[edit chassis [aggregated-devices](#)]

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 11.4 for EX Series switches.

### Description

Configure properties for Ethernet aggregated devices on the router.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## Hierarchy Level

[edit protocols [oam](#)]

**Release Information**

Statement introduced in Junos OS Release 8.2 for MX, T, ACX Series routers, SRX firewalls, M320 and EX Series switches.

Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

**connectivity-fault-management** introduced in Junos OS Release 10.2 for EX Series switches.

**Description**

Provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support for Ethernet interfaces or configure connectivity fault management (CFM) for IEEE 802.1ag Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

**RELATED DOCUMENTATION**

*Enabling IEEE 802.3ah OAM Support*

*Example: Configuring Ethernet OAM Link Fault Management*

## ethernet-policer-profile

### Syntax

```
ethernet-policer-profile {
  input-priority-map {
    ieee802.1p premium [ values ];
  }
  output-priority-map {
    classifier {
      premium {
        forwarding-class class-name {
          loss-priority (high | low);
        }
      }
    }
  }
  policer cos-policer-name {
    aggregate {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    premium {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
  }
}
```

### Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile],  
 [edit interfaces *interface-name* aggregated-ether-options ethernet-switch-profile]

### Release Information

Statement introduced before Junos OS Release 7.4.

### Description

**NOTE:** On QFX Series standalone switches, this statement hierarchy is only supported on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure a class of service (CoS)-based policer. Policing applies to the inner VLAN identifiers, not to the outer tag. For Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the **premium** policer is not supported.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**RELATED DOCUMENTATION**

## evcs

### Syntax

```
evcs evc-id {  
    evc-protocol cfm;  
    remote-uni-count count;  
    multipoint-to-multipoint;  
}
```

### Hierarchy Level

[edit protocols [oam ethernet](#)]

### Release Information

Statement introduced in Junos OS Release 9.5.

### Description

On MX Series routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet virtual connection.

### Options

**remote-uni-count** *count*—(Optional) Specify the number of remote UNIs in the EVC configuration, the default is 1.

**multipoint-to-multipoint**—(Optional) Specify multiple points in the EVC configuration, the default is point-to-point if **remote-uni-count** is 1.

Remaining options are explained separately.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## evc-protocol cfm

### Syntax

```
evc-protocol cfm {
  maintenance-association association-name | vpls routing-instance routing-id;
  maintenance-domain domain-id;
  mep-id mep-id;
}
```

### Hierarchy Level

[edit protocols [oam](#) ethernet [evcs](#)]

### Release Information

Statement introduced in Junos OS Release 9.5.

**mep-id** *mep-id* statement introduced in Junos OS Release 15.1.

### Description

Specify connectivity fault management (CFM) or virtual private LAN service (VPLS) as the Ethernet virtual connection (EVC) protocol.

### Options

**management-domain** *domain-id*—(Optional) For CFM, specify the CFM management domain.

**management-association** *association-id*—(Optional) For CFM, specify the CFM management association.

**routing-instance** *instance-id*—(Optional) For VPLS, specify the VPLS routing instance.

**mep-id** *mep-id*—(Required for CFM) Identifier for the maintenance association endpoint

**NOTE:** This option is available on MX Series routers only.

**Range:** 1 through 8191

### Required Privilege Level

### Release Information

Statement introduced before Junos OS Release 7.4.

Option **max-sessions-vs-a-ignore** introduced in Junos OS Release 11.4.

### Description

Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate statements are available to every protocol family.

## Options

**family**—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

**NOTE:** This option is not supported on T4000 Type 5 FPCs.

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.
- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation
- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.
- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.
- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet
- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in *Understanding Internal Ethernet Interfaces*.
- **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the **family vpls** statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See [CLI Explorer](#).

## flow-control

### Syntax

```
(flow-control | no-flow-control);
```

### Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],  
[edit interfaces interface-name ether-options],  
[edit interfaces interface-name fastether-options],  
[edit interfaces interface-name gigether-options],  
[edit interfaces interface-name multiservice-options],  
[edit interfaces interface-range name aggregated-ether-options],  
[edit interfaces interface-range name ether-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 in EX Series switches.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

### Description

For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

### Default

Flow control is enabled.

**NOTE:** Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

### Required Privilege Level

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## fnp

### Syntax

```
fnp {
  interval <100ms | 1s | 10s | 1m | 10m>;
  loss-threshold number
  interface interface name {
    domain-id domain-id
  }
}
```

### Hierarchy Level

[edit protocols [oam ethernet](#)]

### Release Information

Command introduced in Junos OS Release 11.4.

### Description

On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet failure notification protocol.

### Options

**interval *number***—Specifies the time between the transmission of FNP messages.

**loss-threshold *number***—FNP messages that can be lost before the FNP message is considered aged out and flushed.

**interface *interface-name***—Name of the Ethernet interface.

**domain-id *number***—Domain ID of the access network.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

## force-up

### Syntax

```
force-up;
```

### Hierarchy Level

```
[edit interfaces interface-name aggregated-ethernet-options lacp]
```

### Release Information

Statement introduced in Junos OS Release 14.2 for MX Series routers.

**NOTE:** For EX9200 switches, you must configure **force-up** on physical interfaces of both MC-LAG peers for this feature to work properly.

### Description

Configure the peer interface (in MC-LAG) to remain up even with limited LACP capability.

### Required Privilege Level

interface— To view this statement in the configuration.

interface-control— To add this statement to the configuration.

### RELATED DOCUMENTATION

## forwarding-class (Gigabit Ethernet IQ Classifier)

### Syntax

```
forwarding-class class-name {
    loss-priority (high | low);
}
```

### Hierarchy Level

```
[edit interfaces interface-name gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map
  classifier premium]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

### Description

For Gigabit Ethernet IQ interfaces only, define forwarding class name and option values.

### Options

***class-name***—Name of forwarding class.

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## frame-error

### Syntax

```
frame-error count;
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],  
[edit protocols oam link-fault-management interface interface-name event-thresholds]
```

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Threshold for sending frame error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.

The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.

### Options

**count**—Threshold count for frame error events.

**Range:** 0 through 100

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

```
frame-period count;
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],  
[edit protocols oam link-fault-management interface interface-name event-thresholds]
```

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Threshold for sending frame period error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

### Options

**count**—Threshold count for frame period error events.

**Range:** 0 through 100

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## framing (10-Gigabit Ethernet Interfaces)

### Syntax

```
framing (lan-phy | wan-phy);  
precise-bandwidth;
```

### Hierarchy Level

```
[edit interfaces xe-fpc/pic/port]
```

```
[edit interfaces et-fpc/pic/port] (PTX Series Packet Transport Routers and MX Series Routers)
```

### Release Information

Statement introduced in Junos OS Release 8.0.

Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.

The option **precise-bandwidth** introduced in Junos OS Release 19.3R1 for MX Series Routers.

### Description

For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only.

**NOTE:**

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ .
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.
- In Junos OS Releases 17.4R2, 17.4R3, and later, on the following MPCs or routers, you cannot configure **wan-phy** mode at 10-Gbps, 40-Gbps, and 100-Gbps on a per-port basis:
  - MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E
  - MPC10003
  - MX204 router
  - JNP10K-LC2101 MPC

**Default**

Operates in LAN PHY mode.

**Options**

**lan-phy**—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.

**wan-phy**—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.

**precise-bandwidth**—Enables precise bandwidth for WAN-PHY interface framing format.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## hold-time up

### Syntax

```
hold-time up timer-value;
```

### Hierarchy Level

```
[edit interfaces aex aggregated-ether-options lacp],
```

### Release Information

Statement introduced in Junos OS Release 14.2R3.

### Description

Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.

When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.

The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.

### Options

***timer-value***—Hold-up interval in seconds.

**Range:** 1 to 6000 seconds

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## ingress-policer-overhead

### Syntax

```
ingress-policer-overhead bytes;
```

### Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number]
```

### Release Information

Statement introduced before Junos OS Release 11.1.

Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.

### Description

Add the configured number of bytes to the length of a packet entering the interface.

Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.

Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.

You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports **fpc 0 pic 0**. When you commit the **ingress-policer-overhead** statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge-0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

### Options

**bytes**—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

### Required Privilege Level

## inline

### Syntax

```
inline;
```

### Hierarchy Level

```
[edit protocols lacp ppm]
```

### Release Information

Statement introduced in Junos OS Release 19.1R1 for MX Series routers with MPC line cards.

### Description

(MX Series routers with MPC line cards only) To enable the inline Link Aggregation Control Protocol (LACP) PDU transmission processing.

This statement disables the default distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all Link Aggregation Control Protocol (LACP) PDU transmission processing inline. The inline option can be used in scenarios where the line card CPU is under heavy load and cannot schedule the PPM processing for LACP packets. PPM, by default, delegates the transmission of PDUs to the PPMAN process on the PFE/line card. But when the inline option is configured, it delegates the transmission of LCAP PDUs even further away from the line card CPU and into the forwarding chipset.

For example, in a system with both MPCs and DPCs, upon configuration of **[protocols lacp ppm inline]**, the PDUs are sent inline on the MPCs and performed by periodic packet management (PPM) on DPCs.

**BEST PRACTICE:** We recommend to retain the default and disable distributed PPM or enable inline processing only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM or enable inline processing only if you have a compelling reason to disable it.

Refer *Disabling or Enabling Inline Periodic Packet Management for LACP Packets* for more details.

### Default

Distributed PPM processing is enabled for all packets that use PPM.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## interface

### Syntax

```
interface (all | interface-name) {  
    disable;  
}
```

### Hierarchy Level

```
[edit protocols lldp],  
[edit routing-instances routing-instance-name protocols lldp]
```

### Release Information

Statement introduced in Junos OS Release 9.6.

### Description

Specify an LLDP interface.

### Options

***interface-name***—A valid physical interface name.

**NOTE:** On MX Series and T Series routers, you run LLDP on a physical interface, such as **ge-1/0/0**, and not at the logical interface (unit) level.

Starting with Junos OS Release 14.2, you can also specify LLDP neighbor details for management interfaces, such as **fxp** or **me**, on MX Series routers.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**all**—Run LLDP on all interfaces.

**disable**—Disable LLDP on the specified interface

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

#### RELATED DOCUMENTATION

| *Configuring LLDP*

## interface (OAM Link-Fault Management)

### Syntax

```
interface interface-name {
  apply-action-profile profile-name;
  link-discovery (active | passive);
  pdu-interval interval;
  pdu-threshold threshold-value;
  remote-loopback;
  event-thresholds {
    frame-error count;
    frame-period count;
    frame-period-summary count;
    symbol-period count;
  }
  negotiation-options {
    allow-remote-loopback;
    no-allow-link-events;
  }
}
```

### Hierarchy Level

[edit protocols **oam ethernet link-fault-management**]

### Release Information

Statement introduced in Junos OS Release 8.2.

### Description

For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.3ah Operation, Administration, and Management (OAM) support.

### Options

**interface** *interface-name*—Interface to be enabled for IEEE 802.3ah link fault management OAM support.

The remaining statements are described separately.

### Required Privilege Level

**interface**—To view this statement in the configuration.

**interface-control**—To add this statement to the configuration.

## RELATED DOCUMENTATION

| *Enabling IEEE 802.3ah OAM Support*

## interface-group

### Syntax

```
interface-group {
    interface-device-name
    unit-list
}
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name
maintenance-association ma-name mep mep-id remote-mep mep-id ]
```

### Release Information

Statement introduced in Junos OS Release 18.1R1.

### Description

Mark the interface group down for the action profile configured with the action **interface-group-down**. Provides information for the interface-group on which the configured action will be taken when the configured event occur for a specific remote MEP ID.

### Options

**interface-device name**—Name of the interface device. Only Ethernet devices are allowed. The device interface name includes **ge**, **ae**, **xe** and **et**. .

**unit-list**—One or more logical interface unit numbers.

**Range:** A string in the range <0-16385> or <0-16385>-<0-16385>. For example, **unit-list**[12 23-33 44]

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## isolated-vlan (MX Series)

### Syntax

```
isolated-vlan vlan-id;
```

### Hierarchy Level

```
[edit bridge-domains bridge-domain-name ],
[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains bridge-domain-name
  bridge-options],
[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains bridge-domain-name
  ],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name ],
```

### Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.

### Description

Configure the specified isolated VLAN to be a secondary VLAN of the specified primary VLAN. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.

**NOTE:** When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID that you specify using the **isolated-vlan** state is treated as an isolated port.

### Options

***vlan-id***—Individual VLAN IDs separated by a space.

### Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## lacp (802.3ad)

### Syntax

```
lacp {  
    port-priority port-priority;  
}
```

### Hierarchy Level

```
[edit interfaces interface-name fastether-options 802.3ad],  
[edit interfaces interface-name gigether-options 802.3ad]
```

### Release Information

Statement introduced in Junos OS Release 9.3.

### Description

Configure the Link Aggregation Control Protocol (LACP) port priority for Ethernet interfaces.

### Options

*port-priority*—Priority for being elected as the active port to collect and distribute traffic. A smaller value indicates a higher priority for selection.

**Range:** 0 through 65,535

**Default:** 127

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

## lACP (Aggregated Ethernet)

### List of Syntax

[Syntax \(NFX Series\) on page 1219](#)

[Syntax \(EX Series\) on page 1219](#)

### Syntax (NFX Series)

```
lACP (active | passive) {
    admin-key key;
    fast-failover;
    link-protection {
        disable;
        (revertive | non-revertive);
    }
    periodic interval
    system-ID mac-address;
    system-priority priority;
    force-up;
}
```

### Syntax (EX Series)

```
lACP {
    (active | passive);
    admin-key key;
    accept-data;
    fast-failover;
    link-protection {
        disable;
        (revertive | non-revertive);
    }
    periodic interval;
    system-id mac-address;
    system-priority priority;
}
```

### Hierarchy Level (EX Series)

```
[edit interfaces aeX aggregated-ether-options]
[edit logical-systems logical-system-name interfaces aeX aggregated-ether-options]
```

### Hierarchy Level (NFX Series)

```
[edit interfaces interface-name aggregated-ether-options]
```

### Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description

Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

For EX Series, when you configure the **accept-data** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

**NOTE:** When you configure the **accept-data** statement at the **[edit interfaces aeX aggregated-ether-options lacp]** hierarchy level, this behavior occurs:

- By default, the **accept-data** statement is not configured when LACP is enabled.
- You can configure the **accept-data** statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the **accept-data** statement is configured.

**NOTE:** The force-up statement is not supported on QFX10002 switches.

### Default

If you do not specify LACP as either **active** or **passive**, LACP remains passive.

### Options

**active**—Initiate transmission of LACP packets.

**admin-key *number***—Specify an administrative key for the router or switch.

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the **admin-key**.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

**interface**—To view this statement in the configuration.

**interface-control**—To add this statement to the configuration.

## lACP (Protocols)

### Syntax

```
lACP {  
    traceoptions {  
        file <filename> <files number> <size size> <world-readable | no-world-readable>;  
        flag flag;  
        no-remote-trace;  
    }  
    fast-hello-issu;  
    ppm (Ethernet Switching) centralized;  
}
```

### Hierarchy Level

[edit protocols]

### Release Information

Statement introduced in Junos OS Release 9.3.

The **ppm centralized** option introduced in Junos OS Release 9.4.

The **fast-hello-issu** option introduced in Junos OS Release 14.1.

### Description

On MX and T Series routers, you can specify periodic packet management (PPM) as centralized. By default, the PPM is distributed.

MX Series routers support Link Aggregation Control Protocol (LACP) with fast hellos during unified ISSU. This support is disabled by default. You must enable the **fast-hello-issu** option on the main router and on the peer routers before starting unified ISSU. Note that the peer router must also be an MX Series router for this functionality to work.

### Default

Distributed PPM processing is enabled for all packets that use PPM.

### Options

**ppm**—Set PPM to centralized.

**fast-hello-issu**—Enable LACP with fast hellos during unified ISSU.

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

#### RELATED DOCUMENTATION

## layer2-policer

### Syntax

```
layer2-policer {
  input-policer policer-name;
  input-three-color policer-name;
  output-policer policer-name;
  output-three-color policer-name;
}
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number],
```

### Release Information

Statement introduced in Junos OS Release 8.2.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

### Description

For 1-Gigabit Ethernet and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces on M Series, MX Series, and T Series routers, and for aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces on EX Series switches, apply Layer 2 logical interface policers. The following policers are supported:

- Two-color
- Single-rate tricolor marking (srTCM)
- Two-rate tricolor marking (trTCM)

Two-color and tricolor policers are configured at the **[edit firewall]** hierarchy level.

### Options

**input-policer *policer-name***—Two-color input policer to associate with the interface. This statement is mutually exclusive with the **input-three-color** statement.

**input-three-color *policer-name***—Tricolor input policer to associate with the interface. This statement is mutually exclusive with the **input-policer** statement.

**output-policer *policer-name***—Two-color output policer to associate with the interface. This statement is mutually exclusive with the **output-three-color** statement.

**output-three-color *policer-name***—Tricolor output policer to associate with the interface. This statement is mutually exclusive with the **output-policer** statement.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## link-discovery

### Syntax

```
link-discovery (active | passive);
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management interface interface-name]
```

### Release Information

Statement introduced in Junos OS Release 8.2.

### Description

For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

### Options

**(active | passive)**—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

| [Configuring Link Discovery](#) | 661

## link-degrade-monitor

### Syntax

```
link-degrade-monitor {
  actions media-based;
  recovery {
    (auto | manual);
    timer timer;
  }
  thresholds {
    clear clear-value;
    interval interval-value;
    set set-value;
    warning-clear warning-clear-value;
    warning-set warning-set-value;
  }
}
```

### Hierarchy Level

```
[edit interfaces interfaces-name]
```

### Release Information

Statement introduced in Junos OS Release 15.1.

### Description

Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as  $10^{-13}$  to  $10^{-5}$ .

### Options

**actions media based**—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.

The remaining statements are described separately.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## link-mode

### Syntax

```
link-mode mode (automatic | full-duplex | half-duplex);
```

### Hierarchy Level

```
[edit interfaces interface-name],  
[edit interfaces interface-name ether-options],  
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

### Description

Set the device's link connection characteristic.

### Options

*mode*—Link characteristics:

- **automatic**—Link mode is negotiated. This is the default for EX Series switches.
- **full-duplex**—Connection is full duplex.
- **half-duplex**—Connection is half duplex.

**Default:** Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router's or switch's management Ethernet interface, **fxp0** or **em0**, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.

**NOTE:** On EX Series switches, if **no-auto-negotiation** is specified in **[edit interfaces *interface-name* ether-options]**, you can select only **full-duplex** or **half-duplex**. If **auto-negotiation** is specified, you can select any mode.

**NOTE:**

- Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
- Starting with Junos OS release 16.1R7 and later, the **link-mode** configuration is not supported on 10-Gigabit Ethernet Interfaces.
- Starting in Junos OS release 18.4R1, half-duplex mode is supported on SRX340 and SRX345 devices.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## link-protection

### Syntax

```
link-protection {
  disable;
  (revertive | non-revertive);
}
```

### Hierarchy Level

```
[edit interfaces aex aggregated-ether-options]
[edit interfaces aex aggregated-ether-options lacp]
```

### Release Information

Statement introduced in Junos OS Release 8.3.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Support for **disable**, **revertive**, and **non-revertive** statements added in Junos OS Release 9.3.

### Description

On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the **primary** and **backup** statements at the `[edit interfaces ge-fpc/pic/port gige-ether-options 802.3ad aex]` hierarchy level or the `[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]` hierarchy level.

On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.

For Junos OS link protection, specify **link-protection** at the following hierarchy levels:

- `[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]`
- `[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]` hierarchy level or at the `[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]` hierarchy level.

To disable link protection, use the **delete interface ae aggregate-ether-options link-protection** statement at the `[edit interfaces aex aggregated-ether-options]` hierarchy level or the `[edit interfaces aex aggregated-ether-options lacp]` hierarchy level.

### Options

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[Configuring Aggregated Ethernet Link Protection | 133](#)

*Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches*

## link-protection (non-LACP)

### Syntax

```
link-protection {
    link-protection-revertive;
}
```

### Hierarchy Level

```
[edit interfaces aex aggregated-ether-options]
```

### Release Information

Statement introduced in Junos OS Release 17.3R1.

### Description

User can specify the *link-protection-revertive* statement in the link protection configuration at the aggregated Ethernet interface level to set revertive mode. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in recalculation of the priorities and traffic will switch from the currently active link to the newly added, higher-priority link. Recalculation of priorities is performed only while link event such as addition\deletion and UP/Down operation on link, that is, configuration of this option will not result in any recalculation immediately until next link-event occurs.

In addition to enabling static link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the **primary** and **backup** statements at the `[edit interfaces ge-fpc/pic/port gige-ether-options 802.3ad aex]` hierarchy level or the `[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]` hierarchy level.

For static link protection, specify **link-protection** at the following hierarchy levels:

- `[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]`
- `[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]` hierarchy level or at the `[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]` hierarchy level.

To disable static link protection, use the **delete interface ae aggregate-ether-options link-protection** statement at the `[edit interfaces aex aggregated-ether-options]` hierarchy level.

### Options

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

RELATED DOCUMENTATION

| [Configuring Aggregated Ethernet Link Protection](#) | 133

## link-speed (Aggregated Ethernet)

### Syntax

```
link-speed speed;
```

### Hierarchy Level (EX Series)

```
[edit interfaces aex aggregated-ether-options],  
[edit interfaces interface-range name aggregated-ether-options],  
[edit interfaces interface-range name aggregated-sonet-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**mixed** option added in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers and 15.1F6 and 16.1R2 for PTX3000 routers.

### Description

For aggregated Ethernet interfaces only, set the required link speed.

### Options

**speed**—For aggregated Ethernet links, you can specify **speed** in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet links on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

## link-speed (Aggregated SONET/SDH)

### Syntax

```
link-speed (speed | mixed);
```

### Hierarchy Level

```
[edit interfaces asx aggregated-sonet-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

**mixed** option added in Release 8.0.

### Description

For aggregated SONET/SDH interfaces only, set the required link speed.

### Options

**speed**—Aggregated SONET/SDH links can have one of the following speed values.

- **oc3**—Links are OC3c or STM1c.
- **oc12**—Links are OC12c or STM4c.
- **oc48**—Links are OC48c or STM16c.
- **oc192**—Links are OC192c or STM64c.
- **oc768**—Links are OC768c or STM256c.

**mixed**—For aggregated SONET/SDH links on T Series routers, you can mix interface speeds in SONET/SDH aggregation bundles. Interface speeds from OC3 through OC768 are supported.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Imi (Ethernet OAM)

### Syntax

```

Imi {
  status-counter count;
  polling-verification-timer value;
  interface name {
    uni-id uni-name;
    status-counter number;
    polling-verification-timer value;
    evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
    evc evc-name {
      default-evc;
      vlan-list vlan-id-list;
    }
  }
}

```

### Hierarchy Level

[edit protocols [oam ethernet](#)]

### Release Information

Statement introduced in Junos OS Release 9.5.

### Description

On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

### Options

**status-counter** *count*—Status counter (N393), defaults to 4.

**interface** *name*—Polling verification timer (T392), defaults to 15 seconds.

**uni-id** *uni-name*—(Optional) Defaults to the physical interface name.

**status-counter** *number*—(Optional) Defaults to a global value.

**polling-verification-timer** *value*—(Optional) Defaults to a global value.

**evc-map-type** (**all-to-one-bundling** | **bundling** | **service-multiplexing**)—Specify the Ethernet virtual connection (EVC) map type.

**evc** *evc-name*—Specify the name of the EVC.

**default-evc**—Set the specified EVC as the default EVC.

**vlan-list** *vlan-id-list*—Specify a group of VLANs to assign to the EVC.

#### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit interfaces interface-range name logical-tunnel-options]
```

### Release Information

Statement introduced in Junos OS Release 13.3.

Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers.

### Description

Load-balances the received traffic across all the available paths of aggregated Ethernet bundles for better link utilization.

### Options

**adaptive**— (MX Series and PTX Series) Corrects a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an Aggregated Ethernet bundle.

**no-adaptive**— (MX Series and PTX Series) Disables the adaptive load-balancing solution configured to distribute traffic by using a feedback mechanism.

**per-packet**— (MX Series only) Randomly sprays packets to the aggregate next hops in a round-robin manner to avoid traffic imbalance.

**Required Privilege Level**

interface - To view statement in the configuration.

interface-control - To add this statement to the configuration.

## load-balance-stateful (Aggregated Ethernet Interfaces)

### Syntax

```
load-balance-stateful {
  per-flow;
  rebalance interval;
  load-type (low | medium | large);
}
```

### Hierarchy Level

```
[edit interfaces aeX unit logical-unit-number forwarding-options]
```

### Release Information

Statement introduced in Junos OS Release 13.2R1.

### Description

Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for *m* number of flows, they are distributed among *n* member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.

### Options

**stateful**—Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

## load-type (Aggregated Ethernet Interfaces)

### Syntax

```
load-type (low | medium | large);
```

### Hierarchy Level

```
[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]
```

### Release Information

Statement introduced in Junos OS Release 13.2R1.

### Description

Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.

### Options

**low**—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).

**medium**—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).

**large**—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## local-bias (ae load-balance)

### Syntax

```
local-bias percent bias;
```

### Hierarchy Level

```
[edit interfaces aex aggregated-ether-options load-balance]
```

### Release Information

Statement introduced in Junos OS Release 19.2R1.

### Description

Next hop addresses may be local or remote, and traffic can be expected to be more-or-less evenly distributed among the available next-hop addresses whether they are local or remote. You can skew distribution to favor local addresses, however, by setting a value for local bias (local relative to the packet forwarding engine (PFE) performing the packet look up).

For example, a value of 100 would exclude remote next-hop addresses from the traffic distribution by forcing 100% of next-hop traffic flows to use local addresses. A value of 50, on the other hand, would skew 50% of the flows that would otherwise use remote links so they use local links instead. That is, for a value set to 50, given four next-hop links, two of which are local and two of which are remote, each of the remote links could be expected to get one eighth of the flows ( $25\% / 2 = 12.5\%$ ). Likewise, each of the local links could also be expected to receive about a third of the flows ( $25\% + 12.5\% = 37.5\%$ ).

In contrast, with no value set for local bias, each of the four links would be expected to receive 25% of the total flows.

You can use **local-bias** with adaptive load balancing, which uses a feedback mechanism to automatically correct load imbalance by adjusting the bandwidth and packet streams traversing links within an AE bundle. In this case, **local-bias** also employs a combination of link-saturation prediction, and random restart delay, to govern link utilization in a way that prevents oscillation of the load and load balancing schemes in effect.

**NOTE:** MPC5 and MPC6 line cards include XM and XL-based packet forwarding engines, or PFEs, and locality is decided on the basis of the XL chip, not the XM chip. Therefore, when an AE bundle has child links hosted on two different XMs that are connected (in the chip architecture) to a single XL, they are considered local to the XL PFE. In practice, what this means is that if a single AE interface includes member links that happen to be spread over two XMs but are actually served by the same XL, **local-bias** may not work as expected because links considered local to the XL PFE.

**Required Privilege Level**

interface - To view statement in the configuration.

interface-control - To add this statement to the configuration.

```

For SRX Series Devices and vSRX:

```
[edit interfaces interface-name redundant-ether-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4 for MX Series.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Statement modified in Junos OS Release 9.2 for the SRX Series.

### Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

**NOTE:**

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the **loopback** statement is configured at the **[edit interfaces ge-fpc/pic/port gigether-options]** hierarchy level, an NDP address cannot be configured at the **[edit interfaces ge-fpc/pic/port unit logical-unit-number family inet6 address]** hierarchy level.

**Default**

By default, loopback is disabled.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## loopback-tracking

### Syntax

```
loopback-tracking;
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management]
```

### Release Information

Statement introduced in Junos OS Release 14.2.

### Description

Enables loopback tracking on Ethernet interfaces. When loopback tracking is enabled and the Ethernet Operation, Administration, and Management (OAM) link-fault management process (lfmd) detects its own generated packets on an interface, it marks the interface as down. When the loopback issue resolves, the interface is brought back up.

### Required Privilege Level

## mac-address (Accept Source Mac)

### Syntax

```
mac-address mac-address policer;
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number accept-source-mac],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number accept-source-mac ]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

### Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP, specify a remote MAC address on which to count incoming and outgoing packets.

### Options

**mac-address**—MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**.

**policer**—MAC policer. For more information, see [policer \(MAC\)](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

[Configuring Gigabit Ethernet Policers](#) | 293

## mac-learn-enable

### Syntax

```
mac-learn-enable;
```

### Hierarchy Level

```
[edit interfaces interface-name gigether-options ethernet-switch-profile]  
[edit interfaces aex aggregated-ether-options ethernet-switch-profile]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Support for statement under the **[edit interfaces aex aggregated-ether-options ethernet-switch-profile]** hierarchy introduced in Junos OS Release 15.1.

### Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete **mac-learn-enable** from the configuration.

MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## mac-validate

### Syntax

```
mac-validate (loose | strict);
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family]
```

### Release Information

Statement introduced in Junos OS Release 9.3.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

### Description

Enable IP and MAC address validation for static Ethernet and IP demux interfaces.

### Options

**loose**—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not match the MAC address of the tuple. Continues to forward incoming packets when the source address of the incoming packet does not match any of the trusted IP addresses.

**strict**—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

### Required Privilege Level

## max-sessions (PPPoE Service Name Tables)

### Syntax

```
max-sessions number;
```

### Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name]
```

### Release Information

Statement introduced in Junos OS Release 10.2.

### Description

Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, **empty** service, or **any** service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.

The router uses the **max-sessions** value for a PPPoE service name table entry in conjunction with the **max-sessions** value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.

### Options

**number**—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family pppoe],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options]
```

### Release Information

Statement introduced in Junos OS Release 11.4.

### Description

Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the **max-sessions** statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.

### Default

If you do not include the **max-sessions-vsa-ignore** statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the **max-sessions** statement.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## maximum-links

### Syntax

```
maximum-links maximum-links-limit;
```

### Hierarchy Level

```
[edit chassis aggregated-devices]
```

### Release Information

Statement introduced in Junos OS Release 11.1 for T Series routers.

Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Statement introduced in Junos OS Release 12.3 for MX Series routers.

### Description

Configure the maximum links limit for aggregated devices. Note that for MX Series routers, to set a range of 32 or 64 the router must be running in Enhanced IP mode, which is only supported for Trio-based MPCs and multiservice DPCs (MS-DPCs). For more information on Enhanced IP mode, *Network Services Mode Overview*.

For MX series routers and PTX series switches, the option for 64 links is only supported for Junos OS release 12.3 and later.

**NOTE:** This statement is not supported on the MX80, MX104, and PTX1000 routers.

### Options

***maximum-links-limit***—Maximum links limit for aggregated devices.

**Range:** 16, 32, 64

**NOTE:** On T-Series routers, the maximum-links supported is 32 in an aggregated Ethernet link.

### Required Privilege Level

interface—To view this statement in the configuration.

### Release Information

Statement introduced in Junos OS Release 9.6 for MX Series routers.

**events** statement introduced in Junos OS Release 11.4R4 for MX Series routers.

Statement introduced in Junos OS Release 12.2 for the QFX Series. Only the **chassis-id**, **mc-ae-id**, **mode active-active**, and **status-control (active | standby)** options are supported on QFX Series devices.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**prefer-status-control-active** statement introduced in Junos OS Release 13.2R1 for EX Series switches.

**init-delay-time seconds** statement introduced in Junos OS Release 13.2R3 for EX Series switches.

**switchover-mode** and **revert-time** statements introduced in Junos OS Release 13.3.

Support for logical systems introduced in Junos OS Release 14.1.

### Description

Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.

### Options

**chassis-id**—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links. Each MC-LAG peer should have a unique chassis ID.

**Values:** 0 or 1

**events**—Specify an action if a specific MC-LAG event occurs.

**iccp-peer-down**—Specify an action if the ICCP peer of this node goes down.

**force-icl-down**—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.

**prefer-status-control-active**—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

**NOTE:** The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the **[edit interfaces interface-name]** hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lACP periodic interval** statement at the **[edit interface interface-name aggregated-ether-options]** hierarchy level as **slow** or configure the **detection-time threshold** statement at the **[edit protocols iccp peer liveness-detection]** hierarchy level as less than 3 seconds.

**init-delay-time seconds**—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer. By delaying the startup of the interface until after protocol convergence, you can prevent packet loss during the recovery of failed links and devices.

**NOTE:** On QFX and EX Series switches, the default session establishment hold time is 300 seconds. However, the session establishment time must be at least 100 seconds higher than the init delay time. You can optionally update the session establishment time to be 340 seconds and the init delay time to be 240 seconds.

**mc-ae-id** *mc-ae-id*—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode (active-active | active-standby)**—Specify whether the MC-LAG is in active-active or active-standby mode. Chassis that are in the same group must be in the same mode.

**NOTE:** You can configure IPv4 (inet) and IPv6 (inet6) addresses on **mc-ae** interfaces when the **active-standby** mode is configured.

In active-active mode, all member links are active on the MC-LAG. In this mode, media access control (MAC) addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer. Active-active mode is a simple and deterministic design and is easier to troubleshoot than active-standby mode.

**NOTE:** Active-active mode is not supported on Dense Port Concentrator (DPC) line cards. Instead, use active-standby mode.

In active-active MC-LAG topologies, network interfaces are categorized into three interface types, as follows:

- S-Link—Single-homed link (S-Link) terminating on an MC-LAG peer device
- MC-Link—MC-LAG link
- ICL—Inter-chassis link
- Mode

Indicates whether an MC-LAG is in active-standby mode or active-active mode. Chassis that are in the same group must be in the same mode.

In active-active mode, all member links are active on the MC-LAG. In this mode, media access control (MAC) addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer. Active-active mode is a simple and deterministic design and is easier to troubleshoot than active-standby mode.

**NOTE:** Active-active mode is not supported on Dense Port Concentrator (DPC) line cards. Instead, use active-standby mode.

Depending on the incoming and outgoing interface types, some constraints are added to the Layer 2 forwarding rules for MC-LAG configurations. The following data traffic forwarding rules apply.

**NOTE:** If only one MC-LAG member link is in the up state, it is considered an S-Link.

- When an MC-LAG network receives a packet from a local MC-Link or S-Link, the packet is forwarded to other local interfaces, including S-Links and MC-Links based on the normal Layer 2 forwarding rules and on the configuration of the **mesh-group** and **no-local-switching** statements. If MC-Links and S-Links are in the same mesh group and their **no-local-switching** statements are enabled, the received packets are only forwarded upstream and not sent to MC-Links and S-Links.
- The following circumstances determine whether or not an ICL receives a packet from a local MC-Link or S-Link:
  - If the peer MC-LAG network device has S-Links or MC-LAGs that do not reside on the local MC-LAG network device
  - Whether or not interfaces on two peering MC-LAG network devices are allowed to talk to each other
- When an MC-LAG network receives a packet from the ICL, the packet is forwarded to all local S-Links and active MC-LAGs that do not exist in the MC-LAG network from which the packet was sent.

In active-standby mode, only one of the MC-LAG peers is active at any given time. The other MC-LAG peer is in backup (standby) mode. The active MC-LAG peer uses Link Aggregation Control Protocol (LACP) to advertise to client devices that its child link is available for forwarding data traffic. Active-standby mode should be used if you are interested in redundancy only. If you require both redundancy and load sharing across member links, use active-active mode.

**NOTE:** Active-standby mode is not supported on EX4300 and QFX Series switches.

**redundancy-group group-id**—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**BEST PRACTICE:** We recommend that you configure only one redundancy group between MC-LAG nodes. The redundancy group represents the domain of high availability between the MC-LAG nodes. One redundancy group is sufficient between a pair of MC-LAG nodes. If you are using logical systems, then configure one redundancy group between MC-LAG nodes in each logical system.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

**Range:** 1 through 10

**status-control (active | standby)**—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

- Events ICCP-Peer-Down Force-ICL-Down

Forces the ICL to be down if the peer of this node goes down.

- Events ICCP-Peer-Down Prefer-Status-Control-Active

Allows the LACP system ID to be retained during a reboot, which provides better convergence after a failover.

**switchover-mode (non-revertive | revertive)**—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For **revertive** mode to automatically switch over to the preferred node, the **status-control** statement should be configured as **active**.

## minimum-bandwidth (aggregated Ethernet)

### Syntax

```
minimum-bandwidth bw-unit unit bw-value value;
```

### Hierarchy Level

```
[edit interfaces aex aggregated-ether-options]
```

### Release Information

Statement introduced before Junos OS Release 14.1R1 and 14.2 for MX Series.

### Description

Configure the minimum bandwidth unit for an aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps and the bandwidth value from 1 through 128,000.

### Options

***unit***—Minimum bandwidth unit for the aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps.

***value***—Minimum bandwidth value from 1 through 128,000.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Hierarchy Level (QFX Series)

```
[edit interfaces aex aggregated-ether-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

### Description

For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.

### Options

***number***—Number of links.

**Range:** On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX4600, QFX Series and Q Fabric Systems, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.

Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Support at the **[set interfaces interface-name unit logical-unit-number family ccc]** hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.

Statement introduced in Junos OS 17.3R1 Release for MX Series Routers.

### Description

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named `irb` or `vlan`, respectively).

**CAUTION:** For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

**NOTE:**

The MTU for an IRB interface is calculated by removing the Ethernet header overhead  $[6(\text{DMAC})+6(\text{SMAC})+2(\text{EtherType})]$ . Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the **flexible-vlan-tagging** statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
- In case of Layer 2 IFL configured with the **vlan-tagging** statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.

**NOTE:**

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the **mtu** statement at the **[edit interfaces interface-name unit logical-unit-number family inet]** or **[edit interfaces interface-name unit logical-unit-number family inet6]** hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both **inet** and **inet6** families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for **inet** and **inet6** families that are configured on the same logical interface.
- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (**6(DMAC)+6(SMAC)+2(EtherType)**), and the MTU is a minimum of the two values:
  - Configured MTU
  - Associated bridge domain's physical or logical interface MTU
    - For Layer 2 logical interfaces configured with **flexible-vlan-tagging**, IRB MTU is calculated by including 8 bytes overhead (**SVLAN+CVLAN**).
    - For Layer 2 logical interfaces configured with **vlan-tagging**, IRB MTU is calculated by including single VLAN 4 bytes overhead.

**NOTE:** Changing the Layer 2 logical interface option from **vlan-tagging** to **flexible-vlan-tagging** or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configuring the Media MTU*.

**Options**

**bytes**—MTU size.

**Range:** 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

**Default:** 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

## mru

### Syntax

```
mru mru;
```

### Hierarchy Level

```
[edit dynamic-profiles name interfaces name gigether-options],  
[edit dynamic-profiles name logical-systems name interfaces name gigether-options],  
[edit interfaces name gigether-options]
```

### Release Information

Statement introduced in Junos OS Release 19.1R1 for MX Series Routers.

### Description

Configure the maximum receive unit (MRU) of the interface in bytes. The maximum receive unit of an interface indicates the largest size of a packet that the interface can accept. You can configure the parameters so that the value of MRU equals the value of MTU. You can also configure different values for MRU and MTU. When a device receives packets whose size is greater than the interface MRU, those packets are dropped by the device's forwarding plane.

### Options

*mru*—MRU size in bytes.

**Range:** 256 through 16008 bytes.

### Required Privilege Level

interface

## no-pre-classifier

### Syntax

```
no-pre-classifier;
```

### Hierarchy Level

```
[edit chassis fpc n pic n]
```

### Release Information

Statement introduced in Junos OS Release 10.4.

### Description

Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

**NOTE:** For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the **no-pre-classifier** statement to disable the control queue.

### Default

The **no-pre-classifier** statement is not configured and the control queue is operational.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## no-send-pads-ac-info

### Syntax

```
no-send-pads-ac-info;
```

### Hierarchy Level

```
[edit protocols pppoe]
```

### Release Information

Statement introduced in Junos OS Release 12.2.

### Description

Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.

**NOTE:** In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

## number-of-sub-ports

### Syntax

```
number-of-sub-ports <number-of-sub-ports>;
```

### Hierarchy Level

```
[edit chassis fpc fpc-slot pic pic-number port port-num]
```

### Release Information

Statement introduced in Junos OS Release 19.1R1 for MPC10E-15C-MRATE supported on MX240, MX480, and MX960 routers.

Statement introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C and PTX10003-160C router.

### Description

*For PTX10003-80C, PTX10003-160C router:*

To configure the number of optical channels for a particular port if the optics are used in a channelized mode. You can use this configuration option to configure a speed (10, 40, and 100 Gbps) in different number of channels based on the optics used. The default value of **number-of-sub-ports** per optics is 1. Following are the configurable values for the corresponding optic types:

| Optic Type      | QSFP56-DD-400GBASE-LR8 (400G) | QSFP DD 28F (200G) | QSFP 28 (100G) | QSFP+ (40G) | QSFP 28 (25G) | QSFP 28 DD(25G) | Default |
|-----------------|-------------------------------|--------------------|----------------|-------------|---------------|-----------------|---------|
| Channelized     | 1                             | 2                  | 1              | 4           | 4             | 8               | 1       |
| Non-channelized | NA                            | NA                 | 1              | 1           | 1             | 1               | 1       |

You are not required to set any value for **number-of-sub-ports** while configuring 40G or 400G, as the default value for number-of-sub-ports is 1.

*For MPC10E-15C-MRATE supported on MX240, MX480, MX960 routers:*

To configure the number of sub-channels for a particular port if the optics are used in a channelized mode.

(Channelized mode) To specify the number of IFDs (or interfaces) that need to be created on a physical port for a specified speed, use the **number-of-sub-ports <number-of-sub-ports>** configuration statement. For example, on a given port that supports 4x10GE mode, if the **number-of-sub-ports** to 2, then two IFDs are created, namely et-x/y/z:0 and et-x/y/z:1.

The default value of channelized 10-Gigabit Ethernet interface is 4. The number of sub-ports that can be configured are, 1, 2, 3, or 4. You must set the **number-of-sub-ports** to 4, to channelize 40-Gigabit Ethernet interface to four 10-Gigabit Ethernet interfaces.

The **number-of-sub-ports** configuration statement can be used with rate selectability configuration at both PIC level and port level. This configuration statement is effective only when the port speed is 10 Gbps.

(MPC11E) To specify the number of interfaces to be created on a physical port.

### Options

On PTX10003-80C, PTX10003-160C router: *number-of-sub-ports*—Specify the number of sub-ports per physical port. Configurable options are 1, 2, and 4.

On MPC10E-15C-MRATE supported on MX240, MX480, and MX960 routers:

*number-of-sub-ports*—Specify the number of sub-ports per physical port. Configurable options are 1, 2, 3, and 4.

**NOTE:** You can configure the *number-of-sub-ports* only for 10-Gbps speed. For other speeds, this configuration is not supported.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## optics-options

### Syntax

```
optics-options {
  alarm low-light-alarm {
    (link-down | syslog);
  }
  tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number);
  tx-power dbm;
  warning low-light-warning {
    (link-down | syslog);
  }
  wavelength nm;
  loopback;
}
```

### Hierarchy Level

```
[edit interfaces interface-name]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

**alarm** option and **warning** options introduced in Junos OS Release 10.0.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

Statement and **tx-power** option introduced in Junos OS Release 13.2 for PTX Series routers.

**tca** option introduced in Junos OS Release 14.2 for PTX Series routers.

Statement introduced in Junos OS Release 18.3R1 for PTX10K-LC1104 on the PTX10008 and PTX10016 routers.

Statement introduced in Junos OS Release 18.3R1 for ACX6360 routers.

**loopback** option introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

Statement introduced in Junos OS Release 19.2R1-S1 for ACX5448-D routers.

### Description

For 10-Gigabit Ethernet or 100-Gigabit Ethernet dense wavelength-division multiplexing (DWDM) interfaces only, configure full C-band International Telecommunication Union (ITU)-Grid tunable optics.

On the PTX Series routers, when an interface is configured in 8QAM mode, you must configure both the optics from a AC400 module with the same optics-options for the links to come up.

### Options

**loopback**—Displays the electrical loopback status of QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

## pdu-interval

### Syntax

```
pdu-interval interval;
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management interface interface-name]
```

### Release Information

Statement introduced in Junos OS Release 8.2 for MX, M, T, ACX, Series routers, SRX Series firewalls, and EX Series Switches.

Statement introduced in Junos OS Release 9.4 for EX Series switches.

### Description

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the periodic OAM PDU sending interval for fault detection. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

### Options

**interval**—Periodic OAM PDU sending interval.

**Range:** For MX, M, T, ACX, Series routers, SRX Series firewalls and EX Series switches – 100 through 1000 milliseconds

**Default:** 1000 milliseconds

### Required Privilege Level

## per-flow (Aggregated Ethernet Interfaces)

### Syntax

```
per-flow;
```

### Hierarchy Level

```
[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]
```

### Release Information

Statement introduced in Junos OS Release 13.2R1.

### Description

Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (**ae**) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an **ae** interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part.

### Options

**per-flow**—Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit interfaces interface-range name aggregated-ether-options lacp]
```

### Hierarchy Level (QFX Series)

```
[edit interfaces aex aggregated-ether-options lacp]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

### Description

For aggregated Ethernet interfaces only, configure the interval for periodic transmission of LACP packets.

### Options

***interval***—Interval for periodic transmission of LACP packets.

- **fast**—Transmit packets every second.
- **slow**—Transmit packets every 30 seconds.

**Default:** fast

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## **policer (CFM Firewall)**

### **Syntax**

```
policer cfm-policer {  
  if-exceeding {  
    bandwidth-limit 8k;  
    burst-size-limit 2k;  
  }  
  then discard;  
}
```

### **Hierarchy Level**

```
[edit firewall]
```

### **Release Information**

Statement introduced in Junos OS Release 10.0.

### **Description**

Attach an explicit policer to CFM sessions.

### **Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## **RELATED DOCUMENTATION**

## policer (CoS)

### Syntax

```
policer cos-policer-name {  
  aggregate {  
    bandwidth-limit bps;  
    burst-size-limit bytes;  
  }  
  premium {  
    bandwidth-limit bps;  
    burst-size-limit bytes;  
  }  
}
```

### Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile [ethernet-policer-profile](#)]

### Release Information

Statement introduced before Junos OS Release 7.4.

### Description

For Gigabit Ethernet IQ , Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, define a CoS policer template to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits. The premium policer is not supported on MX Series routers or for Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

### Options

***cos-policer-name***—Name of one policer to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits.

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## policer (MAC)

### Syntax

```
policer {
  input cos-policer-name;
  output cos-policer-name;
}
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number accept-source-mac mac-address mac-address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number accept-source-mac
mac-address mac-address]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

### Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure MAC policing.

#### NOTE:

On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

### Options

**input *cos-policer-name***—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

**output *cos-policer-name***—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**RELATED DOCUMENTATION**

## port-priority

### Syntax

```
port-priority priority;
```

### Hierarchy Level

```
[edit interfaces interface-name gigether-options 802.3ad lACP]
```

### Release Information

Statement introduced in Junos OS Release 9.3.

Statement introduced in Junos OS Release 11.4 for EX Series switches.

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

### Description

Define LACP port priority at the interface level.

### Options

***priority***—Priority for being elected to be the active port and both collect and distribute traffic. A smaller value indicates a higher priority for being elected.

**Range:** 0 through 65535

**Default:** 127

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

    }
    output filter-name {
        precedence precedence;
    }
}
}
}
}
}

```

### Hierarchy Level

[edit dynamic-profiles *profile-name* interfaces]

### Release Information

Statement introduced in Junos OS Release 10.1.

### Description

Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (**ppp-over-ether**) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## ppm (Ethernet Switching)

### Syntax

```
ppm {  
    centralized;  
}
```

### Hierarchy Level

```
[edit protocols lacp]
```

### Release Information

Statement introduced in Junos OS Release 9.4 for MX Series routers.

Statement introduced in Junos OS Release 10.2 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

Statement introduced in Junos OS Release 12.1 for T Series devices.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description

Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.

This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the **no-delegate-processing** configuration statement in the **[edit routing-options ppm]** statement hierarchy.

### Default

Distributed PPM processing is enabled for all packets that use PPM.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## pppoe-options

### Syntax

```
pppoe-options {
  access-concentrator name;
  auto-reconnect seconds;
  (client | server);
  service-name name;
  underlying-interface interface-name;
  ppp-max-payload ppp-max-payload
}
```

### Hierarchy Level

```
[edit interfaces pp0 unit logical-unit-number],
[edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number]
[set interface ppp interfaceunit logical-unit-number ppp-max-payload ppp-max-payload],
```

### Release Information

Statement introduced before Junos OS Release 7.4.

**client** Statement introduced in Junos OS Release 8.5.

**server** Statement introduced in Junos OS Release 8.5.

**ppp-max-payload** Statement introduced in Junos OS Release 15.1X49-D100.

### Description

Configure PPP over Ethernet-specific interface properties.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.

For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.

The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE

server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.

It is important to set an appropriate value for the MTU size of the physical interface before setting **ppp-max-payload**. The value of **mtu** must be greater than the value of **ppp-max-payload**.

To enable Jumbo frames refer *Understanding Jumbo Frames Support for Ethernet Interfaces*.

#### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## preferred-source-address

### Syntax

```
preferred-source-address address;
```

### Hierarchy Level

```
[edit dynamic-profiles interfaces interface-name unit logical-unit-number family family unnumbered-address
interface-name],
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family],
```

### Release Information

Statement introduced in Junos OS Release 9.2.

Support for the **\$junos-preferred-source-address** and **\$junos-preferred-source-ipv6-address** predefined variables introduced in Junos OS Release 9.6.

### Description

For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the **\$junos-preferred-source-address** predefined variable for IPv4 (family inet) addresses or the **\$junos-preferred-source-ipv6-address** predefined variable for IPv6 (family inet6) addresses.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.

**NOTE:** When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the **\$junos-routing-instance** predefined variable, you must not configure a preferred source address, whether with the **\$junos-preferred-source-address** predefined variable, the **\$junos-preferred-source-ipv6-address** predefined variable, or the **preferred-source-address** statement. Configuring the preferred source address in this circumstance causes a commit failure.

### Options

**address**—Secondary IP address of the donor loopback interface. Alternatively, use the **\$junos-preferred-source-address** or the **\$junos-preferred-source-ipv6-address** predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## recovery

### Syntax

```
recovery {  
  (auto | manual);  
  timer timer-value;  
}
```

### Hierarchy Level

```
[edit interfaces interfaces-name link-degrade-monitor]
```

### Release Information

Statement introduced in Junos OS Release 15.1.

### Description

Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

### Options

**auto**—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

**manual**— Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the **request interface link-degrade-recover *interface-name*** statement to recover the link.

**NOTE:** The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

**timer *timer-value***—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

**NOTE:** During autorecovery, you might notice link flaps at the remote end of the link.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## restore-interval

### Syntax

```
restore-interval number;
```

### Hierarchy Level

```
[edit protocols protection-group ethernet-ring ring-name]
```

### Release Information

Statement introduced in Junos OS Release 9.4.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

### Description

Configures the number of minutes that the node does not process any Ethernet ring protection (ERP) protocol data units (PDUs).. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

### Options

*number*—Specify the restore interval.

**Range:** 1 through 12 minutes

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## routing-instance

### Syntax

```
routing-instance {  
    destination routing-instance-name;  
}
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number tunnel],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number tunnel]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

### Description

To configure **interfaces** and **logical-systems**, specify the destination routing instance that points to the routing table containing the tunnel destination address.

### Default

The default Internet routing table is **inet.0**.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## routing-instance (PPPoE Service Name Tables)

### Syntax

```
routing-instance routing-instance-name;
```

### Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name],  
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari  
remote-id-string]
```

### Release Information

Statement introduced in Junos OS Release 10.2.

### Description

Use in conjunction with the **dynamic-profile** statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, **empty** service entry, or **any** service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the **routing-instance** statement at the `[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]` hierarchy level, you cannot also include the **static-interface** statement at this level. The **routing-instance** and **static-interface** statements are mutually exclusive for ACI/ARI pair configurations.

### Options

***routing-instance-name***—Name of the routing instance in which the router instantiates the dynamic PPPoE interface.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## rx-enable

### Syntax

```
expected-defect {  
  rx-enable ;
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

### Release Information

Statement introduced in Junos OS Release 19.1.

### Description

Enable the ethernet expected defect (ETH-ED) function to process the received EDM PDUs.

The remaining statements are explained separately. See [CLI Explorer](#).

### Default

The MEP does not process EDM PDUs.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[connectivity-fault-management](#) | **1132**

## rx-max-duration

### Syntax

```
expected-defect {
  rx-max-duration ;
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

### Release Information

Statement introduced in Junos OS Release 19.1.

### Description

Duration to indicate the maximum acceptable value at which the loss of continuity alarms are suppressed. If the duration in the received EDM PDU exceeds this configured value then the duration value will be truncated to this configured value and loss of continuity (LoC) alarms shall be suppressed for this duration.

### Options

**Minimum value**—The minimum value at which the loss of continuity alarms will be suppressed is 120 *seconds*.

**Maximum value**—The maximum acceptable value at which the loss of continuity alarms will be suppressed is 3600 *seconds*.

**Default**—900 *seconds*.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## sa-multicast (100-Gigabit Ethernet)

### Syntax

```
sa-multicast;
```

### Hierarchy Level

```
[edit chassis fpc slot pic slot forwarding-mode]
```

### Release Information

Statement introduced in Junos OS Release 10.4.

### Description

Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs.

**NOTE:** The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

sa-multicast supports interoperability between the following PICs and MICs:

- 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) .
- 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## service (PPPoE)

### Syntax

```
service service-name {
  drop;
  delay seconds;
  terminate;
  dynamic-profile profile-name;
  routing-instance routing-instance-name;
  max-sessions number;
  agent-specifier {
    aci circuit-id-string ari remote-id-string {
      drop;
      delay seconds;
      terminate;
      dynamic-profile profile-name;
      routing-instance routing-instance-name;
      static-interface interface-name;
    }
  }
}
```

### Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name]
```

### Release Information

Statement introduced in Junos OS Release 10.0.

**any**, **dynamic-profile**, **routing-instance**, **max-sessions**, and **static-interface** options introduced in Junos OS Release 10.2.

### Description

Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, **empty** service, or **any** service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

### Default

The default action is terminate.

### Options

**service-name**—Service entry in the PPPoE service name table:

- **service-name**—Named service entry of up to 32 characters; for example, **premiumService**. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
- **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one **empty** service entry by default.
- **any**—Default service for non-empty service entries that do not match the named or **empty** service entries configured in the PPPoE service name table. Each PPPoE service name table includes one **any** service entry by default.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## session-expiry (MX Series in Enhanced LAN Mode)

#### Syntax

```
session-expiry seconds;
```

#### Hierarchy Level

```
[edit protocols authentication-access-control interface (all | [interface-names])]
```

#### Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

#### Description

Configure the maximum duration in seconds of a session.

#### Options

*seconds*—Duration of session.

**Range:** 1 through 65535

**Default:** 3600

#### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## source-address-filter

### Syntax

```
source-address-filter {
    mac-address;
}
```

### Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

### Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the **source-filtering** statement in the configuration to enable source address filtering.

### Options

**mac-address**—MAC address filter. You can specify the MAC address as *nn:nn:nn:nn:nn:nn* or *nnnn.nnnn.nnnn*, where *n* is a decimal digit. To specify more than one address, include multiple **mac-address** options in the **source-address-filter** statement.

If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in *VRRP and VRRP for IPv6 Overview*, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement. MAC addresses ranging from **00:00:5e:00:01:00** through **00:00:5e:00:01:ff** are reserved for VRRP, as defined in RFC 3768, *Virtual Router Redundancy Protocol*. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

On untagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement with an identical MAC address specified in both filters.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

#### RELATED DOCUMENTATION

## source-filtering

### Syntax

```
(source-filtering | no-source-filtering);
```

### Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],  
[edit interfaces interface-name fastether-options],  
[edit interfaces interface-name gigether-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

### Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the **source-address-filter** statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

### Default

Source address filtering is disabled.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.

Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.

Speed option 1-Gbps is introduced in Junos OS Release 19.1R1 on the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module on EX4300-48MP switches.

Speed options 100-Mbps, 1-Gbps, and auto is introduced in Junos OS Releases 18.4R1S2, 18.4R2, and 19.2R1 and later for ACX5448 Universal Metro Routers.

Speed option 10Gbps, 40Gbps, and 100Gbps introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C, PTX10003-160C routers.

Speed options 100-Gbps, 40-Gbps, 25-Gbps, and 10-Gbps introduced in Junos OS Release 19.2R1-S1 for ACX5448-D routers.

## Description

Configure the interface speed. This statement applies to the management Ethernet interface (**fxp0** or **em0**), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

**NOTE:** On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the **auto-10m-100m** option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the **show interfaces** command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the **show interfaces** command only. The actual interface speed is 100 Mbps.

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

(For QFX5100-48T only) To negotiate any speed on QFX5100-48T switches:

```
set interfaces xe-0/0/0 ether-options auto-negotiation
```

```
set interfaces xe-0/0/0 speed auto
```

Basically, when you configure a port using **speed auto** option, the port deletes the last configured speed, comes up again and advertises all the possible speeds:

For a port to start with a specific speed, it is mandatory that both the auto-negotiation must be enabled and interface must be configured with a particular speed. Otherwise, the switch will remain with the last negotiated speed. If you only set the **auto-negotiation** option (and no speed option), then the switch will start with the last speed it connected at and will only advertise that to the server.

To configure a particular speed on QFX5100-48T switches, mention the speed:

```
set interfaces xe-0/0/0 ether-options auto-negotiation
```

```
set interfaces xe-0/0/0 speed speed
```

For example to configure 1-Gbps speed in full duplex mode, execute the following command:

```
set interfaces xe-0/0/0 ether-options auto-negotiation
```

```
set interfaces xe-0/0/0 speed 1g
```

Note that you can not disable auto-negotiation on 1-Gigabit Ethernet ports. It is mandatory to enable autonegotiation when 1-Gbps speed is configured on a particular interface.

**NOTE:** In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the **set interface *name* ether-options auto-negotiation** command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

**NOTE:** Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

**NOTE:** When displaying interface information with **show interfaces** commands, you might see speed values for 1 Gbps interfaces displayed as **1000mbps**.

(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10-Gbps, 5-Gbps, and 2.5-Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100-Mbps, 1-Gbps, and 2.5-Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbps speed is supported only on **ge** interfaces of EX2300 switch.

On EX2300-24MP and EX2300-48MP switches, if both Energy Efficient Ethernet (EEE) and 100-Mbps speed are configured on a rate-selectable (or multirate) Gigabit Ethernet (mge) port, the port operates only at 100-Mbps speed but EEE is not enabled on that port. EEE is supported only on mge interfaces that operate at 1-Gbps and 2.5-Gbps speeds.

(For EX4300-48MP only) Starting with Junos OS Release 19.1R1, the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module (EX-UM-4SFPP-MR) on EX4300-48MP switches supports 1-Gbps speed. You do not need to explicitly configure 1-Gbps speed on the uplink module as it automatically identifies the installed 1-gigabit SFP transceivers and creates the interface accordingly.

**NOTE:** On EX4300-48MP, the status LED of 1-Gigabit Ethernet uplink module port is solid green (instead of blinking green) because of a device limitation. However, there is no impact on device functionality.

(For ACX5448 only) 100-Gbps speed is supported from interfaces xe-0/0/24 to xe-0/0/47 only.

On ACX5448-D routers, you can configure speeds of 100-Gbps, 40-Gbps, 25-Gbps, and 10-Gbps are supported on the et- and ot- interfaces.

#### **Default (EX Series)**

If the [auto-negotiation](#) statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled, the auto-negotiation option is enabled by default.

**Options**

You can specify the speed as either **10m** (10 Mbps), **100m** (100 Mbps), and on MX Series routers, **1g** (1 Gbps). You can also specify the **auto** option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

Table 121: Options for speed

| Platforms                           | Speed Supported                                                                                                                                                                                                                           | Auto-negotiation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## speed (MX Series DPC)

### Syntax

```
speed (auto | 1Gbps | 100Mbps | 10Mbps);
```

### Hierarchy Level

```
[edit interfaces ge-fpc/pic/port]
```

### Release Information

Statement introduced in Junos OS Release 9.5.

### Description

On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the **speed (auto | 1Gbps | 100Mbps | 10Mbps)** statement under the **[edit interface ge-/fpc/pic/port]** hierarchy level. The **auto** option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to **1Gbps**, **100Mbps**, or **10Mbps**.

**NOTE:** If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

### Options

You can specify the speed as either **auto** (autonegotiate), **10Mbps** (10 Mbps), **100Mbps** (100 Mbps), or **1Gbps** (1 Gbps).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## static-interface

### Syntax

```
static-interface interface-name;
```

### Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari
remote-id-string]
```

### Release Information

Statement introduced in Junos OS Release 10.2.

### Description

Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, **empty** service entry, or **any** service entry in the PPPoE service name table.

The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.

If you include the **static-interface** statement in the configuration, you cannot also include either the **dynamic-profile** statement or the **routing-instance** statement. The **dynamic-profile**, **routing-instance**, and **static-interface** statements are mutually exclusive for ACI/ARI pair configurations.

### Options

***interface-name***—Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format **pp0.*logical***, where ***logical*** is a logical unit number from 0 through 16385 for static interfaces.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## switch-options

### Syntax

```
switch-options {  
  switch-port port-number {  
    (auto-negotiation | no-auto-negotiation);  
    speed (10m | 100m | 1g);  
    link-mode (full-duplex | half-duplex);  
  }  
}
```

### Hierarchy Level

```
[edit interfaces ge-pim/0/0]
```

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Configuration of the physical port characteristics is done under the single physical interface.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## switch-port

### Syntax

```
switch-port port-number {  
    (auto-negotiation | no-auto-negotiation);  
    speed (10m | 100m | 1g);  
    link-mode (full-duplex | half-duplex);  
}
```

### Hierarchy Level

```
[edit interfaces ge-pim/0/0 switch-options]
```

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Configuration of the physical port characteristics, done under the single physical interface.

### Default

Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.

### Options

***port-number***—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.

The remaining statements are explained separately. See [CLI Explorer](#).

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## symbol-period

### Syntax

```
symbol-period count;
```

### Hierarchy Level

```
[edit protocols oam ethernet link-fault-management action-profile event, link-event-rate],  
[edit protocols oam link-fault-management interface interface-name event-thresholds]
```

### Release Information

Statement introduced in Junos OS Release 8.4.

### Description

Configure the threshold for sending symbol period events or taking the action specified in the action profile.

A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

### Options

**count**—Threshold count for symbol period events.

**Range:** 0 through 100

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## sync-reset

### Syntax

```
sync-reset (disable | enable);
```

### Hierarchy Level

```
[edit dynamic-profiles name interfaces name aggregated-ether-options lacp],  
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options lacp],  
[edit interfaces name aggregated-ether-options lacp]
```

### Release Information

Statement introduced in Junos OS Release 16.1R1.

### Description

For redundant Ethernet interface link aggregation group links, you can configure the minimum number of physical child links on the primary node in the redundant Ethernet interface that must be working. If the minimum number of operating child links falls below the configured value, the interface is marked down even if some of the child interfaces are working. LACP marks these operating child interfaces or links that are working, as out of synchronization. This enables a peer switch, that does not have the minimum link configuration, to mark its interface as down as well. The peer switch can be a Juniper Switch or any other third party switch. As a result, the interface is marked as down on both the switches until the number of operating child links is more than the configured value. By default, LACP handles the minimum-link failure. You can disable the minimum-link failure at LACP level, by using the **disable** option with the **sync-reset** command.

### Default

By default, LACP handles the minimum-link failure.

### Options

**disable**—To disable handling of the minimum-link failure at LACP level

**enable**—To enable handling of the minimum-link failure at LACP level

### Required Privilege Level

interface

## system-id

### Syntax

```
system-id system-id;
```

### Hierarchy Level

```
[edit interfaces aeX aggregated-ether-options lacp]
```

### Release Information

Statement introduced in Junos OS Release 12.2R1

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

### Description

Define the LACP system identifier at the aggregated Ethernet interface level.

The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[Configuring LACP for Aggregated Ethernet Interfaces](#) | 67

## system-priority

### Syntax

```
system-priority priority;
```

### Hierarchy Level

```
[edit interfaces aeX aggregated-ether-options lacp]
```

### Release Information

Statement introduced in Junos OS Release 9.3.

Statement introduced in Junos OS Release 11.4 for EX Series switches.

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

### Description

Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global **[edit chassis]** hierarchy level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

### Options

***priority***—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.

**Range:** 0 through 65535

**Default:** 127

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## targeted-options (Grouping Subscribers by Bandwidth Usage)

### Syntax

```
targeted-options {
  backup backup;
  group group;
  primary primary;
  weight ($junos-interface-target-weight | weight-value);
}
```

### Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit logical-unit-number],
[edit dynamic-profiles name logical-systems name interfaces name unit logical-unit-number],
[edit interfaces name unit logical-unit-number]
```

### Release Information

Statement introduced in Junos OS Release 16.1.

**weight** option added in Junos OS Release 17.3 for MX Series and MX Virtual Chassis.

**\$junos-interface-target-weight** option added in Junos OS Release 18.4R1.

### Description

Configure primary and backup links, group similar subscribers, and specify a subscriber weight for manual targeting to distribute subscribers across aggregated Ethernet member links.

### Options

**backup**—(Optional) Specify a backup member link per subscriber when you configure manual targeting.

**group**—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the **default** group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.

**Default:** default

**primary**—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.

**weight (\$junos-interface-target-weight | *weight-value*)**—Specify the weight for targeted subscribers like PPPoE, demux, and conventional VLANs based on factors such as customer preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight. When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.

The `$junos-interface-target-weight` predefined variable is supported for dynamic configuration only. When you configure this predefined variable, the weight value is sourced from VSA 26-213 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated.

**Range:** 1 through 1000

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## targeted-options (Manual Targeting)

### Syntax

```
targeted-options {
  (logical-interface-chassis-redundancy | logical-interface-fpc-redundancy);
  rebalance-periodic {
    interval interval;
    start-time start-time;
  }
  type (auto | manual);
}
```

### Hierarchy Level

```
[edit dynamic-profiles name interfaces name aggregated-ether-options],
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options],
[edit interfaces name aggregated-ether-options]
[edit interfaces name unit ]
```

### Release Information

Statement introduced in Junos OS Release 16.1.

### Description

Configure manual targeting or auto-targeting.

### Options

**type**—Configure manual targeting type as **manual** or **auto**.

#### Values:

- **auto**—Configure targeted-distribution without specific primary and backup links.
- **manual**—Configure targeted distribution with specific member links as primary and backup for a subscriber. When you configure manual targeting, you must always configure a primary link. Configuring a backup link is optional. You specify the primary and backup links for a subscriber in the individual interface configuration. You configure primary and backup links by using the [targeted-options](#) statement at the **[edit interfaces *name* unit]** hierarchy level.  
  
Manual targeting enhances the distribution of targeted VLANs or subscribers across member links of an aggregated Ethernet bundle by making it bandwidth-aware.

**Default:** auto

The remaining statements are described separately.

### Required Privilege Level

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## targeted-distribution

### Syntax

```
targeted-distribution primary-list primary-list [backup-list backup-list;
```

### Hierarchy Level

```
[edit logical-systems name interfaces name unit ]
```

### Release Information

Statement introduced in Junos OS Release 16.1R1.

### Description

Configure egress data for a member link in an aggregated Ethernet bundle. Specify a distribution list as primary list and a different distribution list as backup list. A backup list is provisioned in the event the primary list goes down.

### Options

**primary-list**—(Optional) Specify the role of the distribution list as primary. Member links of the aggregated Ethernet are assigned membership to the distribution list.

**backup-list**—(Optional) Specify the role of the distribution list as backup. Member links of the aggregated Ethernet are assigned membership to the distribution list.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## terminate (PPPoE Service Name Tables)

### Syntax

```
terminate;
```

### Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name],  
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari  
remote-id-string]
```

### Release Information

Statement introduced in Junos OS Release 10.0.

Support at [edit protocols pppoe service-name-tables *table-name* service *service-name* **agent-specifier** aci *circuit-id-string* ari *remote-id-string*] hierarchy level introduced in Junos OS Release 10.2.

### Description

Direct the router to immediately respond to a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client by sending the client a PPPoE Active Discovery Offer (PADO) packet. The PADO packet contains the name of the access concentrator (router) that can service the client request. The **terminate** action is the default action for a named service entry, **empty** service entry, **any** service entry, or agent circuit identifier/agent remote identifier (ACI/ARI) pair in a PPPoE service name table.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## thresholds

### Syntax

```
thresholds {
  clear clear-value;
  interval interval-value;
  set set-value;
  warning-clear warning-clear-value;
  warning-set warning-set-value;
}
```

### Hierarchy Level

```
[edit interfaces interfaces-name link-degrade-monitor]
```

### Release Information

Statement introduced in Junos OS Release 15.1.

### Description

Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

### Options

**clear *clear-value***—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the  $1E-n$  format, where 1 is the mantissa (remains constant) and  $n$  is the exponent. For example, a threshold value of  $1E-3$  refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 12.

**interval *interval-value***—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

**set *set-value***—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the  $1E-n$  format, where 1 is the mantissa (remains constant) and  $n$  is the exponent. For example, a threshold value of  $1E-3$  refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 7.

**warning clear *warning-clear-value***—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the  $1E-n$  format, where 1 is the mantissa (remains

constant) and  $n$  is the exponent. For example, a threshold value of  $1\text{E}-3$  refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 11.

**warning set warning-set-value**—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the  $1\text{E}-n$  format, where 1 is the mantissa (remains constant) and  $n$  is the exponent. For example, a threshold value of  $1\text{E}-3$  refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 9.

**NOTE:** The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

## traceoptions (LLDP)

### Syntax

```
traceoptions {
  file filename <files number> <size maximum-file-size> <world-readable | no-world-readable>;
  flag flag <disable>;
}
```

### Hierarchy Level

```
[edit protocols lldp],
[edit routing-instances routing-instance-name protocols lldp]
```

### Release Information

Statement introduced in Junos OS Release 9.6.

### Description

Set LLDP protocol-level tracing options.

### Default

The default LLDP protocol-level trace options are inherited from the global **traceoptions** statement.

### Options

**disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file **/var/log/stp-log**.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 1 trace file only

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. The following are the LLDP-specific tracing options:

- **all**—Trace all operations.
- **config**—Log configuration events.

- **interface**—Trace interface update events.
- **protocol**—Trace protocol information.
- **rtsock**—Trace socket events.
- **vlan**—Trace vlan update events.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

**size *maximum-file-size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

#### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```

## Hierarchy Level (Interface process with ACX Series, SRX Series, MX Series, M Series, T Series)

[edit interfaces]

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Statement introduced in JUNOS Release 10.2 for EX Series switches.

Statement introduced in Junos OS Release 11.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description

Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple **flag** statements.

The interfaces **traceoptions** statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system **syslog** file in the directory **/var/log/dcd**.

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

### Default

If you do not include this statement, no interface-specific tracing operations are performed.

**Options**

[Table 122 on page 1392](#) lists options for traceoption command for the following platforms:

Table 122: Options for traceoptions

| Option               | Individual interfaces with PTX Series, ACX Series, EX Series                                                                                                                                                                                                                                 | Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series | Interface Process with OAMLFM with EX Series, QFX Series, NFX Series                                                                                                                                                                                                                                                                                                                                                                                                                       | Interface process with ACX Series, SRX Series, MX Series, M Series, T Series                                                                                                                                                                                                                                                                                                                                                                        |

## traceoptions (LACP)

### Syntax

```
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

### Hierarchy Level

```
[edit protocols lacp]
```

### Release Information

Statement introduced in Junos OS Release 7.6.

Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

### Description

Define tracing operations for the LACP protocol.

### Default

If you do not include this statement, no LACP protocol tracing operations are performed.

### Options

**filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, interface process tracing output is placed in the file **lacpd**.

**files number**—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—All LACP tracing operations
- **configuration**—Configuration code
- **packet**—Packets sent and received

- **process**—LACP process events
- **protocol**—LACP protocol state machine
- **routing-socket**—Routing socket events
- **startup**—Process startup events

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option:

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

#### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## traceoptions (PPPoE)

### Syntax

```
traceoptions {
  file <filename> <files number> <match regular-expression > <size maximum-file-size> <world-readable |
    no-world-readable>;
  filter {
    aci regular-expression;
    ari regular-expression;
    service-name regular-expression;
    underlying-interface interface-name;
  }
  flag flag;
  level (all | error | info | notice | verbose | warning);
  no-remote-trace;
}
```

### Hierarchy Level

```
[edit protocols pppoe]
```

### Release Information

Statement introduced in Junos OS Release 9.6.

Option **filter** introduced in Junos OS Release 12.3

### Description

Define tracing operations for PPPoE processes.

### Options

**file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

**files number**—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**disable**—Disable this trace flag.

**filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

**BEST PRACTICE:** Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.

- **aci *regular-expression***—Regular expression to match the agent circuit identifier provided by PPPoE client.
- **ari *regular-expression***—Regular expression to match the agent remote identifier provided by PPPoE client.
- **service *regular-expression***—Regular expression to match the name of PPPoE service.
- **underlying-interface *interface-name***—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## tx-duration

### Syntax

```
expected-defect {  
  tx-duration ;
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

### Release Information

Statement introduced in Junos OS Release 19.1.

### Description

The expected duration for which the peer MEP should suppress the LoC alarms.

### Options

**Minimum value**—The minimum value at which the peer MEP should suppress the LoC alarms is 120 *seconds*.

**Maximum value**—The maximum acceptable value at which the peer MEP should suppress the LoC alarms is 3600 *seconds*.

**Default**—900 *seconds*.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## tx-enable

### Syntax

```
expected-defect {  
  tx-enable ;
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management expected-defect]
```

### Release Information

Statement introduced in Junos OS Release 19.1.

### Description

Enable the ethernet expected defect (ETH-ED) function to control if EDM transmission need to be triggered on ISSU.

The remaining statements are explained separately. See [CLI Explorer](#).

### Default

The MEP does not generate EDM PDUs by default.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

logical-unit-number pppoe-options]
```

### Release Information

Statement introduced before Junos OS Release 7.4.

Support for aggregated Ethernet added in Junos OS Release 9.4.

### Description

Configure the interface on which PPP over Ethernet is running.

For demux interfaces, configure the underlying interface on which the demultiplexing (demux) interface is running.

### Options

***interface-name***—Name of the interface on which PPP over Ethernet or demux is running. For example, **at-0/0/1.0** (ATM VC), **fe-1/0/1.0** (Fast Ethernet interface), **ge-2/0/0.0** (Gigabit Ethernet interface), **ae1.0** (for IP demux on an aggregated Ethernet interface), or **ae1** (for VLAN demux on an aggregated Ethernet interface).

**NOTE:** Demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet interfaces, or aggregated Ethernet devices.

### Required Privilege Level

## Release Information

Statement introduced before Junos OS Release 7.4.

Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

## Description

Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

## Options

***logical-unit-number***—Number of the logical unit.

**Range:** 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.

***etree-ac-role (leaf | root)***—To configure an interface as either leaf or root.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

## unnumbered-address (Dynamic Profiles)

### Syntax

```
unnumbered-address interface-name <preferred-source-address address>;
```

### Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family family],  
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family family]
```

### Release Information

Statement introduced in Junos OS Release 9.2.

Support for the **\$junos-preferred-source-address** and **\$junos-preferred-source-ipv6-address** predefined variables introduced in Junos OS Release 9.6.

Support for the **\$junos-loopback-interface** predefined variable introduced in Junos OS Release 9.6.

### Description

For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the **\$junos-loopback-interface-address** predefined variable.

You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.

### Options

***interface-name***—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the **\$junos-loopback-interface** predefined variable.

When defining the **unnumbered-address** statement using a static interface, keep the following in mind:

- If you choose to include the **routing-instance** statement at the **[edit dynamic-profiles]** hierarchy level, that statement must be configured with a dynamic value by using the **\$junos-routing-instance** predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.
- If you choose to not include the **routing-instance** statement at the **[edit dynamic-profiles]** hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

**NOTE:** When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the **\$junos-routing-instance** predefined variable, you must not configure a preferred source address, whether with the **\$junos-preferred-source-address** predefined variable, the **\$junos-preferred-source-ipv6-address** predefined variable, or the **preferred-source-address** statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable, keep the following in mind:

- To use the **\$junos-loopback-interface** predefined variable, the dynamic profile must also contain the **routing-instance** statement configured with the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

**address**—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the **\$junos-preferred-source-address** predefined variable for the inet family, or the **\$junos-preferred-source-ipv6-address** predefined variable for the inet6 family.

When defining the **preferred-source-address** value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the **preferred-source-address** must be configured in the specified unnumbered interface.

When defining the **preferred-source-address** value using the **\$junos-preferred-source-address** or the **\$junos-preferred-source-ipv6-address** predefined variables, keep the following in mind:

- You must configure the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable.
- You must configure the **routing-instance** statement using the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

```

### Release Information

Statement introduced in Junos OS Evolved Release 19.3R1 for PTX10003-80C and PTX10003-160C routers.

### Description

, you cannot use port 1,3, 6 and/or 7 of the same logical PIC.

(PTX10003-80C and PTX10003-160C routers) While setting port 0 to 400-Gigabit Ethernet mode (using QSFP56-DD-400GBASE-LR8 optics), the total bandwidth (speed x **number-of-subports**) of port 1 has to be less than 100G and port 2 has to be configured as 'unused'. When using port 4 as 400G, port 3 has to be configured with total bandwidth and port 2 has to be configured 'unused'. Similarly, with port 5, 9 using 400G, port 6, 8 respectively has to be configured for less than 100G and port 7 should be configured as 'unused'. That is, when a port is configured in 400-Gigabit ethernet mode, you cannot configure speed of the adjacent port to be more than 100-Gbps, and the middle port (2 between 0~4 or 7 between 5~9) must be set to unused. To set a particular port to unused port, use **unused** CLI command.

Refer to [“Configuring 400-Gigabit Ethernet Interfaces on PTX10003 Routers” on page 381](#) for more information.

### Options

None

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[speed \(Ethernet\) | 1359](#)

[number-of-sub-ports | 1291](#)

## virtual-control-channel

### Syntax

```
virtual-control-channel channel-name {  
    west-interface name;  
    east-interface name;  
}
```

### Hierarchy Level

```
[edit protocols protection-group ethernet-ring name (east-interface | west-interface)]
```

### Release Information

Statement introduced in Junos OS Release 14.2.

### Description

Specify virtual control channels which are logical interfaces on the east and west interfaces of the major ring.

### Options

**west-interface *name***—Logical interface on the major ring's west port.

**east-interface *name***—Logical interface on the major ring's east port.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[Ethernet Ring Protection Switching Overview](#)

[Configuring Ethernet Ring Protection Switching on Switches \(CLI Procedure\)](#)

## virtual-switch

### Syntax

```
virtual-switch name bridge-domain name vlan-id [vlan-ids ];
```

### Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name default-x]
```

### Release Information

Statement introduced in Junos OS Release 9.6.

### Description

Specify the routing-instance type as a virtual switch, under which bridge-domain MIPs must be enabled.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### RELATED DOCUMENTATION

| [Configuring Maintenance Intermediate Points \(MIPs\)](#) | 556

## vlan-rule (100-Gigabit Ethernet Type 4 PIC with CFP)

### Syntax

```
vlan-rule (high-low | odd-even);
```

### Hierarchy Level

```
[edit chassis fpc slot pic slot forwarding-mode vlan-steering]
```

### Release Information

Statement introduced in Junos OS Release 10.4.

### Description

Configure the interoperation mode of the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) when interoperating with 100 gigabit Ethernet interfaces from other vendors.

If no VLAN rule is configured, all tagged packets are distributed to PFE0.

### Options

**high-low**—VLAN IDs 1 through 2047 are distributed to PFE0 and VLAN IDs 2048 through 4096 are distributed to PFE1.

**odd-even**—Odd number VLAN IDs are distributed to PFE1 and even number VLAN IDs are distributed to PFE0.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

[vlan-steering \(100-Gigabit Ethernet Type 4 PIC with CFP\)](#) | 1425

## vlan-steering (100-Gigabit Ethernet Type 4 PIC with CFP)

### Syntax

```
vlan-steering {  
    vlan-rule (high-low | odd-even);  
}
```

### Hierarchy Level

```
[edit chassis fpc slot pic slot forwarding-mode]
```

### Release Information

Statement introduced in Junos OS Release 9.4.

### Description

Configure the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) to interoperate with 100 gigabit Ethernet interfaces from other vendors.

The other statement is explained separately.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## clear interfaces interface-set statistics

### Syntax

```
clear interfaces interface-set statistics interface-set-name
```

### Release Information

Command introduced in Junos OS Release 8.5.

### Description

Set interface set statistics to zero.

### Options

***interface-set-name***—Set statistics on a specified interface set to zero. Wildcard values can be used in the interface set name. This command will not clear the statistics of the member logical interfaces.

### Required Privilege Level

clear

### List of Sample Output

[clear interfaces interface-set statistics on page 1430](#)

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
clear interfaces interface-set statistics
```

```
user@host> clear interfaces interface-set statistics
```

## clear interfaces interval

### Syntax

```
clear interfaces interval interface-name
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

Clear the channel service unit (CSU) alarm and defect counters so that only the current time interval is displayed. This operation affects the **show interface interval** command, but not an SNMP query.

### Options

***interface-name***—Name of a particular interface.

### Required Privilege Level

clear

## RELATED DOCUMENTATION

[show interfaces interval](#) | 1816

### List of Sample Output

[clear interfaces interval on page 1431](#)

### Output Fields

See [show interfaces interval](#) for an explanation of output fields.

## Sample Output

### clear interfaces interval

The following example displays the output for a T3 interface before and after the **clear interfaces** command is entered:

```
user@host> show interfaces interval t3-0/3/0:4
```

```
Physical interface: t3-0/3/0:4, SNMP ifIndex: 23
17:43-current:
    LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
```

```

UAS: 0

```

## clear interfaces aeX forwarding-options load-balance state

### Syntax

```
clear interfaces aeX unit logical-unit-number aggregate forwarding-options load-balance state
```

### Release Information

Command introduced in Junos OS Release 13.2R1.

### Description

Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.

### Options

**aeX**—Name of a particular aggregated Ethernet interface.

***logical-unit-number***—Number of the logical unit of the interface.

**forwarding-options load-balance state**—Cause the load-balancing state to be cleared for the specific interface.

### Required Privilege Level

clear

### RELATED DOCUMENTATION

| [show interfaces interval](#) | 1816

### List of Sample Output

## Sample Output

```
clear interfaces aeX aggregate forwarding-options
```

```
user@host> clear interfaces ae1 aggregate forwarding-options load-balance state
```

## clear interfaces aggregate forwarding-options load-balance state

### Syntax

```
clear interfaces aggregate forwarding-options load-balance state
```

### Release Information

Command introduced in Junos OS Release 13.2R1.

### Description

Clear all the aggregate Ethernet interface load balancing states and re-create them newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

### Options

***interface-name***—Name of a particular interface.

```

## clear interfaces transport pm

### Syntax

```
clear interfaces transport pm (all | optics | otn) (all | current | current-day) (all | interface-name)
```

### Release Information

Command introduced in Junos OS Release 14.2 on the PTX Series.

Command introduced in Junos OS release 16.1 on the MX Series.

Command introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

### Description

Clear optics and OTN information from the transport performance monitoring data.

### Options

(all | optics | otn)—Clear both optics and OTN information or either only optics or only OTN information.

(all | current | current-day)—Clear information for the current 15-minute interval, the ninety-six 15-minute intervals, the current day, and the previous day; information only for the current 15-minute interval; or information only for the current 24 hours.

(all | *interface-name*)—Clear information for all interfaces or only for the specified interface (for example, *et-fpc/pic/port*)).

## clear oam ethernet connectivity-fault-management continuity-measurement

### Syntax

```
clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain md-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 11.1.

### Description

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing continuity measurement and restart counting the operational uptime (that is, the total time during which CCM adjacency is active for a particular remote MEP.).

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**local-mep *local-mep-id***—(Optional) Display connectivity fault management information for the specified local MEP only.

**remote-mep *remote-mep-id***—(Optional) Display connectivity fault management information for the specified remote MEP only.

```

## clear oam ethernet connectivity-fault-management linktrace path-database

### Syntax

```
clear oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association
    ma-name maintenance-domain md-name
```

### Release Information

Command introduced in Junos OS Release 9.0.

### Description

Clear all the linktrace entries and the relevant path information from the database for a particular remote host on M320, MX Series, T320, and T640 routers.

### Options

**mac-address**—Clear connectivity fault management path database information for the specified MAC address of the remote host.

**maintenance-association *ma-name***—Clear connectivity fault management path database information for the specified maintenance association.

**maintenance-domain *md-name***—Clear connectivity fault management path database information for the specified maintenance domain.

```

This command produces no output.

## clear oam ethernet connectivity-fault-management loss-statistics

### Syntax

```
clear oam ethernet connectivity-fault-management loss-statistics  
<interface ethernet-interface-name>  
<level md-level>
```

### Release Information

Command introduced in Junos OS Release 11.1.

### Description

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear all loss statistics maintained by CFM for a given maintenance domain and maintenance association.

In addition, for Ethernet interfaces on MX Series routers, clear any ITU-T Y.1731 Ethernet frame loss measurement (ETH-LM) statistics.

By default, the command clears ETH-LM statistics for CFM maintenance association end points (MEPs) attached to any interface on the router.

### Options

**interface *ethernet-interface-name***—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs attached to the specified Ethernet physical interface.

**level *md-level***—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.

### Required Privilege Level

management loss-statistics
```

```
user@host> clear oam ethernet connectivity-fault-management loss-statistics
```

```
Cleared loss measurements statistics of all CFM sessions
```

## clear oam ethernet connectivity-fault-management policer

### Syntax

```
clear oam ethernet connectivity-fault-management policer maintenance-domain md-name maintenance-association ma-name
```

### Release Information

Command introduced in Junos OS Release 10.0.

### Description

On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, M120, MX Series, T320, and T640 routers, clear connectivity-fault-management policer statistics.

### Options

The following options are supported:

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are cleared for all maintenance associations for all maintenance domains.

**maintenance-association *ma-name*** —Name of an existing CFM maintenance association. If this option is not specified, policer statistics are cleared for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

### Required Privilege Level

## clear oam ethernet connectivity-fault-management statistics

### Syntax

```
clear oam ethernet connectivity-fault-management statistics
<interface ethernet-interface-name>
<level md-level>
```

### Release Information

Command introduced in Junos OS Release 8.4.

Support for ETH-DM statistics and frame counts added in Junos OS Release 9.5.

### Description

For all routers that support IEEE 802.1ag OAM connectivity-fault management (CFM), clear all statistics maintained by CFM.

In addition, for Ethernet interfaces on Dense Port Concentrators (DPCs) in MX Series routers only, also clear any ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) statistics and ETH-DM frame counts.

By default, the command clears CFM statistics and ETH-DM statistics and frame counts for CFM maintenance association end points (MEPs) attached to any interface on the router.

### Options

**ethernet-interface-name**—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs attached to the specified Ethernet physical interface.

**level**—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.

**clear oam ethernet connectivity-fault-management statistics**

**user@host> clear oam ethernet connectivity-fault-management statistics**

Cleared statistics of all CFM sessions

## clear oam ethernet connectivity-fault-management synthetic-loss-measurement

### Syntax

```
clear oam ethernet connectivity-fault-management synthetic-loss-measurement
maintenance-domain md-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

### Description

(MX Series routers)—For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing on-demand Ethernet synthetic loss measurement (ETH-SLM) statistics and restart counting the ETH-SLM frame counts and statistics.

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**local-mep *local-mep-id***—(Optional) Clear connectivity fault management information for the specified local MEP only.

Synthetic loss measurement restarted.
```

## clear oam ethernet link-fault-management state

### Syntax

```
clear oam ethernet link-fault-management state <interface-name>
```

### Release Information

Command introduced in Junos OS Release 8.4.

### Description

On all M Series, MX Series, ACX series, PTX Series, T320, and T640 routers, clear link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on Ethernet interfaces.

### Options

**none**—Clear OAM link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on all Ethernet interfaces.

**interface-name**—(Optional) Clear OAM link fault management state information, restart the link discovery process, and reset OAM loopback state (if set previously) on the specified Ethernet interface only.

### Required Privilege Level

view

### List of Sample Output

[clear oam ethernet link-fault-management state on page 1448](#)

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
clear oam ethernet link-fault-management state
```

```
user@host> clear oam ethernet link-fault-management state ge-0/3/3
```

```
Cleared link-fault-management state for interface ge-0/3/3
```

## clear oam ethernet link-fault-management statistics

### Syntax

```
clear oam ethernet link-fault-management <interface-name>
```

### Release Information

Command introduced in Junos OS Release 8.2.

### Description

On M320, M120, MX Series, PTX Series, T320, and T640 routers, clear Operation, Administration, and Management (OAM) link fault management statistics or state information from Ethernet interfaces.

### Options

**none**—Clear OAM link fault management statistics from all Ethernet interfaces.

**interface-name**—(Optional) Clear OAM link fault management statistics from the specified Ethernet interface only.

### Required Privilege Level

view

### List of Sample Output

[clear oam ethernet link-fault-management statistics on page 1449](#)

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
clear oam ethernet link-fault-management statistics
```

```
user@host> clear oam ethernet link-fault-management statistics
```

```
Cleared link-fault-management statistics for all interfaces
```

## clear protection-group ethernet-ring statistics

### Syntax

```
clear protection-group ethernet-ring statistics  
<group-name group-name>
```

### Release Information

Command introduced in Junos OS Release 9.4.

### Description

On MX Series routers, clear the statistics for all Ethernet ring protection groups or a specific Ethernet ring protection group.

### Options

**group-name group-name**—(Optional) Clear the Ethernet ring protection statistics for the specified group.

### Required Privilege Level

view

### List of Sample Output

[clear protection-group ethernet-ring statistics on page 1450](#)

[clear protection-group ethernet-ring statistics on page 1450](#)

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**clear protection-group ethernet-ring statistics**

To clear all Ethernet ring protection group statistics for all protection groups, use the following command:

```
user@host> clear protection-group ethernet-ring statistics
```

## Sample Output

**clear protection-group ethernet-ring statistics**

To clear Ethernet ring protection group statistics for the group *my\_prot\_group*, use the following command:

```
user@host> clear protection-group ethernet-ring statistics group-name my_prot_group
```

## monitor ethernet delay-measurement

### Syntax

```
monitor ethernet delay-measurement
maintenance-domain md-name
maintenance-association ma-name
(one-way | two-way)
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-seconds>
<priority 802.1p value>
<size>
<no-session-id-tlv>
<xml>
```

### Release Information

Command introduced in Junos OS Release 9.5.

**local-mep** option introduced in Junos OS Release 15.1.

### Description

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

## Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**one-way**—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (1DM) frame and the time at which the receiver MEP receives the frame.

**two-way**—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.

**mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.

**remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

**count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.

**local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.

**wait *interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

**priority *802.1p value***—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.

**size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

**no-session-id-tlv**—(Optional) Prevent insertion of the session ID TLV in the request frame.

**xml**—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

### Additional Information

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

### Output Fields

The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- [Table 123 on page 1454](#) lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- [Table 124 on page 1454](#) lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

Table 123: monitor ethernet delay-measurement one-way Output Fields

| Output Field Name                | Output Field Description                                                                       |
|----------------------------------|------------------------------------------------------------------------------------------------|
| <b>One-way ETH-DM request to</b> | Unicast MAC address of the remote peer MEP.                                                    |
| <b>Interface</b>                 | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached. |
| <b>1DM Frames sent</b>           | PDU frames sent to the remote MEP in this ETH-DM session.                                      |
| <b>Packets transmitted</b>       | Total number of 1DM PDU frames sent to the remote MEP during this measurement session.         |
| <b>Average delay</b>             | Average two-way frame delay measured in this session.                                          |
| <b>Average delay variation</b>   | Average frame jitter measured in this session.                                                 |
| <b>Best case delay</b>           | Lowest two-way frame delay measured in this session.                                           |
| <b>Worst case delay</b>          | Highest two-way frame delay measured in this session.                                          |

**NOTE:** For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 124: monitor ethernet delay-measurement two-way Output Fields

| Output Field Name                                          | Output Field Description                                                                                        |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Two-way Ethernet frame delay measurement request to</b> | Unicast MAC address of the remote peer MEP.                                                                     |
| <b>Interface</b>                                           | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                  |
| <b>DMR received from</b>                                   | Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.               |
| <b>Delay</b>                                               | Two-way delay, in microseconds, for the initiator-transmitted DMM frame.                                        |
| <b>Delay variation</b>                                     | Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter. |
| <b>Packets transmitted</b>                                 | Total number of DMM PDU frames sent to the remote MEP in this measurement session.                              |

Table 124: monitor ethernet delay-measurement two-way Output Fields (*continued*)

| Output Field Name              | Output Field Description                                                                 |
|--------------------------------|------------------------------------------------------------------------------------------|
| <b>Valid packets received</b>  | Total number of DMR PDU frames received from the remote MEP in this measurement session. |
| <b>Average delay</b>           | Average two-way frame delay measured in this session.                                    |
| <b>Average delay variation</b> | Average frame jitter measured in this session.                                           |
| <b>Best case delay</b>         | Lowest two-way frame delay measured in this session.                                     |
| <b>Worst case delay</b>        | Highest two-way frame delay measured in this session.                                    |

## monitor ethernet loss-measurement

### Syntax

```
monitor ethernet loss-measurement
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-seconds>
<priority 802.1p value>
<no-session-id-tlv>
<xml>
```

### Release Information

Command introduced in Junos OS Release 11.1.

**local-mep** option introduced in Junos OS Release 15.1

### Description

Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

**NOTE:** If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.

**remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

**count frame-count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

**local-mep mep-id**—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait interval-seconds**—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

**priority 802.1p value**—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

**no-session-id-tlv**—(Optional) Disable the **session id TLV** argument set in the request frame.

**xml**—(Optional) Allow the output of the command to be displayed in XML format.

### Additional Information

To display the iterator output for an LM session, run the following command:

- **show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>**

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the [CLI Explorer](#).

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

| <b>Near-end frame loss</b>                        | Count of frame loss associated with ingress data frames.                                                                                                                       |
| <b>Far-end frame loss</b>                         | Count of frame loss associated with egress data frames.                                                                                                                        |
| <b>Near-end loss ratio</b>                        | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface. |
| <b>Far-end loss ratio</b>                         | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.  |

Table 125: monitor ethernet loss-measurement output fields (*continued*)

| Output Field Name                     | Output Field Description                                                                 |
|---------------------------------------|------------------------------------------------------------------------------------------|
| <b>LMM packets transmitted</b>        | Total number of LMM PDU frames sent to the remote MEP in this measurement session.       |
| <b>LMR packets received</b>           | Total number of LMR PDU frames received from the remote MEP in this measurement session. |
| <b>Average near-end frame loss</b>    | Average frame loss measured in this session associated with ingress data frames.         |
| <b>Average near-end loss ratio</b>    | Average frame loss ratio measured in this session associated with ingress data frames.   |
| <b>Average far-end frame loss</b>     | Average frame loss measured in this session associated with egress data frames.          |
| <b>Average far-end loss ratio</b>     | Average frame loss ratio measured in this session associated with egress data frames.    |
| <b>Near-end best case frame loss</b>  | Lowest frame loss measured in this session associated with ingress data frames.          |
| <b>Near-end best case loss ratio</b>  | Lowest frame loss ratio measured in this session associated with ingress data frames.    |
| <b>Near-end worst case frame loss</b> | Highest frame loss measured in this session associated with ingress data frames.         |
| <b>Near-end worst case loss ratio</b> | Highest frame loss ratio measured in this session associated with ingress data frames.   |
| <b>Far-end best case frame loss</b>   | Lowest frame loss measured in this session associated with egress data frames.           |
| <b>Far-end best case loss ratio</b>   | Lowest frame loss ratio measured in this session associated with egress data frames.     |
| <b>Far-end worst case frame loss</b>  | Highest frame loss measured in this session associated with egress data frames.          |
| <b>Far-end worst case loss ratio</b>  | Highest frame loss ratio measured in this session associated with egress data frames.    |

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

## monitor ethernet synthetic-loss-measurement

### Syntax

```
monitor ethernet synthetic-loss-measurement
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-milliseconds>
<priority 802.1p value>
<size>
<xml>
```

### Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

**local-mep** option introduced in Junos OS Release 15.1

### Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

***remote-mac-address***—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

**count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

**local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait *interval-milliseconds***—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

**priority *802.1p value***—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

**size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

**xml**—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

### Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

#### List of Sample Output

[monitor ethernet synthetic-loss-measurement on page 1466](#)

#### Output Fields

The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- [Table 126 on page 1466](#) lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

Table 126: monitor ethernet synthetic-loss-measurement Output Fields

| Output Field Name                        | Output Field Description                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ETH-SLM request to</b>                | Unicast MAC address of the remote peer MEP.                                                                                                                                                                                                                                                                                       |
| <b>Interface</b>                         | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                                                                                                                                                                                                                                    |
| <b>SLM packets sent</b>                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| <b>SLR packets received</b>              | Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.                                                                                                                                                                                             |
| <b>Local TXFC1 value</b>                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| <b>Local RXFC1 value</b>                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| <b>Last Received SLR frame TXFCf(tc)</b> | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| <b>Last Received SLR frame TXFCb(t)</b>  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| <b>Frame loss (near-end)</b>             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| <b>Frame loss (far-end)</b>              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

```

### Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

**local-mep** option introduced in Junos OS Release 15.1

### Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

***remote-mac-address***—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

**count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

**local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait *interval-milliseconds***—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

**priority *802.1p value***—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

**size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

**xml**—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

### Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

#### Output Fields

The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- [Table 126 on page 1466](#) lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

Table 127: monitor ethernet synthetic-loss-measurement Output Fields

| Output Field Name                        | Output Field Description                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ETH-SLM request to</b>                | Unicast MAC address of the remote peer MEP.                                                                                                                                                                                                                                                                                       |
| <b>Interface</b>                         | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                                                                                                                                                                                                                                    |
| <b>SLM packets sent</b>                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| <b>SLR packets received</b>              | Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.                                                                                                                                                                                             |
| <b>Local TXFC1 value</b>                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| <b>Local RXFC1 value</b>                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| <b>Last Received SLR frame TXFCf(tc)</b> | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| <b>Last Received SLR frame TXFCb(t)</b>  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| <b>Frame loss (near-end)</b>             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| <b>Frame loss (far-end)</b>              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

## Sample Output

monitor ethernet synthetic-loss-measurement

```

md6 maintenance-association ma6 count 10
```

ETH-SLM request to 00:05:85:73:39:4a, interface ge-1/0/0.0

Synthetic Loss measurement statistics:

SLM packets sent : 100

SLR packets received : 100

Accumulated SLM statistics:

Local TXFC1 value : 100

Local RXFC1 value : 100

Last Received SLR frame TXFCf(tc) : 100

Last Received SLR frame TXFCb(tc) : 100

SLM Frame Loss:

Frame Loss (far-end) : 0 (0.00 %)

Frame Loss (near-end) : 0 (0.00 %)

## prbs-test-start

### Syntax

```
test interfaces ifd-name prbs-test-start pattern-type type direction 0/1 flip 0/1
```

### Release Information

Command introduced in Junos OS Release 19.2R1 for MX10003 and MX204 router.

### Description

You can check the physical link connectivity by issuing this command that starts collecting the Pseudo Random Binary Sequence (PRBS) statistics. The PRBS pattern generation and verification validates the physical link connectivity in a routers. If the PRBS test passes with PRBS31 pattern type consistently, it indicates that the quality of signal received is good.

This command provides the PRBS test statistics while test is in progress. Use the **clear interfaces statistics** command to clear the collected statistics.

Use the **show interfaces interface-name prbs-stats** command to view the collected statistics.

#### NOTE:

- While running PRBS statistics, the link will be down.
- The interface link status goes down when PRBS is enabled and the interface state is back to the original state when PRBS is disabled.
- On MX10003 routers, the PRBS58 pattern is supported only on JNP-MIC1-MACSEC MIC.

Issue the **prbs-test-stop** command to stop collecting the PRBS statistics .

For the step-by-step procedure on how to collect and view the PRBS statistics, refer "[Verifying Link and Transceivers using Pseudo Random Binary Sequence \(PRBS\) Test](#)" on page 910.

### Options

***ifd-name***—Name of the interface.

***type***—Specifies the pattern type, that is in the range from 7 to 58.

Following pattern types are supported:

| Pattern Type | Pattern Name |
|--------------|--------------|
| 7            | PRBS7        |
| 9            | PRBS9        |

| Pattern Type | Pattern Name                                                                |
|--------------|-----------------------------------------------------------------------------|
| 11           | PRBS11                                                                      |
| 15           | PRBS15                                                                      |
| 23           | PRBS23                                                                      |
| 31           | PRBS31                                                                      |
|              | <b>NOTE:</b> Recommended pattern to check the quality of the received link. |
| 58           | PRBS58                                                                      |

**direction**—Specifies to configure transmit or receive PRBS pattern.

**flip**—Specifies if the pattern bits needs to be flipped or not.

## prbs-test-stop

### Syntax

```
test interfaces ifd-name prbs-test-stop direction (0|1)
```

### Release Information

Command introduced in Junos OS Release 19.2R1 for MX10003 and MX204 routers.

### Description

Use this command to stop collecting the Pseudo Random Binary Sequence (PRBS) statistics that is initiated using [prbs-test-start](#) command. This command only disables the statistics collection and does not clear the statistics collected. To clear the collected statistics, issue the **clear interfaces statistics** command.

For the step-by-step procedure on how to collect and view the PRBS statistics, refer “[Verifying Link and Transceivers using Pseudo Random Binary Sequence \(PRBS\) Test](#)” on page 910.

### Options

***ifd-name***—Name of the interface.

```

## request interface link-degrade-recover

### Syntax

```
request interface link-degrade-recover interfaces-name
```

### Release Information

Command introduced in Junos OS Release 15.1.

### Description

Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.

**NOTE:** Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.

### Options

*interfaces-name*—Name of the interface.

## request interface mc-ae switchover (Multichassis Link Aggregation)

### Syntax

```
request interface mc-ae switchover
<immediate> mcae-id mcae-id;
mcae-id mcae-id;
```

### Release Information

Command introduced in Junos OS Release 13.3.

### Description

Manually revert egress traffic from the active node to the designated preferred node of a multichassis aggregated Ethernet interface. You can use this command to manually switch over traffic to the preferred node when the **switchover-mode** statement for the multichassis aggregated Ethernet interface is configured as **non-revertive** at the **[edit interfaces aeX mc-ae]** hierarchy level.

**NOTE:** To run this command successfully, the **status-control** statement should be configured as **active** at the **[edit interfaces aeX mc-ae]** hierarchy level.

### Options

**immediate**—(Optional) Trigger immediate switchover to the preferred node. If this option is not configured, Junos OS waits for the timer configured using the **revert-time** statement at the **[edit interfaces aeX mc-ae]** hierarchy level to expire before it triggers the switchover.

**mcae-id *mcae-id***—Triggers switchover for the specified mc-ae interface.

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
request interface mc-ae switchover immediate mcae-id
```

```
user@host >request interface mc-ae switchover immediate mcae-id 2
```

```
MCAE: Switchover Done
```

## Sample Output

```
request interface mc-ae switchover mcae-id
```

```
user@host >request interface mc-ae switchover mcae-id 2
```

```
Switchover In Progress: Please check after 1 minutes,
```

```
Use "show interfaces mc-ae revertive-info" to check for the status
```

## request interface (revert | switchover) (Aggregated Ethernet Link Protection)

### Syntax

```
request interface (revert | switchover) aex
```

### Release Information

Command introduced in Junos OS Release 8.3.

### Description

Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

**NOTE:** When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the **request interface (revert | switchover) (Aggregated Ethernet Link Protection)** operational command and specifying the **revert** keyword.

On M Series and T Series routers, use the **request interface (revert | switchover) (Adaptive Services)** operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see *request interface (revert | switchover) (Adaptive Services)*.

### Options

**revert**—Restores egress traffic processing to the primary link.

**switchover**—Transfers egress traffic processing to the secondary (backup) link.

**aex**—Aggregated Ethernet logical interface number: 0 through 15.

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
request interface revert
```

```
user@host >request interface revert ae1
```

## request lacp link-switchover

### Syntax

```
request lacp link-switchover aex
```

### Release Information

Command introduced in Junos OS Release 9.3.

### Description

Manually switch aggregated Ethernet active or standby LACP links.

**NOTE:** Because this command overrides LACP priority calculations, we strongly recommend that you use this command only when the actor (in this case, the Juniper Networks router) is controlling the active or standby link and the partner (peer) is following. This scenario occurs when you configure only the actor for link protection.

### Options

**aex**—Aggregated Ethernet logical interface number: 0 through 15.

## Release Information

Command introduced before Junos OS Release 7.4.

**models** option introduced in Junos OS Release 8.2.

Command introduced in Junos OS Release 9.0 for EX Series switches.

**sfc** option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.

Command introduced in Junos OS Release 11.1 for QFX Series.

Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Command introduced in Junos OS Release 12.3 for MX2010 and MX2020 Universal Routing Platforms.

Information for **disk** and **usb** introduced in Junos OS Release 15.1X53-D60 for QFX10002, QFX10008, and QFX10016 switches.

Command introduced in Junos OS Release 15.1X54-D20 for ACX5048 and ACX5096 Routers.

Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms and PTX10008 Routers.

Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms and MX150 Router Appliance.

Command introduced in Junos OS Release 17.4 for MX204 Routers.

Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.

Command introduced in Junos OS Release 18.2R1 for MX10008 Routers and EX9253 Switches.

**NOTE:** Routers and routing platforms use the basic syntax, unless otherwise listed. For example, the EX Series has an additional satellite parameter available.

## Description

Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In the EX Series switch command output, FPC refers to the following:

- On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; *FPC number* is always 0.
- On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; *FPC number* equals the member ID, from 0 through 9.
- On EX8208 and EX8216 switches—Refers to a line card; *FPC number* equals the slot number for the line card.

On QFX3500, QFX5100, and OCX Series standalone switches, and PTX1000 routers both the FPC and *FPC number* are always 0.

On T4000 Type 5 FPCs, there are no **top temperature sensor** or **bottom temperature sensor** parameters. Instead, **fan intake temperature sensor** and **fan exhaust temperature sensors** parameters are displayed.

Starting from Junos OS Release 11.4, the output of the **show chassis hardware models** operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

## Options

**none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

**clei-models**—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

**detail**—(Optional) Include RAM and disk information in output.

**extensive**—(Optional) Display ID EEPROM information.

**all-members**—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member *member-id***—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**satellite [*slot-id slot-id* | *device-alias alias-name*]**—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

### Additional Information

The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines, as shown in [Table 128 on page 1489](#).

Table 128: Routing Engines Displaying DIMM Information

| Routing Engines             | Routers                         |
|-----------------------------|---------------------------------|
| RE-S-1800x2 and RE-S-1800x4 | MX240, MX480, and MX960 routers |
| RE-A-1800x2                 | M120 and M320 routers           |

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 17.3R1, the output of the **show chassis hardware** command displays the mode in which vMX is running (performance mode or lite mode) in the part number field for the FPC. **RIOT-PERF** indicates performance mode and **RIOT-LITE** indicates lite mode.

```

### Release Information

Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.

Command introduced in Junos OS Release 11.1 for QFX Series.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2010 and MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers and MX104 3D Universal Edge Routers.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**transport** option introduced in Junos OS Release 16.1R1 for MX Series Routers.

Command introduced in Junos OS Release 17.2 for MX2008 3D Universal Edge Routers and PTX10008 Routers.

Command introduced in Junos OS Release 17.3 for MX10003 3D Universal Edge Routers and MX150 Router Appliance.

Command introduced in Junos OS Release 17.4 for MX204 3D Universal Edge Routers.

### Description

Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

### Options

**fpc-slot slot-number**—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from **0** through **7**. Otherwise, replace **slot-number** with a value from **0** through **31**.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from **0** through **7**. Otherwise, replace **slot-number** with a value from **0** through **31**. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- MX2008 routers only—Replace **slot-number** with a value from 0 through 9.
- MX10003 routers only—Replace **slot-number** with a value from 0 through 1.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

## Output Fields

[Table 130 on page 1509](#) lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 130: show chassis pic Output Fields

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                    | <p>PIC type.</p> <p><b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b>. By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b>.</p> |
| Account Layer2 Overhead | (MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.                                                                                                                                                                |
| ASIC type               | Type of ASIC on the PIC.                                                                                                                                                                                                                                                                                                    |

Table 130: show chassis pic Output Fields (*continued*)

| Field Name                                                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## show ethernet-switching redundancy-groups

### Syntax

```
show ethernet-switching redundancy-groups  
<redundancy-group-id [0 to 4294967294]>  
arp-statistics  
nd-statistics  
remote-macs
```

### Release Information

Command introduced in Junos OS Release 13.2.

Command introduced in Junos OS Release 15.1R1 for EX Series switches

### Description

Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

### Options

**redundancy-group-id**—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.

**arp-statistics**—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.

**nd-statistics**—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.

**remote-macs** —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.

### Required Privilege Level

|----------------------------------|---------------------------------------------------------------------------------|
| ND Rx Count From Peer            | Total number of Neighbor Discovery packets received from the peer.              |
| ND Drop Count received from line | Total number of Neighbor Discovery packets sent by the peer that were received. |
| ND Drop Count received from peer | Total number of Neighbor Discovery packets sent by the peer that were dropped   |
| ND Install Count                 | ND Install Count                                                                |

Table 133: show ethernet-switching redundancy-groups remote-macs Output Fields

| Field Name          | Field Description                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| Redundancy Group ID | Redundancy Group to which the following details apply.                                                             |
| Service ID          | Service ID (configured at the routing instance level).                                                             |
| Peer-Addr           | IP address of the remote peer.                                                                                     |
| VLAN                | Virtual LAN identifier associated with the redundancy group.                                                       |
| MAC                 | Hardware media access control address associated with the redundancy group.                                        |
| MCAE-ID             | ID number of the MC-AE used by the redundancy group.                                                               |
| Flags               | Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected. |
| Status              | Installation state: Installed or Not Installed.                                                                    |

## Sample Output

**show ethernet-switching redundancy-groups arp-statistics**

```
user@host> show ethernet-switching redundancy-groups arp-statistics
```

```
Redundancy Group ID : 1      Flags : Local Connect,Remote Connect
```

#### MCLAG ARP Statistics

```
Group ID                : 1
ARP Rx Count From Line  : 3493
ARP Tx Count To Peer    : 647
ARP Rx Count From Peer  : 0
ARP Install Count       : 0
ARP Drop Count received from line : 2846
ARP Drop Count received from peer  : 0
```

### show ethernet-switching redundancy-groups nd-statistics

```
user@host> show ethernet-switching redundancy-groups nd-statistics
```

```
Redundancy Group ID : 1      Flags : Local Connect, Remote Connect
```

#### MCLAG ND Statistics

```
Group ID                : 1
ND Rx Count From Line   : 52
ND Tx Count To Peer     : 15
ND Rx Count From Peer   : 39
ND Install Count        : 34
ND Drop Count received from line : 37
ND Drop Count received from peer  : 5
```

### show ethernet-switching redundancy-groups remote-macs

```
user@host> show ethernet-switching redundancy-groups <redundancy-group-id> remote-macs
```

```
Redundancy Group ID : 1      Flags : Local Connect,Remote Connect
```

| Service-id | Peer-Addr | VLAN | MAC               | MCAE-ID | Subunit | Opcode |
|------------|-----------|------|-------------------|---------|---------|--------|
| Flags      | Status    |      |                   |         |         |        |
| 10         | 10.3.3.2  | 100  | 80:ac:ac:1f:10:a1 | 1       | 0       | 1 0    |
|            | Installed |      |                   |         |         |        |

**show ethernet-switching redundancy-groups group-id**

user@host> **show ethernet-switching redundancy-groups 1**

```
Redundancy Group ID : 1          Flags : Local Connect,Remote Connect
```

## show interfaces (Adaptive Services)

### Syntax

```
show interfaces interface-type
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

Display status information about the specified adaptive services interface.

### Options

***interface-type***—On M Series and T Series routers, the interface type is **sp- *fpc/pic/port***.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

### Required Privilege Level

view

### List of Sample Output

[show interfaces brief \(Adaptive Services\) on page 1550](#)

[show interfaces detail \(Adaptive Services\) on page 1550](#)

[show interfaces extensive \(Adaptive Services\) on page 1551](#)

### Output Fields

[Table 134 on page 1546](#) lists the output fields for the **show interfaces** (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

Table 134: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields

| Field Name                | Field Description                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                    |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                    |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Fields Description</i> .                             |
| <b>Interface index</b>    | Physical interface's index number, which reflects its initialization sequence.                                                                     |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                      |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                  |
| <b>Type</b>               | Encapsulation being used on the interface.                                                                                                         |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                |
| <b>MTU</b>                | MTU size on the physical interface.                                                                                                                |
| <b>Clocking</b>           | Reference clock source: can be <b>Internal</b> or <b>External</b> .                                                                                |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                           |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Output Fields Description</i> .           |
| <b>Link type</b>          | Physical interface link type: <b>Full-Duplex</b> or <b>Half-Duplex</b> .                                                                           |
| <b>Link flags</b>         | Information about the link. Possible values are described in the “Link Flags” section under <i>Fields Description</i> .                            |
| <b>Physical info</b>      | Information about the physical interface.                                                                                                          |
| <b>Hold-times</b>         | Current interface hold-time up and hold-time down, in milliseconds.                                                                                |
| <b>Current address</b>    | Configured MAC address.                                                                                                                            |
| <b>Hardware address</b>   | MAC address of the hardware.                                                                                                                       |

Table 134: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped <i>year-month-day hour:minute:second timezone (hour:minute:second ago)</i></b> . For example, <b>Last flapped 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <p><b>NOTE:</b> With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field because of the accounting of 16 bytes of the Juniper Forwarding Module cookie.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                          |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meanings are obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the queue is saturated, this number increments once for every packet that is dropped by the ASIC.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Frames received smaller than the runt threshold.</li> <li>• <b>Giants</b>—Frames received larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not support.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> |

Table 134: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Output errors</b>      | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning is not obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number normally increments quickly, increasing only when the cable is unplugged, the far-end system goes down and then up, or another problem occurs. If the number of carrier transitions increments slowly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the queue is saturated, this number increments once for every packet that is dropped by the ASIC.</li> <li>• <b>MTU errors</b>—Number of packets larger than the MTU threshold.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> |
| <b>Logical Interface</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Logical interface</b>  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Index</b>              | Logical interface index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SNMP ifIndex</b>       | SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flags</b>              | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Encapsulation</b>      | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Input packets</b>      | Number of packets received on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Output packets</b>     | Number of packets transmitted on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Local statistics</b>   | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic occurs, the value in the output packet rate field might briefly exceed the peak cell rate. It takes less than 1 second for this counter to stabilize.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 134: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields *(continued)*

| Field Name                    | Field Description                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transit statistics</b>     | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the value to stabilize. |
| <b><i>protocol-family</i></b> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address is also displayed.                                                                                                   |
| <b>Protocol</b>               | Protocol family configured on the logical interface, such as <b>iso</b> , <b>inet6</b> , <b>mpls</b> .                                                                                                                    |
| <b>MTU</b>                    | MTU size on the logical interface.                                                                                                                                                                                        |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                         |
| <b>Route table</b>            | Routing table in which the logical interface address is located. For example, <b>0</b> refers to the inet.0.                                                                                                              |
| <b>Flags</b>                  | Information about the protocol family flags. Possible values are described in the “Family Flags” section of the <i>Common Output Fields Description</i> .                                                                 |
| <b>Addresses, Flags</b>       | Information about the address flags. Possible values are described in the “Addresses and Flags” section of the <i>Common Output Fields Description</i> .                                                                  |
| <b>Destination</b>            | IP address of the remote side of the connection.                                                                                                                                                                          |
| <b>Local</b>                  | IP address of the logical interface.                                                                                                                                                                                      |
| <b>Broadcast</b>              | Broadcast address.                                                                                                                                                                                                        |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                         |

## Sample Output

### show interfaces (Adaptive Services)

```
user@host> show interfaces sp-1/2/0
```

```
Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Interface index: 147, SNMP ifIndex: 72
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
```

```

Speed: 800mbps
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
Link type      : Full-Duplex
Link flags     : None
Last flapped   : 2006-03-06 11:37:18 PST (00:57:29 ago)
Input rate     : 0 bps (0 pps)
Output rate    : 0 bps (0 pps)

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
  Input packets : 3057
  Output packets: 3044
  Protocol inet, MTU: 9192
    Flags: Receive-options, Receive-TTL-Exceeded
    Addresses, Flags: Is-Preferred Is-Primary
      Destination: 10.0.0.34, Local: 10.0.0.1

```

### show interfaces brief (Adaptive Services)

user@host> **show interfaces sp-1/2/0 brief**

```

Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
  Clocking: Unspecified, Speed: 800mbps
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000

Logical interface sp-1/2/0.16383
  Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
  inet  10.0.0.1          --> 10.0.0.34

```

### show interfaces detail (Adaptive Services)

user@host> **show interfaces sp-1/2/0 detail**

```

Physical interface: sp-1/2/0, Enabled, Physical link is Up
  Interface index: 147, SNMP ifIndex: 72, Generation: 30
  Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
  Clocking: Unspecified, Speed: 800mbps
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
Link type      : Full-Duplex

```

```

Link flags      : None
Physical info   : Unspecified
Hold-times      : Up 0 ms, Down 0 ms
Current address: Unspecified, Hardware address: Unspecified
Alternate link address: Unspecified
Last flapped    : 2006-03-06 11:37:18 PST (00:57:56 ago)
Statistics last cleared: Never
Traffic statistics:
  Input  bytes :          125147          0 bps
  Output bytes :          1483113        0 bps
  Input  packets:           3061        0 pps
  Output packets:           3048        0 pps

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73) (Generation 7)
  Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
  Traffic statistics:
    Input  bytes :          125147
    Output bytes :          1483113
    Input  packets:           3061
    Output packets:           3048
  Local statistics:
    Input  bytes :          125147
    Output bytes :          1483113
    Input  packets:           3061
    Output packets:           3048
  Transit statistics:
    Input  bytes :              0          0 bps
    Output bytes :              0          0 bps
    Input  packets:              0          0 pps
    Output packets:              0          0 pps
  Protocol inet, MTU: 9192, Generation: 20, Route table: 1
  Flags: Receive-options, Receive-TTL-Exceeded
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.0.0.34, Local: 10.0.0.1, Broadcast: Unspecified,

## show interfaces (Aggregated Ethernet)

### Syntax

```
show interfaces aenumber
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

(M Series, T Series, MX Series, and PTX Series routers) Display status information about the specified aggregated Ethernet interfaces.

### Options

***aenumber***—Display standard information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

**NOTE:** On Junos OS Evolved, in untagged aggregated ethernet (ae) interfaces with no logical interface configuration, the ae interface will not be shown as "down" and the speed will not be shown as "unspecified." The speed will be the aggregate speed of all the child member interfaces which are "up." In Junos OS, the speed is shown as "unspecified" in this case.

**Output Fields**

Table 135 on page 1554 lists the output fields for the **show interfaces** (Aggregated Ethernet) command. Output fields are listed in the approximate order in which they appear.

**Table 135: Aggregated Ethernet show interfaces Output Fields**

| Field Name                | Field Description                                                                                                                             | Level of Output                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Physical Interface</b> |                                                                                                                                               |                                 |
| <b>Physical interface</b> | Name of the physical interface and state of the interface.                                                                                    | All levels                      |
| <b>Enabled</b>            | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels                      |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                           | All levels                      |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                 | <b>detail extensive</b><br>none |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                             | <b>detail extensive</b>         |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                           | All levels                      |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                     | All levels                      |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                      | All levels                      |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                | All levels                      |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                  | All levels                      |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                      | All levels                      |

Table 135: Aggregated Ethernet show interfaces Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output         |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Minimum links needed</b>    | Number of child links that must be operational for the aggregate interface to be operational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | All levels              |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels              |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interfaces Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels              |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Hardware address</b>        | Hardware MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up or from up to down. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | None specified          |
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | None specified          |

| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>         |
| <b>Queue counters</b>          | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p> | <b>detail extensive</b>         |
| <b>Logical Interface</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                 |

Table 135: Aggregated Ethernet show interfaces Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                          | Level of Output                 |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Maximum labels</b>        | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                            | <b>detail extensive</b><br>none |
| <b>Generation</b>            | Unique number for use by Juniper Networks technical support only.                                                                                          | <b>detail extensive</b>         |
| <b>Route Table</b>           | Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.                                 | <b>detail extensive</b>         |
| <b>Flags</b>                 | Information about protocol family flags. Possible values are described in the “Family Flags Field” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b><br>none |
| <b>Mac-Validate Failures</b> | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface. | <b>detail extensive</b><br>none |
| <b>Addresses, Flags</b>      | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .            | <b>detail extensive</b><br>none |
| <b>Destination</b>           | IP address of the remote side of the connection.                                                                                                           | <b>detail extensive</b><br>none |
| <b>Local</b>                 | IP address of the logical interface.                                                                                                                       | <b>detail extensive</b><br>none |
| <b>Broadcast</b>             | Broadcast address of the logical interface.                                                                                                                | <b>detail extensive</b><br>none |
| <b>Generation</b>            | Unique number for use by Juniper Networks technical support only.                                                                                          | <b>detail extensive</b>         |

## Sample Output

### show interfaces (Aggregated Ethernet)

```
user@host> show interfaces ae0
```

```
Physical interface: ae0, Enabled, Physical link is Up
  Interface index: 153, SNMP ifIndex: 59
  Link-level type: Ethernet, MTU: 1514, Speed: 300mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1
```

```

Device flags      : Present Running
Interface flags: SNMP-Traps 16384
Current address: 00:00:5e:00:53:f0, Hardware address: 00:00:5e:00:53:f0
Last flapped     : Never
Input rate       : 0 bps (0 pps)
Output rate      : 0 bps (0 pps)

Logical interface ae0.0 (Index 72) (SNMP ifIndex 60)
  Flags: SNMP-Traps 16384 Encapsulation: ENET2
  Statistics
  Packets      pps      Bytes      bps
Bundle:
  Input :      0      0      0      0
  Output:      0      0      0      0
  Protocol inet, MTU: 1500
  Flags: None
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 203.0.113/24, Local: 203.0.113.2, Broadcast: 10.100.1.255

```

### show interfaces brief (Aggregated Ethernet)

```
user@host> show interfaces ae0 brief
```

```

Physical interface: ae0, Enabled, Physical link is Up
Link-level type: Ethernet, MTU: 1514, Speed: 300mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled
Device flags      : Present Running
Interface flags: SNMP-Traps 16384

Logical interface ae0.0
  Flags: SNMP-Traps 16384 Encapsulation: ENET2
  inet 203.0.113.2/24

```

### show interfaces detail (Aggregated Ethernet)

```
user@host> show interfaces ae0 detail
```

```

Physical interface: ae0, Enabled, Physical link is Up
Interface index: 153, SNMP ifIndex: 59, Generation: 36
Link-level type: Ethernet, MTU: 1514, Speed: 300mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1
Device flags      : Present Running
Interface flags: SNMP-Traps 16384
Current address: 00:00:5e:00:53:f0, Hardware address: 00:00:5e:00:53:f0

```

```

## show interfaces demux0 (Demux Interfaces)

### Syntax

```
show interfaces demux0.logical-interface-number
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced in Junos OS Release 9.0.

### Description

(MX Series and M Series routers only) Display status information about the specified demux interface.

### Options

**none**—Display standard information about the specified demux interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index snmp-index**—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

### Required Privilege Level

| <b>Traffic statistics</b> | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> <li>• <b>IPv6 transit statistics</b>—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</li> </ul> <p><b>NOTE:</b> These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b> |
| <b>Input errors</b>       | <p>Input errors on the interface whose definitions are as follows:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant packet threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                        | <b>extensive</b>        |
| <b>Input Rate</b>         | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | none                    |

Table 136: show interfaces demux0 (Demux Interfaces) Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output                              |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Output errors</b>                 | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>                             |
| <b>Output Rate</b>                   | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | none                                         |

| <b>ACI VLAN:<br/>Dynamic Profile</b> | Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>brief detail</b><br><b>extensive</b> none |

Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b><br>none |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b><br>none |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>         |
| <b>Route table</b>             | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b><br>none |

Table 136: show interfaces demux0 (Demux Interfaces) Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                    | Level of Output                                   |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Mac-Validate Failures</b> | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                                                                                                                           | <b>detail extensive</b><br>none                   |
| <b>Addresses, Flags</b>      | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                  | <b>detail extensive</b><br>none                   |
| <b>Destination</b>           | IP address of the remote side of the connection.                                                                                                                                                                                                                                                     | <b>detail extensive</b><br><b>statistics</b> none |
| <b>Local</b>                 | IP address of the logical interface.                                                                                                                                                                                                                                                                 | <b>detail extensive</b><br><b>terse</b> none      |
| <b>Remote</b>                | IP address of the remote interface.                                                                                                                                                                                                                                                                  | <b>terse</b>                                      |
| <b>Broadcast</b>             | Broadcast address of the logical interlace.                                                                                                                                                                                                                                                          | <b>detail extensive</b><br>none                   |
| <b>Generation</b>            | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                    | <b>detail extensive</b>                           |
| <b>Link</b>                  | Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.                                                                                                                    | <b>detail extensive</b><br>none                   |
| <b>Dynamic-profile</b>       | Name of the PPPoE dynamic profile assigned to the underlying interface.                                                                                                                                                                                                                              | <b>detail extensive</b><br>none                   |
| <b>Service Name Table</b>    | Name of the PPPoE service name table assigned to the PPPoE underlying interface.                                                                                                                                                                                                                     | <b>detail extensive</b><br>none                   |
| <b>Max Sessions</b>          | Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.                                                                                                                                                                                         | <b>detail extensive</b><br>none                   |
| <b>Duplicate Protection</b>  | State of duplicate protection: <b>On</b> or <b>Off</b> . Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface. | <b>detail extensive</b><br>none                   |
| <b>Direct Connect</b>        | State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.                                                                                                 | <b>detail extensive</b><br>none                   |

Table 136: show interfaces demux0 (Demux Interfaces) Output Fields (*continued*)

| Field Name | Field Description                | Level of Output          |
|------------|----------------------------------|--------------------------|
| AC Name    | Name of the access concentrator. | detail extensive<br>none |

## Sample Output

### show interfaces demux0 (Demux)

user@host> show interfaces demux0

```
Physical interface: demux0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 79, Generation: 129
  Type: Software-Pseudo, Link-level type: Unspecified, MTU: 9192, Clocking: 1,
  Speed: Unspecified
  Device flags      : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type        : Full-Duplex
  Link flags       : None
  Physical info    : Unspecified
  Hold-times       : Up 0 ms, Down 0 ms
  Current address: Unspecified, Hardware address: Unspecified
  Alternate link address: Unspecified
  Last flapped     : Never
  Statistics last cleared: Never
  Traffic statistics:
    Input  bytes   :                0          0 bps
    Output bytes   :                0          0 bps
    Input packets:                0          0 pps
    Output packets:                0          0 pps
  IPv6 transit statistics:
    Input  bytes   :                0
    Output bytes   :                0
    Input  packets:                0
    Output packets:                0
  Input errors:
    Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0,
    Policed discards: 0, Resource errors: 0
  Output errors:
    Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0,
    Resource errors: 0
```

```

Logical interface demux0.0 (Index 87) (SNMP ifIndex 84) (Generation 312)
  Flags: SNMP-Traps 0x4000 Encapsulation: ENET2
  Demux:
    Underlying interface: ge-2/0/1.0 (Index 74)
  Family Inet Source prefixes, total 1
  Prefix: 203.0.113/24
  Traffic statistics:
    Input  bytes   :                0
    Output bytes   :             1554
    Input  packets :                0
    Output packets :             37
  IPv6 transit statistics:
    Input  bytes   :                0
    Output bytes   :                0
    Input  packets :                0
    Output packets :                0
  Local statistics:
    Input  bytes   :                0
    Output bytes   :             1554
    Input  packets :                0
    Output packets :             37

## show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)

### Syntax

```
show interfaces diagnostics optics interface-name
```

### Release Information

Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 12.1 for PTX Series routers.

Command introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

### Description

Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces.

### Options

***interface-name***—Interface name. For example:

***ge-fpc/pic/port***

***et-fpc/pic/port***

***et-fpc/pic/port:channel***

***xe-fpc/pic/port***

***vcp-fpc/pic/port***

### Additional Information

The transceivers are polled in 1-second intervals for diagnostics data, warnings, and alarms. The alarms do not cause the links to go down or the LEDs to change color, nor generate SNMP traps. Changes in alarm and warning status generate system log messages.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transceiver vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a device is not working.

**NOTE:** Some transceivers do not support all optical diagnostics features described in the output fields.

If optics measures transmit or receive power as zero, then, the measured power is displayed as **0.000 mW / - Inf dBm**

You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode. When the PIC is in 40-Gigabit Ethernet mode, you must execute the **show interfaces diagnostics optics et-fpc/pic/port** command. The output of this command displays the diagnostic optics information about the corresponding 40-Gigabit Ethernet port of the PIC. However, when the PIC is in 10-Gigabit Ethernet mode, you must execute the **show interfaces diagnostics optics et-fpc/pic/port:channel** command. The output of this command displays the diagnostic optics information about the corresponding 10-Gigabit Ethernet port of the PIC. For information about the P2-10G-40G-QSFPP PIC, see “P2-10G-40G-QSFPP PIC Overview” on page 207.

### Output Fields

[Table 137 on page 1582](#) lists the output fields for the **show interfaces diagnostics optics** command for DWDM and DWDM OTN PICs. Output fields are listed in the approximate order in which they appear.

**Table 137: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs**

| Field Name                                   | Field Description                                                                                                                                                        |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical interface</b>                    | Name of the physical interface.                                                                                                                                          |
| <b>Laser bias current</b>                    | Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.               |
| <b>Laser output power</b>                    | Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the <b>LsPOWMON</b> pin in hardware.                   |
| <b>Receiver signal average optical power</b> | Average received optical power, in mW and dBm. This indicator is a software equivalent to the <b>RxPOWMON</b> pin in hardware. Average optical power is vendor-specific. |
| <b>Laser end-of-life alarm</b>               | Laser end-of-life alarm: <b>On</b> or <b>Off</b> .                                                                                                                       |
| <b>Laser wavelength alarm</b>                | Laser wavelength alarm: <b>On</b> or <b>Off</b> .                                                                                                                        |
| <b>Laser bias current alarm</b>              | Laser bias current alarm: <b>On</b> or <b>Off</b> .                                                                                                                      |
| <b>Laser temperature alarm</b>               | Laser temperature alarm: <b>On</b> or <b>Off</b> .                                                                                                                       |
| <b>Laser power alarm</b>                     | Laser power alarm: <b>On</b> or <b>Off</b> .                                                                                                                             |
| <b>Modulator temperature alarm</b>           | Modulator temperature alarm: <b>On</b> or <b>Off</b> .<br><br>Transceivers from some vendors do not support this field.                                                  |
| <b>Modulator bias alarm</b>                  | Modulator bias alarm: <b>On</b> or <b>Off</b> .                                                                                                                          |
| <b>Tx multiplexer FIFO error alarm</b>       | Transmit multiplexer first in, first out (FIFO) error alarm: <b>On</b> or <b>Off</b> .                                                                                   |

Table 137: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs (*continued*)

| Field Name                                    | Field Description                                                                                                          |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Tx loss of PLL lock alarm</b>              | Transmit loss of phase-locked loop (PLL) lock alarm: <b>On</b> or <b>Off</b> .                                             |
| <b>Rx loss of average optical power alarm</b> | Receive loss of average optical power alarm: <b>On</b> or <b>Off</b> .                                                     |
| <b>Rx loss of AC power alarm</b>              | Receive loss of AC power alarm: <b>On</b> or <b>Off</b> .<br><br>Transceivers from some vendors do not support this field. |
| <b>Rx loss of PLL lock alarm</b>              | Receive loss of phase-locked loop (PLL) lock alarm: <b>On</b> or <b>Off</b> .                                              |

Table 138 on page 1583 lists the output fields for the **show interfaces diagnostics optics** command when the router is operating with bidirectional SFP optics. Output fields are listed in the approximate order in which they appear.

Table 138: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics

| Field Name                                   | Field Description                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical interface</b>                    | Name of the physical interface.                                                                                                                            |
| <b>Laser bias current</b>                    | Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents. |
| <b>Laser output power</b>                    | Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).                                                                           |
| <b>Module temperature</b>                    | Temperature of the optics module, in Celsius and Fahrenheit.                                                                                               |
| <b>Module voltage</b>                        | Internally measured module voltage.                                                                                                                        |
| <b>Receiver signal average optical power</b> | Average received optical power, in mW and dBm.                                                                                                             |
| <b>Wavelength Channel number</b>             | Wavelength channel number set in the optics module.                                                                                                        |
| <b>Wavelength setpoint</b>                   | Wavelength set in the optics module.                                                                                                                       |

Table 138: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics  
(continued)

| Field Name                             | Field Description                                                                |
|----------------------------------------|----------------------------------------------------------------------------------|
| <b>Tx Dither</b>                       | Transmit dither status. Displays whether transmit dither is enabled or disabled. |
| <b>Frequency Error</b>                 | Frequency error reported from optics module.                                     |
| <b>Wavelength Error</b>                | Wavelength error reported from optics module.                                    |
| <b>Laser bias current high alarm</b>   | Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .          |
| <b>Laser bias current low alarm</b>    | Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .           |
| <b>Laser bias current high warning</b> | Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .        |
| <b>Laser bias current low warning</b>  | Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .         |
| <b>Laser output power high alarm</b>   | Laser output power high alarm. Displays <b>on</b> or <b>off</b> .                |
| <b>Laser output power low alarm</b>    | Laser output power low alarm. Displays <b>on</b> or <b>off</b> .                 |
| <b>Laser output power high warning</b> | Laser output power high warning. Displays <b>on</b> or <b>off</b> .              |
| <b>Laser output power low warning</b>  | Laser output power low warning. Displays <b>on</b> or <b>off</b> .               |
| <b>Module temperature high alarm</b>   | Module temperature high alarm. Displays <b>on</b> or <b>off</b> .                |
| <b>Module temperature low alarm</b>    | Module temperature low alarm. Displays <b>on</b> or <b>off</b> .                 |
| <b>Module temperature high warning</b> | Module temperature high warning. Displays <b>on</b> or <b>off</b> .              |

Table 138: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics

|-----------------------------------------|--------------------------------------------------------------------------------------------------|
| Module temperature low warning          | Module temperature low warning. Displays <b>on</b> or <b>off</b> .                               |
| Module voltage high alarm               | Module voltage high alarm. Displays <b>on</b> or <b>off</b> .                                    |
| Module voltage low alarm                | Module voltage low alarm. Displays <b>on</b> or <b>off</b> .                                     |
| Module voltage high warning             | Module voltage high warning. Displays <b>on</b> or <b>off</b> .                                  |
| Module voltage low warning              | Module voltage high warning. Displays <b>on</b> or <b>off</b> .                                  |
| Laser rx power high alarm               | Receive laser power high alarm. Displays <b>on</b> or <b>off</b> .                               |
| Laser rx power low alarm                | Receive laser power low alarm. Displays <b>on</b> or <b>off</b> .                                |
| Laser rx power high warning             | Receive laser power high warning. Displays <b>on</b> or <b>off</b> .                             |
| Laser rx power low warning              | Receive laser power low warning. Displays <b>on</b> or <b>off</b> .                              |
| TEC fault alarm                         | TEC fault alarm. Displays <b>on</b> or <b>off</b> .                                              |
| Wavelength unlocked alarm               | Wavelength unlocked alarm. Displays <b>on</b> or <b>off</b> .                                    |
| TxTune                                  | Optical transmit side status. Displays whether optical transmit side is not ready due to tuning. |
| Laser bias current high alarm threshold | Vendor-specified threshold for the laser bias current high alarm: <b>70.000 mA</b> .             |
| Laser bias current low alarm threshold  | Vendor-specified threshold for the laser bias current low alarm: <b>0.0002 mA</b> .              |

Table 138: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics  
(continued)

| Field Name                                | Field Description                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Laser bias current high warning threshold | Vendor-specified threshold for the laser bias current high warning: <b>65.000 mA</b> .                     |
| Laser bias current low warning threshold  | Vendor-specified threshold for the laser bias current low warning: <b>0.0002 mA</b> .                      |
| Laser output power high alarm threshold   | Vendor-specified threshold for the laser output power high alarm: <b>1.0000 mW</b> or <b>0.00 dBm</b> .    |
| Laser output power low alarm threshold    | Vendor-specified threshold for the laser output power low alarm: <b>0.0560 mW</b> or <b>-12.52 dBm</b> .   |
| Laser output power high warning threshold | Vendor-specified threshold for the laser output power high warning: <b>0.6300 mW</b> or <b>-2.01 dBm</b> . |
| Laser output power low warning threshold  | Vendor-specified threshold for the laser output power low warning: <b>0.0890 mW</b> or <b>-10.51 dBm</b> . |
| Module temperature high alarm threshold   | Vendor-specified threshold for the module temperature high alarm: <b>100° C</b> or <b>212° F</b> .         |
| Module temperature low alarm threshold    | Vendor-specified threshold for the module temperature low alarm: <b>-50° C</b> or <b>-58° F</b> .          |
| Module temperature high warning threshold | Vendor-specified threshold for the module temperature high warning: <b>95 ° C</b> or <b>203 ° F</b> .      |
| Module temperature low warning threshold  | Vendor-specified threshold for the module temperature low warning: <b>-48° C</b> or <b>-54° F</b> .        |
| Module voltage high alarm threshold       | Module voltage high alarm threshold: <b>3.700 v</b> .                                                      |

Table 138: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

| Field Name                            | Field Description                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------|
| Module voltage low alarm threshold    | Module voltage low alarm threshold: 2.900 v.                                            |
| Module voltage high warning threshold | Module voltage high warning threshold: 3.7600 v.                                        |
| Module voltage low warning threshold  | Module voltage low warning threshold: 3.000 v.                                          |
| Laser rx power high alarm threshold   | Vendor-specified threshold for the laser Rx power high alarm: 1.9953 mW or 3.00 dBm.    |
| Laser rx power low alarm threshold    | Vendor-specified threshold for the laser Rx power low alarm: 0.0001 mW or -40.00 dBm.   |
| Laser rx power high warning threshold | Vendor-specified threshold for the laser Rx power high warning: 1.0000 mW or 0.00 dBm.  |
| Laser rx power low warning threshold  | Vendor-specified threshold for the laser Rx power low warning: 0.0010 mW or -30.00 dBm. |

Table 139 on page 1587 lists the output fields for the **show interfaces diagnostics optics** command for SFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 139: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers

| Field Name         | Field Description                       |
|--------------------|-----------------------------------------|
| Physical interface | Name of the physical interface.         |
| Laser bias current | Measured laser bias current in uA.      |
| Laser output power | Measured laser output power in mW.      |
| Module temperature | Internally measured module temperature. |
| Module voltage     | Internally measured module voltage.     |
| Laser rx power     | Measured receive optical power in mW.   |

Table 139: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (*continued*)

| Field Name                      | Field Description                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------|
| Laser bias current high alarm   | Laser bias current high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser bias current low alarm    | Laser bias current low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Laser output power high alarm   | Laser output power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser output power low alarm    | Laser output power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Module temp high alarm          | Module temperature high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Module temp low alarm           | Module temperature low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Laser rx power high alarm       | Laser receive power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.    |
| Laser rx power low alarm        | Laser receive power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser bias current high warning | Laser bias current high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |
| Laser bias current low warning  | Laser bias current low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.  |
| Laser output power high warning | Laser output power high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |
| Laser output power low warning  | Laser output power low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.  |
| Module temperature high warning | Module temperature high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |
| Module temperature low warning  | Module temperature low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.  |

Table 139: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (*continued*)

| Field Name                                | Field Description                                                                               |
|-------------------------------------------|-------------------------------------------------------------------------------------------------|
| Laser rx power high warning               | Laser receive power high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |
| Laser rx power low warning                | Laser receive power low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.  |
| Laser bias current high alarm threshold   | Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Laser bias current low alarm threshold    | Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.             |
| Laser bias current high warning threshold | Laser bias current high warning threshold. Warning ranges are vendor-specific.                  |
| Laser bias current low warning threshold  | Laser bias current low warning threshold. Warning ranges are vendor-specific.                   |
| Laser output power high alarm threshold   | Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Laser output power low alarm threshold    | Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.             |
| Laser output power high warning threshold | Laser output power high warning threshold. Warning ranges are vendor-specific.                  |
| Laser output power low warning threshold  | Laser output power low warning threshold. Warning ranges are vendor-specific.                   |
| Module temperature high alarm threshold   | Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Module temperature low alarm threshold    | Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.             |

| Laser rx power low warning threshold      | Laser receive power low warning threshold. Warning threshold ranges are vendor-specific.  |

Table 141 on page 1593 lists the output fields for the **show interfaces diagnostics optics** command for 100-Gigabit Ethernet transceivers. Output fields are listed in the approximate order in which they appear.

Table 141: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers

| Field Name              | Field Description                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface      | Name of the physical interface.                                                                                                                                                               |
| Grid Channel Number     | Set of wavelengths are divided into 40 grids. At a time transceiver will be programmed in one of this set (grid). Mapping of center wavelength to grid number is presented by this parameter. |
| Corrected Error Ratio   | Indicates accumulated Bit Error Ratio.                                                                                                                                                        |
| Uncorrected Words Ratio | Monitors the error rate for either the full 100G link or on a channel-by-channel basis. Indicates the frame errors.                                                                           |

Table 141: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers (continued)

| Field Name                      | Field Description                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------|
| Laser bias current              | Measured laser bias current in mA.                                                             |
| Laser output power              | Measured laser output power in mW.                                                             |
| Module temperature              | Internally measured module temperature.                                                        |
| Laser rx power                  | Measured receive optical power in mW.                                                          |
| Laser bias current high alarm   | Laser bias current high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser bias current low alarm    | Laser bias current low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Laser output power high alarm   | Laser output power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser output power low alarm    | Laser output power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Module temp high alarm          | Module temperature high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Module temp low alarm           | Module temperature low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.      |
| Laser rx power high alarm       | Laser receive power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.    |
| Laser rx power low alarm        | Laser receive power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.     |
| Laser bias current high warning | Laser bias current high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |
| Laser bias current low warning  | Laser bias current low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.  |
| Laser output power high warning | Laser output power high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific. |

| Laser bias current high alarm threshold | Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Laser bias current low alarm threshold  | Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.             |
| Laser output power high alarm threshold | Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Laser output power low alarm threshold  | Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.             |
| Module temperature high alarm threshold | Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.            |
| Module temperature low alarm threshold  | Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.             |
| Laser rx power high alarm threshold     | Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.           |
| Laser rx power low alarm threshold      | Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.            |

Table 141: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers (continued)

| Field Name                                | Field Description                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Laser bias current high warning threshold | Laser bias current high warning threshold. Warning ranges are vendor-specific.                                                                                                                 |
| Laser bias current low warning threshold  | Laser bias current low warning threshold. Warning ranges are vendor-specific.                                                                                                                  |
| Laser output power high warning threshold | Laser output power high warning threshold. Warning ranges are vendor-specific.                                                                                                                 |
| Laser output power low warning threshold  | Laser output power low warning threshold. Warning ranges are vendor-specific.                                                                                                                  |
| Module temperature high warning threshold | Module temperature high warning threshold. Warning ranges are vendor-specific.                                                                                                                 |
| Module temperature low warning threshold  | Module temperature low warning threshold. Warning ranges are vendor-specific.                                                                                                                  |
| Laser rx power high warning threshold     | Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.                                                                                                      |
| Laser rx power low warning threshold      | Laser receive power low warning threshold. Warning threshold ranges are vendor-specific.                                                                                                       |
| Lane carrier frequency offset             | Difference (in frequency units) between the target frequency and the actual frequency.                                                                                                         |
| Lane SNR                                  | Signal-to-noise ratio of the electrical data present on the channel.                                                                                                                           |
| TEC Current                               | Monitors the amount of current flowing to the TEC of a cooled laser. It is a 16-bit signed 2s complement value with a LSB unit of 0.1 mA. Thus the total range is from -3.2768 A to +3.2767 A. |

Table 141: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers (continued)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Residual ISI  | Measures the amount of correction being done by the module to account for residual inter-symbol interference (ISI). The usual cause for this is optical dispersion so this measurement is a proxy for residual (uncorrected) optical dispersion that is being corrected by the module. The parameter is unitless and the threshold alarm and warning values will give an indication of the severity of the uncorrected dispersion. |
| PAM Histogram | Provides the rate of measured signal on the line that has an analog level near the cutoff for a PAM bit transition (for example, 0 <-> 1, 1<->2, 2<->3).                                                                                                                                                                                                                                                                           |

Table 142 on page 1597 lists the output fields for the **show interfaces diagnostics optics** command for XFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 142: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers

| Field Name                      | Field Description                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface              | Name of the physical interface.                                                                                                                            |
| Laser bias current              | Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power              | Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the <b>LsPOWMON</b> pin in hardware.     |
| Module temperature              | Temperature of the XFP optics module, in Celsius and Fahrenheit.                                                                                           |
| Laser rx power                  | Laser received optical power, in mW and dBm.                                                                                                               |
| Laser bias current high alarm   | Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .                                                                                    |
| Laser bias current low alarm    | Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .                                                                                     |
| Laser bias current high warning | Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .                                                                                  |
| Laser bias current low warning  | Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .                                                                                   |
| Laser output power high alarm   | Laser output power high alarm. Displays <b>on</b> or <b>off</b> .                                                                                          |

Table 142: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers  
(continued)

| Field Name                      | Field Description                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Laser output power low alarm    | Laser output power low alarm. Displays <b>on</b> or <b>off</b> .                                                                          |
| Laser output power high warning | Laser output power high warning. Displays <b>on</b> or <b>off</b> .                                                                       |
| Laser output power low warning  | Laser output power low warning. Displays <b>on</b> or <b>off</b> .                                                                        |
| Module temperature high alarm   | Module temperature high alarm. Displays <b>on</b> or <b>off</b> .                                                                         |
| Module temperature low alarm    | Module temperature low alarm. Displays <b>on</b> or <b>off</b> .                                                                          |
| Module temperature high warning | Module temperature high warning. Displays <b>on</b> or <b>off</b> .                                                                       |
| Module temperature low warning  | Module temperature low warning. Displays <b>on</b> or <b>off</b> .                                                                        |
| Laser rx power high alarm       | Receive laser power high alarm. Displays <b>on</b> or <b>off</b> .                                                                        |
| Laser rx power low alarm        | Receive laser power low alarm. Displays <b>on</b> or <b>off</b> .                                                                         |
| Laser rx power high warning     | Receive laser power high warning. Displays <b>on</b> or <b>off</b> .                                                                      |
| Laser rx power low warning      | Receive laser power low warning. Displays <b>on</b> or <b>off</b> .                                                                       |
| Module not ready alarm          | Module not ready alarm. When <b>on</b> , indicates the module has an operational fault. Displays <b>on</b> or <b>off</b> .                |
| Module power down alarm         | Module power down alarm. When <b>on</b> , module is in a limited power mode, low for normal operation. Displays <b>on</b> or <b>off</b> . |

Table 142: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers  
(continued)

| Field Name                                       | Field Description                                                                                                                           |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tx data not ready alarm</b>                   | Any condition leading to invalid data on the transmit path. Displays <b>on</b> or <b>off</b> .                                              |
| <b>Tx not ready alarm</b>                        | Any condition leading to invalid data on the transmit path. Displays <b>on</b> or <b>off</b> .                                              |
| <b>Tx laser fault alarm</b>                      | Laser fault condition. Displays <b>on</b> or <b>off</b> .                                                                                   |
| <b>Tx CDR loss of lock alarm</b>                 | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays <b>on</b> or <b>off</b> .       |
| <b>Rx not ready alarm</b>                        | Any condition leading to invalid data on the receive path. Displays <b>on</b> or <b>off</b> .                                               |
| <b>Rx loss of signal alarm</b>                   | Receive Loss of Signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays <b>on</b> or <b>off</b> . |
| <b>Rx CDR loss of lock alarm</b>                 | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays <b>on</b> or <b>off</b> .                                   |
| <b>Laser bias current high alarm threshold</b>   | Vendor-specified threshold for the laser bias current high alarm: <b>130.000 mA</b> .                                                       |
| <b>Laser bias current low alarm threshold</b>    | Vendor-specified threshold for the laser bias current low alarm: <b>10.000 mA</b> .                                                         |
| <b>Laser bias current high warning threshold</b> | Vendor-specified threshold for the laser bias current high warning: <b>120.000 mA</b> .                                                     |
| <b>Laser bias current low warning threshold</b>  | Vendor-specified threshold for the laser bias current low warning: <b>12.000 mA</b> .                                                       |
| <b>Laser output power high alarm threshold</b>   | Vendor-specified threshold for the laser output power high alarm: <b>0.8910 mW</b> or <b>-0.50 dBm</b> .                                    |
| <b>Laser output power low alarm threshold</b>    | Vendor-specified threshold for the laser output power low alarm: <b>0.2230 mW</b> or <b>-6.52 dBm</b> .                                     |

**Table 142: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers**  
(continued)

| Field Name                                | Field Description                                                                                         |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Laser output power high warning threshold | Vendor-specified threshold for the laser output power high warning: <b>0.7940 mW</b> or <b>-100 dBm</b> . |
| Laser output power low warning threshold  | Vendor-specified threshold for the laser output power low warning: <b>0.2510 mW</b> or <b>-600 dBm</b> .  |
| Module temperature high alarm threshold   | Vendor-specified threshold for the module temperature high alarm: <b>90° C</b> or <b>194° F</b> .         |
| Module temperature low alarm threshold    | Vendor-specified threshold for the module temperature low alarm: <b>-5° C</b> or <b>23° F</b> .           |
| Module temperature high warning threshold | Vendor-specified threshold for the module temperature high warning: <b>85° C</b> or <b>185° F</b> .       |
| Module temperature low warning threshold  | Vendor-specified threshold for the module temperature low warning: <b>0° C</b> or <b>32° F</b> .          |
| Laser rx power high alarm threshold       | Vendor-specified threshold for the laser Rx power high alarm: <b>1.2589 mW</b> or <b>1.00 dBm</b> .       |
| Laser rx power low alarm threshold        | Vendor-specified threshold for the laser Rx power low alarm: <b>0.0323 mW</b> or <b>-14.91 dBm</b> .      |
| Laser rx power high warning threshold     | Vendor-specified threshold for the laser Rx power high warning: <b>1.1220 mW</b> or <b>0.50 dBm</b> .     |
| Laser rx power low warning threshold      | Vendor-specified threshold for the laser Rx power low warning: <b>0.0363 mW</b> or <b>-14.40 dBm</b> .    |

[Table 143 on page 1601](#) lists the output fields for the **show interfaces diagnostics optics** command for VCP. Output fields are listed in the approximate order in which they appear.

Table 143: show interfaces diagnostics optics Output for Virtual Chassis Ports

| Field Name                            | Field Description                                                                                                                                          |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface                    | Name of the physical interface.                                                                                                                            |
| Laser bias current                    | Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                    | Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).                                                                           |
| Module temperature                    | Temperature of the optics module, in Celsius and Fahrenheit.                                                                                               |
| Module voltage                        | Internally measured module voltage.                                                                                                                        |
| Receiver signal average optical power | Average received optical power, in mW and dBm.                                                                                                             |
| Laser bias current high alarm         | Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .                                                                                    |
| Laser bias current low alarm          | Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .                                                                                     |
| Laser bias current high warning       | Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .                                                                                  |
| Laser bias current low warning        | Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .                                                                                   |
| Laser output power high alarm         | Laser output power high alarm. Displays <b>on</b> or <b>off</b> .                                                                                          |
| Laser output power low alarm          | Laser output power low alarm. Displays <b>on</b> or <b>off</b> .                                                                                           |
| Laser output power high warning       | Laser output power high warning. Displays <b>on</b> or <b>off</b> .                                                                                        |
| Laser output power low warning        | Laser output power low warning. Displays <b>on</b> or <b>off</b> .                                                                                         |
| Module temperature high alarm         | Module temperature high alarm. Displays <b>on</b> or <b>off</b> .                                                                                          |

# show interfaces (far-end-interval)

## Syntax

```
show interfaces far-end-interval interface-fpc/pic/port
```

## Release Information

Command introduced in Junos OS Release 9.4.

## Description

On channelized interfaces, display the far end interval data for the specified interface.

## Required Privilege Level

view

## List of Sample Output

[show interfaces far-end-interval coc12-5/2/0 on page 1631](#)

[show interfaces far-end-interval coc1-5/2/1:1 on page 1632](#)

## Output Fields

[Table 144 on page 1631](#) lists the output fields for the **show interfaces far-end-interval** command. Output fields are listed in the approximate order in which they appear.

Table 144: show interfaces far-end-interval Output Fields

| Field Name         | Field Description                         |
|--------------------|-------------------------------------------|
| Physical interface | Interface FPC/PIC/port values.            |
| SNMP ifIndex       | SNMP interface index value.               |
| ES-L/P             | Error detection—Errored seconds.          |
| SES-L/P            | Error detection—Severely errored seconds. |
| UAS-L/P            | Error detection—Unavailable seconds.      |

# Sample Output

show interfaces far-end-interval coc12-5/2/0

```
user@host> show interfaces far-end-interval coc12-5/2/0
```

```
Physical interface: coc12-5/2/0, SNMP ifIndex: 121
05:30-current:
    ES-L: 1, SES-L: 1, UAS-L: 0
05:15-05:30:
    ES-L: 0, SES-L: 0, UAS-L: 0

## show interfaces (Fast Ethernet)

### Syntax

```
show interfaces interface-type
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

Display status information about the specified Fast Ethernet interface.

### Options

***interface-type***—On M Series and T Series routers, the interface type is ***fe-fpc/pic/port***.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

### Required Privilege Level

view

### List of Sample Output

[show interfaces \(Fast Ethernet\) on page 1651](#)

[show interfaces brief \(Fast Ethernet\) on page 1652](#)

[show interfaces detail \(Fast Ethernet\) on page 1652](#)

[show interfaces extensive \(Fast Ethernet\) on page 1653](#)

### Output Fields

[Table 145 on page 1634](#) lists the output fields for the **show interfaces** (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 145: show interfaces Fast Ethernet Output Fields

| Field Name                | Field Description                                                                                                                                                                                                         | Level of Output              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                           |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                      | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                       | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                         | <b>detail extensive</b>      |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                       | All levels                   |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                 | All levels                   |
| <b>Link-mode</b>          | Type of link connection configured for the physical interface: <b>Full-duplex</b> or <b>Half-duplex</b>                                                                                                                   | <b>extensive</b>             |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                  | All levels                   |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                            | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                              | All levels                   |
| <b>LAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                             | All levels                   |
| <b>WAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH. | All levels                   |
| <b>Unidirectional</b>     | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                         | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                  | All levels                   |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                    | Level of Output                 |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                            | All levels                      |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>  | All levels                      |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                   | All levels                      |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                      | All levels                      |
| <b>Link flags</b>       | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                               | All levels                      |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                               | All levels                      |
| <b>Frequency</b>        | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                     | All levels                      |
| <b>CoS queues</b>       | Number of CoS queues configured.                                                                                                                                                                                                                     | <b>detail extensive</b><br>none |
| <b>Schedulers</b>       | (GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.                                                                                                                                                   | <b>extensive</b>                |
| <b>Hold-times</b>       | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                  | <b>detail extensive</b>         |
| <b>Current address</b>  | Configured MAC address.                                                                                                                                                                                                                              | <b>detail extensive</b><br>none |
| <b>Hardware address</b> | Hardware MAC address.                                                                                                                                                                                                                                | <b>detail extensive</b><br>none |
| <b>Last flapped</b>     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive</b><br>none |
| <b>Input Rate</b>       | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                    | None specified                  |

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output Rate</b>             | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | None specified          |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</p> | <b>detail extensive</b> |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Output errors</b> | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Egress queues</b>            | <p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p> | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive</b><br>none |
| <b>OTN FEC statistics</b>               | <p>The forward error correction (FEC) counters provide the following statistics:.</p> <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—The count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>                                                                                                                                                                                                                                                                                                                                               |                                 |
| <b>PCS statistics</b>                   | <p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>                                                                                                                                                                                                          | <b>detail extensive</b>         |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| MAC statistics | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</li> </ul> | extensive       |

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output  |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Filter statistics</b> | <p><b>Receive and Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | <b>extensive</b> |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output  |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output                 |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Received path trace,<br/>Transmitted path trace</b> | (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>                |

| <b>IPv6 transit statistics</b>  | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>                |
| <b>Local statistics</b>         | Number and rate of bytes and packets destined to the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>extensive</b>                |
| <b>Transit statistics</b>       | <p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | <b>extensive</b>                |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |
| <b>Route Table</b>              | Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> none    |
| <b>Flags</b>                    | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>         |
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> none    |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b> none    |

Table 145: show interfaces Fast Ethernet Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                    | Level of Output                 |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Input Filters</b>          | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.  | <b>detail extensive</b>         |
| <b>Output Filters</b>         | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces. | <b>detail extensive</b>         |
| <b>Mac-Validate Failures</b>  | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                           | <b>detail extensive</b><br>none |
| <b>Addresses, Flags</b>       | Information about the address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .                                                  | <b>detail extensive</b> none    |
| <b><i>protocol-family</i></b> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                             | <b>brief</b>                    |
| <b>Flags</b>                  | Information about address flag (possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .                                                       | <b>detail extensive</b> none    |
| <b>Destination</b>            | IP address of the remote side of the connection.                                                                                                                                                     | <b>detail extensive</b> none    |
| <b>Local</b>                  | IP address of the logical interface.                                                                                                                                                                 | <b>detail extensive</b> none    |
| <b>Broadcast</b>              | Broadcast address of the logical interlace.                                                                                                                                                          | <b>detail extensive</b> none    |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                    | <b>detail extensive</b>         |

## Sample Output

### show interfaces (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0
```

```
Physical interface: fe-0/0/0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 22
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled
```

```

Device flags      : Present Running
Interface flags:  SNMP-Traps Internal: 0x4000
CoS queues       : 4 supported, 4 maximum usable queues
Current address:  00:00:5e:00:53:38, Hardware address: 00:00:5e:00:53:38
Last flapped    : 2006-01-20 14:50:58 PST (2w4d 00:44 ago)
Input rate      : 0 bps (0 pps)
Output rate     : 0 bps (0 pps)
Active alarms   : None
Active defects  : None
Logical interface fe-0/0/0.0 (Index 66) (SNMP ifIndex 198)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500
    Flags: None
    Addresses, Flags: Is-Preferred Is-Primary
      Destination: 203.0.113/24, Local: 203.0.113.1, Broadcast: 203.0.113.255

```

### show interfaces brief (Fast Ethernet)

user@host> **show interfaces fe-0/0/0 brief**

```

Physical interface: fe-0/0/0, Enabled, Physical link is Up
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled
Device flags      : Present Running
Interface flags:  SNMP-Traps Internal: 0x4000
Logical interface fe-0/0/0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  inet 203.0.113.1/24

```

### show interfaces detail (Fast Ethernet)

user@host> **show interfaces fe-0/0/0 detail**

```

Physical interface: fe-0/0/0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 22, Generation: 5391
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled
Device flags      : Present Running
Interface flags:  SNMP-Traps Internal: 0x4000
CoS queues       : 4 supported, 4 maximum usable queues
Hold-times       : Up 0 ms, Down 0 ms
Current address:  00:00:5e:00:53:38, Hardware address: 00:00:5e:00:53:3f:38
Last flapped    : 2006-01-20 14:50:58 PST (2w4d 00:45 ago)

```

```

## show interfaces

### List of Syntax

[Syntax \(Gigabit Ethernet\) on page 1656](#)

[Syntax \(10 Gigabit Ethernet\) on page 1656](#)

[Syntax \(SRX Series Devices and \(vSRX and vSRX 3.0 platforms\)\) on page 1656](#)

### Syntax (Gigabit Ethernet)

```
show interfaces ge-fpc/pic/port
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Syntax (10 Gigabit Ethernet)

```
show interfaces xe-fpc/pic/port
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Syntax (SRX Series Devices and (vSRX and vSRX 3.0 platforms))

```
show interfaces (
  <interface-name>
  <brief | detail | extensive | terse>
  <controller interface-name>|
  <descriptions interface-name>|
  <destination-class (all | destination-class-name logical-interface-name)>|
  <diagnostics optics interface-name>|
  <far-end-interval interface-fpc/pic/port>|
  <filters interface-name>|
  <flow-statistics interface-name>|
  <interval interface-name>|
  <load-balancing (detail | interface-name)>|
  <mac-database mac-address mac-address>|
  <mc-ae id identifier unit number revertive-info>|
  <media interface-name>|
  <policers interface-name>|
```

```

<queue both-ingress-egress egress forwarding-class forwarding-class ingress l2-statistics>|
<redundancy (detail | interface-name)>|
<routing brief detail summary interface-name>|
<routing-instance (all | instance-name)>|
<snmp-index snmp-index>|
<source-class (all | destination-class-name logical-interface-name)>|
<statistics interface-name>|
<switch-port switch-port number>|
<transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all | interface-name)>|
<zone interface-name>
)

```

### Release Information

Command introduced before Junos OS Release 7.4 for Gigabit interfaces.

Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.

Command modified in Junos OS Release 9.5 for SRX Series devices.

Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Command modified in Junos OS Release 19.3R1 for MX Series Routers.

Starting in Junos OS Release 19.3R1, Output fields **lindex** and **speed** is modified in the **show interfaces *interface name* extensive** command, on all MX Series routers.

- The default behavior of WAN-PHY interface remains the same. The new **precise-bandwidth** option reflects the new speed (9.294-Gbps) configured on the supported line cards.
- The WAN-PHY framing mode is supported only on MPC5E and MPC6E line cards.

Starting in Junos OS Release 19.3R1, class of service (CoS) features can be configured on the physical interface with speed rates of 1-Gbps, 10-Gbps, 40-Gbps, and 100-Gbps to provide better bandwidth for processing traffic during congestion using variant speeds.

### Description

Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series, vSRX, and vSRX 3.0 platforms running Junos OS.

**NOTE:** On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields **Next-hop** and **vpls-status** is displayed in the **show interfaces *interface name* detail** command, only for Layer 2 protocols on MX480 routers.

### Options

For Gigabit interfaces:

**ge-*fpc/pic/port***—Display standard information about the specified Gigabit Ethernet interface.

**NOTE:** Interfaces with different speeds are named uniformly with ge-0/0/x for backward compatibility. Use the **show interfaces** command to view the interface speeds.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

**xe-*fpc/pic/port***—Display standard information about the specified 10-Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.

- **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
- **ce1-*pim*/0/ *port***—Channelized E1 interface.
- **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
- **ct1-*pim*/0/*port***—Channelized T1 interface.
- **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
- **e1-*pim*/0/*port***—E1 interface.
- **e3-*pim*/0/*port***—E3 interface.
- **fe-*pim*/0/*port***—Fast Ethernet interface.
- **ge-*pim*/0/*port***—Gigabit Ethernet interface.
- **se-*pim*/0/*port***—Serial interface.
- **t1-*pim*/0/*port***—T1 (also called DS1) interface.
- **t3-*pim*/0/*port***—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and *port* with the port number.
  - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim*/0/ *port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim*/0/*port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim*/0/*port***—E1 interface.
  - **e3-*pim*/0/*port***—E3 interface.
  - **fe-*pim*/0/*port***—Fast Ethernet interface.
  - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
  - **se-*pim*/0/*port***—Serial interface.
  - **t1-*pim*/0/*port***—T1 (also called DS1) interface.
  - **t3-*pim*/0/*port***—T3 (also called DS3) interface.
  - **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

### Additional Information

In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

## Output Fields

[Table 146 on page 1662](#) describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see [Table 147 on page 1700](#).

Table 146: show interfaces (Gigabit Ethernet) Output Fields

| Field Name                | Field Description                                                                                                                                                                                                         | Level of Output              |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                           |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                      | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                       | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                         | <b>detail extensive</b>      |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                       | All levels                   |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                 | All levels                   |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                  | All levels                   |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                            | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                              | All levels                   |
| <b>LAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                             | All levels                   |
| <b>WAN-PHY mode</b>       | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH. | All levels                   |
| <b>Unidirectional</b>     | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                         | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                  | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                 | All levels                   |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                           | Level of Output              |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>                         | All levels                   |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                          | All levels                   |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                             | All levels                   |
| <b>Link flags</b>       | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                      | All levels                   |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                                                      | All levels                   |
| <b>Frequency</b>        | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                                            | All levels                   |
| <b>CoS queues</b>       | Number of CoS queues configured.                                                                                                                                                                                                                                            | <b>detail extensive</b> none |
| <b>Schedulers</b>       | (Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.                                                                                                                                                                         | <b>extensive</b>             |
| <b>Hold-times</b>       | Current interface hold-time up and hold-time down, in milliseconds (ms).                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>Current address</b>  | Configured MAC address.                                                                                                                                                                                                                                                     | <b>detail extensive</b> none |
| <b>Hardware address</b> | Hardware MAC address.                                                                                                                                                                                                                                                       | <b>detail extensive</b> none |
| <b>Last flapped</b>     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                        | <b>detail extensive</b> none |
| <b>Input Rate</b>       | Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. | None                         |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output         |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output Rate</b>              | Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | None                    |
| <b>Statistics last cleared</b>  | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>Egress account overhead</b>  | Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Ingress account overhead</b> | Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Traffic statistics</b>       | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</p> | <b>detail extensive</b> |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Output errors | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | extensive       |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Egress queues</b>            | <p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p> | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Ingress queues</b>           | <p>Total number of ingress queues supported on the specified interface. Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
|            | <p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds interface MTU, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> </ul> |                 |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (continued)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output  |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
|                                       | <p><b>NOTE:</b> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the <b>VLAN tagged frames</b> field displays 0 when the <b>show interfaces</b> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> <ul style="list-style-type: none"> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”</li> </ul> |                  |
| <b>OTN Received Overhead Bytes</b>    | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58<br>Payload Type: 0x08                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Filter statistics</b> | <p><b>Receive and Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul> | <b>extensive</b> |

| <b>Received path trace, Transmitted path trace</b> | (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>             |

| <b>Dynamic Profile</b>         | Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Service Name Table</b>      | Name of the service name table for the interface configured with a PPPoE family.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Max Sessions</b>            | Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>Duplicate Protection</b>    | State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| Direct Connect                 | State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>AC Name</b>                 | Name of the access concentrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul> | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>extensive</b>             |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b>             |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output              |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Transit statistics</b>       | <p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | <b>extensive</b>             |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>      |
| <b>Route Table</b>              | Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Flags</b>                    | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Output Filters</b>           | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>Mac-Validate Failures</b>    | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>         | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive none</b> |

Table 146: show interfaces (Gigabit Ethernet) Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                  | Level of Output              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b><i>protocol-family</i></b> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.           | <b>brief</b>                 |
| <b>Flags</b>                  | Information about the address flag. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive none</b> |
| <b>Destination</b>            | IP address of the remote side of the connection.                                                                                                   | <b>detail extensive none</b> |
| <b>Local</b>                  | IP address of the logical interface.                                                                                                               | <b>detail extensive none</b> |
| <b>Broadcast</b>              | Broadcast address of the logical interface.                                                                                                        | <b>detail extensive none</b> |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |

The following table describes the output fields for the **show interfaces** (10-Gigabit Ethernet) command.

| Field Name                | Field Description                                                                                                                    | Level of Output              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                  | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                        | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                    | <b>detail extensive</b>      |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                  | All levels                   |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                            | All levels                   |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                             | All levels                   |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .       | All levels                   |

|                         |                                                                                                                                                                                                                                                     |                                        |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <b>Source filtering</b> | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                             |
| <b>LAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                                                       | All levels                             |
| <b>WAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.                           | All levels                             |
| <b>Unidirectional</b>   | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                                                   | All levels                             |
| <b>Flow control</b>     | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                             |
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                             |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                             |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                  | All levels                             |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                     | All levels                             |
| <b>Link flags</b>       | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                              | All levels                             |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                              | All levels                             |
| <b>Frequency</b>        | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                    | All levels                             |
| <b>CoS queues</b>       | Number of CoS queues configured.                                                                                                                                                                                                                    | <b>detail</b><br><b>extensive</b> none |
| <b>Schedulers</b>       | (Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.                                                                                                                                                 | <b>extensive</b>                       |
| <b>Hold-times</b>       | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                 | <b>detail</b><br><b>extensive</b>      |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                          |

| Current address          | Configured MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail<br>extensive none |
| Hardware address         | Hardware MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail<br>extensive none |
| Last flapped             | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail<br>extensive none |
| Input Rate               | Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | None specified           |
| Output Rate              | Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | None specified           |
| Statistics last cleared  | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail<br>extensive      |
| Egress account overhead  | Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail<br>extensive      |
| Ingress account overhead | Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail<br>extensive      |
| Traffic statistics       | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | detail<br>extensive      |

**Input errors**

Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

- **Errors**—Sum of the incoming frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.
- **Framing errors**—Number of packets received with an invalid frame checksum (FCS).
- **Runts**—Number of frames received that are smaller than the runt threshold.
- **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.
- **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement.
- **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame.
- **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.
- **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **Resource errors**—Sum of transmit drops.

**extensive**

**Output errors**

Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:

**extensive**

- **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.
- **Errors**—Sum of the outgoing frame aborts and FCS errors.
- **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.
- **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.
- **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.
- **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.
- **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.
- **MTU errors**—Number of packets whose size exceeded the MTU of the interface.
- **Resource errors**—Sum of transmit drops.

| <b>Egress queues</b>                    | <p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p> | <b>detail<br/>extensive</b>      |

| MAC statistics                 | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | extensive |
| OTN Received Overhead Bytes    | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | extensive |

|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Filter statistics | <p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive |

| Received path trace,<br>Transmitted path trace | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | extensive |

The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>                                                                           | <b>detail<br/>extensive</b>      |
| <b>IPv6 transit statistics</b>  | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>                 |
| <b>Local statistics</b>         | Number and rate of bytes and packets destined to the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>extensive</b>                 |
| <b>Transit statistics</b>       | <p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | <b>extensive</b>                 |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail<br/>extensive</b>      |
| <b>Route Table</b>              | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail<br/>extensive none</b> |
| <b>Flags</b>                    | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail<br/>extensive</b>      |
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail<br/>extensive none</b> |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail<br/>extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail<br/>extensive</b>      |

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

Table 147: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

| Interface Type              | Sample Command                               | Byte and Octet Counts Include                                                                                                                                                                                 | Comments                                                                                                                                           |

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b>.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 148: show interfaces Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output         |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>                   | <p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Ingress queues</b>                  | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>        |
| <b>Queue counters and queue number</b> | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |

Table 148: show interfaces Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| MAC statistics | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | extensive       |

Table 148: show interfaces Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Filter statistics</b> | <p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul> | <b>extensive</b> |

Table 148: show interfaces Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |

| <b>Traffic statistics</b>    | <p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>                                                                           | <b>detail extensive</b>      |
| <b>Local statistics</b>      | Number and rate of bytes and packets destined to the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>extensive</b>             |
| <b>Transit statistics</b>    | <p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | <b>extensive</b>             |

  Policer: Input: __default_arp_policer__

```

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 146 on page 1662](#).

### show interfaces (Gigabit Ethernet Unnumbered Interface)

```
user@host> show interfaces ge-3/2/0
```

```

Physical interface: ge-3/2/0, Enabled, Physical link is Up
  Interface index: 148, SNMP ifIndex: 50
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000

### show interfaces mac-database mac-address

user@host> **show interfaces mac-database xe-0/3/3 mac-address (SRX devices) 00:00:c8:01:01:09**

```
Physical interface: xe-0/3/3, Enabled, Physical link is Up
  Interface index: 372, SNMP ifIndex: 788
  Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, Loopback:
None, Source filtering: Disabled, Flow control: Enabled
  Device flags      : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags        : None

Logical interface xe-0/3/3.0 (Index 364) (SNMP ifIndex 829)
  Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
  MAC address: 00:00:c8:01:01:09, Type: Configured,
    Input bytes      : 202324652
    Output bytes     : 202324560
    Input frames     : 4398362
    Output frames    : 4398360
  Policer statistics:
  Policer type      Discarded frames   Discarded bytes
  Output aggregate      3992386         183649756
```

### show interfaces mc-ae (SRX devices)

user@host> **show interfaces mc-ae ae0 unit 512**

```
Member Links      : ae0
Local Status      : active
Peer Status       : active
Logical Interface      : ae0.512
Core Facing Interface : Label Ethernet Interface
ICL-PL            : Label Ethernet Interface
```

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

user@host> **show interfaces media so-4/1/2**

```
Physical interface: so-4/1/2, Enabled, Physical link is Up
  Interface index: 168, SNMP ifIndex: 495
  Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
  Loopback: None, FCS: 16, Payload scrambler: Enabled
  Device flags      : Present Running
  Interface flags: Point-To-Point SNMP-Traps 16384
  Link flags        : Keepalives
  Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
  Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
  LCP state: Opened
  NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
  mpls: Not-configured
  CHAP state: Not-configured
  CoS queues        : 8 supported
  Last flapped      : 2005-06-15 12:14:59 PDT (04:31:29 ago)
  Input rate        : 0 bps (0 pps)
  Output rate       : 0 bps (0 pps)
  SONET alarms      : None
  SONET defects     : None
  SONET errors:
    BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
  Received path trace: routerb so-1/1/2
  Transmitted path trace: routera so-4/1/2
```

### show interfaces policers (SRX devices)

user@host> **show interfaces policers**

| Interface  | Admin | Link | Proto | Input                 | Policer | Output                 | Policer |

### show interfaces queue (SRX devices)

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```
user@host> show interfaces queue
```

```
Physical interface: ge-0/0/0, Enabled, Physical link is Up
  Interface index: 134, SNMP ifIndex: 509
Forwarding classes: 8 supported, 8 in use
Egress queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: class0
  Queued:
    Packets          :                0          0 pps
    Bytes            :                0          0 bps
  Transmitted:
    Packets          :                0          0 pps
    Bytes            :                0          0 bps
    Tail-dropped packets :                0          0 pps
    RL-dropped packets  :                0          0 pps
    RL-dropped bytes    :                0          0 bps
    RED-dropped packets :                0          0 pps
    Low                :                0          0 pps
    Medium-low         :                0          0 pps
    Medium-high        :                0          0 pps
    High               :                0          0 pps
    RED-dropped bytes   :                0          0 bps
    Low                :                0          0 bps
    Medium-low         :                0          0 bps
```

```

    Medium-high      :                0                0 bps
    High             :                0                0 bps
Queue Buffer Usage:
    Reserved buffer   :          118750000 bytes
    Queue-depth bytes :
    Current           :                0
..
..
Queue: 1, Forwarding classes: class1

### show security zones (SRX devices)

user@host> show security zones

```

Functional zone: management
  Description: This is the management zone.
  Policy configurable: No
  Interfaces bound: 1
  Interfaces:
    ge-0/0/0.0
Security zone: Host
  Description: This is the host zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    fxp0.0
Security zone: abc
  Description: This is the abc zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/1.0
Security zone: def
  Description: This is the def zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/2.0

```

## show interfaces (M Series, MX Series, T Series Routers, and PTX Series Management and Internal Ethernet)

### List of Syntax

[Syntax \(M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface\) on page 1763](#)

[Syntax \(M Series, MX Series, T Series, and PTX Series Routers Internal Ethernet Interface\) on page 1763](#)

### Syntax (M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface)

```
show interfaces em0 | fxp0 | mgmtre0
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Syntax (M Series, MX Series, T Series, and PTX Series Routers Internal Ethernet Interface)

```
show interfaces bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced before Junos OS Release 7.4.

Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

### Description

(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.

### Options

**em0 | fxp0 | mgmtre0**—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see *Supported Routing Engines by Router*.

**bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1**—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See *Supported Routing Engines by Router* for the internal Ethernet interface names for each Routing Engine by hardware platform.

**NOTE:** On Junos OS Evolved, the ixgbe0 and ixgbe1 internal interfaces are deprecated.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

### Output Fields

[Table 149 on page 1765](#) lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

**Table 149: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface**

| Field Name                | Field Description                                                                                                                                  | Level of Output              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                    |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                    | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .               | All levels                   |
| <b>Interface index</b>    | Physical interface index number, which reflects its initialization sequence.                                                                       | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                      | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |
| <b>Type</b>               | Type of interface.                                                                                                                                 | All levels                   |
| <b>Link-level type</b>    | Encapsulation type used on the physical interface.                                                                                                 | All levels                   |
| <b>MTU</b>                | Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.                                                                      | All levels                   |
| <b>Clocking</b>           | Reference clock source of the interface.                                                                                                           | All levels                   |
| <b>Speed</b>              | Network speed on the interface.                                                                                                                    | All levels                   |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .    | All levels                   |
| <b>Link type</b>          | Data transmission type.                                                                                                                            | <b>detail extensive none</b> |
| <b>Link flags</b>         | Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .              | <b>detail extensive</b>      |
| <b>Physical info</b>      | Information about the physical interface.                                                                                                          | <b>detail extensive</b>      |
| <b>Hold-times</b>         | Current interface hold-time up and hold-time down. Value is in milliseconds.                                                                       | <b>detail extensive</b>      |

Table 149: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers  
Management Ethernet Interface (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output              |

Usually, this field reports protocols that Junos does not support.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |

Table 149: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers  
Management Ethernet Interface (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output              |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Output errors</b>     | <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning.</li> <li>• <b>Errors</b>—Sum of outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                              |

| <b>Protocol</b>          | Protocol family configured on the logical interface (such as <b>iso</b> or <b>inet6</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |
| <b>MTU</b>               | MTU size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Generation</b>        | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Route table</b>       | Route table in which this address exists. For example, <b>Route table:0</b> refers to inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>      |
| <b>Flags</b>             | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |

**Table 149: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

| Field Name              | Field Description                                                                                                                               | Level of Output              |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive none</b> |
| <b>Destination</b>      | IP address of the remote side of the connection.                                                                                                | <b>detail extensive none</b> |
| <b>Local</b>            | IP address of the logical interface.                                                                                                            | <b>detail extensive none</b> |
| <b>Broadcast</b>        | Broadcast address.                                                                                                                              | <b>detail extensive none</b> |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                               | <b>detail extensive</b>      |

## Sample Output

### show interfaces brief (Management Ethernet)

```
user@host> show interfaces fxp0 brief
```

```
Physical interface: fxp0, Enabled, Physical link is Up
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps

Logical interface fxp0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  inet  192.168.70.143/21
```

### show interfaces (Management Ethernet)

```
user@host> show interfaces fxp0
```

```
Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Half-Duplex
```

```

Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89
Last flapped   : Never
  Input packets : 80804
  Output packets: 1105

Logical interface fxp0.0 (Index 2) (SNMP ifIndex 13)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500
    Flags: Is-Primary
    Addresses, Flags: Is-Preferred Is-Primary
      Destination: 192.168.64/21, Local: 192.168.70.143,
      Broadcast: 192.168.71.255

```

### **show interfaces (Management Ethernet [TX Matrix Plus Router])**

user@host> **show interfaces em0**

```

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 17
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Current address: 00:00:5E:00:53:c0, Hardware address: 00:00:5E:00:53:c0
  Last flapped   : Never
    Input packets : 1424
    Output packets: 5282

Logical interface em0.0 (Index 3) (SNMP ifIndex 18)
  Flags: SNMP-Traps Encapsulation: ENET2
  Input packets : 1424
  Output packets: 5282
  Protocol inet, MTU: 1500
    Flags: Is-Primary
    Addresses, Flags: Is-Preferred Is-Primary
      Destination: 192.168.178.0/25, Local: 192.168.178.11, Broadcast:
192.168.178.127

```

### **show interfaces (Management Ethernet [PTX Series Packet Transport Routers])**

user@host> **show interfaces em0**

```

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 0
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps
  Device flags      : Present Running
  Interface flags: SNMP-Traps
  Link type         : Full-Duplex
  Current address: 00:00:5E:00:53:1b, Hardware address: 00:00:5E:00:53:1b
  Last flapped     : Never
Input packets : 212581
Output packets: 71

    Logical interface em0.0 (Index 3) (SNMP ifIndex 0)
Flags: SNMP-Traps Encapsulation: ENET2
Input packets : 212551
Output packets: 71
Protocol inet, MTU: 1500
  Flags: Is-Primary
  Addresses, Flags: Is-Default Is-Preferred Is-Primary
    Destination: 192.168.3/24, Local: 192.168.3.30,
    Broadcast: 192.168.3.255

```

### show interfaces detail (Management Ethernet)

user@host> show interfaces fxp0 detail

```

Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1, Generation: 0
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags      : Present Running
  Interface flags: SNMP-Traps
  Link type         : Half-Duplex
  Physical info     : Unspecified
  Hold-times        : Up 0 ms, Down 0 ms
  Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89
  Alternate link address: Unspecified
  Last flapped     : Never
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes      :          6484031
    Output bytes     :          167503
    Input packets    :          81008
    Output packets   :           1110

```

```

Logical interface fxp0.0 (Index 2) (SNMP ifIndex 13) (Generation 1)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500, Generation: 6, Route table: 0
    Flags: Is-Primary
    Addresses, Flags: Is-Preferred Is-Primary
      Destination: 192.168.64/21, Local: 192.168.70.143,
      Broadcast: 192.168.71.255, Generation: 1

```

### show interfaces detail (Management Ethernet [TX Matrix Plus Router])

user@host> show interfaces em0 detail

```

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 17, Generation: 2
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags      : Present Running
  Interface flags:  SNMP-Traps
  Link type        : Full-Duplex
  Physical info     : Unspecified
  Hold-times       : Up 0 ms, Down 0 ms
  Current address:  00:00:5E:00:53:c0, Hardware address: 00:00:5E:00:53:c0
  Alternate link address: Unspecified
  Last flapped     : Never
  Statistics last cleared: Never
  Traffic statistics:
    Input  bytes   :           124351
    Output bytes   :          1353212
    Input  packets :           1804
    Output packets :           5344

## show interfaces (PPPoE)

### Syntax

```
show interfaces pp0.logical
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

### Options

**pp0.logical**—Display standard status information about the PPPoE interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about PPPoE interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display PPPoE interface statistics.

### Required Privilege Level

view

### List of Sample Output

[show interfaces \(PPPoE\) on page 1794](#)

[show interfaces \(PPPoE over Aggregated Ethernet\) on page 1794](#)

[show interfaces brief \(PPPoE\) on page 1795](#)

[show interfaces detail \(PPPoE\) on page 1795](#)

[show interfaces extensive \(PPPoE on M120 and M320 Routers\) on page 1796](#)

### Output Fields

[Table 150 on page 1787](#) lists the output fields for the **show interfaces (PPPoE)** command. Output fields are listed in the approximate order in which they appear.

Table 150: show interfaces (PPPoE) Output Fields

| Field Name                | Field Description                                                                                                                                  | Level of Output              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                    |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                    | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .               | All levels                   |
| <b>Interface index</b>    | Physical interface index number, which reflects its initialization sequence.                                                                       | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                      | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |
| <b>Type</b>               | Physical interface type (PPPoE).                                                                                                                   | All levels                   |
| <b>Link-level type</b>    | Encapsulation on the physical interface (PPPoE).                                                                                                   | All levels                   |
| <b>MTU</b>                | MTU size on the physical interface.                                                                                                                | All levels                   |
| <b>Clocking</b>           | Reference clock source. It can be <b>Internal</b> or <b>External</b> .                                                                             | All levels                   |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                           | All levels                   |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .    | All levels                   |
| <b>Link type</b>          | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                           | All levels                   |
| <b>Link flags</b>         | Information about the interface. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .         | All levels                   |
| <b>Input rate</b>         | Input rate in bits per second (bps) and packets per second (pps).                                                                                  | None specified               |
| <b>Output rate</b>        | Output rate in bps and pps.                                                                                                                        | None specified               |
| <b>Physical Info</b>      | Physical interface information.                                                                                                                    | All levels                   |
| <b>Hold-times</b>         | Current interface hold-time up and hold-time down, in milliseconds.                                                                                | <b>detail extensive</b>      |

Table 150: show interfaces (PPPoE) Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Hardware address</b>        | MAC address of the hardware.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                        | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b> |

Table 150: show interfaces (PPPoE) Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output              |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Input errors</b>      | <p>Input errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul>                                                                                                            | <b>extensive</b>             |
| <b>Output errors</b>     | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b> —Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                              |
| <b>Logical interface</b> | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels                   |
| <b>Index</b>             | Logical interface index number (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>      | Logical interface SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |

Table 150: show interfaces (PPPoE) Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output         |

| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Flags</b>              | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels              |
| <b>Encapsulation</b>      | Type of encapsulation configured on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>PPP parameters</b>     | PPP status: <ul style="list-style-type: none"> <li>• LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests.</li> <li>• NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>           |
| <b>PPPoE</b>              | PPPoE status: <ul style="list-style-type: none"> <li>• <b>State</b>—State of the logical interface (<b>up</b> or <b>down</b>).</li> <li>• <b>Session ID</b>—PPPoE session ID.</li> <li>• <b>Service name</b>—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service.</li> <li>• <b>Configured AC name</b>—Configured access concentrator name.</li> <li>• <b>Auto-reconnect timeout</b>—Time after which to try to reconnect after a PPPoE session is terminated, in seconds.</li> <li>• <b>Idle Timeout</b>—Length of time (in seconds) that a connection can be idle before disconnecting.</li> <li>• <b>Underlying interface</b>—Interface on which PPPoE is running.</li> </ul> | All levels              |
| <b>Link</b>               | Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| <b>Traffic statistics</b> | Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |

Table 150: show interfaces (PPPoE) Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                | <b>detail extensive</b> |
| <b>Local statistics</b>        | <p>Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Transit statistics</b>      | <p>Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p>                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Keepalive settings</b>      | <p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> <li>• <b>interval seconds</b>—The time in seconds between successive keepalive requests. The range is <b>10</b> seconds through <b>32,767</b> seconds, with a default of <b>10</b> seconds.</li> <li>• <b>down-countnumber</b>—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is <b>1</b> through <b>255</b>, with a default of <b>3</b>.</li> <li>• <b>up-count number</b>—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is <b>1</b> through <b>255</b>, with a default of <b>1</b>.</li> </ul> | <b>detail extensive</b> |

Table 150: show interfaces (PPPoE) Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output              |

| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>      |
| <b>Route table</b>            | Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |
| <b>Flags</b>                  | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> none |
| <b>Addresses, Flags</b>       | Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |
| <b>Destination</b>            | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> none |
| <b>Local</b>                  | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> none |
| <b>Broadcast</b>              | Broadcast address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |

## Sample Output

### show interfaces (PPPoE)

user@host> show interfaces pp0

```
Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532
  Device flags      : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type        : Full-Duplex
  Link flags       : None
  Input rate       : 0 bps (0 pps)
  Output rate      : 0 bps (0 pps)

Logical interface pp0.0 (Index 72) (SNMP ifIndex 72)
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
    Underlying interface: at-5/0/0.0 (Index 70)
  Input packets : 0
  Output packets: 0
  LCP state: Not-configured
  NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
  mpls: Not-configured
  CHAP state: Closed
    Protocol inet, MTU: 100
    Flags: User-MTU, Negotiate-Address
```

### show interfaces (PPPoE over Aggregated Ethernet)

user@host> show interfaces pp0.1073773821

```
Logical interface pp0.1073773821 (Index 80) (SNMP ifIndex 32584)
  Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionUp, Session ID: 1,
    Session AC name: alcor, Remote MAC address: 00:00:5e:00:53:01,
    Underlying interface: demux0.100 (Index 88)
  Link:
    ge-1/0/0.32767
```

```

    ge-1/0/1.32767
    Input packets : 6
    Output packets: 6
    LCP state: Opened
    NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mpls:
Not-configured
    CHAP state: Closed
    PAP state: Success
    Protocol inet, MTU: 1500
    Flags: Sendbcst-pkt-to-re
    Addresses, Flags: Is-Primary
    Local: 203.0.113.1

```

### show interfaces brief (PPPoE)

user@host> **show interfaces pp0 brief**

```

Physical interface: pp0, Enabled, Physical link is Up
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps

Logical interface pp0.0
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
    Underlying interface: at-5/0/0.0 (Index 70)
  inet

```

### show interfaces detail (PPPoE)

user@host> **show interfaces pp0 detail**

```

Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24, Generation: 9
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Physical info  : Unspecified

```

```

Hold-times      : Up 0 ms, Down 0 ms
Current address: Unspecified, Hardware address: Unspecified
Alternate link address: Unspecified
Statistics last cleared: Never
Traffic statistics:
  Input  bytes :                0                0 bps
  Output bytes :                0                0 bps
  Input  packets:                0                0 pps
  Output packets:                0                0 pps
Logical interface pp0.0 (Index 72) (SNMP ifIndex 72) (Generation 14)
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
    Underlying interface: at-5/0/0.0 (Index 70)
  Traffic statistics:
    Input  bytes :                0
    Output bytes :                0
    Input  packets:                0
    Output packets:                0
  Local statistics:

## show interfaces interface-set (Ethernet Interface Set)

### Syntax

```
show interfaces interface-set interface-set-name
<detail | terse>
```

### Release Information

Command introduced in Junos OS Release 8.5.

### Description

Display information about the specified gigabit or 10-Gigabit Ethernet interface set.

You can also use the **show interfaces interface-set** command to display information about agent circuit identifier (ACI) interface sets.

### Options

**interface-set** *interface-set-name*—Display information about the specified Gigabit Ethernet, 10-Gigabit Ethernet, ACI, or ALI interface set.

**detail | terse**—(Optional) Display the specified level of output.

### Required Privilege Level

view

## RELATED DOCUMENTATION

*Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration*

*Verifying and Managing Configurations for Dynamic VLANs Based on Access-Line Identifiers*

### List of Sample Output

[show interfaces interface-set terse on page 1801](#)

[show interfaces interface-set detail on page 1802](#)

[show interfaces interface-set \(ACI Interface Set based on ACI\) on page 1802](#)

[show interfaces interface-set \(ACI Interface Set based on ACI Trusted Option\) on page 1802](#)

[show interfaces interface-set \(ACI Interface Set based on ARI Trusted Option\) on page 1803](#)

[show interfaces interface-set \(ACI Interface Set based on ARI Trusted Option when both ACI and ARI are received\) on page 1803](#)

[show interfaces interface-set \(ACI Interface Set based on Accept-No-IDs Trusted Option when neither ACI nor ARI is received\) on page 1803](#)

[show interfaces interface-set \(L2BSA and PPPoE Subscribers\) on page 1804](#)

### Output Fields

Table 151 on page 1800 describes the information for the **show interfaces interface-set** command. Output fields are listed in the approximate order in which they appear.

**Table 151: Ethernet show interfaces interface-set Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output    |

## show interfaces interface-set queue

### Syntax

```
show interfaces interface-set queue interface-set-name
<aggregate | remaining-traffic>
<forwarding-class class-name>
```

### Release Information

Command introduced in Junos OS Release 8.5.

### Description

Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.

### Options

***interface-set-name***—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.

***aggregate***—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.

***both-ingress-egress***—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.

***egress***—(Optional) Display egress queue statistics.

***forwarding-class class-name***—(Optional) Display queuing statistics for the specified forwarding class.

***ingress***—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.

***remaining-traffic***—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.

### Required Privilege Level

view

### List of Sample Output

[show interfaces interface-set queue \(Gigabit Ethernet\) on page 1807](#)

[show interfaces interface-set queue both-ingress-egress \(Enhanced DPC\) on page 1808](#)

[show interfaces interface-set queue egress \(Enhanced DPC\) on page 1811](#)

[show interfaces interface-set queue forwarding-class \(Gigabit Ethernet\) on page 1812](#)

[show interfaces interface-set queue \(Enhanced DPC\) on page 1813](#)

[show interfaces interface-set queue remaining-traffic \(Gigabit Ethernet\) on page 1814](#)

### Output Fields

Table 152 on page 1806 describes the information for the **show interfaces interface-set queue** command.

Table 152: Ethernet show interfaces interface-set queue Output Fields

| Field Name                          | Field Description                                                                                                                                                                                                                                                                      | Level of Output |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|

# show interfaces interval

## Syntax

```
show interfaces interval
<interface-name>
```

## Release Information

Command introduced before Junos OS Release 7.4.

## Description

Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

## Options

**interface-name**—(Optional) Name of a particular interface.

## Required Privilege Level

view

## RELATED DOCUMENTATION

[clear interfaces interval](#) | [1431](#)

## List of Sample Output

[show interfaces interval \(Channelized OC12\) on page 1817](#)

[show interfaces interval \(E3\) on page 1818](#)

[show interfaces interval \(SONET/SDH\) on page 1818](#)

## Output Fields

[Table 153 on page 1816](#) lists the output fields for the **show interfaces interval** command. Output fields are listed in the approximate order in which they appear.

Table 153: show interfaces interval Output Fields

| Field Name         | Field Description                             |
|--------------------|-----------------------------------------------|
| Physical interface | Name of the interface.                        |
| SNMP ifIndex       | SNMP index number for the physical interface. |

Table 153: show interfaces interval Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hh:mm-current</b>               | Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.                                                                                                                                                                                                  |
| <b>hh:mm-hh:mm</b>                 | Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.                                                                                                                                                                                                                                                                       |
| <b>alarm or event: n</b>           | Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the <b>interface-type media</b> field (for example, <b>T1 media</b> ) under the <b>show interfaces</b> command for the particular interface type in which you are interested. |
| <b>Interval Total</b>              | Sum of all the alarm and defect counters for the last 24-hour period.                                                                                                                                                                                                                                                                                         |
| <b>Interval Total</b>              | Sum of all the alarm and defect counters for the last 24-hour period.                                                                                                                                                                                                                                                                                         |
| <b>Current Day Interval Total</b>  | Sum of all the alarm and defect counters in the current day.<br><br><b>NOTE:</b> The <b>Current Day Interval</b> output field is reset after 24 hours.                                                                                                                                                                                                        |
| <b>Previous Day Interval Total</b> | Sum of all the alarm and defect counters in the previous day.                                                                                                                                                                                                                                                                                                 |

## Sample Output

### show interfaces interval (Channelized OC12)

```
user@host> show interfaces interval t3-0/3/0:0
```

```
Physical interface: t3-0/3/0:0, SNMP ifIndex: 23
17:43-current:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,

## show interfaces irb

### Syntax

```
show interfaces irb
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>
```

### Release Information

Command introduced in Junos OS Release 8.4.

### Description

Display integrated routing and bridging interfaces information.

### Options

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**mac**—Display hardware MAC address

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the interface with the specified SNMP index.

**statistics**—(Optional) Display static interface statistics.

### Additional Information

Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

### Required Privilege Level

### Output Fields

[Table 154 on page 1821](#) lists the output fields for the **show interfaces irb** command. Output fields are listed in the approximate order in which they appear.

Table 154: show interfaces irb Output Fields

| Field Name                | Field Description                                                                                                                                  | Level of Output                |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                    |                                |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                    | All levels                     |
| <b>Enabled</b>            | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .      | All levels                     |
| <b>Proto</b>              | Protocol configured on the interface.                                                                                                              | terse                          |
| <b>Interface index</b>    | Physical interface index number, which reflects its initialization sequence.                                                                       | detail extensive<br>none       |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                      | detail extensive<br>none       |
| <b>Type</b>               | Physical interface type.                                                                                                                           | detail extensive<br>none       |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                | detail extensive<br>brief none |
| <b>MTU</b>                | MTU size on the physical interface.                                                                                                                | detail extensive<br>brief none |
| <b>Clocking</b>           | Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.                                                 | detail extensive<br>brief      |
| <b>Speed</b>              | Speed at which the interface is running. Always unspecified on IRB interfaces.                                                                     | detail extensive<br>brief      |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> . | detail extensive<br>brief none |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .    | detail extensive<br>brief none |
| <b>Link type</b>          | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                           | detail extensive<br>none       |
| <b>Link flags</b>         | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .             | detail extensive<br>none       |

Table 154: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Physical Info</b>           | Physical interface information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels                      |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>         |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b><br>none |
| <b>Hardware address</b>        | MAC address of the hardware.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b><br>none |
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>         |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                              | <b>detail extensive</b><br>none |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface.<br><br><ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                             | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.<br><br><ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |

Table 154: show interfaces irb Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Input errors</b>      | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>           | <b>detail extensive</b>         |
| <b>Output errors</b>     | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>detail extensive</b>         |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                 |
| <b>Logical interface</b> | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels                      |
| <b>Index</b>             | Index number of the logical interface (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b><br>none |

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output                 |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>SNMP ifIndex</b>            | SNMP interface index number of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>         |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>         |
| <b>Bandwidth</b>               | Dummy value that is ignored by an IRB interface. IRB interfaces are pseudo interfaces and do not have physical bandwidth associated with them.                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>         |
| <b>Routing Instance</b>        | Routing instance IRB is configured under.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>         |
| <b>Bridging Domain</b>         | Bridging domain IRB is participating in.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the logical interface.<br><br><ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                             | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.<br><br><ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |
| <b>Local statistics</b>        | Statistics for traffic received from and transmitted to the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>         |
| <b>Transit statistics</b>      | Statistics for traffic transiting the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>         |
| <b>Protocol</b>                | Protocol family configured on the local interface. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |

Table 154: show interfaces irb Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                               | Level of Output                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>MTU</b>              | Maximum transmission unit size on the logical interface.                                                                                                        | <b>detail extensive</b>         |
| <b>Maximum labels</b>   | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                 | <b>detail extensive</b><br>none |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                               | <b>detail extensive</b>         |
| <b>Route table</b>      | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                             | <b>detail extensive</b>         |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                 | <b>detail extensive</b>         |
| <b>Policer</b>          | The policer that is to be evaluated when packets are received or transmitted on the interface.                                                                  | <b>detail extensive</b>         |
| <b>Flags</b>            | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b>         |

## Sample Output

**show interfaces irb extensive**

user@host> **show interfaces irb extensive**

```
Physical interface: irb, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23, Generation: 130
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
Speed: Unspecified
  Device flags      : Present Running
  Interface flags: SNMP-Traps
  Link type        : Full-Duplex
  Link flags       : None
  Physical info    : Unspecified
  Hold-times       : Up 0 ms, Down 0 ms
  Current address: 02:00:00:00:00:30, Hardware address: 02:00:00:00:00:30
  Alternate link address: Unspecified
  Last flapped    : Never
```

    Flags: Is-Primary

```

## show interfaces mac-database

### Syntax

```
show interfaces mac-database (ge-fpc/pic/port | ge-fpc/pic/port.n | aex| xe-fpc/pic/port | xe-fpc/pic/port.n |
et-fpc/pic/port | et-fpc/pic/port.n) <mac-address mac-address>
```

### Release Information

Command introduced before Junos OS Release 7.4.

Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

Support for statement with the **aex** option introduced in Junos OS Release 15.1.

### Description

(M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only) Display media access control (MAC) address information for the specified interface.

### Options

**ge-fpc/pic/port**—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

**ge-fpc/pic/port.n**—Display MAC addresses that have been learned on a particular logical interface.

**aex**—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.

**xe-fpc/pic/port**—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

**xe-fpc/pic/port.n**—Display MAC addresses that have been learned on a particular logical interface.

**et-fpc/pic/port**—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

**et-fpc/pic/port.n**—Display MAC addresses that have been learned on a particular logical interface.

**mac-address mac-address**—(Optional) Display detailed MAC address statistics, including policer information for **ge**, **xe**, and **et** interfaces.

### Additional Information

On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.

### Required Privilege Level

view

## Output Fields

Table 155 on page 1829 lists the output fields for the **show interfaces mac-database** command. Output fields are listed in the approximate order in which they appear.

Table 155: show interfaces mac-database Output Fields

| Field Name                      | Field Description                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical Interface</b>       |                                                                                                                                                           |
| <b>Physical interface</b>       | Name of the physical interface.                                                                                                                           |
| <b>Enabled</b>                  | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .             |
| <b>Interface index</b>          | Physical interface index number, which reflects its initialization sequence.                                                                              |
| <b>SNMP ifIndex</b>             | SNMP index number for the physical interface.                                                                                                             |
| <b>Description</b>              | Description and name of the interface.                                                                                                                    |
| <b>Link-level type</b>          | Encapsulation being used on the physical interface.                                                                                                       |
| <b>MTU</b>                      | MTU size on the physical interface.                                                                                                                       |
| <b>Speed</b>                    | Speed at which the interface is running.                                                                                                                  |
| <b>Loopback</b>                 | Whether loopback is enabled and the type of loopback: <b>local</b> or <b>remote</b> .                                                                     |
| <b>Source filtering</b>         | Whether source filtering is configured.                                                                                                                   |
| <b>Flow control</b>             | Whether flow control is enabled or disabled.                                                                                                              |
| <b>Minimum links needed</b>     | (Aggregated Ethernet interfaces only) Number of child links that must be operational for the aggregated interface to be operational.                      |
| <b>Minimum bandwidth needed</b> | (Aggregated Ethernet interfaces only) Minimum amount of bandwidth of child links that must be operational for the aggregated interface to be operational. |
| <b>Device flags</b>             | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .        |

Table 155: show interfaces mac-database Output Fields (*continued*)

| Field Name                                                                 | Field Description                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current address</b>                                                     | (Aggregated Ethernet interfaces only) Configured MAC address.                                                                                                                                                                                                                                                                    |
| <b>Hardware address</b>                                                    | (Aggregated Ethernet interfaces only) Hardware MAC address.                                                                                                                                                                                                                                                                      |
| <b>Last flapped</b>                                                        | (Aggregated Ethernet interfaces only) Date, time, and how long ago the interface went from down to up or from up to down. The format is <b>Last flapped: <i>year-month-day hours:minutes:seconds timezone (wwEEKSddays hours:minutes ago)</i></b> . For example, <b>Last flapped: 2013-12-18 04:33:22 PST (1w5d 22:23 ago)</b> . |
| <b>Input Rate</b>                                                          | (Aggregated Ethernet interfaces only) Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                          |
| <b>Output Rate</b>                                                         | (Aggregated Ethernet interfaces only) Output rate in bps and pps.                                                                                                                                                                                                                                                                |
| <b>Interface flags</b>                                                     | Information about the interface. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                      |
| <b>Link flags</b>                                                          | Information about the link. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                          |
| <b>Logical Interface</b>                                                   |                                                                                                                                                                                                                                                                                                                                  |

Number of MAC addresses : 21

```

### show interfaces mac-database (All MAC Addresses on an Aggregated Ethernet Interface)

user@host> show interfaces mac-database ae4

```

Physical interface: ae4, Enabled, Physical link is Up
  Interface index: 132, SNMP ifIndex: 588
  Description: Member links xe-0/2/0
  Link-level type: Ethernet, MTU: 9188, Speed: Unspecified, BPDU Error: None,
  MAC-REWRITE Error: None, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
  Minimum bandwidth needed: 0
  Device flags   : Present Running
  Interface flags: Interface flags: SNMP-Traps Internal: 0x4000
  Current address: 00:22:83:76:ff:c4, Hardware address: 00:22:83:76:ff:c4
  Last flapped   : 2013-12-18 04:33:22 PST (1w5d 22:23 ago)
  Input rate      : 62756384 bps (85266 pps)
  Output rate     : 62759472 bps (85272 pps)

```

```

Logical interface ae4.0 (Index 334) (SNMP ifIndex 647)
  Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
  MAC address      Input frames   Input bytes   Output frames   Output bytes

## show interfaces mc-ae

### Syntax

```
show interfaces mc-ae
extensive
revertive-info
<id identifier unit number>
```

### Release Information

Command introduced in Junos OS Release 9.6.

**revertive-info** statement introduced in Junos OS Release 13.3

**extensive** statement introduced in Junos OS Release 16.1R1

### Description

On MX Series routers with multichassis aggregated Ethernet (**aeX**) interfaces, displays information about the **aeX** interfaces.

### Options

**extensive**—(Optional) Display extensive information for multichassis aggregated Ethernet interface.

**revertive-info**—(Optional) Display revertive mode information for multichassis aggregated Ethernet interface.

**identifier**—(Optional) Identifier of the multichassis aggregated Ethernet interface.

**number**—(Optional) Specify the logical interface by unit number.

### Required Privilege Level

view

### RELATED DOCUMENTATION

*Configuring Multichassis Link Aggregation on MX Series Routers*

## Output Fields

Table 156 on page 1836 lists the output fields for the **show interfaces mc-ae** command. Output fields are listed in the approximate order in which they appear.

Table 156: show interfaces mc-ae Output Fields

| Output Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Member Link</b>                   | Identifiers of the configured multichassis link aggregate interfaces configured interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Current State Machine's State</b> | Current state of the MCLAG state machine. The MCLAG state machine is responsible for synchronization with the peer MCLAG node.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Local Status</b>                  | Status of the local link: <b>active</b> or <b>standby</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Peer Status</b>                   | Status of the peer link: <b>active</b> or <b>standby</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Local State</b>                   | Up or down state of the local device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Peer State</b>                    | <p>Status of the local and peer links in an <b>active/active</b> bridge or VRRP over integrated routing and bridging (IRB) configuration on MX Series routers, including:</p> <p><b>Logical Interface</b>—Aggregated Ethernet (AE) aggregate number and unit number.</p> <p><b>Topology Type</b>—The bridge or VRRP topology type configured on the AE.</p> <p><b>Local State</b>—Up or down state of the local device.</p> <p><b>Peer State</b>—Up or down state of the peer device.</p> <p><b>Peer Ip/ICL-PL/State</b>—Address, interface and state of the peer device.</p> |
| <b>Core Facing Interface</b>         | Label: <b>pseudowire interface</b> or <b>Ethernet interface</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ICL-PL</b>                        | Label: <b>pseudowire interface</b> or <b>Ethernet interface</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>switchover mode</b>               | The configured switchover mode for the multichassis aggregated Ethernet interface: <b>revertive</b> or <b>non-revertive</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 156: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name                 | Field Description                                                                                                                                                                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>switchover status</b>          | Status of the switchover if the <b>revert-time</b> statement is configured at the <b>[edit interfaces aex mc-ae]</b> hierarchy level.                                                                                                    |
| <b>revert time</b>                | Revert time configured for the multichassis aggregated Ethernet interface.                                                                                                                                                               |
| <b>switchover time remaining</b>  | Seconds left to trigger the switchover if the switchover is in progress.                                                                                                                                                                 |
| <b>Configuration Error Status</b> | Reason for the configuration error.                                                                                                                                                                                                      |
| MCAE Configuration                |                                                                                                                                                                                                                                          |
| <b>Redundancy Groups</b>          | Identification number of the redundancy group. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions. Possible values: 1 through 4,294,967,294. |
| <b>MCAE ID</b>                    | Identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number. Possible values: 1 through 65,535.                                                       |
| <b>MCAE Mode</b>                  | Specifies whether the MC-LAG is in active-active or active-standby mode. Possible values: active-active or active-standby.                                                                                                               |
| <b>Status Control</b>             | Specifies whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs. Possible values: active or standby.                                                                                    |
| <b>Chassis ID</b>                 | Chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links. Possible values: 0 or 1.                                                                                           |
| LACP Configuration                |                                                                                                                                                                                                                                          |
| <b>System ID</b>                  | System id of the local system.                                                                                                                                                                                                           |

Table 156: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name              | Field Description                                                                  |
|--------------------------------|------------------------------------------------------------------------------------|
| <b>Admin Key</b>               | LACP administrative key of the node. Value should be the same on both MCLAG peers. |
| LACP Information               |                                                                                    |
| <b>Local Partner System ID</b> | LACP partner system ID as seen by the local node.                                  |
| <b>Peer Partner System ID</b>  | LACP partner system ID as seen by MC-AE peer node.                                 |

## show interfaces prbs-stats

Syntax (MX10003 and MX204)

```
show interfaces interface-name prbs-stats
```

### Release Information

Statement introduced in Junos OS Release 19.2R1 for MX10003 and MX204 routers.

### Description

Displays the Pseudo Random Binary Sequence (PRBS) statistics and the status of the test (PASS/FAIL) along with error counters.

Use the [prbs-test-start](#) and [prbs-test-stop](#) commands to run and stop the PRBS statistics collection respectively.

For the step-by-step procedure on how to collect and view the PRBS statistics, refer [“Verifying Link and Transceivers using Pseudo Random Binary Sequence \(PRBS\) Test” on page 910](#).

A 10-Gigabit ethernet interface contains a single lane of data transmission and reception, while a 40-Gigabit ethernet and 100-Gigabit ethernet interface comprises of four lanes of 10G and 25G for data transmission and reception respectively. The PRBS tests are executed per lane of an interface. Hence, The PRBS test status displays the status per lane of the interface.

[clear interfaces statistics](#)

---

[Verifying Link and Transceivers using Pseudo Random Binary Sequence \(PRBS\) Test](#) | [910](#)

### List of Sample Output

[show interfaces et-0/1/2 prbs-stats \(MX10003 and MX204 routers\) on page 1843](#)

## Sample Output

**show interfaces et-0/1/2 prbs-stats (MX10003 and MX204 routers)**

user@host> **show interfaces et-0/1/2 prbs-stats**

```
PRBS Statistics : Enabled

Lane 0 : State : Pass, Error count : 0
Lane 1 : State : Pass, Error count : 0
Lane 2 : State : Pass, Error count : 0
Lane 3 : State : Pass, Error count : 0
```

The PRBS tests are executed per lane of an interface. Hence, The PRBS test status displays the status per lane of the interface.

## show interfaces transport pm

### Syntax

```
show interfaces transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all | interface-name)
```

### Release Information

Command introduced in Junos OS Release 14.2 on the PTX Series.

Command introduced in Junos OS Release 16.1 on the MX Series.

Command introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

### Description

Display diagnostic data, warnings, and alarms for transport performance monitoring interfaces.

### Options

(all | optics | otn)—Display both optics and OTN information or either only optics or only OTN information.

(all | current | currentday | interval | previousday)—Display information for the current 15-minute interval, the current day, the ninety-six 15-minute intervals, and the previous day; information only for the current 15-minute interval; information only for the current 24 hours; information only for the ninety-six 15-minute intervals; information only for the previous day.

(all | *interface-name*)—Display information for all interfaces or only for the specified interface (for example, *et-fpc/pic/port*).

### Output Fields

[Table 157 on page 1845](#) lists the output fields for the **show interfaces transport pm optics** command. Fields are listed in the approximate order in which they appear.

Table 157: show interfaces transport pm Output Fields

| Field Name         | Field Description                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------|
| Physical interface | Name of the physical interface.                                                                     |
| Interval           | The 15 minute interval for performance monitoring.                                                  |
| Suspect Flag       | TRUE if the performance monitoring data for the interval ap                                         |
| Reason             | Reason for setting the suspect flag.                                                                |
| COUNT              | Measured value.                                                                                     |
| THRESHOLD          | Threshold value set.                                                                                |
| TCA-ENABLED        | Threshold crossing alert. Set to TRUE if enabled.                                                   |
| TCA-RAISED         | TRUE if enabled and the value crosses the threshold.                                                |
| Near End PM        | Near end threshold crossing defect trigger. For more inform                                         |
| Far End PM         | Far end threshold crossing defect trigger. For more informat                                        |
| FEC PM             | Forwarding equivalence class threshold crossing defect trigge<br>trigger, see <a href="#">tca</a> . |
| BER PM             | Bit error rate threshold crossing defect trigger. For more info                                     |
| CURRENT            | Current value measured.                                                                             |
| PM                 | Performance monitor.                                                                                |
| MIN                | Minimum value measured.                                                                             |
| MAX                | Maximum value measured.                                                                             |

Table 157: show interfaces transport pm Output Fields (*continued*)

| Field Name                     | Field Description                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------|
| AVG                            | Average value.                                                                                    |
| Lane Chromatic dispersion      | Residual chromatic dispersion measured.                                                           |
| Lane differential group delay  | Measured differential group delay.                                                                |
|                                |                                                                                                   |
| q Value                        | Measured Quality factor value.                                                                    |
| SNR                            | Signal to noise ratio.                                                                            |
| Tx output power                | The transmit laser output power.                                                                  |
| Rx input power                 | The laser's received optical power.                                                               |
| Module temperature (Celsius)   | The laser's temperature.                                                                          |
| Tx Laser bias current (0.1mA)  | Magnitude of the laser bias power setting current. The laser laser diodes and modulates currents. |
| Rx Laser bias current (0.1mA)  | Magnitude of the laser bias power setting current.                                                |
| Carrier frequency offset (MHz) | Measured carrier frequency offset.                                                                |

## show l2-learning instance

### Syntax

```
show l2-learning instance
```

### Release Information

(MX Series routers only) Command introduced in Junos OS Release 8.4.

### Description

Display Layer 2 learning properties for all the configured routing instances.

### Options

This command has no options.

### Required Privilege Level

view

### List of Sample Output

[show l2-learning instance on page 1855](#)

### Output Fields

[Table 158 on page 1854](#) describes the output fields for the **show l2-learning instance** command. Output fields are listed in the approximate order in which they appear.

Table 158: show l2-learning instance Output Fields

| Field Name       | Field Description                                                                                                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing Instance | Name of routing instance.                                                                                                                                                                                                                           |
| Bridging Domain  | Name of bridging domain.<br><br>On MX Series routers you can use the <b>show l2-learning instance &lt;extensive&gt;</b> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID. |
| Index            | Number associated with the routing instance or bridging domain.                                                                                                                                                                                     |
| Logical System   | Name of logical system or <b>Default</b> if no logical system is configured.                                                                                                                                                                        |

Table 158: show l2-learning instance Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing instance flags</b> | <p>Status of Layer 2 learning properties for each routing instance:</p> <ul style="list-style-type: none"> <li>• <b>DL</b>—MAC learning is disabled.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>AD</b>—Packets are dropped after MAC address limit is reached.</li> <li>• <b>LH</b>—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.</li> </ul> |
| <b>MAC limit</b>              | Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.                                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

**show l2-learning instance**

user@host> **show l2-learning instance**

Information for routing instance:

Routing Instance flags (DL -disable learning, SE -stats enabled,  
AD -packet action drop, LH -mac limit hit)

| Routing Instance     | Bridging Domain | Index | Logical System | Routing flags | MAC limit |
|----------------------|-----------------|-------|----------------|---------------|-----------|
| __juniper_private1__ |                 | 1     | Default        |               | 5000      |
| vs1                  | vlan100         | 3     | Default        |               | 5120      |
| vs1                  | vlan200         | 4     | Default        |               | 5120      |

## show l2-learning redundancy-groups

### Syntax

```
show l2-learning redundancy-groups
logical-system [system-name | all]
<redundancy-group-id [0 to 4294967294]>
arp-statistics
nd-statistics
remote-macs
```

### Release Information

Command introduced in Junos OS Release 13.2.

Support for logical systems added in Junos OS Release 14.1.

Command introduced in Junos OS Release 15.1R1 for EX Series switches

### Description

(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

### Options

**logical-system** [*system-name* | all]—(Optional) Display information for a specified logical system or all systems.

**redundancy-group-id**—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.

**arp-statistics**—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.

**nd-statistics**—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.

**remote-macs**—(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.

### Output Fields

Output fields are listed in the approximate order in which they appear.

**Table 159: show l2-learning redundancy-groups arp-statistics Output Fields**

| Field Name                        | Field Description                                                              |
|-----------------------------------|--------------------------------------------------------------------------------|
| Redundancy Group ID               | Redundancy Group to which the following details apply.                         |
| MCLAG ARP Statistics Group ID     | ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance. |
| ARP Rx Count From Line            | Total number of ARPs received from the Line.                                   |
| ARP Tx Count To Peer              | Total number of ARPs sent to the peer.                                         |
| ARP Rx Count From Peer            | Total number of ARPs received from the peer.                                   |
| ARP Drop Count received from line | Total number of ARPs sent by the peer that were received.                      |
| ARP Drop Count received from peer | Total number of ARPs sent by the peer that were dropped                        |
| Service-id                        | Service ID (configured at the routing instance level).                         |

Table 160: show l2-learning redundancy-groups nd-statistics Output Fields

| Field Name                       | Field Description                                                                             |
|----------------------------------|-----------------------------------------------------------------------------------------------|
| Redundancy Group ID              | Redundancy Group to which the following details apply.                                        |
| MCLAG ND Statistics Group ID     | Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance. |
| ND Rx Count From Line            | Total number of Neighbor Discovery packets received from the Line.                            |
| ND Tx Count To Peer              | Total number of Neighbor Discovery packets sent to the peer.                                  |
| ND Rx Count From Peer            | Total number of Neighbor Discovery packets received from the peer.                            |
| ND Drop Count received from line | Total number of Neighbor Discovery packets sent by the peer that were received.               |
| ND Drop Count received from peer | Total number of Neighbor Discovery packets sent by the peer that were dropped                 |
| Service-id                       | Service ID (configured at the routing instance level).                                        |

Table 161: show l2-learning redundancy-groups remote-macs Output Fields

| Field Name          | Field Description                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| Redundancy Group ID | Redundancy Group to which the following details apply.                                                             |
| Peer-Addr           | IP address of the remote peer.                                                                                     |
| VLAN                | Virtual LAN identifier associated with the redundancy group.                                                       |
| MAC                 | Hardware media access control address associated with the redundancy group.                                        |
| MCAE-ID             | ID number of the MC-AE used by the redundancy group.                                                               |
| Flags               | Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected. |
| Status              | Installation state: Installed or Not Installed.                                                                    |

## Sample Output

### show l2-learning redundancy-groups arp-statistics

user@host> show l2-learning redundancy-groups arp-statistics

```

Logical System : default
  Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID                      : 1

```
user@host> show l2-learning redundancy-groups 1
```

```

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

```

**show l2-learning redundancy-groups logical-system**

```
user@host> show l2-learning redundancy-groups logical-system ls1
```

Redundancy Group ID : 2

Flags : Local Connect,Remote Connect

## show lacp interfaces

### Syntax

```
show lacp interfaces
<interface-name>
extensive
```

### Release Information

Command introduced in Junos OS Release 7.6.

**extensive** statement introduced in Junos OS Release 16.1R1

Command introduced in Junos OS Release 10.0 for EX Series switches.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Command introduced in Junos OS Release 14.2R3

### Description

Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

### Options

**none**—Display LACP information for all interfaces.

**interface-name**—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**aenumber**
- Fast Ethernet—**fe-fpc/pic/port**
- Gigabit Ethernet—**ge-fpc/pic/port**
- 10 Gigabit Ethernet—**xe-fpc/pic/port**

**extensive**—Display LACP information for the interface in detail.

**NOTE:** The **show lacp interfaces** command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lacp subsystem not running – not needed by configuration”

Table 162: show lacp interfaces Output Fields

| Field Name           | Field Description                                                                                                    | Level of Out |
|----------------------|----------------------------------------------------------------------------------------------------------------------|--------------|
| LACP State           | For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name. | All Levels   |
| Aggregated interface | Aggregated interface value.                                                                                          | All Levels   |

Table 162: show lacp interfaces Output Fields (continued)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Out |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| LACP State | <p>LACP state information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>• <b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li>• <b>Actor</b>—Local device participating in LACP negotiation.</li> <li>• <b>Partner</b>—Remote device participating in LACP negotiation.</li> </ul> </li> <li>• <b>Exp</b>—Expired state. <b>Yes</b> indicates the actor or partner is in an expired state. <b>No</b> indicates the actor or partner is not in an expired state.</li> <li>• <b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. <b>No</b> indicates the operational partner information in use has been received in an LACP PDU.</li> <li>• <b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li>• <b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li>• <b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. It is currently not in the right aggregation.</li> <li>• <b>Aggr</b>—Ability of aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li>• <b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li>• <b>Activity</b>—Actor or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> <li>• <b>Core isolation state down (CDN)</b>— LACP interface state. Down indicates the LACP interface is down because all the eBGP sessions for Ethernet VPN (EVPN) are down.</li> </ul> | All Levels   |

## show oam ethernet connectivity-fault-management delay-statistics

### Syntax

```
show oam ethernet connectivity-fault-management delay-statistics
<count entry-count>
<local-mep mep-id>
<maintenance-association ma-name>
<maintenance-domain md-name>
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 9.5.

Command introduced in Junos OS Release 11.4 for EX Series switches.

### Description

On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs), display ETH-DM delay statistics.

On EX Series switches, display delay measurement results.

### Options

**count entry-count**—(Optional) Number of entries to display from the statistics table. The range of values is **1** through **100**. The default value is **100** entries.

**local-mep mep-id**—(Optional) Numeric identifier of the local MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.

**maintenance-association ma-name**—Name of an existing CFM maintenance association.

**maintenance-domain md-name**—Name of an existing connectivity fault management (CFM) maintenance domain.

**remote-mep remote-mep-id**—(Optional) Numeric identifier of the remote MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.

# show oam ethernet connectivity-fault-management forwarding-state

## Syntax

```
show oam ethernet connectivity-fault-management forwarding-state
interface interface-name | instance instance-name
<brief | detail | extensive>
```

## Release Information

Command introduced in Junos OS Release 8.4.

## Description

On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

## Options

**interface *interface-name***—Display forwarding state information for the specified Ethernet interface only.

**instance *instance-name***—Display forwarding state information for the specified forwarding instance only.

**brief | detail | extensive**—(Optional) Display the specified level of output.

## Required Privilege Level

## show oam ethernet connectivity-fault-management interfaces

### Syntax

```
show oam ethernet connectivity-fault-management interfaces
<ethernet-interface-name>
<level md-level>
<brief | detail | extensive>
```

### Release Information

Command introduced in Junos OS Release 8.4.

Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.

Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for ACX Series and MX Series routers.

### Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts when **detail** or **extensive** mode is specified.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

### Options

**brief | detail | extensive**—(Optional) Specified level of output.

**ethernet-interface-name**—(Optional) CFM information only for CFM entities attached to the specified Ethernet interface.

**level md-level**—(Optional) CFM information for CFM identities enclosed within a maintenance domain of the specified level.

|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Ethernet-ais status       | Status of alarm indication signal (AIS). <b>active</b> or <b>in-active</b> .                                                                                                                                                                                            | <b>detail extensive</b> |
| Interval                  | Continuity-check message interval.                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| Loss-threshold            | Lost continuity-check message threshold.                                                                                                                                                                                                                                | <b>detail extensive</b> |
| Interface status TLV      | Status of the interface status TLV, if configured on the MEP interface: <b>none, up, down, testing, unknown, dormant, notPresent, lowerLayerDown</b>                                                                                                                    | <b>detail extensive</b> |
| Port status TLV           | Status of the port status TLV, if configured on the MEP interface: <b>none, no, yes</b>                                                                                                                                                                                 | <b>detail extensive</b> |
| Connection Protection TLV | Status of the connection protection TLV if configured on the MEP interface: <b>no, yes</b><br><br>If <b>yes</b> , then the transmitted connection protection TLV is decoded and the following three fields are displayed: <b>Prefer me, Protection in use, FRR Flag</b> | <b>detail extensive</b> |
| Prefer me                 | If set to <b>yes</b> , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                          | <b>detail extensive</b> |
| Protection in use         | Used for protection decision coordination. Its value is set to <b>yes</b> if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                         | <b>detail extensive</b> |
| FRR Flag                  | LSR/LER forwarding the CCM Frame into a bypass tunnel is set.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                                                                                                         | <b>detail extensive</b> |
| MEP identifier            | Maintenance association end point (MEP) identifier.                                                                                                                                                                                                                     | All levels              |
| Neighbors                 | Number of MEP neighbors.                                                                                                                                                                                                                                                | All levels              |
| Direction                 | MEP direction configured.                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| MAC address               | MAC address configured for the MEP.                                                                                                                                                                                                                                     | <b>detail extensive</b> |

Table 165: show oam ethernet connectivity-fault-management interfaces Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                              | Level of Output         |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>MEP status</b>                        | Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: <b>Running, inactive, disabled, or unsupported.</b>                                                               | <b>detail extensive</b> |
| <b>Remote MEP not receiving CCM</b>      | Whether the remote MEP is not receiving connectivity check messages (CCMs).                                                                                                                                    | <b>detail extensive</b> |
| <b>Erroneous CCM received</b>            | Whether erroneous CCMs have been received.                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Cross-connect CCM received</b>        | Whether cross-connect CCMs have been received.                                                                                                                                                                 | <b>detail extensive</b> |
| <b>RDI sent by some MEP</b>              | Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs. | <b>detail extensive</b> |
| Some remote MEP's MAC in error state     | Indicates whether the remote MEP's MAC is in error state.                                                                                                                                                      | <b>detail extensive</b> |
| Alarm Indication Signal                  | Indicates whether the AIS is triggered or is cleared.                                                                                                                                                          | <b>detail extensive</b> |
| <b>CCMs sent</b>                         | Number of CCMs transmitted.                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>CCMs received out of sequence</b>     | Number of CCMs received out of sequence.                                                                                                                                                                       | <b>detail extensive</b> |
| <b>LBM sent</b>                          | Number of loopback request messages (LBMs) sent.                                                                                                                                                               | <b>detail extensive</b> |
| <b>Valid in-order LBRs received</b>      | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                 | <b>detail extensive</b> |
| <b>Valid out-of-order LBRs received</b>  | Number of LBRs received that were valid messages and not in sequence.                                                                                                                                          | <b>detail extensive</b> |
| <b>LBRs received with corrupted data</b> | Number of LBRs received that were corrupted.                                                                                                                                                                   | <b>detail extensive</b> |

Table 165: show oam ethernet connectivity-fault-management interfaces Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                            | Level of Output         |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>LBRs sent</b>                           | Number of LBRs transmitted.                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>LTM sent</b>                            | Linktrace messages (LTMs) transmitted.                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>LTM received</b>                        | Linktrace messages received.                                                                                                                                                                                                 | <b>detail extensive</b> |
| <b>LTR sent</b>                            | Linktrace responses (LTRs) transmitted.                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>LTR received</b>                        | Linktrace responses received.                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Sequence number of next LTM request</b> | Sequence number of next LTM request to be transmitted.                                                                                                                                                                       | <b>detail extensive</b> |
| <b>1DMs sent</b>                           | If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays 0. | <b>detail extensive</b> |
| <b>Valid 1DMs received</b>                 | If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received.<br><br>For all other cases, this field displays 0.                                                         | <b>detail extensive</b> |
| <b>Invalid 1DMs received</b>               | If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received.<br><br>For all other cases, this field displays 0.                                                       | <b>detail extensive</b> |
| <b>Out of sync 1DMs received</b>           | If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.                                                                       | <b>detail extensive</b> |
| <b>DMMs sent</b>                           | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays 0. | <b>detail extensive</b> |
| <b>Valid DMMs received</b>                 | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.                                                                           | <b>detail extensive</b> |

Table 165: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

| Field Name                          | Field Description                                                                                                                                                                     | Level of Output         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Invalid DMMs received</b>        | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.                                  | <b>detail extensive</b> |
| <b>DMRs sent</b>                    | If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent.<br><br>For all other cases, this field displays 0. | <b>detail extensive</b> |
| <b>Valid DMRs received</b>          | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received.<br><br>For all other cases, this field displays 0.                      | <b>detail extensive</b> |
| <b>Invalid DMRs received</b>        | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received.<br><br>For all other cases, this field displays 0.                    | <b>detail extensive</b> |
| <b>LMM sent</b>                     | If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.                      | <b>detail extensive</b> |
| <b>Valid LMM received</b>           | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.                                                     | <b>detail extensive</b> |
| <b>Invalid LMM received</b>         | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.                                                   | <b>detail extensive</b> |
| <b>LMR sent</b>                     | If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.                                                             | <b>detail extensive</b> |
| <b>Valid LMR received</b>           | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.                                                                           | <b>detail extensive</b> |
| <b>Invalid LMR received</b>         | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.                                                                         | <b>detail extensive</b> |
| <b>Valid AIS frames transmitted</b> | Number of valid AIS frames transmitted to the peer MEPs.                                                                                                                              | <b>detail extensive</b> |
| <b>Valid AIS frames received</b>    | Number of valid AIS frames received from the peer MEPs.                                                                                                                               | <b>detail extensive</b> |

Table 165: show oam ethernet connectivity-fault-management interfaces Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                       | Level of Output         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>SLM sent</b>                 | If the interface is attached to an initiator MEP for a ETH-SLM session:<br>Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session. | <b>detail extensive</b> |
| <b>Valid SLM received</b>       | If the interface is attached to a responder MEP for a ETH-SLM session:<br>Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                    | <b>detail extensive</b> |
| <b>Invalid SLM received</b>     | If the interface is attached to a responder MEP for a ETH-SLM session:<br>Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                  | <b>detail extensive</b> |
| <b>SLR sent</b>                 | If the interface is attached to a responder MEP for a ETH-SLM session:<br>Number detail extensive of synthetic loss reply (SLR) frames sent.                                                                            | <b>detail extensive</b> |
| <b>Valid SLR received</b>       | If the interface is attached to an initiator MEP for a ETH-SLM session:<br>Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.                                                    | <b>detail extensive</b> |
| <b>Invalid SLR received</b>     | If the interface is attached to an initiator MEP for a ETH-SLM session:<br>Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.                                                  | <b>detail extensive</b> |
| <b>Remote MEP count</b>         | Number of remote MEPs.                                                                                                                                                                                                  | <b>extensive</b>        |
| <b>Identifier (remote MEP)</b>  | MEP identifier of the remote MEP.                                                                                                                                                                                       | <b>extensive</b>        |
| <b>MAC address (remote MEP)</b> | MAC address of the remote MEP.                                                                                                                                                                                          | <b>extensive</b>        |
| <b>State (remote MEP)</b>       | State of the remote MEP.                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Interface (remote MEP)</b>   | Interface of the remote MEP.                                                                                                                                                                                            | <b>extensive</b>        |

# show oam ethernet connectivity-fault-management linktrace path-database

## Syntax

```
show oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association
ma-name maintenance-domain md-name
```

## Release Information

Command introduced in Junos OS Release 9.0.

## Description

On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

## Options

**mac-address**—Display connectivity fault management path database information for the specified MAC address of the remote host.

**maintenance-association *ma-name***—Display connectivity fault management path database information for the specified maintenance association.

**maintenance-domain *md-name***—Display connectivity fault management path database information for the specified maintenance domain.

## List of Sample Output

[show oam ethernet connectivity-fault-management linktrace path-database on page 1894](#)  
[show oam ethernet connectivity-fault-management linktrace path-database \(Two traceroute Commands\) on page 1895](#)

## Output Fields

[Table 166 on page 1893](#) lists the output fields for the **show oam ethernet connectivity-fault-management linktrace path-database** command. Output fields are listed in the approximate order in which they appear.

Table 166: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

| Field Name         | Field Description                                                           |
|--------------------|-----------------------------------------------------------------------------|
| Linktrace to       | MAC address of the 802.1ag node to which the linktrace message is targeted. |
| Interface          | Interface used by the local MEP to send the linktrace message (LTM).        |
| Maintenance Domain | Maintenance domain identifier specified in the traceroute command.          |

**Table 166: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)**

| Field Name                     | Field Description                                                                                                                                                                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Maintenance Association</b> | Maintenance association identifier specified in the traceroute command.                                                                                                                                                                                                       |
| <b>Level</b>                   | Maintenance domain level configured for the maintenance domain.                                                                                                                                                                                                               |
| <b>Local Mep</b>               | MEP identifier of the local MEP originating the linktrace.                                                                                                                                                                                                                    |
| <b>Hop</b>                     | Sequential hop count of the linktrace path.                                                                                                                                                                                                                                   |
| <b>TTL</b>                     | Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.                                                                                                                                                                   |
| <b>Source MAC address</b>      | MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.                                                                                                                                                                                   |
| <b>Next hop MAC address</b>    | MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.                                                                                        |
| <b>Transaction Identifier</b>  | 4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM. |

## Sample Output

**show oam ethernet connectivity-fault-management linktrace path-database**

**user@host> show oam ethernet connectivity-fault-management linktrace path-database  
maintenance-domain MD1 maintenance-association MA1 00:01:02:03:04:05**

## show oam ethernet connectivity-fault-management loss-statistics

### Syntax

```
show oam ethernet connectivity-fault-management loss-statistics
maintenance-domain md-name
maintenance-association ma-name
<count entry-count>
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 11.1.

### Description

On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**count *entry-count***—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.

**local-mep *local-mep-id***—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.

**remote-mep *remote-mep-id***—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.

Table 167: show oam ethernet connectivity-fault-management loss-statistics Output Fields

| Output Field Name                    | Field Description                                                                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MEP identifier</b>                | Maintenance association end point (MEP) numeric identifier.                                                                                                                    |
| <b>MAC address</b>                   | Unicast MAC address configured for the MEP.                                                                                                                                    |
| <b>Remote MEP count</b>              | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                                                                                       |
| <b>Remote MEP identifier</b>         | Numeric identifier of the remote MEP.                                                                                                                                          |
| <b>Remote MAC address</b>            | Unicast MAC address of the remote MEP.                                                                                                                                         |
| <b>Index</b>                         | Index number that corresponds to the ETH-LM entry in the CFM database.                                                                                                         |
| <b>Near-end frame loss</b>           | Count of frame loss associated with ingress data frames.                                                                                                                       |
| <b>Far-end frame loss</b>            | Count of frame loss associated with egress data frames.                                                                                                                        |
| <b>Near-end loss ratio</b>           | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface. |
| <b>Far-end loss ratio</b>            | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.  |
| <b>Average near-end frame loss</b>   | Average frame loss measured in this session associated with ingress data frames.                                                                                               |
| <b>Average near-end loss ratio</b>   | Average frame loss ratio measured in this session associated with ingress data frames.                                                                                         |
| <b>Average far-end frame loss</b>    | Average frame loss measured in this session associated with egress data frames.                                                                                                |
| <b>Average far-end loss ratio</b>    | Average frame loss ratio measured in this session associated with egress data frames.                                                                                          |
| <b>Near-end best case loss</b>       | Lowest frame loss measured in this session associated with ingress data frames.                                                                                                |
| <b>Near-end best case loss ratio</b> | Lowest frame loss ratio measured in this session associated with ingress data frames.                                                                                          |

Table 167: show oam ethernet connectivity-fault-management loss-statistics Output Fields (continued)

| Output Field Name              | Field Description                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------|
| Near-end worst case loss       | Highest frame loss measured in this session associated with ingress data frames.       |
| Near-end worst case loss ratio | Highest frame loss ratio measured in this session associated with ingress data frames. |
| Far-end best case frame loss   | Lowest frame loss measured in this session associated with egress data frames.         |
| Far-end best case loss ratio   | Lowest frame loss ratio measured in this session associated with egress data frames.   |
| Far-end worst case loss        | Highest frame loss measured in this session associated with egress data frames.        |
| Far-end worst case loss ratio  | Highest frame loss ratio measured in this session associated with egress data frames.  |

## show oam ethernet connectivity-fault-management mep-database

### Syntax

```
show oam ethernet connectivity-fault-management mep-database
maintenance-domain domain-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
extensive
```

### Release Information

Command introduced in Junos OS Release 8.4.

Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.

Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.

Support for ITU-T Y.1731 ethernet expected defect function (ETH-ED) added in Junos OS Release 19.1 for MX Series routers

**NOTE:** Ethernet expected defect function (ETH-ED) will be supported on all MX series routers only when **enhanced-ip** mode is enabled. ETH-ED will not be supported if CFM is running in centralized mode.

### Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.

In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

### Options

**maintenance-association *ma-name***—Name of the maintenance association.

**maintenance-domain *domain-name***—Name of the maintenance domain.

**local-mep-id**—(Optional) Numeric identifier of local MEP.

**remote-mep-id**—(Optional) Numeric identifier of the remote MEP.

**Required Privilege Level**

| <b>Interval</b>                         | Continuity-check message interval.                                                                                                                                                                                                                                                               |
| <b>Loss-threshold</b>                   | Lost continuity-check message threshold.                                                                                                                                                                                                                                                         |
| <b>Connection Protection TLV</b>        | Status of the connection protection TLV, if configured on the MEP interface: <b>no</b> , <b>yes</b><br><br>If <b>yes</b> , then the transmitted connection protection TLV is decoded and the following three fields are displayed: <b>Prefer me</b> , <b>Protection in use</b> , <b>FRR Flag</b> |
| <b>Prefer me</b>                        | If set to <b>yes</b> , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                       |
| <b>Protection in use</b>                | Used for protection decision coordination. Its value is set to <b>yes</b> if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                  |
| <b>FRR Flag</b>                         | LSR/LER forwarding the CCM Frame into a bypass tunnel is set.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                                                                                                                                  |
| <b>MEP identifier</b>                   | Maintenance association end point (MEP) identifier.                                                                                                                                                                                                                                              |
| <b>Direction</b>                        | MEP direction configured.                                                                                                                                                                                                                                                                        |
| <b>MAC address</b>                      | MAC address configured for the MEP.                                                                                                                                                                                                                                                              |
| <b>Auto-discovery</b>                   | Whether automatic discovery is enabled or disabled.                                                                                                                                                                                                                                              |
| <b>Priority</b>                         | Priority used for CCMs and linktrace messages transmitted by the MEP.                                                                                                                                                                                                                            |
| <b>Interface name</b>                   | Interface identifier.                                                                                                                                                                                                                                                                            |

Table 168: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

| Field Name                           | Field Description                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface status</b>              | Local interface status.                                                                                                                                                                                           |
| <b>Link status</b>                   | Local link status.                                                                                                                                                                                                |
| <b>Remote MEP not receiving CCM</b>  | Whether the remote MEP is not receiving CCMs.                                                                                                                                                                     |
| <b>Erroneous CCM received</b>        | Whether erroneous CCMs have been received.                                                                                                                                                                        |
| <b>Cross-connect CCM received</b>    | Whether cross-connect CCMs have been received.                                                                                                                                                                    |
| <b>RDI sent by some MEP</b>          | Whether the remote defect indication (RDI) bit is set in messages that have been received.<br>The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs. |
| <b>CCMs sent</b>                     | Number of CCMs transmitted.                                                                                                                                                                                       |
| <b>CCMs received out of sequence</b> | Number of CCMs received out of sequence.                                                                                                                                                                          |
| <b>LBMs sent</b>                     | Number of loopback messages (LBMs) sent.                                                                                                                                                                          |
| <b>Valid in-order LBRs received</b>  | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                    |
| <b>1DMs sent</b>                     | If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays 0.            |
| <b>Valid 1DMs received</b>           | If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received.<br><br>For all other cases, this field displays 0.                                                                    |
| <b>Invalid 1DMs received</b>         | If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received.<br><br>For all other cases, this field displays 0.                                                                  |
| <b>Out of sync 1DMs received</b>     | If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.                                                                                  |

Table 168: show oam ethernet connectivity-fault-management mep-database Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                      |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DMMs sent</b>                           | If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays 0. |
| <b>Valid DMMs received</b>                 | If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.                                                                                   |
| <b>Invalid DMMs received</b>               | If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.                                                                                 |
| <b>DMRs sent</b>                           | If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent.<br><br>For all other cases, this field displays 0.                                                |
| <b>Valid DMRs received</b>                 | If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received.<br><br>For all other cases, this field displays 0.                                                             |
| <b>Invalid DMRs received</b>               | If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received.<br><br>For all other cases, this field displays 0.                                                           |
| <b>Valid out-of-order LBRs received</b>    | Number of LBRs received that were valid messages and not in sequence.                                                                                                                                  |
| <b>LBRs received with corrupted data</b>   | Number of LBRs received that were corrupted.                                                                                                                                                           |
| <b>LBRs sent</b>                           | Number of LBRs transmitted.                                                                                                                                                                            |
| <b>LTM sent</b>                            | Linktrace messages (LTMs) transmitted.                                                                                                                                                                 |
| <b>LTM received</b>                        | Linktrace messages received.                                                                                                                                                                           |
| <b>LTR sent</b>                            | Linktrace responses (LTRs) transmitted.                                                                                                                                                                |
| <b>LTR received</b>                        | Linktrace responses received.                                                                                                                                                                          |
| <b>Sequence number of next LTM request</b> | Sequence number of the next linktrace message request to be transmitted.                                                                                                                               |

Table 168: show oam ethernet connectivity-fault-management mep-database Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LMM sent</b>              | If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.                                                     |
| <b>Valid LMM received</b>    | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.                                                                                    |
| <b>Invalid LMM received</b>  | If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.                                                                                  |
| <b>LMR sent</b>              | If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.                                                                                            |
| <b>Valid LMR received</b>    | If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.                                                                                                          |
| <b>Invalid LMR received</b>  | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.                                                                                                        |
| <b>SLM sent</b>              | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session. |
| <b>Valid SLM received</b>    | If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                    |
| <b>Invalid SLM received</b>  | If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                  |
| <b>SLR sent</b>              | If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.                                                                            |
| <b>Valid SLR received</b>    | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.                                                    |
| <b>Invalid SLR received</b>  | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.                                                  |
| <b>Remote MEP identifier</b> | MEP identifier of the remote MEP.                                                                                                                                                                                    |
| <b>State (remote MEP)</b>    | State of the remote MEP: <b>idle</b> , <b>start</b> , <b>ok</b> , or <b>failed</b> .                                                                                                                                 |

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC address              | MAC address of the remote MEP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Type                     | Whether the remote MEP MAC address was learned using automatic discovery or configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interface                | Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Last flapped             | Date, time, and how long ago the remote MEP interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                              |
| Remote defect indication | Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Port status TLV          | <ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted port status TLV value.</li> <li>In the Remote MEP section, displays the last value of port status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, displays, the last occurred event <b>port-status-tlv blocked</b> event. This event occurred due to the reception of <b>blocked</b> value in the port status TLV from remote MEP.</p>                                                                      |
| Interface status TLV     | <ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted interface status TLV value.</li> <li>In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, if displays, the last occurred event interface-status-tlv event (either <b>lower-layer-down</b> or <b>down</b>). This event occurred due to the reception of either lower or <b>down</b> value in the interface status TLV from remote MEP.</p> |
| Action profile           | Name of the action profile occurrence associated with a remote MEP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Last event               | When an action profile occurs, displays the last event that triggered it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Last event cleared       | When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.                                                                                                                                                                                                                                                                                                                                         |
| Action                   | Action taken and the corresponding time of the action occurrence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

md5 maintenance-association ma5
```

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

## show oam ethernet connectivity-fault-management mep-statistics

### Syntax

```
show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md-name
maintenance-association ma-name
<mep mep-id>
<remote-mep remote-mep-id>
<count entry-count>
```

### Release Information

Command introduced in Junos OS Release 9.5.

Command introduced in Junos OS Release 11.4 for EX Series switches.

Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for MX Series routers.

### Description

On MX Series and ACX Series routers and EX Series switches with Ethernet interfaces, display ETH-DM statistics and ETH-DM frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

### Options

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**mep *mep-id***—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

**remote-mep *remote-mep-id***—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

**count *entry-count***—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.

### Output Fields

[Table 169 on page 1917](#) lists the output fields for the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 169: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields**

| Output Field Name             | Field Description                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------|
| MEP identifier                | Maintenance association end point (MEP) numeric identifier.                                                |
| MAC address                   | Unicast MAC address configured for the MEP.                                                                |
| Remote MEP count              | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                   |
| CCMs sent                     | Number of continuity check messages (CCMs) sent.                                                           |
| CCMs received                 | Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association. |
| CCMs received out of sequence | Number of continuity check messages (CCMs) received that were not in sequence.                             |
| Remote MEP identifier         | Numeric identifier of the remote MEP.                                                                      |
| Remote MAC address            | Unicast MAC address of the remote MEP.                                                                     |
| Index                         | Index number that corresponds to the ETH-DM entry in the CFM database.                                     |

**Table 169: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)**

| Output Field Name                      | Field Description                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Average two-way delay variation</b> | Average two-way “frame jitter” for the statistics displayed.                                                                                                                                                                                                                                                             |
| <b>Best-case two-way delay</b>         | Lowest two-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                 |
| <b>Worst-case two-way delay</b>        | Highest two-way frame delay calculated in this session.                                                                                                                                                                                                                                                                  |
| <b>SLM packets sent</b>                | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                          |
| <b>SLM packets received</b>            | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                    |
| <b>SLR packets sent</b>                | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                        |
| <b>SLR packets received</b>            | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                  |

**Table 169: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)**

| Output Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Local TXFC1 value</b>                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| <b>Local RXFC1 value</b>                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| <b>Last Received SLR frame TXFCf(tc)</b> | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| <b>Last Received SLR frame TXFCb(t)</b>  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| <b>Frame loss (near-end)</b>             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| <b>Frame loss (far-end)</b>              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

## show oam ethernet connectivity-fault-management path-database

### Syntax

```
show oam ethernet connectivity-fault-management path-database
<host-mac-address>
<maintenance-association ma-name>
<maintenance-domain domain-name>
```

### Release Information

Command introduced in Junos OS Release 8.4.

### Description

On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

### Options

**host-mac-address**—(Optional) Display connectivity fault management path database information for a specified Ethernet host.

**maintenance-association *ma-name***—(Optional) Display connectivity fault management path database information for the specified maintenance association.

**maintenance-domain *domain-name***—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

### Output Fields

[Table 170 on page 1932](#) lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

Table 170: show oam ethernet connectivity-fault-management path-database Output Fields

| Field Name   | Field Description                           |
|--------------|---------------------------------------------|
| Linktrace to | MAC address of the remote MEPs in the path. |
| Interface    | Interface identifier.                       |

Table 170: show oam ethernet connectivity-fault-management path-database Output Fields (*continued*)

| Field Name                          | Field Description                          |
|-------------------------------------|--------------------------------------------|
| <b>Maintenance domain name</b>      | Maintenance domain name.                   |
| <b>Format (Maintenance domain)</b>  | Maintenance domain name format configured. |
| <b>Level</b>                        | Maintenance domain level configured.       |
| <b>Maintenance association name</b> | Maintenance association name.              |
| <b>Local Mep</b>                    | Local MEP identifier.                      |

## Sample Output

```
show oam ethernet
connectivity-fault
-management
path-database
```

```
user@host> show oam ethernet connectivity-fault-management path-database maintenance-domain
md1 maintenance-association ma1 00:05:85:79:39:ef
```

```
Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
Maintenance Domain: mdl, Level: 7
Maintenance Association: ma1, Local Mep: 201
```

## show oam ethernet connectivity-fault-management policer

### Syntax

```
show oam ethernet connectivity-fault-management policer <maintenance-domain md-name>
<maintenance-association ma-name>
```

### Release Information

Command introduced in Junos OS Release 10.0.

### Description

On M120, M320, MX Series, T320, and T640 routers displays connectivity-fault-management policer statistics.

### Options

This command has the following options:

**maintenance-domain *md-name***—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

Table 171: show oam ethernet connectivity-fault-management policer Output Fields

| Field Name                     | Field Description                                                                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Legend for Policer</b>      | Describes the symbols used under the <b>Scope</b> and <b>Type</b> headings: <ul style="list-style-type: none"> <li>• G - Global scope</li> <li>• S - Service scope</li> <li>• cc - Continuity check (Type)</li> </ul>                                                          |
| <b>Maintenance Domain</b>      | Displays the maintenance domain name.                                                                                                                                                                                                                                          |
| <b>Level</b>                   | Displays the maintenance domain level configured.                                                                                                                                                                                                                              |
| <b>Maintenance association</b> | Displays the maintenance association name.                                                                                                                                                                                                                                     |
| <b>Policer</b>                 | Displays the policer name.                                                                                                                                                                                                                                                     |
| <b>Type</b>                    | Policer type. Value <b>cc</b> means this policer is used only to police continuity check CFM messages. Value <b>other</b> means this policer is used only to police non-continuity check CFM messages. Value <b>all</b> means this policer is used to police all CFM messages. |
| <b>Scope</b>                   | Policer scope. Displays whether the <i>global</i> (G) policer configuration is applicable or the session (S) specific policer config is applicable.                                                                                                                            |
| <b>Drop count</b>              | Displays the number of packets dropped by the indicated policer.                                                                                                                                                                                                               |

## Sample Output

```
show oam ethernet
connectivity-fault
-management
policer
```

Displays the policer information for all maintenance associations and their maintenance domains.

## show oam ethernet connectivity-fault-management sla-iterator-statistics

### Syntax

```
show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain md-name
maintenance-association ma-name
sla-iterator sla-iterator
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.

Command introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 12.2 for ACX Series routers.

Command introduced in Junos OS Release 13.2 for MX Series routers (not on MPC3E Hyperion cards).

### Description

Display the Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics.

### Options

**maintenance-domain *md-name***—Name of an existing connectivity fault management (CFM) maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**sla-iterator *sla-iterator***— Name of the iterator profile.

**local-mep *local-mep-id***—(Optional) Numeric identifier of the local MEP. The range of values is **1** through **8191**.

**remote-mep *remote-mep-id***—(Optional) Numeric identifier of the remote MEP. The range of values is **1** through **8192**.

## Output Fields

[Table 172 on page 1939](#) lists the output fields for the **show oam ethernet connectivity-fault-management sla-iterator-statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 172: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields**

| Output Field Name              | Output Field Description                                                                                     |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Maintenance domain</b>      | Name of the maintenance domain.                                                                              |
| <b>Level</b>                   | Level of the maintenance domain level configured.                                                            |
| <b>Maintenance association</b> | Name of the maintenance association.                                                                         |
| <b>Local MEP id</b>            | Numeric identifier of the local MEP.                                                                         |
| <b>Remote MEP id</b>           | Numeric identifier of the remote MEP.                                                                        |
| <b>Remote MAC address</b>      | Unicast MAC address of the remote MEP.                                                                       |
| <b>Iterator name</b>           | Name of iterator.                                                                                            |
| <b>Iterator Id</b>             | Numeric identifier of the iterator.                                                                          |
| <b>Iterator cycle time</b>     | Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection |
| <b>Iteration period</b>        | Maximum number of cycles per iteration                                                                       |
| <b>Iterator status</b>         | Current status of iterator whether running or stopped.                                                       |

Table 172: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (*continued*)

| Output Field Name                               | Output Field Description                                                                                |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Infinite iterations</b>                      | Status of iteration as infinite or finite.                                                              |
| <b>Counter reset time</b>                       | Date and time when the counter was reset.                                                               |
| <b>Reset reason</b>                             | Reason to reset counter.                                                                                |
| <b>Delay weight</b>                             | Calculation weight of delay.                                                                            |
| <b>Delay variation weight</b>                   | Calculation weight of delay variation.                                                                  |
| <b>DMM sent</b>                                 | Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.                        |
| <b>DMM skipped for threshold hit</b>            | Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.                 |
| <b>DMM skipped for threshold hit window</b>     | Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window. |
| <b>DMR received</b>                             | Number of delay measurement reply (DMR) frames received.                                                |
| <b>DMR out of sequence</b>                      | Total number of DMR out of sequence packets received.                                                   |
| <b>DMR received with invalid time stamps</b>    | Total number of DMR frames received with invalid timestamps.                                            |
| <b>Average two-way delay</b>                    | Average two-way frame delay for the statistics displayed.                                               |
| <b>Average two-way delay variation</b>          | Average two-way "frame jitter" for the statistics displayed.                                            |
| <b>Average one-way forward delay variation</b>  | Average one-way forward delay variation for the statistics displayed in microseconds.                   |
| <b>Average one-way backward delay variation</b> | Average one-way backward delay variation for the statistics displayed in microseconds.                  |
| <b>Weighted average two-way delay</b>           | Weighted average two-way delay for the statistics displayed in microseconds.                            |
| <b>Weighted average two-way delay variation</b> | Weighted average two-way delay variation for the statistics displayed in microseconds.                  |

Table 172: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (*continued*)

| Output Field Name                                        | Output Field Description                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Weighted average one-way backward delay variation</b> | Weighted average one-way backward delay variation for the statistics displayed in microseconds.                                                                                                                                                                                                                                   |
| <b>Weighted average one-way forward delay variation</b>  | Weighted average one-way forward delay variation for the statistics displayed in microseconds.                                                                                                                                                                                                                                    |
| <b>SLM packets sent</b>                                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| <b>SLM packets received</b>                              | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                             |
| <b>SLR packets sent</b>                                  | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                                 |
| <b>SLR packets received</b>                              | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                           |
| <b>Local TXFC1 value</b>                                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| <b>Local RXFC1 value</b>                                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| <b>Last Received SLR frame TXFCf(tc)</b>                 | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| <b>Last Received SLR frame TXFCb(t)</b>                  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| <b>Frame loss (near-end)</b>                             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| <b>Frame loss (far-end)</b>                              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

#### **show oam ethernet connectivity-fault-management state - To verify the Connectivity Fault Management (CFM) state**

The following command is to verify whether the CFM state is in enhanced-cfm mode or not.

**user@router> show oam ethernet connectivity-fault-management state**

```

Connectivity fault management state:
  CFM Mode Of Operation: Enhanced
  Enhanced IP Mode: Enabled
  CFM Config State: Ok
  CFM Cleanup State: Ok
  CFM Restart Timer State: Cleanup Timer State stopped Rebooting in 0 sec
  CFM CFMMAN Job State: Not Pending
  Number of sessions: 1
  Number of sessions created: 1
  Number of sessions deleted: 0
  Number of sessions freed: 0
  Number of sessions enqueued: 1
  Number of sessions dequeued: 1
  VPLS feature: enabled
  Token based forwarding feature: enabled
  Forwarding table filtering simulation feature: disabled
  Hardware assisted flooding feature: enabled
  Flood resynchronization for GRES feature: enabled
  Shared interface filter feature: disabled
  Hardware timestamping feature: disabled

```

```
Marking of connection protection TLV feature: disabled
CFMD config memory resource  limit(in bytes): 3221225472
CFMD max resident set (peak) size (in bytes):  24158208
```

Packet processing state:

```
State of the connection to packet processing daemon: down
State of the flow to packet processing daemon: ready
State of the packet processing job: ready
Number of times the connection to packet processing daemon was blocked: 0
State of the connection to cfmmman: slots: 2 3 4 5
```

Filter state:

```
State of the connection to firewall daemon: Connected
Number of reconnects made to firewall daemon: 0
Number of requests sent to firewall daemon: 13
Number of requests accepted by firewall daemon: 13
Number of requests rejected by firewall daemon: 0
Number of requests lost due to disconnection: 0
```

## show oam ethernet connectivity-fault-management synthetic-loss-statistics

### Syntax

```
show oam ethernet connectivity-fault-management synthetic-loss-statistics
<local-mep local-mep-id>
maintenance-association ma-name
<count entry-count>
maintenance-domain md-name
<remote-mep remote-mep-id>
```

### Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

### Description

On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.

### Options

**count entry-count**—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.

**local-mep local-mep-id**—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.

**maintenance-association ma-name**—Name of an existing CFM maintenance association.

**maintenance-domain md-name**—Name of an existing connectivity fault management (CFM) maintenance domain.

**remote-mep remote-mep-id**—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.

**Table 173: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields**

| Output Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MEP identifier</b>                    | Maintenance association end point (MEP) numeric identifier.                                                                                                                                                                                                                                                                       |
| <b>MAC address</b>                       | Unicast MAC address configured for the MEP.                                                                                                                                                                                                                                                                                       |
| <b>Remote MEP count</b>                  | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                                                                                                                                                                                                                                          |
| <b>Remote MEP identifier</b>             | Numeric identifier of the remote MEP.                                                                                                                                                                                                                                                                                             |
| <b>Remote MAC address</b>                | Unicast MAC address of the remote MEP.                                                                                                                                                                                                                                                                                            |
| <b>SLM packets sent</b>                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| <b>SLM packets received</b>              | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                             |
| <b>SLR packets sent</b>                  | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                                 |
| <b>SLR packets received</b>              | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                           |
| <b>Local TXFC1 value</b>                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| <b>Local RXFC1 value</b>                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFC1 is sent in the packet. |
| <b>Last Received SLR frame TXFCf(tc)</b> | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |

**Table 173: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields (continued)**

| Output Field Name                      | Field Description                                                       |
|----------------------------------------|-------------------------------------------------------------------------|
| <b>Last Received SLR frame TXFCb(t</b> | Value of the local counter RxFCI at the time of SLR frame transmission. |
| <b>Frame loss (near-end)</b>           | Count of frame loss associated with ingress data frames.                |
| <b>Frame loss (far-end)</b>            | Count of frame loss associated with egress data frames.                 |

# show oam ethernet evc

## Syntax

```
show oam ethernet evc <evc-id>
```

## Release Information

Command introduced in Junos OS Release 9.5.

## Description

On MX Series routers with OAM Ethernet Virtual Connection (EVC) configurations, displays the EVC configuration and status information.

## Options

This command has no options.

## Required Privilege Level

View

## Output Fields

[Table 174 on page 1954](#) lists the output fields for the **show oam ethernet evc** command. Output fields are listed in the approximate order in which they appear.

Table 174: show oam ethernet evc Output Fields

| Field Name     | Field Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------------|
| EVC identifier | Header for the EVC information showing the EVC name, configuration, and active/inactive status. |
| UNI count      | Number of configured and active UNIs.                                                           |
| Protocol       | Protocol configured between the UNIs.                                                           |
| Local UNIs     | Heading for the list of local UNIs                                                              |
| UNI Identifier | Name of the UNI.                                                                                |
| Interface      | Interface type-dpc/pic/port.unit-number.                                                        |
| Status         | Status operational or not operational.                                                          |

## Sample Output

**show oam ethernet evc**

user@host> **show oam ethernet evc**

```
EVC identifier: evc1, Point-to-Point, Active
UNI count: Configured(2), Active(2)
Protocol: cfm, Management domain: md, Management association: ma
Local UNIs:
  UNI Identifier      Interface      Status
  uni1                ge-1/1/1      Operational
  uni2                ge-1/1/1      Not Operational
```

# show oam ethernet fnp interface

## Syntax

```
show oam ethernet fnp interface
<ethernet-interface-name>
<routing-instance routing-instance-name>
```

## Release Information

Command introduced in Junos OS Release 11.4.

## Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

## Options

**interface-name**—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

**routing-instance-name**—(Optional) Display FNP for the specified routing instance.

Table 176: show oam ethernet fnp messages Output Fields

| Field Name                      | Field Description                                                                |
|---------------------------------|----------------------------------------------------------------------------------|
| Message from source MAC address | The source MAC address of the message.                                           |
| Originating port number         | Port number of the original message.                                             |
| Time since last message         | Elapsed time in hours, minutes, and seconds since the last message was received. |
| Time since last message update  | Elapsed time in hours, minutes, and seconds since the last message was updated.  |
| Total messages received         | Number of messages received.                                                     |

Table 176: show oam ethernet fnp messages Output Fields (*continued*)

| Field Name          | Field Description                         |
|---------------------|-------------------------------------------|
| Domain ID           | Domain ID of the message.                 |
| STP Root ID         | The spanning tree Root ID of the message. |
| Trigger Reason      | The reason why the message was triggered. |
| Effectuated VLANs   | Number of VLANs that are affected.        |
| Disabled interfaces | Name of the interfaces that are disabled. |

## Sample Output

**show oam ethernet fnp messages**

user@host> **show oam ethernet fnp messages**

```

Active FNP messages on interface lsi.1054465
Message source MAC: a0:aa:aa:aa:aa:aa
  Originating port number: 141077
  Time since last message: 00:00:00
  Time since last message update: 00:00:00
  Total messages received: 1
  Domain ID: 0
  STP Root ID: 0.f0:ff:ff:ff:ff:ff
  Trigger reason: todo
  Effectuated VLANs: 10
  Disabled interfaces:
    Interface VLAN
    ge-0/0/0.10 10

```

# show oam ethernet fnp status

## Syntax

```
show oam ethernet fnp status
<interface interface-name>
<routing instance routing-instance-name>
```

## Release Information

Command introduced in Junos OS Release 11.4

## Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) status.

## Options

**interface-name**—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

**routing-instance-name**—(Optional) Display FNP for the specified routing instance.

## Required Privilege Level

view

## List of Sample Output

[show oam ethernet fnp status on page 1961](#)

## Output Fields

[Table 177 on page 1960](#) lists the output fields for the **show oam ethernet fnp status** command. Output fields are listed in the approximate order in which they appear.

Table 177: show oam ethernet fnp status Output Fields

| Field Name             | Field Description                                                     |
|------------------------|-----------------------------------------------------------------------|
| FNP interval           | The time interval between messages.                                   |
| Loss threshold         | The number of messages that can be lost before FNP is marked as down. |
| FNP enabled interfaces | Displays interfaces that are enabled.                                 |
| Interface              | The name of the interface.                                            |
| Domain ID              | Domain ID of the message.                                             |
| STP Root ID            | The spanning tree Root ID of the message.                             |

Table 177: show oam ethernet fnp status Output Fields (*continued*)

| Field Name   | Field Description                      |
|--------------|----------------------------------------|
| FNP Messages | The total number of messages received. |

```

# show oam ethernet link-fault-management

## Syntax

```
show oam ethernet link-fault-management
<brief | detail>
<interface-name>
```

## Release Information

Command introduced in Junos OS Release 8.2.

## Description

On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.

## Options

**brief | detail**—(Optional) Display the specified level of output.

**interface-name**—(Optional) Display link fault management information for the specified Ethernet interface only.

## Required Privilege Level

| <b>Flags</b>                  | <p>Information about the interface. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i>.</p> <ul style="list-style-type: none"> <li>• <b>Remote-Stable</b>—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. <b>False</b> indicates that remote DTE either has not seen or is unsatisfied with local state information. <b>True</b> indicates that remote DTE has seen and is satisfied with local state information.</li> <li>• <b>Local-Stable</b>—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. <b>False</b> indicates that local DTE either has not seen or is unsatisfied with remote state information. <b>True</b> indicates that local DTE has seen and is satisfied with remote state information.</li> <li>• <b>Remote-State-Valid</b>—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. <b>False</b> indicates that OAM client has not seen remote state information. <b>True</b> indicates that the OAM client has seen remote state information.</li> </ul> | All levels      |
| <b>Remote loopback status</b> | Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |

Table 178: show oam ethernet link-fault-management Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output |

## show oam ethernet lmi

### Syntax

```
show oam ethernet lmi (interface <interface-name>)
```

### Release Information

Command introduced in Junos OS Release 9.5.

### Description

On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

### Options

**interface**—(Optional) Display LMI information for a specified interface.

**interface-name**—(Optional) Display Ethernet LMI information for the specified interface only.

### Required Privilege Level

View

### Output Fields

[Table 179 on page 1972](#) lists the output fields for the **show oam ethernet lmi** command. Output fields are listed in the approximate order in which they appear.

**Table 179: show oam ethernet lmi Output Fields**

| Field Name                        | Field Description                                                                                                          |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Physical Interface</b>         | Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status. |
| <b>UNI Identifier</b>             | Name of the UNI.                                                                                                           |
| <b>EVC map type</b>               | EVC configuration.                                                                                                         |
| <b>Polling verification timer</b> | Polling verification timer status.                                                                                         |

Table 179: show oam ethernet lmi Output Fields (*continued*)

| Field Name                       | Field Description                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------|
| <b>E-LMI state</b>               | Operational status of the E-LMI configuration in the interfaces or specified interface. |
| <b>Priority/Untagged VLAN ID</b> | To be provided.                                                                         |
| <b>Default EVC</b>               | The EVC set as the default EVC.                                                         |
| <b>Associated EVCs</b>           | Heading for the list of configured EVCs.                                                |
| <b>EVC Identifier</b>            | EVC name.                                                                               |
| <b>Reference ID</b>              | To be provided.                                                                         |
| <b>Status</b>                    | Status active or not active.                                                            |
| <b>CE VLAN IDs</b>               | Customer edge VLAN ID numbers.                                                          |

## Sample Output

**show oam ethernet lmi interface**

user@host> **show oam ethernet lmi interface ge-1/1/1**

```
Physical interface: ge-1/1/1, Physical link is Up
UNI identifier: uni-cel, EVC map type: Bundling
Polling verification timer: Enabled, E-LMI state: Operational
Priority/Untagged VLAN ID: 20, Default EVC: evc1
Associated EVCs:
  EVC      Reference   Status      CE VLAN IDs
  Identifier ID
  evc1      1      Active (New)  1-2048
  evc2      2      Not Active   2049-4096
```

# show oam ethernet lmi statistics

## Syntax

```
show oam ethernet lmi statistics <interface interface-name>
```

## Release Information

Command introduced in Junos OS Release 9.5.

## Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

## Options

**interface**—(Optional) Display LMI statistics for a specified interface.

**interface-name**—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

## Output Fields

[Table 180 on page 1974](#) lists the output fields for the **show oam ethernet lmi statistics** command. Output fields are listed in the approximate order in which they appear.

Table 180: show oam ethernet lmi statistics Output Fields

| Field Name            | Field Description                                   |
|-----------------------|-----------------------------------------------------|
| Physical interface    | Name of the interface for the displayed statistics. |
| Reliability errors    | Number of E-LMI reliability errors logged.          |
| Protocol errors       | Number of E-LMI protocol errorse.                   |
| Status check received | Number of E-LMI status check receive errors.        |
| Status check sent     | Number of E-LMI status check sent errors.           |
| Full status received  | Number of E-LMI full status receive errors.         |
| Full status sent      | Number of E-LMI full status sent errors.            |

Table 180: show oam ethernet lmi statistics Output Fields (*continued*)

| Field Name                            | Field Description                                  |
|---------------------------------------|----------------------------------------------------|
| <b>Full status continued received</b> | Number of E-LMI status continued received errors.  |
| <b>Full status continued sent</b>     | Number of E-LMI full status continued sent errors. |
| <b>Asynchronous status sent</b>       | Number of E-LMI asynchronous status sent errors.   |

## Sample Output

**show oam ethernet lmi statistics**

**user@host> show oam ethernet lmi statistics interface ge-1/1/1**

```
Physical interface: ge-1/1/1
  Reliability errors          4  Protocol errors
0
  Status check received      0  Status check sent
0
  Full status received       694  Full status sent          694

  Full status continued received  0  Full status continued sent
0
  Asynchronous status sent      0
```

## show pppoe interfaces

### Syntax

```
show pppoe interfaces
<brief | detail>
<pp0.logical>
```

### Release Information

Command introduced before Junos OS Release 7.4.

### Description

Display session-specific information about PPPoE interfaces.

### Options

**none**—Display interface information for all PPPoE interfaces.

**brief | detail**—(Optional) Display the specified level of output.

**pp0.logical**—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your router.

### Output Fields

[Table 181 on page 1977](#) lists the output fields for the **show pppoe interfaces** command. Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.

Table 181: show pppoe interfaces Output Fields

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                   | Level of Output              |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Logical Interface</b>                |                                                                                                                                                                                                                                                                                                                                     |                              |
| <b>Logical interface</b>                | Name of the logical interface.                                                                                                                                                                                                                                                                                                      | All levels                   |
| <b>Index</b>                            | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>State</b>                            | State of the logical interface: <b>up</b> or <b>down</b> .                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Session ID</b>                       | Session ID.                                                                                                                                                                                                                                                                                                                         | All levels                   |
| <b>Type</b>                             | Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Service name</b>                     | Type of service required (can be used to indicate an ISP name or a class or quality of service).                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Configured AC name</b>               | Configured access concentrator name.                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Session AC name</b>                  | Name of the access concentrator.                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Remote MAC address or Remote MAC</b> | MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.                                                                                                                                                                                                                               | All levels                   |
| <b>Session uptime</b>                   | Length of time the session has been up, in <i>hh:mm:ss</i> .                                                                                                                                                                                                                                                                        | <b>detail extensive none</b> |
| <b>Dynamic Profile</b>                  | Name of the dynamic profile that was used to create this interface. If the interface was statically created, this field is not displayed.                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Underlying interface</b>             | Interface on which PPPoE is running.                                                                                                                                                                                                                                                                                                | All levels                   |
| <b>Agent Circuit ID</b>                 | Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. If the agent circuit ID is not configured, this field is not displayed. | <b>detail extensive none</b> |

Table 181: show pppoe interfaces Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Agent Remote ID</b>   | Agent remote identifier that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. If the agent remote ID is not configured, this field is not displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive none</b> |
| <b>ACI Interface Set</b> | Internally-generated name of the dynamic ACI interface set, if configured, and the set index number of the ACI entry in the session database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>Packet Type</b>       | <p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul> | <b>extensive</b>             |

## Sample Output

**show pppoe interfaces**

user@host> **show pppoe interfaces**

```
pp0.0 Index 66
  State: Down, Session ID: None,
  Service name: None, Configured AC name: sapphire,
  Session AC name: None, Remote MAC address: 00:00:5e:00:53:00,
```

```
Auto-reconnect timeout: 100 seconds, Idle timeout: Never,  
Underlying interface: at-5/0/0.0 Index 71
```

**show pppoe interfaces (Status for the Specified Interface)**

```
user@host> show pppoe interfaces pp0.1073741827
```

```
pp0.1073741827 Index 70  
State: Session Up, Session ID: 30, Type: Dynamic,  
Session AC name: velorum,  
Remote MAC address: 00:00:5e:00:53:c1,  
Session uptime: 16:45:46 ago,  
Underlying interface: ge-2/0/3.1 Index 73  
Service name: premium  
Dynamic Profile: PppoeProfile  
Agent Circuit ID: velorum-ge-2/0/3  
Agent Remote ID: westford
```

**show pppoe interfaces brief**

```
user@host> show pppoe interfaces brief
```

| Interface      | Underlying<br>interface | State      | Session<br>ID | Remote<br>MAC     |
|----------------|-------------------------|------------|---------------|-------------------|
| pp0.0          | ge-2/0/3.2              | Session Up | 27            | 00:00:5e:00:53:c1 |

```

# show pppoe service-name-tables

## Syntax

```
show pppoe service-name-tables
<table-name>
```

## Release Information

Command introduced in Junos OS Release 10.0.

## Description

Display configuration information about PPPoE service name tables.

## Options

**none**—Display the names of configured PPPoE service name tables.

**table-name**—(Optional) Name of a configured PPPoE service name table.

## Required Privilege Level

view

## RELATED DOCUMENTATION

## List of Sample Output

- [show pppoe service-name-tables on page 1983](#)
- [show pppoe service-name-tables \(For the Specified Table Name\) on page 1983](#)

## Output Fields

[Table 182 on page 1981](#) lists the output fields for the **show pppoe service-name-tables** command. Output fields are listed in the approximate order in which they appear.

Table 182: show pppoe service-name-tables Output Fields

| Field Name         | Field Description                     | Level of Output |
|--------------------|---------------------------------------|-----------------|
| Service Name Table | Name of the PPPoE service name table. | none            |

Table 182: show pppoe service-name-tables Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Service Name</b>     | <p>Name of a configured service in the PPPoE service name table:</p> <ul style="list-style-type: none"> <li>• <b>&lt;empty&gt;</b>—Service of zero length that represents an unspecified service</li> <li>• <b>&lt;any&gt;</b>—Default service for non-empty service entries that do not match the configured empty or named service entries</li> <li>• <b>service-name</b>—Named service entry</li> </ul>                                                                                                                                          | none            |
| <b>Action</b>           | <p>Action taken when the PPPoE underlying interface receives a PPPoE Active Discovery Initiation (PADI) packet with the specified named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair:</p> <ul style="list-style-type: none"> <li>• <b>Delay seconds</b>—Number of seconds that the interface delays before responding with a PPPoE Active Discovery Offer (PADO) packet</li> <li>• <b>Drop</b>—Interface drops (ignores) the packet.</li> <li>• <b>Terminate</b>—Interface responds immediately with a PADO packet</li> </ul> | none            |
| <b>Dynamic Profile</b>  | <p>Name of the dynamic profile with which the router creates a dynamic PPPoE subscriber interface. A dynamic profile can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.</p>                                                                                                                                                                                                                                                                                                                             | none            |
| <b>Routing Instance</b> | <p>Name of the routing instance in which to instantiate the dynamic PPPoE subscriber interface. A routing instance can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.</p>                                                                                                                                                                                                                                                                                                                               | none            |
| <b>Max Sessions</b>     | <p>Maximum number of active PPPoE sessions that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service.</p>                                                                                                                                                                                                                                                                                                                                                                                         | none            |
| <b>Active Sessions</b>  | <p>Current count of active PPPoE sessions created using the specified named service, <b>empty</b> service, or <b>any</b> service. The Active Sessions value cannot exceed the Max Sessions value.</p>                                                                                                                                                                                                                                                                                                                                               | none            |
| <b>ACI</b>              | <p>Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. An ACI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service.</p>                                                                                                                                                            | none            |

Table 182: show pppoe service-name-tables Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>ARI</b>              | Agent remote identifier (ARI) that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. An ARI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service. | none            |
| <b>Static Interface</b> | Name of the static PPPoE interface reserved for exclusive use by the PPPoE client with matching ACI/ARI information. A static interface can be configured only for an ACI/ARI pair.                                                                                                                                                                                                                         | none            |

## show pppoe sessions

### Syntax

```
show pppoe sessions  
<aci circuit-id-string>  
<ari remote-id-string>  
<service service-name>
```

### Release Information

Command introduced in Junos OS Release 10.2.

### Description

Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

### Options

**none**—Display information for all active PPPoE sessions on the router.

**aci *circuit-id-string***—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

**ari *remote-id-string***—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

**service *service-name***—(Optional) Display information only for active PPPoE sessions established with the specified service, where *service-name* can be **empty**, **any**, or a named service.

### Output Fields

Table 183 on page 1986 lists the output fields for the **show pppoe sessions** command. Output fields are listed in the approximate order in which they appear.

**Table 183: show pppoe sessions Output Fields**

| Field Name                  | Field Description                                                                                     | Level of Output |
|-----------------------------|-------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>            | Name of the statically-created or dynamically-created PPPoE interface for the active PPPoE session.   | none            |
| <b>Underlying interface</b> | Interface on which PPPoE is running.                                                                  | none            |
| <b>State</b>                | State of the PPPoE session; displays <b>Session Up</b> for active PPPoE sessions.                     | none            |
| <b>Session ID</b>           | PPPoE session identifier.                                                                             | none            |
| <b>Remote MAC</b>           | MAC address of the remote side of the connection, either the access concentrator or the PPPoE client. | none            |

## Sample Output

### show pppoe sessions (For All Active Sessions)

```
user@host> show pppoe sessions
```

| Interface      | Underlying interface | State      | Session ID | Remote MAC        |
|----------------|----------------------|------------|------------|-------------------|
| pp0.0          | ge-2/0/3.2           | Session Up | 27         | 00:00:5e:00:53:c1 |
| pp0.1          | ge-2/0/3.2           | Session Up | 28         | 00:00:5e:00:53:c1 |
| pp0.1073741824 | ge-2/0/3.1           | Session Up | 29         | 00:00:5e:00:53:c1 |
| pp0.1073741825 | ge-2/0/3.1           | Session Up | 30         | 00:00:5e:00:53:c1 |
| pp0.1073741826 | ge-2/0/3.1           | Session Up | 31         | 00:00:5e:00:53:c1 |

### show pppoe sessions (For All Active Sessions Matching the Agent Circuit Identifier)

```
user@host> show pppoe sessions aci "velorum-ge-2/0/3"
```

| Interface | Underlying interface | State      | Session ID | Remote MAC        |
|-----------|----------------------|------------|------------|-------------------|
| pp0.0     | ge-2/0/3.2           | Session Up | 27         | 00:00:5e:00:53:c1 |
| pp0.1     | ge-2/0/3.2           | Session Up | 28         | 00:00:5e:00:53:c1 |

## show pppoe statistics

### Syntax

```
show pppoe statistics
<logical-interface-name>
```

### Release Information

Command introduced before Junos OS Release 7.4.

**logical-interface-name** option introduced in Junos OS Release 10.1.

### Description

Display statistics information about PPPoE interfaces.

### Options

**none**—Display PPPoE statistics for all interfaces.

**logical-interface-name**—(Optional) Name of a PPPoE underlying logical interface.

### Required Privilege Level

view

## show pppoe underlying-interfaces

### Syntax

```
show pppoe underlying-interfaces  
<brief | detail | extensive>  
<lockout>  
<logical-interface-name>
```

### Release Information

Command introduced in Junos OS Release 10.0.

**lockout** option added in Junos OS Release 11.4.

### Description

Display information about PPPoE underlying interfaces.

### Options

**brief | detail | extensive**—(Optional) Display the specified level of output.

**lockout**—(Optional) Display summary information about the lockout condition and the lockout grace period for PPPoE clients on the PPPoE underlying interface.

**logical-interface-name**—(Optional) Name of a PPPoE underlying logical interface.

### Required Privilege Level

### Output Fields

Table 185 on page 1991 lists the output fields for the **show pppoe underlying-interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 185: show pppoe underlying-interfaces Output Fields

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                      | Level of Output              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Underlying Interface</b>    | Name of the PPPoE underlying logical interface.                                                                                                                                                                                                                                                                                                                        | All levels                   |
| <b>Service Name Table</b>      | Name of the service name table.                                                                                                                                                                                                                                                                                                                                        | All levels                   |
| <b>Dynamic Profile</b>         | Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is <b>none</b> .                                                                                                                                                                                                                           | All levels                   |
| <b>Index</b>                   | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>State</b>                   | Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.                                                                                                                                                                                                                              | <b>detail extensive</b>      |
| <b>Operational States</b>      | Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Max Sessions</b>            | Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses. | <b>detail extensive</b>      |
| <b>Max Sessions VSA Ignore</b> | Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the <b>max-sessions</b> statement: <b>Off</b> (default) or <b>On</b> .                        | <b>detail extensive none</b> |

Table 185: show pppoe underlying-interfaces Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output              |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Active Sessions</b>          | Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>      |
| <b>Agent Circuit Identifier</b> | <p>Whether the underlying interface is configured with the <b>agent-circuit-identifier</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information.</p> <p><b>Autosensing</b> indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p>          | <b>detail extensive none</b> |
| <b>Line Identity</b>            | <p>Whether the underlying interface is configured with the <b>line-identity</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither.</p> <p><b>Autosensing</b> indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p> | <b>detail extensive none</b> |
| <b>Duplicate Protection</b>     | State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client's MAC address.                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |

Table 185: show pppoe underlying-interfaces Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output              |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Short Cycle Protection</b> | State of PPPoE short cycle protection: <b>mac-address</b> , <b>circuit-id</b> , or <b>Off</b> . Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>Direct Connect</b>         | State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>AC Name</b>                | Name of the access concentrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>      |
| <b>PacketType</b>             | Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors: <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul> | <b>detail extensive</b>      |

# show pppoe version

## Syntax

```
show pppoe version
```

## Release Information

Command introduced before Junos OS Release 7.4.

## Description

( M120 routers and M320 routers only) Display version information about PPPoE.

## Options

This command has no options.

## Required Privilege Level

view

## List of Sample Output

[show pppoe version on page 2000](#)

## Output Fields

[Table 186 on page 1999](#) lists the output fields for the **show pppoe version** command. Output fields are listed in the approximate order in which they appear.

Table 186: show pppoe version Output Fields

| Field Name          | Field Description                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version <i>n</i>    | PPPoE version number and RFC. For example, <b>version 1, rfc 2516</b> .                                                                                                                                                                                                             |
| PPPoE protocol      | State of the PPPoE protocol: <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                    |
| Maximum Sessions    | Maximum active sessions supported per router. The default is 256 sessions.                                                                                                                                                                                                          |
| PADI resend timeout | Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Offer (PADO) packet for the PPoE Active Discovery Initiation (PADI) packet sent. This timeout doubles for each successive PADI packet sent. Not displayed for M120 and M320 routers.             |
| PADR resend timeout | Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Session Confirmation (PADS) packet for the PPoE Active Discovery Request (PADR) packet sent. This timeout doubles for each successive PADR packet sent. Not displayed for M120 and M320 routers. |

Table 186: show pppoe version Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Max resend timeout        | Maximum value, in seconds, that the PADI or PADR resend timer can accept. The maximum value is 64. Not displayed for M120 and M320 routers. |
| Max Configured AC timeout | Time, in seconds, during which the configured access concentrator must respond. Not displayed for M120 and M320 routers.                    |

## Sample Output

**show pppoe version**

```
user@host> show pppoe version
```

```
Point-to-Point Protocol Over Ethernet, version 1. rfc2516
  PPPoE protocol           = Enabled
  Maximum Sessions         = 256
  PADI resend timeout      = 2 seconds
  PADR resend timeout      = 16 seconds
  Max resend timeout       = 64 seconds
  Max Configured AC timeout = 4 seconds
```

## show protection-group ethernet-ring aps

### Syntax

```
show protection-group ethernet-ring aps
```

### Release Information

Command introduced in Junos OS Release 9.4.

Command introduced in Junos OS Release 12.1 for EX Series switches.

Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

### Description

Display the status of the Automatic Protection Switching (APS) and Ring APS (RAPS) messages on an Ethernet ring.

### Options

This command has no options.

### Required Privilege Level

view

**Table 187: show protection-group ethernet-ring aps Output Fields**

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ethernet Ring</b>                | Name configured for the Ethernet ring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Request/State</b>                | <p>Status of the Ethernet ring RAPS messages.</p> <ul style="list-style-type: none"> <li>• <b>NR</b>—Indicates that there is no request for APS on the ring.</li> <li>• <b>SF</b>—Indicates that there is a signal failure on the ring.</li> <li>• <b>FS</b>—Indicates that there are active forced-switch requests in the ring.</li> <li>• <b>MS</b>—Indicates that there are active manual-switch requests in the ring.</li> </ul> <p><b>NOTE:</b> Both <b>FS</b> and <b>MS</b> values are valid only when G.8032v2 is supported.</p> |
| <b>Ring Protection Link Blocked</b> | Blocking on the ring protection link: <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>No Flush</b>                     | Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Blocked Port Reference</b>       | This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.                                                                                                                                    |
| <b>Blocked Port Reference</b>       | Reference of the ring port on which traffic is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Originator</b>                   | Indicates whether the node is the originator of the RAPS messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remote Node ID</b>               | Identifier (in MAC address format) of the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Sample Output

# show protection-group ethernet-ring configuration

## Syntax

```
show protection-group ethernet-ring configuration
```

## Release Information

Command introduced in Junos OS Release 12.1 for EX Series switches.  
Command introduced in Junos OS Release 14.1 for MX Series routers.  
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

## Description

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

## Required Privilege Level

view

## Output Fields

[Table 188 on page 2007](#) lists the output fields for the **show protection-group ethernet-ring configuration** command. Output fields are listed in the approximate order in which they appear.

Table 188: show protection-group ethernet-ring configuration Output Fields

| Output Fields                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>G8032 Compatability Version</b> | This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>East Interface</b>              | One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>West Interface</b>              | One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Restore Interval</b>            | <p>Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ER Pv1 and 1 through 12 minutes for ER Pv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p> <p><b>NOTE:</b> Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.</p>               |
| <b>Wait to Block Interval</b>      | <p>Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval 'Wait to Block' to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2.</p> <p><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p> |

Table 188: show protection-group ethernet-ring configuration Output Fields (*continued*)

| Output Fields                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Guard Interval</b>              | Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. |
| <b>Hold off interval</b>           | This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                                                          |
| <b>Node ID</b>                     | Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.                                                                                                                                                                                                                                                                                |
| <b>Ring ID</b>                     | In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                                                                     |
| <b>Node Role</b>                   | Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                                                                                               |
| <b>Revertive Mode of Operation</b> | This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.                                                                                                   |
| <b>RAPS Tx Dot1p priority</b>      | The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                   |

Table 188: show protection-group ethernet-ring configuration Output Fields (*continued*)

| Output Fields                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Node type</b>                       | Indicates whether ring node is a normal ring node having two ring-links or a open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.                                    |
| <b>Major ring name</b>                 | If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                            |
| <b>Interconnection mode</b>            | Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.                                                                                                                                                                   |
| <b>Propagate Topology Change event</b> | When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers. |
| <b>Control Vlan</b>                    | The VLAN that transfers ERP PDUs from one node to another.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Physical Ring</b>                   | Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.                                                                                                                                                                                   |
| <b>Data Channel VLAN(s)</b>            | Data VLANs for which forwarding behavior is controlled by the ring instance.                                                                                                                                                                                                                                                                                                                                             |

## Sample Output

show protection-group ethernet-ring configuration (EX Switch)

```
user@switch>show protection-group ethernet-ring configuration
```

```

Ethernet ring configuration parameters for protection group erp1
East Interface   : ge-0/0/3.0
West Interface   : ge-0/0/9.0
Restore Interval : 5 minutes
Guard Interval   : 500 ms
Node Id          : 00:1F:12:30:B8:81
Control Vlan     : 101
Physical Ring     : yes

```

### show protection-group ethernet-ring configuration detail (MX Series Router)

# show protection-group ethernet-ring data-channel

## Syntax

```
show protection-group ethernet-ring data-channel
<brief | detail>
<group-name group-name>
```

## Release Information

Command introduced in Junos OS Release 10.2.  
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

## Description

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

## Options

- brief | detail**—(Optional) Display the specified level of output.
- group-name**—(Optional) Protection group for which to display statistics. If you omit this optional field, all protection group statistics for configured groups will be displayed.

## Required Privilege Level

## Output Fields

[Table 189 on page 2016](#) lists the output fields for the **show protection-group ethernet-ring data-channel** command. Output fields are listed in the approximate order in which they appear.

Table 189: show protection-group ethernet-ring data-channel Output Fields

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>     | Name of the interface configured for the Ethernet ring.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>STP index</b>     | The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior. |
| <b>Forward State</b> | Forwarding state on the Ethernet ring. <ul style="list-style-type: none"> <li>• <b>fowarding</b>—Indicates packets are being forwarded.</li> <li>• <b>discarding</b>—Indicates packets are being discarded.</li> </ul>                                                                                                                                                                                                  |

## Sample Output

### show protection-group ethernet-ring data-channel

```
user@host> show protection-group ethernet-ring data-channel
```

```
Ethernet ring data channel information for protection group pg301
```

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| xe-5/0/2  | 78        | forwarding    |
| xe-2/2/0  | 79        | discarding    |

```
Ethernet ring data channel parameters for protection group pg302
```

| Interface | STP index | Forward State |
|-----------|-----------|---------------|
| xe-5/0/2  | 80        | forwarding    |
| xe-2/2/0  | 81        | forwarding    |

### show protection-group ethernet-ring data-channel detail

```
user@host> show protection-group ethernet-ring data-channel detail
```

```
Ethernet ring data channel parameters for protection group pg301
```

```
Interface name           : xe-5/0/2
```

```

STP index           : 78
Forward State       : forwarding

Interface name      : xe-2/2/0
STP index           : 79
Forward State       : discarding

```

Ethernet ring data channel parameters for protection group pg302

```

Interface name      : xe-5/0/2
STP index           : 80
Forward State       : forwarding

```

```

Interface name      : xe-2/2/0
STP index           : 81
Forward State       : forwarding

```

### **show protection-group ethernet-ring data-channel detail (EX2300 and EX3400 Switches)**

```

STP index           : 53
Forward State       : forwarding

```

# show protection-group ethernet-ring flush-info

## Syntax

```
show protection-group ethernet-ring flush-info
```

## Release Information

Command introduced in Junos OS Release 14.2.

## Description

Display information about flush ports in an Ethernet ring.

## Options

This command has no options.

## Required Privilege Level

view

## RELATED DOCUMENTATION

## Output Fields

Table 190 on page 2018 lists the output fields for the **show protection-group ethernet-ring flush-info** command. Output fields are listed in the approximate order in which they appear.

Table 190: show protection-group ethernet-ring flush-info Output Fields

| Field Name       | Field Description                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------|
| Interface        | Physical interface configured for the Ethernet ring. This can be an aggregated Ethernet link also. |
| Originating Node | Node from which RAPS protocol data units originates on the Ethernet Ring.                          |

Table 190: show protection-group ethernet-ring flush-info Output Fields (*continued*)

| Field Name                    | Field Description                                       |
|-------------------------------|---------------------------------------------------------|
| <b>Blocked Port Reference</b> | Reference of the ring port on which traffic is blocked. |

## Sample Output

### show protection-group ethernet-ring flush-info (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info
```

```
Ethernet ring flush port information for protection group pg100
```

| Interface     | Originating Node  | Blocked Port Reference |
|---------------|-------------------|------------------------|
| xe-5/0/2.4001 | 00:00:00:00:00:00 | 0                      |

### Output Fields

[Table 191 on page 2021](#) lists the output fields for both the EX Series switch, and the ACX Series and MX Series router **show protection-group ethernet-ring interface** commands. Output fields are listed in the approximate order in which they appear.

Table 191: MX Series Routers show protection-group ethernet-ring interface Output Fields

| Field Name                                                           | Field Description                                                                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet ring port parameters for protection group <i>group-name</i> | Output is organized by configured protection group.                                                                                                      |
| Interface                                                            | Physical interfaces configured for the Ethernet ring. This can be an aggregated Ethernet link also.                                                      |
| Control Channel                                                      | (MX Series router only) Logical unit configured on the physical interface.                                                                               |
| Direction                                                            | Direction of the traffic.                                                                                                                                |
| Forward State                                                        | State of the ring forwarding on the interface: <b>discarding</b> or <b>forwarding</b> .                                                                  |
| Ring Protection Link End                                             | Whether this interface is the end of the ring: <b>Yes</b> or <b>No</b> .                                                                                 |
| Signal Failure                                                       | Whether there a signal failure exists on the link: <b>Clear</b> or <b>Set</b> .                                                                          |
| Admin State                                                          | State of the interface: For EX switches, <b>ready</b> , <b>ifl ready</b> , or <b>waiting</b> . For MX routers, <b>IFF ready</b> or <b>IFF disabled</b> . |

## Sample Output

show protection-group ethernet-ring interface (EX Series Switch Owner Node)

```
user@host> show protection-group ethernet-ring interface
```

```
Ethernet ring port parameters for protection group pg101
```

| Interface  | Forward State | RPL End | Signal Failure | Admin State |

## show protection-group ethernet-ring node-state

### Syntax

```
show protection-group ethernet-ring node-state
```

### Release Information

Command introduced in Junos OS Release 9.4 for MX Series routers.

Command introduced in Junos OS Release 12.1 for EX Series switches.

Command introduced in Junos OS Release 12.3X54 for ACX Series routers.

Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

### Description

Display the status of the Automatic Protection Switching (APS) nodes on an Ethernet ring.

### Options

This command has no options.

### Required Privilege Level

[Table 192 on page 2026](#) lists the output fields for the **show protection-group ethernet-ring node-state** command. Output fields are listed in the approximate order in which they appear.

**Table 192: show protection-group ethernet-ring node-state Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ring Name/Ethernet Ring | Name configured for the Ethernet ring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| APS State               | <p>State of the Ethernet ring APS.</p> <ul style="list-style-type: none"> <li>• <b>idle</b>—Indicates that the ring is working in normal condition and there is no active or pending protection-switching request in the ring. When the ring is in idle state, it is blocked at the RPL link.</li> <li>• <b>protected</b>—Indicates that there is a protection switch on the ring because of a signal failure condition on the ring link.</li> <li>• <b>MS</b>—Indicates that the manual switch command is active in the ring.</li> <li>• <b>FS</b>—Indicates that the forced switch command is active in the ring.</li> <li>• <b>pending</b>—Indicates that the ring is in pending state.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Event                   | <p>Events on the ring.</p> <ul style="list-style-type: none"> <li>• <b>NR-RB</b>—Indicates that there is no APS request and the ring link is blocked on the ring owner node.</li> <li>• <b>NR</b>—Indicates that there is no APS request pending in the ring.</li> <li>• <b>local SF</b>—Indicates that there is signal failure on one or both of the ring links of the node.</li> <li>• <b>remote SF</b>—Indicates that there is signal failure on one or more ring links of any other node of the ring.</li> <li>• <b>local FS</b>—Indicates that there is a forced switched command active on one or both of the ring links of the node.</li> <li>• <b>remote FS</b>—Indicates that there is a forced switch command active on one or more ring links of any other node of the ring.</li> <li>• <b>local MS</b>—Indicates that there is a manual switch command active on one of the ring links of the node.</li> <li>• <b>remote MS</b>—Indicates that there is a manual switch command active on one or more ring links of any other node of the ring.</li> <li>• <b>WTR running</b>—Indicates that the wait to restore timer is running on the RPL owner.</li> <li>• <b>WTB running</b>—Indicates that the wait to block timer is running on the RPL owner.</li> </ul> |

Table 192: show protection-group ethernet-ring node-state Output Fields (continued)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPL Owner / Ring Protection Link Owner | Whether this node is the ring owner: <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                                                              |
| WTR Timer / Restore Timer              | Restoration timer: <b>running</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                                      |
| WTB Timer / Wait to block timer        | Wait to block timer: <b>running</b> or <b>disabled</b> .<br><br><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect. |
| Wait to block timer (WTB Timer)        | Wait to block interval.<br><br><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.                                  |
| Guard Timer                            | Guard timer: <b>running</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                                            |
| Op State / Operational State           | State of the node: <b>Operational</b> or <b>any internal wait state..</b>                                                                                                                                                                                                                                                                                                                                   |

## Sample Output

show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

| Ethernet ring   | APS State | Event | RPL Owner | WTR Timer | WTB Timer | Guard Timer |
|-----------------|-----------|-------|-----------|-----------|-----------|-------------|
| Operation state |           |       |           |           |           |             |
| pg101           | idle      | NR-RB | Yes       | disabled  | disabled  | disabled    |
| operational     |           |       |           |           |           |             |
| pg102           | idle      | NR-RB | No        | disabled  | disabled  | disabled    |
| operational     |           |       |           |           |           |             |

**show protection-group ethernet-ring node-state (MX Series Router - Normal Ring Node, Normal Operation)**

```
user@host> show protection-group ethernet-ring node-state
```

|               |           |             |                 |
|---------------|-----------|-------------|-----------------|
| Ethernet ring | APS State | Event       | RPL Owner       |
| pg102         | idle      | NR-RB       | No              |
| WTR Timer     | WTB Timer | Guard Timer | Operation state |
| disabled      | disabled  | disabled    | operational     |

**show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Remote Failure Condition)**

```
user@host> show protection-group ethernet-ring node-state
```

|               |           |             |                 |
|---------------|-----------|-------------|-----------------|
| Ethernet ring | APS State | Event       | RPL Owner       |
| pg101         | protected | remote SF   | Yes             |
| WTR Timer     | WTB Timer | Guard Timer | Operation state |
| disabled      | disabled  | disabled    | operational     |

**show protection-group ethernet-ring node-state detail (ACX Series and MX Series Router)**

```
user@host> show protection-group ethernet-ring node-state detail
```

|                            |               |

```

## show protection-group ethernet-ring statistics

### Syntax

```
show protection-group ethernet-ring statistics group-name group-name
```

<brief | detail>

### Release Information

Command introduced in Junos OS Release 9.4.

Command introduced in Junos OS Release 12.1 for EX Series switches.

Command introduced in Junos OS Release 12.3X54 for ACX Series routers.

### Description

Display statistics regarding Automatic Protection Switching (APS) protection groups on an Ethernet ring.

### Options

**group-name**—Display statistics for the protection group. If you omit this option, protection group statistics for all configured groups are displayed.

**brief**—Display brief statistics for the protection group.

**detail**—Display detailed statistics for the protection group.

### Required Privilege Level

### Output Fields

Table 193 on page 2032 lists the output fields for the **show protection-group ethernet-ring statistics** command.

Table 193: show protection-group ethernet-ring statistics Output Fields

| Field Name                             | Field Description                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ethernet Ring Statistics for PG</b> | Name of the protection group for which statistics are displayed.                                                                                                |
| <b>RAPS event sent</b>                 | Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.     |
| <b>RAPS event received</b>             | Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers. |
| <b>Local SF</b>                        | Number of times a signal failure has occurred locally.                                                                                                          |
| <b>Remote SF</b>                       | Number of times a signal failure has occurred anywhere else on the ring.                                                                                        |
| <b>NR event</b>                        | Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.                                               |
| <b>NR event sent</b>                   | Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.                                                    |
| <b>NR event received</b>               | Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                                  |
| <b>NR-RB event</b>                     | Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.                                 |
| <b>NR-RB event sent</b>                | Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.                                      |
| <b>NR-RB event received</b>            | Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                    |

Table 193: show protection-group ethernet-ring statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flush event sent</b>         | Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.                    |
| <b>Flush event received</b>     | Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers. |
| <b>Local FS event sent</b>      | Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.                                      |
| <b>Remote FS event received</b> | Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                    |
| <b>Local MS event sent</b>      | Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.                                      |
| <b>Remote MS event received</b> | Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                    |

Table 194 on page 2033 lists the output fields for the **show protection-group ethernet-ring statistics** command when the **detail** option is used. These fields are valid only for MX Series routers.

Table 194: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)

| Field Name                                      | Field Description                                                                                                                |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Total number of FDB flush</b>                | Number of times forwarding database (FDB) flush has happened for the ring instance.                                              |
| <b>Flush-logic triggered flush</b>              | Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).                 |
| <b>Remote RAPS PDU received</b>                 | Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.       |
| <b>Remote RAPS dropped due to guard-timer</b>   | Number of RAPS messages dropped by the device because the guard timer is running.                                                |
| <b>Invalid remote RAPS PDU dropped</b>          | Number of RAPS messages dropped by the device because the messages are invalid.                                                  |
| <b>RAPS dropped due to miscellaneous errors</b> | Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality. |

**Table 194: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers) (continued)**

| Field Name                      | Field Description                                            |
|---------------------------------|--------------------------------------------------------------|
| Local received RAPS PDU dropped | Number of self-generated RAPS messages received and dropped. |

## Sample Output

## show protection-group ethernet-ring vlan

### Syntax

```
show protection-group ethernet-ring vlan  
<brief | detail>  
<group-name group-name>
```

### Release Information

Command introduced in Junos OS Release 10.2.

Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

### Description

On MX Series routers, display all data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

### Options

**brief | detail**—(Optional) Display the specified level of output.

**group-name**—(Optional) Protection group for which to display details such as data channel interfaces, vlan, and bridge-domain. If you omit this optional field, details for all configured protection groups will be displayed.

## Output Fields

Table 195 on page 2039 lists the output fields for the **show protection-group ethernet-ring vlan** command. Output fields are listed in the approximate order in which they appear.

Table 195: show protection-group ethernet-ring vlan Output Fields

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>     | Name of the interface configured for the Ethernet protection ring.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Vlan</b>          | Name of the VLAN associated with the interface configured for the Ethernet protection ring.                                                                                                                                                                                                                                                                                                                             |
| <b>STP index</b>     | The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior. |
| <b>Bridge Domain</b> | Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.                                                                                                                                                                                                                                                                                                                 |

## Sample Output

## traceroute ethernet

### Syntax

```
traceroute ethernet
local-mep mep-id
maintenance-association ma-name
maintenance-domain md-name
<ttl value>
<wait seconds>
mac-address | mep-id
<detail>
```

### Release Information

Command introduced in Junos OS Release 9.0.

**mep-id** option introduced in Junos OS Release 9.1.

**local-mep** option introduced in Junos OS Release 15.1

### Description

Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the **show oam ethernet connectivity-fault-management path-database** command.

Before using the traceroute command, you can verify the remote MEP's MAC address using the **show oam ethernet connectivity-fault-management path-database** command.

### Options

**local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**detail**—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.

**mac-address**—Destination unicast MAC address of the remote maintenance point.

***mep-id***—MEP identifier of the remote maintenance point. The range of values is 1 through 8191.

**maintenance-association *ma-name***—Specifies an existing maintenance association from the set of configured maintenance associations.

**maintenance-domain *md-name***—Specifies an existing maintenance domain from the set of configured maintenance domains.

**ttl *value***—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.

**wait seconds**—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.

**Required Privilege Level**  
network

**List of Sample Output**  
[traceroute ethernet on page 2046](#)  
[traceroute ethernet detail on page 2047](#)

**Output Fields**  
[Table 196 on page 2045](#) lists the output fields for the **traceroute ethernet** command. Output fields are listed in the approximate order in which they appear.

**Table 196: traceroute ethernet Output Fields**

| Field Name                     | Field Description                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Linktrace to</b>            | MAC address of the destination maintenance point.                                                                                                                                                                                                                            |
| <b>Interface</b>               | Local interface used to send the linktrace message (LTM).                                                                                                                                                                                                                    |
| <b>Maintenance Domain</b>      | Maintenance domain specified in the traceroute command.                                                                                                                                                                                                                      |
| <b>Level</b>                   | Maintenance domain level configured.                                                                                                                                                                                                                                         |
| <b>Maintenance Association</b> | Maintenance association specified in the traceroute command.                                                                                                                                                                                                                 |
| <b>Local Mep</b>               | The local maintenance end point identifier.                                                                                                                                                                                                                                  |
| <b>Transaction Identifier</b>  | 4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM. |
| <b>Hop</b>                     | Sequential hop count of the linktrace path.                                                                                                                                                                                                                                  |
| <b>TTL</b>                     | Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.                                                                                                                                                                        |
| <b>Source MAC address</b>      | MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.                                                                                                                                                                                  |

Table 196: traceroute ethernet Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Next-hop MAC address</b> | MAC address of the egress interface of the node to which the LTM is forwarded or<br><br>the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.                                                                                                                                                                    |
| <b>Responder Hostname</b>   | The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.                                                                                                                                                                                                                                |
| <b>Ingress port name</b>    | The port name for ingress connections.                                                                                                                                                                                                                                                                                                                           |
| <b>Egress port name</b>     | The port name for egress connections.                                                                                                                                                                                                                                                                                                                            |
| <b>Flags</b>                | The configurable flags can include: <ul style="list-style-type: none"> <li>• H— Hardware only, incoming LT frame has hardware bit set.</li> <li>• T— Terminal MEP, responder is a terminating MEP.</li> <li>• F— FWD yes, LTM frame is relayed further.</li> </ul>                                                                                               |
| <b>Relay Action</b>         | The associated relay action. Relay action can be one of the following: <ul style="list-style-type: none"> <li>• RlyHit— Relay hit; target MAC address matches the MP mac address.</li> <li>• RlyFDB— Relay FDB; output port decided by consulting forwarding database.</li> <li>• RlyMPDB— Relay MIP; output port decided by consulting MIP database.</li> </ul> |

## Sample Output

traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05
```

```
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
```

### traceroute ethernet detail

user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6 mep  
101 detail

Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1  
Maintenance Domain: md6, Level: 6  
Maintenance Association: ma6, Local Mep: 201  
Transaction Identifier: 2077547465

#### Legend for RelayAction:

RlyHit -- Relay hit, Target MAC address matches the MP mac address  
RlyFDB -- Relay FDB, output port decided by consulting FDB database  
RlyMPDB -- Relay MIP, output port decided by consulting MIP database

#### Legend for Flags:

H -- Hardware only, incoming LT frame has hardware bit set  
T -- Terminal MEP, responder is a terminating MEP  
F -- FWD yes, LTM frame is relayed further

| TTL               | Responder Hostname  | Ingress port name  | Egress port name  | RelayAction |
|-------------------|---------------------|--------------------|-------------------|-------------|
| Responder Service | Ingress MAC address | Egress MAC address | Flags             |             |
