The ring-1 RPL owner is CS1; the ring-2 RPL owner is CS2. The RPL owners block or unblock the RPL as conditions require and initiate R-APS messages.

Each ring instance has two interface ports (an east interface and a west interface) that participate in the instance. Interface **ge-2/0/8.0**, the west interface on CS2, is the ring protection link end where ring-2's RPL terminates. Interface **ge-3/2/4.0**, the east interface on CS1, is the ring protection link end where ring-1's RPL terminates.

Each ring instance has a data channel. A data channel is a group of bridge domain virtual LAN (VLAN) IDs. All VLAN IDs within the same ring interface share the same data-forwarding properties controlled by the ERP. The data channel on ring-1 is [200, 300]. The data channel on ring-2 is [500, 600].

Two customer site switches are connected to AS1. Customer site 1 uses VLANs 200 and 300. Customer site 2 uses VLANs 500 and 600.

*Figure 38: ERP with Multiple Protection Instances Configured on Three MX Series Routers*

Table 102 on page 806 describes the components of the example topology.

*Table 102: Components of the Network Topology*

|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS1 router | <p>AS1 has the following protection group properties:</p> <ul style="list-style-type: none"> <li>• East interface—<b>ge-2/0/5.0</b>.</li> <li>• West interface—<b>ge-2/1/1.0</b>.</li> <li>• Data channel for <b>ring-1</b>—<b>VLAN 200, VLAN 300</b>.</li> <li>• Data channel for <b>ring-2</b>—<b>VLAN 500, VLAN 600</b>.</li> </ul> <p>AS1 has the following bridging properties:</p> <ul style="list-style-type: none"> <li>• <b>bd100</b> is associated with <b>vlan-id 100</b>.</li> <li>• <b>bd101</b> is associated with <b>vlan-id 101</b>.</li> <li>• <b>bd200</b> is associated with <b>vlan-id 200</b>.</li> <li>• <b>bd300</b> is associated with <b>vlan-id 300</b>.</li> <li>• <b>bd500</b> is associated with <b>vlan-id 500</b>.</li> <li>• <b>bd600</b> is associated with <b>vlan-id 600</b>.</li> </ul> |

## Configuration

To enable ERP with ring instances on CS1, CS2, and AS1, perform these tasks:

- [Configuring ERP on CS1 on page 808](#)
- [Configuring ERP on CS2 on page 811](#)
- [Configuring ERP on AS1 on page 814](#)

### Configuring ERP on CS1

**CLI Quick Configuration** To quickly configure CS1 for ERP, copy the following commands and paste them into the switch terminal window of CS1:

```
[edit]
set interfaces ge-3/2/4 vlan-tagging
set interfaces ge-3/2/4 unit 0 family bridge interface-mode trunk
set interfaces ge-3/2/4 unit 0 family bridge vlan-id-list 100-1000
set interfaces ge-5/2/3 vlan-tagging
set interfaces ge-5/2/3 unit 0 family bridge interface-mode trunk
set interfaces ge-5/2/3 unit 0 family bridge vlan-id-list 100-1000
set protocols protection-group ethernet-ring ring-1 ring-protection-link-owner
set protocols protection-group ethernet-ring ring-1 east-interface control-channel ge-3/2/4.0
set protocols protection-group ethernet-ring ring-1 east-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 east-interface ring-protection-link-end
set protocols protection-group ethernet-ring ring-1 west-interface control-channel ge-5/2/3.0
set protocols protection-group ethernet-ring ring-1 west-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 data-channel vlan [200, 300]
set protocols protection-group ethernet-ring ring-2 east-interface control-channel ge-3/2/4.0
set protocols protection-group ethernet-ring ring-2 east-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 west-interface control-channel ge-5/2/3.0
set protocols protection-group ethernet-ring ring-2 west-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 data-channel vlan [500, 600]
set routing-instances vs instance-type virtual-switch
set routing-instances vs interface ge-3/2/4.0
set routing-instances vs interface ge-5/2/3.0
```

```

set routing-instances vs bridge-domains bd101 vlan-id 101
set routing-instances vs bridge-domains bd200 vlan-id 200
set routing-instances vs bridge-domains bd300 vlan-id 300
set routing-instances vs bridge-domains bd500 vlan-id 500
set routing-instances vs bridge-domains bd600 vlan-id 600

```

### Step-by-Step Procedure

To configure ERP on CS1:

1. Configure the trunk interface **ge-3/2/4** to connect CS1 to CS2 and the trunk interface **ge-5/2/3** to connect CS1 to AS, and configure the **family** statement as **bridge** with a VLAN ID list of 100 through 1000:

```

[edit interfaces]
user@cs1# set ge-3/2/4 vlan-tagging
user@cs1# set ge-3/2/4 unit 0 family bridge interface-mode trunk
user@cs1# set ge-3/2/4 unit 0 family bridge vlan-id-list 100-1000
user@cs1# set ge-5/2/3 vlan-tagging
user@cs1# set ge-5/2/3 unit 0 family bridge interface-mode trunk
user@cs1# set ge-5/2/3 unit 0 family bridge vlan-id-list 100-1000

```

2. Enable ERP, specifying the control channels and data channels for **ring-1** and **ring-2**, and configure **ring-1** as the ring protection link owner:

**NOTE:** Always configure the **east-interface** statement first, before configuring the **west-interface** statement.

```

[edit protection-group]
user@cs1# set ethernet-ring ring-1 ring-protection-link-owner
user@cs1# set ethernet-ring ring-1 east-interface control-channel ge-3/2/4.0
user@cs1# set ethernet-ring ring-1 east-interface control-channel vlan 100
user@cs1# set ethernet-ring ring-1 east-interface ring-protection-link-end
user@cs1# set ethernet-ring ring-1 west-interface control-channel ge-5/2/3.0
user@cs1# set ethernet-ring ring-1 west-interface control-channel vlan 100
user@cs1# set ethernet-ring ring-1 data-channel vlan [200, 300]
user@cs1# set ethernet-ring ring-2 east-interface control-channel ge-3/2/4.0
user@cs1# set ethernet-ring ring-2 east-interface control-channel vlan 101
user@cs1# set ethernet-ring ring-2 west-interface control-channel ge-5/2/3.0
user@cs1# set ethernet-ring ring-2 west-interface control-channel vlan 101
user@cs1# set ethernet-ring ring-2 data-channel vlan [500, 600]

```

3. Configure the routing instance, the bridge domains, and the VLAN IDs associated with each bridge domain:

```

[edit routing-instances]
user@cs1# set vs instance-type virtual-switch
user@cs1# set vs interface ge-3/2/4.0
user@cs1# set vs interface ge-5/2/3.0
user@cs1# set vs bridge-domains bd100 vlan-id 100
user@cs1# set vs bridge-domains bd101 vlan-id 101
user@cs1# set vs bridge-domains bd200 vlan-id 200
user@cs1# set vs bridge-domains bd300 vlan-id 300
user@cs1# set vs bridge-domains bd500 vlan-id 500

```

```
user@cs1# set vs bridge-domains bd600 vlan-id 600
```

**Results** Check the results of the configuration:

```
user@cs1> show configuration
interfaces {
 ge-3/2/4 {
 vlan-tagging;
 unit 0 {
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000;
 }
 }
 }
 ge-5/2/3 {
 vlan-tagging;
 unit 0 {
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000;
 }
 }
 }
}
protocols {
 protection-group {
 ethernet-ring ring-1 {
 east-interface {
 control-channel {
 ge-3/2/4.0;
 vlan 100;
 }
 ring-protection-link-end;
 }
 west-interface {
 control-channel {
 ge-5/2/3.0;
 vlan 100;
 }
 }
 data-channel {
 vlan [200 300];
 }
 }
 }
 protection-group {
 ethernet-ring ring-2 {
 east-interface {
 control-channel {
 ge-3/2/4.0;
 vlan 101;
 }
 }
 }
 }
}
```

```

 west-interface {
 control-channel {
 ge-5/2/3.0;
 vlan 101;
 }
 }
 data-channel {
 vlan [500 600];
 }
 }
}
routing-instances {
 vs {
 instance-type virtual-switch;
 interface ge-3/2/4.0;
 interface ge-5/2/3.0;
 bridge-domains {
 bd100 {
 vlan-id 100;
 }
 bd101 {
 vlan-id 101;
 }
 bd200 {
 vlan-id 200;
 }
 bd300 {
 vlan-id 300;
 }
 bd500 {
 vlan-id 500;
 }
 bd600 {
 vlan-id 600;
 }
 }
 }
}
}

```

### Configuring ERP on CS2

**CLI Quick Configuration** To quickly configure CS2 for ERP, copy the following commands and paste them into the switch terminal window of CS2:

```

[edit]
set interfaces ge-2/0/4 unit 0 family bridge interface-mode trunk
set interfaces ge-2/0/4 unit 0 family bridge vlan-id-list 100-1000
set interfaces ge-2/0/8 unit 0 family bridge interface-mode trunk
set interfaces ge-2/0/8 unit 0 family bridge vlan-id-list 100-1000
set protocols protection-group ethernet-ring ring-1 east-interface control-channel ge-2/0/4.0
set protocols protection-group ethernet-ring ring-1 east-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 west-interface control-channel ge-2/0/8.0

```

```

set protocols protection-group ethernet-ring ring-1 west-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 data-channel vlan [200, 300]
set protocols protection-group ethernet-ring ring-2 ring-protection-link-owner
set protocols protection-group ethernet-ring ring-2 east-interface control-channel ge-2/0/4.0
set protocols protection-group ethernet-ring ring-2 east-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 west-interface control-channel ge-2/0/8.0
set protocols protection-group ethernet-ring ring-2 west-interface ring-protection-link-end
set protocols protection-group ethernet-ring ring-2 west-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 data-channel vlan [500, 600]
set bridge-domains bd100 vlan-id 100
set bridge-domains bd101 vlan-id 101
set bridge-domains bd200 vlan-id 200
set bridge-domains bd300 vlan-id 300
set bridge-domains bd500 vlan-id 500
set bridge-domains bd600 vlan-id 600

```

### Step-by-Step Procedure

To configure ERP on CS2:

1. Configure the trunk interface **ge-2/0/4** to connect CS2 to CS1 and trunk interface **ge-2/0/8** to connect CS2 to CS1, and configure the **family** statement as **bridge** with a VLAN ID list of 100 through 1000:

```

[edit interfaces]
user@cs2# set ge-2/0/4 unit 0 family bridge interface-mode trunk
user@cs2# set ge-2/0/4 unit 0 family bridge vlan-id-list 100-1000
user@cs2# set ge-2/0/8 unit 0 family bridge interface-mode trunk
user@cs2# set ge-2/0/8 unit 0 family bridge vlan-id-list 100-1000

```

2. Enable ERP, specifying the control channels and data channels for **ring-1** and **ring-2**, and configure **ring-2** as the ring protection link owner:

**NOTE:** Always configure the east-interface statement first, before configuring the west-interface statement.

```

[edit protection-group]
user@cs2# set ethernet-ring ring-1 east-interface control-channel ge-2/0/4.0
user@cs2# set ethernet-ring ring-1 east-interface control-channel vlan 100
user@cs2# set ethernet-ring ring-1 west-interface control-channel ge-2/0/8.0
user@cs2# set ethernet-ring ring-1 west-interface control-channel vlan 100
user@cs2# set ethernet-ring ring-2 data-channel vlan [200, 300]
user@cs2# set ethernet-ring ring-2 east-interface control-channel ge-2/0/4.0
user@cs2# set ethernet-ring ring-2 east-interface control-channel vlan 101
user@cs2# set ethernet-ring ring-2 ring-protection-link-owner
user@cs2# set ethernet-ring ring-2 west-interface control-channel ge-2/0/8.0
user@cs2# set ethernet-ring ring-2 west-interface control-channel vlan 101
user@cs2# set ethernet-ring ring-2 west-interface ring-protection-link-end
user@cs2# set ethernet-ring ring-2 data-channel vlan [500, 600]

```

3. Configure the routing instance, the bridge domains, and the VLAN IDs associated with each bridge domain:

```

[edit bridge-domains]
user@cs2# set bd100 vlan-id 100

```

```

user@cs2# set bd101 vlan-id 101
user@cs2# set bd200 vlan-id 200
user@cs2# set bd300 vlan-id 300
user@cs2# set bd500 vlan-id 500
user@cs2# set bd600 vlan-id 600

```

**Results** Check the results of the configuration:

```

user@cs2> show configuration
interfaces {
 ge-2/0/4 {
 unit 0 {
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000;
 }
 }
 }
 ge-2/0/8 {
 unit 0 {
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000;
 }
 }
 }
}
protocols {
 protection-group {
 ethernet-ring ring-1 {
 east-interface {
 control-channel {
 ge-2/0/4.0;
 vlan 100;
 }
 }
 west-interface {
 control-channel {
 ge-2/0/8.0;
 vlan 100;
 }
 }
 data-channel {
 vlan [200, 300];
 }
 }
 }
 ethernet-ring ring-2 {
 east-interface {
 control-channel {
 ge-2/0/4.0;
 vlan 101;
 }
 }
 west-interface {

```

```

 control-channel {
 ge-2/0/8.0;
 vlan 101;
 }
 ring-protection-link-end;
 }
 data-channel {
 vlan [500, 500];
 }
}
bridge-domains {
 bd100 {
 vlan-id 100;
 }
 bd101 {
 vlan-id 101;
 }
 bd200 {
 vlan-id 200;
 }
 bd300 {
 vlan-id 300;
 }
 bd500 {
 vlan-id 500;
 }
 bd600 {
 vlan-id 600;
 }
}
}

```

### Configuring ERP on AS1

**CLI Quick Configuration** To quickly configure AS1 for ERP, copy the following commands and paste them into the switch terminal window of AS1:

```

[edit]
set interfaces ge-2/0/5 unit 0 family bridge interface-mode trunk
set interfaces ge-2/0/5 unit 0 family bridge vlan-id-list 100-1000
set interfaces ge-2/1/1 unit 0 family bridge interface-mode trunk
set interfaces ge-2/1/1 unit 0 family bridge vlan-id-list 100-1000
set protocols protection-group ethernet-ring ring-1 east-interface control-channel ge-2/0/5.0
set protocols protection-group ethernet-ring ring-1 east-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 west-interface control-channel ge-2/1/1.0
set protocols protection-group ethernet-ring ring-1 west-interface control-channel vlan 100
set protocols protection-group ethernet-ring ring-1 data-channel vlan [200, 300]
set protocols protection-group ethernet-ring ring-2 east-interface control-channel ge-2/0/5.0
set protocols protection-group ethernet-ring ring-2 east-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 west-interface control-channel ge-2/1/1.0
set protocols protection-group ethernet-ring ring-2 west-interface control-channel vlan 101
set protocols protection-group ethernet-ring ring-2 data-channel vlan [500, 600]
set bridge-domains bd100 vlan-id 100
set bridge-domains bd101 vlan-id 101

```

```

set bridge-domains bd200 vlan-id 200
set bridge-domains bd300 vlan-id 300
set bridge-domains bd500 vlan-id 500
set bridge-domains bd600 vlan-id 600

```

### Step-by-Step Procedure

To configure ERP on AS1:

1. Configure the trunk interface **ge-2/0/5** to connect CS2 to CS1 and trunk interface **ge-2/1/1** to connect CS2 to CS1, and configure the **family** statement as **bridge** with a VLAN ID list of 100 through 1000:

```

[edit interfaces]
user@as1# set ge-2/0/5 unit 0 family bridge interface-mode trunk
user@as1# set ge-2/0/5 unit 0 family bridge vlan-id-list 100-1000
user@as1# set ge-2/1/1 unit 0 family bridge interface-mode trunk
user@as1# set ge-2/1/1 unit 0 family bridge vlan-id-list 100

```

2. Enable ERP, specifying the control channels and data channels for **ring-1** and **ring-2**:

**NOTE:** Always configure the east-interface statement first, before configuring the west-interface statement.

```

[edit protection-group]
user@as1# set ethernet-ring ring-1 east-interface control-channel ge-2/0/5.0
user@as1# set ethernet-ring ring-1 east-interface control-channel vlan 100
user@as1# set ethernet-ring ring-1 west-interface control-channel ge-2/1/1.0
user@as1# set ethernet-ring ring-1 west-interface control-channel vlan 100
user@as1# set ethernet-ring ring-2 east-interface control-channel ge-2/0/5.
user@as1# set ethernet-ring ring-2 east-interface control-channel vlan 101
user@as1# set ethernet-ring ring-2 west-interface control-channel ge-2/1/1.0
user@as1# set ethernet-ring ring-2 west-interface control-channel vlan 101
user@as1# set ethernet-ring ring-2 data-channel vlan [500, 600]

```

3. Configure the routing instance, the bridge domains, and the VLAN IDs associated with each bridge domain:

```

[edit bridge-domains]
user@as1# set bd100 vlan-id 100
user@as1# set bd101 vlan-id 101
user@as1# set bd200 vlan-id 200
user@as1# set bd300 vlan-id 300
user@as1# set bd500 vlan-id 500
user@as1# set bd600 vlan-id 600

```

**Results** Check the results of the configuration:

```

user@as1> show configuration
interfaces {
 ge-2/0/5 {
 unit 0 {

```

```
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000
 }
 }
}
ge-2/1/1 {
 unit 0 {
 family bridge {
 interface-mode trunk;
 vlan-id-list 100-1000
 }
 }
}
protocols {
 protection-group {
 ethernet-ring ring-1 {
 east-interface {
 control-channel {
 ge-2/0/5.0;
 vlan 100;
 }
 }
 west-interface {
 control-channel {
 ge-2/1/1.0;
 vlan 100;
 }
 }
 data-channel {
 vlan [200, 300];
 }
 }
 }
}
 protection-group {
 ethernet-ring ring-2 {
 east-interface {
 control-channel {
 ge-2/0/5.0;
 vlan 101;
 }
 }
 west-interface {
 control-channel {
 ge-2/1/1.0;
 vlan 101;
 }
 }
 data-channel {
 vlan [500, 600];
 }
 }
 }
}
bridge-domains {
```

```

bd100 {
 vlan-id 100;
}
bd101 {
 vlan-id 101;
}
bd200 {
 vlan-id 200;
}
bd300 {
 vlan-id 300;
}
bd500 {
 vlan-id 500;
}
bd600 {
 vlan-id 600;
}
}
}

```

## Verification

To confirm that the ERP configuration for multiple ring instances is operating, perform these tasks:

- [Verifying the Ethernet Protection Ring on CS1 on page 817](#)
- [Verifying the Data Channel CS1 on page 818](#)
- [Verifying the VLANs on CS1 on page 818](#)
- [Verifying the Ethernet Protection Ring on CS2 on page 819](#)
- [Verifying the Data Channel CS2 on page 820](#)
- [Verifying the VLANs on CS2 on page 820](#)
- [Verifying the Ethernet Protection Ring on AS1 on page 821](#)
- [Verifying the Data Channels on AS1 on page 821](#)
- [Verifying the VLANs on AS1 on page 822](#)

### Verifying the Ethernet Protection Ring on CS1

**Purpose** Verify that ERP is enabled on CS1.

**Action** Show the status of the ring automatic protection switching (R-APS) messages to determine if there is a ring failure:

```
user@cs1>show protection-group ethernet-ring aps
```

| Ethernet Ring Name<br>Node ID | Request/state | No Flush | Ring Protection     | Originator | Remote |
|-------------------------------|---------------|----------|---------------------|------------|--------|
| ring-1                        | NR            | No       | Link Blocked<br>Yes | Yes        |        |

|                   |    |    |     |    |
|-------------------|----|----|-----|----|
| ring-2            | NR | No | Yes | No |
| 13:22:af:31:fc:00 |    |    |     |    |

**Meaning** The output displayed shows that protection groups **ring-1** and **ring-2** have a **Request/state** of **NR**, meaning there is no request for APS on the ring. If a **Request/state** of **SF** is displayed, it indicates there is a signal failure on the ring. The output also shows that the ring protection link is not blocked. The **No Flush** field displays **No**, indicating that MAC addresses will be flushed when the ring nodes receive this message first time. A value of **Yes** would indicate MAC address flushing is not needed. The **Originator** field for **ring-1** displays **yes**, indicating that this node is an R-APS originator.

### Verifying the Data Channel CS1

**Purpose** Verify the forwarding state of the data channel.

**Action** List the interfaces acting as the control channels and their respective data channels (represented by the Spanning Tree Protocol (STP) index number):

```
user@cs1>show protection-group ethernet-ring data-channel
```

Ethernet ring data channel parameters for protection group ring-1

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-3/2/4  | 122       | forwarding    |
| ge-5/2/3  | 123       | forwarding    |

Ethernet ring data channel parameters for protection group ring-2

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-3/2/4  | 124       | discarding    |
| ge-5/2/3  | 125       | forwarding    |

**Meaning** The output displayed shows the STP index number used by each interface in ring instances **ring-1** and **ring-2**. The STP index controls the forwarding behavior for a set of VLANs on the data channel of a ring instance on a ring interface. For ring instances, there are multiple STP index numbers (here representing VLANs 200, 300, 500, and 600). The **Forward State** shows whether the data channel is **forwarding** or **discarding** traffic.

### Verifying the VLANs on CS1

**Purpose** Verify the data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

**Action** List dynamic VLAN membership:

```
user@cs1>show protection-group ethernet-ring vlan
```

Ethernet ring IFBD parameters for protection group ring-1

| Interface | Vlan | STP Index | Bridge Domain |
|-----------|------|-----------|---------------|
| ge-3/2/4  | 200  | 122       | vs/bd200      |
| ge-5/2/3  | 200  | 123       | vs/bd200      |
| ge-3/2/4  | 300  | 122       | vs/bd300      |
| ge-5/2/3  | 300  | 123       | vs/bd300      |

Ethernet ring IFBD parameters for protection group ring-2

| Interface | Vlan | STP Index | Bridge Domain |
|-----------|------|-----------|---------------|
| ge-3/2/4  | 500  | 124       | vs/bd500      |
| ge-5/2/3  | 500  | 125       | vs/bd500      |
| ge-3/2/4  | 600  | 124       | vs/bd600      |
| ge-5/2/3  | 600  | 125       | vs/bd600      |

**Meaning** The output displayed shows the ring interfaces **ge-3/2/4** and **ge-5/2/3** in protection groups **ring-1** and **ring-2**. For **ring-1**, VLAN 200 and VLAN 300 are being supported on both **STP Index 122** and **123** on bridge domains **bd200** and **bd300**. For **ring-2**, VLAN 500 and VLAN 600 are being supported on both **STP Index 124** and **125** on bridge domains **bd500** and **bd600**. The data channel controls the traffic on the VLAN IDs to facilitate load balancing.

### Verifying the Ethernet Protection Ring on CS2

**Purpose** Verify that ERP is enabled on CS2.

**Action** Show the status of the ring APS (R-APS) messages to determine if there is a ring failure:

```
user@cs2>show protection-group ethernet-ring aps
```

| Ethernet Ring Name<br>Node ID | Request/state | No Flush | Ring Protection    | Originator | Remote |
|-------------------------------|---------------|----------|--------------------|------------|--------|
| Ring-1<br>00:21:59:03:ff:d0   | NR            | No       | Link Blocked<br>No | No         |        |
| Ring-2                        | NR            | No       | Yes                | Yes        |        |

**Meaning** The output displayed shows that protection groups **ring-1** and **ring-2** have a **Request/state** of **NR**, meaning there is no request for APS on the ring. If a **Request/state** of **SF** is displayed, it indicates there is a signal failure on the ring. The output also shows that the ring protection link is not blocked. The **No Flush** field displays **No**, indicating that MAC addresses will be flushed when the ring nodes receive this message first time. A value of **Yes** would indicate MAC address flushing is not needed. The **Originator** field for **ring-1** displays **yes**, indicating that this node is an R-APS originator. The **Originator** field for **ring-2** displays **No**, indicating that this node is not an R-APS originator.

## Verifying the Data Channel CS2

**Purpose** Verify the forwarding state of the data channel.

**Action** List the interfaces acting as the control channels and their respective data channels (represented by the STP index number):

```
user@cs2> show protection-group ethernet-ring data-channel
```

Ethernet ring data channel parameters for protection group ring-1

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-2/0/4  | 44        | forwarding    |
| ge-2/0/8  | 45        | forwarding    |

Ethernet ring data channel parameters for protection group ring-2

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-2/0/4  | 46        | forwarding    |
| ge-2/0/8  | 47        | discarding    |

**Meaning** The output displayed shows the STP index number used by each interface in ring instances **ring-1** and **ring-2**. The STP index controls the forwarding behavior for a set of VLANs on the data channel of a ring instance on a ring interface. For ring instances, there are multiple STP index numbers (here representing VLANs 200, 300, 500, and 600). The **Forward State** shows whether the data channel is **forwarding** or **discarding** traffic.

## Verifying the VLANs on CS2

**Purpose** Verify the data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

**Action** List dynamic VLAN membership:

```
user@cs2> show protection-group ethernet-ring vlan
```

Ethernet ring IFBD parameters for protection group ring-1

| Interface | Vlan | STP Index | Bridge Domain        |
|-----------|------|-----------|----------------------|
| ge-2/0/4  | 200  | 44        | default-switch/bd200 |
| ge-2/0/8  | 200  | 45        | default-switch/bd200 |
| ge-2/0/4  | 300  | 44        | default-switch/bd300 |
| ge-2/0/8  | 300  | 45        | default-switch/bd300 |

Ethernet ring IFBD parameters for protection group ring-2

| Interface | Vlan | STP Index | Bridge Domain        |
|-----------|------|-----------|----------------------|
| ge-2/0/4  | 500  | 46        | default-switch/bd500 |
| ge-2/0/8  | 500  | 47        | default-switch/bd500 |
| ge-2/0/4  | 600  | 46        | default-switch/bd600 |
| ge-2/0/8  | 600  | 47        | default-switch/bd600 |

**Meaning** The output displayed shows the ring interfaces **ge-2/0/4** and **ge-2/0/8** in protection groups **ring-1** and **ring-2**. For **ring-1**, VLAN 200 and VLAN 300 are being supported on both **STP Index 44** and **45** on bridge domains **bd200** and **bd300**. For **ring-2**, VLAN 500 and VLAN 600 are being supported on both **STP Index 46** and **47** on bridge domains **bd500** and **bd600**. The data channel controls the traffic on the VLAN IDs to facilitate load balancing.

### Verifying the Ethernet Protection Ring on AS1

**Purpose** Verify that ERP is enabled on AS1.

**Action** Show the status of the ring APS (R-APS) messages to determine if there is a ring failure:

```
user@as1> show protection-group ethernet-ring aps
```

| Ethernet Ring Name<br>Node ID | Request/state | No Flush | Ring Protection     | Originator | Remote |
|-------------------------------|---------------|----------|---------------------|------------|--------|
| Ring-1<br>00:21:59:03:ff:d0   | NR            | No       | Link Blocked<br>Yes | No         |        |
| Ring-2<br>13:22:af:31:fc:00   | NR            | No       | Yes                 | No         |        |

**Meaning** The output displayed shows that protection groups **ring-1** and **ring-2** have a **Request/state** of **NR**, meaning there is no request for APS on the ring. If a **Request/state** of **SF** is displayed, it indicates there is a signal failure on the ring. The output also shows that the ring protection link is not blocked. The **No Flush** field displays **No**, indicating that MAC addresses will be flushed when the ring nodes receive this message first time. A value of **Yes** would indicate MAC address flushing is not needed. The **Originator** field for **ring-1** and **ring-2** displays **No**, indicating that this node is not the R-APS originator.

### Verifying the Data Channels on AS1

**Purpose** Verify the forwarding state of the data channel.

**Action** List the interfaces acting as the control channels and their respective data channels (represented by the STP index number):

```
user@as1> show protection-group ethernet-ring data-channel
```

Ethernet ring data channel parameters for protection group ring-1

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-2/0/5  | 22        | forwarding    |
| ge-2/1/1  | 23        | forwarding    |

## Ethernet ring data channel parameters for protection group ring-2

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| ge-2/0/5  | 24        | forwarding    |
| ge-2/1/1  | 25        | forwarding    |

**Meaning** The output displayed shows the STP index number used by each interface in ring instances **ring-1** and **ring-2**. The STP index controls the forwarding behavior for a set of VLANs on the data channel of a ring instance on a ring interface. For ring instances, there are multiple STP index numbers (here representing VLANs 200, 300, 500, and 600). The **Forward State** shows whether the data channel is **forwarding** or **discarding** traffic. All data channels are forwarding traffic.

## Verifying the VLANs on AS1

**Purpose** Verify the data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

**Action** List dynamic VLAN membership:

```
user@as1>show protection-group ethernet-ring vlan
```

## Ethernet ring IFBD parameters for protection group ring-1

| Interface | Vlan | STP Index | Bridge Domain        |
|-----------|------|-----------|----------------------|
| ge-2/0/5  | 200  | 22        | default-switch/bd200 |
| ge-2/1/1  | 200  | 23        | default-switch/bd200 |
| ge-2/0/5  | 300  | 22        | default-switch/bd300 |
| ge-2/1/1  | 300  | 23        | default-switch/bd300 |

## Ethernet ring IFBD parameters for protection group ring-2

| Interface | Vlan | STP Index | Bridge Domain        |
|-----------|------|-----------|----------------------|
| ge-2/0/5  | 500  | 24        | default-switch/bd500 |
| ge-2/1/1  | 500  | 25        | default-switch/bd500 |
| ge-2/0/5  | 600  | 24        | default-switch/bd600 |
| ge-2/1/1  | 600  | 25        | default-switch/bd600 |

**Meaning** The output displayed shows the ring interfaces **ge-2/0/5** and **ge-2/1/1** in protection groups **ring-1** and **ring-2**. For **ring-1**, VLAN 200 and VLAN 300 are being supported on both **STP Index 22** and **23** on bridge domains **bd200** and **bd300**. For **ring-2**, VLAN 500 and VLAN 600 are being supported on both **STP Index 24** and **25** on bridge domains **bd500** and **bd600**. The data channel controls the traffic on the VLAN IDs to facilitate load-balancing.

## Example: Viewing Ethernet Ring Protection Status—Normal Ring Operation

Under normal operating conditions, when Ethernet ring protection is configured correctly, the ring protection link (RPL) owner (Router 1 in the configuration example) will see the following:

### Router 1 Operational Commands (Normal Ring Operation)

```
user@router1> show protection-group ethernet-ring aps
```

| Ethernet Ring Name | Request/state | No Flush | Ring Protection Link Blocked |
|--------------------|---------------|----------|------------------------------|
| pg101              | NR            | No       | Yes                          |

| Originator | Remote Node ID |
|------------|----------------|
| Yes        |                |

Note that the ring protection link is blocked and the node is marked as the originator of the protection.

```
user@router1> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg101

| Interface | Control Channel | Forward State | Ring Protection Link End |
|-----------|-----------------|---------------|--------------------------|
| ge-1/0/1  | ge-1/0/1.1      | discarding    | Yes                      |
| ge-1/2/4  | ge-1/2/4.1      | forwarding    | No                       |

| Signal Failure | Admin State |
|----------------|-------------|
| Clear          | IFF ready   |
| Clear          | IFF ready   |

Note that the protection interface is discarding while the other interface is forwarding.

```
user@router1> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | Ring Protection Link Owner |
|---------------|-----------|-------|----------------------------|
| pg101         | idle      | NR-RB | Yes                        |

| Restore Timer | Quard Timer | Operation state |
|---------------|-------------|-----------------|
| disabled      | disabled    | operational     |

Note that Router 1 is the owner and timers are disabled.

```
user@router1> show protection-group ethernet-ring statistics group-name pg101
```

Ethernet Ring statistics for PG pg101

|                       |     |
|-----------------------|-----|
| RAPS sent             | : 1 |
| RAPS received         | : 0 |
| Local SF happened:    | : 0 |
| Remote SF happened:   | : 0 |
| NR event happened:    | : 0 |
| NR-RB event happened: | : 1 |

Note that only minimal RAPS messages have been sent to establish the ring.

Under normal operating conditions, the other routers on the ring (Router 2 and Router 3) will see the following similar output:

#### Router 2 and Router 3 Operational Commands (Normal Ring Operation)

```
user@router2> show protection-group ethernet-ring aps
```

| Ethernet Ring Name | Request/state | No Flush | Ring Protection Link Blocked |
|--------------------|---------------|----------|------------------------------|
| pg102              | NR            | No       | Yes                          |

| Originator | Remote Node ID    |
|------------|-------------------|
| No         | 00:01:01:00:00:01 |

Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg102

| Interface | Control Channel | Forward State | Ring Protection Link End |
|-----------|-----------------|---------------|--------------------------|
| ge-1/2/1  | ge-1/2/1.1      | forwarding    | No                       |
| ge-1/0/2  | ge-1/0/2.1      | forwarding    | No                       |

| Signal Failure | Admin State |
|----------------|-------------|
| Clear          | IFF ready   |
| Clear          | IFF ready   |

Note that both interfaces are forwarding. Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | Ring Protection Link Owner |
|---------------|-----------|-------|----------------------------|
| pg102         | idle      | NR-RB | No                         |

| Restore Timer | Quard Timer | Operation state |
|---------------|-------------|-----------------|
| disabled      | disabled    | operational     |

Note that Router 2 is not the owner. Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring statistics group-name pg102
```

Ethernet Ring statistics for PG pg102

|                       |     |

## Example: Viewing Ethernet Ring Protection Status—Ring Failure Condition

This section assumes that Ethernet ring protection is configuring correctly, that Router 1 is the ring protection link (RPL) owner, and that there is a link failure between Router 2 and Router 3 in the configuration example.

### Router 1 Operational Commands (Ring Failure Condition)

```
user@router1> show protection-group ethernet-ring aps
```

| Ethernet Ring Name | Request/state | No Flush | Ring Protection Link Blocked |
|--------------------|---------------|----------|------------------------------|
| pg101              | SF            | NO       | No                           |

| Originator | Remote Node ID    |
|------------|-------------------|
| No         | 00:01:02:00:00:01 |

Note that the ring protection link is no longer blocked and the node is no longer marked as originator.

```
user@router1> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg101

| Interface | Control Channel | Forward State | Ring Protection Link End |
|-----------|-----------------|---------------|--------------------------|
| ge-1/0/1  | ge-1/0/1.1      | forwarding    | Yes                      |
| ge-1/2/4  | ge-1/2/4.1      | forwarding    | No                       |

| Signal Failure | Admin State |
|----------------|-------------|
| Clear          | IFF ready   |
| Clear          | IFF ready   |

Note that the protection interface is now forwarding (so is the other interface).

```
user@router1> show protection-group ethernet-ring node-state
```

```
how protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | Ring Protection Link Owner |
|---------------|-----------|-------|----------------------------|
| pg101         | protected | SF    | Yes                        |

| Restore Timer | Quard Timer | Operation state |
|---------------|-------------|-----------------|
| disabled      | disabled    | operational     |

Note that Router 1 has recorded the span failure (SF).

```
user@router1> show protection-group ethernet-ring statistics group-name pg101
```

Ethernet Ring statistics for PG pg101

|                       |     |
|-----------------------|-----|
| RAPS sent             | : 1 |
| RAPS received         | : 1 |
| Local SF happened:    | : 0 |
| Remote SF happened:   | : 1 |
| NR event happened:    | : 0 |
| NR-RB event happened: | : 1 |

Note that the R-APS messages have recorded the remote failure.

Under a failure condition, the other routers on the ring (Router 2 and Router 3) will see the following similar output:

#### Router 2 and Router 3 Operational Commands (Failure Condition)

```
user@router2> show protection-group ethernet-ring aps
```

| Ethernet Ring Name | Request/state | No Flush | Ring Protection Link Blocked |
|--------------------|---------------|----------|------------------------------|
| pg102              | SF            | No       | No                           |

| Originator | Remote Node ID    |
|------------|-------------------|
| Yes        | 00:00:00:00:00:00 |

Note the failure event (SF). Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg102

| Interface | Control Channel | Forward State | Ring Protection Link End |
|-----------|-----------------|---------------|--------------------------|
| ge-1/2/1  | ge-1/2/1.1      | forwarding    | No                       |
| ge-1/0/2  | ge-1/0/2.1      | discarding    | No                       |

| Signal Failure | Admin State |
|----------------|-------------|
| Clear          | IFF ready   |
| set            | IFF ready   |

Note that the failed interface (ge-1/0/2.1) is not forwarding. Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | Ring Protection Link Owner |
|---------------|-----------|-------|----------------------------|
| pg102         | idle      | NR-RB | No                         |

| Restore Timer | Quard Timer | Operation state |
|---------------|-------------|-----------------|
| disabled      | disabled    | operational     |

Note that Router 2 is not the owner. Router 3 will see almost identical information.

```
user@router2> show protection-group ethernet-ring statistics group-name pg102
```

Ethernet Ring statistics for PG pg102

|                       |     |
|-----------------------|-----|
| RAPS sent             | : 1 |
| RAPS received         | : 1 |
| Local SF happened:    | : 1 |
| Remote SF happened:   | : 0 |
| NR event happened:    | : 0 |
| NR-RB event happened: | : 1 |

Note that the R-APS messages have recorded the remote failure. Router 3 will see almost identical information.

# CFM Action Profile to Bring Down a Group of Logical Interfaces

- [CFM Action Profile to Bring Down a Group of Logical Interfaces Overview on page 829](#)
- [Configuring a CFM Action Profile to Bring Down a Group of Logical Interfaces on page 830](#)

## CFM Action Profile to Bring Down a Group of Logical Interfaces Overview

---

With growing networks, there is a requirement of monitoring a large number of services using CFM. To monitor each service, one session per service logical interface is required. If the services are large in number, this method does not scale as the number of sessions are limited. Instead of one CFM session per service, a single CFM session can monitor multiple services.

Also, there are scenarios where the user-to-network interface (UNI) device needs to be brought down based on sessions on network-to-network Interface (NNI) logical interface. Here, the NNI logical interface refers to core interface and UNI physical interface refers to access interface hosting multiple service logical interfaces. Based on core interface monitoring, you can bring down service logical interfaces associated with access interface.

[Figure 39 on page 830](#) illustrates a topology where a number of services destined to customer-edge (CE) routers share a single port on a provider-edge (PE) router. Each service uses one logical interface. A set of services or logical interfaces (colored in yellow) are destined to one CE router and a set of services or logical interfaces colored in red are destined to another CE router. To monitor each service, you need dedicated down maintenance association end point (MEP) sessions for each service. You can bring down the service by bringing down the service logical interface whenever the session goes down. However, this approach is not scalable if we have large number of services. Monitoring the CFM session on the physical interface is also not feasible because multiple CE routers might be connected and the services to other CE router could be disrupted. To address this issue of monitoring multiple services with a single session, you can create a CCM action profile to bring down a group of logical interfaces by using a CFM session that is configured on a single logical interface.

**Figure 39: Topology of Multiple VLAN Services Sharing a Single Port on PE Router Destined to Multiple CE Routers**

You can configure CCM action profiles for the following scenarios:

- To bring down a group of logical interfaces all having the same parent port when CCM monitoring session is running on one of the logical interface but on a different parent port.
- To bring down a group of logical interfaces when CCM monitoring session is running on one of the logical interfaces, all belonging to the same parent port.
- To bring down the port, when the CCM monitoring session is running on one of the logical interfaces of a different parent port.

### Benefits of Creating CFM Action Profile to Bring Down a Group of Logical Interfaces

- Reduces resource requirement in scaled networks where multiple services need to be monitored.
- Avoids the need to create individual MEP sessions for each service in a topology that includes multiple services to be monitored, thereby enhancing the performance and scalability of the network.

### Configuring a CFM Action Profile to Bring Down a Group of Logical Interfaces

To monitor multiple services or IFLs using CFM session configured on a single logical interface, you can create a CCM action profile to bring down a group of logical interfaces. You need to define an action to bring down the interface group in the action profile. You will then define the interface device name and the number of logical interfaces that have to be brought down. A logical interface is represented by a combination of the **interface-device-name** and **unit-list**. The following steps explain the procedure to bring down a group of logical interfaces when the **interface-device-name** and/or **unit-list** are specified.

1. In configuration mode, at the **[edit protocols oam ethernet connectivity-fault-management]** hierarchy level, specify the name of the action profile and the CFM event(s). You can configure more than one event in the action profile.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set action-profile profile-name event [event1, event2, event3..]
```

For example,

```
user@host# set action-profile AP_test event adjacency-loss rdi
```

**NOTE:** The action interface-group-down will not be supported with events other than adjacency-loss and RDI. Any other events configured results in a commit error.

2. In configuration mode, at the `[edit protocols oam ethernet connectivity-fault-management action-profile profile-name]` hierarchy level, define the action to bring down the interface group.

```
[edit protocols oam ethernet connectivity-fault-management action-profile AP-test]
user@host# set action interface-group-down
```

**NOTE:** The action interface-group-down will not be supported with other interface related actions. Any other actions configured results in a commit error.

3. At the `[edit protocols oam ethernet connectivity-fault-management]` hierarchy level, define the maintenance domain. Specify the maintenance-association parameters.

```
[edit protocols oam ethernet connectivity-fault-management]
user@host# set maintenance-domain domain-name level number
maintenance-association ma-name continuity-check interval ls
```

For example,

```
user@host# set maintenance-domain md6 level 6 maintenance-association ma6
continuity-check interval 1s
```

4. At the `edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name`, define the maintenance association endpoint and the associated parameters.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
md-name maintenance-association ma-name]
user@host# set mep mep-id interface interface-name direction down remote -mep
mep-id
```

For example,

```
user@host# set mep 101 interface ge-0/0/0.0 direction down remote -mep 102
```

5. If the action-profile has **interface-group-down** action configured, it is mandatory to configure the **interface-group** at the RMEP level. In the configuration mode at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name* mep *mep-id* remote-mep *mep-id* action-profile *profile-name*]** include the **interface-group** statement to bring down the interface group marked with the action profile as **interface-group-down**.

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep mep-id
 action-profile profile-name]
user@host# set interface-group
```

For example,

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md6 maintenance-association ma6 mep 101 remote-mep 102 action-profile AP_test]
user@host# set interface-group
```

**NOTE:** If the **interface-group** configuration is not included in the RMEP configuration. The configuration results in commit error.

6. A logical interface is represented by a combination of the **interface-device-name** and **unit-list**. Configure the device interface name and the number of logical interfaces at the **[edit protocols oam ethernet connectivity-fault-management maintenance-domain *md-name* maintenance-association *ma-name* mep *mep-id* remote-mep *mep-id* action-profile *profile-name* interface-group]**

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md-name maintenance-association ma-name mep mep-id remote-mep mep-id
 action-profile profile-name interface-group]
user@host# set interface interface-name
user@host# set unit-list logical-interface-unit-number
```

For example,

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain
 md6 maintenance-association ma6 mep 101 remote-mep 102 action-profile AP_test
 interface-group]
user@host# set interface ge-0/0/0.0
user@host# set unit-list 1223-3344
```

In this configuration example, the interface ge-0/0/0.0 is brought down.

**NOTE:**

- At least one of the interface-group parameters, *interface-device-name* or *unit-list* must be configured. If the interface device name is not configured, the MEP interface is considered as the device name and the logical interface on that device is brought down.
- If the *unit-list* parameter exceeds the recommended limit, a commit error occurs.
- If the *interface-device-name* is not specified in the interface-group, the logical interface numbers mentioned in *unit-list* for the physical interface is brought down.
- If the *unit-list* is not specified in the interface-group, IFLs are brought down for the configured interface.

7. Verify the configuration using **show protocols oam** command.

```
[edit]
user@host# show protocols oam
 ethernet {
 connectivity-fault-management {
 action-profile AP_TEST {
 event {
 adjacency-loss;
 rdi;
 }
 action {
 interface-group-down;
 }
 }
 }
 maintenance-domain md6 {
 level 6;
 maintenance-association ma6 {
 continuity-check {
 interval 1s;
 }
 mep 102 {
 interface ge-0/0/0.0;
 direction down;
 remote-mep 103 {
 action-profile AP_TEST;
 interface-group {
 ge-0/0/1;
 unit-list [12 23-33 44];
 }
 }
 }
 }
 }
 }
}
```

### Configuring Loopback Testing

Loopback testing allows you to verify the connectivity of a circuit. You can configure any of the following interfaces to execute a loopback test: aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, E1, E3, NxDS0, serial, SONET/SDH, T1, and T3.

The physical path of a network data circuit usually consists of segments interconnected by devices that repeat and regenerate the transmission signal. The transmit path on one device connects to the receive path on the next device. If a circuit fault occurs in the form of a line break or a signal corruption, you can isolate the problem by using a loopback test. Loopback tests allow you to isolate segments of the circuit and test them separately.

To do this, configure a *line loopback* on one of the routers. Instead of transmitting the signal toward the far-end device, the line loopback sends the signal back to the originating router. If the originating router receives back its own Data Link Layer packets, you have verified that the problem is beyond the originating router. Next, configure a line loopback

farther away from the local router. If this originating router does not receive its own Data Link Layer packets, you can assume that the problem is on one of the segments between the local router and the remote router's interface card. In this case, the next troubleshooting step is to configure a line loopback closer to the local router to find the source of the problem.

The following types of loopback testing are supported by Junos OS:

- DCE local—Loops packets back on the local data circuit-terminating equipment (DCE).
- DCE remote—Loops packets back on the remote DCE.
- Local—Useful for troubleshooting physical PIC errors. Configuring local loopback on an interface allows transmission of packets to the channel service unit (CSU) and then to the circuit toward the far-end device. The interface receives its own transmission, which includes data and timing information, on the local router's PIC. The data received from the CSU is ignored. To test a local loopback, issue the **show interfaces *interface-name*** command. If PPP keepalives transmitted on the interface are received by the PIC, the **Device Flags** field contains the output **Loop-Detected**.
- Payload—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A payload loopback loops data only (without clocking information) on the remote router's PIC. With payload loopback, overhead is recalculated.
- Remote—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A remote loopback loops packets, including both data and timing information, back on the remote router's interface card. A router at one end of the circuit initiates a remote loopback toward its remote partner. When you configure a remote loopback, the packets received from the physical circuit and CSU are received by the interface. Those packets are then retransmitted by the PIC back toward the CSU and the circuit. This loopback tests all the intermediate transmission segments.

Table 103 on page 838 shows the loopback modes supported on the various interface types.

**Table 103: Loopback Modes by Interface Type**

| Interface                                            | Loopback Modes   | Usage Guidelines                                                                 |

| T1 and T3              | Local, payload, and remote               | <i>Configuring T1 Loopback Capability and Configuring T3 Loopback Capability</i><br><br><i>See also Configuring the T1 Remote Loopback Response</i>                                                                                                      |

To configure loopback testing, include the **loopback** statement:

```
user@host# loopback mode;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* [aggregated-ether-options](#)]
- [edit interfaces *interface-name* **ds0-options**]
- [edit interfaces *interface-name* **e1-options**]
- [edit interfaces *interface-name* **e3-options**]
- [edit interfaces *interface-name* [fastether-options](#)]
- [edit interfaces *interface-name* [gigether-options](#)]
- [edit interfaces *interface-name* **serial-options**]
- [edit interfaces *interface-name* **sonet-options**]
- [edit interfaces *interface-name* **t1-options**]
- [edit interfaces *interface-name* **t3-options**]

## Configuring BERT Testing

To configure BERT:

- Configure the duration of the test.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-period seconds;
```

You can configure the BERT period to last from 1 through 239 seconds on some PICs and from 1 through 240 seconds on other PICs. By default, the BERT period is 10 seconds.

- Configure the error rate to monitor when the inbound pattern is received.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-error-rate rate;
```

*rate* is the bit error rate. This can be an integer from 0 through 7, which corresponds to a bit error rate from  $10^{-0}$  (1 error per bit) to  $10^{-7}$  (1 error per 10 million bits).

- Configure the bit pattern to send on the transmit path.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-algorithm algorithm;
```

*algorithm* is the pattern to send in the bit stream. For a list of supported algorithms, enter a ? after the **bert-algorithm** statement; for example:

```
[edit interfaces t1-0/0/0 t1-options]
```

```
user@host# set bert-algorithm ?
```

Possible completions:

|                  |                                          |
|------------------|------------------------------------------|
| pseudo-2e11-o152 | Pattern is 2^11 -1 (per 0.152 standard)  |
| pseudo-2e15-o151 | Pattern is 2^15 - 1 (per 0.152 standard) |
| pseudo-2e20-o151 | Pattern is 2^20 - 1 (per 0.151 standard) |
| pseudo-2e20-o153 | Pattern is 2^20 - 1 (per 0.153 standard) |
| ...              |                                          |

For specific hierarchy information, see the individual interface types.

**NOTE:** The four-port E1 PIC supports only the following algorithms:

|                  |                                          |
|------------------|------------------------------------------|
| pseudo-2e11-o152 | Pattern is 2^11 -1 (per 0.152 standard)  |
| pseudo-2e15-o151 | Pattern is 2^15 - 1 (per 0.151 standard) |
| pseudo-2e20-o151 | Pattern is 2^20 - 1 (per 0.151 standard) |
| pseudo-2e23-o151 | Pattern is 2^23 (per 0.151 standard)     |

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** The 12-port T1/E1 Circuit Emulation (CE) PIC supports only the following algorithms:

```
all-ones-repeating Repeating one bits
all-zeros-repeating Repeating zero bits
alternating-double-ones-zeros Alternating pairs of ones and zeros
alternating-ones-zeros Alternating ones and zeros
pseudo-2e11-o152 Pattern is 2^11 -1 (per 0.152 standard)
pseudo-2e15-o151 Pattern is 2^15 - 1 (per 0.151 standard)
pseudo-2e20-o151 Pattern is 2^20 - 1 (per 0.151 standard)
pseudo-2e7 Pattern is 2^7 - 1
pseudo-2e9-o153 Pattern is 2^9 - 1 (per 0.153 standard)
repeating-1-in-4 1 bit in 4 is set
repeating-1-in-8 1 bit in 8 is set
repeating-3-in-24 3 bits in 24 are set
```

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** The IQE PICs support only the following algorithms:

```
all-ones-repeating Repeating one bits
all-zeros-repeating Repeating zero bits
alternating-double-ones-zeros Alternating pairs of ones and zeros
alternating-ones-zeros Alternating ones and zeros
pseudo-2e9-o153 Pattern is 2^9 -1 (per 0.153 (511 type) standard)
pseudo-2e11-o152 Pattern is 2^11 -1 (per 0.152 and 0.153 (2047 type)
standards)
pseudo-2e15-o151 Pattern is 2^15 -1 (per 0.151 standard)
pseudo-2e20-o151 Pattern is 2^20 -1 (per 0.151 standard)
pseudo-2e20-o153 Pattern is 2^20 -1 (per 0.153 standard)
pseudo-2e23-o151 Pattern is 2^23 -1 (per 0.151 standard)
repeating-1-in-4 1 bit in 4 is set
repeating-1-in-8 1 bit in 8 is set
repeating-3-in-24 3 bits in 24 are set
```

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** BERT is supported on the PDH interfaces of the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP and the DS3/E3 MIC. The following BERT algorithms are supported:

|                               |                                              |
|-------------------------------|----------------------------------------------|
| all-ones-repeating            | Repeating one bits                           |
| all-zeros-repeating           | Repeating zero bits                          |
| alternating-double-ones-zeros | Alternating pairs of ones and zeros          |
| alternating-ones-zeros        | Alternating ones and zeros                   |
| repeating-1-in-4              | 1 bit in 4 is set                            |
| repeating-1-in-8              | 1 bit in 8 is set                            |
| repeating-3-in-24             | 3 bits in 24 are set                         |
| pseudo-2e9-o153               | Pattern is $2^9 - 1$ (per 0.153 standard)    |
| pseudo-2e11-o152              | Pattern is $2^{11} - 1$ (per 0.152 standard) |
| pseudo-2e15-o151              | Pattern is $2^{15} - 1$ (per 0.151 standard) |
| pseudo-2e20-o151              | Pattern is $2^{20} - 1$ (per 0.151 standard) |
| pseudo-2e20-o153              | Pattern is $2^{20} - 1$ (per 0.153 standard) |
| pseudo-2e23-o151              | Pattern is $2^{23}$ (per 0.151 standard)     |

Table 104 on page 842 shows the BERT capabilities for various interface types.

**Table 104: BERT Capabilities by Interface Type**

| Interface                                              | T1 BERT               | T3 BERT                        | Comments                                                                                                                                                                      |
|--------------------------------------------------------|-----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12-port T1/E1<br>Circuit Emulation                     | Yes (ports 0–11)      | —                              | <ul style="list-style-type: none"> <li>Limited algorithms</li> </ul>                                                                                                          |
| 4-port<br>Channelized<br>OC3/STM1<br>Circuit Emulation | Yes (port 0–3)        | —                              | <ul style="list-style-type: none"> <li>Limited algorithms</li> </ul>                                                                                                          |
| E1 or T1                                               | Yes (port 0–3)        | Yes (port 0–3)                 | <ul style="list-style-type: none"> <li>Single port at a time</li> <li>Limited algorithms</li> </ul>                                                                           |
| E3 or T3                                               | Yes (port 0–3)        | Yes (port 0–3)                 | <ul style="list-style-type: none"> <li>Single port at a time</li> </ul>                                                                                                       |
| Channelized<br>OC12                                    | —                     | Yes (channel<br>0–11)          | <ul style="list-style-type: none"> <li>Single channel at a time</li> <li>Limited algorithms</li> <li>No bit count</li> </ul>                                                  |
| Channelized<br>STM1                                    | Yes (channel<br>0–62) | —                              | <ul style="list-style-type: none"> <li>Multiple channels</li> <li>Only one algorithm</li> <li>No error insert</li> <li>No bit count</li> </ul>                                |
| Channelized T3<br>and Multichannel<br>T3               | Yes (channel<br>0–27) | Yes (port 0–3 on<br>channel 0) | <ul style="list-style-type: none"> <li>Multiple ports and channels</li> <li>Limited algorithms for T1</li> <li>No error insert for T1</li> <li>No bit count for T1</li> </ul> |

These limitations do not apply to channelized IQ interfaces. For information about BERT capabilities on channelized IQ interfaces, see *Channelized IQ and IQE Interfaces Properties*.

## Starting and Stopping a BERT Test

Before you can start the BERT test, you must disable the interface. To do this, include the **disable** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]
disable;
```

After you configure the BERT properties and commit the configuration, begin the test by issuing the **test interface *interface-name interface-type-bert-start*** operational mode command:

```
user@host> test interface interface-name interface-type-bert-start
```

The test runs for the duration you specify with the **bert-period** statement. If you want to terminate the test sooner, issue the **test interface *interface-name interface-type-bert-stop*** command:

```
user@host> test interface interface-name interface-type-bert-stop
```

For example:

```
user@host> test interface t3-1/2/0 t3-bert-start
user@host> test interface t3-1/2/0 t3-bert-stop
```

To view the results of the BERT test, issue the **show interfaces extensive | find BERT** command:

```
user@host> show interfaces interface-name extensive | find BERT
```

For more information about running and evaluating the results of the BERT procedure, see the [CLI Explorer](#).

**NOTE:** To exchange BERT patterns between a local router and a remote router, include the **loopback remote** statement in the interface configuration at the remote end of the link. From the local router, issue the **test interface** command.

### Verifying Link and Transceivers using Pseudo Random Binary Sequence (PRBS) Test

The Pseudo Random Binary Sequence (PRBS) test is a standard feature to verify link quality and transceiver operation. There are two possible diagnostic scenarios:

- Bidirectional verification using remote loopback. Test sequence is initiated from the local end. Remote end is configured with the loopback and analysis of the test pattern is performed at local end as well.
- Unidirectional. Test sequence is initiated from the local end. Test pattern is analyzed by the remote end.

In the first case, verification is bidirectional and loopback support is required on the remote end.

#### *Guidelines to perform Unidirectional Diagnostics*

Enable the transmission of pseudo-random binary sequence pattern on one end of the link (TX), and enable monitoring on the other end (RX).

The PRBS statistics report on the receiving end reflects link quality.

Following are the steps to collect and view the PRBS statistics:

1. Start a TX (direction 0) by issuing the following command:

```
[edit]
user@host1> test interface et-0/1/2 prbs-test-start pattern-type 31 direction 0 flip 0
```

After executing the command, you can check the link status by executing **show interfaces terse et-0/1/\***:

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| et-0/1/2  | up    | down |       |       |        |

2. Start a RX (direction 1) by issuing the following command:

```
[edit]
user@host2> test interface et-1/1/4 prbs-test-start pattern-type 31 direction 1 flip 0
```

After executing the command, you can check the link status by executing **show interfaces terse et-1/1/4**:

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| et-1/1/4  | up    | down |       |       |        |

3. After starting the statistics collection, you can view the collected statistics at RX by issuing the following command:

```
[edit]
user@host2> show interfaces interface-name prbs-stats
```

For example:

Checking PRBS statistics at RX:

```
user@host2> show interfaces et-1/1/4 prbs-stats
```

```
PRBS Statistics : Enabled
```

```
Lane 0 : State : Pass, Error count : 0
Lane 1 : State : Pass, Error count : 0
Lane 2 : State : Pass, Error count : 0
Lane 3 : State : Pass, Error count : 0
```

The PRBS test is successful, if the state is pass with error count 0.

4. Stop the PRBS statistics collection by issuing the following command:

```
user@host2> test interface interface-name prbs-test-stop direction 1
user@host1> test interface interface-name prbs-test-stop direction 0
```

For example:

To stop the PRBS at RX:

```
user@host2> test interface et-1/1/4 prbs-test-stop direction 1
```

Verify the statistics at TX by executing the following command:

```
show interfaces et-0/1/2 prbs-stats
```

```
PRBS Statistics : Disabled
```

To stop the PRBS at TX:

```
user@host1> test interface et-0/1/2 prbs-test-stop direction 0
```

After executing the command, you can check the link status at RX by executing **show interfaces terse et-1/1/4**:

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| et-1/1/4  | up    | up   |       |       |        |

Check the link status at TX by executing **show interfaces terse et-0/1/2**:

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| et-0/1/2  | up    | up   |       |       |        |

This command only disables the statistics collection and does not clear the statistics collected. To clear the collected statistics, issue the **clear interfaces statistics** command.

```
user@host1> clear interfaces statistics et-0/1/2
```

- See Also**
- [prbs-test-start on page 1365](#)
  - [prbs-test-stop on page 1367](#)
  - [show interfaces prbs-stats on page 1650](#)
  - [clear interfaces statistics](#)

## Guidelines to perform Bidirectional Diagnostics using Remote Loopback

Configure loopback on the remote end of the link. Test pattern generation and analysis is performed on the local end.

The PRBS statistics report on the receiving end reflects link quality.

Following are the steps to collect and view the PRBS statistics:

1. Enable remote loopback.

```
set interfaces et-0/1/2 gigether-options loopback-remote
```

**NOTE:** You must disable Forward Error Correction (FEC), if loopback is configured in the router with JNP-MIC1 MIC at the remote end.

```
user@host1> show interfaces et-0/1/2 | display set
set interfaces et-0/1/2 gigether-options fec none
```

2. Start a TX (direction 0) by issuing the following command:

```
[edit]
user@host1> test interface et-0/1/2 prbs-test-start pattern-type 31 direction 0 flip 0
```

After executing the command, you can check the link status by executing `show interfaces terse et-0/1/*`:

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
| et-0/1/2  | up    | down |       |       |        |

3. Start a RX (direction 1) by issuing the following command on the same host.

```
[edit]
user@host2> test interface et-1/1/4 prbs-test-start pattern-type 31 direction 1 flip 0
```

4. After starting the statistics collection, you can view the collected statistics at RX by issuing the following command:

```
[edit]
user@host2> show interfaces interface-name prbs-stats
```

For example:

Checking PRBS statistics at RX:

```
user@host2> show interfaces et-1/1/4 prbs-stats
```

```
PRBS Statistics : Enabled

Lane 0 : State : Pass, Error count : 0
Lane 1 : State : Pass, Error count : 0
Lane 2 : State : Pass, Error count : 0
Lane 3 : State : Pass, Error count : 0
```

The PRBS test is successful, if the state is pass with error count 0.

5. Stop the PRBS statistics collection by issuing the following command:

```
user@host2> test interface interface-name prbs-test-stop direction 1
user@host1> test interface interface-name prbs-test-stop direction 0
```

For example:

To stop the PRBS at RX:

```
user@host2> test interface et-1/1/4 prbs-test-stop direction 1
```

Verify the statistics at TX by executing the following command:

```
show interfaces et-0/1/2 prbs-stats
```

```
PRBS Statistics : Disabled
```

To stop the PRBS at TX:

```
user@host1> test interface et-0/1/2 prbs-test-stop direction 0
```

After executing the command, you can check the link status at RX by executing show interfaces terse et-0/1/2:

```
Interface Admin Link Proto Local Remote
et-0/1/2 up up
```

This command only disables the statistics collection and does not clear the statistics collected. To clear the collected statistics, issue the clear interfaces statistics command.

```
user@host1> clear interfaces statistics et-0/1/2
```

#### Interface Card Specific differences

While collecting statistics, the JNP-MIC1-MACSEC and JNP-MIC1 MICs behave differently:

- On JNP-MIC1-MACSEC MIC, if RX is not latching to any PRBS signal, then the "state" in the **show interfaces interface-name prbs-stats** displays as "Disabled" with Error count as 0, where the JNP-MIC1 MIC displays as failed with MAX error count.

For Example: On JNP-MIC1-MACSEC MIC

```
user@host> test interface et-0/1/10 prbs-test-start pattern-type 31 direction 1 flip 0
user@host> show interfaces et-0/1/10 prbs-stats
```

```
PRBS Statistics : Enabled
Lane 0 : State : Disabled, Error count : 0
Lane 1 : State : Disabled, Error count : 0
Lane 2 : State : Disabled, Error count : 0
Lane 3 : State : Disabled, Error count : 0
```

For Example: On JNP-MIC1 MIC

```
user@host> test interface et-0/0/1 prbs-test-start pattern-type 31 direction 1 flip 0
user@host> show interfaces et-0/0/1 prbs-stats
```

```
PRBS Statistics : Enabled
Lane 0 : State : Fail, Error count : 4294967295
Lane 1 : State : Fail, Error count : 4294967295
Lane 2 : State : Fail, Error count : 4294967295
Lane 3 : State : Fail, Error count : 4294967295
```

- If any mismatch is encountered between the pattern-type and flip between TX and RX, the maximum error counts are observed in case of JNP-MIC1 MIC and state "disabled" in case of JNP-MIC1-MACSEC MIC (flip is only supported in JNP-MIC1-MACSEC).
- In case of JNP-MIC1 MIC, if TX is interrupted, the RX displays the state as failed with error counts. Even if TX is started again, RX also must to be restarted to work properly. In case of JNP-MIC1-MACSEC MIC, if TX is interrupted, the RX displays the state as "Disabled" with Error Count 0 (point 1) and if TX is started, RX need not be started again.
- If TX or RX is started consecutively without stopping the earlier run, then difference in the behavior of JNP-MIC1-MACSEC and JNP-MIC1 MICs are observed.
- Decision feedback equalization (DFE) tuning is required on JNP-MIC1 MIC to start a PRBS test. But, on JNP-MIC1-MACSEC MIC, the DFE tuning is not required. If PRBS is started again at TX or RX without stopping the earlier run, there will be errors until DFE tuning is completed again, in JNP-MIC1 MIC. JNP-MIC1-MACSEC MIC does not show this behavior as there is no DFE tuning involved.
- You must disable Forward Error Correction (FEC), if loopback is configured in the router with JNP-MIC1 MIC at the remote end.

```
user@host> show interfaces et-1/1/1 | display set
set interfaces et-1/1/1 gigether-options loopback-remote
set interfaces et-1/1/1 gigether-options fec none
```

## Clearing the Interface Statistics

The **clear interface statistics** command clears only the error counters and not the status, RX needs to be restarted to get the right status.

Following are the steps to clear the interface statistics:

1. Check the statistics at RX by issuing the following command:

```
[edit]
user@host2> show interfaces et-1/1/4 prbs-stats

PRBS Statistics : Enabled
 Lane 0 : State : Fail, Error count : 4294967295
 Lane 1 : State : Fail, Error count : 4294967295
 Lane 2 : State : Fail, Error count : 4294967295
 Lane 3 : State : Fail, Error count : 4294967295
```

Because only RX is started, there is no PRBS pattern and RX shows maximum error.

2. To clear the interface statistics, execute the following command:

```
[edit]
user@host2> clear interfaces statistics et-1/1/4
user@host2> show interfaces et-1/1/4 prbs-stats

PRBS Statistics : Enabled
 Lane 0 : State : Fail, Error count : 0
 Lane 1 : State : Fail, Error count : 0
 Lane 2 : State : Fail, Error count : 0
 Lane 3 : State : Fail, Error count : 0
```

Here the status still shows as fail, although the statistics displays the delta value. In this case, because both the current and previous values are INT\_MAX, the delta value 0 is displayed.

Consider a scenario where the error count increments as the PRBS test is ongoing. In this case, the **show interfaces interface-name prbs-stats** shows the incremental error (delta value). Also after issuing **clear interfaces statistics et-1/1/4**, if the error count is updated, the **clear interfaces statistics** displays the incremental error too.

For Example:

```
[edit]
user@host2> show interfaces et-1/1/4 prbs-stats

PRBS Statistics : Enabled
 Lane 0 : State : Fail, Error count : 640
 Lane 1 : State : Fail, Error count : 647
 Lane 2 : State : Fail, Error count : 661
 Lane 3 : State : Fail, Error count : 596
```

```
[edit]
```

```
user@host2> show interfaces et-1/1/4 prbs-stats
```

```
PRBS Statistics : Enabled
Lane 0 : State : Fail, Error count : 52
Lane 1 : State : Fail, Error count : 65
Lane 2 : State : Fail, Error count : 626
Lane 3 : State : Fail, Error count : 132
```

As shown above, in the second instance the **show interfaces *interface-name* prbs-stats** command displays the "change" in error count. So, the total error count is 640 + 52 = 692 for Lane 0.

  - [Display the Status of Fast Ethernet Interfaces on page 852](#)

### Monitor Fast Ethernet and Gigabit Ethernet Interfaces

By monitoring Fast Ethernet and Gigabit Ethernet interfaces, you begin to isolate Fast Ethernet and Gigabit Ethernet interface problems when they occur.

To monitor your Fast Ethernet and Gigabit Ethernet interfaces, follow these steps:

1. [Display the Status of Fast Ethernet Interfaces on page 852](#)
2. [Display the Status of Gigabit Ethernet Interfaces on page 853](#)
3. [Display the Status of a Specific Fast Ethernet or Gigabit Ethernet Interface on page 854](#)
4. [Display Extensive Status Information for a Specific Fast Ethernet or Gigabit Ethernet Interface on page 855](#)
5. [Monitor Statistics for a Fast Ethernet or Gigabit Ethernet Interface on page 858](#)

### Display the Status of Fast Ethernet Interfaces

**Purpose** To display the status of Fast Ethernet interfaces, use the following Junos OS command-line interface (CLI) operational mode command:

**Action** `user@host> show interfaces terse (fe* | ge*)`

### Sample Output

user@host> show interfaces terse fe\*

| Interface  | Admin | Link | Proto | Local             | Remote |
|------------|-------|------|-------|-------------------|--------|
| fe-2/1/0   | up    | up   |       |                   |        |
| fe-2/1/0.0 | up    | up   | inet  | 10.116.115.217/29 |        |
| fe-3/0/2   | up    | down |       |                   |        |
| fe-3/0/2.0 | up    | down |       |                   |        |
| fe-3/0/3   | up    | up   |       |                   |        |
| fe-3/0/3.0 | up    | up   | inet  | 192.168.223.65/30 |        |
| fe-4/1/0   | down  | up   |       |                   |        |
| fe-4/1/0.0 | up    | down | inet  | 10.150.59.133/30  |        |
| fe-4/1/1   | up    | up   |       |                   |        |
| fe-4/1/1.0 | up    | up   | inet  | 10.150.59.129/30  |        |
| fe-4/1/2   | up    | down |       |                   |        |
| fe-4/1/2.0 | up    | down |       |                   |        |

**Meaning** The sample output lists only the Fast Ethernet interfaces. It shows the status of both the physical and logical interfaces. For a description of what the output means, see [Table 107 on page 852](#).

*Table 107: Status of Fast Ethernet Interfaces*

| Physical Interface | Logical Interface | Status Description                                                     |
|--------------------|-------------------|------------------------------------------------------------------------|
| fe-2/1/0           | fe-2/1/0.0        | This interface has both the physical and logical links up and running. |
| Admin Up           | Admin Up          |                                                                        |
| Link Up            | Link Up           |                                                                        |

Table 107: Status of Fast Ethernet Interfaces (continued)

| Physical Interface | Logical Interface | Status Description                                                                                                                                                                                                  |
|--------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fe-3/0/2           | fe-3/0/2.0        | This interface has the physical link down, the link layer down, or both down ( <b>Link Down</b> ). The logical link is also down as a result.                                                                       |
| Admin Up           | Admin Up          |                                                                                                                                                                                                                     |
| Link Down          | Link Down         |                                                                                                                                                                                                                     |
| fe-4/1/0           | fe-4/1/0.0        | This interface is administratively disabled and the physical link is healthy ( <b>Link Up</b> ), but the logical interface is not established. The logical interface is down because the physical link is disabled. |
| Admin Down         | Admin Up          |                                                                                                                                                                                                                     |
| Link Up            | Link Down         |                                                                                                                                                                                                                     |
| fe-4/1/2           | fe-4/1/2.0        | This interface has both the physical and logical links down.                                                                                                                                                        |
| Admin Up           | Admin Up          |                                                                                                                                                                                                                     |
| Link Down          | Link Down         |                                                                                                                                                                                                                     |

### Display the Status of Gigabit Ethernet Interfaces

**Purpose** To display the status of Gigabit Ethernet interfaces, use the following Junos OS command-line interface (CLI) operational mode command:

#### Sample Output Action

```
user@host> show interfaces terse ge*
```

| Interface  | Admin | Link | Proto | Local            | Remote |
|------------|-------|------|-------|------------------|--------|
| ge-2/2/0   | down  | down |       |                  |        |
| ge-2/2/0.0 | up    | down | inet  | 65.113.23.105/30 |        |
| ge-2/3/0   | up    | up   |       |                  |        |
| ge-2/3/0.0 | up    | up   | inet  | 65.115.56.57/30  |        |
| ge-3/1/0   | up    | up   |       |                  |        |
| ge-3/1/0.0 | up    | up   | inet  | 65.115.56.193/30 |        |
| ge-3/2/0   | up    | down |       |                  |        |

**Meaning** This sample output lists only the Gigabit Ethernet interfaces. It shows the status of both the physical and logical interfaces. See [Table 108 on page 854](#) for a description of what the output means.

Table 108: Status of Gigabit Ethernet Interfaces

| Physical Interface | Logical Interface | Status Description                                                                                                                    |
|--------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| ge-2/2/0           | ge-2/2/0.0        | This interface is administratively disabled ( <b>Admin Down</b> ). Both the physical and logical links are down ( <b>Link Down</b> ). |
| Admin Down         | Admin Up          |                                                                                                                                       |
| Link Down          | Link Down         |                                                                                                                                       |
| ge-2/3/0           | ge-2/3/0.0        | This interface has both the physical and logical links up and running.                                                                |
| Admin Up           | Admin Up          |                                                                                                                                       |
| Link Up            | Link Up           |                                                                                                                                       |
| ge-3/2/0           | ge-3/2/0.0        | This interface has both the physical link and the logical interface down.                                                             |
| Admin Up           | Admin Up          |                                                                                                                                       |
| Link Down          | Link Down         |                                                                                                                                       |

**See Also** • [Display the Status of Fast Ethernet Interfaces on page 852](#)

### Display the Status of a Specific Fast Ethernet or Gigabit Ethernet Interface

**Purpose** To display the status of a specific Fast Ethernet or Gigabit Ethernet interface when you need to investigate its status further, use the following Junos OS CLI operational mode command:

**Action** `user@host> show interfaces (fe-fpc/pic/port | ge-fpc/pic/port)`

### Sample Output 1

The following sample output is for a Fast Ethernet interface with the physical link up:

```
user@host> show interfaces fe-2/1/0
Physical interface: fe-2/1/0, Enabled, Physical link is Up
 Interface index: 31, SNMP ifIndex: 35
 Description: customer connection
 Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
 Speed: 100mbps, Loopback: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps
 Link flags : None
 Current address: 00:90:69:86:71:1b, Hardware address: 00:90:69:86:71:1b
 Input rate : 25768 bps (11 pps), Output rate: 1576 bps (3 pps)
 Active alarms : None
 Active defects : None
 Logical interface fe-2/1/0.0 (Index 2) (SNMP ifIndex 43)
 Flags: SNMP-Traps, Encapsulation: ENET2
 Protocol inet, MTU: 1500, Flags: Is-Primary
```

```
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.116.151.218/29, Local: 10.119.115.217
Broadcast: 10.116.151.225
```

## Sample Output 2

The following output is for a Gigabit Ethernet interface with the physical link up:

```
user@host> show interfaces ge-3/1/0
Physical interface: ge-3/1/0, Enabled, Physical link is Up
 Interface index: 41, SNMP ifIndex: 55
 Description: customer connection
 Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
 Speed: 1000mbps, Loopback: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps
 Link flags : None
 Current address: 00:90:69:85:71:99, Hardware address: 00:90:69:85:71:99
 Input rate : 7412216 bps (1614 pps), Output rate: 2431184 bps (1776 pps)
 Active alarms : None
 Active defects : None
 Logical interface ge-3/1/0.0 (Index 11) (SNMP ifIndex 57)
 Flags: SNMP-Traps, Encapsulation: ENET2
 Protocol inet, MTU: 1500
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.117.65.192/30, Local: 10.115.65.193
 Broadcast: 10.115.65.195
```

**Meaning** The first line of sample output 1 and 2 shows that the physical link is up. This means that the physical link is healthy and can pass packets. Further down the sample output, look for active alarms and defects. If you see active alarms or defects, to further diagnose the problem, see Step 3, [“Display Extensive Status Information for a Specific Fast Ethernet or Gigabit Ethernet Interface” on page 855](#), to display more extensive information about the Fast Ethernet interface and the physical interface that is down.

## Display Extensive Status Information for a Specific Fast Ethernet or Gigabit Ethernet Interface

**Purpose** To display extensive status information about a specific Fast Ethernet or Gigabit Ethernet interface, use the following Junos OS CLI operational mode command:

**Action** `user@host> show interfaces (fe-fpc/pic/port | ge-fpc/pic/port) extensive`

## Sample Output

The following sample output is for a Fast Ethernet interface:

```
user@router> show interfaces fe-1/3/3 extensive
Physical interface: fe-1/3/3, Enabled, Physical link is Up
 Interface index: 47, SNMP ifIndex: 38
```

```

Description: Test
Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
Speed: 100mbps, Loopback: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps
Link flags : None
Current address: 00:90:69:8d:2c:de, Hardware address: 00:90:69:8d:2c:de
Statistics last cleared: 2002-01-11 23:03:09 UTC (1w2d 23:54 ago)
Traffic statistics:

Addresses, Flags: Is-Preferred Is-Primary

```

```
Destination: 10.115.107.192/29, Local: 10.115.107.193
Broadcast: 10.115.107.199
```

**Meaning** The sample output shows where the errors might be occurring and includes autonegotiation information. See [Table 109 on page 857](#) for a description of errors to look for.

**Table 109: Errors to Look For**

| Error             | Meaning                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policed discards  | Discarded frames that were not recognized or were not of interest.                                                                                                        |
| L2 channel errors | Packets for which the router could not find a valid logical interface. For example, the packet is for a virtual LAN (VLAN) that is not configured on the interface.       |
| MTU               | The maximum transmission unit (MTU) must match the interface of either the router at the remote end of the Fast Ethernet or Gigabit Ethernet link, or that of the switch. |
| Input DA rejects  | Number of packets with a destination Media Access Control (MAC) address that is not on the accept list. It is normal to see this number increment.                        |
| Input SA rejects  | Number of packets with a source MAC address that is not on the accept list. This number only increments when source MAC address filtering is configured.                  |

If the physical link is down, look at the active alarms and defects for the Fast Ethernet or Gigabit Ethernet interface and diagnose the Fast Ethernet or Gigabit Ethernet media accordingly. See [“Checklist for Locating Fast Ethernet and Gigabit Ethernet Alarms and Counters” on page 876](#) for an explanation of Fast Ethernet and Gigabit Ethernet alarms.

[Table 110 on page 857](#) lists and describes some MAC statistics errors to look for.

**Table 110: MAC Statistics Errors**

| Error              | Meaning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CRC/Align errors   | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad FCS with an integral number of octets ( <b>FCS Error</b> ) or a bad FCS with a non-integral number of octets ( <b>Alignment Error</b> ).                                                                                                                                                                       |
| MAC control frames | The number of MAC control frames.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| MAC pause frames   | The number of MAC control frames with <b>pause</b> operational code.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Jabber frames      | <p>The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Note that this definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p> |

Table 110: MAC Statistics Errors (continued)

| Error                  | Meaning                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fragment frames</b> | <p>The total number of packets received that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Note that it is entirely normal for fragment frames to increment because both runts (which are normal occurrences due to collisions) and noise hits are counted.</p> |

Autonegotiation is the process that connected Ethernet interfaces use to communicate the information necessary to interoperate. [Table 111 on page 858](#) explains the autonegotiation information of the **show interface *interface-name* extensive** command output.

Table 111: Autonegotiation Information

| Autonegotiation Field Information                                     | Explanation                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Negotiation status: Incomplete</b>                                 | The <b>Negotiation status</b> field shows <b>Incomplete</b> when the Ethernet interface has the speed or link mode configured.                                                                                                                         |
| <b>Negotiation status: No autonegotiation</b>                         | The <b>Negotiation status</b> field shows <b>No autonegotiation</b> when the remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.                                                                     |
| <b>Negotiation status: Complete</b><br><b>Link partner status: OK</b> | The <b>Negotiation status</b> field shows <b>Complete</b> and the <b>Link partner</b> field shows <b>OK</b> when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process completes successfully. |
| <b>Link partner: Half-duplex</b>                                      | The <b>Link partner</b> field can be <b>Full-duplex</b> or <b>Half-duplex</b> depending on the capability of the attached Ethernet device.                                                                                                             |
| <b>Flow control: Symmetric/asymmetric</b>                             | The <b>Flow control</b> field displays the types of flow control supported by the remote Ethernet device.                                                                                                                                              |

### Monitor Statistics for a Fast Ethernet or Gigabit Ethernet Interface

**Purpose** To monitor statistics for a Fast Ethernet or Gigabit Ethernet interface, use the following Junos OS CLI operational mode command:

**Action** `user@host> monitor interface (fe-fpc/pic/port | ge-fpc/pic/port)`

**CAUTION:** We recommend that you use the monitor interface `fe-fpc/pic/port` or monitor interface `ge-fpc/pic/port` command only for diagnostic purposes. Do not leave these commands on during normal router operations because real-time monitoring of traffic consumes additional CPU and memory resources.

## Sample Output

The following sample output is for a Fast Ethernet interface:

```

user@host> monitor interface fe-2/1/0
Interface: fe-2/1/0, Enabled, Link is Up
Encapsulation: Ethernet, Speed: 100mbps
Traffic statistics:
Input bytes: 282556864218 (14208 bps) [40815]
Output bytes: 42320313078 (384 bps) [890]
Input packets: 739373897 (11 pps) [145]
Output packets: 124798688 (1 pps) [14]
Error statistics:
Input errors: 0 [0]
Input drops: 0 [0]
Input framing errors: 0 [0]
Policed discards: 6625892 [6]
L3 incompletes: 75 [0]
L2 channel errors: 0 [0]
L2 mismatch timeouts: 0 [0]
Carrier transitions: 1 [0]
Output errors: 0 [0]
Output drops: 0 [0]
Aged packets: 0 [0]
Active alarms : None
Active defects: None
Input MAC/Filter statistics:
Unicast packets 464751787 [154]
Packet error count 0 [0]

```

**Meaning** Use the information from this command to help narrow down possible causes of an interface problem.

**NOTE:** If you are accessing the router from the console connection, make sure you set the CLI terminal type using the `set cli terminal` command.

The statistics in the second column are the cumulative statistics since the last time they were cleared using the `clear interfaces statistics interface-name` command. The statistics in the third column are the cumulative statistics since the `monitor interface interface-name` command was executed.

If the input errors are increasing, verify the following:

1. Check the cabling to the router and have the carrier verify the integrity of the line. To verify the integrity of the cabling, make sure that you have the correct cables for the interface port. Make sure you have single-mode fiber cable for a single-mode interface and multimode fiber cable for a multimode interface.
2. For a fiber-optic connection, measure the received light level at the receiver end and make sure that it is within the receiver specification of the Ethernet interface. See

[“Fiber-Optic Ethernet Interface Specifications” on page 860](#) for the fiber-optic Ethernet interface specifications.

3. Measure the transmit light level on the Tx port to verify that it is within specification. See [“Fiber-Optic Ethernet Interface Specifications” on page 860](#) for the optical specifications.

## Fiber-Optic Ethernet Interface Specifications

[Table 112 on page 860](#) shows the specifications for fiber-optic interfaces for Juniper Networks routers.

**Table 112: Fiber-Optic Ethernet Interface Specifications**

| Fiber-Optic Ethernet Interface                   | Length                                                                                                           | Wavelength      | Average Launch Power | Receiver Saturation | Receiver Sensitivity                     |

## Diagnose a Suspected Hardware Problem with a Fast Ethernet or Gigabit Ethernet Interface

**Problem**    **Description:** When you suspect a hardware problem, take the following steps to help verify if there is a problem.

**Solution**    To diagnose a suspected hardware problem with the Ethernet interface, follow these steps:

- [Create a Loopback on page 862](#)
- [Verify That the Fast Ethernet or Gigabit Ethernet Interface Is Up on page 865](#)
- [Configure a Static Address Resolution Protocol Table Entry on page 868](#)
- [Clear Fast Ethernet or Gigabit Ethernet Interface Statistics on page 872](#)
- [Check for Fast Ethernet or Gigabit Ethernet Interface Error Statistics on page 874](#)

### Create a Loopback

You can create a physical loopback or configure a local loopback to help diagnose a suspected hardware problem. Creating a physical loopback is recommended because it allows you to test and verify the transmit and receive ports. If a field engineer is not available to create the physical loopback, you can configure a local loopback for the

interface. The local loopback creates a loopback internally in the Physical Interface Card (PIC).

1. [Create a Physical Loopback for a Fiber-Optic Interface on page 863](#)
2. [Create a Loopback Plug for an RJ-45 Ethernet Interface on page 863](#)
3. [Configure a Local Loopback on page 864](#)

### Create a Physical Loopback for a Fiber-Optic Interface

#### Action

To create a physical loopback at the port, connect the transmit port to the receive port using a known good fiber cable.

**NOTE:** Make sure you use single-mode fiber for a single-mode port and multimode fiber for a multimode port.

#### Meaning

When you create and then test a physical loopback, you are testing the transmit and receive ports of the PIC. This action is recommended if a field engineer is available to create the physical loop as it provides a more complete test of the PIC.

- See Also**
- [Create a Loopback Plug for an RJ-45 Ethernet Interface on page 863](#)
  - [Configure a Local Loopback on page 864](#)
  - [Verify That the Fast Ethernet or Gigabit Ethernet Interface Is Up on page 865](#)
  - [Configure a Static Address Resolution Protocol Table Entry on page 868](#)

### Create a Loopback Plug for an RJ-45 Ethernet Interface

#### Action

To create a loopback plug, cross pin 1 (TX+) and pin 3 (RX+) together, and cross pin 2 (TX-) and pin 6 (RX-) together. You need the following equipment to create the loopback:

- A 6-inch long CAT5 cable
- An RJ-45 connector
- A crimping tool

[Figure 40 on page 864](#) illustrates how to create a loopback plug for an RJ-45 Ethernet interface.

*Figure 40: RJ-45 Ethernet Loopback Plug***RJ-45 Ethernet Loopback Plug****Meaning**

When you create and then test a physical loopback, you are testing the RJ-45 interface of the PIC. This action is recommended if a field engineer is available to create the physical loop as it provides a more complete test of the PIC.

- See Also**
- [Configure a Local Loopback on page 864](#)
  - [Verify That the Fast Ethernet or Gigabit Ethernet Interface Is Up on page 865](#)
  - [Configure a Static Address Resolution Protocol Table Entry on page 868](#)
  -

**Configure a Local Loopback****Action**

To configure a local loopback without physically connecting the transmit port to the receive port, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces interface-name (fastether-options | gigether-options)
```

2. Configure the local loopback:

```
[edit interfaces interface-name (fastether-options | gigether-options)]
user@host# set loopback
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit interfaces fe-1/0/0 fastether-options]
```

```
user@host# show
loopback;
```

4. Commit the change:

```
user@host# commit
```

For example:

```
[edit interfaces fe-1/0/0 fastether-options]
user@host# commit
commit complete
```

When you create a local loopback, you create an internal loop on the interface being tested. A local loopback loops the traffic internally on that PIC. A local loopback tests the interconnection of the PIC but does not test the transmit and receive ports. On an Ethernet interface, you cannot create a remote loopback, therefore there is no option to use a **local** or **remote** statement. Simply including the **loopback** statement at the **[edit interfaces *interface-name* (fastether-options | gigheter-options)]** hierarchy level, places the interface into local loopback mode.

**NOTE:** Remember to delete the loopback statement after completing the test.

## Verify That the Fast Ethernet or Gigabit Ethernet Interface Is Up

**Purpose** Display the status of the Fast Ethernet or Gigabit Ethernet interface to provide the information you need to determine whether the physical link is up or down.

**Action** To verify that the status of the Fast Ethernet or Gigabit Ethernet interface is up, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show interfaces (fe-fpc/port | ge-fpc/pic/port)
```

### Sample Output

```
user@host# show interfaces ge-4/0/6 extensive
```

```
Physical interface: ge-4/0/6, Enabled, Physical link is Up Interface index: 144, SNMP

```

### Meaning

The sample output shows that the link is up and there are no alarms in this loopback configuration. When an internal loopback is configured, the physical loopback should come up without an alarm.

### Sample Output

When you see that the physical link is down, there may be a problem with the port. The following output is an example of the `show interfaces fe-fpc/pic/port` command when the physical link is down:

```

user@router> show interfaces fe-1/3/0
Physical interface: fe-1/3/0, Enabled, Physical link is Down
Interface index: 44, SNMP ifIndex: 35
Link-level type: Ethernet, MTU: 1514, Source filtering: Disabled
Speed: 100mbps, Loopback: Disabled, Flow control: Enabled
Device flags : Present Running Down
Interface flags: Hardware-Down SNMP-Traps
Link flags : None
Current address: 00:90:69:8d:2c:db, Hardware address: 00:90:69:8d:2c:db

Active alarms : LINK
Active defects : LINK
MAC statistics:
 Input octets: 0, Input packets: 0, Output octets: 0, Output packets: 0
Filter statistics:
 Filtered packets: 0, Padded packets: 0, Output packet errors: 0
Autonegotiation information:
 Negotiation status: Incomplete, Link partner status: Down
 Reason: Link partner autonegotiation failure
 Link partner: Half-duplex, Flow control: None

```

**Meaning** The sample output shows that the physical link is down and there are active alarms and defects.

[Table 114 on page 868](#) presents problem situations and actions for a physical link that is down.

*Table 114: Problems and Solutions for a Physical Link That Is Down*

| Problem                                                                                   | Action                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cable mismatch                                                                            | Verify that the fiber connection is correct.                                                                                                                                                                                                                                  |
| Damaged and/or dirty cable                                                                | Verify that the fiber can successfully loop a known good port of the same type.                                                                                                                                                                                               |
| Too much or too little optical attenuation                                                | Verify that the attenuation is correct per the PIC optical specifications.                                                                                                                                                                                                    |
| The transmit port is not transmitting within the dBm optical range per the specifications | Verify that the Tx power of the optics is within range of the PIC optical specification.                                                                                                                                                                                      |
| Mismatch between the cable type and the port                                              | Verify that a single-mode fiber cable is connected to a single-mode interface and that a multimode fiber cable is connected to a multimode interface. (This problem does not always cause the physical link to go down; errors and dropped packets are sometimes the result.) |

## Configure a Static Address Resolution Protocol Table Entry

### Purpose

Configure a static Address Resolution Protocol (ARP) entry to allow a packet to be sent out of a looped Ethernet interface.

**NOTE:** Remove the static ARP entry at the end of the loop test after you have completed the tests and monitored interface traffic.

## Action

To configure a static ARP table entry for a Gigabit Ethernet interface, follow these steps. You can follow the same procedure to configure a static ARP entry for a Fast Ethernet interface.

1. Find the Media Access Control (MAC) address for the Gigabit Ethernet interface:

```
user@host> show interfaces ge-fpc/pic/port
```

```
Physical interface: ge-4/0/6, Enabled, Physical link is Up
Interface index: 144, SNMP ifIndex: 516, Generation: 147
Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
MAC-REWRITE Error: None, Loopback: Enabled, Source filtering: Disabled,
Flow control: Enabled, Auto-negotiation: Enabled, Remote fault: Online
Device flags : Present Running Loop-Detected
Interface flags: SNMP-Traps Internal: 0x4000
Link flags : None
CoS queues : 8 supported, 4 maximum usable queues
Schedulers : 0
Hold-times : Up 0 ms, Down 0 ms
Current address: 00:1f:12:fe:c5:2e, Hardware address: 00:1f:12:fe:c5:2e

```

```
Protocol multiservice, MTU: Unlimited, Generation: 159, Route table: 0
Policer: Input: __default_arp_policer__
```

2. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces interface-name unit logical-unit-number family inet address
address
```

3. Configure the static ARP entry:

```
user@host# set arp ip-address mac mac-address
```

4. Commit the configuration:

```
user@host# commit
```

5. Verify that the static ARP entry is installed:

```
[edit interfaces ge-4/0/6 unit 0 family inet address 10.108.120.1/30]
user@host# run show arp no-resolve
```

| MAC Address       | Address       | Interface  | Flags     |
|-------------------|---------------|------------|-----------|

| 52:54:00:48:03:b7 | 10.204.128.46 | fxp0.0     | none      |

## Meaning

The sample output is for Step 1 through Step 6 and shows that a static ARP entry was configured on Gigabit Ethernet interface **ge-4/0/6**.

## Clear Fast Ethernet or Gigabit Ethernet Interface Statistics

### Purpose

You can reset the Fast Ethernet and Gigabit Ethernet interface statistics. Resetting the statistics provides a clean start so that previous input/output errors and packet statistics do not interfere with the current diagnostics.

### Action

To clear all statistics for the interface, use the following Junos OS CLI operational mode command:

```
user@host> clear interfaces statistics (fe-fpc/pic/port | ge-fpc/pic/port)
```

### Sample Output

```
user@host> clear interfaces statistics ge-4/0/6
user@host>
```

### Meaning

This command clears the interface statistics counters for the Gigabit Ethernet interface only.

## Ping the Fast Ethernet or Gigabit Ethernet Interface

**Purpose** Use the ping command to verify the loopback connection.

**Action** To send ping packets from the Ethernet interface, use the following Junos OS CLI operational mode command:

```
user@host> ping remote-IP-address bypass-routing interface (fe-fpc/pic/port |
ge-fpc/pic/port) count 100 rapid
```

### Sample Output

```
user@router> ping 10.108.120.2 bypass-routing interface ge-7/2/1 count 100 rapid
PING 10.108.120.2 (10.108.120.2): 56 data bytes
36 bytes from 10.108.120.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e871 0 0000 01 01 cc5c 10.108.120.1 10.108.120.2

 4 5 00 0054 e878 0 0000 01 01 cc55 10.108.120.1 10.108.120.2
.36 bytes from 10.108.120.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e87c 0 0000 01 01 cc51 10.108.120.1 10.108.120.2
.36 bytes from 10.108.120.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e880 0 0000 01 01 cc4d 10.108.120.1 10.108.120.2
.36 bytes from 10.108.120.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e884 0 0000 01 01 cc49 10.108.120.1 10.108.120.2
.36 bytes from 10.108.120.1: Time to live exceeded
```

**Meaning** The sample output shows that the time to live (TTL) expired, indicating that the link is receiving the frames from the ping test. The MAC address used is the same as the physical address of the port being tested because this allows the port to accept the frames from the ping test. As the packet is looped over the link, you expect to receive a TTL exceeded message for each ping sent. These messages are generated because the ping packets

are repeatedly looped between the router and the physical loopback. When the packet is sent to the other end of the link, which does not exist, the loopback returns the packet back to the same interface, where it is again subjected to the Packet Forwarding Engine fabric for routing. After the route lookup, the TTL is decremented, and the packet is again sent out of the looped interface. This process repeats until the packet is either lost, or the TTL expires with subsequent TTL expired message displayed. Should any errors occur, the packet is discarded and a time-out error is displayed, rather than the expected TTL expired message. Note that the default TTL for ICMP echo packets in Junos OS is 64. This means a given test packet must be successfully sent and received 63 times before a TTL expired message can be generated. You can alter the TTL value to adjust the tolerance for loss, for example, a value of 255 is the most demanding test because now the packet must be sent and received error free 254 times.

## Check for Fast Ethernet or Gigabit Ethernet Interface Error Statistics

- Purpose** Persistent interface error statistics indicate that you need to open a case with the Juniper Networks Technical Assistance Center (JTAC).
- Action** To check the local interface for error statistics, use the following Junos OS CLI operational mode command:

```
user@host> show interfaces (fe-fpc/pic/port | ge-fpc/pic/port) extensive
```

### Sample Output

```
user@router> show interfaces ge-4/0/6 extensive
```

```

```

**Meaning** Check for any error statistics. There should not be any input or output errors. If there are any persistent input or output errors, open a case with the Juniper Networks Technical Assistance Center (JTAC) at [support@juniper.net](mailto:support@juniper.net), or at 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).

## Diagnose a Suspected Circuit Problem

**Purpose** When you suspect a circuit problem, it is important to work with the transport-layer engineer to resolve the problem. The transport-layer engineer may create a loop to the router from various points in the network. You can then perform tests to verify the connection from the router to that loopback in the network.

**Action** After the transport-layer engineer has created the loop to the router from the network, you must verify the connection from the router to the loopback in the network. Follow Step 2 through Step 8 in [“Diagnose a Suspected Hardware Problem with a Fast Ethernet or Gigabit Ethernet Interface” on page 862](#). Keep in mind that any problems encountered in the test indicate a problem with the connection from the router to the loopback in the network.

By performing tests to loopbacks at various points in the network, you can isolate the source of the problem.

## Locating the Fast Ethernet and Gigabit Ethernet LINK Alarm and Counters

- [Checklist for Locating Fast Ethernet and Gigabit Ethernet Alarms and Counters on page 876](#)
- [Display the Fast Ethernet or Gigabit Ethernet Interface LINK Alarm on page 877](#)
- [Fast Ethernet and Gigabit Ethernet Counters on page 879](#)

## Checklist for Locating Fast Ethernet and Gigabit Ethernet Alarms and Counters

**Purpose** To locate LINK alarm and major counters associated with Fast Ethernet and Gigabit Ethernet interfaces.

**Action** [Table 115 on page 877](#) provides links and commands for locating LINK alarm and major counters for Fast Ethernet and Gigabit Ethernet interfaces.

*Table 115: Checklist for Locating Fast Ethernet and Gigabit Ethernet Alarms and Counters*

| Tasks                                                                                            | Command or Action                                                          |

## Display the Fast Ethernet or Gigabit Ethernet Interface LINK Alarm

**Problem** **Description:** To display the Fast Ethernet or Gigabit Ethernet LINK alarm, use the following Junos OS command-line interface (CLI) operational mode command:

**Solution** `user@host> show interfaces (fe-fpc/pic/port | ge-fpc/pic/port) extensive`

### Sample Output

The following sample output is for a Fast Ethernet interface:

```
user@host> show interfaces fe-1/3/3 extensive
Physical interface: fe-1/3/3, Enabled, Physical link is Down
 Interface index: 47, SNMP ifIndex: 38
 Description: Test

```

## Meaning

The sample output shows where the alarm and other errors might be occurring and any counters that are incrementing. The only alarm associated with Fast Ethernet or Gigabit Ethernet interfaces is the LINK alarm. A LINK alarm indicates a physical problem. To isolate where the physical problem might be occurring, conduct loopback testing. See [“Checklist for Using Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces” on page 861](#) for information on conducting a loopback test.

**NOTE:** Since link status is polled once every second, some items that require fast link down detection, such as Multiprotocol Label Switching (MPLS) fast reroute, take longer to execute.

## Fast Ethernet and Gigabit Ethernet Counters

**Problem** **Description:** [Table 116 on page 879](#) shows the major counters that appear in the output for the **show interfaces fe-fpc/pic/port extensive** and the **show interfaces ge-fpc/pic/port extensive** commands. These counters generally increment when there is a problem with a Fast Ethernet or Gigabit Ethernet interface. In the **Counters** column, the counters are listed in the order in which they are displayed in the output.

**Table 116: Major Fast Ethernet and Gigabit Ethernet Counters**

| Counter                     | Description                                                                                                                            | Reason for Increment                                                                                                                                                                                                         |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input Errors:</b>        |                                                                                                                                        |                                                                                                                                                                                                                              |
| <b>Errors</b>               | The sum of the incoming frame aborts and frame check sequence (FCS) errors.                                                            |                                                                                                                                                                                                                              |
| <b>Policed discards</b>     | The frames discarded by the incoming packet match code.                                                                                | The frames were discarded because they were not recognized or of interest. Usually, this field reports protocols that the Junos OS does not handle.                                                                          |
| <b>Drops</b>                | The number of packets dropped by the output queue of the I/O Manager application-specific integrated circuit (ASIC).                   | If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's random early detection (RED) mechanism.                                                                            |
| <b>L3 incompletes</b>       | The number of packets discarded due to the packets failing Layer 3 header checks.                                                      | This counter increments when the incoming packet fails Layer 3 (usually IPv4) checks of the header. For example, a frame with less than 20 bytes of available IP header would be discarded and this counter would increment. |
| <b>L2 channel errors</b>    | The errors that occur when the software could not find a valid logical interface (such as fe-1/2/3.0) for an incoming frame.           | This error increments when, for example, a lookup for a virtual LAN (VLAN) fails.                                                                                                                                            |
| <b>L2 mismatch timeouts</b> | The count of malformed or short packets.                                                                                               | The malformed or short packets cause the incoming packet handler to discard the frame and be unreadable.                                                                                                                     |
| <b>FIFO errors</b>          | The number of first in, first out (FIFO) errors in the receive direction as reported by the ASIC on the Physical Interface Card (PIC). | The value in this field should always be 0. If this value is not zero, cabling could be badly organized or the PIC could be broken.                                                                                          |

Table 116: Major Fast Ethernet and Gigabit Ethernet Counters (continued)

| Counter                                            | Description                                                                                                                                        | Reason for Increment                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Output Errors</b>                               |                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Errors</b>                                      | The sum of outgoing frame aborts and FCS errors.                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Collisions</b>                                  | The number of Ethernet collisions.                                                                                                                 | The Fast Ethernet PIC supports only full-duplex operation, so this number should always remain 0. If it is incrementing, there is a software bug.                                                                                                                                                                                                                          |
| <b>Drops</b>                                       | The number of packets dropped by the output queue of the I/O Manager ASIC.                                                                         | If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.                                                                                                                                                                                                                                                   |
| <b>Aged packets</b>                                | The number of packets that remained in shared packet SDRAM for so long that the system automatically purged them.                                  | The value in this field should never increment. If it increments, it is probably a software bug or broken hardware.                                                                                                                                                                                                                                                        |
| <b>HS link FCS errors, FIFO errors</b>             | The number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.                                     | The value in this field should always be 0. If it increments, either the FPC or the PIC is broken.                                                                                                                                                                                                                                                                         |
| <b>Miscellaneous Counters</b>                      |                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Input DA rejects</b>                            | The number of packets that the filter rejected because the destination Media Access Control (MAC) address of the packet is not on the accept list. | It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad Address Resolution Protocol (ARP) entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). |
| <b>Output packet pad count</b>                     | The number of packets that the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware.                 | Usually, padding is done only on small ARP packets, but some very small Internet Protocol (IP) packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist, or it is misconfigured.                                                                                      |
| <b>Output packet error count</b>                   | Number of packets with an indicated error that the filter was given to transmit.                                                                   | These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.                                                                                                                                                                                                     |
| <b>CAM destination filters, CAM source filters</b> | The number of entries in the content-addressable memory (CAM) dedicated to destination and source MAC address filters.                             | There can be up to 64 source entries. If source filtering is disabled, which is the default, the value for these fields should be 0.                                                                                                                                                                                                                                       |

## Troubleshooting: 10-Gigabit Ethernet Port Stuck in Down State

**Problem**    **Description:** 10-Gigabit Ethernet port is stuck in DPC or PIC down state.

**Environment:** Juniper Networks T Series and MX Series routers. Refer to the related documentation section for more information.

**Symptoms:** The device has failed to initialize because the Ethernet port is down.

**Diagnosis**    Try disabling and reenabling the interface and resetting the transceiver and cable. If the interface remains down, it can be stuck in DPC or PIC down state.

Does the router function normally after disabling and reenabling the interface and resetting the transceiver and cable?

**Yes:**

The system is not stuck in DPC or PIC down state. Disabling and reenabling the interface or resetting the transceiver, and cable resolved the issue.

**No:**

The interface might be stuck in DPC or PIC down state. Refer to the [“To resolve the issue” on page 881](#) section for recovery options.

1.

**Resolution**    *To resolve the issue*

From the aforementioned diagnosis, you ascertain that the interface is stuck in DPC or PIC down state.

This is not a hardware defect. Implement one of the following solutions on the backup Routing Engine to resolve this issue:

- Reset the PIC.
- Toggle the framing mode.

1. In configuration mode, go to the **[edit interfaces]** hierarchy level.

```
user@host1# edit interfaces interface name
```

2. Toggle the framing mode. In the following configuration, WAN-PHY mode is toggled.

```
[edit interfaces interface-name is in the et-fpc/pic/port
```

```
user@host1# set framing wan-phy
user@host1# commit
user@host1# framing {
user@host1# wan-phy;
user@host1# }
user@host1# delete framing
user@host1# commit
```

3. Reset the PIC (T Series Routers)

```
user@host1# request chassis pic fpc-slot x pic-slot y offline
user@host1# request chassis pic fpc-slot x pic-slot y online
```

4. Reset the PIC (MX Series Routers)

```
user@host1# request chassis fpc slot x offline
user@host1# request chassis fpc slot x online
```

| Release Information      | Statement introduced in Junos OS Release 13.2 for PTX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | <p>Enable or disable backward fast reroute status insertion.</p> <p>Enable backward fast reroute to insert local pre-forward error correction (FEC) bit error rate (BER) status into transmitted OTN frames, notifying the remote interface. The remote interface can use the information to reroute traffic to a different interface. When you enable backward fast reroute and also enable pre-FEC BER monitoring including the <b>signal-degrade-monitor-enable</b> statement, notification of signal degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol.</p> <hr/> <div>  <p><b>NOTE:</b> When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the <b>signal-degrade-monitor-enable</b> and <b>backward-frr-enable</b> statements.</p> </div> <hr/> <p>You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used. Include the <b>ber-threshold-signal-degrade value</b>, <b>ber-threshold-clear value</b>, and <b>interval value</b> statements at the [edit interfaces <i>interface-name</i> <b>otn-options signal-degrade</b>] hierarchy level to configure the BER thresholds and time interval. See “Understanding Pre-FEC BER Monitoring and BER Thresholds” on <a href="#">page 420</a> for more information about pre-FEC BER monitoring and determining BER threshold settings.</p> |
| Default                  | By default, backward fast reroute insertion is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## ber-threshold-clear

|                            |                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>ber-threshold-clear value;</code>                                                                                                                                                                                                         |
| <b>Hierarchy Level</b>     | <code>[edit interfaces <i>interface-name</i> <b>otn-options signal-degrade</b>]</code><br><code>[edit interfaces <i>interface-name</i> <b>otn-options odu-signal-degrade</b>]</code>                                                            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2 for PTX Series routers.<br>Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.                                 |
| <b>Description</b>         | Specify bit error rate (BER) threshold to clear the interface alarm for signal degradation.<br><br>You can configure the BER clear threshold to customize the BER that will clear an interface alarm when signal degrade monitoring is enabled. |

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See “[Understanding Pre-FEC BER Monitoring and BER Thresholds](#)” on page 420 for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

**NOTE:** You can configure ODU BER thresholds only at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level on the P2-100GE-OTN PIC.

[Table 117 on page 890](#) shows the default values for pre-FEC BER and ODU BER signal degrade threshold values for different PICs. If the BER signal degrade threshold is not configured, the default value is used.

Table 117: Default Clear Threshold Values

| PIC or MPC           | Default Pre-FEC BER Clear Threshold Value | Default ODU BER Clear Threshold Value |
|----------------------|-------------------------------------------|---------------------------------------|
| P1-PTX-2-100G-WDM    | 3.0E-3                                    | Not supported                         |
| P2-100GE-OTN         | 3.0E-3                                    | 1.0E-9                                |
| P1-PTX-24-10G-W-SFPP | 3.0E-3                                    | Not supported                         |
| MIC6-100G-CFP2       | 1.0E-6                                    | 1.0E-9                                |
| MPC5E                | 1.0E-6                                    | 1.0E-9                                |

To configure the threshold that raises the signal degrade alarm, include the `ber-threshold-signal-degrade` statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the `interval` statement at the same hierarchy level.

**NOTE:** For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms \* 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

**Options**    **Values:** *value*—BER threshold for clearing the signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format  $x\text{E}-n$ , where  $x$  is the mantissa and  $n$  is the exponent. For example, 4.5E-3.

**Range:** The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point. The exponent must be an integer from 0 through 9.

**Default:** See [Table 117 on page 890](#) for the default values.

**BEST PRACTICE:** Always set the `ber-threshold-clear` *value* lower than the `ber-threshold-signal-degrade` *value*. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in [“Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 420](#).

**NOTE:** In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, and the mantissa is not configurable. The BER threshold value is  $1.0\text{E}-n$  where  $n > 0$ , and the valid range of  $n$  is from 1 through 10.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                          interface-control—To add this statement to the configuration.

## ber-threshold-signal-degrade

|                            |                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>ber-threshold-signal-degrade value;</code>                                                                                                                                                                                                                   |
| <b>Hierarchy Level</b>     | <code>[edit interfaces <i>interface-name</i> otn-options signal-degrade]</code><br><code>[edit interfaces <i>interface-name</i> otn-options odu-signal-degrade]</code>                                                                                             |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 13.2 for PTX Series routers.</p> <p>Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.</p>                                         |
| <b>Description</b>         | <p>Specify the bit error rate (BER) threshold to raise an interface alarm for signal degradation.</p> <p>You can configure the BER signal degrade threshold to customize the BER that will raise an interface alarm when signal degrade monitoring is enabled.</p> |

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal bit error counter register to get saturated. For example, for the P1-PTX-2-100G-WDM PIC, the internal bit error counter gets saturated when the error count reaches  $2E+29$ . Therefore, the value of `ber-threshold-signal-degrade * line rate / interval` must be less than  $2E+29$  to avoid saturation. Assuming a fixed PIC line rate of  $1.27E+11$  bits per second and an interval of 1000 ms, the `ber-threshold-signal-degrade` value must be less than  $4.22E-3$ .

If the value of the `ber-threshold-signal-degrade * line rate / interval` exceeds the saturation limit, the configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See “[Understanding Pre-FEC BER Monitoring and BER Thresholds](#)” on page 420 for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

**NOTE:** You can configure ODU BER thresholds only at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level on the P2-100GE-OTN PIC.

Table 118 on page 893 shows the default values for pre-FEC BER and ODU BER signal degrade threshold values for different PICs. If the BER signal degrade threshold is not configured, the default value is used.

**Table 118: Default Signal Degrade Threshold Values**

| PIC or MPC           | Default Pre-FEC BER Signal Degrade Threshold Value | Default ODU BER Signal Degrade Threshold Value |
|----------------------|----------------------------------------------------|------------------------------------------------|
| P1-PTX-2-100G-WDM    | 7.5E-3                                             | Not supported                                  |
| P2-100GE-OTN         | 7.5E-3                                             | 1.0E-6                                         |
| P1-PTX-24-10G-W-SFPP | 7.5E-3                                             | Not supported                                  |
| MIC6-100G-CFP2       | 1.14E-5                                            | 1.0E-06                                        |
| MPC5E                | 1.14E-5                                            | 1.0E-06                                        |

To configure the threshold that clears the signal degrade alarm, include the [ber-threshold-clear](#) statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the [interval](#) statement at the same hierarchy level.

**NOTE:** For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms \* 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

**Options**    **value**—BER threshold for signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format  $x\text{E}-n$ , where  $x$  is the mantissa and  $n$  is the exponent. For example, 4.5E-3.

**Range:** The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point. The exponent must be an integer from 0 through 9.

**Default:** See [Table 118 on page 893](#).

**NOTE:** In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, the mantissa is not configurable. The BER threshold value is 1.0E- $n$  where  $n > 0$ , and the valid range of  $n$  is from 1 through 10.

---

**BEST PRACTICE:** To enable proactive protection before packet loss occurs, set the `ber-threshold-signal-degrade value` below the FEC limit. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in [“Understanding Pre-FEC BER Monitoring and BER Thresholds” on page 420](#).

| <b>Description</b>                                       | Enable forward error correction (FEC) mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default</b>                                           | If you do not specify a mode, the default mode is <b>gfec</b> . On PTX Series routers with P1-PTX-2-100G-WDM, the default value is <b>gfec-sdfec</b> . On PTX Series routers with PTX-5-100G-WDM and on MX Series routers with MIC3-100G-DWDM, the default value is <b>sdfec</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                                           | efec—(M Series, MX Series routers and PTX Series routers only) G.975.1 I.4 enhanced forward error correction (EFEC) is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

gfec—(M series, MX Series routers and PTX Series routers only) G.709 generic forward error correction (GFEC) mode is configured to detect and correct bit errors.

gfec-sdfec—(PTX Series routers only) GFEC and soft-decision forward error correction (SD-FEC) modes are configured to detect and correct bit errors.

hgfec—(MX Series routers only) High gain forward error correction mode is configured to detect and correct bit errors.

sdfec—(MX Series routers, PTX Series routers, and ACX6360 routers only) Sky-Compatible Soft-decision forward error correction mode is configured to detect and correct bit errors.

sdfec15—(ACX6360 routers only) Soft Decision Forward Error Correction with 15 percent overhead is configured to detect and correct bit errors.

none—(M Series and MX Series routers only) FEC mode is not configured.

**NOTE:** On MX Series routers with MIC3-100G-DWDM and PTX Series routers with PTX-5-100G-WDM, none option is not supported. The fec mode must be enabled on the MIC3-100G-DWDM MIC and the PTX-5-100G-WDM PIC.

ufec—(MX Series routers and PTX Series routers only) G.975.1 I.7 Ultra Forward Error Correction (UFEC) mode is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.

| Release Information | Statement introduced in Junos OS Release 13.2 for PTX Series routers.<br>Statement introduced in Junos OS Release 15.1F6 for MPC5E, MIC6-100G-CFP2 on MPC6E on MX240, MX480, MX960, MX2010, and MX2020 routers.                                                                                                                                                                                   |
| Description         | Specify the interval for which the BER must stay above the signal degradation threshold—as configured in the <code>ber-threshold-signal-degrade value</code> statement—for the alarm to be raised. After an alarm is raised, if the BER returns below the clear threshold—as configured in the <code>ber-threshold-clear value</code> statement—for the specified interval, the alarm is cleared. |

**NOTE:** Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options signal-degrade]` hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See “[Understanding Pre-FEC BER Monitoring and BER Thresholds](#)” on page 420 for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

**NOTE:** You can configure ODU BER thresholds only at the `[edit interfaces interface-name otn-options odu-signal-degrade]` hierarchy level on the P2-100GE-OTN PIC.

**Options** `value`—Time interval in milliseconds.

**NOTE:** For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms \* 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

**NOTE:** For P1-PTX-24-10G-W-SFPP PIC and P2-100GE-OTN PIC, when the router cannot configure BER with the given interval, it selects an optimum interval that is supported for the given BER configuration. If the router is still not able to support the configuration (for example, with a wider gap between the degrade set and clear values), the default values are used and a log is generated.

For the P2-10G-40G-QSFPP PIC, the time interval is supported in multiples of 100 ms. For example, when you configure the interval as 10 ms, then it is rounded off to the nearest multiple of 100 ms.

**Range:** 1 ms through 1000 ms.

**Default:** 100 ms.

**NOTE:** For the P2-100GE-OTN PIC, the default value is 10 ms.

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 17.1 for 100-Gigabit OTN DWDM PIC with CFP2 on PTX3000 and PTX5000 routers.</p> <p>Statement introduced in Junos OS Release 17.1 for 100-Gigabit OTN DWDM MIC with CFP2-ACO on MX240, MX480, MX960, MX2010, and MX2020 routers with MPC3E and MPC3E-NG.</p>                                                                                                                                                                  |
| <b>Description</b>              | <p>Enable the remote interface to loop back the delay measurement pattern to the local interface. Delay is measured by transmitting a known pattern (delay measurement pattern) in a selected bit of the delay measurement (<b>DM</b>) field and measuring the number of frames that are missed when the delay measurement pattern is received at the transmitting end (local interface).</p>                                                                            |
|                                 | <p> <b>NOTE:</b> Do not enable remote loopback on both ends (local and remote). If you enable remote loopback on both interfaces, the delay measurement pattern is looped back continuously between the two interfaces.</p>                                                                                                                                                           |
| <b>Default</b>                  | Delay measurement is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                |
