The Junos OS REST API is a Representational State Transfer (REST) interface that enables you to securely connect to Junos OS devices, execute remote procedure calls, use a REST API Explorer graphical user interface enabling you to conveniently experiment with any of the REST APIs, and use a variety of formatting and display options including JavaScript Object Notation (JSON).

Documentation and Release Notes

To obtain the most current version of all Juniper Networks[®] technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xsl;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {  
    file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]  
user@host# edit system scripts  
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]  
user@host# load merge relative /var/tmp/ex-script-snippet.conf  
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

Documentation Conventions

[Table 1 on page viii](#) defines notice icons used in this guide.

Table 1: Notice Icons

| Icon | Meaning | Description |
|---|--------------------|---|
|  | Informational note | Indicates important features or instructions. |
|  | Caution | Indicates a situation that might result in loss of data or hardware damage. |
|  | Warning | Alerts you to the risk of personal injury or death. |
|  | Laser warning | Alerts you to the risk of personal injury from a laser. |
|  | Tip | Indicates helpful information. |
|  | Best practice | Alerts you to a recommended use or implementation. |

Table 2 on page viii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

| Convention | Description | Examples |
|------------------------------|---|--|
| Bold text like this | Represents text that you type. | To enter configuration mode, type the configure command: user@host> configure |
| Fixed-width text like this | Represents output that appears on the terminal screen. | user@host> show chassis alarms No alarms currently active |
| <i>Italic text like this</i> | <ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. | <ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i> |

Table 2: Text and Syntax Conventions (*continued*)

| Convention | Description | Examples |
|--------------------------------|--|--|
| <i>Italic text like this</i> | Represents variables (options for which you substitute a value) in commands or configuration statements. | Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i> |
| Text like this | Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components. | <ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE. |
| < > (angle brackets) | Encloses optional keywords or variables. | stub <default-metric <i>metric</i> >; |
| (pipe symbol) | Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity. | broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>) |
| # (pound sign) | Indicates a comment specified on the same line as the configuration statement to which it applies. | rsvp { # Required for dynamic MPLS only |
| [] (square brackets) | Encloses a variable for which you can substitute one or more values. | community name members [<i>community-ids</i>] |
| Indentation and braces ({ }) | Identifies a level in the configuration hierarchy. | [edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } } |
| ; (semicolon) | Identifies a leaf statement at a configuration hierarchy level. | |

GUI Conventions

Table 2: Text and Syntax Conventions (*continued*)

| Convention | Description | Examples |
|------------------------------|--|---|
| Bold text like this | Represents graphical user interface (GUI) items you click or select. | <ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel. |
| > (bold right angle bracket) | Separates levels in a hierarchy of menu selections. | In the configuration editor hierarchy, select Protocols>Ospf . |

Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are

covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

1

CHAPTER

Overview

[Understanding the REST API | 13](#)

Understanding the REST API

The REST API is a Representational State Transfer (REST) interface that enables you to securely connect to Juniper Networks Junos operating system (Junos OS) devices, execute remote procedure calls (**rpc** commands), use a REST API Explorer GUI enabling you to conveniently experiment with any of the REST APIs, and use a variety of formatting and display options, including JavaScript Object Notation (JSON).

The REST API can be configured on Junos OS devices using commands available under the **[edit system services rest]** hierarchy level. Once configured, the REST API becomes available as the **rest** service, a REST-based interface that enables you to submit **rpc** commands to the device from a remote location, and supports GET and POST requests. With the REST API you can:

- Use GET requests to submit **rpc** commands.
- Use POST requests to submit information via **rpc** commands.
- Retrieve configuration information in XML, ASCII (plain text), or JSON.
- Retrieve operational data in XML, ASCII, or JSON.

At the **[edit system services rest]** hierarchy level, you can configure and secure the REST API service on a Junos OS device; set up IP addresses, port numbers, server certificates, control parameters, and trace options; and enable a REST API explorer tool that enables you to try the REST APIs using a convenient GUI.

The following CLI display options are available:

- A **display json** option is added to the **| (pipe)** command. For example, the CLI command **show interfaces | display json** displays the interfaces in JSON notation.
- A **format="json"** option is added to NETCONF server commands to return operational information in JSON notation.

NOTE: Starting in Junos OS Release 17.3R1, OpenConfig supports the operational state emitted by daemons directly in JSON format in addition to XML format. To configure JSON compact format, specify the following CLI command:

set system export-format state-data json compact.

This CLI command converts XML format to compact JSON format. Else, it emits the JSON in non-compact format.

NOTE: The REST API incoming request payload size cannot exceed 1174KB.

Workaround: Chunk the incoming REST API requests into a smaller size.

The REST API supports HTTP Basic Authentication, and all requests require a base64-encoded username and password included in the Authorization header. Both HTTP and HTTPS support are available:

- You can use HTTP to exchange content using clear text if you do not need a secure connection.
- We recommend that you use HTTPS to exchange encrypted content using one of the available cipher suites. You can configure the REST API to require server authentication without client authentication, or you can configure mutual authentication.

Once the REST API is configured on the device, new REST endpoints are available for executing either single **rpc** commands via GET or POST requests, or executing multiple **rpc** commands via a single POST request. See [“Submitting a GET Request to the REST API” on page 34](#) and [“Submitting a POST Request to the REST API” on page 37](#) for more information.

The REST API also provides a GUI called the REST API Explorer, which allows you to easily and quickly learn how to use the REST API. It is disabled by default, and can be enabled by specifying **set system services rest enable-explorer**. To learn more about the REST API Explorer, see [“Example: Using the REST API Explorer” on page 23](#).

Release History Table

| Release | Description |
|------------------------|--|
| 17.3R1 | Starting in Junos OS Release 17.3R1, OpenConfig supports the operational state emitted by daemons directly in JSON format in addition to XML format. To configure JSON compact format, specify the following CLI command: set system export-format state-data json compact. This CLI command converts XML format to compact JSON format. Else, it emits the JSON in non-compact format. |

CHAPTER

Configuring and Using the REST API

Configuring the REST API | **16**

Example: Configuring the REST API | **17**

Example: Using the REST API Explorer | **23**

Submitting a GET Request to the REST API | **34**

Submitting a POST Request to the REST API | **37**

Configuring the REST API

The REST API can be configured on Junos OS devices using commands available under the **[edit system services rest]** hierarchy level. Once configured, the REST API becomes available as the **rest** service, a REST-based interface that enables you to submit **rpc** commands to the device from a remote location, and supports GET and POST requests.

To enable the REST API on your device, you need to configure:

- **Control parameters**— These allow you to optionally specify permitted source IP addresses and connection limits common to both HTTP and HTTPS connections.
- **REST API Explorer**— The REST API provides a GUI called the REST API Explorer, which allows you to easily and quickly learn how to use the REST API. It is disabled by default, and can be enabled by specifying **set system services rest enable-explorer**. To learn more about the REST API Explorer, see [“Example: Using the REST API Explorer” on page 23](#).
- **HTTP access**— You can specify a list of addresses and TCP ports for incoming connections. HTTP connections are not secure because they exchange credentials and data in clear text, so we recommend using HTTPS.
- **HTTPS access (recommended)**— You can specify a list of addresses and TCP ports for incoming connections, a list of preferred cipher suites, transport layer security (TLS) mutual authentication, and server certificates. HTTPS connections are secure, encrypting both credentials and information.
- **Trace options**— You can enable tracing for `lighttpd`, User Interface Script Environment (`juise`), or both. Trace information for `lighttpd` is stored at `/var/chroot/rest-api/var/log/lighttpd`, and trace information for `juise` is stored at `/var/chroot/rest-api/var/log/juise`. Tracing is disabled by default.

To configure the optional control parameters for settings common to both HTTP and HTTPS connections:

1. Specify **set system services rest control allowed-sources [value-list]** to set the permitted IP addresses for both HTTP and HTTPS connections. Use spaces as delimiters between values.
2. Specify **set system services rest control connection-limit limit** to set the maximum number of allowed simultaneous connections for both HTTP and HTTPS connections. You can assign a value from 1 through 1024 (the default is 64).

To configure HTTP access:

1. Specify **set system services rest http addresses [addresses]** to set the addresses on which the server listens for incoming HTTP connections.
2. Specify **set system services rest http port port-number** to set the TCP port for incoming HTTP connections. You can assign a value from 1024 through 65535 (the default is 3000).

To configure HTTPS access:

1. Specify **set system services rest https addresses** [*addresses*] to set the addresses on which the server listens for incoming HTTPS connections.
2. Specify **set system services rest https port** *port-number* to set the TCP port for incoming HTTPS connections. You can assign a value from 1024 through 65535 (the default is 3443).
3. Specify **set system services rest https cipher-list**[*cipher-1 cipher-2 cipher-3 ...*] to configure the set of cipher suites the SSH server can use to perform encryption and decryption functions.
4. Specify **set system services rest https server-certificate** *local-certificate-identifier* to configure the server certificate. See *request security pki generate-certificate-request* for information about creating local certificates.
5. You can configure the REST API to require server authentication without client authentication, or you can configure TLS mutual authentication on both the server and client by specifying **set system services rest https mutual-authentication certificate-authority** *certificate-authority-profile-name*.

To configure trace options for `lighttpd`, `juise`, or both, specify **set system services rest traceoptions** *flag*. Set *flag* to `lighttpd`, `juise`, or `all`. When you specify the trace options, the command overwrites any previous trace option settings.

Example: Configuring the REST API

IN THIS SECTION

● [Requirements](#) | 18

● [Overview](#) | 18

- Configuration | 18
- Verification | 21

This example demonstrates how to configure the REST API on a Junos OS device.

Requirements

- A routing, switching, or security device running Junos OS Release 14.2 or later is required.

Overview

This example configures the REST API on a Juniper Networks M10i Multiservice Edge Router. The example configures both HTTP and HTTPS access, with both `lighttpd` and `juise` tracing.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter **commit** from configuration mode.

```
set system services rest control allowed-sources [192.0.2.0 198.51.100.0]
set system services rest control connection-limit 100
set system services rest http port 3000
set system services rest http addresses [203.0.113.0 203.0.113.1]
set system services rest https port 3443
set system services rest https addresses [203.0.113.2 203.0.113.3]
set system services rest https server-certificate testcert
set system services rest https cipher-list rsa-with-3des-edc-sha
set system services rest https mutual-authentication certificate-authority testca
set system services rest traceoptions flag all
set system services rest enable-explorer
```

Configuring the REST API

Step-by-Step Procedure

To configure the REST API:

1. Specify allowed IP addresses for incoming HTTP and HTTPS connections.

```
[edit]  
user@R1# set system services rest control allowed-sources [192.0.2.0 198.51.100.0]
```

2. Specify the maximum number of allowed connections over both HTTP and HTTPS.

```
[edit]  
user@R1# set system services rest control connection-limit 100
```

3. Set the TCP port for incoming HTTP connections.

```
[edit]  
user@R1# set system services rest http port 3000
```

4. Set the addresses on which the server listens for incoming HTTP connections.

```
[edit]  
user@R1# set system services rest http addresses [203.0.113.0 203.0.113.1]
```

5. Set the TCP port for incoming HTTPS connections.

```
[edit]  
user@R1# set system services rest https port 3443
```

6. Set the addresses on which the server listens for incoming HTTPS connections.

```
[edit]  
user@R1# set system services rest https addresses [203.0.113.2 203.0.113.3]
```

7. Set the server certificate.

```
[edit]
```

```
user@R1# set system services rest https server-certificate testcert
```

8. Configure the set of ciphers the server can use to perform encryption and decryption functions.

```
[edit]
user@R1# set system services rest https cipher-list rsa-with-3des-edc-cbc-sha
```

9. (Optional) Set up TLS mutual authentication on both the server and client with a certificate.

```
[edit]
user@R1# set system services rest https mutual-authentication certificate-authority testca
```

10. (Optional) Configure trace options for lighttpd, juise, or both.

```
[edit]
user@R1# set system services rest traceoptions flag all
```

11. (Optional) Enable the REST API Explorer.

```
[edit]
user@R1# set system services rest enable-explorer
```

12. Commit the configuration.

```
[edit]
user@R1# commit and-quit
```

Results

```
system {
  services {
    rest {
      control {
        allowed-sources [ 192.0.2.0 198.51.100.0 ];
        connection-limit 100;
      }
      enable-explorer;
    }
  }
}
```

```

    http {
        addresses [ 203.0.113.0 203.0.113.1 ];
        port 3000;
    }
    https {
        port 3443;
        addresses [ 203.0.113.2 203.0.113.3 ];
        server-certificate testcert;
        cipher-list rsa-with-3des-edc-sha;
        mutual-authentication {
            certificate-authority testca;
        }
    }
    traceoptions {
        flag all;
    }
}
}
}

```

Verification

Verifying REST API Configuration

Purpose

Confirm that the REST API configuration is working properly on the device.

Action

Display the REST API configuration by issuing the **show configuration system services rest** operational mode command.

user@R1> **show configuration system services rest**

```

http {
    port 3000;
    addresses [ 203.0.113.0 203.0.113.1 ];
}
https {
    port 3443;
    addresses [ 203.0.113.2 203.0.113.3 ];
}

```

```

server-certificate testcert;
cipher-list rsa-with-3des-edc-cbc-sha;
mutual-authentication {
    certificate-authority testca;
}
}
control {
    allowed-sources [ 192.0.2.0 198.51.100.0 ];
    connection-limit 100;
}
traceoptions {
    flag all;
}
enable-explorer;

```

Meaning

This example configured both HTTP and HTTPS access on a Juniper Networks M10i Multiservice Edge Router. For HTTP access, the device listens on port 3000 and permits traffic from IP addresses 192.0.2.0, 198.51.100.0, 203.0.113.0, and 203.0.113.1. For a more secure connection, HTTPS access was configured with mutual authentication, using port 3443 and allowed IP addresses of 192.0.2.0, 198.51.100.0, 203.0.113.2, and 203.0.113.3. A connection limit of 100 has been configured for both HTTP and HTTPS, and both `juise` and `lighttpd` tracing has been enabled. By default, the REST API Explorer is disabled (see [“Example: Using the REST API Explorer” on page 23](#)).

RELATED DOCUMENTATION

[Understanding the REST API | 13](#)

[Configuring the REST API | 16](#)

[Example: Using the REST API Explorer | 23](#)

Example: Using the REST API Explorer

IN THIS SECTION

- [Requirements | 23](#)
- [Overview | 23](#)
- [Configuration | 23](#)

This example demonstrates how to optionally use the REST API Explorer on a Junos OS device on which the REST API has been configured.

Requirements

- An M Series, MX Series, T Series, or PTX Series device running Junos OS Release 14.2 or later is required.

Overview

The REST API Explorer allows you to conveniently test out single or multiple RPC calls. Its GUI provides you with options to select the HTTP method (GET or POST), the required output format (XML, JSON, or plain text), the RPC URL, the input data type when using POST requests (XML or plain text), and an exit-on-error condition. When you submit the request, the REST API Explorer displays the request header, response header, response body, and equivalent cURL request, all of which are useful to your development efforts.

Configuration

IN THIS SECTION

- [Enabling the REST API Explorer | 24](#)
- [Opening the REST API Explorer | 25](#)

- [Executing a Single RPC Using an HTTP GET Request | 25](#)
- [Executing a Single RPC Using an HTTP POST Request | 26](#)
- [Executing Multiple RPCs | 30](#)
- [Viewing Error Messages | 31](#)

To use the REST API Explorer on any device on which the REST API has been configured, perform these tasks:

Enabling the REST API Explorer

Step-by-Step Procedure

To enable the REST API Explorer:

1. Configure the REST API on the device.

See [“Configuring the REST API” on page 16](#) and [“Example: Configuring the REST API” on page 17](#) for information and examples.

2. Check whether the REST API Explorer is enabled.

Use the **show** command to see if **enable-explorer;** appears in the REST API configuration. If it appears, the REST API Explorer has been enabled. If it does not appear, you must enable the REST API Explorer.

```
[edit]
user@R1# show system services rest
http;
traceoptions {
    flag all;
}
enable-explorer;
```

3. Enable the REST API Explorer if necessary.

Use the **set** command to ensure that **enable-explorer;** appears in the REST API configuration.

```
[edit]
user@R1# set system services rest enable-explorer
```

Opening the REST API Explorer

Step-by-Step Procedure

To open the REST API Explorer:

- Ensure that the REST API Explorer is enabled, open a browser, and go to the following URL:
scheme://device-name:port (for example, https://mydevice:3000).

The screenshot shows the Juniper REST-API explorer web interface. At the top left is the title "REST-API explorer" and at the top right is the Juniper Networks logo. Below the header, there are two radio buttons: "Single RPC" (which is selected) and "Multiple RPCs". Underneath, there are three dropdown menus: "HTTP method" with "GET" selected, "Required output format" with "XML" selected, and "RPC URL" with "/rpc/" entered. Below these are two text input fields for "Username" and "Password", both of which are empty. A "Submit" button is located at the bottom center of the form area. At the very bottom of the page, there is a copyright notice: "© Juniper Networks".

Executing a Single RPC Using an HTTP GET Request

Step-by-Step Procedure

To execute a single RPC using an HTTP GET Request:

1. In the **HTTP method** drop-down list, select **GET**.
2. Enter the RPC URL endpoint.
For example, type `/rpc/get-software-information`.

3. Enter your username and password.
4. Click **Submit**.

In this example, the default output format, XML, is returned in the Response Body:

The screenshot shows the 'REST-API explorer' interface. At the top, there are two radio buttons: 'Single RPC' (selected) and 'Multiple RPCs'. Below this, there are four input fields: 'HTTP method' (a dropdown menu showing 'GET'), 'Required output format' (a dropdown menu showing 'XML'), 'RPC URL' (a text box containing '/rpc/get-software-information'), 'Username' (a text box containing 'username'), and 'Password' (a text box filled with dots). A 'Submit' button is located below the password field. At the bottom, there is a section titled 'Request Headers' which contains a pre-formatted text box showing the following request details:

```
GET /rpc/get-software-information HTTP/1.1
Authorization: Basic dXNlcm5hbWU6UGFzc3dvcmQ=
Accept: application/xml
Content-Type: application/xml
```

Executing a Single RPC Using an HTTP POST Request

Step-by-Step Procedure

To execute a single RPC using an HTTP POST Request:

1. In the **HTTP method** drop-down list, select **POST**.
2. In the **Required output format** drop-down list, select **JSON**.
3. Enter this RPC URL endpoint: **/rpc/get-software-information**.
4. Enter your username and password.
5. Enter the XML-formatted request in the **Request body** text area.

For example:

```
<brief/>
```

6. Click **Submit**.

In this example, the JSON output format is returned in the Response Body:

REST-API explorer

☒ Single RPC ☐ Multiple RPCs

HTTP method

Input data type

Required output format

RPC URL

Username

Password

Request body

Submit

7. If you prefer a different output format, select one of the available choices in the **Required output format** drop-down list.

For example, you could select **Plain text**. When you click **Submit**, you will see plain text in the Response Body:

REST-API explorer

☒ Single RPC ☐ Multiple RPCs

HTTP method

Input data type

Required output format

RPC URL

Username

Password

Request body

Submit

Similarly, if you select **XML** in the **Required output format** drop-down list, the response body will contain XML-formatted information:

The screenshot shows the 'REST-API explorer' interface. At the top, there are two radio buttons: 'Single RPC' (selected) and 'Multiple RPCs'. Below this, there are several input fields and a 'Submit' button. The 'HTTP method' is set to 'POST'. The 'Input data type' is set to 'XML'. The 'Required output format' is set to 'XML'. The 'RPC URL' is '/rpc/get-software-information'. The 'Username' is 'username'. The 'Password' is masked with dots. The 'Request body' contains the XML snippet '<brief/>'. A 'Submit' button is at the bottom.

| Field | Value |
|------------------------|-------------------------------|
| HTTP method | POST |
| Input data type | XML |
| Required output format | XML |
| RPC URL | /rpc/get-software-information |
| Username | username |
| Password | |
| Request body | <brief/> |

Executing Multiple RPCs

Step-by-Step Procedure

To execute multiple RPCs:

1. In the **HTTP method** drop-down list, select **POST**.
This is always required when executing multiple RPCs.
2. To set a conditional exit in the event of an error, select the **Exit on error** checkbox.
3. Select an output format in the **Required output format** drop-down list.
For example, you could select **JSON**.
4. This RPC URL endpoint will automatically populate: **/rpc?exit-on-error=1**.

5. Enter your username and password.
6. Enter the XML-formatted request in the **Request body** text area.

For example:

```
<get-software-information />
<get-interface-information />
```

7. Click **Submit**.

In this example, the JSON output format is returned in the Response Body:

The screenshot shows the REST-API explorer interface. On the left, the configuration is set to:

- Single RPC: ☐ (unselected)
- Multiple RPCs: ☒ (selected)
- Exit on error: ☒ (checked)
- HTTP method: POST (dropdown)
- Input data type: XML (dropdown)
- Required output format: JSON (dropdown)
- RPC URL: /rpc?exit-on-error=1
- Username: username
- Password: [masked]
- Request body: <get-software-information /> <get-interface-information />

 On the right, the response is displayed:

- Response Headers:** Content-Type: multipart/mixed; boundary=nwlrbbmqbhcdarz, Transfer-Encoding: chunked, Date: Thu, 01 May 2014 21:56:54 GMT, Server: lighttpd/1.4.32
- Response Body:** --nwlrbbmqbhcdarz, Content-Type: application/json; charset=utf-8, followed by a JSON object: {"software-information": [{"host-name": [{"data": "ghost"}]}]}

Viewing Error Messages

Step-by-Step Procedure

When executing multiple RPCs, an error might occur. If you select the **Exit on error** checkbox, an error message will appear in the output if an error occurs.

To view error messages:

1. In the **HTTP method** drop-down list, select **POST**.
This is always required when executing multiple RPCs.
2. To set a conditional exit in the event of an error, select the **Exit on error** checkbox.
3. Select an output format in the **Required output format** drop-down list.

For example, you could select **JSON**.

4. This RPC URL endpoint will automatically populate: **/rpc?exit-on-error=1**.
5. Enter your username and password.
6. Enter the XML-formatted request containing an error in the **Request body** text area.

For example:

```
<get-software-information />
<get-unknown-rpc />
<get-interface-information />
```

7. Click **Submit**.

In this example, the JSON output format is returned in the Response Body, and you can see an XML-formatted error message at the end of the Response Body:

REST-API explorer

☐ Single RPC ☒ Multiple RPCs

☒ Exit on error

HTTP method: POST

Input data type: XML

Required output format: JSON

RPC URL: /rpc?exit-on-error=1

Username: username

Password:

Request body:

```
<get-software-information />
<get-unknown-rpc />
<get-interface-information />
```

Submit

8. If you do not select the **Exit on error** checkbox, an error message will appear in the Response Body if an error occurs.

Execution will continue after the error is processed, and the results will also be included in the Response Body:

REST-API explorer

☐ Single RPC ☒ Multiple RPCs

☐ Exit on error

HTTP method: POST

Input data type: XML

Required output format: JSON

RPC URL: /rpc

Username: username

Password: ••••••••

Request body:

```
<get-software-information />
<get-unknown-rpc />
<get-interface-information />
```

Submit

RELATED DOCUMENTATION

[Understanding the REST API | 13](#)

[Configuring the REST API | 16](#)

Submitting a GET Request to the REST API

For an **rpc** command, the general format of the endpoints is:

scheme://device-name:port/rpc/method[@attributes]/params

- **scheme:** `http` or `https`
- **method:** The name of any Junos OS `rpc` command. The **method** name is identical to the tag element. For more information, see the *Junos XML API Operational Developer Reference*.
- **params:** Optional parameter values (`name[=value]`).

To authenticate your request, submit the base64-encoded username and password included in the Authorization header:

```
curl -u "username:password" http://device-name:port/rpc/get-interface-information
```

To specify `rpc` data as a query string in the URI for GET requests, you can use a `?` following the URI with the `&` delimiter separating multiple arguments, or use the `/` delimiter, as shown in these equivalent cURL calls:

For example:

```
curl -u "username:password"
http://device-name:port/rpc/get-interface-information?interface-name=cbp0&snmp-index=1
```

```
curl -u "username:password"
http://device-name:port/rpc/get-interface-information/interface-name=cbp0/snmp-index=1
```

HTTP Accept headers can be used to specify the return format using one of the following Content-Type values:

- `application/xml` (the default)
- `application/json`
- `text/plain`
- `text/html`

For example, the following cURL call specifies an output format of JSON:

```
curl -u "username:password"
http://device-name:port/rpc/get-interface-information?interface-name=cbp0 -header
"Accept: application/json"
```

You can also specify the output format using the optional **format** parameter.

For example, the `<get-software-information>` tag element retrieves software process revision levels. The following HTTPS GET request executes this command and retrieves the results in JSON format:

```
https://device-name:3000/rpc/get-software-information@format=json
```

The following Python program uses the REST interface to execute the **get-route-engine-information** RPC, extracts the data from the response, and plots a graph of the CPU load average:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation
import requests

temp_y = 1
def update_line(num, data, line):
    if num == 0:
        return line,
    global temp_y
    x_data.append(num)
    if num is not 0 and num%8 == 1:
        r =
requests.get('scheme://device:port/rpc/get-route-engine-information@format=json',
auth=('username', 'password'))
        if r: temp_y =
r.json()["route-engine-information"][0]["route-engine"][0]["load-average-one"][0]["data"]

        y_data.append(temp_y)
        line.set_data(x_data, y_data)
        return line,
fig1 = plt.figure()
x_data = []
y_data = []
l, = plt.plot([], [])
plt.xlim(0, 80)
plt.ylim(0, 1.5)
plt.xlabel('Time in seconds')
plt.ylabel('CPU utilization (load average)')
plt.title('REST-API test')
line_ani = animation.FuncAnimation(fig1, update_line, 80, fargs=(0, 1), interval=1000,
    blit=True)
plt.show()
```

RELATED DOCUMENTATION

[Understanding the REST API | 13](#)

[Configuring the REST API | 16](#)

[Example: Using the REST API Explorer | 23](#)

| (pipe)

Pipe (|) Filter Functions in the Junos OS Command-Line Interface

Specifying the Output Format for Operational Information Requests in a NETCONF Session

Submitting a POST Request to the REST API

Use an HTTP POST request to send single or multiple RPC requests to the REST API. You can use the POST request to do device configuration.

For a single **rpc** command, the general format of the endpoints is:

scheme://device-name:port/rpc/method[@attributes]/params

- **scheme:** **http** or **https**
- **method:** The name of any Junos OS **rpc** command. The **method** name is identical to the tag element. For more information, see the Junos XML Protocol Operations, Processing Instructions, and Response Tags in the *Junos XML Management Protocol Developer Guide* and the *Junos XML API Operational Developer Reference*.
- **params:** Optional parameter values (**name[=value]**).

To authenticate your request, submit the base64-encoded username and password included in the Authorization header:

```
curl -u "username:password" http://device-name:port/rpc/get-interface-information
```

To specify **rpc** data as a query string in the URI for POST requests, submit the query data in the POST body. In such cases you can specify the **Content-Type** as **text/plain** or **application/xml**, as shown in these equivalent cURL calls:

```
curl -u "username:password" http://device-name:port/rpc/get-interface-information
--header "Content-Type: text/plain" -d "interface-name=cbp0"
curl -u "username:password" http://device-name:port/rpc/get-interface-information
--header "Content-Type: application/xml" -d "<interface-name>cbp0</interface-name>"
```

For both single and multiple RPC commands, HTTP Accept headers can be used to specify the return format using one of the following Content-Type values:

- application/xml (the default)
- application/json
- text/plain
- text/html

For example, the following cURL call specifies an output format of JSON:

```
curl -u "username:password" http://device-name:port/rpc -d <get-software-information
/> -header "Accept: application/json"
```

You can also specify the output format using the optional **format** attribute:

```
curl -u "username:password" http://device-name:port/rpc -d "<get-software-information
format=application/json' />"
```

NOTE: The default Content-Type for POST requests containing arguments in the body is application/xml. If you want to use any other content, such as a query string, you can specify a Content-Type of text/plain. Specify the **format** attribute in configuration commands.

When executing multiple **rpc** commands in a single request, the general format of the endpoint is:

```
scheme://device-name:port/rpc
```

The RPCs must be provided as XML data in the POST body. The Content-Type for the response is multipart/mixed, with boundary and subtype associated with the output from each RPC execution. The format specified in the Accept header is used as the output format for each of the RPCs if they are missing a **format** attribute. If an Accept header is not specified and no **format** attribute is specified in a given RPC, the default output format is XML. For example, to send a single HTTP request to execute the RPCs **get-software-information** and **get-interface-information**, submit a POST request to **/rpc** with "**Auth: Basic <base64hash>**", "**Content-Type: application/xml**". The POST body would contain:

```
<get-software-information/> <get-interface-information/>
```

Here is a cURL call using this POST body:

```
curl -u "username:password" http://device-name:port/rpc -d
"<get-software-information/><get-interface-information/>"
```

The output from the request, containing XML as the default, would appear as follows:

```
HTTP/1.1 200 OK
Content-Type: multipart/mixed; boundary=fkj49sn38dcn3
Transfer-Encoding: chunked
Date: Thu, 20 Mar 2014 11:01:27 GMT
Server: lighttpd/1.4.32
--fkj49sn38dcn3
Content-Type: application/xml

<software-information>
<host-name>...</host-name>
...
</software-information>
--fkj49sn38dcn3
Content-Type: application/xml

<interface-information>
<physical-interface>...</physical-interface>
</interface-information>
--fkj49sn38dcn3--
```

You can also specify the output format for each of the elements in the POST body. For example, the following request emits JSON for the **get-interface-information** RPC and plain text for the **get-software-information** RPC:

```
curl -u "username:password" http://device-name:port/rpc
-d "<get-interface-information/><get-software-information format='text/plain'/>"
-header "Accept: application/json"
```

When executing multiple RPCs, if an error occurs, the default behavior is to ignore the error and continue execution. If you want to exit when the first error is encountered, specify the **stop-on-error** flag in the URI. For example, the following request configures the device and terminates if an error is encountered:

```
curl -u "username:password" http://device-name:port/rpc?stop-on-error=1
-d "<lock-configuration/>
  <load-configuration>
    <configuration><system><hostname>foo</hostname></system></configuration>
  </load-configuration>
  <commit/>
  <unlock-configuration/>"
```

    port port-number;
    server-certificate local-certificate-identifier;
  }
  routing-instance routing-instance;
  traceoptions {
    flag flag;
  }
}
```

Hierarchy Level

[edit system services]

Release Information

Statement introduced in Junos OS Release 14.2.

routing-instance option introduced in Junos OS Release 20.3R1.

Description

Execute Junos OS commands over HTTP or HTTPS using REST. Optionally, specify JSON output for operational and configuration commands.

Options

routing-instance *routing-instance*—Specify the routing instance through which the remote server is reachable. This can be the non-default management instance `mgmt_junos` or a user-defined non-default routing instance. If you do not specify a routing instance, REST API requests are sent over the default routing instance.

NOTE: If you want to use the non-default management instance `mgmt_junos`, you must also define the `mgmt_junos` routing instance under the **[edit routing-instances]** hierarchy level and configure the **management-instance** statement.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level

`system`—To view this statement in the configuration.

`system-control`—To add this statement to the configuration.

server-certificate (REST API)

Syntax

```
server-certificate local-certificate-identifier;
```

Hierarchy Level

[edit system services [rest https](#)]

Release Information

Statement introduced in Junos OS Release 14.2.

Description

Set the server certificate when configuring SSL/TLS mutual authentication.

Options

local-certificate-identifier—The server certificate. This must be set when configuring SSL/TLS mutual authentication.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

RELATED DOCUMENTATION

traceoptions (REST API)

Syntax

```
traceoptions {  
    flag flag;  
}
```

Hierarchy Level

[edit system services [rest](#)]

Release Information

Statement introduced in Junos OS Release 14.2.

Description

Define tracing operations for the REST API service.

Options

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, specify **all**. REST API tracing options include:

- **all**—All tracing operations. A combination of the **juise** and **lighttpd** tracing operations.
- **juise**—Trace juise operations. Trace information is captured in **/var/chroot/rest-api/var/log/juise**.
- **lighttpd**—Trace lighttpd operations. Trace information is captured in **/var/chroot/rest-api/var/log/lighttpd**.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.
