## YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

## END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

- Requesting Technical Support | xi

Use this guide to configure and model both configurational and operational data of your switches and routers using OpenConfig data models.

## Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

## Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xsl;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {  
    file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]  
user@host# edit system scripts  
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]  
user@host# load merge relative /var/tmp/ex-script-snippet.conf  
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

## Documentation Conventions

[Table 1 on page ix](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page ix defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
<b>Text like this</b>	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"><li>• To configure a stub area, include the <b>stub</b> statement at the [edit <b>protocols ospf area area-id</b>] hierarchy level.</li><li>• The console port is labeled <b>CONSOLE</b>.</li></ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub &lt;default-metric <i>metric</i>&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <b>(<i>string1</i>   <i>string2</i>   <i>string3</i>)</b>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [ <i>community-ids</i> ]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are

covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

## Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

# OpenConfig Overview

OpenConfig is a collaborative effort in the networking industry to move toward a more dynamic, programmable method for configuring and managing multivendor networks. OpenConfig supports the use of vendor-neutral data models to configure and manage the network. These data models define the configuration and operational state of network devices for common network protocols or services. The data models are written in YANG, a standards-based, data modeling language that is modular, easy to read, and supports remote procedure calls (RPCs). Using industry standard models greatly benefits an operator with devices in a network from multiple vendors. The goal of OpenConfig is for operators to be able to use a single set of data models to configure and manage all the network devices that support the OpenConfig initiative.

OpenConfig for Junos OS supports the YANG data models and uses RPC frameworks to facilitate communications between a client and the router. You have the flexibility to configure your router directly by using Junos OS, or by using a third-party schema, such as OpenConfig. OpenConfig modules define a data model through its data, and the hierarchical organization of and constraints on that data. Each module is uniquely identified by a namespace URL to avoid possible conflicts with the Junos OS name.

The configuration and operational statements in Junos OS have corresponding path statements in OpenConfig. The following is a list of data modules for which mapping of OpenConfig and Junos OS configuration and operational statements is supported:

- BGP
- Interfaces
- LACP
- LLDP
- Local routing
- MPLS
- Network instance
- Platform
- Routing policy
- VLAN

When you configure OpenConfig statements on devices running Junos OS, the following features are *not* supported:

- Using **configure batch** or **configure private** mode
- Configuring statements under the **[edit groups]** hierarchy

For more information on the OpenConfig initiative, see <http://www.openconfig.net/>.

## Installing the OpenConfig Package

Starting in Junos OS Release 18.3R1, the Junos OS image includes the OpenConfig package; therefore, you do not need to install OpenConfig separately on your device.

By default, the OpenConfig schema is not available through CLI. To unhide the OpenConfig knob from the CLI, run the following command:

## set system schema openconfig unhide

**NOTE:** The **show system yang package** command in the operational mode does not display native Junos OS OpenConfig package. This is because the Junos OS image includes the OpenConfig package.

OpenConfig package includes the following files:

- OpenConfig set of data models—Data models are written in YANG.
- Translation scripts—Translates OpenConfig configuration schemas to Junos OS configuration schemas for each supported Junos OS release.
- Deviation modules—Specifies the unsupported nodes within the schema for each supported Junos OS release.
- Augmentation module—Specifies additions to various OpenConfig specified models.
- Dynamic rendering files—Maps operational state data for each supported Junos OS release.

In releases before Junos OS Release 18.3R1, OpenConfig for Junos OS software package have the following naming convention:

```
junos-openconfig-XX.YY.ZZ.JJ-signed.tgz (Junos OS)
junos-openconfig-x86-32-XX.YY.ZZ.JJ.tgz (Junos OS with Upgraded FreeBSD)
```

where:

- XX represents the OpenConfig major release number.
- YY represents the OpenConfig minor release number.
- ZZ represents the OpenConfig patch release number.
- JJ represents the Juniper Networks release number.

**NOTE:** The **junos-openconfig-x86-32-XX.YY.ZZ.JJ.tgz** package supports both 32 and 64 bit systems.

To install the OpenConfig for Junos OS software package, use the following command:

**request system software add**

For example:

```
user@router> request system software add junos-openconfig-XX.YY.ZZ.JJ-signed.tgz
```

or

```
user@router> request system software add junos-openconfig-x86-32-XX.YY.ZZ.JJ.tgz
```

For more details on the OpenConfig for Junos OS software package, see Release Notes available with the package on the [Juniper Software Download website](#).

Starting in Junos OS Release 16.1R3, you can use a set of remote procedure call (RPC) interfaces to configure the Junos Telemetry Interface and stream telemetry data using the gRPC framework. OpenConfig supports the use of vendor-neutral data models for configuring and managing multivendor networks. gRPC is an open source framework that provides secure and reliable transport of data.

**NOTE:** JTI support for PTX10008 routers is documented for Junos OS Evolved Release 19.4R1, but not supported.

**NOTE:** OpenConfig for Junos OS and gRPC are supported only on MPCs on MX Series and on PTX Series routers starting with Junos OS Release 16.1R3.

Starting with Junos OS Release 17.2R1, OpenConfig and gRPC are also supported on QFX10000 switches, QFX5200 switches, and PTX1000 routers.

Starting with Junos OS Release 17.3R1, Junos Telemetry Interface is supported on the Routing Control and Board (RCB) on PTX3000 routers, QFX5110 switches, and EX4600 and EX9200 switches.

OpenConfig and gRPC are not supported on MX80 and MX104 routers.

Starting with Junos OS Release 17.4R1, MX2008 routers are supported.

Starting with Junos OS Release 18.3R1, ON\_CHANGE streaming of LLDP telemetry sensor information is supported through gRPC for MX Series and PTX Series routers.

Starting with Junos OS Release 18.3R1, QFX5120-AY and EX4650 switches are also supported.

Starting with Junos OS Release 18.4R1, EX4600 switches are also supported.

Starting with Junos OS Release 18.4R1, MX480, MX960, MX2010, MX2020, MX2008 and MX-ELM routers are also supported.

Starting with Junos OS Release 19.1R1, MX Series routers operating with MS-MIC and MS-MPC, QFX10002 switches, and PTX10002 routers are also supported.

Starting in Junos OS Evolved Release 19.1R1, OpenConfig (OC) and Junos Telemetry Interface (JTI) are supported. Both gRPC APIs and the customer-facing CLI remain the same as for the Junos OS. As was standard for Junos OS, Network Agent (NA) and OC packages are part of the Junos OS Evolved image.

Starting with Junos OS Evolved 19.1R1, Packet Forwarding Engine sensors on PTX10003 routers are also supported.

Starting with Junos OS Release 19.2R1, SRX4100, SRX4200, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX Series Services Gateways.

Starting with Junos OS Release 19.2R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX960, MX2008, MX2010 and MX2020 routers, PTX1000 and PTX10000 routers, and QFX5100 and QFX5200 switches.

Starting with Junos OS Release 19.2R1, gNMI services for streaming statistics is supported on QFX5100, QFX5110, QFX5120, QFX5200 and QFX5210 switches.

Starting with Junos OS Release 19.3R1, gRPC service for exporting statistics is supported on MX Series routers hosting MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards.

Starting with Junos OS Evolved Release 19.3R1, gRPC service for exporting statistics is supported on QFX5220-128C and QFX5220-32CD switches.

## Network Agent Software

Implementing OpenConfig with gRPC for Junos Telemetry Interface requires that you download and install a package called Network Agent if your Juniper Networks device is running a version of Junos OS with Upgraded FreeBSD. For all other versions of Junos OS, the Network Agent functionality is embedded in the software. Network Agent functions as a gRPC server and terminates the OpenConfig RPC interfaces. It is also responsible for streaming the telemetry data according to the OpenConfig specification. To view the OpenConfig specification for telemetry, see the [OpenConfig Telemetry specification](#). For more information about OpenConfig for Junos OS, see the *OpenConfig User Guide*.

The Network Agent component also supports server-based Secure Sockets Layer (SSL) authentication. Client-based SSL authentication is not supported. You must install SSL certificates on your Juniper Networks device.

For information about installing the Network Agent package, see [“Installing the Network Agent Package” on page 50](#).

## Using OpenConfig for Junos OS to Enable Junos Telemetry Interface

OpenConfig for Junos OS specifies an RPC model to enable the Junos Telemetry Interface. You must download and install the OpenConfig for Junos OS package on your Juniper Networks device. This package also includes the required YANG models. Using a Web browser, navigate to the All Junos Platforms software download URL on the Juniper Networks webpage: <https://www.juniper.net/support/downloads/>. From the **Network Management** tab, scroll down to select **OpenConfig**. Select the **Software** tab. Select the appropriate version of OpenConfig module. Two versions are available, one for devices running Junos OS with Upgraded FreeBSD and another for devices running all other versions of Junos OS. For more information, see [“Installing the OpenConfig Package” on page 21](#) and *Understanding Junos OS YANG Modules*.

The programmatic interface **OpenConfigTelemetry** that is installed by the Network Agent package defines the telemetry gRPC service. The **telemetrySubscribe** RPC specifies the following subscription parameters:

- OpenConfig path that identifies the system resource to stream telemetry data, for example:  
`/interfaces/interface/state/counters/`
- Interval at which data is reported and streamed to the collector server, in milliseconds, for example:  
`sample_frequency = 4000`

The **telemetrySubscribe** RPC is used by a streaming server, or collector, to request an inline subscription for data at the specified path. The device should then send telemetry data back on the same connection as the subscription request.

## Using gRPC to Stream Data

Per the OpenConfig specification, only gRPC-based transport is supported for streaming data. The gRPC server that is installed by the Network Agent package terminates the gRPC sessions from the management system that runs the client. RPC calls trigger the creation of Junos OS sensors that either stream data periodically or report events, which are then funneled onto the appropriate gRPC channel by Network Agent.

**NOTE:** Starting in Junos OS Release 18.2R1, when an external streaming server, or collector, provisions sensors to export data through gRPC on devices running Junos OS, the sensor configuration is committed to the **junos-analytics** instance of the ephemeral configuration database, and the configuration can be viewed by using the **show ephemeral-configuration instance junos-analytics** operational command. In earlier releases, the sensor configuration is committed to the default instance of the ephemeral configuration database.

See [Table 4 on page 28](#) for a list and descriptions of the RPCs implemented to support the Junos Telemetry Interface.

**Table 4: Telemetry RPCs**

RPC Name	Description
<b>telemetrySubscribe</b>	Specify telemetry parameters and stream data for the specified list of OpenConfig paths.
<b>getTelemetrySubscriptions</b>	Retrieve the list of subscriptions that are created through <b>telemetrySubscribe</b> .

Table 4: Telemetry RPCs (*continued*)

RPC Name	Description
<b>cancelSubscription</b>	Unsubscribe a subscription created through <b>telemetrySubscribe</b> .

Data streamed through gRPC is formatted in OpenConfig key/value pairs in protocol buffers (gpb) messages. In this universal format, keys are strings that correspond to the path of the system resources in the OpenConfig schema for the device being monitored. The values correspond to integers or strings that identify the operational state of the system resource, such as interface counters, and the state of the resource.

**NOTE:** Starting in Junos OS Release 18.2R1, data streamed through gRPC can be formatted as protobuf in addition to key/value pairs for OpenConfig-based routing engine (RE) sensors. These sensors are in addition to the packet forwarding engine (PFE) sensors.

The following shows the universal key/value format:

```
message KeyValue {
    string key          = 1 [(telemetry_options).is_key = true];
    uint64 int_value    = 2;
    string str_value    = 3;
    string prefix_str   = 4;
}

message TelemetryStream {
    // router name or export IP address
    required string system_id      = 1 [(telemetry_options).is_key = true];

    // line card / RE (slot number)
    optional uint32 component_id   = 2 [(telemetry_options).is_key = true];

    // PFE (if applicable)
    optional uint32 sub_component_id = 3 [(telemetry_options).is_key = true];

    // timestamp (common to all entries in the kv array)
    optional uint64 timestamp      = 4 [(telemetry_options).is_timestamp = true];

    // key / value pairs
    repeated KeyValue kv;
}
```

The following example shows how a set of counters for an interface can be represented:

```
key = "/interfaces/counters/rx-bytes",    int_value = 1000
key = "/interfaces/counters/tx-bytes",    int_value = 2000
key = "/interfaces/counters/rx-packets",  int_value = 10
key = "/interfaces/counters/rx-bytes" ,    int_value = 20
key = "/interfaces/counters/oper-state",  str_value = "up"
```

The Network Agent package provides a mapping table that maps field names to the OpenConfig key strings.

## Exporting Packet Forwarding Engine Traffic Sensor Data

Starting with Junos OS Release 17.4R1, you can export Packet Forwarding Engine traffic statistics through the Junos Telemetry Interface for MX Series and PTX Series routers. Both UDP and gRPC are supported.

This sensor tracks reporting of Packet Forwarding Engine statistics counters and provides visibility into Packet Forwarding Engine error and drop statistics. The resource name for the sensor is `/junos/system/linecard/packet/usage/`. The OpenConfig paths report data specific to CPU, NPU and center chip (CC). The following paths are supported:

- `/components/component[name='FPCid:NPUid']/properties/property[name='counter']/state/value`, where FPC refers to the Flexible PIC Concentrator and NPU refers to the network processing unit (packet forwarding engine). A sample resource path is `/components/component[name='FPC0:NPU3']/properties/property[name='ts-output-pps']/state/value` where `hwds-data-error` is the counter for **Hardware Discards: Data Error**.
- `/components/component[name='FPCid:CCid']/properties/property[name='counter']/state/value`, where FPC refers to the Flexible PIC Concentrator and CC refers to the center chip. A sample resource path is `/components/component[name='FPC0:CC1']/properties/property[name='lpbk-packets']/state/value` where `lpbk-packets` is the count of **Forward packets** specific to FPC0, center chip 1.
- `/components/component[name='FPCid']/properties/property[name='counter']/state/value`, where FPC refers to the Flexible PIC Concentrator. A sample resource path is `/components/component[name='FPC0']/properties/property[name='lts-input-packets']/state/value` where `lts-input-packets` is the CPU counter **Local packets input**.

To provision the sensor to export data through gRPC, use the `telemetrySubscribe` RPC to specify telemetry parameters. For streaming through UDP, all parameters are configured at the `[edit services analytics]` hierarchy level.

The following is a map of counters to output fields in the **show pfe statistics traffic** command or **show pfe statistics traffic detail** command (supported only on MX Series routers).

CPU stats: (FPCX:CPUY)

Packet Forwarding Engine local traffic statistics:

Local packets input	:	2
Local packets output	:	1
Software input control plane drops	:	0
Software input high drops	:	0
Software input medium drops	:	0
Software input low drops	:	0
Software output drops	:	0
Hardware input drops	:	0

Counter

lts-input-packets	Local packets input
lts-output-packets	Local packets output
lts-sw-input-control-drops	Software input control plane drops
lts-sw-input-high-drops	Software input high drops
lts-sw-input-medium-drops	Software input medium drops
lts-sw-input-low-drops	Software input low drops
lts-sw-output-low-drops	Software output drops

NPU stats: (FPCX:CCY)

Input packets:	1169	0 pps
Output packets:	0	0 pps
Fabric Input :	277235149	16078 pps
Fabric Output :	277235149	16079 pps

Counter

ts-input-packets	Input packets
ts-input-packets-pps	Input packets in pps
ts-output-packets	Output packets
ts-output-packets-pps	Output packets in pps
ts-fabric-input-packets	Fabric Input
ts-fabric-input-packets-pps	Fabric Input in pps
ts-fabric-output-packets	Fabric Output
ts-fabric-output-packets-pps	Fabric Output in pps

Packet Forwarding Engine loopback statistics:

Forward packets :	0	0 pps
-------------------	---	-------

```

Forward bytes      :                0          0 bps
Drop packets      :                0          0 pps
Drop bytes        :                0          0 bps

```

#### Counter

```

lpbk-packets      Forward packets
lpbk-packets-pps  Forward packets pps
lpbk-packets-byte Forward bytes
lpbk-packets-bps  Forward bytes   bps

```

```

lpbk-drop-packets Drop packets
lpbk-drop-packets Drop packets pps
lpbk-drop-packets Drop bytes
lpbk-drop-packets Drop bytes bps

```

#### Lu chips stats: FPCx:NPUY

hwds-dlu-not-routable

```

## Enabling “ON CHANGE” Sensor Support Through gRPC Network Management Interface (gNMI)

Periodical streaming of OpenConfig operational states and counters has been supported since Junos OS Release 16.1, exporting telemetry data from Juniper equipment to an external collector. While useful in collecting all the needed information and creating a baseline “snapshot,” periodical streaming is less useful for time-critical missions. In such instances, you can configure ON\_CHANGE streaming for an external collector to receive information only when operational states experience a change in state.

To support ON\_CHANGE streaming, a new specification called gRPC Network Management Interface (gNMI) is implemented for the modification and retrieval of configurations from a network element. Additionally, the gNMI specification can be used to generate and control telemetry streams from a network element to a data collection system. Using the new gNMI specification, one gRPC service definition can provide a single implementation on a network element for both configuration and telemetry as well as a single NMS element to interact with a device by means of telemetry and configuration RPCs.

The Junos file package (junos-telemetry-interface) includes the gnmi.proto file and GnmiJuniperTelemetryHeader.proto Juniper extension for gNMI support.

Information about the RPCs supporting this feature can be found in the gNMI Proto file version 0.4.0 (the supported version) and the specification released

- <https://github.com/openconfig/reference/blob/master/rpc/gnmi/gnmi-specification.md>
- <https://github.com/openconfig/gnmi/blob/master/proto/gnmi/gnmi.proto>

The telemetry RPC **subscribe** under gNMI service supports ON\_CHANGE streaming. RPC **subscribe** allows a client to request the target to send it values of particular paths within the data tree. Values may be streamed (STREAM), sent one-off on a long-lived channel (POLL), or sent one-off as a retrieval (ONCE).

If a subscription is made for a top level container with a sample frequency of 0, leaves with ON\_CHANGE support are streamed based on events. Other leaves will not be streamed.

**NOTE:** In order to permit a device to decide which nodes will be streamed as ON\_CHANGE and which will SAMPLE, the collector must subscribe for TARGET\_DEFINED with sample\_interval.

## Enabling “ONCE” Mode for Sensor Support Through gRPC Network Management Interface (gNMI)

In addition to STREAM mode of gNMI subscription, ONCE mode is also supported. Use ONCE mode to export sensor data from a network device only once. When the subscription is received on the Juniper network device, Junos telemetry interface (JTI) ensures that the collector streams all leaves once. There is no zero suppression. All counters, those holding a value and those with a value of 0, are exported once. Upon successful completion of the response for all the resource paths, Network Agent closes the collector connection. Multiple parallel collectors can request the same or different sensors through the RPC subscribe and specify ONCE mode. JTI infra responds to each collector. ONCE mode is supported only for Openconfig sensors and not for native (UDP) sensors.

In the sample subscription below, the mode is set to ONCE for the sensor path `"/interfaces/".` Data will be streamed for one full reap. After all responsible processes stream the data, the subscription channel will close.

```
{
  "host": "1.1.1.1",
  "port": 50051,
  "user": "foo",
  "password": "foo",
  "cid": "myclient-gnmi",
  "gnmi": {
    "mode": ONCE,
    "encoding": 2
  },
  "paths": [{
    "path": "/interfaces/",
    "freq": 2000000000
  } ]
}
```

gNMI is a gRPC-based protocol for the modification and retrieval of configurations, as well as a tool to tap telemetry streams out of a network element in order to manage and monitor it.

The Junos file package (junos-telemetry-interface) includes the gnmi.proto file and GnmiJuniperTelemetryHeader.proto Juniper extension for gNMI support.

You can find information about the RPCs supporting this feature in the gNMI Proto file version 0.7.0 (the supported version).

You can find the gNMI service gRPC RPCs that network vendors can implement in the gNMI specification. See the gNMI Proto file and the gNMI specifications here:

- <https://github.com/openconfig/reference/blob/master/rpc/gnmi/gnmi-specification.md>
- <https://github.com/openconfig/gnmi/blob/master/proto/gnmi/gnmi.proto>

## Enabling Client Streaming and Bidirectional Streaming of Telemetry Sensor Information

Starting with Junos OS Release 18.1R1, OpenConfig support through Remote Procedure Calls (gRPC) and JTI is extended to support client streaming and bidirectional streaming of telemetry sensor information on MX Series and PTX Series routers.

APIs are implemented in Junos based on Protobuf specifications for OpenConfig. These APIs perform configuration, operational state retrieval, and telemetry on Junos routers using gRPC as the transport mechanism.

With client streaming, the client sends a stream of requests to the server instead of a single request. The server typically sends back a single response containing status details and optional trailing metadata. With bidirectional streaming, both client and server send a stream of requests and responses. The client starts the operation by invoking the RPC and the server receives the client metadata, method name, and deadline. The server can choose to send back its initial metadata or wait for the client to start sending requests. The client and server can read and write in any order. The streams operate completely independently.

Junos devices can be managed through API (RPC) prototypes:

- rpc Capabilities (CapabilityRequest)

Returns (CapabilityResponse). Allows the client to retrieve the set of capabilities that is supported by the target.

- rpc Get (GetRequest)

Returns (GetResponse). Retrieves a snapshot of data from the target.

- rpc Set (SetRequest)

Returns (SetResponse). Allows the client to modify the state of data on the target.

- rpc Subscribe (stream SubscribeRequest)

Returns (stream SubscribeResponse). Allows a client to request the target to send it values for particular paths within the data tree. These values may be streamed (STREAM) or sent one-off on a long-lived channel (POLL), or sent as a one-off retrieval (ONCE). If a subscription is made for a top-level container with a sample frequency of 0, leaves with ON\_CHANGE support are streamed based on events. Other leaves will not be streamed.

Juniper Extension Toolkit (JET) support provides insight to users regarding the status of clients connected to JSD. JET support for gRPC includes expanding the maximum number of clients that can connect to JSD

from 8 to 30 (the default remains 5). To specify the maximum number of connections, include the **max-connections** statement at the `[edit system services extension-service request-response grpc]` hierarchy level.

To provide information regarding the status of clients connected to JSD, issue the enhanced **show extension-service client information** command and include the **clients** or **servers** options. The **clients** option displays request-response client information. The **servers** option displays request-response server information.

## Enabling Streaming of Telemetry Sensor Information for SR-TE policies (BGP or Static)

Starting with Junos OS Release 18.3R1, OpenConfig support through gRPC and JTI provides continuous statistics streaming via the same sensor irrespective of the route that is active (BGP or static) for a given Segment Routing Traffic Engineering (SR-TE) policy.

This feature provides support for BGP [DRAFT-SRTE] and statically configured SR-TE policies at ingress routers.

To provision the sensor to export data through gRPC streaming, use the `telemetrySubscribe` RPC to specify telemetry parameters. Include the resource path `/mpls/signaling-protocols/segment-routing/` to export these statistics.

In addition to configuring the sensor, you must enable statistics collection through the Junos OS. To do this, include the **statistics** configuration statement at the `[edit protocols source-packet-routing telemetry]` hierarchy level. Optionally, you can limit statistics by including the **no-transit** or **no-ingress** parameter.

See *Configure a NETCONF Proxy Telemetry Sensor in Junos* for instructions on configuring a sensor.

See [“Guidelines for gRPC and gNMI Sensors \(Junos Telemetry Interface\)” on page 57](#) for further information about resource paths.

## Support for LSP Statistics

You can provision the LSP statistics sensor `/junos/services/label-switched-path/usage/` to monitor per-MPLS LSP statistics. Telemetry data is streamed from Junos devices and exported through JTI to external collectors at configurable intervals through gRPC without involving polling.

Initial support of this feature in Junos OS Release 15.1F6 supported ingress LSPs only when a subscription was made to `/junos/services/label-switched-path/usage/`. With bypass support added to this feature in

Junos OS Release 17.4R1, this subscription now streams both ingress LSP and bypass LSP statistics to a collector.

Statistics that are streamed are similar to the output displayed by the operational mode commands **show mpls lsp bypass statistics** and **show mpls lsp ingress statistics**.

For bypass LSPs, the following are exported:

- Bypass LSP originating at the ingress router of the protected LSP.
- Bypass LSP originating at the transit router of the protected LSP.
- Bypass LSP protecting the transit LSP as well as the locally originated LSP.

When the bypass LSP is active, traffic is exported both on the bypass LSP and the ingress (protected) LSP.

To provision a sensor to export data through gRPC, use the `telemetrySubscribe` RPC to specify telemetry parameters. Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module. Both OpenConfig and Network Agent packages are bundled into the Junos OS image by default.

See *Configuring a Junos Telemetry Interface Sensor (CLI Procedure)* for information about configuring a UDP (native) sensor.

See [Table 5 on page 37](#) for the level of LSP sensor support by platform.

**Table 5: LSP Support by Platform**

Platform	Ingress LSP, UDP Feature Introduced	Ingress LSP, gRPC Str Feature Introduced
ACX6360		
MX80/MX104	Junos OS Release 15.1F6 Junos OS Release 16.1R3 Junos OS Release 17.2R1	
MX Series with MPC	Junos OS Release 15.1F6	Junos OS Release 16.1F6 Junos OS Release 17.2R1
PTX5000 with FPC3		Junos OS Release 18.2R1

Table 5: LSP Support by Platform (continued)

Platform	Ingress LSP, UDP Feature Introduced	Ingress LSP, gRPC Str Feature Introduced
PTX3000 with FPC3	Junos OS Release 15.1F6	Junos OS Release 16.1F6
	Junos OS Release 16.1R3	Junos OS Release 17.2R1
	Junos OS Release 17.2R1	Junos OS Release 18.2R1

Table 5: LSP Support by Platform (*continued*)

Platform	Ingress LSP, UDP Feature Introduced	Ingress LSP, gRPC Str Feature Introduced
QFX5100	Junos OS Release 18.2R1	Junos OS Release 18.2R1
QFX5110	Junos OS Release 18.2R1	Junos OS Release 18.2R1
QFX5120-48Y	Junos OS Release 18.3R1	Junos OS Release 18.3R1
QFX5200	Junos OS Release 18.2R1	Junos OS Release 18.2R1

## Dynamic Tunnel Statistics Support

Starting with Junos OS Release 17.4R1, you can export counter statistics for Packet Forwarding Engine dynamic tunnels to an outside collector using either native (UDP) or OpenConfig telemetry sensors through JTI.

The statistics are used to report various network element performance metrics in a scalable and efficient way, providing visibility into Packet Forwarding Engine errors and drops.

A timestamp indicating when the counters were last reset is included with all the exported data to allow collectors to determine if and when a reset event happened; for example, if the Packet Forwarding Engine hardware restarted.

Exported statistics are similar to the output of the operational mode command **show nhdb hw dynamic-ip-tunnels**.

To provision statistics export through gRPC, use the telemetrySubscribe RPC to create a subscription and specify telemetry parameters. Include the resource path **/junos/services/ip-tunnel[name='tunnel-name']/usage/counters[name='counter-name']** in the subscription.

Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module. Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.

To configure export of statistics through UDP, include the sensor **/junos/services/ip-tunnel/usage/** in the *sensor (Junos Telemetry Interface)* configuration statement at the **[edit services analytics]** hierarchy level. All parameters for UDP sensors are configured at that hierarchy level. MX80 and MX104 routers support only UDP streaming. They do not support gRPC.

## FPC and Optics Support

Starting in Junos OS Release 19.2R1, JTI supports streaming of Flexible PIC Concentrator (FPC) and optics statistics for the MX Series using Remote Procedure Calls (gRPC). gRPC is a protocol for configuration and retrieval of state information. Support includes the addition of a new process (SensorD daemon) to export telemetry data for integration with AFTTelemetry and LibTelemetry libraries in the OpenConfig model called AFT platform.

The following base resource paths are supported:

- `/junos/system/linecard/environment/`
- `/junos/system/linecard/optics/`

To provision the sensor to export data through gRPC, use the `telemetrySubscribe` RPC to specify telemetry parameters. Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module. Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.

## JTI Broadband Edge Statistics Support for Junos Fusion on MX Series

Starting in Junos OS Release 19.2R1, subscriber-based telemetry streaming is enabled when an MX router is configured for Broadband Network Gateway (BNG) and Junos Fusion where subscribers are connected through Junos Fusion Satellite devices. You can use remote procedure calls (gRPC) to export broadband edge (BBE) telemetry statistics to external collectors.

You can stream all BBE resource paths except for the following:

- `/junos/system/subscriber-management/access-network/ancp`
- `/junos/system/subscriber-management/client-protocols/l2tp`
- `/junos/system/subscriber-management/infra/network/l2tp/`

To stream BBE statistics, include a resource path starting with `/junos/system/subscriber-management/` in your gRPC subscription.

To provision the sensor to export data through gRPC, use the `telemetrySubscribe` RPC to specify telemetry parameters.

## CPU and NPU Sensor Support for MX Series Routers with MPC10E-15C-MRATE Line Cards

Junos OS Release 19.3R1 supports CPU and network processing unit (NPU) sensors on MX Series routers with MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards. JTI enables the export of statistics from these sensors to outside collectors at configurable intervals using gRPC services.

Unlike the Junos kernel implementation for the CPU and NPU sensors in previous Junos releases, this feature uses the OpenConfig AFT model. Because of this, there is a difference in the resource path and key-value (kv) pair output compared to the Junos kernel output.

Use the following resource path to export statistics:

```
/junos/system/linecard/cpu/memory/
```

```
/junos/system/linecard/npu/memory/
```

```
/junos/system/linecard/npu/utilization/
```

To provision the sensor to export data through gRPC services, use the **telemetrySubscribe** RPC to specify telemetry parameters. Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module. Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.

For more information about gRPC resource paths, see [Guidelines for gRPC Sensors \(Junos Telemetry Interface\)](#).

## Interface Express Sensor

The interface express sensor is supported by JTI to export interface operational **UP** and **DOWN** status at a user-configurable rate. This sensor leverages statistics out of the physical interface sensor, providing faster and more frequent operational status statistics. Only the physical interfaces' operational status from the Flexible PIC Concentrator (FPC) is collected and reported. Statistics from the Routing Engine interface are not reported.

You can use the sensor to export statistics either through UDP (native) export or through gRPC services.

For either export method, include the following resource path:

- `/junos/system/linecard/intf-exp/`

Junos OS Release 18.1R1 supports interface express sensor for PTX1000, PTX3000, PTX5000, and PTX10000 routers.

Junos OS Release 19.3R1 supports interface express sensor for MX960, MX2010, and MX2020 routers.

For more information about gRPC resource paths, see [Guidelines for gRPC and gNMI Sensors \(Junos Telemetry Interface\)](#).

## Diameter Application Protocol and Diameter Peer Sensors for Subscribers

JTI supports streaming statistics for subscribers for the diameter application protocols Network Access Server Application (NASREQ), policy and charging rules function (PCRF), and Online Charging System (OCS). There are also new diameter peer sensors that provide response time measurements for messages exchanged between an MX router and the peer for each of the diameter applications. Statistics are exported using JTI and the Juniper AAA Model, which covers telemetry export using gRPC, gNMI, or Juniper proprietary RPC or UDP.

To stream diameter application statistics, include the resource paths:

- For NASREQ statistics, `/junos/system/subscriber-management/aaa/diameter/clients/nasreq`
- For PCRF statistics, `/junos/system/subscriber-management/aaa/diameter/clients/gx`
- For OCS statistics, `/junos/system/subscriber-management/aaa/diameter/clients/gy`

To stream response time measurements for the diameter applications, include the resource paths in a subscription or using the **sensor** configuration statement:

- For NASREQ measurements, `/junos/system/subscriber-management/aaa/diameter/peers/peer[peer_address='peer-address']/nasreq/response-time`
- For PCRF measurements, `/junos/system/subscriber-management/aaa/diameter/peers/peer[peer_address='peer-address']/gx/response-time`
- For OCS measurements, `/junos/system/subscriber-management/aaa/diameter/peers/peer[peer_address='peer-address']/gy/response-time`

To enable these statistics for an MX Series router for native (UDP) export, include the **sensors** statement at the `[edit services analytics]` hierarchy level.

To provision the sensor to export data through gNMI, use the Subscribe RPC defined in the [gnmi.proto](#) to specify request parameters.

To provision the sensor to export data through gRPC, use the **telemetrySubscribe** RPC to specify telemetry parameters. Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module. Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.

Junos OS Release 19.3R1 supports diameter application protocol sensors for MX5, MX10, MX40, MX150, MX204, MX240, MX480, MX960, MX2008, MX2010, MX2020, MX10003, MX10008, and MX100016 routers.

For more information about gRPC and gNMI resource paths, see [Guidelines for gRPC and gNMI Sensors \(Junos Telemetry Interface\)](#).

## Interface Burst Monitoring

Junos OS Evolved Release 19.3R1 supports interface burst monitoring on Junos telemetry interface (JTI) to monitor physical interfaces for bursts on QFX5220-128C and QFX5220-32CD switches. Use interface burst monitoring to help troubleshoot problems, make decisions, and adjust resources as needed.

The sampling is done in the millisecond granularity during the export interval (window). The export interval is configured in the sensor with the subscription from the collector. When the sensor is installed, a timer is started in the Packet Forwarding Engine to poll the hardware in 30-100ms intervals. Rates in the first export batch will be 0.

The peak byte is the average of the number of bytes seen in a sampling interval. For bursts lasting less than the sampling interval, the peak byte is averaged out over the interval. Exported statistics also include the time peak bytes are detected, as well as the direction (transmit or receive). The maximum byte rate detected during the export interval among all the samples is considered as the burst. If there are multiple bursts of the same number of bytes rate in the interval, then the first occurring burst is considered as the maximum burst and the timestamp of that burst is considered as the burst timestamp.

Data for all physical interfaces that are UP is exported. Aggregate interfaces are not supported.

You can export interface burst statistics from the Juniper device to an outside collector by including the sensor `/junos/system/linecard/bmon-sw/` in a subscription using remote procedure call (gRPC) services. Only one collector is supported with this sensor.

To provision the sensor to export data through gRPC services, use the **telemetrySubscribe** RPC to specify telemetry parameters. Streaming telemetry data through gRPC also requires the OpenConfig for Junos OS module.

**NOTE:** This feature does not detect microbursts.

## Transceiver Diagnostics

Junos OS Release 19.4R1 supports transceiver diagnostic sensors for ON\_CHANGE and streaming statistics using JTI and gRPC services or gNMI services on MX960, MX2010, MX2020, PTX1000, PTX5000, and

the PTX10000 line of routers. Use transceiver diagnostics to help troubleshoot problems, make decisions, and adjust resources as needed.

This feature supports OpenConfig transceiver model **openconfig-platform-transceiver.yang 0.5.0**.

Use the base resource path **/components/component/transceiver/** in a gRPC or gNMI subscription to export statistics from the Juniper device to an outside collector.

Fields that change continuously, such as temperature, input power, and output power, and laser bias current are not supported for ON\_CHANGE.

## Physical Ethernet Interface Sensor

Junos OS Release 19.4R1 supports physical Ethernet interface statistics for ON\_CHANGE and streaming statistics using JTI and gRPC services or gNMI services on MX960, MX2020, PTX1000, and PTX5000 routers.

This feature supports OpenConfig model **openconfig-if-ethernet.yang** (physical interface level) version 2.6.2 (no configuration).

Use the base resource path **/interfaces/interface/ethernet/state/** in a gRPC or gNMI subscription to export statistics from the Juniper device to an outside collector.

## VLAN Sensors

Junos OS Release 19.4R1 supports streaming VLAN statistics for ON\_CHANGE using JTI and gRPC services on EX4650 and QFX5120 switches.

This feature supports OpenConfig model [openconfig-vlan.yang](#) configuration version 1.0.2.

Use the base resource path **/vlans/** in a gRPC subscription to export statistics from the Juniper device to an outside collector.

Other end points you can use in a subscription include:

- **/vlans/vlan/state/name**
- **/vlans/vlan/state/vlan-id**
- **/vlans/vlan/members/**
- **/vlans/vlan/members/member/interface-ref/state/interface/**
- **/vlans/vlan/members/member/interface-ref/state/interface/switched-vlan/state/interface-mode**

- /vlans/vlan/members/member/interface-ref/state/interface/switched-vlan/state/native-vlan
- /vlans/vlan/members/member/interface-ref/state/interface/switched-vlan/state/access-vlan
- /vlans/vlan/members/member/interface-ref/state/interface/switched-vlan/state/trunk-vlan
- /vlans/vlan/members/member/interface-ref/state/interface/vlan/state/vlan-id

Release History Table

Release	Description
<a href="#">19.4R1</a>	Junos OS Release 19.4R1 supports transceiver diagnostic sensors for ON_CHANGE and streaming statistics using JTI and gRPC services or gNMI services on MX960, MX2010, MX2020, PTX1000, PTX5000, and the PTX10000 line of routers.
<a href="#">19.4R1</a>	Junos OS Release 19.4R1 supports physical Ethernet interface statistics for ON_CHANGE and streaming statistics using JTI and gRPC services or gNMI services on MX960, MX2020, PTX1000, and PTX5000 routers.
<a href="#">19.4R1</a>	Junos OS Release 19.4R1 supports streaming VLAN statistics for ON_CHANGE using JTI and gRPC services on EX4650 and QFX5120 switches.
<a href="#">19.3R1-Evolved</a>	Starting with Junos OS Evolved Release 19.3R1, gRPC service for exporting statistics is supported on QFX5220-128C and QFX5220-32CD switches.
<a href="#">19.3R1-Evolved</a>	Junos OS Evolved Release 19.3R1 supports interface burst monitoring on Junos telemetry interface (JTI) to monitor physical interfaces for bursts on QFX5220-128C and QFX5220-32CD switches.
<a href="#">19.3R1</a>	Starting with Junos OS Release 19.3R1, gRPC service for exporting statistics is supported on MX Series routers hosting MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards.
<a href="#">19.3R1</a>	Junos OS Release 19.3R1 supports CPU and network processing unit (NPU) sensors on MX Series routers with MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards.
<a href="#">19.3R1</a>	Junos OS Release 19.3R1 supports interface express sensor for MX960, MX2010, and MX2020 routers.
<a href="#">19.3R1</a>	Junos OS Release 19.3R1 supports diameter application protocol sensors for MX5, MX10, MX40, MX150, MX204, MX240, MX480, MX960, MX2008, MX2010, MX2020, MX10003, MX10008, and MX100016 routers.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, SRX4100, SRX4200, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX Series Services Gateways.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX960, MX2008, MX2010 and MX2020 routers, PTX1000 and PTX10000 routers, and QFX5100 and QFX5200 switches.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, gNMI services for streaming statistics is supported on QFX5100, QFX5110, QFX5120, QFX5200 and QFX5210 switches.

19.2R1	Starting in Junos OS Release 19.2R1, JTI supports streaming of Flexible PIC Concentrator (FPC) and optics statistics for the MX Series using Remote Procedure Calls (gRPC).
19.2R1	Starting in Junos OS Release 19.2R1, subscriber-based telemetry streaming is enabled when an MX router is configured for Broadband Network Gateway (BNG) and Junos Fusion where subscribers are connected through Junos Fusion Satellite devices.
19.1R1 EVO	Starting in Junos OS Evolved Release 19.1R1, OpenConfig (OC) and Junos Telemetry Interface (JTI) are supported. Both gRPC APIs and the customer-facing CLI remain the same as for the Junos OS. As was standard for Junos OS, Network Agent (NA) and OC packages are part of the Junos OS Evolved image.
19.1R1	Starting with Junos OS Release 19.1R1, MX Series routers operating with MS-MIC and MS-MPC, QFX10002 switches, and PTX10002 routers are also supported.
19.1R1	Starting with Junos OS Evolved 19.1R1, Packet Forwarding Engine sensors on PTX10003 routers are also supported.
18.4R1	Starting with Junos OS Release 18.4R1, MX480, MX960, MX2010, MX2020, MX2008 and MX-ELM routers are also supported.
18.3R1	Starting with Junos OS Release 18.3R1, ON_CHANGE streaming of LLDP telemetry sensor information is supported through gRPC for MX Series and PTX Series routers.
18.3R1	Starting with Junos OS Release 18.3R1, QFX5120-AY and EX4650 switches are also supported.
18.3R1	Starting with Junos OS Release 18.4R1, EX4600 switches are also supported.
18.3R1	Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.
18.3R1	Starting in Junos OS Release 18.3R1, OpenConfig and Network Agent packages are bundled into the Junos OS image by default. Both packages support JTI.
18.2R1	Starting in Junos OS Release 18.2R1, when an external streaming server, or collector, provisions sensors to export data through gRPC on devices running Junos OS, the sensor configuration is committed to the <b>junos-analytics</b> instance of the ephemeral configuration database, and the configuration can be viewed by using the <b>show ephemeral-configuration instance junos-analytics</b> operational command.
18.1R1	Starting with Junos OS Release 18.1R1, OpenConfig support through Remote Procedure Calls (gRPC) and JTI is extended to support client streaming and bidirectional streaming of telemetry sensor information on MX Series and PTX Series routers.

18.1R1	Starting with Junos OS Release 18.3R1, OpenConfig support through gRPC and JTI provides continuous statistics streaming via the same sensor irrespective of the route that is active (BGP or static) for a given Segment Routing Traffic Engineering (SR-TE) policy.
18.1R1	Junos OS Release 18.1R1 supports interface express sensor for PTX1000, PTX3000, PTX5000, and PTX10000 routers.
17.4R1	Starting with Junos OS Release 17.4R1, MX2008 routers are supported.
17.4R1	Starting with Junos OS Release 17.4R1, you can export Packet Forwarding Engine traffic statistics through the Junos Telemetry Interface for MX Series and PTX Series routers. Both UDP and gRPC are supported.
17.4R1	With bypass support added to this feature in Junos OS Release 17.4R1, this subscription now streams both ingress LSP and bypass LSP statistics to a collector.
17.4R1	Starting with Junos OS Release 17.4R1, you can export counter statistics for Packet Forwarding Engine dynamic tunnels to an outside collector using either native (UDP) or OpenConfig telemetry sensors through JTI.
17.3R1	Starting with Junos OS Release 17.3R1, Junos Telemetry Interface is supported on the Routing Control and Board (RCB) on PTX3000 routers, QFX5110 switches, and EX4600 and EX9200 switches.
17.2R1	Starting with Junos OS Release 17.2R1, OpenConfig and gRPC are also supported on QFX10000 switches, QFX5200 switches, and PTX1000 routers.
16.1R3	Starting in Junos OS Release 16.1R3, you can use a set of remote procedure call (RPC) interfaces to configure the Junos Telemetry Interface and stream telemetry data using the gRPC framework.
16.1R3	OpenConfig for Junos OS and gRPC are supported only on MPCs on MX Series and on PTX Series routers starting with Junos OS Release 16.1R3.
15.1F6	Initial support of this feature in Junos OS Release 15.1F6 supported ingress LSPs only when a subscription was made to <code>/junos/services/label-switched-path/usage/</code> .

## RELATED DOCUMENTATION

*Release Information for Junos OS with Upgraded FreeBSD*

[Guidelines for gRPC and gNMI Sensors \(Junos Telemetry Interface\) | 57](#)

## Installing the Network Agent Package (Junos Telemetry Interface)

Starting with Junos OS Release 16.1R3, the Junos Network Agent software package provides a framework to support OpenConfig and gRPC for the Junos Telemetry Interface on MX Series routers and PTX5000 routers. The Network Agent package functions as a gRPC server that terminates the OpenConfig remote procedure call (RPC) interfaces and streams the telemetry data according to the OpenConfig specification. The Junos Network Agent package, which runs on the Routing Engine, implements local statistics collection and reports data to active telemetry stream subscribers.

Starting with Junos OS Release 17.2R1, the Junos Network Agent Package is also supported on QFX10000 switches and QFX5200 switches.

Starting with Junos OS Release 17.3R1, the Junos Network Agent Package is supported on QFX5110 switches and EX9200 switches.

Starting in Junos OS Release 18.3R1, the Junos OS image includes the Network Agent. You do not need to install Network Agent separately. This is true for Junos OS with upgraded FreeBSD and legacy Junos OS.

The Junos Network Agent is available as a separate package only for Junos OS with Upgraded FreeBSD. This package also includes the required YANG models. For other versions of Junos OS, Network Agent functionality is embedded in the software. For more information about Junos OS with Upgraded FreeBSD, see *Release Information for Junos OS with Upgraded FreeBSD*.

Network Agent for Junos OS software package has the following naming conventions:

- Package Name—This is **Network-Agent**.
- Architecture—This field indicates the CPU architecture of the platforms, such as **x86**.
- Application Binary Interface (ABI)—This field indicates the “word length” of the CPU architecture. The value is **32** for 32-bit architectures.
- Release—This field indicates the Junos OS release number, such as **16.1R3.16**.
- Package release and spin number—This field indicates the package version and spin number, such as **C1.1**.

All Junos Network Agent packages are in tarred and gzipped (**.tgz**) format.

**NOTE:** Each version of the Network Agent package is supported on a single release of Junos OS only. The Junos OS version supported is identified by the Junos OS release number included in the Network Agent package name.

An example of a valid Network Agent package name is:

- **network-agent-x86-32-16.1R4.12-C1.1.tgz**

Use the 32-bit Network Agent package for both 32-bit and 64-bit versions of Junos OS or Junos OS Evolved.

Before you begin:

- Install Junos OS Release 16.1R3 or later.
- Install the OpenConfig for Junos OS module. Using a Web browser, navigate to the All Junos Platforms software download URL on the Juniper Networks webpage: <https://www.juniper.net/support/downloads/>. From the **Network Management** tab, scroll down to select **OpenConfig**. Select the **Software** tab. Select the **OpenConfig Package (Junos with upgraded FreeBSD)**. For more information, see “[Installing the OpenConfig Package](#)” on page 21.
- Install Secure Sockets Layer (SSL) certificates of authentication on your Juniper Networks device.

**NOTE:** Only server-based SSL authentication is supported. Client-based authentication is not supported.

To download and install the Network Agent package:

1. Using a Web browser, navigate to the All Junos Platforms software download URL on the Juniper Networks webpage: <https://www.juniper.net/support/downloads/>.
2. Select the name of the Junos OS platform for the software that you want to download.
3. Select the release number (the number of the software version that you want to download) from the **Release** drop-down list to the right of the Download Software page.
4. Select the **Software** tab.
5. In the **Tools** section of the **Software** tab, select the **Junos Network Agent** package for the release.
6. Log in to the Juniper Networks authentication system using the username (generally your e-mail address) and password supplied by a Juniper Networks representative.

7. Download the software to a local host.
8. Copy the software to Juniper Networks device or to your internal software distribution site.
9. Install the new **network-agent** package on the device by issuing the **request system software add *package-name*** from the operational mode:

For example:

```
user@host > request system software add network-agent-x86-32-16.1R3.16-C1.0.tgz
```

**NOTE:** The command uses the **validate** option by default. This option validates the software package against the current configuration as a prerequisite to adding the software package to ensure that the device reboots successfully. This is the default behavior when the software package being added is a different release.

10. Issue the **show version | grep na\ telemetry** command to verify that the Network Agent package was successfully installed.

```
user@host> show version | grep na\ telemetry
```

```
JUNOS na telemetry  
[ 20161109.201405_builder_junos_161_r3]
```

For information about configuring gRPC services on your Juniper Networks device, see [“gRPC Services for Junos Telemetry Interface” on page 53](#).

# gRPC Services for Junos Telemetry Interface

IN THIS SECTION

- [Configuring gRPC for the Junos Telemetry Interface](#) | 54
- [Configuring Bidirectional Authentication for gRPC for Junos Telemetry Interface](#) | 56

## Configuring gRPC for the Junos Telemetry Interface

Starting with Junos OS Release 16.1R3 on MX Series routers and PTX3000 and PTX5000 routers, you can stream telemetry data for various network elements through gRPC, an open source framework for handling remote procedure calls based on TCP. The Junos Telemetry Interface relies on a so-called push model to deliver data asynchronously, which eliminates polling. For all Juniper devices that run a version of Junos OS with upgraded FreeBSD kernel, you must install the Junos Network Agent software package, which provides the interfaces to manage gRPC subscriptions. For Juniper Network devices that run other all other versions of the Junos OS, this functionality is embedded in the Junos OS software. For more information about installing the Junos Network Agent package, see [“Installing the Network Agent Package” on page 50](#).

The Junos Telemetry Interface and gRPC streaming are supported on QFX10000 and QFX5200 switches, and PTX1000 routers starting with Junos OS Release 17.2R1.

The Junos Telemetry Interface and gRPC streaming are supported on QFX5110, EX4600, and EX9200 switches starting with Junos OS Release 17.3R1.

Before you begin:

- Install Junos OS Release 16.1R3 or later on your Juniper Networks device.
- If your Juniper Networks device is running a version of Junos OS with an upgraded FreeBSD kernel, install the Junos Network Agent software package.
- Install the OpenConfig for Junos module. For more information see, [“Installing the OpenConfig Package” on page 21](#).

To configure your system for gRPC services:

1. Specify the API connection setting either as unsecured or as based on Secure Socket Layer (SSL) technology. You can specify only one type of connection.

For example, to set the API connection as unsecured:

```
[edit system services]
user@host# set extension-service request-response grpc
```

For example, to set the API connection based on a SSL:

```
[edit system services]
```

```
user@host# set extension-service request-response grpc ssl
```

For an SSL-based connection, you must specify a local-certificate name or you can rely on the default IP address (::) to enable Junos to “listen” for all IPv4 and IPv6 addresses on incoming connections. If you would rather specify an IP address, follow step b. below.

- a. Specify a local certificate-name. The certificate can be any user-defined value from the certificate configuration (not shown here). The certificate name should used in this example is **jsd\_certificate**:

```
[edit system services extension-service request-response grpc]
user@host# set ssl local-certificate jsd_certificate
```

**NOTE:** Enter the name of a certificate you have configured with the **local certificate-name** statement at the **[edit security certificates]** hierarchy level.

- b. (Optional) Specify an IP address to listen to for incoming connections. for example, **192.0.2.0**:

```
[edit system services extension-service request-response grpc]
user@host# set ssl ip-address 192.0.2.0
```

**NOTE:** If you do not specify an IP address, the default address of :: is used to listen for incoming connections.

2. Specify port 32767 for accepting incoming connections through gRPC.

**NOTE:** Port 32767 is the required port for gRPC streaming for both unsecured and SSL-based connections.

```
[edit system services extension-service request-response grpc]
user@host# set ssl port 32767
```

## Configuring Bidirectional Authentication for gRPC for Junos Telemetry Interface

Starting with Junos OS Release 17.4R1, you can configure bidirectional authentication for gRPC sessions used to stream telemetry data. Previously, only authentication of the server, that is, Juniper device, was supported. Now the external client, that is management station that collects data, can also be authenticated using SSL certificates. The JET service process (**jsd**), which supports application interaction with Junos OS, uses the credentials provided by the external client to authenticate the client and authorize a connection.

Before you begin:

- If your Juniper device is running a version of Junos OS with an upgraded FreeBSD kernel, install the Junos Network Agent software package.
- Install the OpenConfig for Junos module. For more information see, [“Installing the OpenConfig Package” on page 21](#).
- Configure the gRPC server. For more information, see [“Configuring gRPC for the Junos Telemetry Interface” on page 54](#).

To configure authentication for the external client, that is, management station that collects telemetry data streamed from the Juniper device:

1. Enable bidirectional authentication and specify the requirements for a client certificate.

For example, to specify the strongest authentication, which requires a certificate and its validation:

```
[edit system services extension-service request-response grpc ssl]
user@host# set mutual-authentication client-certificate-request require-certificate-and-verify
```

**NOTE:** The default is **no-certificate**. The other options are: **request-certificate**, **request-certificate-and-verify**, **require-certificate**, **require-certificate-and-verify**.

We recommend that you use **no-certificate** option in a test environment only.

2. Specify the certificate authority.

**NOTE:** For the certificate authority, specify a certificate-authority profile you have configured at the **[edit security pki ca-profile]** hierarchy level. This profile is used to validate the certificate provided by the client.

A digital certificate provides a way of authenticating users through a trusted third-party called a certificate authority (CA). The CA validates the identity of a certificate holder and “signs” the certificate to attest that it has not been forged or altered. For more information, see *Digital Certificates Overview* and *Example: Requesting a CA Digital Certificate*.

For example, to specify a certificate-authority profile named **jsd\_certificate**:

```
[edit system services extension-service request-response grpc ssl mutual-authentication]
user@host# set certificate-authority jsd_certificate
```

3. Verify that an external client can successfully connect with the Juniper device through the **jsd** process and invoke OpenConfig RPCs.

The external client passes username and password credentials as part of metadata in each RPC. The RPC is allowed if valid credentials are used. Otherwise an error message is returned.

## Guidelines for gRPC and gNMI Sensors (Junos Telemetry Interface)

Starting with Junos OS Release 16.1R3, the Junos Telemetry Interface supports gRPC remote procedure calls (gRPC) to provision sensors and to subscribe to and receive telemetry data on MX Series routers and PTX3000 and PTX5000 routers.

Starting with Junos OS Release 17.2R1, QFX10002, QFX10008, and QFX10016 switches, QFX5200 switches, and PTX1000 and PTX10008 routers are also supported.

Starting with Junos OS Release 17.3R1, QFX5110 switches, EX4600, EX4600-VC, and EX9200 switches and the Routing and Control Board (RCB) on PTX3000 routers are also supported.

Starting with Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensors are supported.

Starting with Junos OS Release 18.2R1, PTX10002 routers are also supported.

Starting with Junos OS Release 17.4R1, PTX10016 routers and virtual MX Series (vMX) routers are also supported.

Starting with Junos OS Release 18.1R1, QFX5210-64C switches and QFX5100 switches are also supported.

Starting with Junos OS Release 18.1R1, ON\_CHANGE streaming of ARP, ND, and IP sensor information associated with interfaces is supported through gRPC for MX Series routers and PTX Series routers.

Starting with Junos OS Release 18.3R1, ON\_CHANGE streaming of LLDP telemetry sensor information is supported through gRPC for MX Series and PTX Series routers.

Starting with Junos OS Release 18.3R1, QFX5120-AY and EX4650 switches are also supported.

Starting with Junos OS Release 18.4R1, EX4600 switches are also supported.

Starting with Junos OS Release 18.4R1, MX480, MX960, MX2010, MX2020, MX2008 and MX-ELM routers are also supported.

Starting in Junos OS Evolved Release 19.1R1, OpenConfig (OC) and Junos Telemetry Interface (JTI) are supported. Both gRPC APIs and the customer-facing CLI remain the same as for the Junos OS. As was standard for Junos OS, Network Agent (NA) and OC packages are part of the Junos OS Evolved image.

Starting with Junos OS Evolved 19.1R1, Packet Forwarding Engine sensors on PTX10003 routers are also supported.

Starting with Junos OS Release 19.2R1, SRX4100, SRX4200, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX Series Services Gateways.

Starting with Junos OS Release 19.2R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX960, MX2008, MX2010 and MX2020 routers, PTX1000 and PTX10000 routers, and QFX5100 and QFX5200 switches.

Starting with Junos OS Release 19.2R1, gNMI services for streaming statistics is supported on QFX5100, QFX5110, QFX5120, QFX5200 and QFX5210 switches.

Starting with Junos OS Release 19.3R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX240, MX480 and MX960 routers.

Starting with Junos OS Release 19.3R1, gNMI services for streaming and ON\_CHANGE export of Routing Engine statistics is supported on MX960, MX2010, MX2020, PTX5000, PTX1000, and PTX10000 routers.

Starting with Junos OS Release 19.3R1, gRPC service for exporting statistics is supported on MX Series routers hosting MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards. The resource paths `/junos/system/linecard/cpu/memory/`, `/junos/system/linecard/npu/memory/`, and

`/junos/system/linecard/npu/utilization/` can be updated to call out individual sensors (leaves) and their respective paths for better clarity.

Starting with Junos OS Evolved Release 19.3R1, gRPC service for exporting statistics is supported on QFX5220-128C and QFX5220-32CD switches.

Starting with Junos Release 19.4R1, gRPC service for streaming Packet Forwarding Engine and Routing Engine statistics is supported on EX4300-MP switches.

**NOTE:** JTI support for PTX10008 routers is documented for Junos OS Evolved Release 19.4R1, but not supported.

Starting with Junos Release 20.R1, gNMI service for streaming telemetry sensors for Packet Forwarding Engine statistics is supported on MX2K-MPC11E line cards on MX2010 and MX2020 routers.

See [Table 6 on page 60](#) for information about which sensors are supported with gRPC and on which platforms.

See [Table 7 on page 221](#) for a description of supported broadband edge (BBE) gRPC sensors, which are supported on all platforms supporting gRPC unless otherwise noted.

You can also use the [Telemetry Explorer](#) tool to search for and view information about telemetry sensors.

To activate a sensor, use the corresponding resource path. Each resource path enables data streaming for the system resource globally, that is, systemwide. You can also modify each resource path, such as to specify a specific logical or physical interface. For example, to specify a specific interface, include the following at the end of the path: `[name='interface-name']/`

## Supported gRPC and gNMI Sensors

See [Table 6 on page 60](#) for a description of supported gRPC and gNMI sensors and [Table 7 on page 221](#) for a description of supported broadband edge (BBE) gRPC sensors, including the subscription path you use to provision the sensors.

Table 6: gRPC Sensors

resource path	Description
<code>/components/component/</code>	<p>Sensor for chassis components.</p> <p>ON_CHANGE notification is triggered if a component (FPC) is inserted or removed or if a component's power is on or off (FPC is online or offline). Instant reporting of such events is handled with this sensor.</p> <p>ON_CHANGE streaming is supported on MX960, MX2010, MX2020, PTX-5000, PTX1000, and PTX10000 routers starting with Junos OS Release 18.4R1.</p> <p>Starting with Junos OS Release 19.1R1, periodic streaming on QFX10002 switches and PTX10002 routers is supported.</p> <p>Starting with Junos OS Release 19.4R1, periodic streaming using gRPC services with EX4300-MP switches is supported.</p> <p>Starting with Junos OS Release 19.4R1, ON_CHANGE statistics using gRPC services or gNMI services with MX960 routers is supported. Previously, these sensors were only supported to stream statistics.</p> <p>You can also add the following endpoints to the path to stream specific statistics:</p> <ul style="list-style-type: none"> <li>• <b>name</b></li> <li>• <b>state/id</b></li> <li>• <b>state/description</b></li> <li>• <b>state/serial-no</b></li> <li>• <b>state/part-no</b></li> </ul> <p>The <b>state/type</b> identifies the ON_CHANGE event type. Event types are: <b>FRU_ADD</b>, <b>FRU_REMOVE</b>, <b>FRU_POWERON</b>, and <b>FRU_POWEROFF</b></p> <p>For more information about ON_CHANGE statistics, see <a href="#">“Understanding OpenConfig and gRPC on Junos Telemetry Interface”</a> on page 25.</p>

Table 6: gRPC Sensors (*continued*)

resource path	Description
	<p>Sensor for Packet Forwarding Engine Statistics. This sensor exports statistics and provides visibility into Packet Forwarding Engine error and drop statistics. Statistics include counters (CC, CPU, and NPU) for traffic data. Note that NPU statistics are different than those streamed from the sensors <code>/junos/system/linecard/npu/memory/</code> and <code>/junos/system/linecard/npu/utilization/</code>. Sensor output is comparable to the output using the operational mode command <b>show pfe statistics traffic</b>.</p> <p>Shown below, statistics are exported for the default FPC (<b>FPC0</b>). Multiples FPCs are supported. The component values and property values are names (like interface names).</p> <p>Starting in Junos OS Evolved Release 19.4R1, streaming statistics using gRPC and gNMI services on PTX10008 routers is supported.</p> <p>The following paths are also supported:</p> <ul style="list-style-type: none"> <li>• <code>:/components/component[name='FPC0:CC0']/properties/property[name='ts-input-packets']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-output-packets']/</code></li> <li>• <code>//components/component[name='FPC0:CC0']/properties/property[name='ts-input-packets-pps']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-output-packets-pps']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-fabric-input-packets']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-fabric-input-packets-pps']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-fabric-output-packets']/</code></li> <li>• <code>/components/component[name='FPC0:CC0']/properties/property[name='ts-fabric-output-packets-pps']/</code></li> <li>• <code>/components/component[name='FPC0:CPU0']/properties/property[name='ts-input-packets']/</code></li> <li>• <code>/components/component[name='FPC0:CPU0']/properties/property[name='ts-output-packets']/</code></li> <li>• <code>/components/component[name='FPC0:CPU0']/properties/property[name='ts-sw-input-control-drops']/</code></li> <li>• <code>/components/component[name='FPC0:CPU0']/properties/property[name='ts-sw-input-high-drops']/</code></li> </ul>

Release History Table

Release	Description
<a href="#">20.1R1</a>	Starting with Junos Release 20.R1, gNMI service for streaming telemetry sensors for Packet Forwarding Engine statistics is supported on MX2K-MPC11E line cards on MX2010 and MX2020 routers.
<a href="#">19.4R1 Evolved</a>	Starting with Junos Release 19.4R1, gRPC service for streaming Packet Forwarding Engine and Routing Engine statistics is supported on EX4300-MP switches.
<a href="#">19.3R1 EVO</a>	Starting with Junos OS Evolved Release 19.3R1, gRPC service for exporting statistics is supported on QFX5220-128C and QFX5220-32CD switches.
<a href="#">19.3R1</a>	Starting with Junos OS Release 19.3R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX240, MX480 and MX960 routers.
<a href="#">19.3R1</a>	Starting with Junos OS Release 19.3R1, gRPC service for exporting statistics is supported on MX Series routers hosting MPC10E-10C-MRATE and MPC10E-15C-MRATE line cards. The resource paths <code>/junos/system/linecard/cpu/memory/</code> , <code>/junos/system/linecard/npu/memory/</code> , and <code>/junos/system/linecard/npu/utilization/</code> can be updated to call out individual sensors (leaves) and their respective paths for better clarity.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, SRX4100, SRX4200, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX Series Services Gateways.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, gNMI services for streaming Packet Forwarding Engine statistics is supported on MX960, MX2008, MX2010 and MX2020 routers, PTX1000 and PTX10000 routers, and QFX5100 and QFX5200 switches.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.2R1, gNMI services for streaming statistics is supported on QFX5100, QFX5110, QFX5120, QFX5200 and QFX5210 switches.
<a href="#">19.2R1</a>	Starting with Junos OS Release 19.3R1, gNMI services for streaming and ON_CHANGE export of Routing Engine statistics is supported on MX960, MX2010, MX2020, PTX5000, PTX1000, and PTX10000 routers.
<a href="#">19.1R1 EVO</a>	Starting in Junos OS Evolved Release 19.1R1, OpenConfig (OC) and Junos Telemetry Interface (JTI) are supported. Both gRPC APIs and the customer-facing CLI remain the same as for the Junos OS. As was standard for Junos OS, Network Agent (NA) and OC packages are part of the Junos OS Evolved image.
<a href="#">19.1R1</a>	Starting with Junos OS Evolved 19.1R1, Packet Forwarding Engine sensors on PTX10003 routers are also supported.

18.4R1	Starting with Junos OS Release 18.4R1, MX480, MX960, MX2010, MX2020, MX2008 and MX-ELM routers are also supported.
18.3R1	Starting with Junos OS Release 18.3R1, ON_CHANGE streaming of LLDP telemetry sensor information is supported through gRPC for MX Series and PTX Series routers.
18.3R1	Starting with Junos OS Release 18.3R1, QFX5120-AY and EX4650 switches are also supported.
18.3R1	Starting with Junos OS Release 18.4R1, EX4600 switches are also supported.
18.2R1	Starting with Junos OS Release 18.2R1, PTX10002 routers are also supported.
18.1R1	Starting with Junos OS Release 18.1R1, QFX5210-64C switches and QFX5100 switches are also supported.
18.1R1	Starting with Junos OS Release 18.1R1, ON_CHANGE streaming of ARP, ND, and IP sensor information associated with interfaces is supported through gRPC for MX Series routers and PTX Series routers.
17.4R1	Starting with Junos OS Release 17.4R1, PTX10016 routers and virtual MX Series (vMX) routers are also supported.
17.3R1	Starting with Junos OS Release 17.3R1, QFX5110 switches, EX4600, EX4600-VC, and EX9200 switches and the Routing and Control Board (RCB) on PTX3000 routers are also supported.
17.3R1	Starting with Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensors are supported.
17.3R1	In Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensor <b><code>/junos/system/subscriber-management/client-protocols/dhcp/v4/routing-instances/routing-instance[ri-name='routing-instance-name']/server/statistics/</code></b> the only value supported for <i>routing-instance-name</i> is <b>default</b> .
17.3R1	In Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensor <b><code>/junos/system/subscriber-management/client-ancpinstance[ri-name='routing-instance-name']/server/statistics/</code></b> the only value supported for <i>routing-instance-name</i> is <b>default</b> .
17.3R1	In Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensor <b><code>/junos/system/subscriber-management/client-protocols/dhcp/v4/routing-instances/routing-instance[ri-name='routing-instance-name']/relay/statistics/</code></b> the only value supported for the value <i>routing-instance-name</i> is <b>default</b> .

17.3R1	In Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensor <code>/junos/system/subscriber-management/client-protocols/dhcp/v6/routing-instances/routing-instance[ri-name='routing-instance-name']/server/statistics</code> the only value supported for <i>routing-instance-name</i> is default.
17.3R1	In Junos OS Release 17.3R1, broadband edge (BBE) gRPC sensor <code>/junos/system/subscriber-management/client-protocols/dhcp/v6/routing-instances/routing-instance[ri-name='routing-instance-name']/relay/statistics</code> the only value supported for <i>routing-instance-name</i> is default.
17.2R1	Starting with JunosOS Release 17.2R1, QFX10002, QFX10008, and QFX10016 switches, QFX5200 switches, and PTX1000 and PTX10008 routers are also supported.
16.1R3	Starting with Junos OS Release 16.1R3, the Junos Telemetry Interface supports gRPC remote procedure calls (gRPC) to provision sensors and to subscribe to and receive telemetry data on MX Series routers and PTX3000 and PTX5000 routers.

# Mapping OpenConfig AAA Commands to Junos Operation

**NOTE:** See “[OpenConfig Data Model Version](#)” on page 15 topic to understand the data models supported version and its Junos OS release for Juniper Networks ACX Series, EX Series, MX Series, PTX Series, and QFX Series.

The following tables show the mapping of OpenConfig AAA commands with the relevant configuration in Junos OS.

**Table 8: Global AAA Configuration**

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix: <b>/system/aaa</b>	
Config-Name	<b>/server-groups/server-group/config/name</b>	Not supported  <b>NOTE:</b> There is no equivalent configuration in the Junos OS for this path. The configured server group name is used in the RADIUS/TACACS attributes configuration.
Server-Config-Address	<b>/server-groups/server-group/servers/server/config/address</b>	Not supported  <b>NOTE:</b> There is no equivalent configuration in the Junos OS for this path. The configured server address is used in the RADIUS/TACACS attributes configuration.
Server-Config-Name	<b>/server-groups/server-group/servers/server/config/name</b>	Not supported  <b>NOTE:</b> There is no equivalent configuration in the Junos OS for this path. You can configure a server name to identify the server.

Table 8: Global AAA Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Config-Timeout	/server-groups/server-group/servers/ server/config/timeout	Not supported  <b>NOTE:</b> There is no equivalent configuration in the Junos OS for this path. However, the timeout configured is derived from the <b>timeout</b> parameter at the Junos OS <b>edit radius-server</b> or <b>edit tacplus-server</b> hierarchy level.

Table 9: RADIUS Server Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix:  /system/aaa	
Auth-Port	/server-groups/server-group/servers/server/ radius/config/auth-port	set system radius-server <b>address</b> <b>port</b> <b>port</b>  <b>NOTE:</b> The <b>address</b> value is derived from the value configured after <b>server</b> . The <b>port</b> value is the same value as <b>auth-port</b> .
Retransmit-Attempts	/server-groups/server-group/servers/server/ radius/config/retransmit-attempts	set system radius-server <b>address</b> <b>retry</b> <b>retry</b>  <b>NOTE:</b> The <b>address</b> value is derived from the value configured after <b>server</b> . The <b>retry</b> value is the same value as that specified for <b>retransmit-attempts</b> .
Secret-Key	/server-groups/server-group/servers/server/ radius/config/secret-key	set system radius-server <b>address</b> <b>secret</b> <b>secret</b>  <b>NOTE:</b> The <b>address</b> value is derived from the value configured after <b>server</b> . The <b>secret</b> value is the same value as that specified for <b>secret-key</b> .

Table 9: RADIUS Server Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Source-Address	/server-groups/server-group/servers/server/radius/config/source-address	<p>set system radius-server <i>address</i> <i>source-address</i> <i>source-address</i></p> <p>NOTE: The <i>address</i> value is derived from the value configured after <i>server</i>. The <i>source-address</i> value is the same value as that specified for <i>source-address</i>.</p>

Table 10: TACACS Server Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	<p>Command path prefix:</p> <p>/system/aaa</p>	
Config-Port	/server-groups/server-group/servers/server/tacacs/config/port	<p>set system tacplus-server <i>address</i> <i>port</i></p> <p>NOTE: The <i>address</i> value is derived from the value configured after <i>server</i>. The <i>port</i> value is the same value as that specified for <i>port</i>.</p>
Secret-Key	/server-groups/server-group/servers/server/tacacs/config/secret-key	<p>set system tacplus-server <i>address</i> <i>secret</i> <i>secret</i></p> <p>NOTE: The <i>address</i> value is derived from the value configured after <i>server</i>. The <i>secret</i> value is the same value as that specified for <i>secret-key</i>.</p>
Source-Address	/server-groups/server-group/servers/server/tacacs/config/source-address	<p>set system tacplus-server <i>address</i> <i>source-address</i> <i>source-address</i></p> <p>NOTE: The <i>address</i> value is derived from the value configured after <i>server</i>. The <i>source-address</i> value is the same value as that specified for <i>source-address</i>.</p>

Table 11: AAA Admin and User Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix:  <b>/system/aaa</b>	
Admin-Password	<b>/authentication/admin-user/config/ admin-password</b>	<b>set system root-authentication plain-text-password</b>  <b>NOTE:</b> The <b>plain-text-password-authentication</b> value is derived from the value configured for <b>admin-password</b> .
Admin-Password-Hashed	<b>/authentication/admin-user/config/ admin-password-hashed</b>	<b>set system root-authentication encrypted-password encrypted-password</b>  <b>NOTE:</b> The <b>encrypted-password</b> value is derived from the value configured for <b>admin-password-hashed</b> .
Authentication-Method	<b>/authentication/config/ authentication-method</b>	<b>set system authentication-order</b>  <b>NOTE:</b> The <b>authentication-order</b> value is derived from the value configured for <b>authentication-method</b> .
Password	<b>/authentication/users/user/config/password</b>	<b>set system login user user-name authentication plain-text-password plain-text-password</b>  <b>NOTE:</b> The <b>user-name</b> value is derived from the value configured for <b>user</b> . The <b>plain-text-password</b> value is derived from the value configured for <b>password</b> .

Table 11: AAA Admin and User Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Password-Hashed	/authentication/users/user/config/password-hashed	set system login user <i>user-name</i> authentication encrypted-password <i>encrypted-password</i>  <b>NOTE:</b> The <i>user-name</i> value is derived from the value configured for <i>user</i> . The <i>encrypted-password</i> value is derived from the value configured for <i>password-hashed</i> .
Role	/authentication/users/user/config/role	set system login user <i>user-name</i> class <i>class</i>  <b>NOTE:</b> The <i>user-name</i> value is derived from the value configured for <i>user</i> . The <i>class</i> value is derived from the value configured for <i>role</i> .
Username	/authentication/users/user/config/username	Not supported  <b>NOTE:</b> There is no equivalent configuration in the Junos OS.

## Mapping OpenConfig BGP Commands to Junos Configuration

**NOTE:** See “[OpenConfig Data Model Version](#)” on page 15 topic to understand the data models supported version and its Junos OS release for Juniper Networks MX Series, PTX Series, and QFX Series.

Table 12 on page 294 to Table 26 on page 311 show the mapping of OpenConfig BGP commands with the relevant configuration in Junos.

Table 12: Global BGP Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix:  <code>/network-instances/network-instance/protocols/protocol/bgp/global</code>	
As	<code>/config/as</code>	<code>set routing-options autonomous-system as_number</code>
Router-ID	<code>/config/router-id</code>	<code>set routing-options router-id router-id</code>
Confederation	<code>/confederation/config/identifier</code> <code>/confederation/config/member-as</code>	<code>set routing-options confederation confederation_as</code> <code>set routing-options confederation members value</code>
Always-Compare-MED	<code>/route-selection-options/config/always-compare-med</code>	<code>set protocols bgp path-selection always-compare-med</code>
Ignore-AS-Path-Length	<code>/route-selection-options/config/ignore-as-path-length</code>	<code>set protocols bgp path-selection as-path-ignore</code>
Enable-AIGP	<code>/route-selection-options/config/enable-aigp</code>	<code>set protocols bgp family family aigp</code>
Ignore-NextHop-IGP-Metric	<code>/route-selection-options/config/ignore-next-hop-igp-metric</code>	Not supported
Dynamic-Neighbor-Prefixes	<code>/dynamic-neighbor-prefixes/dynamic-neighbor-prefix/config/prefix</code> <code>/dynamic-neighbor-prefixes/dynamic-neighbor-prefix/config/peer-group</code>	<code>set protocols bgp group group allow ip address</code>

Table 12: Global BGP Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration

# Mapping OpenConfig Interface Commands to Junos Configuration

**NOTE:** See “[OpenConfig Data Model Version](#)” on [page 15](#) topic to understand the data models supported version and its Junos OS release for Juniper Networks MX Series, PTX Series, and QFX Series.

[Table 28 on page 315](#) to [Table 35 on page 320](#) shows the mapping of OpenConfig interface commands to the relevant configuration in Junos.

Table 28: VRRP Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Virtual Router ID	ifa/vrrp/vrrp-group/config/virtual-router-id	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i>  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i>
Virtual Address	ifa/vrrp/vrrp-group/config/virtual-address	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> virtual-address <i>address</i>  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> virtual-inet6-address
VRRP Priority	ifa/vrrp/vrrp-group/config/priority	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> priority  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> priority
VRRP Preempt	ifa/vrrp/vrrp-group/config/preempt	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> preempt  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> preempt

Table 28: VRRP Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
VRRP Preempt Hold Time	ifa/vrrp/vrrp-group/config/preempt-delay	<p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> preempt hold-time <i>time</i></p> <p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> preempt hold-time <i>time</i></p>
Accept Data	ifa/vrrp/vrrp-group/config/accept_mode	<p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> accept-data</p> <p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> accept-data</p>
Advertise Interval	ifa/vrrp/vrrp-group/config/advertisement_interval	<p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> vrrp-group <i>virtual-router-id</i> advertise-interval</p> <p>set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>virtual-router-id</i> inet6-advertise-interval</p>

Table 29: IPv4 and IPv6 Address Configuration (*continued*)

Command Name	OpenConfig Command Path	Junos Configuration
Neighbor Address	ipv4/neighbors/neighbor/ip ipv6/neighbors/neighbor/ip	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> arp <i>address</i>  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> ndp <i>address</i>
Link Layer Address	ip4/neighbors/neighbor/ip/link-layer-address ip6/neighbors/neighbor/ip/link-layer-address	set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet address <i>address</i> arp <i>address</i> mac <i>address</i>  set interfaces <i>interface-name</i> unit <i>unit-number</i> family inet6 address <i>address</i> ndp <i>address</i> mac <i>address</i>

Table 30: Interface AE Configuration

Command Name	OpenConfig Command Path	Junos Configuration
LAG Type	/aggregation/config/lag-type/lacp /aggregation/config/lag-type/static	set interfaces <i>ae-name</i> aggregated-ether-options lacp
Minimum Links	/aggregation/config/min-links	set interfaces <i>ae-name</i> aggregated-ether-options minimum-links

Table 31: LACP Configuration

Command Name	OpenConfig Command Path	Junos Configuration
LACP Interval	/lacp/interfaces/interface/config/interval	set interfaces <i>ae-name</i> aggregated-ether-options lacp periodic fast  set interfaces <i>ae-name</i> aggregated-ether-options lacp periodic slow
LACP Mode	/lacp/interfaces/interface/config/lacp-mode	set interfaces <i>ae-name</i> aggregated-ether-options lacp active  set interfaces <i>ae-name</i> aggregated-ether-options lacp passive

Table 31: LACP Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
System ID	/lacp/interfaces/interface/config/system-id-mac	set interfaces <i>ae-name</i> aggregated-ether-options lacp system-id <i>address</i>
System Priority	/lacp/interfaces/interface/config/system-priority	set interfaces <i>ae-name</i> aggregated-ether-options lacp system-priority <i>system-priority</i>
Ethernet Options	/lacp/interfaces/interface/members/member	set interface <i>interface</i> gigether-options 802.3ad  set interface <i>interface</i> fastether-options 802.3ad  set interface <i>interface</i> ether-options 802.3ad

Table 32: Member Interface Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Aggregate ID	/interface/aggregate-id	set interface <i>interface</i> gigether-options 802.3ad <i>aggregate-id</i>  set interface <i>interface</i> fastether-options 802.3ad <i>aggregate-id</i>  set interface <i>interface</i> ether-options 802.3ad <i>aggregate-id</i>

Table 33: Ethernet Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Auto-negotiate	/ethernet/config/auto-negotiate	set interfaces <i>interface</i> gigether-options <i>auto-negotiation/no-auto-negotiation</i>
MAC Address	/ethernet/config/mac-address	set interfaces <i>interface</i> mac
Duplex Mode	/ethernet/config/duplex-mode	set interfaces <i>interface</i> link-mode
Port Speed	/ethernet/config/port-speed	set interface <i>interface</i> speed
Flow Control	/ethernet/config/enable-flow-control	set interface <i>interface</i> gigether-options flow-control

Table 34: IFD Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Interface Type	<code>/interfaces/interface/config/type</code>	Not supported.  Type is derived from the interface name.
Interface MTU	<code>/interfaces/interface/config/mtu</code>	<code>set interface interface mtu</code>
Interface Name	<code>/interfaces/interface/config/name</code>	<code>set interface interface</code>
Interface Description	<code>/interfaces/interface/config/description</code>	<code>set interface interface description</code>
Interface Enabled/Disabled	<code>/interfaces/interface/config/enabled</code>	<code>set interface interface disabled</code>  <code>set interface interface enabled</code>
Hold Time Up	<code>/interfaces/interface/config/hold-time/config/up</code>	<code>set interface interface hold-time up</code>
Hold Time Down	<code>/interfaces/interface/config/hold-time/config/down</code>	<code>set interface interface hold-time down</code>

Table 35: IFL Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Unit Name	<code>/interfaces/interface/subinterfaces/subinterface/config/index</code>	<code>set interfaces interface unit unit</code>
Unnumbered Address	<code>/interfaces/interface/config/subinterfaces/subinterface/config/unnumbered</code>	<code>set interfaces interface unit unit family family unnumbered-address source ifl</code>
Unit Description	<code>/interfaces/interface/subinterfaces/subinterface/config/description</code>	<code>set interfaces interface unit unit description</code>

Table 35: IFL Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Unit Enabled/Disabled	/interfaces/interface/subinterfaces/subinterface/config/enabled	set interfaces <i>interface</i> unit <i>unit</i> enabled  set interfaces <i>interface</i> unit <i>unit</i> disabled
Interface Alias	/interfaces/interface/subinterfaces/subinterface/config/name	set interfaces <i>interface</i> alias

# Mapping OpenConfig MPLS Commands to Junos Configuration

**NOTE:** See “OpenConfig Data Model Version” on page 15 topic to understand the data models supported version and its Junos OS release for Juniper Networks MX Series, PTX Series, and QFX Series.

Table 40 on page 325 to Table 45 on page 332 show the mapping of OpenConfig MPLS commands with the relevant configuration in Junos.

Table 40: Global MPLS Configuration

Command Name	OpenConfig Command Path	Junos Configuration
Explicit Null	/mpls/global/config/null-label/explicit /mpls/global/config/null-label/implicit	set protocols mpls explicit-null
Interface	/mpls/global/interface-attributes/interface/config/interface-id /mpls/global/interface-attributes/interface/config/mpls-enabled /mpls/global/interface-attributes/interface/interface-ref/config/interface /mpls/global/interface-attributes/interface/interface-ref/config/subinterface	set protocols mpls interface <i>interface</i>  set protocols mpls interface <i>interface</i> disable

Table 41: TE Global Attributes

Command Name	OpenConfig Command Path	Junos Configuration
SRLGs	/mpls/te-global-attributes/srlg/srlg/config/name	Flooded:  set routing-options srlg <i>name</i>  Static:  set routing-options fate-sharing group <i>name</i>
SRLG Value	/mpls/te-global-attributes/srlg/srlg/config/value	set routing-options fate-sharing group <i>name</i> srlg-value <i>value</i>
SRLG Cost	/mpls/te-global-attributes/srlg/srlg/config/cost	Flooded:  set routing-options srlg <i>name</i> srlg-cost <i>cost</i>  Static:  set routing-options fate-sharing group <i>name</i> cost <i>cost</i>
Address	/mpls/te-global-attributes/srlg/srlg/static-srlg-members/members-list/config/from-address  /mpls/te-global-attributes/srlg/srlg/static-srlg-members/members-list/config/to-address	set routing-options fate-sharing group <i>name</i> from <i>address</i> to <i>address</i>

Table 41: TE Global Attributes (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Admin Groups	/mpls/te-global-attributes/mpls-admin-groups/admin-group/ config/admin-group-name  /mpls/te-global-attributes/mpls-admin-groups/admin-group/ config/bit-position	Bit position (group-value) 0-31:  <b>set protocols mpls admin-groups group-name group-value</b>  Bit position (group-value) 32-4294967295:  <b>set routing-options admin-groups-extended group-name group-value group-value</b>
Delay	/mpls/te-global-attributes/te-lsp-timers/config/install-delay  /mpls/te-global-attributes/te-lsp-timers/config/cleanup-delay  /mpls/te-global-attributes/te-lsp-timers/config/reoptimize-timer	<b>set protocols mpls optimize-switchover-delay delay</b>  <b>set protocols mpls optimize-hold-dead-delay delay</b>  <b>set protocols mpls optimize-timer timer</b>

Table 42: TE Interface Attributes

Command Name	OpenConfig Command Path	Junos Configuration
TE Interface	/mpls/te-interface-attributes/interface/config/interface-id  /mpls/te-interface-attributes/interface/interface-ref/config/interface  /mpls/te-interface-attributes/interface/interface-ref/config/subinterface	<b>set protocols ospf id interface interface-id</b>  <b>set protocols isis interface interface-name</b>
TE Metric	/mpls/te-interface-attributes/interface/config/te-metric	<b>set protocols ospf id interface interface-id te-metric te-metric</b>  <b>set protocols isis interface interface-name level te-metric te-metric</b>
SRLG Membership	/mpls/te-interface-attributes/interface/config/srlg-membership	<b>set protocols mpls interface name srlg</b>

Table 42: TE Interface Attributes (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Admin Groups	/mpls/te-interface-attributes/interface/config/admin-group	<p>If protocols mpls admin-groups name is configured:</p> <pre>set protocols mpls interface name admin-group name</pre> <p>If routing-options admin-groups-exclude name is configured:</p> <pre>set protocols mpls interface name admin-group-exclude name</pre>
IGP Flooding Bandwidth	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/threshold-type	set protocols rsvp interface name update-threshold threshold
	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/delta-percentage	
	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/threshold-specification	Not supported
	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/up-thresholds	
	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/down-thresholds	
	/mpls/te-interface-attributes/interface/igp-flooding-bandwidth/config/up-down-thresholds	

Table 43: RSVP Signaling Protocols

Command Name	OpenConfig Command Path	Junos Configuration
Graceful Restart	/mpls/signaling-protocols/rsvp-te/global/ graceful-restart/config/enable  /mpls/signaling-protocols/rsvp-te/global/ graceful-restart/config/restart-time  /mpls/signaling-protocols/rsvp-te/global/ graceful-restart/config/recovery-time	set protocols rsvp graceful-restart enable  set protocols rsvp graceful-restart maximum-helper-recovery-time time  set protocols rsvp graceful-restart maximum-helper-restart-time time
Cleanup Timer	/mpls/signaling-protocols/rsvp-te/global/ soft-preemption/config/enable  /mpls/signaling-protocols/rsvp-te/global/ soft-preemption/config/soft-preemption-timeout	set protocols rsvp preemption soft-preemption cleanup-timer timer
Hello Interval (All Interfaces)	/mpls/signaling-protocols/rsvp-te/global/ hellos/config/hello-interval  /mpls/signaling-protocols/rsvp-te/global/ hellos/config/refresh-reduction	set protocols rsvp interface all hello-interval interval  set protocols rsvp interface all no-reliable
Hello Interval (Single Interface)	/mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/config/interface-id  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/interface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/config/interface-name  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/hellos/config/hello-interval  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/hellos/config/refresh-reduction	set protocols rsvp interface name hello-interval interval  set protocols rsvp interface name no-reliable

Table 43: RSVP Signaling Protocols (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Authentication Key	/mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/config/interface-id  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/interface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/subinterface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/authentication/config/enable  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/authentication/config/authentication-key	set protocols rsvp interface name authentication-key key
Subscription	/mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/config/interface-id  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/interface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/subinterface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/subscription/config/subscription	set protocols rsvp interface name subscription subscription
Link Protection	/mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/config/interface-id  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/interface  /mpls/signaling-protocols/rsvp-te/interface-attributes/ interface/interface-ref/config/subinterface  /mpls/signaling-protocols/rsvp-te/interface-attributes/interface/ protection/config/link-protection-style-requested/unprotected  /mpls/signaling-protocols/rsvp-te/interface-attributes/interface/protection/ config/link-protection-style-requested/link-protection-requested  /mpls/signaling-protocols/rsvp-te/interface-attributes/interface/protection/ config/link-protection-style-requested/link-node-protection-requested  /mpls/signaling-protocols/rsvp-te/interface-attributes/interface/protection/ config/bypass-optimize-interval	set protocols rsvp interface name link-protection  To disable node-protection:  set protocols rsvp interface name link-protection no-node-protection  set protocols rsvp interface name link-protection optimize-timer timer

## Mapping OpenConfig Network Instance Commands to Junos Operation

**NOTE:** See “[OpenConfig Data Model Version](#)” on [page 15](#) topic to understand the data models supported version and its Junos OS release for Juniper Networks MX Series, PTX Series, and QFX Series.

Network instance models a generic virtual forwarding table on a device. This supports a Layer 3 forwarding construct such as a virtual routing and forwarding (VRF) instance, or a Layer 2 instance such as a virtual switch instance. A mixed Layer 2 and Layer 3 instances are also supported.

Starting with Junos OS Release 17.4R1, network instance based BGP configuration is supported. After the network instance is configured, you will be prompted with options for BGP configuration such as global bgp, neighbor bgp, and so on.

**NOTE:** There is no change in the existing BGP configuration, you can configure BGP in a specific network instance.

[Table 46 on page 337](#) details the network instance commands.

Table 46: Network Instance

Resource Path	Description
<code>/network-instances/network-instance/config/name</code>	<p>An assigned unique name for the forwarding instance.</p> <p>In Junos, you need to provide a name because you do not run different BGP in the same routing instance.</p>
<code>/network-instances/network-instance/config/name/description</code>	Description of the network instance.
<code>/network-instances/network-instance/config/type</code>	<p>Type of network instance:</p> <ul style="list-style-type: none"> <li>• default_instance</li> <li>• l3vrf</li> <li>• l2vsi</li> <li>• l2p2p</li> <li>• l2l3</li> </ul> <p><b>NOTE:</b> Only default_instance and l3vrf instances are supported.</p>
<code>/network-instances/network-instance/config/enabled</code>	<p>Whether the network instance should be configured to be active on the network element: <i>True</i> or <i>False</i>.</p> <p>By default, the value is <i>True</i>.</p>
<code>/network-instances/network-instance/config/router-id</code>	An identifier for the local network instance.
<code>/network-instances/network-instance/config/route-distinguisher</code>	The route distinguisher that should be used for the local VRF instance when it is signalled through BGP.

Table 46: Network Instance (*continued*)

Resource Path	Description
/network-instances/network-instance/interfaces/config/interface	Name of interfaces belonging to this routing instance.
/network-instances/network-instance/protocols/protocol/config/identifier	Type of identifier: <ul style="list-style-type: none"> <li>• BGP</li> <li>• ISIS</li> <li>• OSPF</li> <li>• OSPF3</li> <li>• STATIC</li> <li>• DIRECTLY_CONNECTED</li> <li>• LOCAL_AGGREGATE</li> </ul> <p>NOTE: Only BGP is supported.</p>
/network-instances/network-instance/protocols/protocol/config/name	A unique name for the protocol instance. This is not a mandatory field.
<ul style="list-style-type: none"> <li>• /network-instances/network-instance/protocols/protocol/config/name/enable</li> <li>• /network-instances/network-instance/protocols/protocol/config/name/target-table</li> <li>• /network-instances/network-instance/inter-instance-policies/apply-policy/config/</li> <li>• /network-instances/network-instance/table-connections/table-connection/config/src-table</li> <li>• /network-instances/network-instance/table-connections/table-connection/config/dst-table</li> <li>• /network-instances/network-instance/table-connections/table-connection/config/tables</li> </ul>	Not supported.

## Release History Table

Release	Description
<a href="#">17.4R1</a>	Starting with Junos OS Release 17.4R1, network instance based BGP configuration is supported.

## Mapping OpenConfig Routing Policy Commands to Junos Configuration

**NOTE:** See “[OpenConfig Data Model Version](#)” on page 15 topic to understand the data models supported version and its Junos OS release for Juniper Networks MX Series, PTX Series, and QFX Series.

Table 47 on page 339 to Table 49 on page 340 show the mapping of OpenConfig routing policy commands to the relevant configuration in Junos.

**Table 47: Defined Set Configuration**

<i>Command Name</i>	<i>OpenConfig Command Path</i>	<i>Junos Configuration</i>
Prefix Set	/routing-policy/defined-sets/prefix-set	set policy-options prefix-list <i>name</i>
Neighbor Set	/routing-policy/defined-sets/neighbor-set	set policy-options neighbor-list <i>name</i>
Tag Set	/routing-policy/defined-sets/tag-set	set policy-options tag-list <i>name</i> tag-set <i>value</i>

**Table 48: BGP Defined Set Configuration**

<i>Command Name</i>	<i>OpenConfig Command Path</i>	<i>Junos Configuration</i>
Community Set	/routing-policy/defined-sets/bgp-defined-sets/community-set	set policy-options community <i>name</i> members <i>value</i>
AS Path Set	/routing-policy/defined-sets/bgp-defined-sets/as-path-set	Not supported
Ext Community Set	/routing-policy/defined-sets/bgp-defined-sets/ext-community-set	set policy-options community <i>name</i> members <i>value</i>

Table 49: Policy Definition Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix: <b>/routing-policy/policy-definition/statement</b>	
Call Policy	<b>/conditions/call-policy</b>	<b>set policy-options</b> <b>policy-statement</b> <i>name</i> from policy <i>value</i>
Prefix Set	<b>/conditions/match-prefix-set/prefix-set</b>	<b>set policy-options</b> <b>policy-statement</b> <i>name</i> from prefix-list <i>name</i>  <b>set policy-options</b> <b>policy-statement</b> <i>name</i> from route-filter <i>address</i> prefix-length-range <i>range</i>
Match Set Options	<b>/conditions/match-prefix-set/match-set-options</b>	Not supported
Neighbor Set	<b>/conditions/match-neighbor-set/neighbor-set</b>	<b>set policy-options</b> <b>policy-statement</b> <i>name</i> from neighbor <i>address</i>
Match Neighbor Set	<b>/conditions/match-neighbor-set/match-set-options</b>	Not supported
Tag Set	<b>/conditions/match-tag-set/tag-set</b>	<b>set policy-options</b> <b>policy-statement</b> <i>name</i> from tag <i>tag</i>
Match Tag Set	<b>/conditions/match-tag-set/match-set-options</b>	Not supported

Table 49: Policy Definition Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
Install Protocol EQ	/conditions/install-protocol-eq	set policy-options policy-statement <i>name</i> from protocol <i>protocol</i>
IGP Conditions	/conditions/igp-conditions	Not supported
BGP Match Community Set	/conditions/bgp-conditions/match-community-set/community-set	set policy-options policy-statement <i>name</i> from community <i>name</i>
BGP Match Ext Community Set	/conditions/bgp-conditions/match-ext-community-set	set policy-options policy-statement <i>name</i> from community <i>name</i>
BGP Match Ext Community Set Options	/conditions/bgp-conditions/match-ext-community-set/match-set-options	Not supported
BGP Match AS Path Set	/conditions/bgp-conditions/match-as-path-set	Not supported
BGP MED EQ	/conditions/bgp-conditions/med-eq	set policy-options policy-statement <i>name</i> from metric <i>metric</i>
BGP Origin EQ	/conditions/bgp-conditions/origin-eq	set policy-options policy-statement <i>name</i> from origin (egp   igp   incomplete)
BGP Next Hop	/conditions/bgp-conditions/next-hop-in	set policy-options policy-statement <i>name</i> from next-hop <i>address</i>

Table 49: Policy Definition Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
BGP Local Preference EQ	/conditions/bgp-conditions/local-pref-eq	set policy-options policy-statement <i>name</i> from local-preference <i>preference</i>
BGP Community Count	/conditions/bgp-conditions/community-count	set policy-options policy-statement <i>name</i> from community-count <i>count</i> (equal   orhigher  orlower)
BGP AS Path Length	/conditions/bgp-conditions/as-path-length	Not supported
Accept-Route	/actions/config/accept-route	set policy-options policy-statement example-accept then accept
Reject-Route	/actions/config/reject-route	set policy-options policy-statement example-reject then reject
IGP Actions	/actions/igp-actions/set-tag	set policy-options policy-statement <i>name</i> then tag <i>tag</i>
BGP Actions Set AS Path Prepend	/actions/bgp-actions/set-as-path-prepend	Not supported
BGP Actions Set Community	/actions/bgp-actions/set-community	set policy-options policy-statement <i>name</i> then community (set   replace   add) <i>name</i>

Table 49: Policy Definition Configuration (continued)

Command Name	OpenConfig Command Path	Junos Configuration
BGP Actions Set Ext Community	/actions/bgp-actions/set-ext-community	set policy-options policy-statement <i>name</i> then community (set   replace   add) <i>name</i>
BGP Actions Set Route Origin	/actions/bgp-actions/set-route-origin	set policy-options policy-statement <i>name</i> then origin (egp   igp   incomplete)
BGP Actions Set Local Preferences	/actions/bgp-actions/set-local-pref	set policy-options policy-statement <i>name</i> then local-preference <i>preference</i>
BGP Actions Set Next Hop	/actions/bgp-actions/set-next-hop	set policy-options policy-statement <i>name</i> then next-hop <i>address</i>
BGP Actions Set Med	/actions/bgp-actions/set-med	set policy-options policy-statement <i>name</i> then metric <i>metric</i>
BGP Actions As-Path-Prepend	/actions/bgp-actions/config/set-as-path-prepend/asn	set policy-options policy-statement <i>name</i> then as-path-prepend <i>as-path</i>

## Mapping OpenConfig VLAN Commands to Junos Configuration

**NOTE:** See “[OpenConfig Data Model Version](#)” on page 15 topic to understand the data models supported version and its Junos OS release for Juniper Networks EX Series and QFX Series.

[Table 12 on page 294](#) to [Table 53 on page 345](#) show the mapping of OpenConfig VLAN commands with the relevant configuration in Junos.

**Table 50: Top Level Group VLAN Configuration**

Command Name	OpenConfig Command Path	Junos Configuration
Interface VLAN ID	vlangs/vlan/vlan-id	set vlangs <i>vlan-name</i> vlan-id vid
Interface VLAN Name	vlangs/vlan/name	
VLAN Admin State	vlangs/vlan/status	deactivate vlangs <i>vlan-name</i>

**Table 51: VLAN Tagged IFL Configuration**

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix: /ocif:interfaces/ocif:interface/ocif:subinterfaces/ocif:subinterface/vlan	
VLAN ID	/config/vlan-id	set interfaces <i>interface</i> unit <i>subinterface</i> index vlan-id vid set interfaces <i>interface</i> vlan-tagging

Table 52: VLAN Membership Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix: <b>/oc-if:interfaces/oc-if:interface/oc-eth:ethernet/switched-vlan</b>	
Interface Mode	<b>/config/interface-mode</b>	<b>set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk (l2ng)</b>
Native VLAN	<b>/config/native-vlan</b>	<b>set interfaces ge-0/0/0 native-vlan-id vid (for a trunk port)</b> <b>set interface ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk</b>
Trunk VLANs	<b>/config/trunk-vlans</b>	<b>set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members 600</b> <b>set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members [10-200]</b> <b>Interface-mode = TRUNK</b>
Access VLAN	<b>/config/access-vlan</b>	<b>set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members 600</b> <b>Interface-mode = ACCESS</b>

Table 53: Routed VLAN Interfaces Configuration

Command Name	OpenConfig Command Path	Junos Configuration
	Command path prefix: <b>/oc-if:interfaces/oc-if:interface/routed-vlan</b>	
VLAN	<b>/config/vlan</b>	<b>Set vlans vlan-name l3-interface irb.vid</b>  <b>NOTE: To create IRB IFL, configure IPv4/IPv6 under routed VLAN hierarchy.</b>

# 4

CHAPTER

## Configuration Statements

---

`netconf` | **348**

`schema` | **350**

`track-igp-metric (LSP)` | **351**

---

# netconf

## Syntax

```
netconf {
  rfc-compliant;
  ssh {
    connection-limit limit;
    port port;
    rate-limit limit;
  }
  traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
    on-demand;
  }
  yang-compliant;
  yang-modules {
    device-specific;
    emit-extensions;
  }
}
```

## Hierarchy Level

[edit system services]

## Release Information

Statement introduced in Junos OS Release 7.5.

## Description

Configure the NETCONF XML management protocol.

The remaining statements are explained separately. See [CLI Explorer](#).

## Default

If you do not include the **netconf** statement, NETCONF connections are not permitted.

## Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

RELATED DOCUMENTATION

<i>connection-limit</i>
<i>port (NETCONF)</i>
<i>rate-limit</i>
<i>ssh (NETCONF)</i>
<i>traceoptions (NETCONF and Junos XML Protocol)</i>

# schema

## Syntax

```
schema {  
  openconfig {  
    unhide;  
  }  
}
```

## Hierarchy Level

```
[edit system]
```

## Release Information

Statement introduced in Junos OS Release 18.3R1.

## Description

Specify whether OpenConfig statements are available and viewable in the CLI.

## Options

**openconfig unhide**—Unhide the OpenConfig statements in the CLI. By default, the OpenConfig schema is not available through the CLI. To rehide the OpenConfig statements, use the following command:

```
delete system schema openconfig unhide
```

## Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

## RELATED DOCUMENTATION

| [Installing the OpenConfig Package](#) | 21

# track-igp-metric (LSP)

## Syntax

```
track-igp-metric <install-v4-prefixes> <install-v6-prefixes>;
```

## Hierarchy Level

The hierarchy level for **track-igp-metric** globally enabled for all LSPs:

```
[edit protocols mpls]
```

The hierarchy level for **track-igp-metric** at the per LSP level:

```
[edit protocols mpls label-switched-path pathname],
```

## Release Information

Statement introduced in Junos OS Release 18.4R1.

## Description

Track IGP metric for LSP install prefixes

## Options

**install-v4-prefixes**—Track IGP metric for IPV4 prefixes.

**install-v6-prefixes**—Track IGP metric for IPV6 prefixes.

## Required Privilege Level

routing
