[edit forwarding-options port-mirroring]
user@host# input {
    maximum-packet-length bytes
    rate rate;
}
family any {
    output {
        (next-hop-group group-name | interface interface-name);
    }
}
```

4. Configure mirroring parameters for an instance. In this configuration, you can specify the output or destination for the Layer 2 packets to be either a valid next-hop group or a Layer 2 interface.

```
[edit forwarding-options port-mirroring]
user@host#instance instance-name {
    family any{
        output {
            (next-hop-group group-name | interface interface-name);
        }
    }
}
```

5. Configure the firewall filter at the ingress or egress interface on which the packets are transmitted.

```
[edit interface interface-name unit]
user@host# filter {
    output filter-name;
    input filter-name;
}
```

Example: Mirroring Employee Web Traffic with a Firewall Filter

IN THIS SECTION

- Requirements | 1377
- Overview | 1378
- Configuring | 1379
- Verification | 1382

Requirements

This example uses the following hardware and software components:

- One switch
- Junos 14.1X53-D20

Overview

IN THIS SECTION

- Topology | 1378

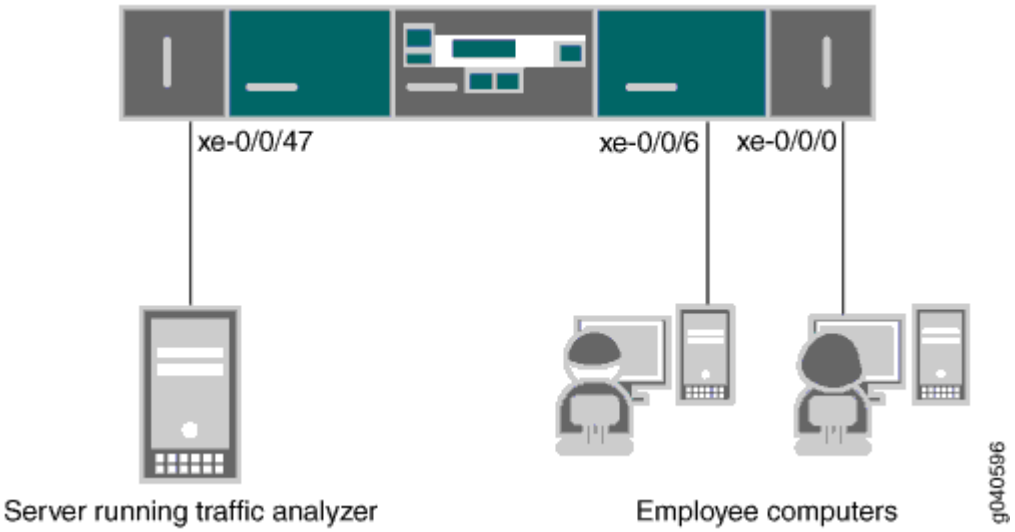
In this example, `xe-0/0/0` and `xe-0/0/6` serve as connections for employee computers. Interface `xe-0/0/47` is connected to a device running an analyzer application.

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more-efficient use of your bandwidth and hardware and might be necessary because of constraints on these assets. This example mirrors only traffic sent from employee computers to the Web.

Topology

Figure 53 on page 1378 shows the network topology for this example.

Figure 53: Network Topology for Local Port Mirroring Example



Configuring

IN THIS SECTION

- Procedure | 1379

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

Procedure

CLI Quick Configuration

To quickly configure local port mirroring of traffic from employee computers that is destined for the Web, copy the following commands and paste them into a switch terminal window:

```
[edit]
 set forwarding-options port-mirroring family inet output interface xe-0/0/47.0 next-hop
192.0.2.100/24
 set firewall family inet filter watch-employee term employee-to-corp from destination-address
192.0.2.16/24
 set firewall family inet filter watch-employee term employee-to-corp from source-address
192.0.2.16/24
 set firewall family inet filter watch-employee term employee-to-corp then accept
 set firewall family inet filter watch-employee term employee-to-web from destination-port 80
 set firewall family inet filter watch-employee term employee-to-web then port-mirror
 set interfaces xe-0/0/0 unit 0 family address 192.0.1.1/24
 set interfaces xe-0/0/6 unit 0 family address 192.0.1.2/24
 set interfaces xe-0/0/47 unit 0 family address 192.0.1.3/24
 set interfaces xe-0/0/0 unit 0 family inet filter input watch-employee
 set interfaces xe-0/0/6 unit 0 family inet filter input watch-employee
```

Step-by-Step Procedure

To configure local port mirroring of employee to web traffic from the two ports connected to employee computers:

1. Configure a port-mirroring instance, including the output interface and the IP address of the device running the analyzer application as the next hop. (Configure only the output—the input comes from the filter.) You must also specifying that the mirror is for IPv4 traffic (`family inet`).

```
[edit forwarding-options]
user@switch# set forwarding-options port-mirroring family inet output interface xe-0/0/47.0
next-hop 192.0.2.100/28
```

2. Configure an IPv4 (`family inet`) firewall filter called `watch-employee` that includes a term to match traffic sent to the Web and send it to the port-mirroring instance. Traffic sent to and arriving from the corporate subnet (destination or source address of `192.0.nn.nn/24`) does not need to be copied, so first create another term to accept that traffic before it reaches the term that sends Web traffic to the instance:

```
[edit firewall family inet]
er@switch# set filter watch-employee term employee-to-corp from destination-address
192.0.nn.nn/24
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.nn.nn/24
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror
```

3. Configure addresses for the IPv4 interfaces connected to the employee computers and the analyzer device:

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet address 192.0.1.1/24
user@switch# set xe-0/0/6 unit 0 family inet address 192.0.1.2/24
user@switch# set interfaces xe-0/0/47 unit 0 family address 192.0.1.3/24
```

4. Apply the firewall filter to the appropriate interfaces as an ingress filter:

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet filter input watch-employee
user@switch# set xe-0/0/6 unit 0 family inet filter input watch-employee
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
forwarding-options {
    port-mirroring {
            employee-web-monitor    {
                output {
                    ip-address 192.0.2.100.0;
                    }
                }
            }
        }
    }
}
...
firewall family inet {
    filter watch-employee {
        term employee-to-corp {
            from {
                destination-address 192.0.2.16/24;
                source-address 192.0.2.16/24;
            }
            then accept {
        }
        term employee-to-web {
            from {
                destination-port 80;
            }
            then port-mirror;
        }
    }
}
...
interfaces {
    xe-0/0/0 {
        unit 0 {
            family inet {
                filter {
                    input watch-employee;
```

```
                }
            }
        }
    }
    xe-0/0/6 {
        family inet {
            filter {
                input watch-employee;
            }
        }
    }
}
```

Verification

IN THIS SECTION

- Verifying That the Analyzer Has Been Correctly Created | **1382**

Verifying That the Analyzer Has Been Correctly Created

Purpose

Verify that the analyzer has been created on the switch with the appropriate input interfaces and appropriate output interface.

Action

You can verify that the port mirror analyzer has been configured as expected using the `show forwarding-options port-mirroring` command.

```
user@switch> show forwarding-options port-mirroring
Instance Name: &global_instance
  Instance Id: 1
  Input parameters:
    Rate                 : 1
    Run-length           : 0
    Maximum-packet-length : 0
```

```
Output parameters:
  Family              State     Destination          Next-hop
  inet                up      xe-0/0/47.0          192.0.2.100
```

Meaning

This output shows that the port-mirroring instance has a ratio of 1 (mirroring every packet, the default setting) and the maximum size of the original packet that was mirrored (`0` indicates the entire packet). If the state of the output interface is down or if the output interface is not configured, the value of state will be `down` and the instance will not be programmed for mirroring.

Layer 2 Port Mirroring of PE Router or PE Switch Logical Interfaces

For a router or switch configured as a provider edge (PE) device on the customer-facing edge of a service provider network, you can apply a Layer 2 port-mirroring *firewall filter* at the following ingress and egress points to mirror the traffic between the router or switch and customer edge (CE) devices, which are typically also routers and Ethernet switches.

Table 135 on page 1383 describes the ways in which you can apply Layer 2 port-mirroring firewall filters to a router or switch configured as a PE device.

Table 135: Application of Layer 2 Port Mirroring Firewall Filters on PE Devices

Point of Application	Scope of Mirroring	Notes	Configuration Details
Ingress Customer-Facing Logical Interface	Packets originating within a service provider customer's network, sent first to a CE device, and sent next to the PE device.	You can also configure aggregated Ethernet interfaces between CE devices and PE devices for VPLS routing instances. Traffic is load-balanced across all of the links in the aggregated interface. Traffic received on an aggregated Ethernet interface is forwarded over a different interface based on a lookup of the destination MAC (DMAC) address:	See Applying Layer 2 Port Mirroring to a Logical Interface. For more information about VPLS routing instances, see *Configuring a VPLS Routing Instance* and Configuring VLAN Identifiers for Bridge Domains and VPLS Routing Instances.

Table 135: Application of Layer 2 Port Mirroring Firewall Filters on PE Devices *(Continued)*

Point of Application	Scope of Mirroring	Notes	Configuration Details
Egress Customer-Facing Logical Interface	Unicast packets being forwarded by the PE device to another PE device. **NOTE:** If you apply a port-mirroring filter to the output for a *logical interface*, only unicast packets are mirrored. To mirror multicast, unknown unicast, and broadcast packets, apply a filter to the input to the flood table of a VLAN or VPLS routing instance.	• Packets destined for a local site are sent out of the load-balanced child interface. • Packets destined for the remote site are encapsulated and forwarded over a label-switched path (LSP).	See Applying Layer 2 Port Mirroring to a Logical Interface.
Input to a VLAN Forwarding Table or Flood Table	Forwarding traffic or flood traffic sent to the VLAN from a CE device.	Forwarding and flood traffic typically consists of broadcast packets, multicast packets, unicast packets with an unknown destination MAC address, or packets with a MAC entry in the DMAC routing table.	See "Applying Layer 2 Port Mirroring to Traffic Forwarded or Flooded to a Bridge Domain" on page 1388. For information about flooding behavior in VPLS, see the Junos OS VPNs Library for Routing Devices.
Input to a VPLS Routing Instance Forwarding Table or Flood Table	Forwarding traffic or flood traffic sent to the VPLS routing instance from a CE device.		See Applying Layer 2 Port Mirroring to Traffic Forwarded or Flooded to a VPLS Routing Instance. For information about flooding behavior in VPLS, see the Junos OS VPNs Library for Routing Devices.

Layer 2 Port Mirroring of PE Router or PE Switch Aggregated Ethernet Interfaces

An aggregated Ethernet interface is a virtual aggregated link that consists of a set of physical interfaces of the same speed and operating in full-duplex link connection mode. You can configure aggregated Ethernet interfaces between CE devices and PE devices for VPLS routing instances. Traffic is load-balanced across all of the links in the aggregated interface. If one or more links in the aggregated interface fails, the traffic is switched to the remaining links.

You can apply a Layer 2 port-mirroring *firewall filter* to an aggregated Ethernet interface to configure *port mirroring* at the parent interface. However, if any child interfaces are bound to different Layer 2 port-mirroring instances, packets received at the child interfaces will be mirrored to the destinations specified by their respective port-mirroring instances. Thus, multiple child interfaces can mirror packets to multiple destinations.

For example, suppose the parent aggregated Ethernet interface instance `ae0` has two child interfaces:

- `xe-2/0/0`
- `xe-3/1/2`

Suppose that these child interfaces on `ae0` are bound to two different Layer 2 port-mirroring instances:

- `pm_instance_A`—A named instance of Layer 2 port-mirroring, bound to child interface `xe-2/0/0`.
- `pm_instance_B`—A named instance of Layer 2 port-mirroring, bound to child interface `xe-3/1/2`.

Now suppose you apply a Layer 2 port-mirroring firewall filter to the Layer 2 traffic sent on `ae0.0` (logical unit `0` on the aggregated Ethernet interface instance `0`). This enables *port mirroring* on `ae0.0`, which has the following effect on the processing of traffic received on the child interfaces for which Layer 2 port-mirroring properties are specified:

- The packets received on `xe-2/0/0` are mirrored to the output interfaces configured in port-mirroring instance `pm_instance_A`.
- The packets received on `xe-3/1/2.0` are mirrored to the output interfaces configured in port-mirroring instance `pm_instance_B`.

Because `pm_instance_A` and `pm_instance_B` can specify different packet-selection properties or mirror destination properties, the packets received on `xe-2/0/0` and `xe-3/1/2.0` can mirror different packets to different destinations.

Applying Layer 2 Port Mirroring to a Logical Interface

You can apply a Layer 2 port-mirroring firewall filter to the input or to the output of a logical interface, including an aggregated Ethernet logical interface. Only packets of the address-type family specified by the filter action are mirrored.

Before you begin, complete the following task:

- Define a Layer 2 port-mirroring firewall filter to be applied to the input to a logical interface or output to a logical interface. For details, see Defining a Layer 2 Port-Mirroring Firewall Filter.

> **NOTE**: This configuration task shows two Layer 2 port-mirroring firewall filters: one filter applied to the logical interface ingress traffic, and one filter applied to the logical interface egress traffic.

To apply a Layer 2 port-mirroring firewall filter to an input or output logical interface:

1. Configure the underlying physical interface for the logical interface.

   a. Enable configuration of the underlying physical interface:

```
[edit]
user@host# edit interfaces interface-name
```

> **NOTE**: A port-mirroring firewall filter can also be applied to an aggregated-Ethernet logical interface.

   b. For Fast Ethernet and Gigabit Ethernet interfaces and aggregated Ethernet interfaces configured for VPLS, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface:

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

   c. For Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID, set the logical link-layer encapsulation type:

```
[edit interfaces interface-name]
user@host# set encapsulation extended-vlan-ethernet-switching
```

2. Configure the logical interface to which you want to apply a Layer 2 port-mirroring firewall filter.

   a.

Specify the logical unit number:

```
[edit interfaces interface-name]
user@host# edit unit logical-unit-number
```

b. For a Fast Ethernet, Gigabit Ethernet, or Aggregated Ethernet interface, bind an 802.1Q VLAN tag ID to the logical interface:

```
[edit interfaces interface-name unit logical-unit-number]
user@host# set vlan-id number
```

3. Enable specification of an input or output filter to be applied to Layer 2 packets that are part of bridging domain, Layer 2 switching cross-connects, or virtual private LAN service (VPLS).

   - If the filter is to be evaluated when packets are received on the interface:

```
[edit interfaces interface-name unit logical-unit-number]
user@host# set family family filter input pm-filter-name-a
```

   - If the filter is to be evaluated when packets are sent on the interface:

```
[edit interfaces interface-name unit logical-unit-number]
user@host# set family family filter output pm-filter-name-b
```

   The value of the *family* option can be `ethernet-switching`, `ccc`, or `vpls`.

   NOTE: If port-mirroring firewall filters are applied at both the input and output of a logical interface, two copies of each packet are mirrored. To prevent the router or switch from forwarding duplicate packets to the same destination, include the optional `mirror-once` statement at the `[edit forwarding-options]` hierarchy level.

4. Verify the minimum configuration for applying a named Layer 2 port mirroring firewall filter to a logical interface:

```
[edit interfaces interface-name unit logical-unit-number family family filter ... ]
user@host# top
[edit]
user@host# show interfaces
```

```
interfaces {
    interface-name {
        vlan-tagging;
        encapsulation extended-vlan-ethernet-switching;
        unit number { # Apply a filter to the input of this interface
            vlan-id number;
            family (ethernet-switching | ccc | vpls) {
                filter {
                    input pm-filter-for-logical-interface-input;
                }
            }
        }
        unit number { # Apply a filter to the output of this interface
            vlan-id number;
            family (ethernet-switching | ccc | vpls) {
                filter {
                    output pm-filter-for-logical-interface-output;
                }
            }
        }
    }
}
```

Applying Layer 2 Port Mirroring to Traffic Forwarded or Flooded to a Bridge Domain

You can apply a Layer 2 port-mirroring firewall filter to traffic being forwarded or flooded to a bridge domain. Only packets of the specified family type and forwarded or flooded to that bridge domain are mirrored.

Before you begin, complete the following task:

- Define a Layer 2 port-mirroring firewall filter to be applied to the traffic being forwarded to a bridge domain or flooded to a bridge domain. For details, see Defining a Layer 2 Port-Mirroring Firewall Filter.

> **NOTE**: This configuration task shows two Layer_2 port-mirroring firewall filters: one filter applied to the bridge domain forwarding table ingress traffic, and one filter applied to the bridge domain flood table ingress traffic.

To apply a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of a bridge domain:

1. Enable configuration of the bridge domain *bridge-domain-name* to which you want to apply a Layer 2 port-mirroring firewall filter for forwarded or flooded traffic:

   - For a bridge domain:

     ```
     [edit]
     user@host# edit bridge-domains bridge-domain-name
     ```

   - For a bridge domain under a routing instance:

     ```
     [edit]
     user@host# edit routing-instances routing-instance-name bridge-domains bridge-domain-name
     user@host# set instance-type virtual-switch
     ```

     For more detailed configuration information, see *Configuring a VPLS Routing Instance*.

2. Configure the bridge domain:

   ```
   [edit]
   user@host# set domain-type bridge
   user@host# set interface interface-name
   user@host# set routing-interface routing-interface-name
   ```

   For detailed configuration information, see Configuring a Bridge Domain and Configuring VLAN Identifiers for Bridge Domains and VPLS Routing Instances.

3. Enable configuration of traffic forwarding on the bridge domain:

   ```
   [edit ... bridge-domains bridge-domain-name]
   user@host# edit forwarding-options
   ```

4. Apply a Layer 2 port-mirroring firewall filter to the bridge domain forwarding table or flood table.

   - To mirror packets being forwarded to the bridge domain:

     ```
     [edit ... bridge-domains bridge-domain-name forwarding-options]
     user@host# set filter input pm-filter-for-bd-ingress-forwarded
     ```

- To mirror packets being flooded to the bridge domain:

```
[edit ... bridge-domains bridge-domain-name forwarding-options]
user@host# set flood input pm-filter-for-bd-ingress-flooded
```

5. Verify the minimum configuration for applying a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of the bridge domain.

   a. Navigate to the hierarchy level at which the bridge domain is configured:

   - [edit]
   - [edit routing-instances *routing-instance-name*]

   b. Display the bridge domain configurations:

```
user@host# show bridge domains

bridge-domains {
    bridge-domain-name {
        instance-type virtual-switch; # For a bridge domain under a routing instance.
        domain-type bridge;
        interface interface-name;
        forwarding-options {
            filter { # Mirror ingress forwarded traffic
                input pm-filter-for-bd-ingress-forwarded;
            }
            flood { # Mirror ingress flooded traffic
                input pm-filter-for-bd-ingress-flooded;
            }
        }
    }
}
```

Applying Layer 2 Port Mirroring to Traffic Forwarded or Flooded to a VPLS Routing Instance

You can apply a Layer 2 port-mirroring firewall filter to traffic being forwarded or flooded to a VPLS routing instance. Only packets of the specified family type and forwarded or flooded to that VPLS routing instance are mirrored.

Before you begin, complete the following task:

- Define a Layer 2 port-mirroring firewall filter to be applied to the traffic being forwarded to a VPLS routing instance or flooded to a VLAN. For details, see Defining a Layer 2 Port-Mirroring Firewall Filter.

  NOTE: This configuration task shows two Layer_2 port-mirroring firewall filters: one filter applied to the VPLS routing instance forwarding table ingress traffic, and one filter applied to the VPLS routing instance flood table ingress traffic.

To apply a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of a VPLS routing instance:

1. Enable configuration of the VPLS routing instance to which you want to apply a Layer 2 port-mirroring firewall filter for forwarded or flooded traffic:

   ```
   [edit]
   user@host# edit routing-instances routing-instance-name
   user@host# set instance-type vpls
   user@host# set interface interface-name
   user@host# set route-distinguisher (as-number:number | ip-address:number)
   user@host# set vrf-import [policy-names]
   user@host# set vrf-export [policy-names]
   user@host# edit protocols vpls
   user@host@ ... vpls-configuration ...
   ```

   For more detailed configuration information, see *Configuring a VPLS Routing Instance*.

2. Enable configuration of traffic forwarding on the VPLS routing instance:

   ```
   [edit routing-instances routing-instance-name protocols vpls]
   user@host# up 2
   [edit routing-instances routing-instance-name]
   user@host# edit forwarding-options
   ```

3. Apply a Layer 2 port-mirroring firewall filter to the VPLS routing instance forwarding table or flood table.

   - To mirror packets being forwarded to the VPLS routing instance:

     ```
     [edit routing-instances routing-instance-name forwarding-options]
     user@host# set filter input pm-filter-for-vpls-ri-forwarded
     ```

- To mirror packets being flooded to the VPLS routing instance:

```
[edit routing-instances routing-instance-name forwarding-options]
user@host# set flood input pm-filter-for-vpls-ri-flooded
```

4. Verify the minimum configuration for applying a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of the VPLS routing instance:

```
[edit routing-instances routing-instance-name forwarding-options]
user@host# top
[edit]
user@host# show routing-instances

routing-instances {
    routing-instance-name {
        instance-type vpls;
        interface interface-name;
        route-distinguisher (as-number:number | ip-address:number);
        vrf-import [policy-names];
        vrf-export [policy-names];
        protocols {
            vpls {
                ...vpls-configuration...
            }
        }
        forwarding-options {
            family vpls {
                filter { # Mirror ingress forwarded traffic
                    input pm-filter-for-vpls-ri-forwarded;
                }
                flood { # Mirror ingress flooded traffic
                    input pm-filter-for-vpls-ri-flooded;
                }
            }
        }
    }
}
```

Applying Layer 2 Port Mirroring to Traffic Forwarded or Flooded to a VLAN

You can apply a Layer 2 port-mirroring firewall filter to traffic being forwarded or flooded to a VLAN. Only packets of the specified family type and forwarded or flooded to that VLAN are mirrored.

Before you begin, complete the following task:

- Define a Layer 2 port-mirroring firewall filter to be applied to the traffic being forwarded to a VLAN or flooded to a VLAN. For details, see Defining a Layer 2 Port-Mirroring Firewall Filter.

> **NOTE**: This configuration task shows two Layer_2 port-mirroring firewall filters: one filter applied to the VLAN forwarding table ingress traffic, and one filter applied to the VLAN flood table ingress traffic.

To apply a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of a VLAN:

1. Enable configuration of the VLAN ***bridge-domain-name*** to which you want to apply a Layer 2 port-mirroring firewall filter for forwarded or flooded traffic:
   - For a VLAN:

     ```
     [edit]
     user@host# edit bridge-domains bridge-domain-name
     ```

   - For a VLAN under a routing instance:

     ```
     [edit]
     user@host# edit routing-instances routing-instance-name bridge-domains bridge-domain-name
     user@host# set instance-type virtual-switch
     ```

     For more detailed configuration information, see *Configuring a VPLS Routing Instance*.
2. Configure the VLAN:

   ```
   [edit]
   user@host# set domain-type bridge
   user@host# set interface interface-name
   user@host# set routing-interface routing-interface-name
   ```

   For more detailed configuration information, see Configuring a Bridge Domain and Configuring VLAN Identifiers for Bridge Domains and VPLS Routing Instances.

3. Enable configuration of traffic forwarding on the VLAN:

```
[edit ... bridge-domains bridge-domain-name]
user@host# edit forwarding-options
```

4. Apply a Layer 2 port-mirroring firewall filter to the VLAN forwarding table or flood table.

   - To mirror packets being forwarded to the VLAN:

```
[edit ... bridge-domains bridge-domain-name forwarding-options]
user@host# set filter input pm-filter-for-bd-ingress-forwarded
```

   - To mirror packets being flooded to the VLAN:

```
[edit ... bridge-domains bridge-domain-name forwarding-options]
user@host# set flood input pm-filter-for-bd-ingress-flooded
```

5. Verify the minimum configuration for applying a Layer 2 port-mirroring firewall filter to the forwarding table or flood table of the VLAN.

   a. Navigate to the hierarchy level at which the VLAN is configured:

      - [edit]
      - [edit routing-instances *routing-instance-name*]

   b. Display the VLAN configurations:

```
user@host# show vlans

vlans {
    vlan-name {
        instance-type virtual-switch; # For a bridge domain under a routing instance.
        domain-type bridge;
        interface interface-name;
        forwarding-options {
            filter { # Mirror ingress forwarded traffic
                input pm-filter-for-bd-ingress-forwarded;
            }
            flood { # Mirror ingress flooded traffic
                input pm-filter-for-bd-ingress-flooded;
            }
```

```
        }
    }
}
```

Example: Layer 2 Port Mirroring at a Logical Interface

The following steps describe an example in which the global port-mirroring instance and a port-mirroring firewall filter are used to configure Layer 2 port mirroring for the input to a logical interface.

1. Configure the VLAN **example-bd-with-analyzer**, which contains the external packet analyzer, and the VLAN **example-bd-with-traffic**, which contains the source and destination of the Layer 2 traffic being mirrored:

```
[edit]
bridge-domains {
    example-bd-with-analyzer { # Contains an external traffic analyzer
        vlan-id 1000;
        interface ge-2/0/0.0; # External analyzer
    }
    example-bd-with-traffic { # Contains traffic input and output interfaces
        vlan-id 1000;
        interface ge-2/0/6.0; # Traffic input port
        interface ge-3/0/1.2; # Traffic output port
    }
}
```

   Assume that logical interface **ge-2/0/0.0** is associated with an external traffic analyzer that is to receive port-mirrored packets. Assume that logical interfaces **ge-2/0/6.0** and **ge-3/0/1.2** will be traffic input and output ports, respectively.

2. Configure Layer 2 port-mirroring for the global instance, with the port-mirroring destination being the VLAN interface associated with the external analyzer (logical interface **ge-2/0/0.0** on VLAN **example-bd-with-analyzer**). Be sure to enable the option that allows filters to be applied to this port-mirroring destination:

```
[edit]
forwarding-options {
    port-mirroring {
        input {
            rate 10;
            run-length 5;
        }
```

```
        family ethernet-switching {
            output {
                interface ge-2/0/0.0; # Mirror packets to the external analyzer
                no-filter-check; # Allow filters on the mirror destination interface
            }
        }
    }
}
```

The `input` statement at the `[edit forwarding-options port-mirroring]` hierarchy level specifies that sampling begins every tenth packet and that each of the first five packets selected are to be mirrored.

The `output` statement at the `[edit forwarding-options port-mirroring family ethernet-switching]` hierarchy level specifies the output mirror interface for Layer 2 packets in a bridging environment:

- Logical interface **ge-2/0/0.0**, which is associated with the external packet analyzer, is configured as the port-mirroring destination.
- The optional `no-filter-check` statement allows filters to be configured on this destination interface.

3. Configure the Layer 2 port-mirroring firewall filter **example-bridge-pm-filter**:

```
[edit]
firewall {
    family ethernet-switching {
        filter example-bridge-pm-filter {
            term example-filter-terms {
                then {
                    accept;
                    port-mirror;
                }
            }
        }
    }
}
```

When this firewall filter is applied to the input or output of a logical interface for traffic in a bridging environment, Layer 2 port mirroring is performed according to the input packet-sampling properties and mirror destination properties configured for the Layer 2 port mirroring global instance. Because this firewall filter is configured with the single, default filter action **accept**, all packets selected by the **input** properties (**rate** = **10** and **run-length** = **5**) match this filter.

4. Configure the logical interfaces:

```
[edit]
interfaces {
    ge-2/0/0 { # Define the interface to the external analyzer
        encapsulation ethernet-bridge;
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-2/0/6 { # Define the traffic input port
        flexible-vlan-tagging;
        encapsulation extended-vlan-bridge;
        unit 0 {
            vlan-id 100;
            family ethernet-switching {
                filter {
                    input example-bridge-pm-filter; # Apply the port-mirroring firewall filter
                }
            }
        }
    }
    ge-3/0/1 { # Define the traffic output port
        flexible-vlan-tagging;
        encapsulation extended-vlan-bridge;
        unit 2 {
            vlan-tags outer 10 inner 20;
            family ethernet-switching;
        }
    }
}
```

Packets received at logical interface **ge-2/0/6.0** on VLAN **example-bd-with-traffic** are evaluated by the port-mirroring firewall filter **example-bridge-pm-filter**. The firewall filter acts on the input traffic according to the filter actions configured in the firewall filter itself plus the input packet-sampling properties and mirror destination properties configured in the global port-mirroring instance:

- All packets received at **ge-2/0/6.0** are forwarded to their (assumed) normal destination at logical interface **ge-3/0/1.2**.
- For every ten input packets, copies of the first five packets in that selection are forwarded to the external analyzer at logical interface **ge-0/0/0.0** in the other VLAN, **example-bd-with-analyzer**.

If you configure the port-mirroring firewall filter **example-bridge-pm-filter** to take the **discard** action instead of the **accept** action, all original packets are discarded while copies of the packets selected using the global port-mirroring **input** properties are sent to the external analyzer.

Example: Layer 2 Port Mirroring for a Layer 2 VPN

The following example is not a complete configuration, but shows all the steps needed to configure port mirroring on an L2VPN using **family ccc**.

1. Configure the VLAN **port-mirror-bd**, which contains the external packet analyzer:

```
[edit]
vlans {
    port-mirror-vlan { # Contains an external traffic analyzer
        interface ge-2/2/9.0; # External analyzer
    }
}
```

2. Configure the Layer 2 VPN CCC to connect logical interface **ge-2/0/1.0** and logical interface **ge-2/0/1.1**:

```
[edit]
protocols {
    mpls {
        interface all;
    }
    connections {
        interface-switch if_switch {
            interface ge-2/0/1.0;
            interface ge-2/0/1.1;
        }
    }
}
```

3. Configure Layer 2 port mirroring for the global instance, with the port-mirroring destination being the VLAN interface associated with the external analyzer (logical interface **ge-2/2/9.0** on VLAN **example-bd-with-analyzer**):

```
[edit]
forwarding-options {
    port-mirroring {
```

```
        input {
            rate 1;
            maximum-packet-length 200;
        }
        family ccc {
            output {
                interface ge-2/2/9.0; # Mirror packets to the external analyzer
            }
        }
        instance {
            inst1 {
                input {
                    rate 1;
                    maximum-packet-length 300;
                }
                family ccc {
                    output {
                        interface ge-2/2/9.0;
                    }
                {
            }
        }
    }
}
```

4. Define the Layer 2 port-mirroring firewall filter **pm_filter_ccc** for **family ccc**:

```
[edit]
firewall {
    family ccc {
        filter pm_filter_ccc {
            term pm {
                then port-mirror;
            }
        }
    }
}
```

5. Apply the port mirror instance to the chassis:

```
[edit]
chassis {
    fpc 2 {
        port-mirror-instance inst1;
    }
}
```

6. Configure interface **ge-2/2/9** for the VLANs, and configure interface **ge-2/0/1** for port mirroring with the **pm_filter_ccc** firewall filter:

```
[edit]
interfaces {
    ge-2/2/9 {
        encapsulation ethernet-bridge;
        unit 0 {
            family ethernet-switching;
        }
    }
    ge-2/0/1 {
        vlan-tagging;
        encapsulation extended-vlan-ccc;
        unit 0 {
            vlan-id 10;
            family ccc {
                filter {
                    input pm_filter_ccc;
                }
            }
        }
        unit 1 {
            vlan-id 20;
            family ccc {
                filter {
                    output pm_filter_ccc;
                }
            }
        }
```

```
    }
}
```

Example: Layer 2 Port Mirroring for a Layer 2 VPN with LAG Links

The following example is not a complete configuration, but shows all the steps needed to configure port mirroring on an L2VPN using **family ccc** and aggregated Ethernet links.

1. Configure the VLAN **port_mirror_bd**, which contains the external packet analyzer:

```
[edit]
vlans {
    port_mirror_vlan { # Contains an external traffic analyzer
        interface ge-2/2/8.0; # External analyzer
    }
}
```

2. Configure the Layer 2 VPN CCC to connect interface **ae0.0** and interface **ae0.1**:

```
[edit]
protocols {
    mpls {
        interface all;
    }
    connections {
        interface-switch if_switch {
            interface ae0.0;
            interface ae0.1;
        }
    }
}
```

3. Configure Layer 2 port mirroring for the global instance, with the port-mirroring destination being the VLAN interface associated with the external analyzer (logical interface **ge-2/2/9.0** on VLAN **example_bd_with_analyzer**):

```
[edit]
forwarding-options {
    port-mirroring {
        input {
```

```
            rate 1;
            maximum-packet-length 200;
        }
        family ccc {
            output {
                interface ge-2/2/8.0; # Mirror packets to the external analyzer
            }
        }
        instance {
            pm_instance_1 {
                input {
                    rate 1;
                    maximum-packet-length 300;
                }
                family ccc {
                    output {
                        interface ge-2/2/8.0;
                    }
                {
            }
        }
    }
}
```

4. Configure the firewall filter **pm_ccc** for **family ccc**:

```
[edit]
firewall {
    family ccc {
        filter pm_ccc {
            term pm {
                then port-mirror;
            }
        }
    }
}
```

5. Apply the aggregated Ethernet interfaces and port mirror instance to the chassis:

```
[edit]
chassis {
```

```
    aggregated-devices {
        ethernet {
            device-count 10;
        }
    }
    fpc 2 {
        port-mirror-instance pm_instance_1;
    }
}
```

6. Configure interfaces **ae0** and **ge-2/0/2** (for aggregated Ethernet) and **ge-2/2/8** (for port mirroring) with the **pm_ccc** filter:

```
[edit]
interfaces {
    ae0 {
        vlan-tagging;
        encapsulation extended-vlan-ccc;
        unit 0 {
            vlan-id 10;
            family ccc {
                filter {
                    input pm_ccc;
                }
            }
        }
        unit 1 {
            vlan-id 20;
            family ccc {
                filter {
                    output pm_ccc;
                }
            }
        }
    }
    ge-2/0/2 {
        gigether-options {
            802.3ad ae0;
        }
    }
    ge-2/2/8 {
        encapsulation ethernet-bridge;
```

```
        unit 0 {
            family ethernet-switching;
        }
    }
}
```

Release History Table

Release	Description
13.3R6	Starting with Junos OS Release 13.3R6, only MPC interfaces support family any to do port mirroring.

Configuring Port Mirroring for Multiple Destinations

IN THIS SECTION

- Understanding Layer 2 Port Mirroring to Multiple Destinations Using Next-Hop Groups | **1404**
- Defining a Next-Hop Group on MX Series Routers for Port Mirroring | **1405**
- Example: Configuring Multiple Port Mirroring with Next-Hop Groups on M, MX and T Series Routers | **1407**
- Example: Layer 2 Port Mirroring to Multiple Destinations | **1412**

Understanding Layer 2 Port Mirroring to Multiple Destinations Using Next-Hop Groups

On an MX Series router and on an EX Series switch, you can mirror traffic to multiple destinations by configuring next-hop groups in Layer 2 port-mirroring firewall filters applied to tunnel interfaces. The mirroring of packets to multiple destinations is also known as *multipacket port mirroring*,

> **NOTE**: Junos OS Release 9.5 introduced support for Layer 2 *port mirroring* using next-hop groups on MX Series routers, but required installation of a Tunnel PIC. Beginning in Junos OS Release 9.6, Layer 2 port mirroring using next-hop groups on MX Series routers does not require Tunnel PICs.

On MX Series routers and on EX Series switches, you can define a *firewall filter* for mirroring packets to a next-hop group. The next-hop group can contain Layer 2 members, Layer 3 members, and subgroups

that are either unit list (mirroring packets to each interface) or load-balanced (mirroring packets to one of several interfaces). The MX Series router and the EX Series switch supports up to 30 next-hop groups. Each next-hop group supports up to 16 next-hop addresses. Each next-hop group must specify at least two addresses.

To enable port mirroring to the members of a next-hop group, you specify the next-hop group as the filter action of a firewall filter, and then you apply the firewall filter to logical tunnel interfaces (`lt-`) or virtual tunnel interfaces (`vt-`) on the MX Series router or on the EX Series switch.

NOTE: The use of subgroups for load-balancing mirrored traffic is not supported.

Defining a Next-Hop Group on MX Series Routers for Port Mirroring

Starting with release 14.2, on routers containing an Internet Processor II application-specific integrated circuit (ASIC) or T Series Internet Processor, you can send a copy of an IP version 4 (IPv4) or IP version 6 (IPv6) packet from the router to an external host address or a packet analyzer for analysis. This is known as *port mirroring*.

Port mirroring is different from traffic sampling. In traffic sampling, a sampling key based on the IPv4 header is sent to the Routing Engine. There, the key can be placed in a file, or cflowd packets based on the key can be sent to a cflowd server. In port mirroring, the entire packet is copied and sent out through a next-hop interface.

You can configure simultaneous use of sampling and port mirroring, and set an independent sampling rate and run-length for port-mirrored packets. However, if a packet is selected for both sampling and port mirroring, only one action can be performed, and port mirroring takes precedence. For example, if you configure an interface to sample every packet input to the interface and a filter also selects the packet to be port mirrored to another interface, only the port mirroring takes effect. All other packets not matching the explicit filter port-mirroring criteria continue to be sampled when forwarded to their final destination.

Next-hop groups allow you to include port mirroring on multiple interfaces.

On MX Series routers, you can mirror tunnel interface input traffic to multiple destinations. To this form of multipacket port mirroring, you specify two or more destinations in a next-hop group, define a firewall filter that references the next-hop group as the filter action, and then apply the filter to a logical tunnel interface `lt-`) or virtual tunnel interfaces (`vt-` on the MX Series router.

To define a next-hop group for a Layer 2 port-mirroring firewall filter action:

1. Enable the configuration of forwarding options.

```
[edit]
user@host set forwarding-options port-mirroring family (inet | inet6) output
```

2. Enable configuration of a next-hop-group for Layer 2 port mirroring.

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output]
user@host# set next-hop-group next-hop-group-name
```

3. Specify the type of addresses to be used in the next-hop group configuration.

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output next-hop-group next-hop-group-name]
user@host# set group-type inet6
```

4. Specify the interfaces of the next-hop route.

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output next-hop-group next-hop-group-name]
user@host# set interface logical-interface-name-1
user@host# set interface logical-interface-name-2
```

or

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output next-hop-group next-hop-group-name]
user@host# set interface interface-name next-hop next-hop-address
```

The MX Series router supports up to 30 next-hop groups. Each next-hop group supports up to 16 next-hop addresses. Each next-hop group must specify at least two addresses. The *next-hop-address* can be an IPv4 or IPv6 address.

5. (Optional) Specify the next-hop subgroup.

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output next-hop-group next-hop-group-name]
user@host# set next-hop-subgroup subgroup-name interface interface-name next-hop next-hop-address
```

6. Verify the configuration of the next-hop group.

```
[edit forwarding-options port-mirroring ... family (inet | inet6) output next-hop-group next-hop-group-name]
user@host# top
[edit]
user@host# show forwarding-options

...
next-hop-group next-hop-group-name {
    group-type inet6;
    interface logical-interface-name-1;
    interface interface-name{
        next-hop next-hop-address;
    }
    next-hop-subgroup subgroup-name{
        interface interface-name{
            next-hop next-hop-address;
        }
    }
}
...
```

Example: Configuring Multiple Port Mirroring with Next-Hop Groups on M, MX and T Series Routers

When you need to analyze traffic containing more than one packet type, or you wish to perform multiple types of analysis on a single type of traffic, you can implement multiple port mirroring and next-hop groups. You can make up to 16 copies of traffic per group and send the traffic to next-hop group members. A maximum of 30 groups can be configured on a router at any given time. The port-mirrored traffic can be sent to any interface, except aggregated SONET/SDH, aggregated Ethernet, loopback

(lo0), or administrative (**fxp0**) interfaces. To send port-mirrored traffic to multiple flow servers or packet analyzers, you can use the `next-hop-group` statement at the `[edit forwarding-options]` hierarchy level.

Figure 54: Active Flow Monitoring—Multiple Port Mirroring with Next-Hop Groups Topology Diagram

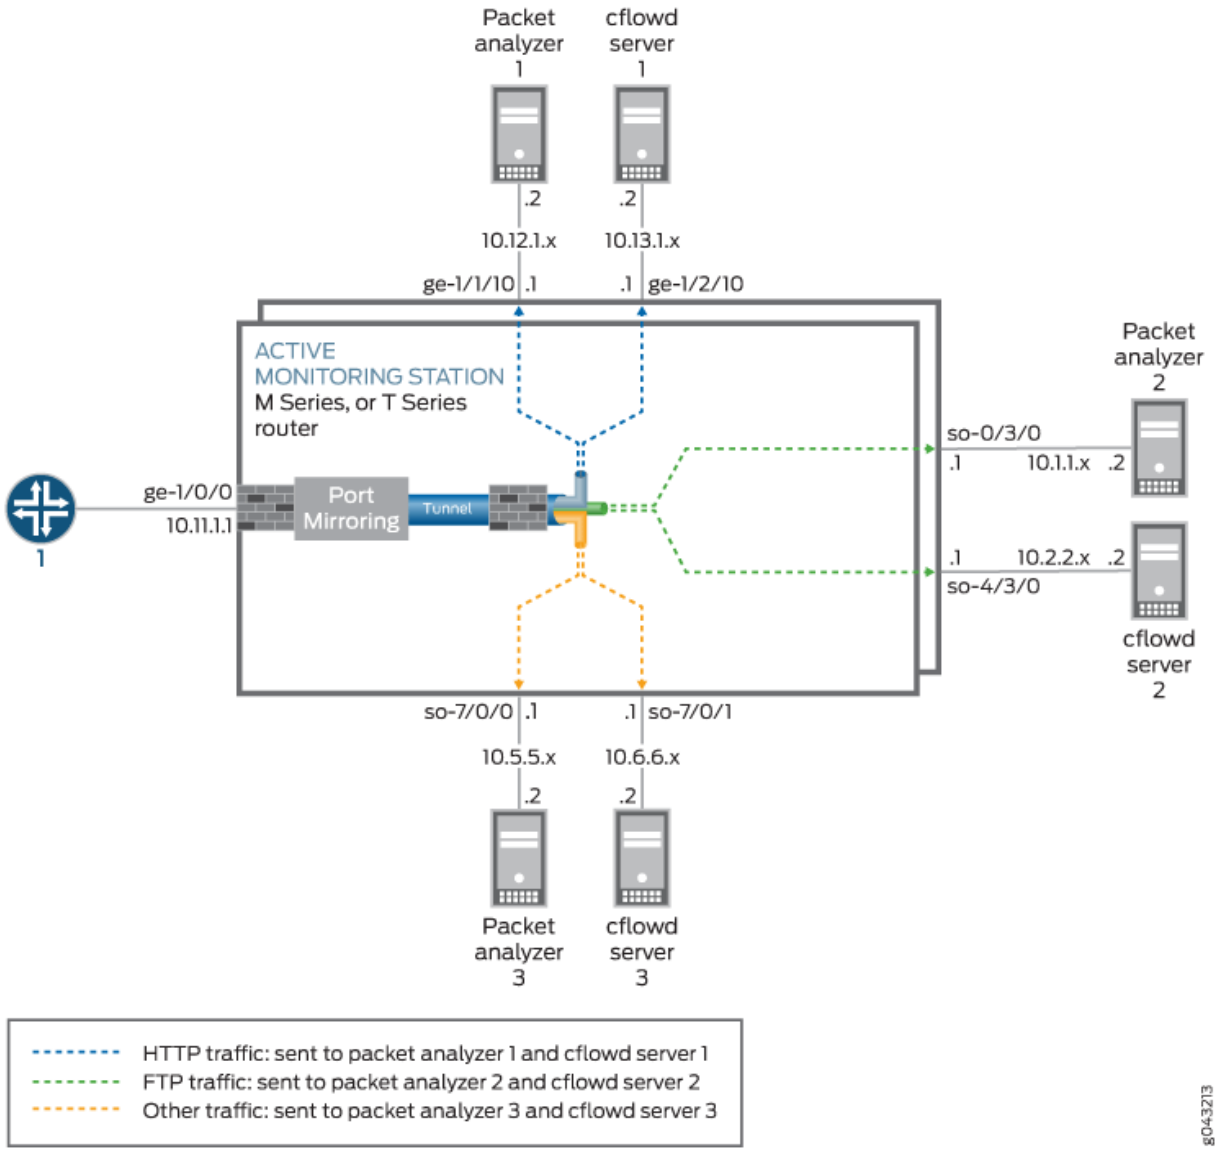


Figure 54 on page 1408 shows an example of how to configure multiple port mirroring with next-hop groups. All traffic enters the monitoring router at interface ge-1/0/0. A firewall filter counts and port-mirrors all incoming packets to a Tunnel Services PIC. A second filter is applied to the tunnel interface and splits the traffic into three categories: HTTP traffic, FTP traffic, and all other traffic. The three types

of traffic are assigned to three separate next-hop groups. Each next-hop group contains a unique pair of exit interfaces that lead to different groups of packet analyzers and flow servers.

NOTE: Instances enabled to mirror packets to different destinations from the same PFE, also use different sampling parameters for each instance. When we configure Layer2 Port-mirroring with both global port-mirroring and instance based port-mirroring, PIC level instances will override FPC level and the FPC level will override the Global instance.

```
[edit]
interfaces {
                  ge-1/0/0 { # This is the input interface where packets enter the router.
        unit 0 {
            family inet {
                filter {
                                        input mirror_pkts; # Here is where you apply the first
filter.
                }
                address 10.11.1.1/24;
            }
        }
    }
                  ge-1/1/0 { # This is an exit interface for HTTP packets.
        unit 0 {
            family inet {
                address 10.12.1.1/24;
            }
        }
    }
                  ge-1/2/0 { # This is an exit interface for HTTP packets.
        unit 0 {
            family inet {
                address 10.13.1.1/24;
            }
        }
    }
                  so-0/3/0 { # This is an exit interface for FTP packets.
        unit 0 {
            family inet {
                address 10.1.1.1/30;
            }
```

```
        }
    }
                so-4/3/0 { # This is an exit interface for FTP packets.
        unit 0 {
            family inet {
                address 10.2.2.1/30;
            }
        }
    }
                so-7/0/0 { # This is an exit interface for all remaining packets.
        unit 0 {
            family inet {
                address 10.5.5.1/30;
            }
        }
    }
                so-7/0/1 { # This is an exit interface for all remaining packets.
        unit 0 {
            family inet {
                address 10.6.6.1/30;
            }
        }
    }
                vt-3/3/0 { # The tunnel interface is where you send the port-mirrored traffic.
        unit 0 {
            family inet;
        }
        unit 1 {
            family inet {
                filter {
                                        input collect_pkts;  # This is where you apply the
second firewall filter.
                }
            }
        }
    }
}
forwarding-options {
                port-mirroring { # This is required when you configure next-hop groups.
        family inet {
            input {
                                    rate 1; # This port-mirrors all packets (one copy for every
packet received).
```

```
            }
                                output { # Sends traffic to a tunnel interface to enable
multiport mirroring.
                interface vt-3/3/0.1;
                no-filter-check;
            }
        }
    }
    next-hop-group ftp-traffic { # Point-to-point interfaces require you to specify the

```

```
            }
                            term http-term { # This term sends HTTP traffic to an HTTP next-
hop group.
                from {
                    protocol http;
                }
                                then next-hop-group http-traffic;
            }
                            term default { # This sends all remaining traffic to a final next-
hop group.
                                then next-hop-group default-collectors;
            }
        }
    }
}
```

Example: Layer 2 Port Mirroring to Multiple Destinations

On MX Series routers, you can mirror traffic to multiple destinations by configuring next-hop groups in Layer 2 port-mirroring firewall filters applied to tunnel interfaces.

1. Configure the chassis to support tunnel services at PIC 0 on FPC 2. This configuration includes two logical tunnel interfaces on FPC 2, PIC 0, port 10.

```
[edit]
chassis {
    fpc 2 {
        pic 0 {
            tunnel-services {
                bandwidth 1g;
            }
        }
    }
}
```

2. Configure the physical and logical interfaces for three bridge domains and one Layer 2 VPN CCC:

   - Bridge domain **bd** will span logical interfaces **ge-2/0/1.0** and **ge-2/0/1.1**.
   - Bridge domain **bd_next_hop_group** will span logical interfaces **ge-2/2/9.0** and **ge-2/0/2.0**.
   - Bridge domain **bd_port_mirror** will use the logical tunnel interface **lt-2/0/10.2**.

- Layer 2 VPN CCC **if_switch** will connect logical interfaces **ge-2/0/1.2** and **lt-2/0/10.1**.

```
[edit]
interfaces {
    ge-2/0/1 {
        flexible-vlan-tagging;
        encapsulation flexible-ethernet-services;
        unit 0 { # An interface on bridge domain 'bd'.
            encapsulation vlan-bridge;
            vlan-id 200;
            family bridge {
                filter {
                    input pm_bridge;
                }
            }
        }
        unit 1 { # An interface on bridge domain 'bd'.
            encapsulation vlan-bridge;
            vlan-id 201;
            family bridge {
                filter {
                    input pm_bridge;
                }
            }
        }
        unit 2 {
            encapsulation vlan-ccc;
            vlan-id 1000;
        }
    }
    ge-2/0/2 { # For 'bd_next_hop_group'
        encapsulation ethernet-bridge;
        unit 0 {
            family bridge;
        }
    }
    lt-2/0/10 {
        unit 1 {
            encapsulation ethernet-ccc;
            peer-unit 2;
        }
        unit 2 {
```

```
            encapsulation ethernet-bridge;
            peer-unit 1;
            family bridge {
                filter {
                    output redirect_to_nhg;
                }
            }
        }
    }
    ge-2/2/9 {
        encapsulation ethernet-bridge;
        unit 0 { # For 'bd_next_hop_group'
            family bridge;
        }
    }
}
```

3. Configure the three bridge domains and the Layer 2 VPN switching CCC:

   - Bridge domain **bd** spans logical interfaces **ge-2/0/1.0** and **ge-2/0/1.1**.
   - Bridge domain **bd_next_hop_group** spans logical interfaces **ge-2/2/9.0** and **ge-2/0/2.0**.
   - Bridge domain **bd_port_mirror** uses the logical tunnel interface **lt-2/0/10.2**.
   - Layer 2 VPN CCC **if_switch** connects interfaces **ge-2/0/1.2** and **lt-2/0/10.1**.

```
[edit]
bridge-domains {
    bd {
        interface ge-2/0/1.0;
        interface ge-2/0/1.1;
    }
    bd_next_hop_group {
        interface ge-2/2/9.0;
        interface ge-2/0/2.0;
    }
    bd_port_mirror {
        interface lt-2/0/10.2;
    }
}
protocols {
    mpls {
```

```
        interface all;
    }
    connections {
        interface-switch if_switch {
            interface ge-2/0/1.2;
            interface lt-2/0/10.1;
        }
    }
}
```

For detailed information about configuring the CCC connection for Layer 2 switching cross-connects, see the MPLS Applications User Guide.

4. Configure forwarding options:

   - Configure global port-mirroring properties to mirror **family vpls** traffic to an interface on the bridge domain **bd_port_mirror**.
   - Configure the next-hop group **nhg_mirror_to_bd** to forward Layer 2 traffic to the bridge domain **bd_next_hop_group**.

   Both of these forwarding options will be referenced by the port-mirroring firewall filter:

```
[edit]
forwarding-options {
    port-mirroring { # Global port mirroring properties.
        input {
            rate 1;
        }
        family vpls {
            output {
                interface lt-2/0/10.2; # Interface on 'bd_port_mirror' bridge domain.
                no-filter-check;
            }
        }
    }
    next-hop-group nhg_mirror_to_bd { # Configure a next-hop group.
        group-type layer-2; # Specify 'layer-2' for Layer 2; default 'inet' is for Layer 3.
        interface ge-2/0/2.0; # Interface on 'bd_next_hop_group' bridge domain.
        interface ge-2/2/9.0; # Interface on 'bd_next_hop_group' bridge domain.
    }
}
```

5. Configure two Layer 2 port-mirroring firewall filters for **family bridge** traffic:

   - **filter_pm_bridge**—Sends all **family bridge** traffic to the global port mirroring destination.
   - **filter_redirect_to_nhg**—Sends all **family bridge** traffic to the final next-hop group **nhg_mirror_to_bd**.

   Layer 2 port-mirroring firewall filters for **family bridge** traffic applies to traffic on a physical interface configured with encapsulation **ethernet-bridge**.

```
[edit]
firewall {
    family bridge {
        filter filter_pm_bridge {
            term term_port_mirror {
                then port-mirror;
            }
        }
        filter filter_redirect_to_nhg {
            term term_nhg {
                then next-hop-group nhg_mirror_to_bd;
            }
        }
    }
}
```

Release History Table

Release	Description
14.2	Starting with release 14.2, on routers containing an Internet Processor II application-specific integrated circuit (ASIC) or T Series Internet Processor, you can send a copy of an IP version 4 (IPv4) or IP version 6 (IPv6) packet from the router to an external host address or a packet analyzer for analysis.

Configuring Port Mirroring for Remote Destinations

IN THIS SECTION

Layer 2 Port Mirroring to Remote Destination by Using Destination as VLAN | **1417**

Configuration Layer 2 Port Mirroring to a Remote VLAN | 1417
Example: Configuring Layer 2 Port Mirroring to Remote VLAN | 1420

Layer 2 Port Mirroring to Remote Destination by Using Destination as VLAN

You configure port mirroring on an EX9200 switch to send copies of traffic to an output destination, such as an interface, a routing-instance, or a VLAN; and for the input traffic, you can configure a firewall filter term with various match conditions and actions.

When you configure VLAN as the output destination in a port-mirroring configuration, the traffic for each port-mirroring session is carried over a user-specified VLAN that is dedicated for that mirroring session in all participating switches. The mirrored traffic is copied onto that VLAN (also called as mirror VLAN) and forwarded to interfaces, which are members of the mirror VLAN. The destination interfaces, which are members of the mirror VLAN, can span across multiple switches in the network provided that the same remote mirroring VLAN is used for a mirroring session in all the switches.

You can use the `port-mirror` or `port-mirror-instance` action in the firewall filter configuration when you mirror traffic to remote destinations by configuring a VLAN as a port-mirroring output destination.

Configuration Layer 2 Port Mirroring to a Remote VLAN

IN THIS SECTION

Configuring Port Mirroring to a Remote VLAN | 1418

EX9200 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy the following packets:

- Packets entering or exiting a port
- Packets entering or exiting a VLAN

BEST PRACTICE: Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable port mirroring that you have configured when you are not using them.
- Specify individual interfaces as input rather than specifying all interfaces as input in a port mirroring configuration.
- Limit the amount of mirrored traffic by:
  - Using statistical sampling.
  - Setting ratios to select statistical samples.
  - Using firewall filters.

Configuring Port Mirroring to a Remote VLAN

To filter packets to be mirrored to a port-mirroring instance, create the instance and then use it as the action in the firewall filter. You can use firewall filters in both local and remote mirroring configurations.

If the same port-mirroring instance is used in multiple filters or terms, the packets are copied to the port-mirroring output port or port-mirroring VLAN only once.

To filter mirrored traffic, create a port-mirroring instance under the `[edit forwarding-options]` hierarchy level, and then create a firewall filter. The filter can use any of the available match conditions and must have `port-mirror-instance` *instance-name* as an action. This action in the firewall filter configuration provides the input to the port-mirroring instance.

To configure a port-mirroring instance with firewall filters:

1. Configure the port-mirroring instance name and set the output destination to a VLAN:

```
[edit forwarding-options]
user@switch# set port-mirroring instance instance-name output vlan (vlan-ID | vlan-name)
```

   For example, configure a port-mirroring instance `employee-monitor` and set the output destination to a VLAN ID `999`:

```
[edit forwarding-options]
user@switch# set port-mirroring instance employee-monitor output vlan 999
```

2. Create a firewall filter by using any of the available match conditions and assign the port-mirroring instance name as an action in the firewall filter configuration.

```
[edit firewall family ethernet-switching]
user@switch set filter filter-name term term-name from match-condition
user@switch set filter filter-name term term-name then match-condition
user@switch# set filter filter-name term term-namethen port-mirror-instance instance-name
```

For example, create a firewall filter called `example-filter` with two terms `no-analyzer` and `to-analyzer`, and assign the `to-analyzer` term to the `employee-monitor` port-mirroring instance:

a. Create the first term to define the traffic that should not pass through to the port-mirroring instance `employee-monitor`:

```
[edit firewall family ethernet-switching]
user@switch# set filter (Firewall Filters) example-filter term no-analyzer from source-
address 192.0.2.14
[edit firewall family ethernet-switching]
user@switch# set filter example-filter term no-analyzer from protocol tcp
[edit firewall family ethernet-switching]
user@switch# set filter example-filter term no-analyzer then accept
```

b. Create the second term to define the traffic that should pass through to the port-mirroring instance `employee-monitor`:

```
[edit firewall family ethernet-switching]
user@switch# set filter example-filter term to-analyzer from destination-port 80
[edit firewall family ethernet-switching]
user@switch# set filter example-filter term to-analyzer then port-mirror-instance employee-
monitor
[edit firewall family ethernet-switching]
user@switch# set filter example-filter term to-analyzer then accept
```

3. Apply the firewall filter to an interface or VLAN that provides input to the port-mirroring instance.

To apply a firewall filter to an interface:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching filer (input |
output) filter-name
```

To apply a firewall filter to a VLAN:

```
[edit]
user@switch# set vlan (vlan-ID or vlan-name) filter (input | output) filter-name
```

For example, to apply the `example-filter` firewall filter to the ge-0/0/1 interface:

```
[edit]
user@switch# set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input example-
filter
```

For example, to apply the `example-filter` filter to the `source-vlan` VLAN:

```
[edit]
user@switch# set vlan source-vlan filter input example-filter
```

Example: Configuring Layer 2 Port Mirroring to Remote VLAN

IN THIS SECTION

- Requirements | **1421**
- Overview and Topology | **1421**
- Mirroring Employee-to-Web Traffic for Remote Analysis | **1422**
- Verification | **1428**

EX9200 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering or existing a VLAN

You can analyze the mirrored traffic by using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to the `remote-analyzer` VLAN so that you can perform analysis from a remote monitoring station. The first example shows how to mirror all traffic entering the ports connected to employee computers. The

second example shows the same scenario but includes a filter to mirror only the employee traffic going to the Web.

BEST PRACTICE: Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable your configured mirroring sessions when you are not using them.
- Specify individual interfaces as input to analyzers rather than specifying all interfaces as input.
- Limit the amount of mirrored traffic by using firewall filters.

This example describes how to configure remote mirroring:

Requirements

Before you configure remote mirroring, be sure that:

- You have an understanding of mirroring concepts.
- The interfaces that port-mirroring will use as output interfaces have been configured on the switch.

Overview and Topology

IN THIS SECTION

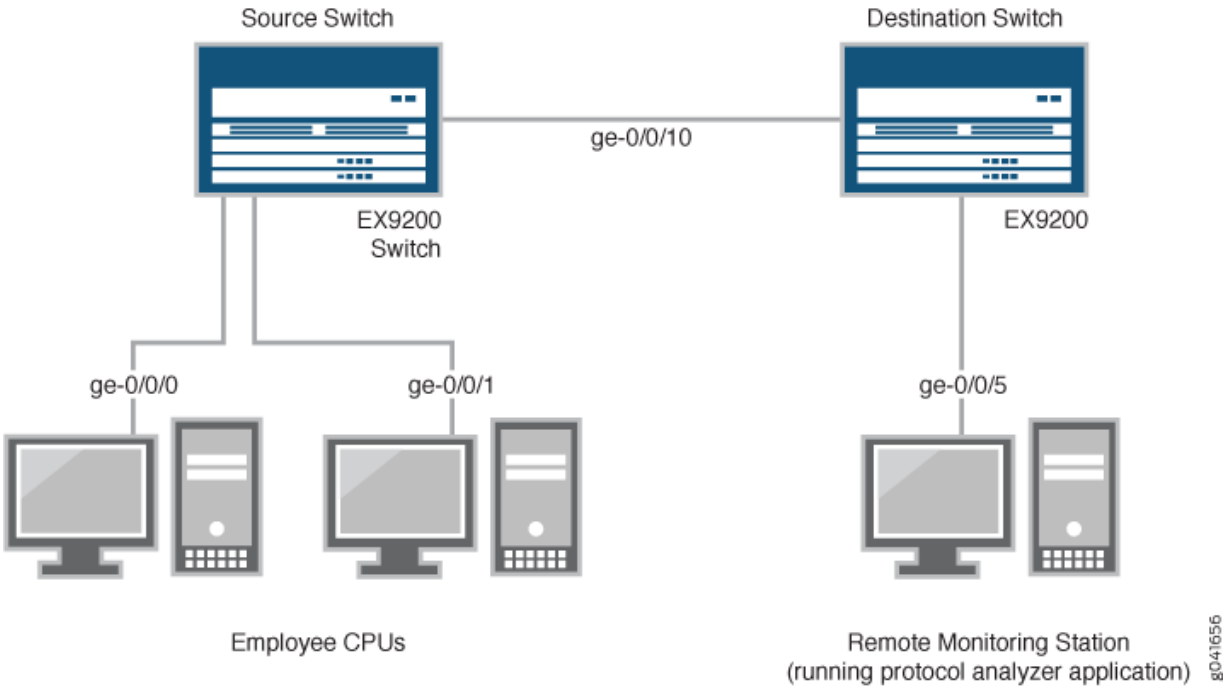
- Topology | **1422**

This topic includes two related examples that describe how to configure mirroring to the `remote-analyzer` VLAN so that analysis can be performed from a remote monitoring station. The first example shows how to configure a switch to mirror all traffic from employee computers. The second example shows the same scenario, but the setup includes a filter to mirror only the employee traffic going to the Web.

Figure 55 on page 1422 shows the network topology for both these example scenarios.

Topology

Figure 55: Remote Mirroring Network Topology Example



In this example:

1. Interface ge-0/0/0 is a Layer 2 interface, and interface ge-0/0/1 is a Layer 2 interface (both interfaces on the source switch) that serve as connections for employee computers.
2. Interface ge-0/0/10 is a Layer 2 interface that connects the source switch to the destination switch.
3. Interface ge-0/0/5 is a Layer 2 interface that connects the destination switch to the remote monitoring station.
4. VLAN `remote-analyzer` is configured on all switches in the topology to carry the mirrored traffic.

Mirroring Employee-to-Web Traffic for Remote Analysis

IN THIS SECTION

- Procedure | 1423

To configure port mirroring for remote traffic analysis of employee-to-Web traffic, perform these tasks:

Procedure

CLI Quick Configuration

To quickly configure port-mirroring to mirror employee traffic to the external Web, copy the following commands and paste them into the switch terminal window:

- Copy and paste the following commands in the source switch terminal window:

```
[edit]
set forwarding-options port-mirroring instance employee-web-monitor output vlan 999
 set vlans remote-analyzer vlan-id 999
 set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode access
 set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
 set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
 set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
 set firewall family ethernet-switching filter watch-employee term employee-to-corp then
accept
 set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
 set firewall family ethernet-switching filter watch-employee term employee-to-web then port-
mirror-instance employee-web-monitor
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
 set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

- Copy and paste the following commands in the destination switch terminal window:

```
[edit]
 set vlans remote-analyzer vlan-id 999
 set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode access
 set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
 set interfaces ge-0/0/5 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/5 unit 0 family ethernet-switching vlan members 999
```

Step-by-Step Procedure

To configure port mirroring of all traffic from the two ports connected to employee computers to the `remote-analyzer` VLAN for use from a remote monitoring station:

1. On the source switch:

   a. Configure the `employee-web-monitor` port-mirroring instance:

   ```
   [edit ]
   user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode access
   user@switch# set forwarding-options port-mirroring instance employee-web-monitor output
   vlan 999
   ```

   b. Configure the VLAN ID for the `remote-analyzer` VLAN:

   ```
   [edit vlans]
   user@switch# set remote-analyzer vlan-id 999
   ```

   c. Configure the interface to associate it with the `remote-analyzer` VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
   ```

   d. Configure the firewall filter called `watch-employee`:

   ```
   [edit firewall family ethernet-switching]
   user@switch# set filter watch-employee term employee-to-corp from destination-address
   192.0.2.16/28
   user@switch# set filter watch-employee term employee-to-corp from source-address
   192.0.2.16/28
   user@switch# set filter watch-employee term employee-to-corp then accept
   user@switch# set filter watch-employee term employee-to-web from destination-port 80
   user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
   employee-web-monitor
   ```

   In this configuration, the `employee-to-corp` term defines that traffic from destination-address `192.0.2.16/28` and source address `192.0.2.16/28` can be accepted to pass through the switch, and the `employee-to-web` term defines that traffic from port `80` must be sent to the port-mirroring instance `employee-web-monitor`.

e. Apply the firewall filter to the employee interfaces:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

2. On the destination switch:

- Configure the VLAN ID for the `remote-analyzer` VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

- Configure the interface on the destination switch for access mode and associate it with the `remote-analyzer` VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode access
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

- Configure the interface connected to the destination switch for access mode and associate it with the `remote-analyzer` VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/5 unit 0 family ethernet-switching interface-mode access
user@switch# set ge-0/0/5 unit 0 family ethernet-switching vlan members 999
```

Results

Check the results of the configuration on the source switch:

```
[edit]
user@switch> show
interfaces {
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode access;
```

```
                vlan {
                    members remote-analyzer;
                }
            }
        }
    }
    ge-0/0/0 {
        unit 0 {
            family ethernet-switching {
                filter {
                    input watch-employee;
                }
            }
        }
    }
    ge-0/0/1 {
        unit 0 {
            family ethernet-switching {
                filter {
                    input watch-employee;
                }
            }
        }
    }
}
firewall {
     family ethernet-switching {
        filter watch-employee {
            term employee-to-corp {
                from {
                    source-address {
                        192.0.2.16/28;
                    }
                    destination-address {
                        192.0.2.16/28;
                    }
                }
                then accept;
            }
            term employee-to-web {
                from {
                    destination-port 80;
                }
```

```
                then port-mirror-instance employee-web-monitor;
            }
        }
    }
}
 forwarding-options {
    analyzer employee-web-monitor {
        output {
            vlan {
                999;
            }
        }
    }
vlans {
    remote-analyzer {
        vlan-id 999;
    }
}
```

Check the results of the configuration on the destination switch:

```
[edit]
user@switch> show
vlans {
    remote-analyzer {
        vlan-id 999;
    }
}
interfaces {
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode access;
                vlan {
                    members remote-analyzer;
                }
            }
        }
    }
    ge-0/0/5 {
        unit 0 {
            family ethernet-switching {
```

```
                interface-mode access;
                vlan {
                    members remote-analyzer;
                }
            }
        }
    }
}
```

Verification

IN THIS SECTION

- Verifying That the Port-Mirroring Instance Has Been Correctly Created | **1428**

To confirm that the configuration is working properly, perform these tasks:

Verifying That the Port-Mirroring Instance Has Been Correctly Created

Purpose

Verify that the port-mirror instance `employee-web-monitor` has been created on the switch with the appropriate output VLAN.

Action

You can verify that the port-mirror is configured as expected by using the `show forwarding-options port-mirror` command. To view previously created analyzers that are disabled, go to the J-Web interface.

To verify that the port-mirror is configured as expected while monitoring employee traffic on the source switch, run the `show forwarding-options port-miror` command on the source switch. The following output is displayed for this configuration example:

```
user@switch> show forwarding-options port-mirror

Instance Name: employee-web-monitor
  Instance Id: 3
  Input parameters:
```

```
    Rate                 : 1
    Run-length           : 0
    Maximum-packet-length : 0
  Output parameters:
    Family              State     Destination                          Next-hop
    ethernet-switching  up       default-switch/remote-analyzer
```

Meaning

This output shows that the `employee-web-monitor` instance has a ratio of 1 (mirroring every packet, which is the default), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration is up (which indicates the proper state and that the analyzer is programmed, is mirroring the traffic entering ge-0/0/0 and ge-0/0/1, and is sending the mirrored traffic to the VLAN called `remote-analyzer`).

Configuring Port Mirroring Local and Remote Analysis

IN THIS SECTION

- Configuring Port Mirroring | **1429**
- Configuring Port Mirroring on SRX Devices | **1433**
- Examples: Configuring Port Mirroring for Local Analysis | **1436**
- Example: Mirroring Employee Web Traffic with a Firewall Filter | **1440**
- Example: Configuring Port Mirroring for Remote Analysis | **1445**

Configuring Port Mirroring

IN THIS SECTION

- Configuring Port Mirroring for Local Analysis | **1430**
- Configuring Port Mirroring for Remote Analysis | **1431**
- Filtering the Traffic Entering an Analyzer | **1432**

You use port mirroring to copy packets and send the copies to a device running an application such as a network analyzer or intrusion detection application so that you can analyze traffic without delaying it. You can mirror traffic entering or exiting a port or entering a VLAN, and you can send the copies to a local access interface or to a VLAN through a trunk interface.

We recommend that you disable port mirroring when you are not using it. To avoid creating a performance issue If you do enable port mirroring, we recommend that you select specific input interfaces instead of using the `all` keyword. You can also limit the amount of mirrored traffic by using a firewall filter.

NOTE: This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see Configuring Port Mirroring. For ELS details, see Using the Enhanced Layer 2 Software CLI.

NOTE: If you want to create additional analyzers without deleting an existing analyzer, first disable the existing analyzer by using the **disable analyzer *analyzer-name*** command.

NOTE: You must configure port mirroring output interfaces as **family ethernet-switching**.

Configuring Port Mirroring for Local Analysis

To mirror interface traffic to a local interface on the switch:

1. If you want to mirror traffic that is ingressing or egressing specific interfaces, choose a name for the port-mirroring configuration and configure what traffic should be mirrored by specifying the interfaces and direction of traffic:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

NOTE: If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs. If you do so, some VLAN packets might contain incorrect VLAN IDs.

NOTE: If you configure mirroring for packets that egress an access interface, the original packets lose any VLAN tags when they exit the access interface, but the mirrored (copied) packets retain the VLAN tags when they are sent to the analyzer system.

2. If you want to specify that all traffic entering a VLAN should be mirrored, choose a name for the port-mirroring configuration and specify the VLAN:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input ingress vlan vlan-name
```

NOTE: You cannot configure port mirroring to copy traffic that egresses a VLAN.

3. Configure the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name output interface interface-name
```

Configuring Port Mirroring for Remote Analysis

To mirror traffic to a VLAN for analysis at a remote location:

1. Configure a VLAN to carry the mirrored traffic:

```
[edit]
user@switch# set vlans vlan-name vlan-id number
```

2. Configure the interface that connects to another switch (the uplink interface) to trunk mode and associate it with the appropriate VLAN:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching port-mode trunk
vlan members (vlan-name | vlan-id)
```

3. Configure the analyzer:

a. Choose a name for the analyzer:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name
```

b. Specify the interface to be mirrored and whether the traffic should be mirrored on ingress or egress:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

c. Specify the appropriate IP address or VLAN as the output (a VLAN is specified in this example:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name output vlan (vlan-name | vlan-id)
```

If you specify an IP address as the output, note the following constraints:

- The address cannot be in the same subnetwork as any of the switch management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (`inet.0` routing table).
- The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

Filtering the Traffic Entering an Analyzer

NOTE: This functionality is not supported on NFX150 devices.

In addition to specifying which traffic to mirror by configuring an analyzer, you can also use a firewall filter to exercise more control over which packets are copied. For example, you might use a filter to specify that only traffic from certain applications be mirrored. The filter can use any of the available match conditions and must have an action of modifier of `port-mirror-instance` *instance-name*. If you use the same analyzer in multiple filters or terms, the output packets are copied only once.

When you use a firewall filter as the input to a port-mirroring instance, you send the copied traffic to a local interface or a VLAN just as you do when a firewall is not involved.

To configure port mirroring with filters:

1. Configure a port-mirroring instance for local or remote analysis. Configure only the output. For example, for local analysis enter:

```
[edit forwarding-options]
user@switch# set port-mirroring-instance instance-name output interface interface-name
```

> **NOTE**: You cannot configure input to this instance.

2. Create a firewall filter using any of the available match conditions. In a `then` term, specify include the action modifier `port-mirror-instance` *`instance-name`*.
3. Apply the firewall filter to the interfaces or VLAN that should provide the input to the analyzer:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching filter input
filter-name

[edit]
user@switch# set vlan (vlan-name | vlan-id) filter input filter-name
```

RELATED DOCUMENTATION

Overview of Firewall Filters (QFX Series)

Configuring Port Mirroring on SRX Devices

To configure port mirroring on an SRX device, you must first configure the `forwarding-options` and `interfaces` at the `[edit]` hierarchy level.

You must configure the `forwarding-options` statement to define an instance of the `mirror-to` port for port mirroring and also configure the interface to be mirrored.

> **NOTE**: The mirrored port and the mirror-to port must be under the same Broadcom chipset in an I/O card.

To configure port mirroring:

1. Specify the `rate` and `run-length` at the `[edit forwarding-options port-mirroring input]` hierarchy level:

   NOTE:

   - `rate`: Ratio of packets to be sampled (1 out of *N*) (1 through 65535)
   - `run-length`: Number of samples after initial trigger (0 through 20)

```
[edit]
    forwarding-options
        port-mirroring {
                input {
                    rate number;
                    run-length number;
                }
            }
```

2. To send the copies of the packet to the `mirror-to` port, include the `interface intf-name` statement at the `[edit forwarding-options port-mirroring family any output]` hierarchy level.

```
output {
    interface intf-name;
}
```

   NOTE: Port mirroring on SRX devices uses `family any` to transfer the `mirror-to` port information to the Packet Forwarding Engine (PFE). The mirroring engine copies all the packets from `mirrored` port to the `mirror-to` port.

NOTE: You can configure an `instance` clause to specify multiple `mirror-to` ports.

To mirror an interface, include the `port-mirror-instance` statement at the `[edit interface mirrored-intf-name]` hierarchy level.

The mirrored interface is configured with an instance name, defined in the `forwarding-options`. The `mirrored` port and the `mirror-to` port are linked through that instance.

```
instance {
    inst-name {
        input {
            rate number;
            run-length number;
        }
        family any {
            output {
                interface intf-name;
            }
        }
    }
}
interfaces
        mirrored-intf-name {
            port-mirror-instance instance-name;
        }
```

NOTE: Port mirroring on SRX devices does not differentiate the traffic direction, but mirrors the ingress and egress samples together.

A sample configuration for port mirroring is shown below:

```
mirror port ge-1/0/2 to port ge-1/0/9.0
forwarding-options
    port-mirroring {
        input {
            rate 1;
            run-length 10;
        }
        family any {
            output {
                interface ge-1/0/9.0;
            }
        }
        instance {
            inst1 {
                input {
```

```
                    rate 1;
                    run-length 10;
                }
                family any {
                    output {
                        interface ge-1/0/9.0;
                    }
                }
            }
        }
interfaces {
    ge-1/0/2  {
        port-mirror-instance inst1;
    }
}
```

Examples: Configuring Port Mirroring for Local Analysis

IN THIS SECTION

- Requirements | **1437**
- Overview and Topology | **1437**
- Example: Mirroring All Employee Traffic for Local Analysis | **1438**

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies to a local interface for local monitoring.

NOTE: This example uses the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see Using the Enhanced Layer 2 Software CLI.

This example describes how to configure port mirroring to copy traffic sent by employee computers to a switch to an access interface on the same switch.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2
- A switch

Overview and Topology

IN THIS SECTION

- Topology | 1437

This topic includes two related examples that describe how to mirror traffic entering interfaces on the switch to an access interface on the same switch. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

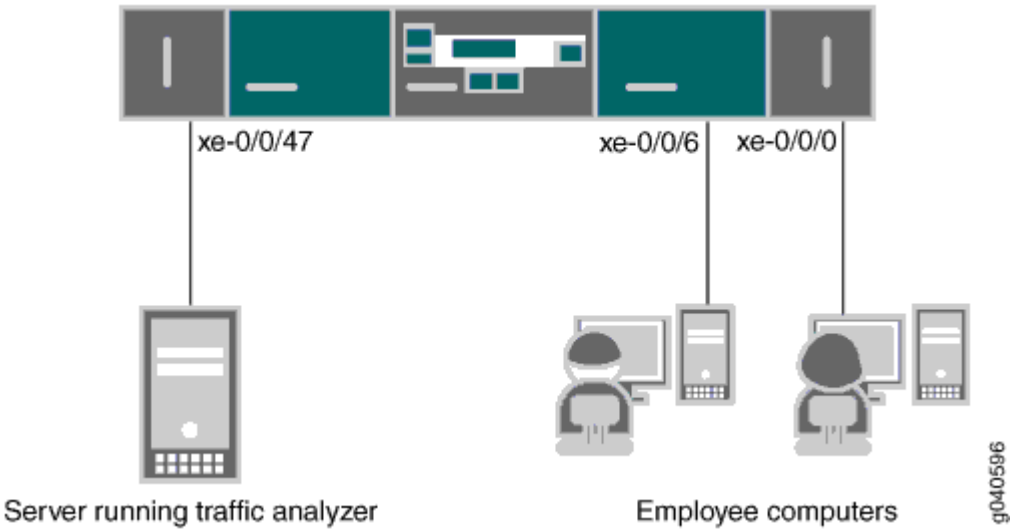
Topology

In this example, `xe-0/0/0` and `xe-0/0/6` serve as connections for employee computers. Interface `xe-0/0/47` is connected to a device running an analyzer application.

NOTE: Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.

Figure 56 on page 1438 shows the network topology for this example.

Figure 56: Network Topology for Local Port Mirroring Example



Example: Mirroring All Employee Traffic for Local Analysis

IN THIS SECTION

- Procedure | 1438

To configure port mirroring for all traffic sent by employee computers for local analysis, perform the tasks explained in this section.

Procedure

CLI Quick Configuration

To quickly configure local port mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into a switch terminal window:

```
[edit]
 set interfaces xe-0/0/0 unit 0 family ethernet-switching
```

```
set interfaces xe-0/0/6 unit 0 family ethernet-switching

set interfaces xe-0/0/47 unit 0 family ethernet-switching
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/6.0
set forwarding-options analyzer employee-monitor output interface xe-0/0/47.0
```

Step-by-Step Procedure

To configure an analyzer called `employee-monitor` and specify the input (source) interfaces and the output interface:

1. Configure the interfaces connected to employee computers as input interfaces for the port-mirror analyzer `employee-monitor`:

```
[edit forwarding-options]
 user@switch# set analyzer employee-monitor input ingress interface xe-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface xe-0/0/6.0
```

2. Configure the output analyzer interface for the `employee-monitor` analyzer. This will be the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor output interface xe-0/0/47.0
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show forwarding-options analyzer
    employee-monitor {
        input {
            ingress {
                interface xe-0/0/0.0;
                interface xe-0/0/6.0;
            }
        }
        output {
```

```
            interface {
                xe-0/0/47.0;
            }
        }
    }
}
```

Example: Mirroring Employee Web Traffic with a Firewall Filter

IN THIS SECTION

- Requirements | 1440
- Overview | 1440
- Configuring | 1440
- Verification | 1444

Requirements

This example uses the following hardware and software components:

- One QFX5100 switch
- Junos OS Release 14.1X53-D30

Overview

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more efficient use of your bandwidth and hardware and might be necessary due to constraints on these assets. To select specific traffic for mirroring, you use a firewall filter to match the desired traffic and direct it to a port-mirroring instance. The port-mirroring instance then copies the packets and sends them to the output VLAN, interface, or IP address.

Configuring

IN THIS SECTION

- Procedure | 1441

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

Procedure

CLI Quick Configuration

To quickly configure local port mirroring of traffic from employee computers that is destined for the Web, copy the following commands and paste them into a switch terminal window:

```
[edit]
 set interface xe-0/0/47 unit 0 family ethernet-switching
 set forwarding-options port-mirroring instance employee-web-monitor family ethernet-switching
output interface xe-0/0/47.0
 set firewall family ethernet-switching filter watch-employee term employee-to-corp from ip-
destination-address 192.0.2.16/28
 set firewall family ethernet-switching filter watch-employee term employee-to-corp from ip-
source-address 192.0.2.16/28
 set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
 set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
 set firewall family ethernet-switching filter watch-employee term employee-to-web then port-
mirror-instance employee-web-monitor
 set interfaces xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
 set interfaces xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

Step-by-Step Procedure

To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:

1. Configure the output interface:

```
[edit interfaces]
user@switch# set xe-0/0/47 unit 0 family ethernet-switching
```

2. Configure the `employee-web-monitor` output interface. (Configure only the output—the input comes from the filter.)

```
[edit forwarding-options]
user@switch# set port-mirroring instance employee-web-monitor family ethernet-switching
output interface xe-0/0/47.0
```

3. Configure a firewall filter called `watch-employee` that includes a term to match traffic sent to the Web and send it to the port-mirroring instance `employee-web-monitor`. Traffic to and from the corporate subnet (destination or source address of `192.0.2.16/28`) does not need to be copied, so create another term to accept that traffic before it reaches the term that sends Web traffic to the instance:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-corp from ip-destination-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from ip-source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor
```

4. Apply the firewall filter to the appropriate interfaces as an ingress filter (egress filters do not allow analyzers):

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

Results

Check the results of the configuration:

```
[edit]
user@switch# show
forwarding-options {
    port-mirroring {
        instance     {
```

```
            employee-web-monitor    {
                family ethernet-switching {
                        output {
                            interface xe-0/0/47.0;
                        }
                }
            }
        }
    }
}
...
firewall {
    family ethernet-switching {
        filter watch-employee {
            term employee-to-corp {
            from {
                    ip-source-address 192.0.2.16/28;
                    ip-destination-address 192.0.2.16/28;
                }
                then accept;
            term employee-to-web {
                from {
                    destination-port 80;
                }
                then port-mirror-instance employee-web-monitor;
            }
        }
    }
}
...
interfaces {
    xe-0/0/0 {
        unit 0 {
            family ethernet-switching {
                filter {
                    input watch-employee;
                }
            }
        }
    }
    xe-0/0/6 {
        family ethernet-switching {
            filter {
```

```
                input watch-employee;
            }
        }
    }
    xe-0/0/47 {
        family ethernet-switching;
    }
}
```

Verification

IN THIS SECTION

- Verifying That the Analyzer Has Been Correctly Created | **1444**

Verifying That the Analyzer Has Been Correctly Created

Purpose

Verify that the port-mirroring instance named `employee-web-monitor` has been created on the switch with the appropriate input interfaces and appropriate output interface.

Action

You can verify that the port mirror port-mirroring instance has been configured as expected by using the `show forwarding-options port-mirroring` command.

```
user@switch> show forwarding-options port-mirroring
Instance name                 : employee-web-monitor
Instance Id:  2
Input parameters:
    Rate                              :1
    Run-length                        :0
    Maximum packet length             :0
Output parameters:
    Family                State       Destination      Next-hop
```

```
    ethernet-switching     up         xe-0/0/47.0
```

Meaning

This output shows the following information about the port-mirroring instance `employee-web-monitor`:

- Has a rate of `1` (mirroring every packet, the default setting)
- The number of consecutive packets sampled (run-length) is `0`
- The maximum size of the original packet that was mirrored is `0` (`0` indicates the entire packet)
- The state of the output parameters: `up` indicates that the instance is mirroring the traffic entering the xe-0/0/0 and xe-0/0/6 interfaces, and is sending the mirrored traffic to the xe-0/0/47 interface

If the state of the output interface is `down` or if the output interface is not configured, the `state` value will be `down` and the instance will not be programmed for mirroring.

Example: Configuring Port Mirroring for Remote Analysis

- Overview and Topology | **1446**
- Mirroring All Employee Traffic for Remote Analysis | **1446**
- Mirroring Employee-to-Web Traffic for Remote Analysis | **1448**
- Verification | **1452**

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies either to a local interface for local monitoring or to a VLAN for remote monitoring. This example describes how to configure port mirroring for remote analysis.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2 for the QFX Series

- A switch

Overview and Topology

IN THIS SECTION

- Topology | 1446

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to an analyzer VLAN so that you can perform analysis using a remote device. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

Topology

In this example:

- Interfaces `ge-0/0/0` and `ge-0/0/1` are Layer 2 interfaces that connect to employee computers.
- Interface `ge-0/0/2` is a Layer 2 interface that connects to another switch.
- VLAN `remote-analyzer` is configured on all switches in the topology to carry the mirrored traffic.

NOTE: In addition to performing the configuration steps described here, you must also configure the analyzer VLAN (`remote-analyzer` in this example) on the other switches that are used to connect the source switch (the one in this configuration) to the one that the monitoring station is connected to.

Mirroring All Employee Traffic for Remote Analysis

IN THIS SECTION

- Procedure | 1447

Procedure

CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `edit` hierarchy level:

```
[edit]
 set vlans remote-analyzer vlan-id 999
 set interfaces ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
 set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
 set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
 set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
 set forwarding-options analyzer employee-monitor output vlan remote-analyzer
```

Step-by-Step Procedure

To configure basic remote port mirroring:

1. Configure the analyzer VLAN (called `remote-analyzer` in this example):

   ```
   [edit vlans]
   user@switch# set vlans remote-analyzer vlan-id 999
   ```

2. Configure the interface connected to another switch for trunk mode and associate it with the `remote-analyzer` VLAN:

   ```
   [edit interfaces]
   user@switch# set ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
   user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
   ```

3. Configure the `employee-monitor` analyzer:

   ```
   [edit forwarding-options]
   user@switch# set analyzer employee-monitor
   user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
   ```

```
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
user@switch# set analyzer employee-monitor output vlan remote-analyzer
```

4. Configure the `remote-analyzer` VLAN on the switches that connect this switch to the monitoring workstation.

Results

Check the results of the configuration:

```
[edit]
user@switch# show
 forwarding-options {
    analyzer employee-monitor {
        input {
            ingress {
                interface ge-0/0/0.0;
                interface ge-0/0/1.0;
            }
        }
        output {
            vlan {
                remote-analyzer;
            }
        }
    }
}
```

Mirroring Employee-to-Web Traffic for Remote Analysis

IN THIS SECTION

- CLI Quick Configuration | **1449**
- Procedure | **1449**

CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `edit` hierarchy level:

```
[edit]
set vlans remote-analyzer vlan-id 999
 set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
 set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999set forwarding-
options port-mirroring instance employee-web-monitor loss-priority high output vlan 999
 set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
 set firewall family ethernet-switching filter watch-employee term employee-to-web then port-
mirror-instance employee-web-monitor employee-web-monitor
set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
 set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

Procedure

Step-by-Step Procedure

1. Configure the analyzer VLAN (called `remote-analyzer` in this example):

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

2. Configure an interface to associate it with the `remote-analyzer` VLAN:

```
[edit interfaces]
user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

3. Configure the `employee-web-monitor` analyzer. (Configure only the output—the input comes from the filter.)

```
[edit forwarding-options]
user@switch# set forwarding-options port-mirroring instance employee-web-monitor output vlan
999
```

4. Configure a firewall filter called `watch-employee` to match traffic sent to the Web and send it to the analyzer `employee-web-monitor`:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor
```

5. Apply the firewall filter to the appropriate interfaces as an ingress filter:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filterinput watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

6. Configure the `remote-analyzer` VLAN on the switches that connect this switch to the monitoring workstation.

Results

Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
    ...
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
                vlan {
                    members remote-analyzer;
                }
```

```
            }
        }
    }
    ge-0/0/0 {
        unit 0 {
            family ethernet-switching {
                filter {
                    input watch-employee;
                }
            }
        }
    }
    ge-0/0/1 {
        unit 0 {
            family ethernet-switching {
                filter {
                    input watch-employee;
                }
            }
        }
    }
}
...
firewall {
     family ethernet-switching {
        ...
        filter watch-employee {
            term employee-to-web {
                from {
                    destination-port 80;
                }
                then port-mirror-instance employee-web-monitor;
            }
        }
    }
}
 forwarding-options analyzer {
    employee-web-monitor {
        output {
            vlan {
                999;
            }
        }
```

```
    }
vlans {
    remote-analyzer {
        vlan-id 999;
    }
}
```

Verification

IN THIS SECTION

- Verifying That the Analyzer Has Been Correctly Created | **1452**

Verifying That the Analyzer Has Been Correctly Created

Purpose

Verify that the analyzer named `employee-monitor` or `employee-web-monitor` has been created on the switch with the appropriate input interfaces and appropriate output interface.

Action

You can verify the port mirror analyzer is configured as expected using the `show analyzer` command.

```
user@switch> show analyzer
    Analyzer name                : employee-monitor
    Output VLAN                  : remote-analyzer
    Ingress monitored interfaces : ge-0/0/0.0
    Ingress monitored interfaces : ge-0/0/1.0
```

Meaning

This output shows that the `employee-monitor` analyzer is mirroring the traffic entering `ge-0/0/0` and `ge-0/0/1` and is sending the mirror traffic to the analyzer `remote-analyzer`.

Monitoring Port Mirroring

IN THIS SECTION

- Displaying Layer 2 Port-Mirroring Instance Settings and Status | 1453
- Displaying Next-Hop Group Settings and Status | 1453

Displaying Layer 2 Port-Mirroring Instance Settings and Status

To display the current state of port-mirroring instances, use the `show forwarding-options port-mirroring <terse | detail> <instance-name>` operational command.

For more information about displaying port mirroring instance settings and status, see the Junos OS Administration Library.

Displaying Next-Hop Group Settings and Status

To display the current state of next-hop groups, use the `show forwarding-options next-hop-group <terse | brief | detail> <group-name>` operational command.

For more information, see the CLI Explorer.

Egress Port Mirroring with VLAN Translation

IN THIS SECTION

- Problem | 1454
- Solution | 1454

Problem

Description

If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

Solution

This is expected behavior.

Understanding Q-in-Q Tunneling and VLAN Translation

Egress Port Mirroring with Private VLANs

IN THIS SECTION

- Problem | 1455
- Solution | 1455

Problem

Description

If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

Solution

This is expected behavior.

Troubleshooting Port Mirroring Configuration Error Messages

IN THIS SECTION

- An Analyzer Configuration Returns a “Multiple interfaces cannot be configured as a member of Analyzer output VLAN” Error Message | **1456**

Troubleshooting issues with port mirroring on EX Series switches:

An Analyzer Configuration Returns a “Multiple interfaces cannot be configured as a member of Analyzer output VLAN” Error Message

IN THIS SECTION

- Problem | **1456**
- Solution | **1456**

Problem

Description

In an analyzer configuration, if the VLAN to which mirrored traffic is sent contains more than one member interface, the following error message is displayed in the CLI when you commit the analyzer configuration and the commit fails:

```
Multiple interfaces cannot be configured as a member of Analyzer output VLAN <vlan name>
```

Solution

You must direct the mirrored traffic to a VLAN that has a single member interface. You can do this by completing either of these tasks:

- Reconfigure the existing VLAN to contain a single member interface. You can choose this method if you want to use the existing VLAN.

- Create a new VLAN with a single member interface and associate the VLAN with the analyzer.

To reconfigure the existing VLAN to contain only one member interface:

1. Remove member interfaces from the VLAN repeatedly by using either the `delete vlan` command or the `delete interface` command until the VLAN contains a single member interface:

   - ```
     [edit]
     user@switch# delete vlan vlan-id interface interface-name
     ```

   - ```
     [edit]
     user@switch# delete interface interface-name unit 0 family family-name vlan member vlan-id
     ```

2. (Optional) Confirm that the VLAN contains only one interface:

   ```
   [edit]
   user@switch# show vlans vlan-name
   ```

   The output for this command must display only one interface.

To create a new VLAN with a single member interface:

1. Configure a VLAN to carry the mirrored traffic:

   ```
   [edit]
   user@switch# set vlans vlan-name
   ```

2. Associate an interface with the VLAN:

   ```
   [edit]
   user@switch# set interfaces interface-name unit logical-unit-number family family-name vlan
   members vlan-name
   ```

3. Associate the VLAN with the analyzer:

   ```
   [edit ethernet-switching-options]
   user@switch# set analyzer analyzer-name output vlan vlan-name
   ```

Interpreting Messages Generated in Standard Format | 1467

Managing Host OS System Log and Core Files | 1468

System Log Overview

Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the device, including the following:

- Routine operations, such as creation of an Open Shortest Path First (*OSPF*) protocol adjacency or a user login to the configuration database
- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a peer process
- Emergency or critical conditions, such as router power-down due to excessive temperature

In Junos OS Release 17.3R1, the syslog-event daemon is able to handle the fxp0 in dedicated management routing instance for for IPv4 addressed remote host. As of Junos OS Release 18.1R1, the syslog-event daemon supports IPv6-based configuration when connecting to a remote host or an archival site and fxp0 is moved to dedicated management instance. In Junos OS Release 18.4R1, the syslog client can send messages through any routing instance you define at appropriate hierarchies. See "routing-instance (Syslog)" on page 2393.

NOTE: This topic describes system log messages for Junos OS processes and libraries and not the system logging services on a *Physical Interface Card* (*PIC*) such as the Adaptive Services PIC.

In Junos OS Evolved, each node has the standard `journalctl` tool, which is an interface to retrieve and filter the system journal. System log messages are parsed from the system journal. The `relay-eventd` process runs on all nodes and retrieves events (based on the syslog configuration) from the system journal as well as error messages from the different applications and forwards them to the `master-eventd` process. The `master-eventd` process runs on the primary Routing Engine and writes the log messages and errors to disk.

Use the System Log Explorer application to view or compare system log messages in different releases.

In Junos OS Evolved there is no `messages` file on the backup Routing Engine. All backup Routing Engine logs are in the `messages` file on the primary Routing Engine node.

Overview of Junos OS System Log Messages

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the System Log Explorer.

> **NOTE**: OCX Series switches comprise both the Junos OS and the host operating system (OS). For information about system logging on the host OS, see "Managing Host OS System Log and Core Files" on page 1468.

Junos OS System Log Configuration Hierarchy

To configure the router to log system messages, include the `syslog` statement at the `[edit system]` hierarchy level:

```
[edit system]
syslog {
    archive <files number> <size size <world-readable | no-world-readable>;
    console {
        facility severity;
    }
    file filename {
        facility severity;
        archive <archive-sites {ftp-url  <password password>}> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
        explicit-priority;
        match "regular-expression";
        structured-data {
            brief;
        }
    }
    host (hostname | other-routing-engine | scc-master) {
        facility severity;
```

```
        explicit-priority;
        facility-override facility;
        log-prefix string
        match "regular-expression";
        source-address source-address;
        structured-data {
            brief;
        }
    }
    source-address source-address;
    time-format (year | millisecond | year millisecond);
    user (username | *) {
        facility severity;
        match "regular-expression";
    }
}
```

Junos OS System Logging Facilities and Message Severity Levels

Table 136 on page 1462 lists the Junos OS system logging facilities that you can specify in configuration statements at the `[edit system syslog]` hierarchy level.

Table 136: Junos OS System Logging Facilities

Facility (number)	Type of Event or Error
`kernel` (0)	Actions performed or errors encountered by the Junos OS kernel
`user` (1)	Actions performed or errors encountered by user-space processes
`daemon` (3)	Actions performed or errors encountered by system processes
`authorization` (4)	Authentication and authorization attempts
`ftp` (11)	Actions performed or errors encountered by the FTP process
`ntp` (12)	Actions performed or errors encountered by the Network Time Protocol processes.

Table 136: Junos OS System Logging Facilities *(Continued)*

Facility (number)	Type of Event or Error
`security` (13)	Security related events or errors.
`dfc` (17)	Events related to dynamic flow capture
`external` (18)	Actions performed or errors encountered by the local external applications.
`firewall` (19)	Packet filtering actions performed by a firewall filter
`pfe` (20)	Actions performed or errors encountered by the Packet Forwarding Engine
`conflict-log` (21)	Specified configuration is invalid on the router type
`change-log` (22)	Changes to the Junos OS configuration
`interactive-commands` (23)	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client

Table 137 on page 1463 lists the severity levels that you can specify in configuration statements at the `[edit system syslog]` hierarchy level. The levels from `emergency` through `info` are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the `none` level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see "Disabling the System Logging of a Facility" on page 1491.

Table 137: System Log Message Severity Levels

Value	Severity Level	Description
N/A	`none`	Disables logging of the associated facility to a destination
0	`emergency`	System panic or other condition that causes the router to stop functioning

Table 137: System Log Message Severity Levels *(Continued)*

Value	Severity Level	Description
1	`alert`	Conditions that require immediate correction, such as a corrupted system database
2	`critical`	Critical conditions, such as hard errors
3	`error`	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
4	`warning`	Conditions that warrant monitoring
5	`notice`	Conditions that are not errors but might warrant special handling
6	`info`	Events or nonerror conditions of interest
7	`any`	Includes all severity levels

Junos OS Default System Log Settings

Table 138 on page 1465 summarizes the default system log settings that apply to all routers that run the Junos OS, and specifies which statement to include in the configuration to override the default value.

Table 138: Default System Logging Settings

Setting	Default	Overriding Statement	Instructions

Alternative facility for message forwarded to a remote machine	For change-log: local6
	For conflict-log: local5
	For dfc: local1
	For firewall: local3
	For interactive-commands: local7
	For pfe: local4
		[edit system syslog]
		host *hostname* {
		facility-override *facility*;
		}
			"Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination" on page 1523

Format of messages logged to a file	Standard Junos OS format, based on UNIX format	[edit system syslog]
		file *filename* {
		structured-data;
		}
			"Logging Messages in Structured-Data Format" on page 1480

Maximum number of files in the archived set	10	[edit system syslog]
		archive {
		files *number*;
		}
		file *filename* {
		archive {
		files *number*;
		}
		}
			"Specifying Log File Size, Number, and Archiving Properties" on page 1481

Maximum size of the log file	M Series, MX Series, and T Series: 1 megabyte (MB)
	TX Matrix: 10 MB
		[edit system syslog]
		archive {
		size *size*;
		}
		file *filename* {
		archive {
		size *size*;
		}
		}
			"Specifying Log File Size, Number, and Archiving Properties" on page 1481

Table 138: Default System Logging Settings *(Continued)*

Setting	Default	Overriding Statement	Instructions
Timestamp format	Month, date, hour, minute, second For example: `Aug 21 12:36:30`	`[edit system syslog]` `time-format` *`format`*;	"Including the Year or Millisecond in Timestamps" on page 1486

Users who can read log files	`root` user and users with the Junos OS `maintenance` permission	`[edit system syslog]`
		`archive {`
		`  world-readable;`
		`}`
		`file` *`filename`* `{`
		`  archive {`
		`  world-readable;`
		`  }`
		`}`
			"Specifying Log File Size, Number, and Archiving Properties" on page 1481

Junos OS Platform-Specific Default System Log Messages

The following messages are generated by default on specific routers. To view any of these types of messages, you must configure at least one destination for messages as described in "Junos OS Minimum System Logging Configuration" on page 1476.

- To log the kernel process message on an M Series, MX Series, or T Series router, include the `kernel info` statement at the appropriate hierarchy level:

```
[edit system syslog]
(console | file filename | host destination | user username) {
    kernel info;
}
```

- On a routing matrix composed of a TX Matrix router and T640 routers, the primary Routing Engine on each T640 router forwards all messages with a severity of `info` and higher to the primary Routing Engine on the TX Matrix router. This is equivalent to the following *configuration statement* included on the TX Matrix router:

```
[edit system syslog]
host scc-master {
```

```
    any info;
}
```

- Starting in Junos OS Release 15.1X49-D10 and Junos OS Release 17.3R1, likewise on a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 routers, the primary Routing Engine on each T1600 or T4000 LCC forwards to the primary Routing Engine on the TX Matrix Plus router all messages with a severity of `info` and higher. This is equivalent to the following configuration statement included on the TX Matrix Plus router:

  NOTE: From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router controls all the T1600 or T4000 routers connected to it in the routing matrix.

```
[edit system syslog]
host sfc0-master {
    any info;
}
```

Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the `explicit-priority` statement is included at the [*filename*] or [*hostname*] hierarchy level, a system log message has the following syntax:

```
timestamp        message-source: %facility-severity-TAG: message-text
```

- When directed to the console or to users, or when the `explicit-priority` statement is not included for files or remote hosts, a system log message has the following syntax:

```
timestamp        message-source: TAG: message-text
```

Table 139 on page 1468 describes the message fields.

Table 139: Fields in Standard-Format Messages

Field	Description
timestamp	Time at which the message was logged.
message-source	Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format: *hostname process[process-ID]*
facility	Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: Facility Codes Reported in Priority Information in "Including Priority Information in System Log Messages" on page 1482.
severity	Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: Numerical Codes for Severity Levels Reported in Priority Information in "Including Priority Information in System Log Messages" on page 1482.
TAG	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix. Not all processes on a routing platform use tags, so this field does not always appear.
message-text	Text of the message.

Managing Host OS System Log and Core Files

IN THIS SECTION

- Viewing Log Files On the Host OS System | **1470**
- Copying Log Files From the Host System To the Switch | **1470**
- Viewing Core Files On the Host OS System | **1470**

Copying Core Files From the Host System To the Switch | 1471
Cleaning Up Temporary Files on the Host OS | 1471

On Junos OS switches with a host OS, the Junos OS might generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

On OCX Series switches:

- System log messages are logged in the **/var/log/dcpfe.log** file in the host OS in the following scenarios:
  - When the forwarding daemon is initialized.
  - Messages are tagged as emergency (LOG_EMERG). A copy of the message is also sent to the **/var/log** directory on the switch.
- Messages from processes are available on the host system in the **/var/log** directory. System log messages from the host chassis management process are recorded in the **lcmd.log** file in the **/var/log** directory.

On QFX switches with a host OS:

- The Junos OS and host OS record log messages for system and process events, and generate core files upon certain system failures.
- These files are stored in directories such as /var/log for log messages, and /var/tmp or /var/crash for core files, depending on the type of host OS running on the switch.

For diagnostic purposes, you can access these host OS system log and core files from the Junos OS CLI on the switch. You can also clean up directories where the host OS stores temporary log and other files.

This topic includes these sections:

Viewing Log Files On the Host OS System

To view a list of the log files created on the host OS, enter the following command:

```
user@switch> show app-engine logs
```

Copying Log Files From the Host System To the Switch

To copy log files from the host OS to the switch, enter the following command:

```
user@switch> request app-engine file-copy log from-jhost source to-vjunos destination
```

For example, to copy the */cmd* log file to the switch, enter the following command:

```
user@switch> request app-engine file-copy log from-jhost lcmd.log  to-vjunos /var/tmp
```

Viewing Core Files On the Host OS System

To view the list of core files generated and stored on the host OS system, enter the following command:

```
user@switch> show app-engine crash
```

The list might look like this example output:

```
Compute cluster: default-cluster
  Compute node: default-node

     Crash Info
     ==========
     total 13480
     -rw-r--r-- 1 root root  178046 Feb 14 23:08 localhost.lcmd.26653.1455520135.core.tgz
     -rw-r--r-- 1 root root 4330343 Feb 15 00:45 localhost.dcpfe.7155.1455525926.core.tgz
     -rw-r--r-- 1 root root 4285901 Feb 15 01:49 localhost.dcpfe.25876.1455529782.core.tgz
     -rw-r--r-- 1 root root 4288508 Feb 15 02:39 localhost.dcpfe.713.1455532774.core.tgz
     -rw-r--r-- 1 root root  264079 Feb 15 17:02 localhost.lcmd.1144.1455584540.core.tgz
```

Copying Core Files From the Host System To the Switch

To copy core files from the host OS to the switch, enter the following command:

```
user@switch> request app-engine file-copy crash from-jhost source to-vjunos destination-dir-or-file-path
```

When the destination Junos OS path is a directory, the source filename is used by default. To rename the file at the destination, enter the destination argument as a full path including the desired filename.

For example, to copy the *localhost.lcmd.26653.1455520135.core.tgz* core archive file to the switch, enter the following command:

```
user@switch> request app-engine file-copy crash from-jhost
localhost.lcmd.26653.1455520135.core.tgz to-vjunos /var/tmp
```

To see the results on the switch, enter the following command:

```
user@switch> show system core-dumps
re0:
--------------------------------------------------------------------------
-rw-r--r--  1 root  field     178046 Feb 15 17:15 /var/tmp/
localhost.lcmd.26653.1455520135.core.tgz
total files: 1
```

Cleaning Up Temporary Files on the Host OS

To remove temporary files created on the host OS, enter the following command:

```
user@switch> request app-engine cleanup
```

For example, the following sample output on a switch with a Linux host OS shows cleanup of temporary files stored in /var/tmp:

```
Compute cluster: default-cluster

  Compute node: default-node

   Cleanup (/var/tmp)
```

```
=======
```

Release History Table

Release	Description
15.1X49-D10	Starting in Junos OS Release 15.1X49-D10 and Junos OS Release 17.3R1, likewise on a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 routers, the primary Routing Engine on each T1600 or T4000 LCC forwards to the primary Routing Engine on the TX Matrix Plus router all messages with a severity of info and higher.

Single-Chassis System Logging Configuration Overview

The Junos system logging utility is similar to the UNIX `syslogd` utility. This section describes how to configure system logging for a single-chassis system that runs the Junos OS.

System logging configuration for the Junos-FIPS software and for Juniper Networks routers in a Common Criteria environment is the same as for the Junos OS. For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

For information about configuring system logging for a routing matrix composed of a TX Matrix router and T640 routers, see "Configuring System Logging for a TX Matrix Router" on page 1496.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516.

You direct messages to one or more destinations by including the appropriate statement at the `[edit system syslog]` hierarchy level:

- To a named file in a local file system, by including the `file` statement. See "Directing System Log Messages to a Log File" on page 1519.
- To the terminal session of one or more specific users (or all users) when they are logged in to the router, by including the `user` statement. See "Directing System Log Messages to a User Terminal" on page 1520.
- To the router console, by including the `console` statement. See "Directing System Log Messages to the Console" on page 1520.
- To a remote machine that is running the `syslogd` utility or to the other Routing Engine on the router, by including the `host` statement.

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the System Log Explorer. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see "Logging Messages in Structured-Data Format" on page 1480.
- A message's facility and severity level are together referred to as its *priority*. By default, the standard Junos format for messages does not include priority information (structured-data format includes a priority code by default.) To include priority information in standard-format messages directed to a file or a remote destination, include the `explicit-priority` statement. For more information, see "Including Priority Information in System Log Messages" on page 1482.

- By default, the standard Junos format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see "Including the Year or Millisecond in Timestamps" on page 1486.

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by the Junos OS or messages generated on particular routers.

- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516.

You direct messages to one or more destinations by including the appropriate statement at the `[edit system syslog]` hierarchy level:

- To a named file in a local file system, by including the `file` statement. See "Directing System Log Messages to a Log File" on page 1519.

- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the `user` statement. See "Directing System Log Messages to a User Terminal" on page 1520.

- To the switch console, by including the `console` statement. See "Directing System Log Messages to the Console" on page 1520.

- To a remote machine that is running the **syslogd** utility, by including the `host` statement. See "Directing System Log Messages to a Remote Machine" on page 1521.

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it

easier for automated applications to extract information from the message. For more information, see Logging Messages in Structured-Data Format.

- A message's facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the `explicit-priority` statement. For more information, see "Including Priority Information in System Log Messages" on page 1482.

- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see Including the Year or Millisecond in Timestamps.

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see "Directing System Log Messages to a Remote Machine" on page 1521.

- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

NOTE: During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the `syslog` statement at the `[edit system]` hierarchy level:

```
[edit system]
syslog {
    archive <files number> <size size> <world-readable | no-world-readable>;
    console {
        facility severity;
    }
    file filename {
        facility severity;
        archive <archive-sites (ftp-url <password password>)> <files number> <size size> <start-
```

```
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
        explicit-priority;
        match "regular-expression";
        structured-data {
            brief;
        }
    }
    host hostname {
        facility severity;
        explicit-priority;
        facility-override facility;
        log-prefix string
        match "regular-expression";
    }
    source-address source-address;
    time-format (year | millisecond | year millisecond);
    user (username | *) {
        facility severity;
        match "regular-expression";
    }
}
```

Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the `syslog` statement at the `[edit system]` hierarchy level. Specify at least one destination for the messages, as described in Table 140 on page 1476. For more information about the configuration statements, see "Single-Chassis System Logging Configuration Overview" on page 1473.

Table 140: Minimum Configuration Statements for System Logging

Destination	Minimum Configuration Statements

File	`[edit system syslog]`
	`file filename {`
	`    facility severity;`
	`}`

Table 140: Minimum Configuration Statements for System Logging *(Continued)*

Destination	Minimum Configuration Statements

Terminal session of one, several, or all users	[edit system syslog]
	user (*username* | *) {
	facility severity;
	}

Router or switch console	[edit system syslog]
	console {
	facility severity;
	}

Remote machine or the other Routing Engine on the router or switch	[edit system syslog]
	host (*hostname* | other-routing-engine) {
	facility severity;
	}

Example: Configuring System Log Messages

IN THIS SECTION

- Requirements | **1478**
- Overview | **1478**
- Configuration | **1478**

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the `show log` command.

This example describes how to configure system log messages on the QFabric system.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

Configuration

IN THIS SECTION

- Procedure | 1478

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
```

```
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *Junos OS CLI User Guide* .

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the `error` severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

> **NOTE**: You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

> **NOTE**: On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of `any any` and a file size of 100 MBs. Therefore, you cannot specify the filename **messages** in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

Results

From configuration mode, confirm your configuration by entering the `show system` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
    file qflogs {
    }
    host 10.1.1.12 {
        any error;
    }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

> *show log*

Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet standard RFC 5424, *The Syslog Protocol*, which is at https://tools.ietf.org/html/rfc5424. The RFC establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the `structured-data` statement at the `[edit system syslog file filename]` hierarchy level:

```
[edit system syslog file filename]
facility severity;
structured-data {
    brief;
}
```

The optional `brief` statement suppresses the English-language text that appears by default at the end of a message to describe the error or event.

The structured format is used for all messages logged to the file that are generated by a Junos process or software library.

> **NOTE**: If you include either or both of the `explicit-priority` and `time-format` statements along with the `structured-data` statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos OS system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called ***logfile*** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file ***logfile*.0.gz**. The logging utility then opens and writes to a new active file called ***logfile***. This process is also known as file rotation. When the new ***logfile*** reaches the configured maximum size, ***logfile*.0.gz** is renamed ***logfile*.1.gz**, and the new ***logfile*** is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the `root` user and users who have Junos OS `maintenance` permission.

Junos OS provides a configuration statement `log-rotate-frequency` that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the `log-rotate-frequency` statement at the `[edit system syslog]` hierarchy level.

You can include the `archive` statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the `archive` statement at the `[edit system syslog]` hierarchy level:

```
archive  <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the `archive` statement at the `[edit system syslog file filename]` hierarchy level:

```
archive <archive-sites (ftp-url  <password password>)> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable> ;
```

`archive-sites site-name` specifies a list of archive sites that you want to use for storing files. The *site-name* value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see Format for Specifying Filenames and URLs in Junos OS CLI Commands.

`binary-data` Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the `no-binary-data` statement.

`files number` specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

`size size` specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter `m` after the integer. There is no space between the digits and the `k`, `m`, or `g` units letter.

`start-time "YYYY-MM-DD.hh:mm"` defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the `archive-sites` statement.

`transfer-interval interval` defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

`world-readable` enables all users to read log files. To restore the default permissions, include the `no-world-readable` statement.

Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority

information in standard-format messages directed to a file, include the `explicit-priority` statement at the `[edit system syslog file filename]` hierarchy level:

```
[edit system syslog file filename]
facility severity;
explicit-priority;
```

NOTE: Messages logged in structured-data format include priority information by default. If you include the `structured-data` statement at the `[edit system syslog file filename]` hierarchy level along with the `explicit-priority` statement, the `explicit-priority` statement is ignored and messages are logged in structured-data format.

For information about the `structured-data` statement, see "Logging Messages in Structured-Data Format" on page 1480.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the `explicit-priority` statement at the `[edit system syslog host (hostname | other-routing-engine)]` hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
explicit-priority;
```

NOTE: The `other-routing-engine` option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the `facility-override` statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see "Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination" on page 1523.

When the `explicit-priority` statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

```
FACILITY-severity[-TAG]
```

(The tag is a unique identifier assigned to some Junos OS system log messages.)

In the following example, the CHASSISD_PARSE_COMPLETE message belongs to the daemon facility and is assigned severity info (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE: Using new configuration
```

When the explicit-priority statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new configuration
```

System Log Facility Codes and Numerical Codes Reported in Priority Information

Table 141 on page 1484 lists the facility codes that can appear in system log messages and maps them to facility names.

NOTE: If the second column in Table 141 on page 1484 does not include the Junos OS facility name for a code, the facility cannot be included in a statement at the [edit system syslog] hierarchy level. Junos OS might use the facilities in Table 141 on page 1484—and others that are not listed—when reporting on internal operations.

Table 141: Facility Codes Reported in Priority Information

Code	Junos Facility Name	Type of Event or Error
AUTH	authorization	Authentication and authorization attempts
AUTHPRIV		Authentication and authorization attempts that can be viewed by superusers only
CHANGE	change-log	Changes to Junos OS configuration
CONFLICT	conflict-log	Specified configuration is invalid on the router type
CONSOLE		Messages written to **/dev/console** by the kernel console output r
CRON		Actions performed or errors encountered by the cron process

Table 141: Facility Codes Reported in Priority Information *(Continued)*

Code	Junos Facility Name	Type of Event or Error
DAEMON	daemon	Actions performed or errors encountered by system processes
DFC	dfc	Actions performed or errors encountered by the dynamic flow capture process
FIREWALL	firewall	Packet filtering actions performed by a firewall filter
FTP	ftp	Actions performed or errors encountered by the FTP process
INTERACT	interactive-commands	Commands issued at the Junos OS CLI prompt or invoked by a client application such as a Junos XML protocol or NETCONF client
KERN	kernel	Actions performed or errors encountered by the Junos kernel
NTP		Actions performed or errors encountered by the Network Time Protocol (NTP)
PFE	pfe	Actions performed or errors encountered by the Packet Forwarding Engine
SYSLOG		Actions performed or errors encountered by the Junos system logging utility
USER	user	Actions performed or errors encountered by user-space processes

Table 142 on page 1486 lists the numerical severity codes that can appear in system log messages and maps them to severity levels.

Table 142: Numerical Codes for Severity Levels Reported in Priority Information

Numerical Code	Severity Level	Description
0	emergency	System panic or other condition that causes the ro functioning
1	alert	Conditions that require immediate correction, such corrupted system database
2	critical	Critical conditions, such as hard errors
3	error	Error conditions that generally have less serious co than errors in the emergency, alert, and critical leve
4	warning	Conditions that warrant monitoring
5	notice	Conditions that are not errors but might warrant sp
6	info	Events or nonerror conditions of interest

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the `time-format` statement at the `[edit system syslog]` or `[edit security log]` hierarchy levels:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the `[edit system syslog time-format]` statement.

The modified timestamp is used in messages directed to each destination configured by a `file`, `console`, or `user` statement at the `[edit system syslog]` hierarchy level, but not to destinations configured by a `host` statement.

NOTE: By default, in a FreeBSD console, the additional time information is not available in system log messages directed to each destination configured by a `host` statement. However, in a Junos OS specific implementation using the FreeBSD console, the additional time information is available in system log messages directed to each destination.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the `[edit system syslog file` *`filename`*`]` hierarchy level along with the `time-format` statement, the `time-format` statement is ignored and messages are logged in structured-data format.

For information about the `structured-data` statement, see "Logging Messages in Structured-Data Format" on page 1480.

Using Strings and Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also match messages against strings and regular expressions to refine which messages from a facility are logged to a file, a user terminal, or a remote destination.

The match-strings and match configuration statements enable you to match system log messages against a string or regular expression, respectively. You can include these statements at the following hierarchy levels:

- [edit system syslog file *filename*] (for a file)
- [edit system syslog user (*username* | *)] (for a specific user session or for all user sessions on a terminal)
- [edit system syslog host (*hostname* | other-routing-engine)] (for a remote destination)

To evaluate messages against a regular expression and only log matching messages to the given destination, include the match statement and specify the regular expression:

```
match "regular-expression";
```

Starting with Junos OS Release 16.1, you can use simple string comparisons to more efficiently filter messages, because it is less CPU-intensive than matching against complex regular expressions. To specify the text string that must appear in a message for the message to be logged to a destination, include the match-strings statement and specify the matching string or list of strings:

```
match-strings string-name;
```

```
match-strings [string1 string2];
```

The match-strings and match statements select messages with the configured facility and severity that match the given string or regular expression. The match-strings statement performs a simple string comparison, and as a result, it is less CPU-intensive than using the match statement to match against complex regular expressions. If you configure both the match and match-strings statements for the same destination, Junos OS evaluates the match-strings condition first; if the message includes any of the configured substrings, then the message is logged and the match condition is not evaluated. If the match-strings condition is not satisfied, then the system evaluates the message against the regular expression in the match configuration statement.

When specifying regular expressions for the match statement, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, http://www.ieee.org).

Table 143 on page 1489 specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term term refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: The `match` statement is not case-sensitive.

Table 143: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
| (pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
$ (dollar sign)	End of a line.
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

Using Strings and Regular Expressions

Filter messages that belong to the `interactive-commands` facility, directing those that include the string `configure` to the terminal of the root user:

```
[edit system syslog]
user root {
    interactive-commands any;
    match-strings configure;
}
```

Messages like the following appear on the `root` user's terminal when a user issues a `configure` command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command 'configure private'
```

Filter messages that belong to the `daemon` facility and have a severity of `error` or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
    daemon error;
    match "!(.*snmpd.*)";
}
file snmpd-errors {
    daemon error;
    match-strings snmpd;
}
```

Junos System Log Regular Expression Operators for the match Statement

Table 144: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.

Table 144: Regular Expression Operators for the match Statement *(Continued)*

Operator	Matches
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
| (pipe)	One of the terms that appear on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of t exclamation point is Junos OS–specific.
^ (caret)	The start of a line, when the caret appears outside square bracket One instance of any character that does not follow it within squa brackets, when the caret is the first character inside square brack
$ (dollar sign)	The end of a line.
[ ] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0 matches any letter or number.
( ) (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the re expression.

Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the *facility* `none` statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the `any` *severity* statement and then a *facility* `none` statement for each facility that you do not want to log. For example, the following logs all messages at the `error` level or

higher to the console, except for messages from the `daemon` and `kernel` facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
    any error;
    daemon none;
    kernel none;
}
file internals {
    daemon info;
    kernel info;
}
```

Examples: Configuring System Logging

The following example shows how to configure the logging of messages about all commands entered by users at the CLI prompt or invoked by client applications such as Junos OS XML protocol or NETCONF client applications, and all authentication or authorization attempts, both to the file **cli-commands** and to the terminal of any user who is logged in:

```
[edit system]
syslog {
    file cli-commands {
        interactive-commands info;
        authorization info;
    }
    user * {
        interactive-commands info;
        authorization info;
    }
}
```

The following example shows how to configure the logging of all changes in the state of alarms to the file **/var/log/alarms**:

```
[edit system]
syslog {
    file alarms {
        kernel warning;
```

```
    }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user `alex`, to a remote machine, and to the console:

```
[edit system]
syslog {
    /* write all security-related messages to file /var/log/security */
    file security {
        authorization info;
        interactive-commands info;
    }
    /* write messages about potential problems to file /var/log/messages: */
    /* messages from "authorization" facility at level "notice" and above, */
    /* messages from all other facilities at level "warning" and above */
    file messages {
        authorization notice;
        any warning;
    }
    /* write all messages at level "critical" and above to terminal of user "alex" if */
    /* that user is logged in */
    user alex {
        any critical;
    }
    /* write all messages from the "daemon" facility at level "info" and above, and */
    /* messages from all other facilities at level "warning" and above, to the */
    /* machine monitor.mycompany.com */
    host monitor.mycompany.com {
        daemon info;
        any warning;
    }
    /* write all messages at level "error" and above to the system console */
    console {
        any error;
    }
}
```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the `interactive-commands` facility at the following severity levels:

- info—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file **/var/log/user-actions**.
- notice—Logs a message when users issue the configuration mode commands rollback and commit. The example writes the messages to the terminal of user philip.
- warning—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

```
[edit system]
syslog {
    file user-actions {
        interactive-commands info;
    }
    user philip {
        interactive-commands notice;
    }
    console {
        interactive-commands warning;
    }
}
```

Examples: Assigning an Alternative Facility

Log all messages generated on the local routing platform at the error level or higher to the local0 facility on the remote machine called monitor.mycompany.com:

```
[edit system syslog]
host monitor.mycompany.com {
    any error;
    facility-override local0;
}
```

Configure routing platforms located in California and routing platforms located in New York to send messages to a single remote machine called central-logger.mycompany.com. The messages from California are assigned alternative facility local0 and the messages from New York are assigned to alternative facility local2.

- Configure California routing platforms to aggregate messages in the `local0` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local0;
}
```

- Configure New York routing platforms to aggregate messages in the `local2` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local2;
}
```

On `central-logger` you can then configure the system logging utility to write messages from the `local0` facility to the file `california-config` and the messages from the `local2` facility to the file `new-york-config`.

Configuring System Logging for a TX Matrix Router

To configure system logging for all routers in a routing matrix composed of a TX Matrix router and T640 routers, include the `syslog` statement at the `[edit system]` hierarchy level on the TX Matrix router. The `syslog` statement applies to every router in the routing matrix.

```
[edit system]
syslog {
    archive <files number> <size size <world-readable | no-world-readable>;
    console {
        facility severity;
    }
    file filename {
        facility severity;
        archive <archive-sites {ftp-url  <password password>}> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
        explicit-priority;
        match "regular-expression";
        structured-data {
            brief;
        }
    }
    host (hostname | other-routing-engine | scc-master) {
        facility severity;
        explicit-priority;
        facility-override facility;
        log-prefix string;
        match "regular-expression";
        source-address source-address;
        port port number;
    }
    source-address source-address;
    time-format (year | millisecond | year millisecond);
     (username | *) {
        facility severity;
        match "regular-expression";
```

```
    }
}
```

When included in the configuration on the TX Matrix router, the following configuration statements have the same effect as on a single-chassis system, except that they apply to every router in the routing matrix:

- `archive`—Sets the size and number of log files on each platform in the routing matrix. See "Specifying Log File Size, Number, and Archiving Properties" on page 1481.
- `console`—Directs the specified messages to the console of each platform in the routing matrix. See "Directing System Log Messages to the Console" on page 1520.
- `file`—Directs the specified messages to a file of the same name on each platform in the routing matrix. See "Directing System Log Messages to a Log File" on page 1519.
- `match`—Limits the set of messages logged to a destination to those that contain (or do not contain) a text string matching a regular expression. See "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

  The separate `match` statement at the `[edit system syslog host scc-master]` hierarchy level applies to messages forwarded from the T640 routers to the TX Matrix router. See "Configuring Optional Features for Forwarded Messages on a TX Matrix Router" on page 1508.
- `port`—Specifies the port number of the remote syslog server.
- `source-address`—Sets the IP address of the router to report in system log messages as the message source, when the messages are directed to the remote machines specified in all *hostname* statements at the `[edit system syslog]` hierarchy level, for each platform in the routing matrix. On a routing matrix composed of a TX Matrix router and T640 routers, the address is not reported by the T640 routers in messages directed to the other Routing Engine on each router or to the TX Matrix router. See "Specifying an Alternative Source Address for System Log Messages Directed to a Remote Destination" on page 1522.
- `structured-data`—Writes messages to a file in structured-data format. See "Logging Messages in Structured-Data Format" on page 1480.
- `time-format`—Adds the millisecond, year, or both to the timestamp in each standard-format message. See "Including the Year or Millisecond in Timestamps" on page 1486.
- `user`—Directs the specified messages to the terminal session of one or more specified users on each platform in the routing matrix that they are logged in to. See "Directing System Log Messages to a User Terminal" on page 1520.

The effect of the other statements differs somewhat for a routing matrix than for a single-chassis system.

Configuring System Logging for a TX Matrix Plus Router

From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router (also called the switch-fabric chassis SFC) controls all the T1600 or T4000 routers (also called the line-card chassis LCC) in the routing matrix.

To configure system logging for all routers in a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 LCCs, include the `syslog` statement at the `[edit system]` hierarchy level on the SFC. The `syslog` statement applies to every router in the routing matrix.

```
[edit system]
syslog {
    archive <files number> <size size <world-readable | no-world-readable>;
    console {
        facility severity;
    }
    file filename {
        facility severity;
        archive <archive-sites {ftp-url  <password password>}> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
        explicit-priority;
        match "regular-expression";
        structured-data {
            brief;
        }
    }
    host (hostname | other-routing-engine | sfc0-master) {
        facility severity;
        explicit-priority;
        facility-override facility;
        log-prefix string;
        match "regular-expression";
    }
    source-address source-address;
    time-format (year | millisecond | year millisecond);
     (username | *) {
        facility severity;
        match "regular-expression";
    }
}
```

When included in the configuration on the TX Matrix Plus router, the following configuration statements have the same effect as on a single-chassis system, except that they apply to every router in the routing matrix.

- `archive`—Sets the size and number of log files on each router in the routing matrix. See "Specifying Log File Size, Number, and Archiving Properties" on page 1481.
- `console`—Directs the specified messages to the console of each router in the routing matrix. See "Directing System Log Messages to the Console" on page 1520.
- `file`—Directs the specified messages to a file of the same name on each router in the routing matrix. See "Directing System Log Messages to a Log File" on page 1519.
- `match`—Limits the set of messages logged to a destination to those that contain (or do not contain) a text string matching a regular expression. See "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

  The separate `match` statement at the `[edit system syslog host sfc0-master]` hierarchy level applies to messages forwarded from the T1600 or T4000 LCCs to the SFC. See "Configuring Optional Features for Forwarded Messages on a TX Matrix Plus Router" on page 1510.
- `source-address`—Sets the IP address of the router as the message source in system log messages when the messages are directed to the remote machines specified in all `host` *`hostname`* statements at the `[edit system syslog]` hierarchy level, for each router in the routing matrix. On a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 LCCs, the address is not reported by the T1600 or T4000 routers in messages directed to the other Routing Engine on each router or to the TX Matrix Plus router. See "Specifying an Alternative Source Address for System Log Messages Directed to a Remote Destination" on page 1522.
- `structured-data`—Writes messages to a file in structured-data format. See "Logging Messages in Structured-Data Format" on page 1480.
- `time-format`—Adds the millisecond, year, or both to the timestamp in each standard-format message. See "Including the Year or Millisecond in Timestamps" on page 1486.
- `user`—Directs the specified messages to the terminal session of one or more specified users on each router in the routing matrix that they are logged in to. See "Directing System Log Messages to a User Terminal" on page 1520.

The effect of the other statements differs somewhat for a routing matrix than for a single-chassis system.

Configuring Message Forwarding to the TX Matrix Router

By default, the primary Routing Engine on each T640 router forwards to the primary Routing Engine on the TX Matrix router all messages from all facilities with severity level of `info` and higher. To change the

facility, the severity level, or both, include the `host scc-master` statement at the `[edit system syslog]` hierarchy level on the TX Matrix router:

```
[edit system syslog]
host scc-master {
    facility severity;
}
```

To disable message forwarding, set the facility to `any` and the severity level to `none`:

```
[edit system syslog]
host scc-master {
    any none;
}
```

In either case, the setting applies to all T640 routers in the routing matrix.

To capture the messages forwarded by the T640 routers (as well as messages generated on the TX Matrix router itself), you must also configure system logging on the TX Matrix router. Direct the messages to one or more destinations by including the appropriate statements at the `[edit system syslog]` hierarchy level on the TX Matrix router:

- To a file, as described in "Directing System Log Messages to a Log File" on page 1519.
- To the terminal session of one or more specific users (or all users), as described in "Directing System Log Messages to a User Terminal" on page 1520.
- To the console, as described in "Directing System Log Messages to the Console" on page 1520.
- To a remote machine that is running the syslogd utility or to the other Routing Engine. For more information, see "Directing Messages to a Remote Destination from the Routing Matrix Based on the TX Matrix Router" on page 1528.

As previously noted, the configuration statements included on the TX Matrix router also configure the same destinations on each T640 router in the routing matrix.

When specifying the severity level for local messages (at the `[edit system syslog (file | host | console | user)]` hierarchy level) and forwarded messages (at the `[edit system syslog host scc-master]` hierarchy level), you can set the same severity level for both, set a lower severity level for local messages, or set a higher severity level for local messages. The following examples describe the consequence of each configuration. (For simplicity, the examples use the `any` facility in every case. You can also specify different severities for different facilities, with more complex consequences.)

Configuring Message Forwarding to the TX Matrix Plus Router

From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router (also called the switch-fabric chassis SFC) controls all the T1600 or T4000 routers (also called the line-card chassis LCC) in the routing matrix.

By default, the primary Routing Engine on each connected T1600 or T4000 LCC forwards to the primary Routing Engine on the SFC all messages from all facilities with severity level of `info` and higher. To change the facility, the severity level, or both, include the `host sfc0-master` statement at the `[edit system syslog]` hierarchy level on the SFC:

```
[edit system syslog]
host sfc0-master {
    facility severity;
}
```

To disable message forwarding, set the facility to `any` and the severity level to `none`:

```
[edit system syslog]
host sfc0-master {
    any none;
}
```

In either case, the setting applies to all connected LCCs in the routing matrix.

To capture the messages forwarded by the T1600 or T4000 LCCs (as well as messages generated on the SFC itself), you must also configure system logging on the SFC. Direct the messages to one or more destinations by including the appropriate statements at the `[edit system syslog]` hierarchy level on the SFC:

- To a file, as described in "Directing System Log Messages to a Log File" on page 1519.
- To the terminal session of one or more specific users (or all users), as described in "Directing System Log Messages to a User Terminal" on page 1520.
- To the console, as described in "Directing System Log Messages to the Console" on page 1520.
- To a remote machine that is running the syslogd utility or to the other Routing Engine. For more information, see "Directing Messages to a Remote Destination from the Routing Matrix Based on a TX Matrix Plus Router" on page 1529.

As previously noted, the configuration statements included on the SFC also configure the same destinations on each connected LCC.

When specifying the severity level for local messages (at the `[edit system syslog (file | host | console | user)]` hierarchy level) and forwarded messages (at the `[edit system syslog host sfc0-master]` hierarchy level), you can set the same severity level for both, set a lower severity level for local messages, or set a higher severity level for local messages. The following examples describe the consequence of each configuration. (For simplicity, the examples use the `any` facility in every case. You can also specify different severities for different facilities, with more complex consequences.)

Impact of Different Local and Forwarded Severity Levels on System Log Messages on a TX Matrix Router

IN THIS SECTION

- Messages Logged When the Local and Forwarded Severity Levels Are the Same | **1502**
- Messages Logged When the Local Severity Level Is Lower | **1503**
- Messages Logged When the Local Severity Level Is Higher | **1504**

This topic describes the impact of different local and forwarded severity levels configured for system log messages on a TX Matrix router:

Messages Logged When the Local and Forwarded Severity Levels Are the Same

When the severity level is the same for local and forwarded messages, the log on the TX Matrix router contains all messages from the logs on the T640 routers. For example, you can specify severity `info` for the **/var/log/messages** file, which is the default severity level for messages forwarded by T640 routers:

```
[edit system syslog]
file messages {
    any info;
}
```

Table 145 on page 1503 specifies which messages are included in the logs on the T640 routers and the TX Matrix router.

Table 145: Example: Local and Forwarded Severity Level Are Both info

Log Location	Source of Messages	Lowest Severity Included
T640 router	Local	`info`
TX Matrix router	Local	`info`
	Forwarded from T640 routers	`info`

Messages Logged When the Local Severity Level Is Lower

When the severity level is lower for local messages than for forwarded messages, the log on the TX Matrix router includes fewer forwarded messages than when the severities are the same. Locally generated messages are still logged at the lower severity level, so their number in each log is the same as when the severities are the same.

For example, on a TX Matrix router, you can specify severity `notice` for the **/var/log/messages** file and severity `critical` for forwarded messages:

```
[edit system syslog]
file messages {
    any notice;
}
host scc-master {
    any critical;
}
```

Table 146 on page 1503 specifies which messages in a routing matrix are included in the logs on the T640 routers and the TX Matrix router. The T640 routers forward only those messages with severity `critical` and higher, so the log on the TX Matrix router does not include the messages with severity `error`, `warning`, or `notice` that the T640 routers log locally.

Table 146: Example: Local Severity Is notice, Forwarded Severity Is critical

Log Location	Source of Messages	Lowest Severity Included
T640 router	Local	`notice`

Table 146: Example: Local Severity Is notice, Forwarded Severity Is critical *(Continued)*

Log Location	Source of Messages	Lowest Severity Included
TX Matrix router	Local	`notice`
	Forwarded from T640 routers	`critical`

Messages Logged When the Local Severity Level Is Higher

When the severity level is higher for local messages than for forwarded messages, the log on the TX Matrix router includes fewer forwarded messages than when the severities are the same, and all local logs contain fewer messages overall.

For example, you can specify severity `critical` for the **/var/log/messages** file and severity `notice` for forwarded messages:

```
[edit system syslog]
file messages {
    any critical;
}
host scc-master {
    any notice;
}
```

Table 147 on page 1504 specifies which messages are included in the logs on the T640 routers and the TX Matrix router. Although the T640 routers forward messages with severity `notice` and higher, the TX Matrix router discards any of those messages with severity lower than `critical` (does not log forwarded messages with severity `error`, `warning`, or `notice`). None of the logs include messages with severity `error` or lower.

Table 147: Example: Local Severity Is critical, Forwarded Severity Is notice

Log Location	Source of Messages	Lowest Severity Included
T640 router	Local	`critical`
TX Matrix router	Local	`critical`

Table 147: Example: Local Severity Is critical, Forwarded Severity Is notice *(Continued)*

Log Location	Source of Messages	Lowest Severity Included
	Forwarded from T640 routers	`critical`

Impact of Different Local and Forwarded Severity Levels on System Log Messages on a TX Matrix Plus Router

IN THIS SECTION

- Messages Logged When the Local and Forwarded Severity Levels Are the Same | **1505**
- Messages Logged When the Local Severity Level Is Lower | **1506**
- Messages Logged When the Local Severity Level Is Higher | **1507**

This topic describes the impact of different local and forwarded severity levels configured for the system log messages on a TX Matrix Plus router:

Messages Logged When the Local and Forwarded Severity Levels Are the Same

When the severity level is the same for local and forwarded messages, the log on the TX Matrix Plus router contains all messages from the logs on the T1600 routers in the routing matrix. For example, you can specify severity `info` for the **/var/log/messages** file, which is the default severity level for messages forwarded by T1600 routers:

```
[edit system syslog]
file messages {
    any info;
}
```

Table 148 on page 1506 specifies which messages in a routing matrix based on a TX Matrix Plus router are included in the logs on the T1600 routers and the TX Matrix Plus router:

Table 148: Example: Local and Forwarded Severity Level Are Both info

Log Location	Source of Messages	Lowest Severity Included
T1600 router	Local	`info`
TX Matrix Plus router	Local	`info`
	Forwarded from T1600 routers	`info`

Messages Logged When the Local Severity Level Is Lower

When the severity level is lower for local messages than for forwarded messages, the log on the TX Matrix Plus router includes fewer forwarded messages than when the severities are the same. Locally generated messages are still logged at the lower severity level, so their number in each log is the same as when the severities are the same.

For example, on a TX Matrix Plus router, you can specify severity `notice` for the **/var/log/messages** file and severity `critical` for forwarded messages:

```
[edit system syslog]
file messages {
    any notice;
}
host sfc0-master {
    any critical;
}
```

Table 149 on page 1506 specifies which messages in a routing matrix are included in the logs on the T1600 routers and the TX Matrix Plus router. The T1600 routers forward only those messages with severity `critical` and higher, so the log on the TX Matrix Plus router does not include the messages with severity `error`, `warning`, or `notice` that the T1600 routers log locally.

Table 149: Example: Local Severity Is notice, Forwarded Severity Is critical

Log Location	Source of Messages	Lowest Severity Included
T1600 router	Local	`notice`

Table 149: Example: Local Severity Is notice, Forwarded Severity Is critical *(Continued)*

Log Location	Source of Messages	Lowest Severity Included
TX Matrix Plus router	Local	`notice`
	Forwarded from T1600 routers	`critical`

Messages Logged When the Local Severity Level Is Higher

When the severity level is higher for local messages than for forwarded messages, the log on the TX Matrix Plus router includes fewer forwarded messages than when the severities are the same, and all local logs contain fewer messages overall.

For example, you can specify severity `critical` for the **/var/log/messages** file and severity `notice` for forwarded messages:

```
[edit system syslog]
file messages {
    any critical;
}
host sfc0-master {
    any notice;
}
```

Table 150 on page 1507 specifies which messages are included in the logs on the T1600 routers and the TX Matrix Plus router. Although the T1600 routers forward messages with severity `notice` and higher, the TX Matrix Plus router discards any of those messages with severity lower than `critical` (does not log forwarded messages with severity `error`, `warning`, or `notice`). None of the logs include messages with severity `error` or lower.

Table 150: Example: Local Severity Is critical, Forwarded Severity Is notice

Log Location	Source of Messages	Lowest Severity Included
T1600 router	Local	`critical`
TX Matrix Plus router	Local	`critical`

Table 150: Example: Local Severity Is critical, Forwarded Severity Is notice *(Continued)*

Log Location	Source of Messages	Lowest Severity Included
	Forwarded from T1600 routers	`critical`

Configuring Optional Features for Forwarded Messages on a TX Matrix Router

IN THIS SECTION

- Including Priority Information in Forwarded Messages | **1509**
- Adding a Text String to Forwarded Messages | **1509**
- Using Regular Expressions to Refine the Set of Forwarded Messages | **1509**

To configure additional optional features when specifying how the T640 routers forward messages to the TX Matrix router, include statements at the `[edit system syslog host scc-master]` hierarchy level. To include priority information (facility and severity level) in each forwarded message, include the `explicit-priority` statement. To insert a text string in each forwarded message, include the `log-prefix` statement. To use regular expression matching to specify more exactly which messages from a facility are forwarded, include the `match` statement.

```
[edit system syslog]
host scc-master {
    facility severity;
    explicit-priority;
    log-prefix string;
    match "regular-expression";
}
```

You can also include the `facility-override` statement at the `[edit system syslog host scc-master]` hierarchy level, but we do not recommend doing so. It is not necessary to use alternative facilities for messages forwarded to the TX Matrix router, because it runs the Junos system logging utility and can interpret the Junos OS-specific facilities. For more information about alternative facilities, see "Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination" on page 1523.

Including Priority Information in Forwarded Messages

When you include the `explicit-priority` statement at the `[edit system syslog host scc-master]` hierarchy level, messages forwarded to the TX Matrix router include priority information. For the information to appear in a log file on the TX Matrix router, you must also include the `explicit-priority` statement at the `[edit system syslog file` *`filename`*`]` hierarchy level for the file on the TX Matrix router. As a consequence, the log file with the same name on each platform in the routing matrix also includes priority information for locally generated messages.

To include priority information in messages directed to a remote machine from all routers in the routing matrix, also include the `explicit-priority` statement at the `[edit system syslog host` *`hostname`*`]` hierarchy level for the remote machine. For more information, see "Directing Messages to a Remote Destination from the Routing Matrix Based on the TX Matrix Router" on page 1528.

In the following example, the **/var/log/messages** file on all routers includes priority information for messages with severity `notice` and higher from all facilities. The log on the TX Matrix router also includes messages with those characteristics forwarded from the T640 routers.

```
[edit system syslog]
host scc-master {
    any notice;
    explicit-priority;
}
file messages {
    any notice;
    explicit-priority;
}
```

Adding a Text String to Forwarded Messages

When you include the `log-prefix` statement at the `[edit system syslog host scc-master]` hierarchy level, the string that you define appears in every message forwarded to the TX Matrix router. For more information, see "Adding a Text String to System Log Messages Directed to a Remote Destination" on page 1523.

Using Regular Expressions to Refine the Set of Forwarded Messages

When you include the `match` statement at the `[edit system syslog host scc-master]` hierarchy level, the regular expression that you specify controls which messages from the T640 routers are forwarded to the TX Matrix router. The regular expression is not applied to messages from the T640 router that are directed to destinations other than the TX Matrix router. For more information about regular expression

matching, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

Configuring Optional Features for Forwarded Messages on a TX Matrix Plus Router

IN THIS SECTION

- Including Priority Information in Forwarded Messages | **1511**
- Adding a Text String to Forwarded Messages | **1511**
- Using Regular Expressions to Refine the Set of Forwarded Messages | **1511**

From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router (also called the switch-fabric chassis SFC) controls all the T1600 or T4000 routers (also called the line-card chassis LCC) in the routing matrix.

To configure additional optional features when specifying how the connected T1600 or T4000 LCCs forward messages to the SFC, include statements at the `[edit system syslog host sfc0-master]` hierarchy level. To include priority information (facility and severity level) in each forwarded message, include the `explicit-priority` statement. To insert a text string in each forwarded message, include the `log-prefix` statement. To use regular expression matching to specify more exactly which messages from a facility are forwarded, include the `match` statement.

```
[edit system syslog]
host sfc0-master {
    facility severity;
    explicit-priority;
    log-prefix string;
    match "regular-expression;
}
```

You can also include the `facility-override` statement at the `[edit system syslog host sfc0-master]` hierarchy level, but we do not recommend doing so. It is not necessary to use alternative facilities for messages forwarded to the SFC, because it runs the Junos system logging utility and can interpret the Junos OS-specific facilities. For more information about alternative facilities, see "Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination" on page 1523.

Including Priority Information in Forwarded Messages

When you include the `explicit-priority` statement at the `[edit system syslog host sfc0-master]` hierarchy level, messages forwarded to the TX Matrix Plus router (or the SFC) include priority information. For the information to appear in a log file on the SFC, you must also include the `explicit-priority` statement at the `[edit system syslog file filename]` hierarchy level for the file on the SFC. As a consequence, the log file with the same name on each platform in the routing matrix also includes priority information for locally generated messages.

To include priority information in messages directed to a remote machine from all routers in the routing matrix, also include the `explicit-priority` statement at the `[edit system syslog host hostname]` hierarchy level for the remote machine. For more information, see "Directing Messages to a Remote Destination from the Routing Matrix Based on a TX Matrix Plus Router" on page 1529.

In the following example, the **/var/log/messages** file on all routers includes priority information for messages with severity `notice` and higher from all facilities. The log on the TX Matrix Plus router SFC also includes messages with those characteristics forwarded from the connected T1600 or T4000 LCCs.

```
[edit system syslog]
host sfc0-master {
    any notice;
    explicit-priority;
}
file messages {
    any notice;
    explicit-priority;
}
```

Adding a Text String to Forwarded Messages

When you include the `log-prefix` statement at the `[edit system syslog host sfc0-master]` hierarchy level, the string that you define appears in every message forwarded to the TX Matrix Plus router. For more information, see "Adding a Text String to System Log Messages Directed to a Remote Destination" on page 1523.

Using Regular Expressions to Refine the Set of Forwarded Messages

When you include the `match` statement at the `[edit system syslog host sfc0-master]` hierarchy level, the regular expression that you specify controls which messages from the connected T1600 or T4000 LCCs are forwarded to the TX Matrix Plus SFC. The regular expression is not applied to messages from the connected LCCs that are directed to destinations other than the SFC. For more information about

regular expression matching, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

Configuring System Logging Differently on Each T640 Router in a Routing Matrix

We recommend that all routers in a routing matrix composed of a TX Matrix router and T640 routers use the same configuration, which implies that you include system logging configuration statements on the TX Matrix router only. In rare circumstances, however, you might choose to log different messages on different routers. For example, if one router in the routing matrix is experiencing problems with authentication, a Juniper Networks support representative might instruct you to log messages from the `authorization` facility with severity `debug` on that router.

To configure routers separately, include configuration statements in the appropriate groups at the `[edit groups]` hierarchy level on the TX Matrix router:

- To configure settings that apply to the TX Matrix router but not the T640 routers, include them in the `re0` and `re1` configuration groups.
- To configure settings that apply to particular T640 routers, include them in the `lcc`*n*`-re0` and `lcc`*n*`-re1` configuration groups, where *n* is the line-card chassis (LCC) index number of the router.

When you use configuration groups, do not issue CLI configuration-mode commands to change statements at the `[edit system syslog]` hierarchy level on the TX Matrix router. If you do, the resulting statements overwrite the statements defined in configuration groups and apply to the T640 routers also. (We further recommend that you do not issue CLI configuration-mode commands on the T640 routers at any time.)

The following example shows how to configure the **/var/log/messages** files on three routers to include different sets of messages:

- On the TX Matrix router, local messages with severity `info` and higher from all facilities. The file does not include messages from the T640 routers, because the `host scc-master` statement disables message forwarding.
- On the T640 router designated `LCC0`, messages from the `authorization` facility with severity `info` and higher.
- On the T640 router designated `LCC1`, messages with severity `notice` from all facilities.

```
[edit groups]
re0 {
    system {
        syslog {
            file messages {
                any info;
```

```
            }
            host scc-master {
                any none;
            }
        }
    }
}
re1 {
    ... same statements as for re0 ...
}
lcc0-re0 {
    system {
        syslog {
            file messages {
                authorization info;
            }
        }
    }
}
lcc0-re1 {
    ... same statements as for lcc0-re0 ...
}
lcc1-re0 {
    system {
        syslog {
            file messages {
                any notice;
            }
        }
    }
}
lcc0-re1 {
    ... same statements as for lcc1-re0 ...
}
```

Configuring System Logging Differently on Each T1600 or T4000 Router in a Routing Matrix

We recommend that all routers in a routing matrix composed of a TX Matrix Plus router with T1600 or T4000 routers use the same configuration, which implies that you include system logging configuration statements on the TX Matrix Plus router only. In rare circumstances, however, you might choose to log different messages on different routers. For example, if one router in the routing matrix is experiencing

problems with authentication, a Juniper Networks support representative might instruct you to log messages from the `authorization` facility with severity `debug` on that router.

To configure routers separately, include configuration statements in the appropriate groups at the `[edit groups]` hierarchy level on the TX Matrix Plus router:

- To configure settings that apply to the TX Matrix Plus router but not the T1600 or T4000 routers, include them in the `re0` and `re1` configuration groups.
- To configure settings that apply to particular T1600 or T4000 routers, include them in the `lcc`*n*`-re0` and `lcc`*n*`-re1` configuration groups, where *n* is the line-card chassis (LCC) index number of the router.

When you use configuration groups, do not issue CLI configuration-mode commands to change statements at the `[edit system syslog]` hierarchy level on the TX Matrix Plus router. If you do, the resulting statements overwrite the statements defined in configuration groups and apply to the T1600 or T4000 routers also. (We further recommend that you do not issue CLI configuration-mode commands on the T1600 or T4000 routers at any time.)

For more information about the configuration groups for a routing matrix, see the chapter about configuration groups in the *Junos OS CLI User Guide* .

The following example shows how to configure the **/var/log/messages** files on three routers to include different sets of messages:

- On the TX Matrix Plus router, local messages with severity `info` and higher from all facilities. The file does not include messages from the T1600 or T4000 routers, because the `host sfc0-master` statement disables message forwarding.
- On the T1600 or T4000 router designated `LCC0`, messages from the `authorization` facility with severity `info` and higher.
- On the T1600 or T4000 router designated `LCC1`, messages with severity `notice` from all facilities.

```
[edit groups]
re0 {
    system {
        syslog {
            file messages {
                any info;
            }
            host sfc0-master {
                any none;
            }
        }
    }
```

```
}
re1 {
    ... same statements as for re0 ...
}
lcc0-re0 {
    system {
        syslog {
            file messages {
                authorization info;
            }
        }
    }
}
lcc0-re1 {
    ... same statements as for lcc0-re0 ...
}
lcc1-re0 {
    system {
        syslog {
            file messages {
                any notice;
            }
        }
    }
}
lcc0-re1 {
    ... same statements as for lcc1-re0 ...
}
```

Directing System Log Messages to a Remote Destination

Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a facility, which groups together messages that either are generated by the same source (such as a software process) or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects routing platform functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level and higher are logged to the following destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
    facility severity ;
}
```

For more information about the destinations, see "Directing System Log Messages to a User Terminal" on page 1520, and, "Directing System Log Messages to the Console" on page 1520.

To log messages belonging to more than one facility to a particular destination, specify each facility and associated severity as a separate statement within the set of statements for the destination.

Table 151 on page 1517 lists the Junos OS system logging facilities that you can specify in configuration statements at the `[edit system syslog]` hierarchy level.

Table 151: Junos OS System Logging Facilities

Facility	Type of Event or Error
any	All (messages from all facilities)
authorization	Authentication and authorization attempts
change-log	Changes to the Junos OS configuration
conflict-log	Specified configuration is invalid on the router type
daemon	Actions performed or errors encountered by system processes
dfc	Events related to dynamic flow capture
explicit-priority	Include priority and facility in system log messages
external	Actions performed or errors encountered by the local external applications
firewall	Packet filtering actions performed by a firewall filter
ftp	Actions performed or errors encountered by the FTP process
interactive-commands	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
kernel	Actions performed or errors encountered by the Junos OS kernel
ntp	Actions performed or errors encountered by the Network Time Protocol processes
pfe	Actions performed or errors encountered by the Packet Forwarding Engine

Table 151: Junos OS System Logging Facilities *(Continued)*

Facility	Type of Event or Error
security	Security related events or errors
user	Actions performed or errors encountered by user-space processes

Table 152 on page 1518 lists the severity levels that you can specify in configuration statements at the [edit system syslog] hierarchy level. The levels from emergency through info are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the none level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see "Disabling the System Logging of a Facility" on page 1491.

Table 152: System Log Message Severity Levels

Value	Severity Level	Description
N/A	none	Disables logging of the associated facility to a destination
0	emergency	System panic or other condition that causes the router to stop functioning
1	alert	Conditions that require immediate correction, such as a corrupted system database
2	critical	Critical conditions, such as hard errors
3	error	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
4	warning	Conditions that warrant monitoring
5	notice	Conditions that are not errors but might warrant special handling
6	info	Events or nonerror conditions of interest

Table 152: System Log Message Severity Levels *(Continued)*

Value	Severity Level	Description
7	any	Includes all severity levels

Directing System Log Messages to a Log File

To direct system log messages to a file in the **/var/log** directory of the local Routing Engine, include the `file` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
    facility severity;
    archive <archive-sites (ftp-url  <password password>)> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
        brief;
    }
}
```

For the list of facilities and severity levels, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516.

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the `archive` statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see "Specifying Log File Size, Number, and Archiving Properties" on page 1481.

For information about the following statements, see the indicated sections:

- `explicit-priority`—See "Including Priority Information in System Log Messages" on page 1482
- `match`—See "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487
- `structured-data`—See "Logging Messages in Structured-Data Format" on page 1480

Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the `user` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516. For information about the `match` statement, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the `console` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516.

Directing System Log Messages to a Remote Machine or the Other Routing Engine

To direct system log messages to a remote machine or to the other Routing Engine on the router, include the `host` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
```

```
    log-prefix string;
    match "regular-expression";
    source-address source-address;
    structured-data {
        brief;
    }
}
source-address source-address;
```

To direct system log messages to a remote machine, include the `host` *hostname* statement to specify the remote machine's IP version 4 *(IPv4)* address, IP version 6 *(IPv6)* address, or fully qualified hostname. The remote machine must be running the standard `syslogd` utility. We do not recommend directing messages to another Juniper Networks router. In each system log message directed to the remote machine, the hostname of the local *Routing Engine* appears after the timestamp to indicate that it is the source for the message.

To direct system log messages to the other Routing Engine on a router with two Routing Engines installed and operational, include the `host other-routing-engine` statement. The statement is not automatically reciprocal, so you must include it in each Routing Engine configuration if you want the Routing Engines to direct messages to each other. In each message directed to the other Routing Engine, the string `re0` or `re1` appears after the timestamp to indicate the source for the message.

To record facility and severity level information in each message, include the `explicit-priority` statement. For more information, see "Including Priority Information in System Log Messages" on page 1482.

For information about the `match` statement, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

When directing messages to remote machines, you can include the `source-address` statement to specify the IP address of the router that is reported in the messages as their source. In each `host` statement, include the `facility-override` statement to assign an alternative facility and the `log-prefix` statement to add a string to each message. You can include the `structured-data` statement to enable the forwarding of structured system log messages to a remote system log server in the *IETF* system log message format.

Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the `host` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
```

```
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the `host` *hostname* statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard `syslogd` utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the `host` statement, see "Specifying the Facility and Severity of Messages to Include in the Log" on page 1516.

To record facility and severity level information in each message, include the `explicit-priority` statement. For more information, see "Including Priority Information in System Log Messages" on page 1482.

For information about the `match` statement, see "Using Strings and Regular Expressions to Refine the Set of Logged Messages" on page 1487.

When directing messages to remote machines, you can include the `source-address` statement to specify the IP address of the switch that is reported in the messages as their source. In each `host` statement, you can also include the `facility-override` statement to assign an alternative facility and the `log-prefix` statement to add a string to each message.

Specifying an Alternative Source Address for System Log Messages Directed to a Remote Destination

To specify the source router to be reported in *system log* messages when the messages are directed to a remote machine, include the `source-address` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
source-address source-address;
```

source-address is a valid *IPv4* or *IPv6* address configured on one of the router interfaces. The address is reported in the messages directed to all remote machines specified in `host` *hostname* statements at the `[edit system syslog]` hierarchy level, but not in messages directed to the other Routing Engine.

Adding a Text String to System Log Messages Directed to a Remote Destination

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the `log-prefix` statement at the `[edit system syslog host]` hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign (=) and the colon (:). It also cannot include the space character; do not enclose the string in quotation marks (“ ”) in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
    any info;
    log-prefix M120;
}
```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user ‘root’, command ‘run show
version’
```

Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see "Junos OS System Logging Facilities" on page 1459). In the recommended configuration, a remote machine designated at the `[edit system syslog host hostname]` hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard `localX` facility name is used instead of the Junos OS-specific facility name.

"Default Facilities for System Log Messages Directed to a Remote Destination" on page 1525 lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called `local-router` direct messages from the `authorization` facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
host monitor.mycompany.com {
    authorization info;
}
```

The default alternative facility for the local `authorization` facility is also `authorization`. If the syslogd utility on `monitor` is configured to write messages belonging to the `authorization` facility to the file **/var/log/auth-attempts**, then the file contains the messages generated when users log in to `local-router` and the messages generated when users log in to `monitor`. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the `auth-attempts` file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on `local-router` when they are directed to `monitor`. You can then configure the syslogd utility on `monitor` to write messages with the alternative facility to a different file from messages generated on `monitor` itself.

To change the facility used for all messages directed to a remote machine, include the `facility-override` statement at the `[edit system syslog host` *`hostname`*`]` hierarchy level:

```
[edit system syslog host hostname]
facility severity;
facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the `local`*`X`* facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

"Facilities for the facility-override Statement" on page 1515 lists the facilities that you can specify in the `facility-override` statement.

We do not recommend including the `facility-override` statement at the `[edit system syslog host other-routing-engine]` hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called monitor.mycompany.com:

```
[edit system syslog]
host monitor.mycompany.com {
    any error;
    facility-override local0;
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called central-logger.mycompany.com. The messages from California are assigned to alternative facility local0 and the messages from New York are assigned to alternative facility local2.

- Configure California routers to aggregate messages in the local0 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local0;
}
```

- Configure New York routers to aggregate messages in the local2 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local2;
}
```

On central-logger, you can then configure the system logging utility to write messages from the local0 facility to the file **change-log** and the messages from the local2 facility to the file **new-york-config**.

Default Facilities for System Log Messages Directed to a Remote Destination

Table 153 on page 1526 lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

Table 153: Default Facilities for Messages Directed to a Remote Destination

Junos OS–Specific Local Facility	Default Facility When Directed to Remote Destination
change-log	local6
conflict-log	local5
dfc	local1
firewall	local3
interactive-commands	local7
pfe	local4

Alternate Facilities for System Log Messages Directed to a Remote Destination

Table 154 on page 1526 lists the facilities that you can specify in the `facility-override` statement.

Table 154: Facilities for the facility-override Statement

Facility	Description
`authorization`	Authentication and authorization attempts
`daemon`	Actions performed or errors encountered by system processes
`ftp`	Actions performed or errors encountered by the FTP process
`kernel`	Actions performed or errors encountered by the Junos OS kernel
`local0`	Local facility number 0
`local1`	Local facility number 1

Table 154: Facilities for the facility-override Statement *(Continued)*

Facility	Description
local2	Local facility number 2
local3	Local facility number 3
local4	Local facility number 4
local5	Local facility number 5
local6	Local facility number 6
local7	Local facility number 7
user	Actions performed or errors encountered by user-space processes

We do not recommend including the `facility-override` statement at the `[edit system syslog host other-routing-engine]` hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

Examples: Assigning an Alternative Facility to System Log Messages Directed to a Remote Destination

Log all messages generated on the local routing platform at the error level or higher to the `local0` facility on the remote machine called `monitor.mycompany.com`:

```
[edit system syslog]
host monitor.mycompany.com {
    any error;
    facility-override local0;
}
```

Configure routing platforms located in California and routing platforms located in New York to send messages to a single remote machine called central-logger.mycompany.com. The messages from

California are assigned alternative facility local0 and the messages from New York are assigned to alternative facility local2.

- Configure California routing platforms to aggregate messages in the `local0` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local0;
}
```

- Configure New York routing platforms to aggregate messages in the `local2` facility:

```
[edit system syslog]
host central-logger.mycompany.com {
    change-log info;
    facility-override local2;
}
```

On `central-logger`, you can then configure the system logging utility to write messages from the `local0` facility to the file **california-config** and the messages from the `local2` facility to the file **new-york-config**.

Directing Messages to a Remote Destination from the Routing Matrix Based on the TX Matrix Router

You can configure a routing matrix composed of a TX Matrix router and T640 routers to direct system logging messages to a remote machine or the other Routing Engine on each router, just as on a single-chassis system. Include the `host` statement at the `[edit system syslog]` hierarchy level on the TX Matrix router:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

The TX Matrix router directs messages to a remote machine or the other Routing Engine in the same way as a single-chassis system, and the optional statements (`explicit-priority`, `facility-override`, `log-prefix`, `match`, and `source-address`) also have the same effect as on a single-chassis system.

For the TX Matrix router to include priority information when it directs messages that originated on a T640 router to the remote destination, you must also include the `explicit-priority` statement at the `[edit system syslog host scc-master]` hierarchy level.

The `other-routing-engine` statement does not interact with message forwarding from the T640 routers to the TX Matrix router. For example, if you include the statement in the configuration for the Routing Engine in slot 0 (`re0`), the `re0` Routing Engine on each T640 router sends messages to the `re1` Routing Engine on its platform only. It does not also send messages directly to the `re1` Routing Engine on the TX Matrix router.

Because the configuration on the TX Matrix router applies to the T640 routers, any T640 router that has interfaces for direct access to the Internet also directs messages to the remote machine. The consequences include the following:

- If the T640 routers are configured to forward messages to the TX Matrix router (as in the default configuration), the remote machine receives two copies of some messages: one directly from the T640 router and the other from the TX Matrix router. Which messages are duplicated depends on whether the severities are the same for local logging and for forwarded messages. For more information, see "Configuring Message Forwarding to the TX Matrix Router" on page 1499.
- If the `source-address` statement is configured at the `[edit system syslog]` hierarchy level, all routers in the routing matrix report the same source address in messages directed to the remote machine. This is appropriate, because the routing matrix functions as a single router.
- If the `log-prefix` statement is included, the messages from all routers in the routing matrix include the same text string. You cannot use the string to distinguish between the routers in the routing matrix.

Directing Messages to a Remote Destination from the Routing Matrix Based on a TX Matrix Plus Router

From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router (also called the switch-fabric chassis SFC) controls all the T1600 or T4000 routers also called the ine-card chassis LCC) in the routing matrix.

You can configure a routing matrix composed of a TX Matrix Plus router with connected T1600 or T4000 LCCs to direct system logging messages to a remote machine or the other Routing Engine on each routing router, just as on a single-chassis system. Include the `host` statement at the `[edit system syslog]` hierarchy level on the SFC:

```
[edit system syslog]
host (hostname | other-routing-engine) {
```

```
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

The TX Matrix Plus router directs messages to a remote machine or the other Routing Engine in the same way as a single-chassis system, and the optional statements (`explicit-priority`, `facility-override`, `log-prefix`, `match`, and `source-address`) also have the same effect as on a single-chassis system.

For the TX Matrix Plus router to include priority information when it directs messages that originated on a connected T1600 or T4000 LCC to the remote destination, you must also include the `explicit-priority` statement at the `[edit system syslog host sfc0-master]` hierarchy level.

The `other-routing-engine` statement does not interact with message forwarding from the connected T1600 or T4000 LCCs to the SFC. For example, if you include the statement in the configuration for the Routing Engine in slot 0 (`re0`), the `re0` Routing Engine on each connected T1600 or T4000 LCC sends messages to the `re1` Routing Engine on its router only. It does not also send messages directly to the `re1` Routing Engine on the SFC.

Because the configuration on the SFC applies to the connected T1600 or T4000 LCCs, any LCC that has interfaces for direct access to the Internet also directs messages to the remote machine. The consequences include the following:

- If the LCCs are configured to forward messages to the SFC (as in the default configuration), the remote machine receives two copies of some messages: one directly from the T1600 or T4000 LCC and the other from the SFC. Which messages are duplicated depends on whether the severities are the same for local logging and for forwarded messages. For more information, see "Configuring Message Forwarding to the TX Matrix Plus Router" on page 1501.

- If the `source-address` statement is configured at the `[edit system syslog]` hierarchy level, all routers in the routing matrix report the same source address in messages directed to the remote machine. This is appropriate, because the routing matrix functions as a single routing router.

- If the `log-prefix` statement is included, the messages from all routers in the routing matrix include the same text string. You cannot use the string to distinguish between the routers in the routing matrix.

Displaying System Log Files

IN THIS SECTION

- Displaying a Log File from a Single-Chassis System | 1531
- Log File Sample Content | 1531
- Displaying a Log File from a Routing Matrix | 1533

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue either of the following commands:

```
user@host> show log log-filename
user@host> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine. To display the file stored on a particular Routing Engine, prefix the file or pathname with the string `re0` or `re1` and a colon. The following examples both display the **/var/log/messages** file stored on the Routing Engine in slot 1:

```
user@host> show log re1:messages
 user@host> file show re1:/var/log/messages
```

For information about the fields in a log message, see Interpreting Messages Generated in Standard Format by a Junos OS Process or Library, Interpreting Messages Generated in Standard Format by Services on a PIC, and Interpreting Messages Generated in Structured-Data Format. For examples, see "Log File Sample Content" on page 1531.

Log File Sample Content

This topic contains sample content from the /var/log directory. You can display the contents of the **/var/log/messages** file stored on the local Routing Engine. (The **/var/log** directory is the default location for log files, so you do not need to include it in the filename. The **messages** file is a commonly configured destination for system log messages.)

NOTE: In Junos OS Evolved, the **messages** file is only written on the primary Routing Engine. Backup Routing Engine messages are found in the **messages** file on the primary Routing Engine.

```
user@host> show log messages Apr 11 10:27:25 router1 mgd[3606]: UI_DBASE_LOGIN_EVENT: User
'barbara' entering configuration mode
 Apr 11 10:32:22 router1 mgd[3606]: UI_DBASE_LOGOUT_EVENT: User 'barbara' exiting configuration
mode
Apr 11 11:36:15 router1 mgd[3606]: UI_COMMIT: User 'root' performed commit: no comment
 Apr 11 11:46:37 router1 mib2d[2905]: SNMP_TRAP_LINK_DOWN: ifIndex 82, ifAdminStatus up(1),
ifOperStatus down(2), ifName at-1/0/0
```

You can display the contents of the file **/var/log/processes**, which has been previously configured to include messages from the `daemon` facility. When issuing the `file show` command, you must specify the full pathname of the file:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm start
 Feb 22 20:35:07 router1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED: trap_throttle_timer_handler:
cleared all throttled traps
 Feb 23 07:34:56 router1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm
start
 Feb 23 07:38:19 router1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold: SNMP trap: cold
start
```

You can display the contents of the file **/var/log/processes** when the `explicit-priority` statement is included at the [`edit system syslog file processes`] hierarchy level:

```
user@host> file show /var/log/processes Feb 22 08:58:24 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm start
 Feb 22 20:35:07 router1 snmpd[359]:
%DAEMON-6-SNMPD_THROTTLE_QUEUE_DRAINED: trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 router1 snmpd[359]:
%DAEMON-3-SNMPD_TRAP_WARM_START: trap_generate_warm: SNMP trap: warm start
Feb 23 07:38:19 router1 snmpd[359]:
%DAEMON-2-SNMPD_TRAP_COLD_START: trap_generate_cold: SNMP trap: cold start
```

Warning Message Support for Throughput Overuse:

The SRX4100 device supports up to 20 Gbps and 7 Mpps of Internet mix (IMIX) firewall performance. When IMIX throughput exceeds 20 Gbps and 7 Mpps on an SRX4100 device, new log messages are logged. These log messages remind you that there is throughput overuse. You can see the following sample log messages when you issue the `show log messages` command.

```
user@host> show log messages
Apr 25 14:01:12 user Throughput exceed 20Gbps and 7Mpps in 35% of last 15 minutes, above the
time threshold 10%!
Apr 25 14:16:12 user Throughput exceed 20Gbps and 7Mpps in 95% of last 15 minutes, above the
time threshold 10%!
```

As a reminder of throughput overuse, every 15 minutes the system calculates how many minutes the throughout has exceeded 20 Gbps and 7 Mpps. The system triggers a log message if the throughput has exceeded more than 1 minute, 30 seconds (10%) of the last 15 minutes. For example, suppose you see the following log message:

```
Throughput exceed 20 Gbps and 7 Mpps in 35% of last 15 minutes, above the time threshold 10%!
```

It means your throughput has exceeded 20 Gbps and 7 Mpps for 5 minutes, 15 seconds of the last 15 minutes (35% of 15 minutes) that triggered the log message.

To turn off this log message, we recommend that you bring down the throughput level below 20 Gbps and 7 Mpps or install the enhanced performance upgrade license.

NOTE: This feature requires a license. Please refer to the Juniper Licensing Guide for general information about License Management. Please refer to the product Data Sheets at SRX Series Services Gateways for details, or contact your Juniper Account Team or Juniper Partner.

Displaying a Log File from a Routing Matrix

One way to display a log file stored on the local Routing Engine of any of the individual platforms in a routing matrix (T640 routing nodes or TX Matrix platform) is to log in to a Routing Engine on the platform, enter Junos OS CLI operational mode, and issue the `show log` or `file show` command described in "Displaying a Log File from a Single-Chassis System" on page 1531.

To display a log file stored on a T640 routing node during a terminal session on the TX Matrix platform, issue the `show log` or `file show` command and add a prefix that specifies the T640 routing node's LCC index number as lccn, followed by a colon. The index can be from 0 (zero) through 3:

```
user@host> show log lccn:log-filename
user@host> file show lccn:log-file-pathname
```

By default, the `show log` and `file show` commands display the specified log file stored on the primary Routing Engine on the T640 routing node. To display the log from a particular Routing Engine, prefix the file- or pathname with the string lccn-primary, `lccn-re0`, or `lccn-re1`, followed by a colon. The following examples all display the **/var/log/messages** file stored on the primary Routing Engine (in slot 0) on routing node LCC2:

```
user@host> show log lcc2:messages
 user@host> show log lcc2-master:messages
 user@host> show log lcc2-re0:messages
user@host> file show lcc2:/var/log/messages
```

If the T640 routing nodes are forwarding messages to the TX Matrix platform (as in the default configuration), another way to view messages generated on a T640 routing node during a terminal session on the TX Matrix platform is simply to display a local log file. However, the messages are intermixed with messages from other T640 routing nodes and the TX Matrix platform itself. For more information about message forwarding, see "Impact of Different Local and Forwarded Severity Levels on System Log Messages on a TX Matrix Router" on page 1502.

For information about the fields in a log message, see Interpreting Messages Generated in Structured-Data Format, Interpreting Messages Generated in Standard Format by Services on a PIC, and Interpreting Messages Generated in Standard Format by a Junos OS Process or Library. For examples, see "Log File Sample Content" on page 1531.

Understanding System Logging for Security Devices

IN THIS SECTION

- Control Plane and Data Plane Logs | **1535**
- Redundant System Log Server | **1536**

Junos OS supports configuring and monitoring of system log messages (also called *syslog messages*). You can configure files to log system messages and also assign attributes, such as severity levels, to messages. Reboot requests are recorded to the system log files, which you can view with the `show log` command.

This section contains the following topics:

Control Plane and Data Plane Logs

Junos OS generates separate log messages to record events that occur on the system's control and data planes.

- The control plane logs, also called system logs, include events that occur on the routing platform. The system sends control plane events to the `eventd` process on the Routing Engine, which then handles the events by using Junos OS policies, by generating system log messages, or both. You can choose to send control plane logs to a file, user terminal, routing platform console, or remote machine. To generate control plane logs, use the `syslog` statement at the `[system]` hierarchy level.
- The data plane logs, also called *security logs*, primarily include security events that are handled inside the data plane. Security logs can be in text or binary format, and they can be saved locally (event mode) or sent to an external server (stream mode). Binary format is required for stream mode and recommended to conserve log space in event mode.

Note the following:

- Security logs can be saved locally (on box) or externally (off box), but not both.
- SRX1400, SRX1500, SRX3400, SRX3600, SRX4100, SRX4200, SRX4600, SRX5400, SRX5600, and SRX5800 devices default to stream mode. To specify binary format and an external server, see "Configuring Off-Box Binary Security Log Files" on page 1558.

  > **NOTE**: Logs might be dropped if you configure event mode logging on these devices.

  Starting with Junos OS Release 15.1X49-D100, the default mode for SRX1500 device is stream mode. Prior to Junos OS Release 15.1X49-D100, the default mode for SRX1500 device was event mode.

- Apart from Junos OS Release 18.4R1, 18,4R2, 19.1 and 19.2R1, in all the other releases starting in Junos OS Release 18.3R3, the default logging mode for SRX300, SRX320, SRX340, SRX345, SRX550, and SRX550M devices is stream mode. Data plane events are written to system log files in a similar manner to control plane events. To specify binary format for the security logs, see "Configuring Off-Box Binary Security Log Files" on page 1558.

Starting in Junos OS Release 20.2R1, we support escape in stream log forwarding and on-box reporting to avoid parsing errors. Stream mode supports escape in `sd-syslog` and `binary` formats when logs are not sent to `eventd` process. For the logs send to `eventd` process, we recommend not to enable an `escape` option as the `eventd` process has enabled the escape for the structure log. Event mode supports escape only in `binary` format. By default the `escape` option is disabled. You must enable the `escape` option using the `set security log escape` command.

Redundant System Log Server

Security system logging traffic intended for remote servers is sent through the network interface ports, which support two simultaneous system log destinations. Each system logging destination must be configured separately. When two system log destination addresses are configured, identical logs are sent to both destinations. While two destinations can be configured on any device that supports the feature, adding a second destination is primarily useful as a redundant backup for standalone and active/backup configured *chassis cluster* deployments.

The following redundant server information is available:

- Facility: `cron`
- Description: cron scheduling process
- Severity Level (from highest to lowest severity): `debug`

- Description: Software debugging messages

Understanding Stream Logging for Security Devices

SEE ALSO

log

Understanding Binary Format for Security Logs

The Junos OS generates separate log messages to record events that occur on the system's control plane and data plane. The control plane monitors events that occur on the routing platform. Such events are recorded in system log messages. To generate system log messages, use the `syslog` statement at the `[system]` hierarchy level.

Data plane log messages, referred to as security log messages, record security events that the system handles directly inside the data plane. To generate security log messages, use the `log` statement at the `[security]` hierarchy level.

System log messages are maintained in log files in text-based formats, such as BSD Syslog, Structured Syslog, and WebTrends Enhanced Log Format (WELF).

Security log messages can also be maintained in text-based formats. Because security logging can produce large amounts of data, however, text-based log files can quickly consume storage and CPU resources. Depending on your implementation of security logging, a log file in a binary-based format can provide more efficient use of on-box or off-box storage and improved CPU utilization. Binary format for security log messages is available on all SRX Series devices.

When configured in event mode, security log messages generated in the data plane are directed to the control plane and stored locally on the device. Security log messages stored in binary format are maintained in a log file separate from that used to maintain system log messages. Events stored in a binary log file are not accessible with advanced log-scripting commands intended for text-based log files. A separate CLI operational command supports decoding, converting, and viewing binary log files that are stored locally on the device.

When configured in stream mode, security log messages generated in the data plane are streamed to a remote device. When these messages are stored in binary format, they are streamed directly to an external log collection server in a Juniper-specific binary format. Externally-stored binary log files can only be read using Juniper Secure Analytics (JSA) or Security Threat Response Manager (STRM).

Starting in Junos OS Release 17.4R2 and later, on SRX300, SRX320, SRX340, SRX345 Series devices and vSRX instances, when the device is configured in stream mode, you can configure maximum of eight system log hosts. In Junos OS Release 17.4R2 and earlier releases, you can configure only three system

log hosts in the stream mode. If you configure more than three system log hosts, then the following error message is displayed **error: configuration check-out failed**.

For information about configuring on-box (event-mode) binary security logs, please see "Configuring On-Box Binary Security Log Files" on page 1556. For information about configuring off-box (stream-mode) binary security logs, please see "Configuring Off-Box Binary Security Log Files" on page 1558.

Understanding On-Box Logging and Reporting

IN THIS SECTION

- Overview | **1538**
- Understanding On-box Logging and Reporting | **1541**
- On-Box Reporting Features | **1542**
- Table Selection | **1544**
- Table Lifetime | **1544**
- Table Dense Mode | **1545**
- Chassis Cluster Scenario | **1545**

This topic describes the on-box logging and reporting CLI functionality and the design aspects of on-box reporting for the SRX devices.

Overview

On-box traffic logging to solid-state drives (SSDs) supports eight external log servers or files.

An all-in-one XML file is added that contains all the traffic logs information. The XML file also generates all the logging header files and traffic log related documents.

A new process (daemon) called *local log management daemon (llmd)* is supported in Services Processing Cards 0 (SPCs0) to handle on-box traffic logging. Traffic produced by flowd in SPCs is listed in traffics logs. The llmd saves these logs to the local SSD. Traffic logs are saved in the four different formats. See Table 155 on page 1539 to know about the log formats.

Table 155: Log formats

Log format	Description	Default
Syslog	• Traditional log format to save logs.	Yes
Sd-syslog	• Structured system log file format. • Most descriptive and lengthy hence takes more space to store. • Takes more time to transfer logs saved in this format because of the size.	-
Welf	• WebTrends Enhanced Log file Format is an industry standard log file exchange format. • Compatible with Firewall Suite 2.0 and later, Firewall Reporting Center 1.0 and later, and Security Reporting Center 2.0 and later.	-
Binary	• Juniper proprietary format. • Least descriptive among all the other log formats and takes the least space compared to other log formats.	-

On-box reporting mechanism is an enhancement to the existing logging functionality. The existing logging functionality is modified to collect system traffic logs, analyzes the logs, and generate reports of these logs in the form of tables using the CLI. On-box reporting feature is intended to provide a simple and easy to use interface for viewing security logs. The on-box reports are easy to use J-Web pages of various security events in the form of tables and graphs. The reports allow the IT security management to identify security information at a glance, and quickly decide the actions to be taken.

The on-box reporting feature is enabled by default when you load the factory-default configurations on the SRX Series device with Junos OS Release 15.1X49-D100 or later.

If you are upgrading your SRX Series device from a Junos OS Release prior to Junos OS 15.1X49-D100, then the SRX device inherits the existing configuration and the on-box reporting feature is disabled by default. You need to configure the `set security log report` command and the `set security log mode stream` command to enable the on-box reporting feature on the device that are upgraded.

Starting in Junos OS Release 19.3R1 , the factory-default configuration does not include on-box reporting configuration to increase the solid-state drive (SSD) lifetime. You can enable the on-box reporting feature by configuring the `set security log report` CLI command at `[edit security log]` hierarchy.

See J-Web User Guide for SRX Series Devices to perform this task on J-Web user interface.

Starting in Junos OS Release 21.3R1, the on-box reporting logs are stored on the memory file system (MFS) if there is no external SSD. The maximum number of logs that you can save on MFS is lesser than what you can save on an external SSD. This prevents memory exhaustion and failure. Logs saved in MFS are not retained after device reboot or power failure. See Table 156 on page 1540 to know the number of logs recorded in on-box reporting and off-box reporting.

Table 156: Number of Logs

Reporting Mode	Session	Screen	IDP	UTM	IPsec-VPN	SKY
Off-box	1200,000	120,000	120,000	120,000	40,000	120,000
On-box	500,000	50,000	50,000	50,000	20,000	50,000

NOTE: You must configure security policy for the session using the `set security policies from-zone zone-name to-zone zone-name policy policy-name then log session-close` command to list all the applications and nested applications in Application Tracking on J-Web using the on-box reporting feature. See for more *log (Security Policies)* for details.

After the log message is recorded, the log is stored within a log file which is then stored in the database table of the RE for further analysis (on SRX300, SRX320, SRX340, SRX345, and SRX550M devices) or on the SSD card for further analysis (on SRX1500, SRX4100, and SRX4200 devices).

NOTE: This feature supports receiving top most reports based on count or volume of the session or the type of log, captures events occurring in each second within a specified time range, captures log content for a specified CLI condition. Various CLI conditions like “summary”, top”, “in-detail”, and “in-interval” are used to generate reports. You can generate only one report at one time using the CLI. All the CLI conditions cannot be used at the same time. You can generate only one report at one time using the CLI.

The benefits of this feature are:

- Reports are stored locally on the SRX Series device and there is no requirement for separate devices or tools for logs and reports storage.
- The on-box reports are easy-to-use J-Web pages of various security events in the form of tables and graphs.

- Provides a simple and easy-to-use interface for viewing security logs.
- The reports generated enables the IT security management team to identify security information at a glance and quickly decide the actions to be taken.

The on-box reporting feature supports:

- Generating reports based on the requirements. For example: count or volume of the session, types of logs for activities such as IDP, UTM, IPsec VPN.
- Capturing real-time events within a specified time range.
- Capturing all the network activities in a logical, organized, and easy-to-understand format based on various CLI specified conditions.

Understanding On-box Logging and Reporting

In the on-box reporting mechanism, CLI is used to fetch the reporting data from the device. The SRX series device collects and saves all the required logs. These recorded logs are then used for further analysis to calculate and generate reports in the form of tables using the CLI. The data generated using CLI in the form of reports can be further retrieved in the form of tables and graphs in J-Web. The reports generated are easy-to-understand tables and graphs in J-Web. Thorough analysis of logs is performed (based on session types) for features such as screen, IDP, UTM and IPSec.

You can define filters for the log data that is reported on based on the following criteria:

NOTE: The top, in-detail, and in-interval conditions cannot be used at the same time.

- `top <number>`—This option allow you to generate reports for top security events as specified in the command. for example: top 5 IPS attacks or top 6 URLs detected through UTM.
- `in-detail <number>`—This option allow you to generate detail log content.
- `in-interval <time-period>`—This option allows you to generate the events logged between certain time intervals.
- `summary`—This option allows you to generate the summary of the events. In this way, you can fine-tune the report to your needs, and displays only the data that you want to use.

The maximum in-interval number which shows the count in intervals is 30. If large duration is specified, then the counters are assembled to ensure the maximum in-interval is less than 30.

Both in-detail and summary have the “all” option, since different table have different attribute (like session table does not have the attribute “reason” but UTM has), the “all” option does not have any filter

except start-time and stop-time. If there is any other filter other than start time and stop time then an error is displayed.

For example: root@kujang> show security log report in-detail all reason reason1

```
error: "query condition error"
```

The application firewall logs for application and user visibility will list applications and nested applications. When the logs of these features list nested applications then nested applications are listed in J-Web. When the logs list nested applications as not-applicable or unknown then only the applications are listed in J-Web.

Use the following CLI commands for application and user visibility for all the applications and nested applications listing:

- For top nested-application by count—`show security log report top session-close top-number <number> group-by application order-by count with user`
- For top nested-application by volume—`show security log report top session-close top-number <number> group-by application order-by volume with user`
- For top user by count with nested application—`show security log report top session-close top-number <number> group-by user order-by count with application`

On-Box Reporting Features

The on-box reporting feature supports:

- **Sqlite3 support as a library**—sqlite3 was not supported prior to Junos OS release 15.1X49-D100. Starting with Junos OS Release 15.1X49-D100, an SQL log database (SQLite Version 3) is used by the daemons running on the RE as well as other potential modules to store logs on SRX Series devices.

  In Junos OS Release 19.4R1, we've upgraded the on-box logging database to improve query performance.

- **Running llmd in both Junos OS and Linux OS**—The forwarding daemon (flowd) decodes database index from binary logs and sends both index and log to the local log management daemon (llmd).

  On SRX300, SRX320, SRX340, SRX345, and SRX550M devices, llmd runs in Junos OS. On SRX1500, SRX4100, and SRX4200 devices, llmd runs in Linux. So, for supporting llmd to run in both Junos OS and Linux OS, the llmd code directory is moved from the Linux side to the Junos OS side.

- **Storing of logs into specified table of the sqlite3 database by llmd**— A new syslog daemon is introduced to collect local logs on SRX Series devices and saving them into the database.

Starting in Junos OS Release 19.3R1, Junos OS stores logs in multiple tables instead of a single table in a database file. Each table contains the timestamp of the oldest and latest logs. When you initiate a query based on the start and end time, llmd finds latest table to generate reports.

For example, if there are 5 million logs in one table of a database file generated in the last 10 hours, and if you want to take a report, you should spend more than half an hour. From Junos OS Release 19.3R1, one table is separated into multiple tables, and each table has 0.5 million of logs. To generate the same report, one table information is sufficient.

We recommend you to query with a shorter time for better performance.

- **Database table definition**—For session logs, the data types are source-address, destination-address, application, user, and so on. For logs related to security features, the data types are attack-name, URL, profile protocol, and so on. Therefore, different tables are designed to store different types of logs to help improve the performance and save disk space. SRX device creates a database table for each log type, when log data is recorded.

  Each type of database table has its maximum record number that is device specific. When the table record number reaches the limitation, new logs replace the oldest logs. Junos OS stores log in an SRX Series device in which active traffic is passed.

  Starting in Junos OS Release 19.3R1, you can create multiple tables in a database file to store logs. You can define the capacity to store logs in a table.

  If the limit of log number exceeds the table capacity, Junos OS stores the logs in the second table. For example, if the limit of logs in table 1 exceeds the table capacity, Junos OS stores logs in table 2.

  If the limit of the log number exceeds the last table of file 1, Junos OS stores the logs in table 1 of file 2. For example, table n is the last table of file 1. When the logs exceed the table capacity, Junos OS stores the logs in table 1 of file 2.

  To make immediate effect after you change the table number, use `clear security log report` operational command.

- **Database table rotation**—Each type of database table has its maximum record number that is device specific. When the table record number reaches the limitation, new logs replace the oldest logs.

  Following Table 157 on page 1544 describes the database file size capacity:

Table 157: Database File Size Capacity

Devices	Session	Screen	IDP	UTM	IPsec-VPN	SKY
SRX300, SRX320, SRX340, SRX345, and SRX550M	1.8G	0.18G	0.18G	0.18G	0.06G	0.18G
SRX1500	12G	2.25G	2.25G	2.25G	0.75G	2.25G
SRX4100 and SRX4200	15G	2.25G	2.25G	2.25G	0.75G	2.25G
SRX4600	22.5G	6G	6G	6G	0.75G	2.25G
vSRX	1.8G	0.18G	0.18G	0.18G	0.06G	0.18G

- **Calculating and displaying the reports that are triggered by CLI**—The reports from the database are received from the CLI as the interface. Using the CLI, you can calculate and display the reporting details.

Table Selection

When you want to generate a report from multiple tables, llmd sorts tables based on timestamp and selects tables as per the requested start-time and stop-time.

For example, there are three tables that is table 1 (1 to 3), table 2 (3 to 5) and table 3 (6 to 8). 1 to 3, 3 to 6, and 6 to 8 denotes time stamp of latest and oldest logs. If you request a report from 4 to 6, Junos OS generates report from table 2 and table 3.

Table Lifetime

You can decide table lifetime by configuring `set security log report table-lifetime` command. Junos OS removes the table after the table identify time exceeds the table lifetime. For example, if you configure table lifetime as 2, and the current date is 26-July-2019, then it means on 24-July-2019 00:00:00 logs are removed.

If you change the date and time manually on a device, the table lifetime changes. For example, if a table identify time is 19-July-2019, and you configure table lifetime as 10, Junos OS should remove the table on 29-July-2019. If you change the device date as 18-July-2019, then the table real lifetime becomes 30-July-2019.

Table Dense Mode

In Junos OS Release 19.4R1, we've upgraded the default storage and search mechanism in the on-box logging database to manage logs. You can now customize log storage and search mechanism results. For example, if you expect fewer traffic logs, you can use the default configuration with a start time and a stop time.

However, if you expect a large number of traffic logs and greater time intervals for which the logs will be generated, then enable dense mode. To enable dense mode, use the `set security log report table-mode dense` configuration command.

Chassis Cluster Scenario

For on-box reporting in a chassis cluster, the logs are stored in the local disk on which the device is processing active traffic. These logs are not synchronized to the chassis cluster peer.

Each node is responsible to store logs when each node is processing active traffic. In case of active/passive mode, only the active node processes the traffic and logs are also stored only in the active node. In case of failover, the new active node is processes the traffic and stores logs in its local disk. In case of active/active mode, each node processes its own traffic and logs are stored in the respective nodes.

Monitoring Reports

IN THIS SECTION

- Threats Monitoring Report | 1546
- Traffic Monitoring Report | 1553

On-box reporting offers a comprehensive reporting facility where your security management team can spot a security event when it occurs, immediately access and review pertinent details about the event, and quickly decide appropriate remedial action. The J-Web reporting feature provides one- or two-page reports that are equivalent to a compilation of numerous log entries.

This section contains the following topics:

Threats Monitoring Report

IN THIS SECTION

- Purpose | 1546
- Action | 1546

Purpose

Use the Threats Report to monitor general statistics and activity reports of current threats to the network. You can analyze logging data for threat type, source and destination details, and threat frequency information. The report calculates, displays, and refreshes the statistics, providing graphic presentations of the current state of the network.

Action

To view the Threats Report:

1. Click **Threats Report** in the bottom right of the Dashboard, or select **Monitor>Reports>Threats** in the J-Web user interface. The Threats Report appears.
2. Select one of the following tabs:
   - **Statistics** tab. See Table 4 for a description of the page content.
   - **Activities** tab. See Table 5 for a description of the page content.

Table 158: Statistics Tab Output in the Threats Report

Field	Description
General Statistics Pane	

Table 158: Statistics Tab Output in the Threats Report *(Continued)*

Field	Description

Threat Category	One of the following categories of threats:
	• Traffic
	• IDP
	• Content Security
	  • Antivirus
	  • Antispam
	  • Web Filter—Click the Web filter category to display counters for 39 subcategories.
	  • Content Filter
	• Firewall Event

Severity	Severity level of the threat: • emerg • alert • crit • err • warning • notice • info • debug
Hits in past 24 hours	Number of threats encountered per category in the past 24 hours.
Hits in current hour	Number of threats encountered per category in the last hour.

Table 158: Statistics Tab Output in the Threats Report *(Continued)*

Field	Description
Threat Counts in the Past 24 Hours	
By Severity	Graph representing the number of threats received each hour for the past 24 hours sorted by severity level.
By Category	Graph representing the number of threats received each hour for the past 24 hours sorted by category.
X Axis	Twenty-four hour span with the current hour occupying the right-most column of the display. The graph shifts to the left every hour.
Y Axis	Number of threats encountered. The axis automatically scales based on the number of threats encountered.
Most Recent Threats	
Threat Name	Names of the most recent threats. Depending on the threat category, you can click the threat name to go to a scan engine site for a threat description.

Category	Category of each threat:
	• Traffic
	• IDP
	• Content Security
	  • Antivirus
	  • Antispam
	  • Web Filter
	  • Content Filter
	• Firewall Event

Source IP/Port	Source IP address (and port number, if applicable) of the threat.

Table 158: Statistics Tab Output in the Threats Report *(Continued)*

Field	Description
Destination IP/Port	Destination IP address (and port number, if applicable) of the threat.
Protocol	Protocol name of the threat.
Description	Threat identification based on the category type: • Antivirus—URL • Web filter—category • Content filter—reason • Antispam—sender e-mail
Action	Action taken in response to the threat.
Hit Time	Time the threat occurred.
Threat Trend in past 24 hours	

Category	Pie chart graphic representing comparative threat counts by category:
	• Traffic
	• IDP
	• Content Security
	  • Antivirus
	  • Antispam
	  • Web Filter
	  • Content Filter
	• Firewall Event

Table 158: Statistics Tab Output in the Threats Report *(Continued)*

Field	Description
Web Filter Counters Summary	
Category	Web filter count broken down by up to 39 subcategories. Clicking on the Web filter listing in the General Statistics pane opens the Web Filter Counters Summary pane.
Hits in past 24 hours	Number of threats per subcategory in the last 24 hours.
Hits in current hour	Number of threats per subcategory in the last hour.

Table 159: Activities Tab Output in the Threats Report

Field	Function
Most Recent Virus Hits	
Threat Name	Name of the virus threat. Viruses can be based on services, like Web, FTP, or e-mail, or based on severity level.
Severity	Severity level of each threat: • emerg • alert • crit • err • warning • notice • info • debug

Table 159: Activities Tab Output in the Threats Report *(Continued)*

Field	Function
Source IP/Port	IP address (and port number, if applicable) of the source of the threat.
Destination IP/Port	IP address (and port number, if applicable) of the destination of the threat.
Protocol	Protocol name of the threat.
Description	Threat identification based on the category type: • Antivirus—URL • Web filter—category • Content filter—reason • Antispam—sender e-mail
Action	Action taken in response to the threat.
Last Hit Time	Last time the threat occurred.
Most Recent Spam E-Mail Senders	
From e-mail	E-mail address that was the source of the spam.

Table 159: Activities Tab Output in the Threats Report *(Continued)*

Field	Function
Severity	Severity level of the threat: • emerg • alert • crit • err • warning • notice • info • debug
Source IP	IP address of the source of the threat.
Action	Action taken in response to the threat.
Last Send Time	Last time that the spam e-mail was sent.
Recently Blocked URL Requests	
URL	URL request that was blocked.
Source IP/Port	IP address (and port number, if applicable) of the source.
Destination IP/Port	IP address (and port number, if applicable) of the destination.
Hits in current hour	Number of threats encountered in the last hour.
Most Recent IDP Attacks	

Table 159: Activities Tab Output in the Threats Report *(Continued)*

Field	Function
Attack	
Severity	Severity of each threat: • emerg • alert • crit • err • warning • notice • info • debug
Source IP/Port	IP address (and port number, if applicable) of the source.
Destination IP/Port	IP address (and port number, if applicable) of the destination.
Protocol	Protocol name of the threat.
Action	Action taken in response to the threat.
Last Send Time	Last time the IDP threat was sent.

Traffic Monitoring Report

IN THIS SECTION

Purpose | 1554

- Action | 1554

Purpose

Monitor network traffic by reviewing reports of flow sessions over the past 24 hours. You can analyze logging data for connection statistics and session usage by a transport protocol.

Action

To view network traffic in the past 24 hours, select **Monitor>Reports>Traffic** in the J-Web user interface. See Table 6 for a description of the report.

Table 160: Traffic Report Output

Field	Description
Sessions in Past 24 Hours per Protocol	
Protocol Name	Name of the protocol. To see hourly activity by protocol, click the protocol name and review the “Protocol activities chart” in the lower pane. • TCP • UDP • ICMP
Total Session	Total number of sessions for the protocol in the past 24 hours.
Bytes In (KB)	Total number of incoming bytes in KB.
Bytes Out (KB)	Total number of outgoing bytes in KB.
Packets In	Total number of incoming packets.
Packets Out	Total number of outgoing packets.

Table 160: Traffic Report Output *(Continued)*

Field	Description
Most Recently Closed Sessions	
Source IP/Port	Source IP address (and port number, if applicable) of the closed session.
Destination IP/Port	Destination IP address (and port number, if applicable) of the closed session.
Protocol	Protocol of the closed session. • TCP • UDP • ICMP
Bytes In (KB)	Total number of incoming bytes in KB.
Bytes Out (KB)	Total number of outgoing bytes in KB.
Packets In	Total number of incoming packets.
Packets Out	Total number of outgoing packets.
Timestamp	The time the session was closed.
Protocol Activities Chart	
Bytes In/Out	Graphic representation of traffic as incoming and outgoing bytes per hour. The byte count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.
Packets In/Out	Graphic representation of traffic as incoming and outgoing packets per hour. The packet count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.

Table 160: Traffic Report Output *(Continued)*

Field	Description
Sessions	Graphic representation of traffic as the number of sessions per hour. The session count is for the protocol selected in the Sessions in Past 24 Hours per Protocol pane. Changing the selection causes this chart to refresh immediately.
X Axis	One hour per column for 24 hours.
Y Axis	Byte, packet, or session count.
Protocol Session Chart	
Sessions by Protocol	Graphic representation of the traffic as the current session count per protocol. The protocols displayed are TCP, UDP, and ICMP.

Configuring On-Box Binary Security Log Files

SRX Series devices use two types of logs—system logs and security logs—to record system events. System logs record control plane events—for example, when an admin user logs in. Security logs, also known as traffic logs, record data plane events regarding specific traffic handling. For example, Junos OS generates a security log if a security policy denies certain traffic because of a policy violation. For more about system logs, see "Junos OS System Log Overview" on page 1460. For more information about security logs, see "Understanding System Logging for Security Devices" on page 1535.

You can collect and save both system and security logs in binary format either on-box (that is, stored locally on the SRX Series device) or off-box (streamed to a remote device). Using binary format ensures that log files are efficiently stored, which in turn improves CPU utilization.

You can configure security files in binary format using the `log` statement at the `[security]` hierarchy level.

On-box logging is also known as event-mode logging. For stream-mode, off-box security logging, see "Configuring Off-Box Binary Security Log Files" on page 1558. When you configure security logs in binary format for event-mode logging, you can optionally define the log filename, file path, and other characteristics, as detailed in the following procedure:

1. Specify the logging mode and format for on-box logging::

```
[edit security]
user@host# set log mode event
user@host# set log format binary
```

> **NOTE**: If you configure system logging to send system logs to an external destination (that is, off-box or stream-mode), security logs are also sent to that destination even if you are using event-mode security logging. For more information about sending system logs to an external destination, see "Examples: Configuring System Logging" on page 1492.

> **NOTE**: Off-box and on-box security logging modes cannot be enabled simultaneously.

2. (Optional) Define a name and path for the log file.

> **NOTE**: By default, the bin_messages file is created in the /var/log directory.

```
[edit security]
user@host# set log file name security-binary-log
user@host# set log file path security/log-folder
```

3. (Optional) Change the maximum size of the log file and the maximum number of log files that can be archived.

> **NOTE**: By default, the maximum size of the log file is 3 MB, and a total of three log files can be archived.

In the following sample commands, you set a value of 5 MB and 5 archived files, respectively:

```
[edit security]
user@host# set log file size 5
user@host# set log file files 5
```

4. (Optional) Configure the hpl flag to enable diagnostic traces for the binary security log files. The smf_hpl prefix identifies all binary logging traces.

```
[edit security]
user@host# set log traceoptions flag hpl
```

5. For the default-permit security policy, traffic logs for RT_FLOW are generated when a session ends.

```
[edit security]
user@host# set policies from-zone trust to-zone untrust policy default-permit then log
session-close
```

6. (Optional) Traffic logs for RT_FlOW are generated when a session starts.

```
[edit security]
user@host# set policies from-zone trust to-zone untrust policy default-permit then log
session-init
```

View the content of the event-mode log file stored on the device using show security log file command and use clear security log file command to clear the content of the binary event-mode security log file.

NOTE: The show security log command displays event-mode security log messages if they are in a text-based format and the show security log file command displays event-mode security log messages if they are in binary format (on-box). Off-box binary logging is read by Juniper Secure Analytics (JSA).

Configuring Off-Box Binary Security Log Files

SRX Series devices have two types of log: system logs and security logs. System logs record control plane events, for example admin login to the device. For more about system logs, please see "Junos OS System Log Overview" on page 1460. Security logs, also known as traffic logs, record data plane events regarding specific traffic handling, for example when a security policy denies certain traffic due to some violation of the policy. For more information about security logs, please see "Understanding System Logging for Security Devices" on page 1535.

The two types of log can be collected and saved either on-box or off-box. The procedure below explains how to configure security logs in binary format for off-box (stream-mode) logging.

You can configure security files in binary format using the log statement at the [security] hierarchy level.

The following procedure specifies binary format for stream-mode security logging, and defines the log filename, path, and log file characteristics. For event-mode, on-box security logging, please see "Configuring On-Box Binary Security Log Files" on page 1556.

1. Specify the logging mode and the format for the log file. For off-box, stream-mode logging:

```
set security log mode stream
set security log stream test-stream format binary host 1.3.54.22
```

NOTE: Off-box and on-box security logging modes cannot be enabled simultaneously.

2. For off-box security logging, specify the source address, which identifies the SRX Series device that generated the log messages. The source address is required.

```
set security log source-address 2.3.45.66
```

3. Optionally, define a log filename and a path. By default, the file bin_messages is created in the /var/log directory.

```
set security log file name security-binary-log
set security log file path security/log-folder
```

4. Optionally, change the maximum size of the log file and the maximum number of log files that can be archived. By default the maximum size of the log file is 3 MB, and a total of three log files can be archived.

```
set security log file size 5
set security log file files 5
```

5. Optionally, select the hpl flag to enable diagnostic traces for binary logging. The prefix smf_hpl identifies all binary logging traces.

```
set security log traceoptions flag hpl
```

6. View the content of the event-mode log file stored on the device using either Juniper Secure Analytics (JSA) or Security Threat Response Manager (STRM).

Sending System Log Messages to a File

You can direct system log messages to a file on the CompactFlash (CF) card. The default directory for log files is `/var/log`. To specify a different directory on the CF card, include the complete pathname.

Create a file named `security`, and send log messages of the `authorization` class at the severity level `info` to the file.

To set the filename, the facility, and severity level:

```
{primary:node0}
user@host# set system syslog file security authorization info
```

Setting the System to Send All Log Messages Through eventd

The `eventd` process of logging configuration is most commonly used for Junos OS. In this configuration, control plane logs and data plane, or security, logs are forwarded from the data plane to the Routing Engine control plane `rtlogd` process. The `rtlogd` process then either forwards syslog or sd-syslog-formatted logs to the `eventd` process or the WELF-formatted logs to the external or remote WELF log collector.

To send all log messages through `eventd`:

1. Set the `eventd` process to handle security logs and send them to a remote server.

   ```
   {primary:node0}
   user@host# set security log mode event
   ```

2. Configure the server that will receive the system log messages.

   ```
   {primary:node0}
   user@host# set system syslog host hostname any any
   ```

   where *hostname* is the fully qualified hostname or IP address of the server that will receive the logs.

NOTE: To send duplicate logs to a second remote server, repeat the command with a new fully qualified *hostname* or IP address of a second server.

If your deployment is an active/active chassis cluster, you can also configure security logging on the active node to be sent to separate remote servers to achieve logging redundancy.

To rename or redirect one of the logging configurations, you need to delete and recreate it. To delete a configuration:

```
{primary:node0}
user@host# delete security log mode event
```

Release History Table

Release	Description
15.1X49-D100	Starting with Junos OS Release 15.1X49-D100, the default mode for SRX1500 device is stream mode. Prior to Junos OS Release 15.1X49-D100, the default mode for SRX1500 device was event mode.
17.4R2	Starting in Junos OS Release 17.4R2 and later, on SRX300, SRX320, SRX340, SRX345 Series devices and vSRX instances, when the device is configured in stream mode, you can configure maximum of eight system log hosts. In Junos OS Release 17.4R2 and earlier releases, you can configure only three system log hosts in the stream mode. If you configure more than three system log hosts, then the following error message is displayed error: configuration check-out failed.
17.4R2	Starting in Junos OS Release 17.4R2 and later, on SRX300, SRX320, SRX340, SRX345 Series devices and vSRX instances, when the device is configured in stream mode, you can configure maximum of eight system log hosts. In Junos OS Release 17.4R2 and earlier releases, you can configure only three system log hosts in the stream mode. If you configure more than three system log hosts, then the following error message is displayed error: configuration check-out failed.
Junos OS Release 15.1X49-D100	The on-box reporting feature is enabled by default when you load the factory-default configurations on the SRX Series device with Junos OS Release 15.1X49-D100 or later.
Junos OS Release 19.3R1	Starting in Junos OS Release 19.3R1, SRX300, SRX320, SRX340, SRX345, SRX550, and SRX550M devices default to stream mode.
Junos OS Release 19.3R1	Starting in Junos OS Release 19.3R1 , the factory-default configuration does not include on-box reporting configuration to increase the solid-state drive (SSD) lifetime.

Configure Syslog over TLS

SUMMARY

Learn how to configure your device to transport system log messages (also known as syslog messages) securely over the Transport Layer Security (TLS) protocol.

IN THIS SECTION

- Control Plane Logs | **1562**
- Data Plane Logs | **1567**

Control Plane Logs

IN THIS SECTION

- Example: Configure Syslog over TLS | **1562**

Control plane logs, also called system logs, include events that occur on the routing platform. The system sends control plane events to the eventd process on the Routing Engine, which then handles the events by using Junos OS policies, by generating system log messages, or by doing both. You can choose to send control plane logs to a file, user terminal, routing platform console, or remote machine. To generate control plane logs, use the `syslog` statement at the `[system]` hierarchy level.

Example: Configure Syslog over TLS

IN THIS SECTION

- Requirements | **1562**
- Overview | **1563**
- Configuration | **1563**

This example shows how to configure a Juniper Networks device to transport syslog messages (control plane logs) securely over TLS.

Requirements

This example uses the following hardware and software components:

- Junos OS Release 21.2 or later

- Device running Junos OS (syslog client)
- Syslog server

Overview

You use the TLS protocol to enable secure transportation of system log messages (control plane logs) from the syslog client to the syslog server. TLS uses certificates to authenticate and encrypt the communication.

- Server authentication (or one-way TLS)—Client verifies the identify of the server and trusts the server.
- Mutual authentication—Both the server and client trust each other.

You can choose either server authentication or mutual authentication depending on your network. To quickly access the information you need, click the links in Table 1 on page 1563.

Table 161: TLS Authentication Modes

Authentication Mode	Procedure	Section Where the Information Is Located
Server authentication	Configure PKI Configure the device	"Server Authentication" on page 1565

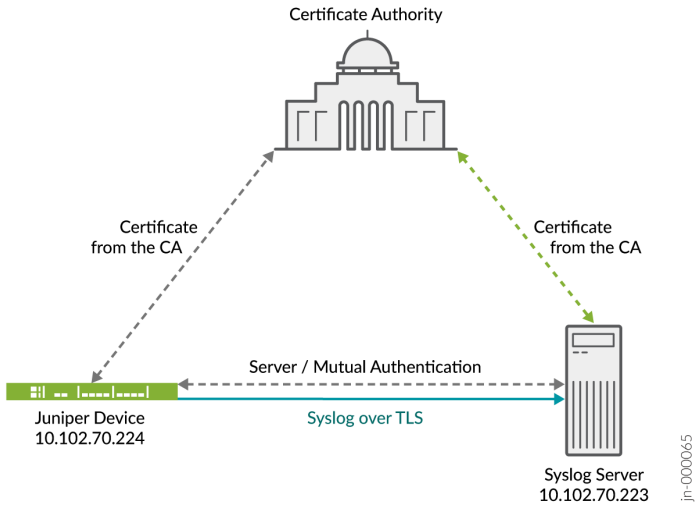
Configuration

IN THIS SECTION

- Public Key Infrastructure (PKI) Configuration Overview | **1564**
- Configure Server Authentication on Your Device | **1565**
- Results | **1566**
- Verification | **1566**

In the following example, we use the TLS protocol to securely transport syslog messages (control plane logs) from the Juniper device to the remote syslog server. Figure 1 shows the basic topology used in this example.

Figure 57: Syslog over TLS



Public Key Infrastructure (PKI) Configuration Overview

To configure PKI on the device:

1. Create a certification authority (CA) profile, and associate a CA identifier with the CA profile. See *Example: Configuring a CA Profile*.
2. (Optional) Create a revocation check to specify a method for validating the certificate. You can use either certificate revocation lists (CRLs) or the Online Certificate Status Protocol (OCSP). See Certificate Revocation.
3. (Optional) Create a trusted CA group, and add the CA profile to the trusted group. See Configuring a Trusted CA Group.
4. Load the CA certificate on the device. You can load the certificate manually. See Example: Loading CA and Local Certificates Manually. Based on your deployment environment, you can use either Certificate Management Protocol version 2 (CMPv2) or Simple Certificate Enrollment Protocol (SCEP) for online certificate enrollment. See Enrolling a CA Certificate Online Using SCEP and Understanding Certificate Enrollment with CMPv2.

5. (Optional for mutual authentication) Load the local certificate on the device. You can load the local certificate manually. Based on your deployment environment, you can use either CMPv2 or SCEP for online certificate enrollment. See Enrolling a Local Certificate Online Using SCEP and Understanding Certificate Enrollment with CMPv2.

6. Verify that the certificates are loaded successfully. Use the request security pki ca-certificate verify command to check whether the CA certificate has loaded successfully. Use the request security pki local-certificate verify command to verify that the local certificate has loaded successfully.

Configure Server Authentication on Your Device

Step-by-Step Procedure

The following procedure requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see Using the CLI Editor in Configuration Mode.

To configure the device:

1. Specify the syslog server that receives the system log messages. You can specify the IP address of the syslog server or a fully qualified hostname. In this example, use 10.102.70.233 as the IP address of the syslog server.

```
[edit]
user@host# set system syslog host 10.102.70.233 any any
```

2. Specify the port number of the syslog server.

```
[edit]
user@host# set system syslog host 10.102.70.233 port 10514
```

3. Specify the syslog transport protocol for the device. In this example, use TLS as the transport protocol.

```
[edit]
user@host# set system syslog host 10.102.70.223 transport tls
```

4. Specify the name of the trusted certificate authority (CA) group or specify the name of the CA profile to be used. In this example, use example-ca as the CA profile.

```
[edit]
user@host# set system syslog host 10.102.70.223 tlsdetails ca-profiles example-ca
```

5. Configure the device to send all log messages.

```
[edit]
user@host# set system syslog file messages any any
```

6. Commit the configuration.

```
[edit]
user@host# commit
```

Results

In configuration mode, confirm your configuration by using the `show system syslog` command.

```
[edit]
user@host# show system syslog
host 10.102.70.223
{
    port 10514;
    transport tls;
    tlsdetails
    {
        local-certificate example-cert;
        ca-profiles example-ca;

    }
}
```

Verification

To verify that the configuration is working properly, enter the `show log` command on the syslog server.

Data Plane Logs

IN THIS SECTION

- Example: Configure the TLS Syslog Protocol on SRX Series Devices | 1567

Data plane logs, also called security logs, include security events that are handled inside the data plane. Security logs can be in text or binary format, and you can save them locally (event mode) or configure your device to send the logs to an external server (stream mode). You require binary format for stream mode. We recommend binary format to conserve log space in event mode.

Example: Configure the TLS Syslog Protocol on SRX Series Devices

IN THIS SECTION

- Requirements | 1567
- Overview | 1567
- Configuration | 1568
- Verification | 1571

This example shows how to configure the Transport Layer Security (TLS) syslog protocol on SRX Series devices to receive encrypted syslog events from network devices that support TLS syslog event forwarding.

Requirements

Before you begin, enable server certificate verification and encryption or decryption capabilities.

Overview

The TLS syslog protocol enables a log source to receive encrypted syslog events from network devices that support TLS syslog event forwarding. The log source creates a listen port for incoming TLS syslog events and generates a certificate file for the network devices.

In this example, you configure a syslog collector associated with one SSL-I profile. Each SSL-I profile enables the user to specify things such as preferred ciphers suite and trusted CA certificates. You can configure multiple SSL-I profiles and associate the profiles with different collector servers.

Configuration

IN THIS SECTION

- Procedure | **1568**

Procedure

CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set security log mode stream
set security log format sd-syslog
set security log source-interface ge-0/0/1.0
set security log transport protocol tls
set security log transport tls-profile ssl-i-tls
set security log stream server1 format sd-syslog
set security log stream server1 category all
set security log stream server1 host 192.0.2.100
set services ssl initiation profile ssl-i-tls protocol-version all
set services ssl initiation profile ssl-i-tls trusted-ca all
set services ssl initiation profile ssl-i-tls actions ignore-server-auth-failure
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see Using the CLI Editor in Configuration Mode in the CLI User Guide.

To configure the TLS syslog protocol:

1. Set the log mode to stream.

```
[edit security]
user@host# set log mode stream
```

2. Specify the structured system log (sd-syslog) format for remote security message logging .

```
[edit security]
user@host# set log format sd-syslog
```

3. Set the host source interface number.

```
[edit security]
user@host# set log source-interface ge-0/0/1.0
```

4. Specify TLS as the security log transport protocol to be used to log the data.

```
[edit security]
user@host# set log transport protocol tls
```

5. Specify the TLS profile name.

```
[edit security]
user@host# set log transport tls-profile ssl-i-tls
```

6. Set the log stream to use the structured syslog format for sending logs to server 1.

```
[edit security]
user@host# set log stream server1 format sd-syslog
```

7. Set the category of server 1 logging to all.

```
[edit security]
user@host# set log stream server1 category all
```

8. Specify server host parameters by entering the server name or IP address.

```
[edit security]
user@host# set log stream server1 host 192.0.2.100
```

9. Define the protocol version *all* for the SSL initiation access profile.

```
[edit services]
user@host# set ssl initiation profile ssl-i-tls protocol-version all
```

10. Attach all CA profile groups to the SSL initiation profile to use when requesting a certificate from the peer.

```
[edit services]
user@host# set ssl initiation profile ssl-i-tls trusted-ca all
```

11. Configure the SSL initiation access profile to ignore the server authentication failure.

```
[edit services]
user@host# set ssl initiation profile ssl-i-tls actions ignore-server-auth-failure
```

Results

In configuration mode, verify your configuration by using the `show security log` command. If the output does not display the intended configuration, then repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security log
    mode stream;
        format sd-syslog;
        source-interface ge-0/0/1.0;
        transport {
            protocol tls;
            tls-profile ssl-i-tls;
        }
        stream server1 {
            format sd-syslog;
```

```
            category all;
            host {
            192.0.2.100;
            }
        }
    }
```

```
[edit]
user@host# run show configuration services ssl initiation
    profile ssl-i-tls {
        protocol-version all;
        trusted-ca all;
        actions {
            ignore-server-auth-failure;
        }
    }
```

If you are done configuring the device, enter `commit` from configuration mode.

Verification

To verify that the configuration is working properly, enter the `show log` command on the syslog server.

Monitoring Log Messages

IN THIS SECTION

- Monitoring System Log Messages | **1571**

Monitoring System Log Messages

IN THIS SECTION

- Purpose | **1572**
- Action | **1572**

- Meaning | **1573**

Purpose

Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action

To view system log messages:

```
user@switch1> show log messages
```

Sample Output

command-name

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent for Fan 1
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent for Fan 2
Nov  4 11:30:06  switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent for Fan 3
...
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor: jroute daemon
memory usage (Management process): new instance detected (variable:
sysApplElmtRunMemory.5.6.2293)
Nov  4 11:52:53  switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor: jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApplElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command 'exit '
Nov  4 12:10:27  switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting configuration
mode
```

```
Nov  4 12:10:31  switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command 'show log
messages
```

Meaning

The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

Pinging Hosts

IN THIS SECTION

- Purpose | 1576
- Action | 1576
- Meaning | 1577

Purpose

Use the CLI `ping` command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action

To use the `ping` command to send four requests (ping count) to host3:

```
ping host count number
```

Sample Output

command-name

```
ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (192.0.2.111): 56 data bytes
64 bytes from 192.0.2.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 192.0.2.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 192.0.2.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 192.0.2.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

Meaning

- The `ping` results show the following information:
  - Size of the ping response packet (in bytes).
  - IP address of the host from which the response was sent.
  - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
  - Time-to-live (ttl) hop-count value of the ping response packet.
  - Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
  - Number of ping requests (probes) sent to the host.
  - Number of ping responses received from the host.
  - Packet loss percentage.
  - Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

Monitoring Traffic Through the Router or Switch

IN THIS SECTION

- Displaying Real-Time Statistics About All Interfaces on the Router or Switch | **1578**
- Displaying Real-Time Statistics About an Interface on the Router or Switch | **1579**

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

IN THIS SECTION

- Purpose | 1578
- Action | 1578
- Meaning | 1579

Purpose

Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action

To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

Sample Output

command-name

```
user@host> monitor interface traffic
host name                 Seconds: 15                 Time: 12:31:09
Interface    Link  Input packets        (pps)     Output packets        (pps)
 so-1/0/0    Down              0          (0)                  0          (0)
 so-1/1/0    Down              0          (0)                  0          (0)
 so-1/1/1    Down              0          (0)                  0          (0)
 so-1/1/2    Down              0          (0)                  0          (0)
 so-1/1/3    Down              0          (0)                  0          (0)
 t3-1/2/0    Down              0          (0)                  0          (0)
 t3-1/2/1    Down              0          (0)                  0          (0)
 t3-1/2/2    Down              0          (0)                  0          (0)
 t3-1/2/3    Down              0          (0)                  0          (0)
 so-2/0/0      Up         211035           (1)              36778          (0)
 so-2/0/1      Up         192753           (1)              36782          (0)
```

```
  so-2/0/2      Up         211020          (1)              36779          (0)
  so-2/0/3      Up         211029          (1)              36776          (0)
  so-2/1/0      Up         189378          (1)              36349          (0)
  so-2/1/1    Down              0          (0)              18747          (0)
  so-2/1/2    Down              0          (0)              16078          (0)
  so-2/1/3      Up              0          (0)              80338          (0)
  at-2/3/0      Up              0          (0)                  0          (0)
  at-2/3/1    Down              0          (0)                  0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning

The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the `C` key. In this example, the `monitor interface` command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

IN THIS SECTION

- Purpose | **1579**
- Action | **1579**
- Meaning | **1581**

Purpose

Display real-time statistics about traffic passing through an interface on the router or switch.

Action

To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface  interface-name
```

Sample Output

command-name

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:                    5856541 (88 bps)
  Output bytes:                   6271468 (96 bps)

```

Meaning

The sample output shows the input and output packets for a particular SONET interface (`so-0/0/1`). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in Table 1.

Table 162: Output Control Keys for the monitor interface Command

Action	Key
Display information about the next interface. The `monitor interface` command scrolls through the physical or logical interfaces in the same order that they are displayed by the `show interfaces terse` command.	`N`
Display information about a different interface. The command prompts you for the name of a specific interface.	`I`
Freeze the display, halting the display of updated statistics.	`F`
Thaw the display, resuming the display of updated statistics.	`T`
Clear (zero) the current delta counters since `monitor interface` was started. It does not clear the accumulative counter.	`C`
Stop the `monitor interface` command.	`Q`

See the CLI Explorer for details on using match conditions with the `monitor traffic` command.

Dynamic Ternary Content Addressable Memory Overview

IN THIS SECTION

- Understanding Dynamic Ternary Content Addressable Memory | 1582
- Applications using Dynamic TCAM Infrastructure | 1582
- Features Using TCAM Resource | 1583
- Monitoring TCAM Resource Usage | 1587
- Example: Monitoring and Troubleshooting the TCAM Resource | 1587

Understanding Dynamic Ternary Content Addressable Memory

In ACX Series routers, Ternary Content Addressable Memory (TCAM) is used by various applications like firewall, connectivity fault management, PTPoE, RFC 2544, etc. The Packet Forwarding Engine (PFE) in ACX Series routers uses TCAM with defined TCAM space limits. The allocation of TCAM resources for various filter applications are statically distributed. This static allocation leads to inefficient utilization of TCAM resources when all the filter applications might not use this TCAM resource simultaneously.

The dynamic allocation of TCAM space in ACX routers efficiently allocates the available TCAM resources for various filter applications. In the dynamic TCAM model, various filter applications (such as inet-firewall, bridge-firewall, cfm-filters, etc.) can optimally utilize the available TCAM resources as and when required. Dynamic TCAM resource allocation is usage driven and is dynamically allocated for filter applications on a need basis. When a filter application no longer uses the TCAM space, the resource is freed and available for use by other applications. This dynamic TCAM model caters to higher scale of TCAM resource utilization based on application's demand.

Applications using Dynamic TCAM Infrastructure

The following filter application categories use the dynamic TCAM infrastructure:

- Firewall filter—All the firewall configurations
- Implicit filter—Routing Engine (RE) demons using filters to achieve its functionality. For example, connectivity fault management, IP MAC validation, etc.
- Dynamic filters—Applications using filters to achieve the functionality at the PFE level. For example, logical interface level fixed classifier, RFC 2544, etc. RE demons will not know about these filters.
- System-init filters—Filters that require entries at the system level or fixed set of entries at router's boot sequence. For example, Layer 2 and Layer 3 control protocol trap, default ARP policer, etc.

NOTE: The System-init filter which has the applications for Layer 2 and Layer 3 control protocols trap is essential for the overall system functionality. The applications in this control group consume a fixed and minimal TCAM space from the overall TCAM space. The system-init filter will not use the dynamic TCAM infrastructure and will be created when the router is initialized during the boot sequence.

Features Using TCAM Resource

Applications using the TCAM resource is termed tcam-app in this document. For example, inet-firewall, bridge-firewall, connectivity fault management, link fault management, etc., are all different tcam-apps.

Table 163 on page 1583 describes the list of tcam-apps that use TCAM resources.

Table 163: Features Using TCAM Resource

TCAM Apps/TCAM Users	Feature/Functionality	TCAM Stage
bd-dtag-validate	Bridge domain dual-tagged validate **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Egress
bd-tpid-swap	Bridge domain vlan-map with swap tpid operation	Egress
cfm-bd-filter	Connectivity fault management implicit bridge-domain filters	Ingress
cfm-filter	Connectivity fault management implicit filters	Ingress
cfm-vpls-filter	Connectivity fault management implicit vpls filters **NOTE**: This feature is supported only on ACX5048 and ACX5096 routers.	Ingress
cfm-vpls-ifl-filter	Connectivity fault management implicit vpls logical interface filters **NOTE**: This feature is supported only on ACX5048 and ACX5096 routers.	Ingress
cos-fc	Logical interface level fixed classifier	Pre-ingress

Table 163: Features Using TCAM Resource *(Continued)*

TCAM Apps/TCAM Users	Feature/Functionality	TCAM Stage
fw-ccc-in	Circuit cross-connect family ingress firewall	Ingress
fw-family-out	Family level egress firewall	Egress
fw-fbf	Firewall filter-based forwarding	Pre-ingress
fw-fbf-inet6	Firewall filter-based forwarding for inet6 family	Pre-ingress
fw-ifl-in	Logical interface level ingress firewall	Ingress
fw-ifl-out	Logical interface level egress firewall	Egress
fw-inet-ftf	Inet family ingress firewall on a forwarding-table	Ingress
fw-inet6-ftf	Inet6 family ingress firewall on a forwarding-table	Ingress
fw-inet-in	Inet family ingress firewall	Ingress
fw-inet-rpf	Inet family ingress firewall on RPF fail check	Ingress
fw-inet6-in	Inet6 family ingress firewall	Ingress
fw-inet6-family-out	Inet6 Family level egress firewall	Egress
fw-inet6-rpf	Inet6 family ingress firewall on a RPF fail check	Ingress
fw-inet-pm	Inet family firewall with port-mirror action **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress

Table 163: Features Using TCAM Resource *(Continued)*

TCAM Apps/TCAM Users	Feature/Functionality	TCAM Stage
fw-l2-in	Bridge family ingress firewall on Layer 2 interface	Ingress
fw-mpls-in	MPLS family ingress firewall	Ingress
fw-semantics	Firewall sharing semantics for CLI configured firewall	Pre-ingress
fw-vpls-in	VPLS family ingress firewall on VPLS interface	Ingress
ifd-src-mac-fil	Physical interface level source MAC filter	Pre-ingress
ifl-statistics-in	Logical level interface statistics at ingress	Ingress
ifl-statistics-out	Logical level interface statistics at egress	Egress
ing-out-iff	Ingress application on behalf of egress family filter for log and syslog	Ingress
ip-mac-val	IP MAC validation	Pre-ingress
ip-mac-val-bcast	IP MAC validation for broadcast	Pre-ingress
ipsec-reverse-fil	Reverse filters for IPsec service **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress
irb-cos-rw	IRB CoS rewrite	Egress
lfm-802.3ah-in	Link fault management (IEEE 802.3ah) at ingress **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress
lfm-802.3ah-out	Link fault management (IEEE 802.3ah) at egress	Egress

Table 163: Features Using TCAM Resource *(Continued)*

TCAM Apps/TCAM Users	Feature/Functionality	TCAM Stage
lo0-inet-fil	Looback interface inet filter	Ingress
lo0-inet6-fil	Looback interface inet6 filter	Ingress
mac-drop-cnt	Statistics for drops by MAC validate and source MAC filters	Ingress
mrouter-port-in	Multicast router port for snooping	Ingress
napt-reverse-fil	Reverse filters for network address port translation (NAPT) service **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress
no-local-switching	Bridge no-local-switching	Ingress
ptpoe	Point-to-Point-Over-the-Ethernet traps **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress
ptpoe-cos-rw	CoS rewrite for PTPoE **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Egress
rfc2544-layer2-in	RFC2544 for Layer 2 service at ingress	Pre-ingress
rfc2544-layer2-out	RFC2544 for Layer 2 service at egress **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Egress
service-filter-in	Service filter at ingress **NOTE**: This feature is not supported on ACX5048 and ACX5096 routers.	Ingress

Monitoring TCAM Resource Usage

You can use the show and clear commands to monitor and troubleshoot dynamic TCAM resource usage.

Table 164 on page 1587 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot dynamic TCAM resource usage.

Table 164: Show and Clear Commands to Monitor and Troubleshoot Dynamic TCAM

Task	Command
Display the shared and the related applications for a particular application	show pfe tcam app
Display the TCAM resource usage for an application and stages (egress, ingress, and pre-ingress)	show pfe tcam usage
Display the TCAM resource usage errors for applications and stages (egress, ingress, and pre-ingress)	show pfe tcam errors
Clears the TCAM resource usage error statistics for applications and stages (egress, ingress, and pre-ingress)	clear pfe tcam-errors

Example: Monitoring and Troubleshooting the TCAM Resource

This section describes a use case where you can monitor and troubleshoot TCAM resources using show commands. In this use case scenario, you have configured Layer 2 services and the Layer 2 service-related applications are using TCAM resources. The dynamic approach, as shown in this example, gives you the complete flexibility to manage TCAM resources on a need basis.

The service requirement is as follows:

- Each bridge domain has one UNI and one NNI interface
- Each UNI interface has:
  - One logical interface level policer to police the traffic at 10 Mbps.
  - Multifield classifier with four terms to assign forwarding class and loss-priority.
- Each UNI interface configures CFM UP MEP at the level 4.
- Each NNI interface configures CFM DOWN MEP at the level 2

Let us consider a scenario where there are 100 services configured on the router. With this scale, all the applications are configured successfully and the status shows **OK** state.

1. Viewing TCAM resource usage for all stages.

   To view the TCAM resource usage for all stages (egress, ingress, and pre-ingress), use the `show pfe tcam usage all-tcam-stages detail` command.

```
user@host> show pfe tcam usage all-tcam-stages detail
Slot 0

Tcam Resource Stage: Egress
---------------------------
Free [hw-grps: 3 out of 3]
No dynamic tcam usage
```

2. Configure additional Layer 2 services on the router.

   For example, add 20 more services on the router, thereby increasing the total number of services to 120. After adding more services, you can check the status of the configuration by verifying either the syslog message using the command `show log messages`, or by running the `show pfe tcam errors` command.

   The following is a sample syslog message output showing the TCAM resource shortage for Ethernet-switching family filters for newer configurations by running the `show log messages` CLI command.

```
[Sat Jul 11 16:10:33.794 LOG: Err] ACX Error
(dfw):acx_dfw_check_phy_slice_availability :Insufficient phy slices to accomodate grp:13/
IN_IFF_BRIDGE mode:1/DOUBLE
[Sat Jul 11 16:10:33.794 LOG: Err] ACX Error (dfw):acx_dfw_check_resource_availability :Could
not write filter: f-bridge-ge-0/0/0.103-i, insufficient TCAM resources

  Related-App-Name ..
-------------------------------------------------------------------
fw-ifl-in                 240      240      120          1     OK

Tcam Resource Stage: Egress
---------------------------
Free [hw-grps: 3 out of 3]
No dynamic tcam usage
```

The output indicates that the **fw-l2-in** application is running out of TCAM resources and moves into a FAILED state. Although there are two TCAM slices available at the ingress stage, the **fw-l2-in** application is not able to use the available TCAM space due to its mode (DOUBLE), resulting in resource shortage failure.

3. Fixing the applications that have failed due to the shortage of TCAM resouces.

   The **fw-l2-in** application failed because of adding more number of services on the routers, which resulted in shortage of TCAM resources. Although other applications seems to work fine, it is recommended to deactivate or remove the newly added services so that the **fw-l2-in** application moves to an OK state. After removing or deactivating the newly added services, you need to run the

`show pfe tcam usage` and `show pfe tcam error` commands to verify that there are no more applications in failed state.

To view the TCAM resource usage for all stages (egress, ingress, and pre-ingress), use the `show pfe tcam usage all-tcam-stages detail` command.

```
user@host> show pfe tcam usage all-tcam-stages detail
Slot 0

Policers            0                   0

Group: 14, Mode: SINGLE, Hw grps used: 1, Tcam apps: 1
               Errors   Resource-Shortage
Tcam-Entries        0                   0
Counters            0                   0
Policers            0                   0

Tcam Resource Stage: Egress
---------------------------
No tcam usage
```

You can see that all the applications using the TCAM resources are in **OK** state and indicates that the hardware has been successfully configured.

NOTE: As shown in the example, you will need to run the `show pfe tcam errors` and `show pfe tcam usage` commands at each step to ensure that your configurations are valid and that the applications using TCAM resource are in OK state.

Service Scaling on ACX5048 and ACX5096 Routers

In ACX5048 and ACX5096 routers, a typical service (such as ELINE, ELAN and IP VPN) that is deployed might require applications (such as policers, firewall filters, connectivity fault management IEEE 802.1ag, RFC2544) that uses the dynamic TCAM infrastructure.

NOTE: Service applications that uses TCAM resources is limited by the TCAM resource availability. Therefore, the scale of the service depends upon the consumption of the TCAM resource by such applications.

A sample use case for monitoring and troubleshooting service scale in ACX5048 and ACX5096 routers can be found at the "Dynamic Ternary Content Addressable Memory Overview" on page 1582 section.

Understanding and Configuring the Unified Forwarding Table

IN THIS SECTION

- Using the Unified Forwarding Table to Optimize Address Storage | **1595**

Configuring the Unified Forwarding Table to Optimize Address Storage Using Profiles | 1597

Using the Unified Forwarding Table to Optimize Address Storage

ACX5048 and ACX5096 routers support the use of a unified forwarding table to optimize address storage. This feature gives you the flexibility to configure your router to match the needs of your particular network environment. You can control the allocation of forwarding table memory available to store the following entries:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

You can use five predefined profiles (**l2-profile-one, l2-profile-two, l2-profile-three, l3-profile, lpm-profile**) to allocate the table memory space differently for each of these entries. The sizes of the Layer 2 MAC address table, Layer 3 host entry table, and Layer 3 LPM table are decided based on the selected profile. You can configure and select the profiles that best suits your network environment needs.

Table 4 illustrates the predefined profiles in the unified forwarding table and the respective table sizes.

Table 165: Unified Forwarding Table Profiles

Profile	Layer 2 MAC Address Table	Layer 3 Host Table	Layer 3 LPM Table
l2-profile-one	288 K	16 K	16 K
l2-profile-two	224 K	80 K	16 K
l2-profile-three (default)	160 K	144 K	16 K
l3-profile	96 K	208 K	16 K
lpm-profile	32 K	16 K	128 K

IPv4 unicast, IPv6 unicast, IPv4 multicast, and IPv6 multicast route addresses share the Layer 3 host entry table. If the host table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate any entries of any other type. The IPv4 multicast and IPv6 unicast

addresses occupy double the space as that occupied by IPv4 unicast entries, and IPv6 multicast addresses occupy four times the space of the IPv4 unicast addresses. Table 5 shows the Layer 3 host table size for each profile.

Table 166: Layer 3 Host Table

Profile	Layer 3 Host Table			
	IPv4 Unicast	IPv4 Multicast	IPv6 Unicast	IPv6 Multicast
l2-profile-one	16 K	8 K	8 K	4 K
l2-profile-two	80 K	40 K	40 K	20 K
l2-profile-three (default)	144 K	72 K	72 K	36 K
l3-profile	208 K	104 K	104 K	52 K
lpm-profile	16 K	8 K	8 K	4 K

The Layer 3 LPM table is shared between IPv4 route prefixes and IPv6 route prefixes. Table 6 illustrates the size of the table for different profiles of the IPv4 and IPv4 addresses in the Layer 3 LPM table. When unicast reverse-path forwarding (unicast RPF) is enabled, the table size reduces to half.

Table 167: Layer 3 LPM Table

Profile	Layer 3 LPM Table		
	IPv4 Unicast	IPv6 Unicast (Prefix <= /64)	IPv6 Unicast (Prefix > /64)
l2-profile-one	16 K	8 K	4 K
l2-profile-two	16 K	8 K	4 K
l2-profile-three (default)	16 K	8 K	4 K
l3-profile	16 K	8 K	4 K

Table 167: Layer 3 LPM Table *(Continued)*

Profile	Layer 3 LPM Table		
	IPv4 Unicast	IPv6 Unicast (Prefix <= /64)	IPv6 Unicast (Prefix > /64)
lpm-profile	128 K	40 K	8 K

By default, there is no space allocated for IPv6 prefix address longer than /64 in the LPM table. Therefore, prefix address longer than /64 are not allowed in the table by default. The entire table is available for IPv4 addresses and for IPv6 addresses that have prefixes shorter than /64. You can provide space in the table for addresses with prefixes longer than /64 by using CLI configuration. The number of entries reserved for these prefixes is configured in multiples of 16.

Configuring the Unified Forwarding Table to Optimize Address Storage Using Profiles

You can use five predefined profiles (**l2-profile-one, l2-profile-two, l2-profile-three, l3-profile, lpm-profile**) to allocate the table memory space. The sizes of the Layer 2 MAC address table, Layer 3 host entry table, and Layer 3 LPM table are decided based on the selected profile. You can configure and select the profiles that best suits your network environment needs.

1. To configure the profile that you want, enter the following statement:

```
[edit]
user@host# set chassis forwarding-options profile-name profile-name
```

2. Commit the profile.

```
[edit]
user@host# commit
```

NOTE: When you configure and commit a profile, the Packet Forwarding Engine (PFE) process restarts and all the data interfaces on the router go down and come back up.

The settings for `l2-profile-three` are configured by default. That is, if you do not configure the `forwarding-options chassis` *`profile-name`* statement, the `l2-profile-three` profile settings are configured.

Troubleshooting and Monitoring TCAM Resource in ACX Series Routers

The dynamic allocation of Ternary Content Addressable Memory (TCAM) space in ACX Series efficiently allocates the available TCAM resources for various filter applications. In the dynamic TCAM model, various filter applications (such as inet-firewall, bridge-firewall, cfm-filters, etc.) can optimally utilize the available TCAM resources as and when required. Dynamic TCAM resource allocation is usage driven and is dynamically allocated for filter applications on a need basis. When a filter application no longer uses the TCAM space, the resource is freed and available for use by other applications. This dynamic TCAM model caters to higher scale of TCAM resource utilization based on application's demand. You can use the show and clear commands to monitor and troubleshoot dynamic TCAM resource usage in ACX Series routers.

NOTE: Applications using the TCAM resource is termed tcam-app in this document.

Table 168 on page 1598 shows the task and the commands to monitor and troubleshoot TCAM resources in ACX Series routers

Table 168: Commands to Monitor and Troubleshoot TCAM Resource in ACX Series

How to	Command
View the shared and the related applications for a particular application.	`show pfe tcam app (list-shared-apps | list-related-apps)`
View the number of applications across all tcam stages.	`show pfe tcam usage all-tcam-stages`
View the number of applications using the TCAM resource at a specified stage.	`show pfe tcam usage tcam-stage (ingress | egress | pre-egress)`
View the TCAM resource used by an application in detail.	`show pfe tcam usage app <application-name> detail`
View the TCAM resource used by an application at a specified stage.	`show pfe tcam usage tcam-stage (ingress | egress | pre-egress) app <application-name>`
Know the number of TCAM resource consumed by a tcam-app	`show pfe tcam usage app <application-name>`

Table 168: Commands to Monitor and Troubleshoot TCAM Resource in ACX Series *(Continued)*

How to	Command
View the TCAM resource usage errors for all stages.	`show pfe tcam errors all-tcam-stages detail`
View the TCAM resource usage errors for a stage	`show pfe tcam errors tcam-stage (`*`ingress`* `/` *`egress`* `/` *`pre-egress`*`)`
View the TCAM resource usage errors for an application.	`show pfe tcam errors app <`*`application-name`*`>`
View the TCAM resource usage errors for an application along with its other shared application.	`show pfe tcam errors app <`*`application-name`*`> shared-usage`
Clear the TCAM resource usage error statistics for all stages.	`clear pfe tcam-errors all-tcam-stages`
Clear the TCAM resource usage error statistics for a specified stage	`clear pfe tcam-errors tcam-stage (`*`ingress`* `/` *`egress`* `/` *`pre-egress`*`)`
Clear the TCAM resource usage error statistics for an application.	`clear pfe tcam-errors app <`*`application-name`*`>`

To know more about dynamic TCAM in ACX Series, see "Dynamic Ternary Content Addressable Memory Overview" on page 1582.

Resource Monitoring Usage Computation Overview

IN THIS SECTION

- Resource Monitoring and Usage Computation For Trio-Based Line Cards | **1600**
- Resource Monitoring and Usage Computation For I-Chip-Based Line Cards | **1601**

You can configure the resource monitoring capability using both the CLI and SNMP MIB queries. You can employ this utility to provision sufficient headroom (memory space limits that are set for the application or virtual router) for monitoring the health and operating efficiency of DPCs and MPCs. You can also analyze and view the usage or consumption of memory for the jtree memory type and for contiguous pages, double words, and free memory pages. The jtree memory on all MX Series router Packet Forwarding Engines has two segments: one segment primarily stores routing tables and related information, and the other segment primarily stores firewall-filter-related information. As the allocation of more memory for routing tables or firewall filters might disrupt the forwarding operations of a Packet Forwarding Engine, the Junos OS CLI displays a warning to restart all affected FPCs when you commit a configuration that includes the memory-enhanced route statement.

The following sections describe the computation equations and the interpretation of the different memory regions for I-chip-based and Trio-based line cards:

Resource Monitoring and Usage Computation For Trio-Based Line Cards

In Trio-based line cards, memory blocks for next-hop and firewall filters are allocated separately. Also, an expansion memory is present, which is used when the allocated memory for next-hop or firewall filter is

fully consumed. Both next-hop and firewall filters can allocate memory from the expansion memory. The encapsulation memory region is specific to I-chip-based line cards and it is not applicable to Trio-based line cards. Therefore, for Trio-based line cards, the percentage of free memory space can be interpreted as follows:

% Free (NH) = (1- (Used NH memory + Used Expansion memory) / (Total NH memory+Total Expansion memory)) × 100

% Free (Firewall or Filter) = (1-(Used FW memory+Used Expansion memory) / (Total FW memory+Total Expansion memory)) × 100

Encapsulation memory is I-chip-specific and is not applicable for Trio-based line cards.

% Free (Encap memory) = Not applicable

Resource Monitoring and Usage Computation For I-Chip-Based Line Cards

I-chip-based line cards contain 32 MB of static RAM (SRAM) memory associated with the route lookup block and 16 MB of SRAM memory associated with the output WAN block.

The route-lookup memory is a single pool of 32 MB memory that is divided into two segments of 16 MB each. In a standard configuration, segment 0 is used for NH and prefixes, and segment 1 is used for firewall or filter. This allocation can be modified by using the route-memory-enhanced option at the [edit chassis] hierarchy level. In a general configuration, NH application can be allocated memory from any of the two segments. Therefore, the percentage of free memory for NH is calculated on 32 MB memory. Currently, firewall applications are allotted memory only from segment 1. As a result, the percentage of free memory to be monitored for firewall starts from the available 16 MB memory in segment 1 only.

For I-chip-based line cards, the percentage of free memory space can be interpreted as follows:

```
% Free (NH) = (32-(Used NH memory+Used FW memory+Used Other application)) / 32×100
```

```
% Free (Firewall or Filter)=(16-(Used NH memory+Used FW memory+Used Other application)) / 16×100
```

The memory size for Output WAN (Iwo) SRAM is 16 MB and stores the Layer 2 descriptors that contain the encapsulation information. This entity is a critical resource and needs to be monitored. This memory space is displayed in the output of the show command as “Encap mem”. The percentage of free memory for the encapsulation region is calculated as follows:

% Free (Encapsulation memory) = (16-(Iwo memory used (L2 descriptors +other applications))) / 16×100

The watermark level configured for next-hop memory is also effective for encapsulation memory. Therefore, if the percentage of free memory for encapsulation region falls below the configured watermark, logs are generated.

If the free memory percentage is lower than the free memory watermark of a specific memory type, the following error message is recorded in the syslog:

“Resource Monitor: FPC <slot no> PFE <pfe inst> <“JNH memory” or “FW/ Filter memory”> is below set watermark <configured watermark>”.

You can configure resource-monitoring tracing operations by using the `traceoptions file <filename> flag flag level level size bytes` statement at the `[edit system services resource-monitor]` hierarchy level. By default, messages are written to **/var/log/rsmonlog**. The error logs associated with socket communication failure (between the Routing Engine and the Packet Forwarding Engine) are useful in diagnosing the problems in the communication between the Routing Engine and the Packet Forwarding Engine.

From the Ukern perspective, MPC5E contains only one Packet Forwarding Engine instance. The show chassis fabric plane command output displays the state of fabric plane connections to the Packet Forwarding Engine. Because two Packet Forwarding Engines exist, you notice PFE-0 and PFE-1 in the output.

```
user@host# run show chassis fabric plane
Fabric management PLANE state
Plane 0
  Plane state: ACTIVE
      FPC 0
          PFE 0 :Links ok
          PFE 1 :Links ok
```

Because only one Packet Forwarding Engine instance for MPC5E exists, the output of the show system resource-monitor fpc command displays only one row corresponding to Packet Forwarding Engine instance 0.

```
user@host# run show system resource-monitor fpc
FPC Resource Usage Summary

Free Heap Mem Watermark         : 20  %
Free NH Mem Watermark           : 20  %
Free Filter Mem Watermark       : 20  %

* - Watermark reached

                    Heap                    ENCAP mem       NH mem          FW mem
   Slot #         % Free    PFE #          % Free       % Free          % Free
        0            94             0                   NA           83              99
```

The configured watermark is retained across GRES and unified ISSU procedures.

Diagnosing and Debugging System Performance by Configuring Memory Resource Usage Monitoring on MX Series Routers

Junos OS supports a resource monitoring capability using both the CLI and SNMP MIB queries. You can employ this utility to provision sufficient headroom (memory space limits that are set for the application or virtual router) for ensuring system stability, especially the health and operating efficiency of I-chip-based line cards and Trio-based FPCs on MX Series routers. When the memory utilization, either the ukernel memory or ASIC memory reaches a certain threshold, the system operations compromise on the health and traffic-handling stability of the line card and such a trade-off on the system performance can be detrimental for supporting live traffic and protocols.

To configure the properties of the memory resource-utilization functionality:

1. Specify that you want to configure the monitoring mechanism for utilization of different memory resource regions.

   ```
   [edit]
   user@host# edit system services resource-monitor
   ```

   This feature is enabled by default and you cannot disable it manually.
2. Specify the high threshold value, exceeding which warnings or error logs are generated, for all the regions of memory, such as heap or ukernel, next-hop and encapsulation, and firewall filter memory.

   ```
   [edit system services resource-monitor]
   user@host# set high-threshold value
   ```
3. Specify the percentage of free memory space used for next-hops to be monitored with a watermark value.

   ```
   [edit system services resource-monitor]
   user@host# set free-nh-memory-watermark percentage
   ```
4. Specify the percentage of free memory space used for ukernel or heap memory to be monitored with a watermark value.

   ```
   [edit system services resource-monitor]
   user@host# set free-heap-memory- watermark percentage
   ```

5. Specify the percentage of free memory space used for firewall and filter memory to be monitored with a watermark value.

```
[edit system services resource-monitor]
user@host# set free-filter-memory-memory- watermark percentage
```

> **NOTE**:
> The default value and the configured value of the watermark value for the percentage of free next-hop memory also applies to encapsulation memory. The default watermark values for the percentage of free ukernel or heap memory, next-hop memory, and firewall filter memory are 20 percent.

6. Disable the generation of error log messages when the utilization of memory resources exceeds the threshold or checkpoint levels. By default, messages are written to /var/log/rsmonlog.

```
[edit system services resource-monitor]
user@host# set no-logging
```

7. Define the resource category that you want to monitor and analyze for ensuring system stability, especially the health and operating efficiency of I-chip-based line cards and Trio-based FPCs on MX Series routers. The resource category includes detailed CPU utilization, session rate, and session count statistics. You use the resource category statistics to understand the extent to which new attack objects or applications affect performance.

```
[edit system services resource-monitor]
user@host# edit resource-category jtree
```

> **NOTE**: The jtree memory on all MX Series router Packet Forwarding Engines has two segments: one segment primarily stores routing tables and related information, and the other segment primarily stores firewall-filter-related information. The Junos OS provides the memory-enhanced statement to reallocate the jtree memory for routes, firewall filters, and Layer 3 VPNs.

8. Configure the type of resource as contiguous pages for which you want to enable the monitoring mechanism to provide sufficient headroom for ensuring effective system performance and traffic-

handling capacity. Specify the high and low threshold value, exceeding which warnings or error logs are generated, for the specified type or region of memory, which is contiguous page in this case.

```
[edit system services resource-monitor resource-category jtree]
user@host# set resource-type contiguous-pages high-threshold percentage
user@host# set resource-type contiguous-pages low-threshold percentage
```

9. Configure the type of resource as free double words (dwords) for which you want to enable the monitoring mechanism to provide sufficient headroom for ensuring effective system performance and traffic-handling capacity. Specify the high and low threshold value, exceeding which warnings or error logs are generated, for the specified type or region of memory, which is free dwords in this case.

```
[edit system services resource-monitor resource-category jtree]
user@host# set resource-type free-dwords high-threshold percentage
user@host# set resource-type free-dwords low-threshold percentage
```

10. Configure the type of resource as free memory pages for which you want to enable the monitoring mechanism to provide sufficient headroom for ensuring effective system performance and traffic-handling capacity. Specify the high and low threshold value, exceeding which warnings or error logs are generated, for the specified type or region of memory, which is free memory pages in this case.

```
[edit system services resource-monitor resource-category jtree]
user@host# set resource-type free-pages high-threshold percentage
user@host# set resource-type free-pages low-threshold percentage
```

11. View the utilization of memory resources on the Packet Forwarding Engines of an FPC by using the `show system resource-monitor fpc` command. The filter memory denotes the filter counter memory used for firewall filter counters. The asterisk (*) displayed next to each of the memory regions denotes the ones for which the configured threshold is being currently exceeded.

```
user@host# run show system resource-monitor fpc
FPC Resource Usage Summary

Free Heap Mem Watermark         : 20  %
Free NH Mem Watermark           : 20  %
Free Filter Mem Watermark       : 20  %

* - Watermark reached
```

```
                    Heap                    ENCAP mem       NH mem          FW mem
   Slot #         % Free    PFE #          % Free       % Free          % Free
        0             94            0                    NA           83              99
```

Troubleshooting the Mismatch of jnxNatObjects Values for MS-DPC and MS-MIC

IN THIS SECTION

- Problem | **1606**
- Resolution | **1606**

Problem

Description

When both MS-DPC and MS-MIC are deployed in a network and the Network Address Translation (NAT) type is configured as `napt-44`, the output of the `snmp mib walk` command for jnxNatObjects displays different values for MS-DPC and MS-MIC.

Resolution

Configure SNMP to Match jnxNatObjects Values for MS-DPC and MS-MIC

To configure SNMP to match jnxNatObjects values for MS-DPC and MS-MIC:

1. Run the `set services service-set` *`service-set-name`* `nat-options snmp-value-match-msmic` configuration mode command. The following configuration example shows how to configure SNMP to match the values for MS-MIC-specific objects in the jnxNatObjects MIB table with the values for MS-DPC objects.

```
[edit]
user@host# set services service-set Mobile nat-options snmp-value-match-msmic
```

2. Issue the `commit` command to confirm the changes.

```
[edit]
user@host# commit
commit complete
```

3. (Optional) Run the `show snmp mib walk jnxNatObjects` command to verify that the values for MS-MIC-specific objects in the jnxNatObjects MIB table match the values for MS-DPC objects. For example, the following output shows that the values for MS-MIC-specific objects and MS-DPC objects match.

```
[edit]
user@host# run show snmp mib walk jnxNatObjects
jnxNatSrcXlatedAddrType.6.77.111.98.105.108.101 = 1
jnxNatSrcPoolType.6.77.111.98.105.108.101 = 13
jnxNatSrcNumPortAvail.6.77.111.98.105.108.101 = 64512
jnxNatSrcNumPortInuse.6.77.111.98.105.108.101 = 0
jnxNatSrcNumAddressAvail.6.77.111.98.105.108.101 = 1
jnxNatSrcNumAddressInUse.6.77.111.98.105.108.101 = 0
jnxNatSrcNumSessions.6.77.111.98.105.108.101 = 0
jnxNatRuleType.9.77.111.98.105.108.101.58.116.49 = 13
jnxNatRuleTransHits.9.77.111.98.105.108.101.58.116.49 = 0
jnxNatPoolType.6.77.111.98.105.108.101 = 13
jnxNatPoolTransHits.6.77.111.98.105.108.101 = 0
```

NOTE: You can use the `delete services service-set` *`service-set-name`* `nat-options snmp-value-match-msmic` configuration mode command to disable this feature.

Managed Objects for Ukernel Memory for a Packet Forwarding Engine in an FPC Slot

The `jnxPfeMemoryUkernTable`, whose object identifier is `{jnxPfeMemory 1}`, contains the `JnxPfeMemoryUkernEntry` that retrieves the global ukernel or heap memory statistics for the specified Packet Forwarding Engine slot. Each `JnxPfeMemoryUkernEntry`, whose object identifier is `{jnxPfeMemoryUkernTable 1}`, contains the objects

listed in the following table. The jnxPfeMemoryUkernEntry denotes the memory utilization, such as the total available memory and the percentage of memory used.

Table 169: jnxPfeMemoryUKernTable

Object	Object ID	Description
jnxPfeMemoryUkernFreePercent	jnxPfeMemoryUkernEntry 3	Denotes the percentage of free Packet Forwarding Engine memory within the ukern heap.

Managed Objects for Packet Forwarding Engine Memory Statistics Data

The jnxPfeMemory table, whose object identifier is {jnxPfeMib 2} contains the objects listed in Table 170 on page 1608

Table 170: jnxPfeMemory Table

Object	Object ID	Description
jnxPfeMemoryUkernTable	jnxPfeMemory 1	Provides global ukern memory statistics for the specified Packet Forwarding Engine slot.
jnxPfeMemoryForwardingTable	jnxPfeMemory 2	Provides global next-hop (for Trio-based line cards) or Jtree (for I-chip-based line cards) memory utilization and firewall filter memory utilization statistics for the specified Packet Forwarding Engine slot.

Managed Objects for Next-Hop, Jtree, and Firewall Filter Memory for a Packet Forwarding Engine in an FPC Slot

The jnxPfeMemoryForwardingTable, whose object identifier is {jnxPfeMemory 2}, contains JnxPfeMemoryForwardingEntry that retrieves the next-hop memory for Trio- based line cards, jtree memory for I-chip-based line cards, and firewall or filter memory statistics for the specified Packet Forwarding Engine slot for both I- chip and Trio-based line cards. Each jnxPfeMemoryForwardingEntry, whose object identifier is {jnxPfeMemoryForwardingTable 1}, contains the objects listed in the following table.

The jnxPfeMemoryForwardingEntry represents the ASIC instance, ASIC memory used, and ASIC free memory. The jtree memory on all MX Series router Packet Forwarding Engines has two segments: one segment primarily stores routing tables and related information, and the other segment primarily stores firewall-filter-related information. As the allocation of more memory for routing tables or firewall filters might disrupt the forwarding operations of a Packet Forwarding Engine, the Junos OS CLI displays a warning

to restart all affected FPCs when you commit a configuration that includes the memory-enhanced route statement. The configuration does not become effective until you restart the FPC or DPC (on MX Series routers).

Table 171: jnxPfeMemoryForwardingTable

Object	Object ID	Description
jnxPfeMemoryForwardingChipSlot	jnxPfeMemoryForwardingEntry 1	Indicates the ASIC instance number in the Packet Forwarding Engine complex.
jnxPfeMemoryType	jnxPfeMemoryForwardingEntry 2	Indicates the Packet Forwarding Engine memory type, where nh = 1, fw = 2, encap = 3.
jnxPfeMemoryForwardingPercentFree	jnxPfeMemoryForwardingEntry 3	Indicates the percentage of memory free for each memory type.

jnxPfeMemoryErrorsTable

The Juniper Networks enterprise-specific Packet Forwarding Engine MIB, whose object ID is {jnxPfeMibRoot 1}, supports a new MIB table, jnxPfeMemoryErrorsTable, to display Packet Forwarding Engine memory error counters. The jnxPfeMemoryErrorsTable, whose object identifier is jnxPfeNotification 3, contains the JnxPfeMemoryErrorsEntry. Each JnxPfeMemoryErrorsEntry, whose object identifier is { jnxPfeMemoryErrorsTable 1 }, contains the objects listed in the following table.

Table 172: jnxPfeMemoryErrorsTable

Object	Object ID	Description
jnxPfeFpcSlot	jnxPfeMemoryErrorsEntry 1	Signifies the FPC slot number for this set of PFE notification
jnxPfeSlot	jnxPfeMemoryErrorsEntry 2	Signifies the PFE slot number for this set of errors
jnxPfeParityErrors	jnxPfeMemoryErrorsEntry 3	Signifies the parity error count
jnxPfeEccErrors	jnxPfeMemoryErrorsEntry 4	Signifies the error-checking code (ECC) error count

pfeMemoryErrors

The pfeMemoryErrorsNotificationPrefix, whose object identifier is {jnxPfeNotification 0}, contains the pfeMemoryErrors attribute. The pfeMemoryErrors object, whose identifier is {pfeMemoryErrorsNotificationPrefix 1} contains the jnxPfeParityErrors and jnxPfeEccErrors objects.

Table 173: pfeMemoryErrors

Object	Object ID	Description
pfeMemoryErrors	pfeMemoryErrorsNotificationPrefix 1	A pfeMemoryErrors notification is sent when the value of jnxPfeParityErrors or jnxPfeEccErrors increases.

Configuring Data Path Debugging and Trace Options

Understanding Data Path Debugging for SRX Series Devices

Data path debugging, or end-to-end debugging, support provides tracing and debugging at multiple processing units along the packet-processing path. The packet filter can be executed with minimal impact to the production system.

If your goal is to collect packet captures, we strongly recommend leveraging the Operational Mode Packet Capture introduced in Junos OS Release 19.3R1. See "Packet Capture from Operational Mode" on page 1612.

On an SRX Series device, a packet goes through series of events involving different components from ingress to egress processing.

With the data path debugging feature, you can trace and debug (capture packets) at different data points along the processing path. The events available in the packet-processing path are: NP ingress, load-balancing thread (LBT), jexec, packet-ordering thread (POT), and NP egress. You can also enable flow module trace if the security flow trace flag for a certain module is set.

At each event, you can specify any of the four actions (count, packet dump, packet summary, and trace). Data path debugging provides filters to define what packets to capture, and only the matched packets are traced. The packet filter can filter out packets based on logical interface, protocol, source IP address prefix, source port, destination IP address prefix, and destination port.

Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX4600, SRX5400, SRX5600, and SRX5800.

To enable end-to-end debugging, you must perform the following steps:

1. Define the capture file and specify the maximum capture size.
2. Define the packet filter to trace only a certain type of traffic based on the requirement.
3. Define the action profile specifying the location on the processing path from where to capture the packets (for example, LBT or NP ingress).
4. Enable the data path debugging.
5. Capture traffic.
6. Disable data path debugging.
7. View or analyze the report.

The packet-filtering behavior for the port and interface options is as follows:

- The packet filter traces both IPv4 and IPv6 traffic if only **port** is specified.
- The packet filter traces IPv4, IPV6, and non-IP traffic if only **interface** is specified.

Packet Capture from Operational Mode

Data path debugging or end-to-end debugging provides tracing and debugging at multiple processing units along the packet-processing path. Packet capture is one of the data path debug function. You can execute the packet capture from the operational mode with minimal impact to the production system without committing the configurations.

You can capture the packets using filters to define what packets to capture. The packet filter can filter out packets based on logical interface, protocol, source IP address prefix, source port, destination IP address prefix, and destination port. You can modify the file name, file type, file size, and capture size of the packet capture output. You can also extend the filters into two filters, and swap the values of filters.

To capture packets from the operational mode, you must perform the following steps:

1. From the operational mode, define the packet filter to trace the type of traffic based on your requirement using the `request packet-capture start` CLI command. See "request packet-capture start" on page 2724 for the available packet capture filter options.
2. Capture the required packets.
3. You can use either the `request packet-capture stop` CLI command to stop the packet capture or after collecting the requested number of packets, the packet capturing stops automatically.
4. View or analyze the captured packet data report.

Limitations of capturing packets from the operational mode are:

1. The configuration mode packet capture and the operational mode packet capture cannot coexist.
2. The operational mode packet capture is a one-time operation and the system does not store the history of this command.
3. You should use the operational mode packet capture in low rate of traffic flow.

request packet-capture stop | 2730

Understanding Security Debugging Using Trace Options

The Junos OS trace function allows applications to write security debugging information to a file. The information that appears in this file is based on criteria you set. You can use this information to analyze security application issues.

The trace function operates in a distributed manner, with each thread writing to its own trace buffer. These trace buffers are then collected at one point, sorted, and written to trace files. Trace messages are

delivered using the InterProcess Communications (IPC) protocol. A trace message has a lower priority than that of control protocol packets such as BGP, OSPF, and IKE, and therefore delivery is not considered to be as reliable.

Understanding Flow Debugging Using Trace Options

For flow trace options, you can define a packet filter using combinations of **destination-port**, **destination-prefix**, **interface**, **protocol**, **source-port**, and **source-prefix**. If the security flow trace flag for a certain module is set, the packet matching the specific packet filter triggers flow tracing and writes debugging information to the trace file.

Debugging the Data Path (CLI Procedure)

Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.

To configure the device for data path debugging:

1. Specify the following request command to set the data path debugging for the multiple processing units along the packet-processing path:

```
[edit]
user@host# set security datapath-debug
```

2. Specify the trace options for data path-debug using the following command:

```
[edit]
user@host# set security datapath-debug traceoptions
```

3. Using the request security packet-filter command, you can set the packet filter to specify the related packets to perform data path-debug action. A maximum of four filters are supported at the same time. For example, the following command sets the first packet-filter:

```
[edit]
user@host# set security datapath-debug packet-filter name
```

4. Using the request security action-profile command, you can set the action for the packet match for a specified filter. Only the default action profile is supported, which is the trace option for network processor ezchip ingress, ezchip egress, spu.lbt, and spu.pot:

```
[edit]
user@host# set security datapath-debug packet-filter name action-profile
```

Setting Flow Debugging Trace Options (CLI Procedure)

The following examples display the options you can set by using `security flow traceoptions`.

- To match the imap destination port for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 destination-port imap
```

- To set the 1.2.3.4 destination IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 destination-prefix 1.2.3.4
```

- To set the fxp0 logical interface for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 interface fxp0
```

- To match the TCP IP protocol for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 protocol tcp
```

- To match the HTTP source port for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-port http
```

- To set the 5.6.7.8 IPv4 prefix address for the filter1 packet filter, use the following statement:

```
[edit]
user@host# set security flow traceoptions packet-filter filter1 source-prefix 5.6.7.8
```

Setting Security Trace Options (CLI Procedure)

Use the following configuration statements to configure security trace options in the CLI configuration editor.

- To disable remote tracing, enter the following statement:

```
[edit]
user@host# set security traceoptions no-remote-trace
```

- To write trace messages to a local file, enter the following statement. The system saves the trace file in the **/var/log/** directory.

```
[edit]
user@host# set security traceoptions use-local-files
```

- To specify a name for the trace file, enter the following statement. Valid values range from 1 and 1024 characters. The name cannot include spaces, /, or % characters. The default filename is security.

```
[edit]
user@host# set security traceoptions file filename
```

- To specify the maximum number of trace files that can accumulate, enter the following statement. Valid values range from 2 to 1000. The default value is 3.

```
[edit]
user@host# set security traceoptions file files 3
```

- To specify the match criteria that you want the system to use when logging information to the file, enter the following statement. Enter a regular expression. Wildcard (*) characters are accepted.

```
[edit]
user@host# set security traceoptions file match *thread
```

- To allow any user to read the trace file, enter the `world-readable` statement. Otherwise, enter the `no-world-readable` statement.

```
[edit]
user@host# set security traceoptions file world-readable
user@host# set security traceoptions file no-world-readable
```

- To specify the maximum size to which the trace file can grow, enter the following statement. Once the file reaches the specified size, it is compressed and renamed *filename*0.gz, the next file is named *filename*1.gz, and so on. Valid values range from 10240 to 1,073,741,824.

```
[edit]
user@host# set security traceoptions file size 10240
```

- To turn on trace options and to perform more than one tracing operation, set the following flags.

```
[edit]
user@host# set security traceoptions flag all
user@host# set security traceoptions flag compilation
user@host#  set security traceoptions flag configuration
user@host# set security traceoptions flag routing-socket
```

- To specify the groups that these trace option settings do or do not apply to, enter the following statements:

```
[edit]
user@host# set security traceoptions apply-groups value
user@host# set security traceoptions apply-groups-except value
```

Displaying Log and Trace Files

Enter the `monitor start` command to display real-time additions to system logs and trace files:

```
user@host> monitor start filename
```

When the device adds a record to the file specified by *filename*, the record displays on the screen. For example, if you have configured a system log file named `system-log` (by including the `syslog` statement at

the [edit system] hierarchy level), you can enter the monitor start system-log command to display the records added to the system log.

To display a list of files that are being monitored, enter the monitor list command. To stop the display of records for a specified file, enter the monitor stop *filename* command.

Displaying Output for Security Trace Options

IN THIS SECTION

- Purpose | 1617
- Action | 1617

Purpose

Display output for security trace options.

Action

Use the show security traceoptions command to display the output of your trace files. For example:

```
[edit]
user@host # show security traceoptions file usp_trace
user@host # show security traceoptions flag all
user@host # show security traceoptions rate-limit 888
```

The output for this example is as follows:

```
Apr 11 16:06:42 21:13:15.750395:CID-906489336:FPC-01:PIC-01:THREAD_ID-01:PFE:now update

Function[util_ssam_handler]
Apr 11 16:06:42 21:13:15.874485:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default1: Rate limit
changed to 888
Apr 11 16:06:42 21:13:15.874538:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default1: Destination ID
set to 1
Apr 11 16:06:42 21:13:15.874651:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default2: Rate limit
changed to 888
```

```
Apr 11 16:06:42 21:13:15.874832:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default2: Destination ID
set to 1
Apr 11 16:06:42 21:13:15.874942:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default3: Rate limit
changed to 888
Apr 11 16:06:42 21:13:15.874997:CID-00:FPC-01:PIC-01:THREAD_ID-01:CTRL:default3: Destination ID
set to 1
```

Displaying Multicast Trace Operations

To monitor and display multicast trace operations, enter the `mtrace monitor` command:

```
user@host> mtrace monitor
```

```
Mtrace query at Apr 21 16:00:54 by 192.1.30.2, resp to 224.0.1.32, qid 2a83aa packet from
192.1.30.2 to 224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60)  Mtrace
query at Apr 21 16:00:57 by 192.1.30.2, resp to 224.0.1.32, qid 25dc17 packet from 192.1.30.2 to
224.0.0.2 from 192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60)  Mtrace query at Apr 21
16:01:00 by 192.1.30.2, resp to same, qid 20e046 packet from 192.1.30.2 to 224.0.0.2 from
192.1.30.2 to 192.1.4.1 via group 224.1.1.1 (mxhop=60)  Mtrace query at Apr 21 16:01:10 by
192.1.30.2, resp to same, qid 1d25ad packet from 192.1.30.2 to 224.0.0.2 from 192.1.30.2 to
192.1.4.1 via group 224.1.1.1 (mxhop=60)
```

This example displays only `mtrace` queries. However, when the device captures an `mtrace` response, the display is similar, but the complete `mtrace` response also appears (exactly as it is appears in the `mtrace from-source` command output).

Table 174 on page 1618 summarizes the output fields of the display.

Table 174: CLI mtrace monitor Command Output Summary

Field	Description
`Mtrace` *`operation-type`* `at` *`time-of-day`*	• *`operation-type`*—Type of multicast trace operation: `query` or `response`. • *`time-of-day`*—Date and time the multicast trace query or response was captured.
`by`	IP address of the host issuing the query.

Table 174: CLI mtrace monitor Command Output Summary *(Continued)*

Field	Description
`resp to` *address*	*address*—Response destination address.
`qid` *qid*	*qid*—Query ID number.
`packet from` *source* `to` *destination*	• *source*—IP address of the source of the query or response. • *destination*—IP address of the destination of the query or response.
`from` *source* `to` *destination*	• *source*—IP address of the multicast source. • *destination*—IP address of the multicast destination.
`via group` *address*	*address*—Group address being traced.
`mxhop=`*number*	*number*—Maximum hop setting.

Displaying a List of Devices

To display a list of devices between the device and a specified destination host, enter the `traceroute` command with the following syntax:

```
user@host> traceroute host <interface interface-name> <as-number-lookup> <bypass-routing>
<gateway address> <inet | inet6> <no-resolve> <routing-instance routing-instance-name>
<source source-address> <tos number> <ttl number> <wait seconds>
```

Table 175 on page 1619 describes the `traceroute` command options.

Table 175: CLI traceroute Command Options

Option	Description
host	Sends traceroute packets to the hostname or IP address you specify.

Table 175: CLI traceroute Command Options *(Continued)*

Option	Description
`interface` *interface-name*	(Optional) Sends the traceroute packets on the interface you specify. If you do not include this option, traceroute packets are sent on all interfaces.
`as-number-lookup`	(Optional) Displays the autonomous system (AS) number of each intermediate hop between the device and the destination host.
`bypass-routing`	(Optional) Bypasses the routing tables and sends the traceroute packets only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. Use this option to display a route to a local system through an interface that has no route through it.
`gateway` *address*	(Optional) Uses the gateway you specify to route through.
`inet`	(Optional) Forces the traceroute packets to an IPv4 destination.
`inet6`	(Optional) Forces the traceroute packets to an IPv6 destination.
`no-resolve`	(Optional) Suppresses the display of the hostnames of the hops along the path.
`routing-instance` *routing-instance-name*	(Optional) Uses the routing instance you specify for the traceroute.
`source` *address*	(Optional) Uses the source address that you specify, in the traceroute packet.
`tos` *number*	(Optional) Sets the type-of-service (TOS) value in the IP header of the traceroute packet. Specify a value from `0` through `255`.
`ttl` *number*	(Optional) Sets the time-to-live (TTL) value for the traceroute packet. Specify a hop count from `0` through `128`.
`wait` *seconds*	(Optional) Sets the maximum time to wait for a response.

To quit the traceroute command, press Ctrl-C.

The following is sample output from a traceroute command:

```
user@host> traceroute host2
```

```
traceroute to 173.24.232.66 (172.24.230.41), 30 hops max, 40 byte packets  1  173.18.42.253
(173.18.42.253)  0.482 ms  0.346 ms  0.318 ms  2  host4.site1.net (173.18.253.5)  0.401 ms
0.435 ms  0.359 ms  3  host5.site1.net (173.18.253.5)  0.401 ms  0.360 ms  0.357 ms  4
173.24.232.65 (173.24.232.65)  0.420 ms  0.456 ms  0.378 ms  5  173.24.232.66 (173.24.232.66)
0.830 ms  0.779 ms  0.834 ms
```

The fields in the display are the same as those displayed by the J-Web traceroute diagnostic tool.

Example: Configuring End-to-End Debugging on SRX Series Device

IN THIS SECTION

- Requirements | **1621**
- Overview | **1622**
- Configuration | **1622**
- Enabling Data Path Debugging | **1625**
- Verification | **1626**

This example shows how to configure and enable end-to-end debugging on an SRX Series device with an SRX5K-MPC.

Requirements

This example uses the following hardware and software components:

- SRX5600 device with an SRX5K-MPC installed with 100-Gigabit Ethernet CFP transceiver
- Junos OS Release 12.1X47-D15 or later for SRX Series devices

Before you begin:

- See "Understanding Data Path Debugging for SRX Series Devices" on page 1611.

No special configuration beyond device initialization is required before configuring this feature.

Overview

Data path debugging enhances troubleshooting capabilities by providing tracing and debugging at multiple processing units along the packet-processing path. With the data path debugging feature, you can trace and debug (capture packets) at different data points along the processing path. At each event, you can specify an action (count, packet dump, packet summary, and trace) and you can set filters to define what packets to capture.

In this example, you define a traffic filter, and then you apply an action profile. The action profile specifies a variety of actions on the processing unit. The ingress and egress are specified as locations on the processing path to capture the data for incoming and outgoing traffic.

Next, you enable data path debugging in operational mode, and finally you view the data capture report.

NOTE: Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.

Configuration

IN THIS SECTION

- Procedure | 1622

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set security datapath-debug traceoptions file e2e.trace size 10m
set security datapath-debug capture-file e2e.pcap format pcap
set security datapath-debug maximum-capture-size 1500
set security datapath-debug capture-file files 10
```

```
set security datapath-debug action-profile profile-1 preserve-trace-order
set security datapath-debug action-profile profile-1 record-pic-history
set security datapath-debug action-profile profile-1 event np-ingress trace
set security datapath-debug action-profile profile-1 event np-ingress count
set security datapath-debug action-profile profile-1 event np-ingress packet-summary
set security datapath-debug action-profile profile-1 event np-egress trace
set security datapath-debug action-profile profile-1 event np-egress count
set security datapath-debug action-profile profile-1 event np-egress packet-summary
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *Junos OS CLI User Guide* .

To configure data path debugging:

1. Edit the security datapath debugging option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```

2. Enable the capture file, file format, file size, and the number of files.

```
[edit security datapath-debug]
user@host# set traceoptions file e2e.trace size 10m
user@host# set capture-file e2e.pcap format pcap;
user@host# set maximum-capture-size 1500
user@host# set capture-file files 10
```

3. Configure action profile, event type, and actions for the action profile.

```
[edit security datapath-debug]
user@host# set action-profile profile-1 preserve-trace-order
user@host# set action-profile profile-1 record-pic-history
user@host# set action-profile profile-1 event np-ingress trace
user@host# set action-profile profile-1 event np-ingress count
user@host# set action-profile profile-1 event np-ingress packet-summary
user@host# set action-profile profile-1 event np-egress trace
```

```
user@host# set action-profile profile-1 event np-egress count
user@host# set action-profile profile-1 event np-egress packet-summary
```

Results

From configuration mode, confirm your configuration by entering the `show security datapath-debug` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
traceoptions {
    file e2e.trace size 10m;
}
capture-file e2e.pcap format pcap;
maximum-capture-size 1500;
capture-file files 10;
action-profile {
    profile-1 {
        preserve-trace-order;
        record-pic-history;
        event np-ingress {
            trace;
            packet-summary;
            packet-dump;
        }
        event np-egress {
            trace;
            packet-summary;
            packet-dump;
        }
    }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

Enabling Data Path Debugging

IN THIS SECTION

- Procedure | 1625

Procedure

Step-by-Step Procedure

After configuring data path debugging, you must start the process on the device from operational mode.

1. Enable data path debugging.

```
user@host> request security datapath-debug capture start
```

```
datapath-debug capture started on file datapcap
```

2. Before you verify the configuration and view the reports, you must disable data path debugging.

```
user@host> request security datapath-debug capture stop
```

```
datapath-debug capture succesfully stopped, use show security datapath-debug capture to view
```

NOTE: You must stop the debug process after you have finished capturing the data. If you attempt to open the captured files without stopping the debug process, the files obtained cannot be opened through any third-party software (for example, tcpdump and wireshark).

Verification

IN THIS SECTION

- Verifying Data Path Debug Packet Capture Details | **1626**

Confirm that the configuration is working properly.

Verifying Data Path Debug Packet Capture Details

Purpose

Verify the data captured by enabling the data path debugging configuration.

Action

From operational mode, enter the `show security datapath-debug capture` command.

```
Packet 8, len 152: (C2/F2/P0/SEQ:57935:np-ingress)
00 10 db ff 10 02 00 30 48 83 8d 4f 08 00 45 00
00 54 00 00 40 00 40 01 9f c7 c8 07 05 69 c8 08
05 69 08 00 91 1f 8f 03 2a a2 ae 66 85 53 8c 7d
02 00 08 09 0a 0b 0c 0d 0e 0f 10 11 12 13 14 15
16 17 18 19 1a 1b 1c 1d 1e 1f 20 21 22 23 24 25
26 27 28 29 2a 2b 2c 2d 2e 2f 30 31 32 33 34 35
36 37
Packet 9, len 152: (C2/F2/P0/SEQ:57935:np-egress)
00 30 48 8d 1a bf 00 10 db ff 10 03 08 00 45 00
00 54 00 00 40 00 3f 01 a0 c7 c8 07 05 69 c8 08
05 69 08 00 91 1f 8f 03 2a a2 ae 66 85 53 8c 7d
02 00 08 09 0a 0b 0c 0d 0e 0f 10 11 12 13 14 15
16 17 18 19 1a 1b 1c 1d 1e 1f 20 21 22 23 24 25
26 27 28 29 2a 2b 2c 2d 2e 2f 30 31 32 33 34 35
36 37....
```

For brevity, the `show` command output is truncated to display only a few samples. Additional samples have been replaced with ellipses (...).

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory **/var/log/<*file-name*>**. The result can be read by using the `tcpdump` utility.

```
user@host>start shell
%tcpdump -nr/var/log/e2e.pcap
```

```
21:50:04.288767 C0/F3 event:1(np-ingress) SEQ:1 IP 192.168.14.2 > 192.168.13.2: ICMP echo
request, id 57627, seq 0, length 64
21:50:04.292590 C0/F3 event:2(np-egress) SEQ:1 IP 192.168.14.2 > 192.168.13.2: ICMP echo
request, id 57627, seq 0, length 64
1:50:04.295164 C0/F3 event:1(np-ingress) SEQ:2 IP 192.168.13.2 > 192.168.14.2: ICMP echo reply,
id 57627, seq 0, length 64
21:50:04.295284 C0/F3 event:2(np-egress) SEQ:2 IP 192.168.13.2 > 192.168.14.2: ICMP echo reply,
id 57627, seq 0, length 64
```

NOTE: If you are finished with troubleshooting the data path debugging, remove all `traceoptions` (not limited to flow traceoptions) and the complete data path debug configuration, including the data path debug configuration for packet capturing (packet-dump), which needs to be started/stopped manually. If any part of the debugging configuration remains active, it will continue to use the resources of the device (CPU/memory).

Using MPLS to Diagnose LSPs, VPNs, and Layer 2 Circuits

IN THIS SECTION

- MPLS Connection Checking Overview | **1628**
- Understanding Ping MPLS | **1630**
- Using the ping Command | **1631**
- Pinging Layer 2 Circuits | **1634**
- Pinging Layer 2 VPNs | **1635**
- Pinging Layer 3 VPNs | **1637**
- Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs | **1638**

MPLS Connection Checking Overview

Use either the J-Web ping MPLS diagnostic tool or the CLI commands `ping mpls`, `ping mpls l2circuit`, `ping mpls l2vpn`, and `ping mpls l3vpn` to diagnose the state of label-switched paths (LSPs), Layer 2 and Layer 3 virtual private networks (VPNs), and Layer 2 circuits.

Based on how the LSP or VPN outbound (egress) node at the remote endpoint of the connection replies to the probes, you can determine the connectivity of the LSP or VPN.

Each probe is an echo request sent to the LSP or VPN exit point as an MPLS packet with a UDP payload. If the outbound node receives the echo request, it checks the contents of the probe and returns a value in the UDP payload of the response packet. If the device receives the response packet, it reports a successful ping response.

Responses that take longer than 2 seconds are identified as failed probes.

Table 176 on page 1628 summarizes the options for using either the J-Web ping MPLS diagnostic tool or the CLI `ping mpls` command to display information about MPLS connections in VPNs and LSPs.

Table 176: Options for Checking MPLS Connections

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Ping RSVP-signaled LSP	`ping mpls rsvp`	Checks the operability of an LSP that has been set up by the Resource Reservation Protocol (RSVP). The device pings a particular LSP using the configured LSP name.	When an RSVP-signaled LSP has several paths, the device sends the ping requests on the path that is currently active.
Ping LDP-signaled LSP	`ping mpls ldp`	Checks the operability of an LSP that has been set up by the Label Distribution Protocol (LDP). The device pings a particular LSP using the forwarding equivalence class (FEC) prefix and length.	When an LDP-signaled LSP has several gateways, the device sends the ping requests through the first gateway. Ping requests sent to LDP-signaled LSPs use only the master routing instance.

Table 176: Options for Checking MPLS Connections *(Continued)*

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Ping LSP to Layer 3 VPN prefix	`ping mpls l3vpn`	Checks the operability of the connections related to a Layer 3 VPN. The device tests whether a prefix is present in a provider edge (PE) device's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix.	The device does not test the connection between a PE device and a customer edge (CE) router.
Locate LSP using interface name	`ping mpls l2vpn interface`	Checks the operability of the connections related to a Layer 2 VPN. The device directs outgoing request probes out the specified interface.	–
Instance to which this connection belongs	`ping mpls l2vpn instance`	Checks the operability of the connections related to a Layer 2 VPN. The device pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, to test the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound and outbound PE routers.	–
Locate LSP from interface name	`ping mpls l2circuit interface`	Checks the operability of the Layer 2 circuit connections. The device directs outgoing request probes out the specified interface.	–

Table 176: Options for Checking MPLS Connections *(Continued)*

J-Web Ping MPLS Tool	ping mpls Command	Purpose	Additional Information
Locate LSP from virtual circuit information	`ping mpls l2circuit virtual-circuit`	Checks the operability of the Layer 2 circuit connections. The device pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE router, testing the integrity of the Layer 2 circuit between the inbound and outbound PE routers.	–
Ping end point of LSP	`ping mpls lsp-end-point`	Checks the operability of an LSP endpoint. The device pings an LSP endpoint using either an LDP FEC prefix or an RSVP LSP endpoint address.	–

Understanding Ping MPLS

IN THIS SECTION

- MPLS Enabled | **1630**
- Loopback Address | **1631**
- Source Address for Probes | **1631**

Before using the ping MPLS feature, make sure that the receiving interface on the VPN or LSP remote endpoint has MPLS enabled, and that the loopback interface on the outbound node is configured as `127.0.0.1`. The source address for MPLS probes must be a valid address on the J Series device.

This section includes the following topics:

MPLS Enabled

To process ping MPLS requests, the remote endpoint of the VPN or LSP must be configured appropriately. You must enable MPLS on the receiving interface of the outbound node for the VPN or

LSP. If MPLS is not enabled, the remote endpoint drops the incoming request packets and returns an "ICMP host unreachable" message to the J Series device.

Loopback Address

The loopback address (`lo0`) on the outbound node must be configured as `127.0.0.1`. If this interface address is not configured correctly, the outbound node does not have this forwarding entry. It drops the incoming request packets and returns a "host unreachable" message to the J Series device.

Source Address for Probes

The source IP address you specify for a set of probes must be an address configured on one of the J Series device interfaces. If it is not a valid J Series device address, the ping request fails with the error message "Can't assign requested address."

Using the ping Command

You can perform certain tasks only through the CLI. Use the CLI `ping` command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The device sends a series of ICMP echo (ping) requests to a specified host and receives ICMP echo responses.

Enter the `ping` command with the following syntax:

```
user@host> ping host <interface source-interface> <bypass-routing> <count number> <do-not-
fragment> <inet | inet6> <interval seconds> <loose-source [hosts]> <no-resolve> <pattern string>
<rapid> <record-route> <routing-instance routing-instance-name> <size bytes> <source source-
address> <strict> <strict-source [hosts]> <tos number> <ttl number> <wait seconds> <detail>
<verbose>
```

Table 177 on page 1631 describes the `ping` command options.

To quit the `ping` command, press Ctrl-C.

Table 177: CLI ping Command Options

Option	Description
host	Pings the hostname or IP address you specify.

Table 177: CLI ping Command Options *(Continued)*

Option	Description
`interface` *source-interface*	(Optional) Sends the ping requests on the interface you specify. If you do not include this option, ping requests are sent on all interfaces.
`bypass-routing`	(Optional) Bypasses the routing tables and sends the ping requests only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. Use this option to ping a local system through an interface that has no route through it.
`count` *number*	(Optional) Limits the number of ping requests to send. Specify a count from `1` through `2,000,000,000`. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
`do-not-fragment`	(Optional) Sets the Don't Fragment (DF) bit in the IP header of the ping request packet.
`inet`	(Optional) Forces the ping requests to an IPv4 destination.
`inet6`	(Optional) Forces the ping requests to an IPv6 destination.
`interval` *seconds*	(Optional) Sets the interval between ping requests, in seconds. Specify an interval from `0.1` through `10,000`. The default value is `1` second.
`loose-source` [*hosts*]	(Optional) For IPv4, sets the loose source routing option in the IP header of the ping request packet.
`no-resolve`	(Optional) Suppresses the display of the hostnames of the hops along the path.
`pattern` *string*	(Optional) Includes the hexadecimal string you specify, in the ping request packet.
`rapid`	(Optional) Sends ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the `count` option.

Table 177: CLI ping Command Options *(Continued)*

Option	Description
`record-route`	(Optional) For IPv4, sets the record route option in the IP header of the ping request packet. The path of the ping request packet is recorded within the packet and displayed on the screen.
`routing-instance` *routing-instance-name*	(Optional) Uses the routing instance you specify for the ping request.
`size` *bytes*	(Optional) Sets the size of the ping request packet. Specify a size from `0` through `65,468`. The default value is `56` bytes, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.
`source` *source-address*	(Optional) Uses the source address that you specify, in the ping request packet.
`strict`	(Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet.
`strict-source` [*hosts*]	(Optional) For IPv4, sets the strict source routing option in the IP header of the ping request packet, and uses the list of hosts you specify for routing the packet.
`tos` *number*	(Optional) Sets the type-of-service (TOS) value in the IP header of the ping request packet. Specify a value from `0` through `255`.
`ttl` *number*	(Optional) Sets the time-to-live (TTL) value for the ping request packet. Specify a value from `0` through `255`.
`wait` *seconds*	(Optional) Sets the maximum time to wait after sending the last ping request packet. If you do not specify this option, the default delay is `10` seconds. If you use this option without the `count` option, the device uses a default count of `5` packets.
`detail`	(Optional) Displays the interface on which the ping response was received.
`verbose`	(Optional) Displays detailed output.

The following is sample output from a `ping` command:

```
user@host> ping host3 count 4
```

```
PING host3.site.net (176.26.232.111): 56 data bytes 64 bytes from 176.26.232.111: icmp_seq=0
ttl=122 time=0.661 ms 64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms 64 bytes
from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms 64 bytes from 176.26.232.111: icmp_seq=3
ttl=122 time=0.634 ms  --- host3.site.net ping statistics --- 4 packets transmitted, 4 packets
received, 0% packet loss round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

The fields in the display are the same as those displayed by the J-Web ping host diagnostic tool.

Pinging Layer 2 Circuits

Enter the `ping mpls l2circuit` command with the following syntax:

```
user@host> ping mpls l2circuit (interface interface-name | virtual-circuit neighbor prefix-name
virtual-circuit-id) <exp forwarding-class> <count number> <source source-address> <detail>
```

Table 178 on page 1634 describes the `ping mpls l2circuit` command options.

Table 178: CLI ping mpls l2circuit Command Options

Option	Description
`l2circuit interface` *interface-name*	Sends ping requests out the specified interface configured for the Layer 2 circuit on the outbound PE device.
`l2circuit virtual-circuit neighbor` *prefix-name virtual-circuit-id*	Pings on a combination of the IPv4 prefix and the virtual circuit identifier on the outbound PE device, testing the integrity of the Layer 2 circuit between the inbound and outbound PE devices.
`exp` *forwarding-class*	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
`count`*number*	(Optional) Limits the number of ping requests to send. Specify a count from `0` through `1,000,000`. The default value is `5`. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.

Table 178: CLI ping mpls l2circuit Command Options *(Continued)*

Option	Description
`source` *source-address*	(Optional) Uses the source address that you specify, in the ping request packet.
`detail`	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the `ping mpls l2circuit` command, press Ctrl-C.

The following is sample output from a `ping mpls l2circuit` command:

```
user@host> ping mpls l2circuit interface fe-1/0/0.0
```

```
Request for seq 1, to interface 69, labels <100000, 100208>
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging Layer 2 VPNs

Enter the `ping mpls l2vpn` command with the following syntax:

```
user@host> ping mpls l2vpn interface interface-name | instance l2vpn-instance-name local-site-id
local-site-id-number remote-site-id remote-site-id-number <bottom-label-ttl> <exp forwarding-
class> <count number> <source source-address> <detail>
```

Table 179 on page 1635 describes the `ping mpls l2vpn` command options.

Table 179: CLI ping mpls l2vpn Command Options

Option	Description
`l2vpn interface` *interface-name*	Sends ping requests out the specified interface configured for the Layer 2 VPN on the outbound (egress) PE device.

Table 179: CLI ping mpls l2vpn Command Options *(Continued)*

Option	Description
`l2vpn instance` *`l2vpn-instance-name`* `local-site-id` *`local-site-id-number`* `remote-site-id` *`remote-site-id-number`*	Pings on a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the inbound (ingress) and outbound PE devices.
`bottom-label-ttl`	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
`exp` *`forwarding-class`*	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
`count`*`number`*	(Optional) Limits the number of ping requests to send. Specify a count from `0` through `1,000,000`. The default value is `5`. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
`source` *`source-address`*	(Optional) Uses the source address that you specify, in the ping request packet.
`detail`	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the `ping mpls l2vpn` command, press Ctrl-C.

The following is sample output from a `ping mpls l2vpn` command:

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail
```

```
Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
```

```
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging Layer 3 VPNs

Enter the `ping mpls l3vpn` command with the following syntax:

```
user@host> ping mpls l3vpn prefix prefix-name  <l3vpn-name> <bottom-label-ttl> <exp forwarding-
class> <count number> <source source-address> <detail>
```

Table 180 on page 1637 describes the `ping mpls l3vpn` command options.

Table 180: CLI ping mpls l3vpn Command Options

Option	Description
`l3vpn prefix` *prefix-name*	Pings the remote host specified by the prefix to verify that the prefix is present in the PE device's VPN routing and forwarding (VRF) table. This option does not test the connectivity between a PE device and a CE device.
l3vpn-name	(Optional) Layer 3 VPN name.
`bottom-label-ttl`	(Optional) Displays the time-to-live (TTL) value for the bottom label in the MPLS label stack.
`exp` *forwarding-class*	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
`count`*number*	(Optional) Limits the number of ping requests to send. Specify a count from `0` through `1,000,000`. The default value is `5`. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.

Table 180: CLI ping mpls l3vpn Command Options *(Continued)*

Option	Description
`source` *source-address*	(Optional) Uses the source address that you specify, in the ping request packet.
`detail`	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the `ping mpls l3vpn` command, press Ctrl-C.

The following is sample output from a `ping mpls l3vpn` command:

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
```

```
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Pinging RSVP-Signaled LSPs and LDP-Signaled LSPs

Enter the `ping mpls` command with the following syntax:

```
user@host> ping mpls (ldp fec | lsp-end-point prefix-name | rsvp lsp-name) <exp forwarding-
class> <count number> <source source-address> <detail>
```

Table 181 on page 1638 describes the `ping mpls` command options.

Table 181: CLI ping mpls ldp and ping mpls lsp-end-point Command Options

Option	Description
`ldp` *fec*	Pings an LDP-signaled LSP identified by the forwarding equivalence class (FEC) prefix and length.

Table 181: CLI ping mpls ldp and ping mpls lsp-end-point Command Options *(Continued)*

Option	Description
`lsp-end-point` *prefix-name*	Pings an LSP endpoint using either an LDP FEC or a RSVP LSP endpoint address.
`rsvp` *lsp-name*	Pings an RSVP-signaled LSP identified by the specified LSP name.
`exp` *forwarding-class*	(Optional) Specifies the value of the forwarding class to be used in the MPLS ping packets.
`count`*number*	(Optional) Limits the number of ping requests to send. Specify a count from `0` through `1,000,000`. The default value is `5`. If you do not specify a count, ping requests are continuously sent until you press Ctrl-C.
`source` *source-address*	(Optional) Uses the source address that you specify, in the ping request packet.
`detail`	(Optional) Displays detailed output about the echo requests sent and received. Detailed output includes the MPLS labels used for each request and the return codes for each request.

To quit the `ping mpls` command, press Ctrl-C.

The following is sample output from a `ping mpls` command:

```
user@host> ping mpls rsvp count 5
```

```
!!xxx
--- lsping statistics ---
5 packets transmitted, 2 packets received, 60% packet loss
3 packets received with error status, not counted as received.
```

The fields in the display are the same as those displayed by the J-Web ping MPLS diagnostic tool.

Using Packet Capture to Analyze Network Traffic

Packet Capture Overview

IN THIS SECTION

- Packet Capture on Device Interfaces | **1641**
- Firewall Filters for Packet Capture | **1642**
- Packet Capture Files | **1642**
- Analysis of Packet Capture Files | **1643**

Packet capture is a tool that helps you to analyze network traffic and troubleshoot network problems. The packet capture tool captures real-time data packets traveling over the network for monitoring and logging.

NOTE: Packet capture is supported on physical interfaces, reth interfaces, and tunnel interfaces, such as gr, ip, st0, and lsq-/ls.

Packets are captured as binary data, without modification. You can read the packet information offline with a packet analyzer such as Ethereal or tcpdump. If you need to quickly capture packets destined for, or originating from, the Routing Engine and analyze them online, you can use the J-Web packet capture diagnostic tool.

NOTE: The packet capture tool does not support IPv6 packet capture.

You can use either the J-Web configuration editor or CLI configuration editor to configure packet capture.

Network administrators and security engineers use packet capture to perform the following tasks:

- Monitor network traffic and analyze traffic patterns.
- Identify and troubleshoot network problems.
- Detect security breaches in the network, such as unauthorized intrusions, spyware activity, or ping scans.

Packet capture operates like traffic sampling on the device, except that it captures entire packets including the Layer 2 header and saves the contents to a file in libpcap format. Packet capture also captures IP fragments. You cannot enable packet capture and traffic sampling on the device at the same time. Unlike traffic sampling, there are no tracing operations for packet capture.

NOTE: You can enable packet capture and *port mirroring* simultaneously on a device.

This section contains the following topics:

Packet Capture on Device Interfaces

Packet capture is supported on the T1, T3, E1, E3, serial, Fast Ethernet, ADSL, G.SHDSL, PPPoE, and ISDN interfaces.

To capture packets on an ISDN interface, configure packet capture on the dialer interface. To capture packets on a PPPoE interface, configure packet capture on the PPPoE *logical interface*.

Packet capture supports PPP, Cisco HDLC, Frame Relay, and other ATM encapsulations. Packet capture also supports Multilink PPP (MLPPP), Multilink Frame Relay end-to-end (MLFR), and Multilink Frame Relay UNI/NNI (MFR) encapsulations.

You can capture all IPv4 packets flowing on an interface in the inbound or outbound direction. However, on traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM),

packets generated by the Routing Engine are not captured unless you have configured and applied a *firewall filter* on the interface in the outbound direction.

Tunnel interfaces can support packet capture in the outbound direction only.

Use the J-Web configuration editor or CLI configuration editor to specify the maximum packet size, the filename to be used for storing the captured packets, the maximum file size, the maximum number of packet capture files, and the file permissions.

NOTE: For packets captured on T1, T3, E1, E3, serial, and ISDN interfaces in the outbound (egress) direction, the size of the packet captured might be 1 byte less than the maximum packet size configured because of the packet loss priority (PLP) bit.

To modify encapsulation on an interface that has packet capture configured, you must first disable packet capture.

Firewall Filters for Packet Capture

When you enable packet capture on a device, all packets flowing in the direction specified in packet capture configuration (inbound, outbound, or both) are captured and stored. Configuring an interface to capture all packets might degrade the performance of the device. You can control the number of packets captured on an interface with firewall filters and specify various criteria to capture packets for specific traffic flows.

You must also configure and apply appropriate firewall filters on the interface if you need to capture packets generated by the host device, because interface sampling does not capture packets originating from the host device.

Packet Capture Files

When packet capture is enabled on an interface, the entire packet including the Layer 2 header is captured and stored in a file. You can specify the maximum size of the packet to be captured, up to 1500 bytes. Packet capture creates one file for each physical interface. You can specify the target filename, the maximum size of the file, and the maximum number of files.

File creation and storage take place in the following way. Suppose you name the packet capture file **pcap-file**. Packet capture creates multiple files (one per physical interface), suffixing each file with the name of the physical interface; for example, **pcap-file.fe-0.0.1** for the Fast Ethernet interface **fe-0.0.1**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size, the file is renamed **pcap-file.fe-0.0.1.0**. When the file named **pcap-file.fe-0.0.1** reaches the maximum size again, the file named **pcap-file.fe-0.0.1.0** is renamed **pcap-file.fe-0.0.1.1** and **pcap-file.fe-0.0.1** is renamed **pcap-file.fe-0.0.1.0**. This process continues until the maximum number of files is exceeded and the oldest file is overwritten. The **pcap-file.fe-0.0.1** file is always the latest file.

Packet capture files are not removed even after you disable packet capture on an interface.

Analysis of Packet Capture Files

Packet capture files are stored in libpcap format in the `/var/tmp` directory. You can specify user or administrator privileges for the files.

Packet capture files can be opened and analyzed offline with tcpdump or any packet analyzer that recognizes the libpcap format. You can also use FTP or the Session Control Protocol (SCP) to transfer the packet capture files to an external device.

NOTE: Disable packet capture before opening the file for analysis or transferring the file to an external device with FTP or SCP. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

Example: Enabling Packet Capture on a Device

IN THIS SECTION

- Requirements | **1643**
- Overview | **1644**
- Configuration | **1644**
- Verification | **1646**

This example shows how to enable packet capture on a device, allowing you to analyze network traffic and troubleshoot network problems

Requirements

Before you begin:

- Establish basic connectivity.
- Configure network interfaces. See Interfaces User Guide for Security Devices.

Overview

In this example, you set the maximum packet capture size in each file as 500 bytes. The range is from 68 through 1500, and the default is 68 bytes. You specify the target filename for the packet capture file as pcap-file. You then specify the maximum number of files to capture as 100. The range is from 2 through 10,000, and the default is 10 files. You set the maximum size of each file to 1024 bytes. The range is from 1,024 through 104,857,600, and the default is 512,000 bytes. Finally, you specify that all users have permission to read the packet capture files.

Configuration

IN THIS SECTION

- Procedure | **1644**

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set forwarding-options packet-capture maximum-capture-size 500
set forwarding-options packet-capture file filename pcap-file files 100 size 1024 world-readable
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To enable packet capture on a device:

1. Set the maximum packet capture size.

```
[edit]
user@host# edit forwarding-options
user@host# set packet-capture maximum-capture-size 500
```

2. Specify the target filename.

```
[edit forwarding-options]
user@host# set packet-capture file filename pcap-file
```

3. Specify the maximum number of files to capture.

```
[edit forwarding-options]
user@host# set packet-capture file files 100
```

4. Specify the maximum size of each file.

```
[edit forwarding-options]
user@host# set packet-capture file size 1024
```

5. Specify that all users have permission to read the file.

```
[edit forwarding-options]
user@host# set packet-capture file world-readable
```

Results

From configuration mode, confirm your configuration by entering the `show forwarding-options` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show forwarding-options
packet-capture {
    file filename pcap-file files 100 size 1k world-readable;
```

```
    maximum-capture-size 500;
}
```

If you are done configuring the device, enter `commit` from configuration mode.

Verification

IN THIS SECTION

- Verifying the Packet Capture Configuration | **1646**
- Verifying Captured Packets | **1646**

Confirm that the configuration is working properly.

Verifying the Packet Capture Configuration

Purpose

Verify that the packet capture is configured on the device.

Action

From configuration mode, enter the `show forwarding-options` command. Verify that the output shows the intended file configuration for capturing packets.

Verifying Captured Packets

Purpose

Verify that the packet capture file is stored under the `/var/tmp` directory and the packets can be analyzed offline.

Action

1. Disable packet capture.

   Using FTP, transfer a packet capture file (for example, `126b.fe-0.0.1`), to a server where you have installed packet analyzer tools (for example, `tools-server`).

a. From configuration mode, connect to `tools-server` using FTP.

```
[edit]
user@host# run ftp tools-server
Connected to tools-server.mydomain.net
220 tools-server.mydomain.net FTP server (Version 6.00LS) ready
Name (tools-server:user):remoteuser
331 Password required for remoteuser.
Password:
230 User remoteuser logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp>
```

b. Navigate to the directory where packet capture files are stored on the device.

```
ftp> lcd /var/tmp
Local directory now /cf/var/tmp
```

c. Copy the packet capture file that you want to analyze to the server, for example `126b.fe-0.0.1`.

```
ftp> put 126b.fe-0.0.1
local: 126b.fe-0.0.1 remote: 126b.fe-0.0.1
200 PORT command successful.
150 Opening BINARY mode data connection for '126b.fe-0.0.1'.
100%   1476       00:00 ETA
226 Transfer complete.
1476 bytes sent in 0.01 seconds (142.42 KB/s)
```

d. Return to configuration mode.

```
ftp> bye
221 Goodbye.
[edit]
user@host#
```

2. Open the packet capture file on the server with tcpdump or any packet analyzer that supports libpcap format and review the output.

```
root@server% tcpdump -r 126b.fe-0.0.1 -xevvvv
```

```
01:12:36.279769 Out 0:5:85:c4:e3:d1 > 0:5:85:c8:f6:d1, ethertype IPv4 (0x0800), length 98: (tos

Example: Configuring Packet Capture on an Interface

IN THIS SECTION

- Requirements | **1649**
- Overview | **1649**
- Configuration | **1649**
- Verification | **1650**

This example shows how to configure packet capture on an interface to analyze traffic.

Requirements

Before you begin:

- Establish basic connectivity.
- Configure network interfaces. See Interfaces User Guide for Security Devices.

Overview

In this example, you create an interface called fe-0/0/1. You then configure the direction of the traffic for which you are enabling packet capture on the logical interface as inbound and outbound.

NOTE: On traffic that bypasses the flow software module (protocol packets such as ARP, OSPF, and PIM), packets generated by the Routing Engine are not captured unless you have configured and applied a firewall filter on the interface in the output direction.

Configuration

IN THIS SECTION

- Procedure | 1649

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
edit interfaces fe-0/0/1
set unit 0 family inet sampling input output
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure packet capture on an interface:

1. Create an interface.

```
[edit]
user@host# edit interfaces fe-0/0/1
```

2. Configure the direction of the traffic.

```
[edit interfaces fe-0/0/1]
user@host# set unit 0 family inet sampling input output
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

Verification

IN THIS SECTION

- Verifying the Packet Capture Configuration | **1650**

Verifying the Packet Capture Configuration

Purpose

Confirm that the configuration is working properly.

Verify that packet capture is configured on the interface.

Action

From configuration mode, enter the `show interfaces fe-0/0/1` command.

Example: Configuring a Firewall Filter for Packet Capture

IN THIS SECTION

- Requirements | **1651**
- Overview | **1651**
- Configuration | **1652**
- Verification | **1654**

This example shows how to configure a firewall filter for packet capture and apply it to a logical interface.

Requirements

Before you begin:

- Establish basic connectivity.
- Configure network interfaces. See Interfaces User Guide for Security Devices.

Overview

IN THIS SECTION

- Topology | **1652**

In this example, you set a firewall filter called dest-all and a term name called dest-term to capture packets from a specific destination address, which is 192.168.1.1/32. You define the match condition to accept the sampled packets. Finally, you apply the dest-all filter to all of the outgoing packets on interface fe-0/0/1.

NOTE: If you apply a firewall filter on the loopback interface, it affects all traffic to and from the Routing Engine. If the firewall filter has a `sample` action, packets to and from the Routing Engine are sampled. If packet capture is enabled, then packets to and from the Routing Engine are captured in the files created for the input and output interfaces.

Topology

Configuration

IN THIS SECTION

- Procedure | 1652

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set firewall filter dest-all term dest-term from destination-address 192.168.1.1/32
set firewall filter dest-all term dest-term then sample accept
edit interfaces
set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *Junos OS CLI User Guide* .

To configure a firewall filter for packet capture and apply it to a logical interface:

1. Specify the firewall filter and its destination address.

```
[edit]
user@host# edit firewall
user@host# set filter dest-all term dest-term from destination-address 192.168.1.1/32
```

2. Define the match condition and its action.

```
[edit firewall]
user@host# set filter dest-all term dest-term then sample accept
```

3. Apply the filter to all the outgoing packets.

```
[edit interfaces]
user@host# set interfaces fe-0/0/1 unit 0 family inet filter output dest-all
```

Results

From configuration mode, confirm your configuration by entering the `show firewall filter dest-all` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show firewall filter dest-all
term dest-term {
    from {
        destination-address 192.168.1.1/32;
    }
    then {
        sample;
        accept;
    }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

Verification

IN THIS SECTION

- Verifying the Firewall Filter for Packet Capture Configuration | 1654

Verifying the Firewall Filter for Packet Capture Configuration

Purpose

Confirm that the configuration is working properly.

Verify that the firewall filter for packet capture is configured.

Action

From configuration mode, enter the `show firewall filter dest-all` command. Verify that the output shows the intended configuration of the firewall filter for capturing packets sent to the destination address.

Example: Configuring Packet Capture for Datapath Debugging

IN THIS SECTION

- Requirements | 1654
- Overview | 1655
- Configuration | 1655
- Verification | 1658

This example shows how to configure packet capture to monitor traffic that passes through the device. Packet capture then dumps the packets into a PCAP file format that can be later examined by the tcpdump utility.

Requirements

Before you begin, see "Debugging the Data Path (CLI Procedure)" on page 1613.

Overview

A filter is defined to filter traffic; then an action profile is applied to the filtered traffic. The action profile specifies a variety of actions on the processing unit. One of the supported actions is packet dump, which sends the packet to the Routing Engine and stores it in proprietary form to be read using the `show security datapath-debug capture` command.

NOTE: Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.

Configuration

IN THIS SECTION

- Procedure | **1655**

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set security datapath-debug capture-file my-capture
set security datapath-debug capture-file format pcap
set security datapath-debug capture-file size 1m
set security datapath-debug capture-file files 5
set security datapath-debug maximum-capture-size 400
set security datapath-debug action-profile do-capture event np-ingress packet-dump
set security datapath-debug packet-filter my-filter action-profile do-capture
set security datapath-debug packet-filter my-filter source-prefix 1.2.3.4/32
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *Junos OS CLI User Guide*.

To configure packet capture:

1. Edit the security datapath-debug option for the multiple processing units along the packet-processing path:

```
[edit]
user@host# edit security datapath-debug
```

2. Enable the capture file, the file format, the file size, and the number of files. Size number limits the size of the capture file. After the limit size is reached, if the file number is specified, then the capture file will be rotated to filename *x*, where *x* is auto-incremented until it reaches the specified index and then returns to zero. If no files index is specified, the packets will be discarded after the size limit is reached. The default size is 512 kilobytes.

```
[edit security datapath-debug]
user@host# set capture-file my-capture format pcap size 1m files 5
[edit security datapath-debug]
user@host# set maximum-capture-size 400
```

3. Enable action profile and set the event. Set the action profile as do-capture and the event type as np-ingress:

```
[edit security datapath-debug]
user@host# edit action-profile do-capture
[edit security datapath-debug action-profile do-capture]
user@host# edit event np-ingress
```

4. Enable packet dump for the action profile:

```
[edit security datapath-debug action-profile do-capture event np-ingress]
user@host# set packet-dump
```

5. Enable packet filter, action, and filter options. The packet filter is set to my-filter, the action profile is set to do-capture, and filter option is set to source-prefix 1.2.3.4/32.

```
[edit security datapath-debug]
user@host# set security datapath-debug packet-filter my-filter action-profile do-capture
```

```
[edit security datapath-debug]
user@host#  set security datapath-debug packet-filter my-filter source-prefix 1.2.3.4/32
```

Results

From configuration mode, confirm your configuration by entering the `show security datapath-debug` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. The following is`show security datapath-debug` output from the `show security datapath-debug` command:

```
security {
    datapath-debug {
        capture-file {
            my-capture
            format pcap
            size 1m
            files 5;
        }
    }
    maximum-capture-size 100;
    action-profile do-capture {
        event np-ingress {
             packet-dump
         }
      }
    packet-filter my-filter {
         source-prefix 1.2.3.4/32
        action-profile do-capture
     }
 }
```

If you are done configuring the device, enter `commit` from configuration mode.

Verification

IN THIS SECTION

- Verifying Packet Capture | 1658
- Verifying Data Path Debugging Capture | 1658
- Verifying Data Path Debugging Counter | 1659

Confirm that the configuration is working properly.

Verifying Packet Capture

Purpose

Verify if the packet capture is working.

Action

From operational mode, enter the `request security datapath-debug capture start` command to start packet capture and enter the `request security datapath-debug capture stop` command to stop packet capture.

To view the results, from CLI operational mode, access the local UNIX shell and navigate to the directory /var/log/my-capture. The result can be read by using the tcpdump utility.

Verifying Data Path Debugging Capture

Purpose

Verify the details of data path debugging capture file.

Action

From operational mode, enter the `show security datapath-debug capture` command.

```
user@host>show security datapath-debug capture
```

WARNING: When you are done troubleshooting, make sure to remove or deactivate all the traceoptions configurations (not limited to flow traceoptions) and the complete security datapath-debug configuration stanza. If any debugging configurations remain active, they will continue to use the device's CPU and memory resources.

Verifying Data Path Debugging Counter

Purpose

Verify the details of the data path debugging counter.

Action

From operational mode, enter the `show security datapath-debug counter` command.

Disabling Packet Capture

You must disable packet capture before opening the packet capture file for analysis or transferring the file to an external device. Disabling packet capture ensures that the internal file buffer is flushed and all the captured packets are written to the file.

To disable packet capture, enter from configuration mode:

```
[edit forwarding-options]
user@host# set packet-capture disable
```

If you are done configuring the device, enter `commit` from configuration mode.

Deleting Packet Capture Files

Deleting packet capture files from the /var/tmp directory only temporarily removes the packet capture files. Packet capture files for the interface are automatically created again the next time a packet capture configuration change is committed or as part of a packet capture file rotation.

To delete a packet capture file:

1. Disable packet capture (see "Disabling Packet Capture" on page 1659).
2. Delete the packet capture file for the interface.

a. From operational mode, access the local UNIX shell.

```
user@host> start shell
%
```

b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
%
```

c. Delete the packet capture file for the interface; for example `pcap-file.fe.0.0.0`.

```
% rm pcap-file.fe.0.0.0
%
```

d. Return to operational mode.

```
% exit
user@host>
```

3. Reenable packet capture (see "Example: Enabling Packet Capture on a Device" on page 1643).
4. If you are done configuring the device, enter `commit` from configuration mode.

Changing Encapsulation on Interfaces with Packet Capture Configured

Before modifying the encapsulation on a device interface that is configured for packet capture, you must disable packet capture and rename the latest packet capture file. Otherwise, packet capture saves the packets with different encapsulations in the same packet capture file. Packet files containing packets with different encapsulations are not useful, because packet analyzer tools like tcpdump cannot analyze such files.

After modifying the encapsulation, you can safely reenable packet capture on the device.

To change the encapsulation on interfaces with packet capture configured:

1. Disable packet capture (see "Disabling Packet Capture" on page 1659).
2. Enter `commit` from configuration mode.
3. Rename the latest packet capture file on which you are changing the encapsulation with the `.chdsl` extension.

a. From operational mode, access the local UNIX shell.

```
user@host> start shell
%
```

b. Navigate to the directory where packet capture files are stored.

```
% cd /var/tmp
%
```

c. Rename the latest packet capture file for the interface on which you are changing the encapsulation; for example `fe.0.0.0`.

```
% mv pcap-file.fe.0.0.0 pcap-file.fe.0.0.0.chdsl
%
```

d. Return to operational mode.

```
% exit
user@host>
```

4. Change the encapsulation on the interface using the J-Web user interface or CLI configuration editor.
5. If you are done configuring the device, enter `commit` from configuration mode.
6. Reenable packet capture (see "Example: Enabling Packet Capture on a Device" on page 1643).
7. If you are done configuring the device, enter `commit` from configuration mode.

Displaying Packet Headers

Enter the `monitor traffic` command to display packet headers transmitted through network interfaces with the following syntax:

NOTE: Using the `monitor traffic` command can degrade system performance. We recommend that you use filtering options—such as `count` and `matching`—to minimize the impact to packet throughput on the system.

```
user@host> monitor traffic <absolute-sequence> <count number> <interface interface-name> <layer2-
headers> <matching "expression"> <no-domain-names> <no-promiscuous> <no-resolve> <no-timestamp>
<print-ascii> <print-hex> <size bytes> <brief | detail | extensive>
```

Table 182 on page 1662 describes the `monitor traffic` command options.

Table 182: CLI monitor traffic Command Options

Option	Description
`absolute-sequence`	(Optional) Displays the absolute TCP sequence numbers.
`count` *number*	(Optional) Displays the specified number of packet headers. Specify a value from `0` through `100,000`. The command quits and exits to the command prompt after this number is reached.
`interface` *interface-name*	(Optional) Displays packet headers for traffic on the specified interface. If an interface is not specified, the lowest numbered interface is monitored.
`layer2-headers`	(Optional) Displays the link-layer packet header on each line.
`matching "`*expression*`"`	(Optional) Displays packet headers that match an expression enclosed in quotation marks (" "). Table 183 on page 1664 through Table 185 on page 1667 list match conditions, logical operators, and arithmetic, binary, and relational operators you can use in the expression.
`no-domain-names`	(Optional) Suppresses the display of the domain name portion of the hostname.

Table 182: CLI monitor traffic Command Options *(Continued)*

Option	Description
`no-promiscuous`	(Optional) Specifies *not* to place the monitored interface in promiscuous mode. In promiscuous mode, the interface reads every packet that reaches it. In nonpromiscuous mode, the interface reads only the packets addressed to it.
`no-resolve`	(Optional) Suppresses the display of hostnames.
`no-timestamp`	(Optional) Suppresses the display of packet header timestamps.
`print-ascii`	(Optional) Displays each packet header in ASCII format.
`print-hex`	(Optional) Displays each packet header, except link-layer headers, in hexadecimal format.
`size` *bytes*	(Optional) Displays the number of bytes for each packet that you specify. If a packet header exceeds this size, the displayed packet header is truncated. The default value is `96`.
`brief`	(Optional) Displays minimum packet header information. This is the default.
`detail`	(Optional) Displays packet header information in moderate detail. For some protocols, you must also use the `size` option to see detailed information.
`extensive`	(Optional) Displays the most extensive level of packet header information. For some protocols, you must also use the `size` option to see extensive information.

To quit the `monitor traffic` command and return to the command prompt, press Ctrl-C.

To limit the packet header information displayed by the `monitor traffic` command, include the `matching` "*expression*" option. An expression consists of one or more match conditions listed in Table 183 on page 1664, enclosed in quotation marks (" "). You can combine match conditions by using the logical operators listed in Table 184 on page 1666 (shown in order of highest to lowest precedence).

For example, to display TCP or UDP packet headers, enter:

```
user@host> monitor traffic matching “tcp || udp”
```

To compare the following types of expressions, use the relational operators listed in Table 185 on page 1667 (listed from highest to lowest precedence):

- Arithmetic—Expressions that use the arithmetic operators listed in Table 185 on page 1667.
- Binary—Expressions that use the binary operators listed in Table 185 on page 1667.
- Packet data accessor—Expressions that use the following syntax:

  ```
  protocol [byte-offset <size>]
  ```

  Replace *protocol* with any protocol in Table 183 on page 1664. Replace *byte-offset* with the byte offset, from the beginning of the packet header, to use for the comparison. The optional *size* parameter represents the number of bytes examined in the packet header—1, 2, or 4 bytes.

  For example, the following command displays all multicast traffic:

  ```
  user@host> monitor traffic matching “ether[0] & 1 !=0”
  ```

Table 183: CLI monitor traffic Match Conditions

Match Condition	Description
Entity Type	
host [*address* | *hostname*]	Matches packet headers that contain the specified address or hostname. You can preprend any of the following protocol match conditions, followed by a space, to host: arp, ip, rarp, or any of the Directional match conditions.
network *address*	Matches packet headers with source or destination addresses containing the specified network address.
network *address* mask *mask*	Matches packet headers containing the specified network address and subnet mask.

Table 183: CLI monitor traffic Match Conditions *(Continued)*

Match Condition	Description
`port [port-number | port-name]`	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.
Directional	
`destination`	Matches packet headers containing the specified destination. Directional match conditions can be prepended to any Entity Type match conditions, followed by a space.
`source`	Matches packet headers containing the specified source.
`source and destination`	Matches packet headers containing the specified source *and* destination.
`source or destination`	Matches packet headers containing the specified source *or* destination.
Packet Length	
`less bytes`	Matches packets with lengths less than or equal to the specified value, in bytes.
`greater bytes`	Matches packets with lengths greater than or equal to the specified value, in bytes.
Protocol	
`arp`	Matches all ARP packets.
`ether`	Matches all Ethernet frames.
`ether [broadcast | multicast]`	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with `source` or `destination`.

Table 183: CLI monitor traffic Match Conditions *(Continued)*

Match Condition	Description
`ether protocol [`*address* `| (\arp | \ip | \rarp)`	Matches Ethernet frames with the specified address or protocol type. The arguments `arp`, `ip`, and `rarp` are also independent match conditions, so they must be preceded with a backslash (\) when used in the `ether protocol` match condition.
`icmp`	Matches all ICMP packets.
`ip`	Matches all IP packets.
`ip [broadcast | multicast]`	Matches broadcast or multicast IP packets.
`ip protocol [`*address* `| (\icmp | igrp | \tcp | \udp)]`	Matches IP packets with the specified address or protocol type. The arguments `icmp`, `tcp`, and `udp` are also independent match conditions, so they must be preceded with a backslash (\) when used in the `ip protocol` match condition.
`isis`	Matches all IS-IS routing messages.
`rarp`	Matches all RARP packets.
`tcp`	Matches all TCP packets.
`udp`	Matches all UDP packets.

Table 184: CLI monitor traffic Logical Operators

Logical Operator	Description
`!`	Logical NOT. If the first condition does not match, the next condition is evaluated.
`&&`	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.

Table 184: CLI monitor traffic Logical Operators *(Continued)*

Logical Operator	Description
||	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
()	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

Table 185: CLI monitor traffic Arithmetic, Binary, and Relational Operators

Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
Binary Operator	
&	Bitwise AND.
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator	
<=	A match occurs if the first expression is less than or equal to the second.
>=	A match occurs if the first expression is greater than or equal to the second.

Table 185: CLI monitor traffic Arithmetic, Binary, and Relational Operators *(Continued)*

Operator	Description
<	A match occurs if the first expression is less than the second.
>	A match occurs if the first expression is greater than the second.
=	A match occurs if the first expression is equal to the second.
!=	A match occurs if the first expression is not equal to the second.

The following is sample output from the `monitor traffic` command:

```
user@host> monitor traffic count 4 matching “arp” detail
```

```
Listening on fe-0/0/0, capture size 96 bytes  15:04:16.276780  In arp who-has 193.1.1.1 tell
host1.site2.net 15:04:16.376848  In arp who-has host2.site2.net tell host1.site2.net
15:04:16.376887  In arp who-has 193.1.1.2 tell host1.site2.net 15:04:16.601923  In arp who-has
193.1.1.3 tell host1.site2.net
```

Configure Packet Mirroring with Layer 2 Headers for Layer 3 Forwarded Traffic

SUMMARY

Selective packet mirroring filters can serve as a highly effective troubleshooting mechanism and can also be used for performance monitoring purposes.

Understanding Packet Mirroring with Layer 2 Headers for Layer 3 Forwarded Traffic

IN THIS SECTION

Features of Packet Mirroring with Layer 2 Headers for Layer 3 Forwarded Traffic | 1669

Limitations for the Packet-Level Mirroring Configuration | 1669

This document focuses on a capability to select traffic using a wide variety of IPv4 or IPv6 filter match conditions and to mirror entire packets with their original Layer 2 header information.

Layer 2 header information might be essential to identify a specific customer in an edge router deployment or a specific Internet peer in a public peering case.

Features of Packet Mirroring with Layer 2 Headers for Layer 3 Forwarded Traffic

In a nutshell, you can mirror the original Layer 2 packet header when the `l2-mirror` action is configured in a `family inet` or `family inet6` filter. Packets can be mirrored locally or remotely by using GRE tunnels.

If you specify the output interface in your mirroring configuration as a GRE tunnel interface, packets are encapsulated in GRE before transmission. A port-mirroring instance can be configured with multiple output protocol families.

Limitations for the Packet-Level Mirroring Configuration

- The new action, `l2-mirror`, is only supported for `family inet` and `family inet6`filters.
- Layer 2 mirroring is not supported on gr-*/*/* interfaces.

Configure a Filter with a Port-Mirroring Instance or with Global Port Mirroring

You configure `l2-mirror` under either `firewall family (inet | inet6) filter` *`filter-name`* `term then port-mirror` (global port mirroring) or `firewall (inet | inet6) filter` *`filter-name`* `term then port-mirror-instance` *`instance-name`* (port-mirroring instances, or "PM instances").

Having `l2-mirror` configured for a term indicates that for packets matching this term, the Layer 2 packet is mirrored. The software performs commit checks for invalid configurations, such as when `l2-mirror` is configured but no port-mirroring output interface is configured for `family any` in the global-level or instance-level port mirroring configuration. If you deactivate `l2-mirror`, the mirroring behavior reverts to Layer 3 mirroring.

The following two examples show the configuration of a filter (the filter name in the examples is f1) with a port-mirroring instance and with global port mirroring. In both examples traffic is mirrored to the remote destination over a GRE tunnel.

NOTE: The port-mirroring configurations, which are under `forwarding-options`, are configured with `family any`, but the match conditions in the filter configuration are done under `family inet`. Using `family any` enables the mirroring of Layer 2 packets.

1. To configure the filter with a **port-mirroring instance**:

   NOTE: You can specify a gr- interface as your mirror destination. See Configuring Generic Routing Encapsulation Tunneling on ACX Series for information on configuring gr- interfaces (the document refers specifically to ACX Series routers; the same information applies to various other routers, including MX10003.)

```
forwarding-options {
  port-mirroring {
    instance {
      mirror-instance-1 {
        input {
          rate 2;
        }
        family any {
          output {
            interface gr-0/0/0.0;
          }
        }
      }
    }
  }
}
firewall {
  family inet {
```

```
    filter f1 {
      term tcp-flags {
        from {
          protocol tcp;
          tcp-flags "(syn & fin & rst)";
        }
        then {
          port-mirror-instance mirror-instance-1;
          l2-mirror;
        }
      }
    }
  }
}
interfaces {
    gr-0/0/0 {
        unit 0 {
            tunnel {
                source 10.1.1.2/32;
                destination 10.1.1.1/32;
            }
            family bridge {
                interface-mode access;
                vlan-id 100;
            }
        }
    }
}
routing-instances {
    i1 {
        instance-type virtual-switch;
        interface gr-0/0/0.0;
        bridge-domains {
            bd100 {
                vlan-id 100;
            }
        }
    }
}
```

2. To configure the filter with **global port mirroring**:

```
forwarding-options {
  port-mirroring {
    input {
      rate 2;
    }
    family any {
      output {
        interface gr-0/0/0.0;
      }
    }
  }
}
firewall {
  family inet {
    filter f1 {
      term tcp-flags {
        from {
          protocol tcp;
          tcp-flags "(syn & fin & rst)";
        }
        then {
          port-mirror;
          l2-mirror;
        }
      }
    }
  }
}
interfaces {
    gr-0/0/0 {
        unit 0 {
            tunnel {
                source 10.1.1.2/32;
                destination 10.1.1.1/32;
            }
            family bridge {
                interface-mode access;
                vlan-id 100;
            }
        }
```

```
    }
}
routing-instances {
    i1 {
        instance-type virtual-switch;
        interface gr-0/0/0.0;
        bridge-domains {
            bd100 {
                vlan-id 100;
            }
        }
    }
}
```

Configure Mirroring for FTI Tunnels

When the data path traverses a flexible tunnel interface (FTI) tunnel, the output packet is sent with tunnel encapsulation. You can set up a configuration that mirrors the original packet as well as the packet with all encapsulations as it egresses out.

To mirror the original packet, configure input mirroring on the ingress WAN interface.

To mirror the packet with all encapsulations, enable output mirroring on the egress WAN interface.

To enable mirroring based on a filter installed on the FTI interface, you use a two-step process:

1. You mark packets for mirroring using the policy action at the fti- interface. The policy action is typically used to select the egress rewrite rule, but in this case, the policy action is used to mark interesting packets with an internal policy attribute, without any special rewrite rule configured.
2. You have the software intercept packets that match the specific policy on the egress WAN side and initiate the `l2-mirror` action. Packets are reported with Layer 2 header information, including tunnel encapsulation.

NOTE: The following example shows Layer 3 port mirroring. To obtain Layer 2 port mirroring, simply configure the `l2-mirror` action as shown in the preceding examples in this document.

1. Define `policy-map` *`policy-map-name`* under the `class-of-service` stanza:

```
class-of-service {
  policy-map {
    pm1;
```

```
  }
}
```

2. Apply an output filter on the FTI with action `policy-map pm1`:

```
family inet {
  filter mirror-all {
    term mirror {
      from {
        policy-map pm1;
      }
      then {
        count all;
        port-mirror-instance mirror-to-gre;
        accept;
      }
    }
     term default {
       then accept;
     }
   }
  filter f1 {
    term t1 {
      from {
        source-address {
          10.1.1.2/32;
        }
      }
      then {
        policy-map pm1;
        count c1;
      }
    }
    term t2 {
      from {
        source-address {
          10.36.100.1/32;
        }
      }
      then accept;
     }
```

```
    }
}
```

3. The following configuration output shows the FTI configuration on interface fti0.1001. (For more detail on configuring an FTI tunnel, see Flexible Tunnel Interfaces Overview.)

```
interfaces {
  fti0 {
    unit 1001 {
     tunnel {
       encapsulation vxlan-gpe {
         source {
           address 198.51.100.1;
         }
         destination {
           address 198.51.100.2;
         }
         tunnel-endpoint vxlan;
         destination-udp-port 4789;
         vni 22701;
       }
     }
     family inet {
       filter {
         output f1;
       }
       address 10.18.1.1/27;
     }
     family inet6 {
       address 2001:db8::1:1/126;
     }
   }
  }
}
```

4. Add a filter (here named `mirror-all`) on the egress WAN interface with match from `policy-map pm1 then port-mirror`:

```
family inet {
  filter mirror-all {
    term mirror {
      from {
```

```
        policy-map policy-map-name;
      }
      then {
        count all;
        port-mirror-instance mirror-to-gre;
                accept;
      }
    }
    term default {
      then accept;
    }
  }
}
```

```
interfaces {
 ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        output mirror-all;
      }
      address 10.200.0.1/24;
    }
    family iso;
  }
 }
}
```

Attachment Points for Filters

Filter Attachment Point	Interface Type	Mirrored Packet Layer 2 Header
Input	Any Ethernet except gr- and fti-	Layer 2 header of the incoming packet is reported
Output	Any Ethernet except gr- and fti-	Layer 2 header of the incoming packet is reported
Input or output	gr- interface	Not supported

Input	fti- interface	Incoming Layer 2 header of the original packet (as it was seen on the WAN port)
Output	fti- interface	Incoming Layer 2 header of the original packet (as it was seen on the WAN port)
Input	irb interface	Incoming Layer 2 header of the original packet (as it was seen on the WAN port)
Output	irb interface	Not supported

Suggestions for Enhancements to Your Packet-Filtering Configuration

Consider the following as an additional practice to enhance your filter network telemetry setup:

You can use input-chain and output-chain filters to separate the filter configuration used for mirroring from existing filters, thus helping you to avoid inadvertent configuration errors while troubleshooting. For details of this feature, see Example: Using Firewall Filter Chains.

Troubleshooting DNS Name Resolution in Logical System Security Policies (Primary Administrators Only)

IN THIS SECTION

- Problem | 1678
- Cause | 1678
- Solution | 1678

Problem

Description

The address of a hostname in an address book entry that is used in a security policy might fail to resolve correctly.

Cause

Normally, address book entries that contain dynamic hostnames refresh automatically for SRX Series devices. The TTL field associated with a DNS entry indicates the time after which the entry should be refreshed in the policy cache. Once the TTL value expires, the SRX Series device automatically refreshes the DNS entry for an address book entry.

However, if the SRX Series device is unable to obtain a response from the DNS server (for example, the DNS request or response packet is lost in the network or the DNS server cannot send a response), the address of a hostname in an address book entry might fail to resolve correctly. This can cause traffic to drop as no security policy or session match is found.

Solution

The primary administrator can use the `show security dns-cache` command to display DNS cache information on the SRX Series device. If the DNS cache information needs to be refreshed, the primary administrator can use the `clear security dns-cache` command.

NOTE: These commands are only available to the primary administrator on devices that are configured for logical systems. This command is not available in user logical systems or on devices that are not configured for logical systems.

To solve configuration problems on a link services interface:

Determine Which CoS Components Are Applied to the Constituent Links

IN THIS SECTION

- Problem | **1680**
- Solution | **1680**

Problem

Description

You are configuring a multilink bundle, but you also have traffic without MLPPP encapsulation passing through constituent links of the multilink bundle. Do you apply all CoS components to the constituent links, or is applying them to the multilink bundle enough?

Solution

You can apply a scheduler map to the multilink bundle and its constituent links. Although you can apply several CoS components with the scheduler map, configure only the ones that are required. We recommend that you keep the configuration on the constituent links simple to avoid unnecessary delay in transmission.

Table 1 shows the CoS components to be applied on a multilink bundle and its constituent links.

Table 186: CoS Components Applied on Multilink Bundles and Constituent Links

Cos Component	Multilink Bundle	Constituent Links	Explanation
Classifier	Yes	No	CoS classification takes place on the incoming side of the interface, not on the transmitting side, so no classifiers are needed on constituent links.
Forwarding class	Yes	No	Forwarding class is associated with a queue, and the queue is applied to the interface by a scheduler map. The queue assignment is predetermined on the constituent links. All packets from Q2 of the multilink bundle are assigned to Q2 of the constituent link, and packets from all the other queues are queued to Q0 of the constituent link.

Table 186: CoS Components Applied on Multilink Bundles and Constituent Links *(Continued)*

Cos Component	Multilink Bundle	Constituent Links	Explanation
Scheduler map	Yes	Yes	Apply scheduler maps on the multilink bundle and the constituent link as follows: • Transmit rate—Make sure that the relative order of the transmit rate configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle. • Scheduler priority—Make sure that the relative order of the scheduler priority configured on Q0 and Q2 is the same on the constituent links as on the multilink bundle. • Buffer size—Because all non-LFI packets from the multilink bundle transit on Q0 of the constituent links, make sure that the buffer size on Q0 of the constituent links is large enough. • RED drop profile—Configure a RED drop profile on the multilink bundle only. Configuring the RED drop profile on the constituent links applies a back pressure mechanism that changes the buffer size and introduces variation. Because this behavior might cause fragment drops on the constituent links, make sure to leave the RED drop profile at the default settings on the constituent links.
Shaping rate for a per-unit scheduler or an interface-level scheduler	No	Yes	Because per-unit scheduling is applied only at the end point, apply this shaping rate to the constituent links only. Any configuration applied earlier is overwritten by the constituent link configuration.

Table 186: CoS Components Applied on Multilink Bundles and Constituent Links *(Continued)*

Cos Component	Multilink Bundle	Constituent Links	Explanation
Transmit-rate exact or queue-level shaping	Yes	No	The interface-level shaping applied on the constituent links overrides any shaping on the queue. Thus apply transmit-rate exact shaping on the multilink bundle only.
Rewrite rules	Yes	No	Rewrite bits are copied from the packet into the fragments automatically during fragmentation. Thus what you configure on the multilink bundle is carried on the fragments to the constituent links.
Virtual channel group	Yes	No	Virtual channel groups are identified through firewall filter rules that are applied on packets only before the multilink bundle. Thus you do not need to apply the virtual channel group configuration to the constituent links.

Determine What Causes Jitter and Latency on the Multilink Bundle

IN THIS SECTION

- Problem | **1683**
- Solution | **1683**

Problem

Description

To test jitter and latency, you send three streams of IP packets. All packets have the same IP precedence settings. After configuring LFI and CRTP, the latency increased even over a noncongested link. How can you reduce jitter and latency?

Solution

To reduce jitter and latency, do the following:

1. Make sure that you have configured a shaping rate on each constituent link.
2. Make sure that you have not configured a shaping rate on the link services interface.
3. Make sure that the configured shaping rate value is equal to the physical interface bandwidth.
4. If shaping rates are configured correctly, and jitter still persists, contact the Juniper Networks Technical Assistance Center (JTAC).

Determine If LFI and Load Balancing Are Working Correctly

IN THIS SECTION

- Problem | **1683**
- Solution | **1684**

Problem

Description

In this case, you have a single network that supports multiple services. The network transmits data and delay-sensitive voice traffic. After configuring MLPPP and LFI, make sure that voice packets are transmitted across the network with very little delay and jitter. How can you find out if voice packets are being treated as LFI packets and load balancing is performed correctly?

Solution

When LFI is enabled, data (non-LFI) packets are encapsulated with an MLPPP header and fragmented to packets of a specified size. The delay-sensitive, voice (LFI) packets are PPP-encapsulated and interleaved between data packet fragments. Queuing and load balancing are performed differently for LFI and non-LFI packets.

To verify that LFI is performed correctly, determine that packets are fragmented and encapsulated as configured. After you know whether a packet is treated as an LFI packet or a non-LFI packet, you can confirm whether the load balancing is performed correctly.

`Solution Scenario`—Suppose two Juniper Networks devices, R0 and R1, are connected by a multilink bundle `lsq-0/0/0.0` that aggregates two serial links, `se-1/0/0` and `se-1/0/1`. On R0 and R1, MLPPP and LFI are enabled on the link services interface and the fragmentation threshold is set to 128 bytes.

In this example, we used a packet generator to generate voice and data streams. You can use the packet capture feature to capture and analyze the packets on the incoming interface.

The following two data streams were sent on the multilink bundle:

- 100 data packets of 200 bytes (larger than the fragmentation threshold)
- 500 data packets of 60 bytes (smaller than the fragmentation threshold)

The following two voice streams were sent on the multilink bundle:

- 100 voice packets of 200 bytes from source port 100
- 300 voice packets of 200 bytes from source port 200

To confirm that LFI and load balancing are performed correctly:

> **NOTE**: Only the significant portions of command output are displayed and described in this example.

1. Verify packet fragmentation. From operational mode, enter the `show interfaces lsq-0/0/0` command to check that large packets are fragmented correctly.

```
user@R0#> show interfaces lsq-0/0/0

```

Meaning—The output shows a summary of packets transiting the device on the multilink bundle. Verify the following information on the multilink bundle:

- The total number of transiting packets = 1000
- The total number of transiting fragments=1100
- The number of data packets that were fragmented =100

The total number of packets sent (600 + 400) on the multilink bundle match the number of transiting packets (1000), indicating that no packets were dropped.

The number of transiting fragments exceeds the number of transiting packets by 100, indicating that 100 large data packets were correctly fragmented.

Corrective Action—If the packets are not fragmented correctly, check your fragmentation threshold configuration. Packets smaller than the specified fragmentation threshold are not fragmented.

2. Verify packet encapsulation. To find out whether a packet is treated as an LFI or non-LFI packet, determine its encapsulation type. LFI packets are PPP encapsulated, and non-LFI packets are encapsulated with both PPP and MLPPP. PPP and MLPPP encapsulations have different overheads resulting in different-sized packets. You can compare packet sizes to determine the encapsulation type.

A small unfragmented data packet contains a PPP header and a single MLPPP header. In a large fragmented data packet, the first fragment contains a PPP header and an MLPPP header, but the consecutive fragments contain only an MLPPP header.

PPP and MLPPP encapsulations add the following number of bytes to a packet:

- PPP encapsulation adds 7 bytes:

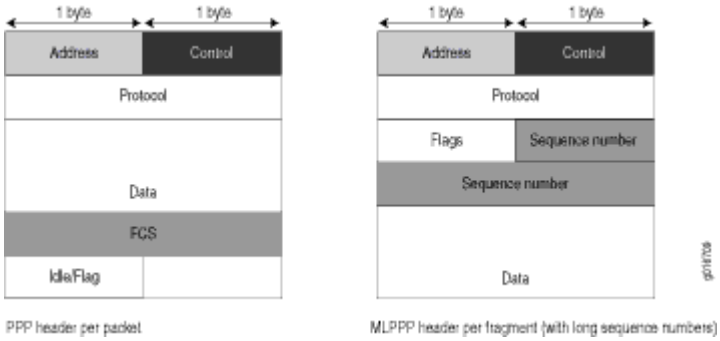
  4 bytes of header+2 bytes of frame check sequence (FCS)+1 byte that is idle or contains a flag

- MLPPP encapsulation adds between 6 and 8 bytes:

  4 bytes of PPP header+2 to 4 bytes of multilink header

Figure 1 shows the overhead added to PPP and MLPPP headers.

Figure 58: PPP and MLPPP Headers



For CRTP packets, the encapsulation overhead and packet size are even smaller than for an LFI packet. For more information, see Example: Configuring the Compressed Real-Time Transport Protocol.

Table 2 shows the encapsulation overhead for a data packet and a voice packet of 70 bytes each. After encapsulation, the size of the data packet is larger than the size of the voice packet.

Table 187: PPP and MLPPP Encapsulation Overhead

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Voice packet (LFI)	PPP	70 bytes	4 + 2 + 1 = 7 bytes	77 bytes

Table 187: PPP and MLPPP Encapsulation Overhead *(Continued)*

Packet Type	Encapsulation	Initial Packet Size	Encapsulation Overhead	Packet Size after Encapsulation
Data fragment (non-LFI) with short sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 2 = 13 bytes	83 bytes
Data fragment (non-LFI) with long sequence	MLPPP	70 bytes	4 + 2 + 1 + 4 + 4 = 15 bytes	85 bytes

From operational mode, enter the `show interfaces queue` command to display the size of transmitted packet on each queue. Divide the number of bytes transmitted by the number of packets to obtain the size of the packets and determine the encapsulation type.

3. Verify load balancing. From operational mode, enter the `show interfaces queue` command on the multilink bundle and its constituent links to confirm whether load balancing is performed accordingly on the packets.

```

```

Meaning—The output from these commands shows the packets transmitted and queued on each queue of the link services interface and its constituent links. Table 3 shows a summary of these values. (Because the number of transmitted packets equaled the number of queued packets on all the links, this table shows only the queued packets.)

Table 188: Number of Packets Transmitted on a Queue

Packets Queued	Bundle lsq-0/0/0.0	Constituent Link se-1/0/0	Constituent Link se-1/0/1	Explanation
Packets on Q0	600	350	350	The total number of packets transiting the constituent links (350+350 = 700) exceeded the number of packets queued (600) on the multilink bundle.
Packets on Q2	400	100	300	The total number of packets transiting the constituent links equaled the number of packets on the bundle.
Packets on Q3	0	19	18	The packets transiting Q3 of the constituent links are for keepalive messages exchanged between constituent links. Thus no packets were counted on Q3 of the bundle.

On the multilink bundle, verify the following:

- The number of packets queued matches the number transmitted. If the numbers match, no packets were dropped. If more packets were queued than were transmitted, packets were dropped because the buffer was too small. The buffer size on the constituent links controls congestion at the output stage. To correct this problem, increase the buffer size on the constituent links.
- The number of packets transiting Q0 (600) matches the number of large and small data packets received (100+500) on the multilink bundle. If the numbers match, all data packets correctly transited Q0.

- The number of packets transiting Q2 on the multilink bundle (400) matches the number of voice packets received on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

On the constituent links, verify the following:

- The total number of packets transiting Q0 (350+350) matches the number of data packets and data fragments (500+200). If the numbers match, all the data packets after fragmentation correctly transited Q0 of the constituent links.

  Packets transited both constituent links, indicating that load balancing was correctly performed on non-LFI packets.

- The total number of packets transiting Q2 (300+100) on constituent links matches the number of voice packets received (400) on the multilink bundle. If the numbers match, all voice LFI packets correctly transited Q2.

  LFI packets from source port `100` transited `se-1/0/0`, and LFI packets from source port `200` transited `se-1/0/1`. Thus all LFI (Q2) packets were hashed based on the source port and correctly transited both constituent links.

`Corrective Action`—If the packets transited only one link, take the following steps to resolve the problem:

a. Determine whether the physical link is `up` (operational) or `down` (unavailable). An unavailable link indicates a problem with the PIM, interface port, or physical connection (link-layer errors). If the link is operational, move to the next step.

b. Verify that the classifiers are correctly defined for non-LFI packets. Make sure that non-LFI packets are not configured to be queued to Q2. All packets queued to Q2 are treated as LFI packets.

c. Verify that at least one of the following values is different in the LFI packets: source address, destination address, IP protocol, source port, or destination port. If the same values are configured for all LFI packets, the packets are all hashed to the same flow and transit the same link.

4. Use the results to verify load balancing.

Determine Why Packets Are Dropped on a PVC Between a Juniper Networks Device and a Third-Party Device

IN THIS SECTION

- Problem | 1692
- Solution | 1692

Problem

Description

You are configuring a permanent virtual circuit (PVC) between T1, E1, T3, or E3 interfaces on a Juniper Networks device and a third-party device, and packets are being dropped and ping fails.

Solution

If the third-party device does not have the same FRF.12 support as the Juniper Networks device or supports FRF.12 in a different way, the Juniper Networks device interface on the PVC might discard a fragmented packet containing FRF.12 headers and count it as a "Policed Discard."

As a workaround, configure multilink bundles on both peers, and configure fragmentation thresholds on the multilink bundles.

Troubleshooting Security Policies

IN THIS SECTION

Synchronizing Policies Between Routing Engine and Packet Forwarding Engine

IN THIS SECTION

- Problem | 1693
- Solution | 1693

Problem

Description

Security policies are stored in the routing engine and the packet forwarding engine. Security policies are pushed from the Routing Engine to the Packet Forwarding Engine when you commit configurations. If the security policies on the Routing Engine are out of sync with the Packet Forwarding Engine, the commit of a configuration fails. Core dump files may be generated if the commit is tried repeatedly. The out of sync can be due to:

- A policy message from Routing Engine to the Packet Forwarding Engine is lost in transit.
- An error with the routing engine, such as a reused policy UID.

Environment

The policies in the Routing Engine and Packet Forwarding Engine must be in sync for the configuration to be committed. However, under certain circumstances, policies in the Routing Engine and the Packet Forwarding Engine might be out of sync, which causes the commit to fail.

Symptoms

When the policy configurations are modified and the policies are out of sync, the following error message displays - `error: Warning: policy might be out of sync between RE and PFE <SPU-name(s)> Please request security policies check/resync.`

Solution

Use the `show security policies checksum` command to display the security policy checksum value and use the `request security policies resync` command to synchronize the configuration of security policies in the Routing Engine and Packet Forwarding Engine, if the security policies are out of sync.

Checking a Security Policy Commit Failure

IN THIS SECTION

Problem | 1694

Solution | 1694

Problem

Description

Most policy configuration failures occur during a commit or runtime.

Commit failures are reported directly on the CLI when you execute the CLI command **commit-check** in configuration mode. These errors are configuration errors, and you cannot commit the configuration without fixing these errors.

Solution

To fix these errors, do the following:

1. Review your configuration data.
2. Open the file /var/log/nsd_chk_only. This file is overwritten each time you perform a commit check and contains detailed failure information.

Verifying a Security Policy Commit

IN THIS SECTION

Problem | 1695

- Solution | 1695

Problem

Description

Upon performing a policy configuration commit, if you notice that the system behavior is incorrect, use the following steps to troubleshoot this problem:

Solution

1. Operational **show** Commands—Execute the operational commands for security policies and verify that the information shown in the output is consistent with what you expected. If not, the configuration needs to be changed appropriately.
2. Traceoptions—Set the `traceoptions` command in your policy configuration. The flags under this hierarchy can be selected as per user analysis of the `show` command output. If you cannot determine what flag to use, the flag option `all` can be used to capture all trace logs.

```
user@host# set security policies traceoptions <flag all>
```

You can also configure an optional filename to capture the logs.

```
user@host# set security policies traceoptions <filename>
```

If you specified a filename in the trace options, you can look in the /var/log/<*filename*> for the log file to ascertain if any errors were reported in the file. (If you did not specify a filename, the default filename is eventd.) The error messages indicate the place of failure and the appropriate reason.

After configuring the trace options, you must recommit the configuration change that caused the incorrect system behavior.

Debugging Policy Lookup

IN THIS SECTION

- Problem | 1696
- Solution | 1696

Problem

Description

When you have the correct configuration, but some traffic was incorrectly dropped or permitted, you can enable the `lookup` flag in the security policies traceoptions. The `lookup` flag logs the lookup related traces in the trace file.

Solution

```
user@host# set security policies traceoptions <flag lookup>
```

Log Error Messages used for Troubleshooting ISSU-Related Problems

IN THIS SECTION

- Chassisd Process Errors | 1697
- Understanding Common Error Handling for ISSU | 1697
- ISSU Support-Related Errors | 1702
- Initial Validation Checks Failure | 1702
- Installation-Related Errors | 1704
- Redundancy Group Failover Errors | 1705
- Kernel State Synchronization Errors | 1706

The following problems might occur during an ISSU upgrade. You can identify the errors by using the details in the logs. For detailed information about specific system log messages, see System Log Explorer.

Chassisd Process Errors

IN THIS SECTION

- Problem | 1697
- Solution | 1697

Problem

Description

Errors related to chassisd.

Solution

Use the error messages to understand the issues related to chassisd.

When ISSU starts, a request is sent to chassisd to check whether there are any problems related to the ISSU from a chassis perspective. If there is a problem, a log message is created.

Understanding Common Error Handling for ISSU

IN THIS SECTION

- Problem | 1698
- Solution | 1698

Problem

Description

You might encounter some problems in the course of an ISSU. This section provides details on how to handle them.

Solution

Any errors encountered during an ISSU result in the creation of log messages, and ISSU continues to function without impact to traffic. If reverting to previous versions is required, the event is either logged or the ISSU is halted, so as not to create any mismatched versions on both nodes of the chassis cluster. Table 189 on page 1698 provides some of the common error conditions and the workarounds for them. The sample messages used in the Table 189 on page 1698 are from the SRX1500 device and are also applicable to all supported SRX Series devices.

Table 189: ISSU-Related Errors and Solutions

Error Conditions	Solutions
Attempt to initiate an ISSU when previous instance of an ISSU is already in progress	The following message is displayed: `warning: ISSU in progress` You can abort the current ISSU process, and initiate the ISSU again using the `request chassis cluster in-service-upgrade abort` command.

Table 189: ISSU-Related Errors and Solutions *(Continued)*

Error Conditions	Solutions

Reboot failure on the secondary node	No service downtime occurs, because the primary node continues to provide required services. Detailed console messages are displayed requesting that you manually clear existing ISSU states and restore the chassis cluster.
	
	`error: [Oct  6 12:30:16]: Reboot secondary node failed (error-code: 4.1)`
	
	`error: [Oct  6 12:30:16]: ISSU Aborted! Backup node maybe in inconsistent state, Please restore backup node`
	`[Oct  6 12:30:16]: ISSU aborted. But, both nodes are in ISSU window.`
	`Please do the following:`
	`1. Rollback the node with the newer image using rollback command`
	`Note: use the 'node' option in the rollback command`
	`otherwise, images on both nodes will be rolled back`
	`2. Make sure that both nodes (will) have the same image`
	`3. Ensure the node with older image is primary for all RGs`
	`4. Abort ISSU on both nodes`
	`5. Reboot the rolled back node`
	
	Starting with Junos OS Release 17.4R1, the hold timer for the initial reboot of the secondary node during the ISSU process is extended from 15 minutes (900 seconds) to 45 minutes (2700 seconds) in chassis clusters on SRX1500, SRX4100, SRX4200, and SRX4600 devices.

Table 189: ISSU-Related Errors and Solutions *(Continued)*

Error Conditions	Solutions

Secondary node failed to complete the cold synchronization	The primary node times out if the secondary node fails to complete the cold synchronization. Detailed console messages are displayed that you manually clear existing ISSU states and restore the chassis cluster. No service downtime occurs in this scenario.
	
	`[Oct 3 14:00:46]: timeout waiting for secondary node node1 to sync(error-code: 6.1)`
	`Chassis control process started, pid 36707`
	
	`error: [Oct 3 14:00:46]: ISSU Aborted! Backup node has been upgraded, Please restore backup node`
	`[Oct 3 14:00:46]: ISSU aborted. But, both nodes are in ISSU window.`
	`Please do the following:`
	`1. Rollback the node with the newer image using rollback command`
	`Note: use the 'node' option in the rollback command`
	`otherwise, images on both nodes will be rolled back`
	`2. Make sure that both nodes (will) have the same image`
	`3. Ensure the node with older image is primary for all RGs`
	`4. Abort ISSU on both nodes`
	`5. Reboot the rolled back node`

Table 189: ISSU-Related Errors and Solutions *(Continued)*

Error Conditions	Solutions

Failover of newly upgraded secondary failed	No service downtime occurs, because the primary node continues to provide required services. Detailed console messages are displayed requesting that you manually clear existing ISSU states and restore the chassis cluster.
	
	`[Aug 27 15:28:17]: Secondary node0 ready for failover.`
	`[Aug 27 15:28:17]: Failing over all redundancy-groups to node0`
	`ISSU: Preparing for Switchover`
	`error: remote rg1 priority zero, abort failover.`
	`[Aug 27 15:28:17]: failover all RGs to node node0 failed (error-code: 7.1)`
	`error: [Aug 27 15:28:17]: ISSU Aborted!`
	`[Aug 27 15:28:17]: ISSU aborted. But, both nodes are in ISSU window.`
	`Please do the following:`
	`1. Rollback the node with the newer image using rollback command`
	`Note: use the 'node' option in the rollback command`
	`otherwise, images on both nodes will be rolled back`
	`2. Make sure that both nodes (will) have the same image`
	`3. Ensure the node with older image is primary for all RGs`
	`4. Abort ISSU on both nodes`
	`5. Reboot the rolled back node`
	`{primary:node1}`

Upgrade failure on primary	No service downtime occurs, because the secondary node fails over as primary and continues to provide required services.
Reboot failure on primary node	Before the reboot of the primary node, devices being out of the ISSU setup, no ISSU-related error messages are displayed. The following reboot error message is displayed if any other failure is detected: `Reboot failure on Primary node` `Before the reboot of primary node, devices will be out of ISSU setup and no primary node error messages will be displayed.`

ISSU Support-Related Errors

IN THIS SECTION

- Problem | 1702
- Solution | 1702

Problem

Description

Installation failure occurs because of unsupported software and unsupported feature configuration.

Solution

Use the following error messages to understand the compatibility-related problems:

```
WARNING: Current configuration not compatible with /var/tmp/junos-srx5000-11.4X3.2-domestic.tgz
Exiting in-service-upgrade window
Exiting in-service-upgrade window
```

Initial Validation Checks Failure

IN THIS SECTION

- Problem | 1702
- Solution | 1703

Problem

Description

The initial validation checks fail.

Solution

The validation checks fail if the image is not present or if the image file is corrupt. The following error messages are displayed when initial validation checks fail when the image is not present and the ISSU is aborted:

When Image Is Not Present

When Image File Is Corrupted

If the image file is corrupted, the following output displays:

```
user@host> ...junos-srx1k3k-11.4X9-domestic.tgz_1 reboot
Chassis ISSU Started
node1:
--------------------------------------------------------------------------
Chassis ISSU Started
ISSU: Validating Image
Initiating in-service-upgrade

node1:
--------------------------------------------------------------------------
```

```
Initiating in-service-upgrade
ERROR: Cannot use /var/tmp/junos-srx1k3k-11.4X9-domestic.tgz_1:
gzip: stdin: invalid compressed data--format violated
tar: Child returned status 1
tar: Error exit delayed from previous errors
ERROR: It may have been corrupted during download.
ERROR: Please try again, making sure to use a binary transfer.
Exiting in-service-upgrade window

node1:
--------------------------------------------------------------------------
Exiting in-service-upgrade window
Chassis ISSU Aborted
Chassis ISSU Aborted

node1:
--------------------------------------------------------------------------
Chassis ISSU Aborted
ISSU: IDLE
ISSU aborted; exiting ISSU window.

{primary:node0}
```

The primary node validates the device configuration to ensure that it can be committed using the new software version. If anything goes wrong, the ISSU aborts and error messages are displayed.

Installation-Related Errors

IN THIS SECTION

- Problem | **1704**
- Solution | **1705**

Problem

Description

The install image file does not exist or the remote site is inaccessible.

Solution

Use the following error messages to understand the installation-related problems:

```
error: File does not exist: /var/tmp/junos-srx5000-11.4X3.2-domest
error: Couldn't retrieve package /var/tmp/junos-srx5000-11.4X3.2-domest
```

ISSU downloads the install image as specified in the ISSU command as an argument. The image file can be a local file or located at a remote site. If the file does not exist or the remote site is inaccessible, an error is reported.

Redundancy Group Failover Errors

IN THIS SECTION

- Problem | **1705**
- Solution | **1705**

Problem

Description

Problem with automatic redundancy group (RG) failure.

Solution

Use the following error messages to understand the problem:

```
failover all RG 1+ groups to node 0
error: Command failed.  None of the redundancy-groups has been failed over.
       Some redundancy-groups on node1 are already in manual failover mode.
       Please execute 'failover reset all' first..
```

Kernel State Synchronization Errors

IN THIS SECTION

- Problem | 1706
- Solution | 1706

Problem

Description

Errors related to ksyncd.

Solution

Use the following error messages to understand the issues related to ksyncd:

```
Failed to get kernel-replication error information from Standby Routing Engine.
mgd_slave_peer_has_errors() returns error at line 4414 in mgd_package_issu.
```

ISSU checks whether there are any ksyncd errors on the secondary node (node 1) and displays the error message if there are any problems and aborts the upgrade.

Release History Table

Release	Description
17.4R1	Starting with Junos OS Release 17.4R1, the hold timer for the initial reboot of the secondary node during the ISSU process is extended from 15 minutes (900 seconds) to 45 minutes (2700 seconds) in chassis clusters on SRX1500, SRX4100, SRX4200, and SRX4600 devices.

802.3ad

IN THIS SECTION

- Syntax | 1724
- Hierarchy Level | 1724
- Description | 1724
- Options | 1725
- Required Privilege Level | 1725
- Release Information | 1725

Syntax

```
802.3ad {
    primary | backup;
    ae interface-number ;
    lacp {
        port-priority priority-number;
    }
    link-index index-number
    distribution-list distribution-list-number
}
```

Hierarchy Level

```
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

Description

Specify aggregated Ethernet logical interface number.

Options

bundle	Join an aggregated Ethernet interface.
ae *interface-number*	Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.
primary | backup	For link protection configurations, specify the link as primary link or backup link for egress traffic.
lacp	Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.
link-index	Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.
distribution-list	For targeted distribution, specify the distribution list to which the interface belongs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`primary` and `backup` options added in Junos OS Release 8.3.

                }
            }
        }
    }
}
```

Hierarchy Level

```
[edit snmp v3 vacm]
```

Description

Set SNMP access limits.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

access-list

IN THIS SECTION

- Syntax | 1727
- Hierarchy Level | 1727
- Description | 1728
- Required Privilege Level | 1728
- Release Information | 1728

Syntax

```
[edit snmp]
    routing-instance-access {
        access-list {
            routing-instance;
            routing-instance restrict;
        }
    }
```

Hierarchy Level

```
[edit snmp routing-instance-access]
```

Description

Create access lists to control SNMP agents in routing instances from accessing SNMP information. To enable the SNMP agent on a routing instance to access SNMP information, specify the routing instance name. To disable the SNMP agent on a routing instance from accessing SNMP information, include the routing-instance name followed by the **restrict** keyword.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

action-profile

IN THIS SECTION

- Syntax | 1737
- Hierarchy Level | 1737
- Description | 1737
- Options | 1737
- Required Privilege Level | 1738
- Release Information | 1738

Syntax

```
action-profile profile-name {
    event (jexec | lbt | lt-enter |  lt-leave | mac-egress | mac-ingress | np-egress | np-
ingress | pot) {
        count;
        packet-dump;
        packet-summary;
        trace;
    }
    module {
        flow {
            flag {
                all;
            }
        }
    }
    preserve-trace-order;
    record-pic-history;
}
```

Hierarchy Level

```
[edit security datapath-debug]
```

Description

Configure the action profile options for data path debugging.

Options

- *action-profile name* — Name of the action profile.
- event—Enable the events to trace the packet when the packet hit the events (jexec, lbt, lt-enter, lt-leave, mac-egress, mac-ingress, np-egress, np-ingress, pot)
  - count—Number of times a packet hits the specified event.
  - packet-dump—Capture the packet that hits the specified event.

- packet-summary—Print the source/destination IP address details with protocol number and IP length details along with trace message for the specified event.
- trace—Print the standard trace message when the packet hits the specified event.

- module—Turn on the flow session related trace messages.
  - flow—Trace flow session related messages.
  - flag—Specify which flow message needs to be traced.
  - all—Trace all possible flow trace messages.
  - trace—Print the standard trace message when the packet hits the specified event.
- preserve-trace-order—Preserve trace order.
- record-pic-history—Record the PICs in which the packet has been processed.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 10.0.

```

Hierarchy Level

```
[edit snmp v3 target-address target-address-name]
```

Description

Specify the SNMP target address for receiving traps or informs.

Options

address—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

agent-address

IN THIS SECTION

- Syntax | **1758**
- Hierarchy Level | **1759**
- Description | **1759**
- Options | **1759**
- Required Privilege Level | **1759**
- Release Information | **1759**

Syntax

```
agent-address outgoing-interface;
```

Hierarchy Level

```
[edit snmp trap-options]
```

Description

Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options

outgoing-interface—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

- **Default:** disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Hierarchy Level

For platforms without ELS:

```
[edit ethernet-switching-options]
```

For platforms with ELS:

```
[edit forwarding-options]
```

Description

Configure port mirroring. You can create a total of four port-mirroring configurations on the QFX Series, subject to the following limits:

- There can be no more than two configurations that mirror ingress traffic.
- There can be no more than two configurations that mirror egress traffic.

Default

Port mirroring is disabled and Junos OS creates no default analyzers.

Options

`all`—Mirror all the access interfaces. Using this option does not cause the QSFP+ or management interfaces to be mirrored.

CAUTION: Configuring the `all` option in a QFabric system causes all the access interfaces on all the nodes to be mirrored. Be cautious about using this option on a QFabric system.

analyzer-name—Name of the analyzer. The name can include as many as 125 characters; must begin with a letter; and can include uppercase letters, lowercase letters, numbers, dashes, and underscores. No other special characters are allowed.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Option `output vlan` added in Junos OS Release 12.1 for the QFX Series.

Option `output ip-address` added in Junos OS Release 12.3 for the QFX Series for non-ELS platforms and added in 14.1X53-D10 for ELS platforms.

Statement introduced for the “Interface Privilege Level” in Junos OS Release 13.2X50-D10.

archive (All System Log Files)

IN THIS SECTION

- Syntax | 1786
- Hierarchy Level | 1786
- Description | 1786
- Options | 1786
- Required Privilege Level | 1787
- Release Information | 1788

Syntax

```
archive <files number> <size size> <start-time time> <transfer-interval interval>
<binary-data | no-binary-data> <world-readable | no-world-readable>;
```

Hierarchy Level

```
[edit system syslog]
```

Description

Configure archiving properties for all system log files.

Options

`files` *number*—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and

renames it ***logfile*.0.gz** (the amount of data is determined by the `size` statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

- **Range:** 1 through 1000
- **Default:** 10 files

`size` *size*—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

- **Syntax:** *x* `k` to specify the number of kilobytes, *x* `m` for the number of megabytes, or *x* `g` for the number of gigabytes
- **Range:** 64 KB through 1 GB

Default:

- - 128 KB for EX Series switches
  - 1 MB for M Series, MX Series, and T Series routers, OCX Series, and the QFX3500 switch, and SRX and vSRX series devices.
  - 10 MB for TX Matrix and TX Matrix Plus routers

`binary-data | no-binary-data`—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..

- **Default:** `no-binary-data`

`world-readable | no-world-readable`—Grant all users permission to read archived log files, or restrict the permission only to the `root` user and users who have the Junos OS `maintenance` permission.

- **Default:** `no-world-readable`

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

archive (Individual System Log File)

IN THIS SECTION

- Syntax | 1788
- Hierarchy Level | 1788
- Description | 1788
- Options | 1789
- Required Privilege Level | 1790
- Release Information | 1790

Syntax

```
archive <archive-sites (ftp-url  <password password>)> <files number> <size size> <start-
time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable | no-world-readable>;
```

Hierarchy Level

```
[edit system syslog file filename]
```

Description

Configure archiving properties for a specific system log file.

Options

archive-sites *site-name*—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see Format for Specifying Filenames and URLs in Junos OS CLI Commands). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the **[edit system syslog]** hierarchy level.

files *number*—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file *logfile*, it closes the file, compresses it, and renames it *logfile*.0.gz (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called *logfile*. When the new file reaches the maximum size, the *logfile*.0.gz file is renamed to *logfile*.1.gz, and the new file is closed, compressed, and renamed *logfile*.0.gz. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

- **Range:** 1 through 1000
- **Default:** 10 files

password *password*—Password for authenticating with the site specified by the **archive-sites** statement.

size *size*—Maximum amount of data that the Junos OS logging utility writes to a log file *logfile* before archiving it (closing it, compressing it, and changing its name to *logfile*.0.gz). The utility then opens and writes to a new file called *logfile*.

- **Syntax:** *x***k** to specify the number of kilobytes, *x***m** for the number of megabytes, or *x***g** for the number of gigabytes
- **Range:** 64 KB through 1 GB
- **Default:** 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers

start-time "*YYYY-MM-DD.hh:mm***"**—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval*—Interval at which to transfer the log file to an archive site.

- **Range: 5** through **2880** minutes

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

- **Default: no-world-readable**

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

start-time and **transfer-interval** statements introduced in Junos OS Release 8.5.

RELATED DOCUMENTATION

Specifying Log File Size, Number, and Archiving Properties | 1481

archive-sites

IN THIS SECTION

- Syntax | 1790
- Hierarchy Level | 1791
- Description | 1791
- Options | 1791
- Required Privilege Level | 1791
- Release Information | 1791

Syntax

```
archive-sites site-name{
    password password;
}
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name_log-filename_timestamp***. When you configure file archival by using the `archive-states` statement, the transfer file utility uses the default routing instance to connect to the destination server. If the default routing instance is unable to connect to the destination server, the transfer file utility does not work.

Starting in Junos OS Release 18.4R1, when you configure file archival by using the `archive-sites` statement, the transfer file utility does not work if you have enabled the management instance.

To delete an archive site, use the `delete` command instead of `set`.

Options

`site-name`—Any valid FTP/SCP/SFTP URL to a destination.

`password` *`password`*—Password for logging into the archive site.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

authentication-md5

IN THIS SECTION

- Syntax | 1793
- Hierarchy Level | 1794
- Description | 1794
- Required Privilege Level | 1794
- Release Information | 1794

Syntax

```
authentication-md5 {
    (authentication-key authentication-key | authentication-password authentication-password);
}
```

Hierarchy Level

```
[edit snmp v3 usm local-engine user username],
[edit snmp v3 usm remote-engine engine-id user username]
```

Description

Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

For authentication, you can either enter a password in clear text, which is immediately encrypted, or, if you already have the encrypted version (known as a *key*), enter the key directly.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Syntax

```
avg-fd-twoway-threshold avg-fd-twoway-threshold-value{
flap-trap-monitor seconds;}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles
profile-name]
```

Description

Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options

avg-fd-twoway-threshold-value—Threshold value for average frame delay, in microseconds, for two-way ETH-DM.

- **Range:** 1 through 4294967295 microseconds

`flap-trap-monitor` *seconds*—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).

- **Range:** 1 through 360 seconds

Required Privilege Level

Configure—To enter configuration mode.

Control—To modify any configuration.

```

Description

Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either

the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics. In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.

Options

avg-ifdv-twoway-threshold-value—Threshold value for average frame delay variation, in microseconds, for two-way ETH-DM.

- **Range:** 1 through 4294967295 microseconds

`flap-trap-monitor` *seconds*—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).

avg-flr-forward-threshold

IN THIS SECTION

- Syntax | 1813
- Hierarchy Level | 1813
- Description | 1813
- Options | 1814
- Required Privilege Level | 1814
- Release Information | 1814

Syntax

```
avg-flr-forward-threshold avg-flr-forward-threshold-value;{
flap-trap-monitor seconds; }
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles
profile-name]
```

Description

Configure the threshold value for average frame loss ratio, in milli-percent, in the upstream or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.

ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.

Options

avg-flr-forward-threshold-value—Threshold value for average frame loss ratio in the forward or upstream direction, in milli-percent, for ETH-SLM and ETH-LM.

- **Range:** 1 through 100000 milli-percent

`flap-trap-monitor` *seconds*—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).

Syntax

```
class-usage-profile profile-name {
    file filename;
    interval minutes;
    start-time time;
    source-classes {
        source-class-name;
    }
    destination-classes {
        destination-class-name;
    }
}
```

Hierarchy Level

```
[edit accounting-options]
```

Description

Create a class usage profile, which is used to log class usage statistics to a file in the `/var/log` directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has `destination-class-usage` configured.

For information about configuring source classes, see the *Junos Routing Protocols Configuration Guide*. For information about configuring source class usage, see the *Junos Network Management Configuration Guide*.

Options

profile-name Name of the destination class profile.

start-time ***time*** (Optional) Specify the start time in *yyyy-mm-dd.hh:mm* local time format for the accounting profile. Sometimes, if the time at which the records are written to the accounting file is beyond the transfer interval window of the file, drifting of accounting records occurs. To prevent drifting and to have predictable timestamps of when accounting data is written to an accounting file, we can specify the start time option for the accounting profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

maintenance-domain md-name
maintenance-association ma-name
local-mep local-mep-id
logical-system
remote-mep remote-mep-id
```

Description

Clear the event for the configured action profile. If you have configured the action profile at the local MEP level, when you clear the event for the configured action profile, you can specify only the local MEP numeric identifier to clear the event. You need not specify the remote MEP numeric identifier. If you have configured the action profile at the remote MEP level, when you clear the event for the configured action profile, you must specify both the local MEP numeric identifier and remote MEP numeric identifier to clear the event.

Options

adjacency loss	Clear the adjacency loss event.
all-defects	Clear the all-defects event.
cross-connect-ccm	Clear the cross-connect-ccm event.
erroneous-ccm	Clear the erroneous-ccm event.
local-mep *local-mep-id*	Specify the local MEP numeric identifier. If you have configured the action profile at the local MEP, you can clear the event for the configured action

	profile at the local MEP level. You need not specify the remote MEP numeric identifier.
logical-system	Name of the logical system
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
receive-ais	Clear the receive-ais event.
remote-mep *remote-mep-id*	Specify the remote MEP numeric identifier. If you have configured the action profile at the remote MEP, you can clear the event for the configured action profile at the remote MEP level. You must specify both the local MEP numeric identifier and the remote MEP numeric identifier.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear oam ethernet connectivity-fault-management event

```
user@host> clear oam ethernet connectivity-fault-management event maintenance-domain md5
maintenance-association ma5 local-mep 2 remote-mep 1
Action Profile Event Cleared.
```

Release Information

Command introduced in Junos OS Release 20.2.

client-list

IN THIS SECTION

- Syntax | 1834

Hierarchy Level

```
[edit chassis]
```

Description

Configure a chassis cluster. Perform the configuration under the `[edit chassis cluster]` configuration stanza to define chassis cluster configuration, operations, and monitoring. This configuration must specify configuration synchronization, control link recovery, heartbeat interval and threshold, network management, redundancy group, and traceoptions.

Options

configuration-synchronize Disable automatic chassis cluster synchronization. See *configuration-synchronize (Chassis Cluster)*.

control-interface Disable and Enable chassis cluster control-link interface on SRX1500, SRX4100, SRX4200, and SRX4600 devices. If you want to reboot any of the nodes, then you must disable the control interfaces on both nodes using the CLI configuration to ensure control link remains disabled after reboot. When control link is down, configuration change on local node will not be synchronized to the remote node.

From configuration mode, run the `set chassis cluster control-interface <node0/node1> disable` on node 0 or node 1 to disable the control link and to enable the control link run the `delete chassis cluster control-interface <node0/node1> disable` on both the nodes. If you have disabled the links using the configuration command, then the links will remain disabled even after system reboot.

From the operational mode, run the `request chassis cluster control-interface <node0/node1> disable` or the `request chassis cluster control-interface <node0/node1> enable` commands to enable or disable the control link from the local node. If you have disabled control link using the operational mode CLI commands, the links will be enabled after system reboot.

control-link-recovery Enable automatic control link recovery option.

control-ports Enable specific chassis cluster control ports.

- Values:
  - `fpc`—FPC slot number
  - `port`—Port number

health-monitoring Enable to monitor the health status of the SRX Series devices operating in chassis cluster mode. The health status between the two nodes is monitored and shared over control links and fabric links. Failover between the nodes occurs based on the heart beat status and health status of the control links and fabric links. By default, the option is disabled.

heartbeat-interval Interval between successive heartbeats (milliseconds)

- **Default:** `1000`
- **Range:** `1000-2000`

heartbeat-threshold Number of consecutive missed heartbeats to indicate device failure

- **Default:** `3`
- **Range:** `3-8`

network-management Define parameters for network management. See *network-management*.

redundancy-group *name* Define a redundancy group. See *redundancy-group (Chassis Cluster)*.

reth-count Number of redundant ethernet interfaces

- **Range:** `1-128`

traceoptions Define chassis cluster redundancy process tracing operations. See *traceoptions (Chassis Cluster)*.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

The `health-monitoring` option is introduced in Junos OS Release 18.4R1.

The `control-interface` option is introduced in Junos OS Release 20.4R1 for SRX1500 devices.

- Required Privilege Level | 1846
- Release Information | 1846

Syntax

```
community community-name;
```

Hierarchy Level

```
[edit snmp rmon event index]
```

Description

The trap group that is used when generating a trap (if `eventType` is configured to send traps). If that trap group has the `rmon-alarm` trap category configured, a trap is sent to all the targets configured for that trap

group. The community string in the trap matches the name of the trap group (and hence, the value of `eventCommunity`). If nothing is configured, traps are sent to each group with the `rmon-alarm` category set.

Options

`community-name`—Identifies the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 1847
- Release Information | 1847

Syntax

```
community community-name;
```

Hierarchy Level

```
[edit snmp rmon event index]
```

Description

Configure the SNMP trap group that is used when generating a trap (if the eventType object is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group that has the rmon-alarm category configured.

The event community is not the same as an SNMP community.

Options

community-name—Name of the trap group that is used when generating a trap if the event is configured to send traps.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

community (SNMP)

IN THIS SECTION

- Syntax | 1848
- Hierarchy Level | 1848
- Description | 1849
- Default | 1849
- Options | 1849
- Required Privilege Level | 1849
- Release Information | 1849

Syntax

```
community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
        address restrict;
    }
    view view-name;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

NOTE: The `authorization read-write` option is not supported on the QFX3000 QFabric system.

The SNMP client application specifies an SNMP community name in `Get`, `GetBulk`, `GetNext`, and `Set` SNMP requests.

Default

If you omit the `community` statement, all SNMP requests are denied.

Options

community-name—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

community-name

IN THIS SECTION

- Syntax | 1850
- Hierarchy Level | 1850
- Description | 1850
- Options | 1850
- Required Privilege Level | 1851
- Release Information | 1851

Syntax

```
community-name community-name;
```

Hierarchy Level

```
[edit snmp v3 snmp-community community-index]
```

Description

The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.

Options

community-name—Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").

NOTE: Community names must be unique. You cannot configure the same community name at the `[edit snmp community]` and `[edit snmp v3 snmp-community community-index]` hierarchy levels.

The community name at the [edit snmp v3 snmp-community *community-index*] hierarchy level is encrypted and not displayed in the command-line interface (CLI).

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

context (SNMPv3)

IN THIS SECTION

- Syntax | 1863
- Hierarchy Level | 1863
- Description | 1863
- Required Privilege Level | 1863
- Release Information | 1863

Syntax

```
context context-name;
```

Hierarchy Level

```
[edit snmp v3 snmp-community community-index]
```

Description

Specify the SNMPv3 context for access control. A context identifies a collection of information accessible for an SNMP entity.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

convey-loss-threshold

IN THIS SECTION

- Syntax | 1864
- Hierarchy Level | 1864
- Description | 1864
- Required Privilege Level | 1865

Syntax

```
convey-loss-threshold;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name continuity-check]
```

Description

Enable loss-threshold-tlv transmission.

During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote maintenance endpoint (MEP) to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value. You can control the transmission of the loss threshold TLV in continuity check messages PDUs. The `convey-loss-threshold` statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the

statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

critical-event (Process)

IN THIS SECTION

- Syntax | **1865**
- Hierarchy Level | **1865**
- Description | **1866**
- Options | **1866**
- Required Privilege Level | **1866**
- Release Information | **1866**

Syntax

```
critical-event {
    threshold process name memory-limit value ;
    action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
}
```

Hierarchy Level

```
[edit system monitor memory process]
```

Description

Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. You can specify the process threshold value for specific processes and their memory limit. When the threshold is crossed, you can configure the action to be performed. For instance, you can specify the process threshold for the `rpd` process and the memory limit for that process which you would classify as a critical event.

Options

threshold Specifies the process threshold level for a minor event. You must specify the process name and the memory limit for the process.

memory Specifies the permissible memory limit for the process after which the critical event is triggered.

action Specifies the action to be performed when the threshold is crossed. For critical events, you can force terminate the process. You can also display a list of system core files created when the system failed which you can use to debug the issue. You can also raise an SNMP trap.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

critical-event (System)

IN THIS SECTION

- Syntax | 1867
- Hierarchy Level | 1867
- Description | 1867
- Options | 1868
- Required Privilege Level | 1868
- Release Information | 1868

Syntax

```
critical-event {
    threshold swap-usage value ;
    action [snmp-trap | live-vmcore | (RE-restart| RE-switchover)];
}
```

Hierarchy Level

```
[edit system monitor memory system]
```

Description

Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. At the system level you can monitor the overall free pages (cache and free pages), kernel memory allocations and compare them with threshold values. You can also monitor the swap usage and specify the threshold for swap space usage. Most devices have a swap partition that you can configure to provide additional transient memory. Ideally, the swap partition is used only under exceptional circumstances. In current dynamic systems, you can sporadically use the swap partition as long as the usage is not high or persistent. For instance, you could categorise a critical event as one where the swap usage is greater than 75%.

You can only configure swap usage threshold for memory monitoring. If you do not configure the swap usage threshold, memory monitoring for swap usage is based on the default threshold. Memory monitoring for other features is based on the default threshold.

Options

threshold Specifies the process threshold level for a minor event. You must specify the process name and the memory limit for the process.

swap-usage Specifies the swap usage in percentage.

action Specifies the action to be performed when the threshold is crossed.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the size of the data portion of ICMP probes. The `data-size` statement is not valid with the `http-get` or `http-metadata-get` probe type.

Options

size—0 through 65400 for RPM, for TWAMP the value is from 60 through 1400.

- **Default:** 0 for RPM and 60 for TWAMP.

NOTE: If you configure the hardware timestamp feature (see *Configuring RPM Timestamping on MX, M, T, and PTX Series Routers and EX Series Switches*):

- The default value of `data-size` is 32 bytes and `32` is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 52 bytes.
- The data size must be at least 100 bytes smaller than the default MTU of the interface of the RPM client interface.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

depth-threshold

IN THIS SECTION

- Syntax | **1882**
- Hierarchy Level | **1882**
- Description | **1882**
- Options | **1882**

Required Privilege Level | 1883
Release Information | 1883

Syntax

```
depth-threshold {
    high number;
    low number;
}
```

Hierarchy Level

```
[edit services analytics interfaces]
[edit services analytics resource-profiles]
```

Description

If network analytics queue statistics monitoring is enabled, specify the high and low values (in bytes) of the queue depth (buffer) threshold. If you configure a depth threshold, you cannot configure the latency threshold. You can configure the depth threshold for one interface or all interfaces. Specify the high and low queue depth threshold numbers:

NOTE: The configuration for a specific interface supersedes the global configuration for all interfaces.

Options

high *number* Specify the maximum value for the depth threshold.

- **Range:** 1 to 1,250,000,000 bytes
- Default:

- Junos OS Release 13.2X51-D10 or later—0 bytes
- Junos OS Release 13.2X50-D15—14,680,064 bytes (14 MB)

low *number* Specify the minimum value for the depth threshold.

- **Range:** 1 to 1,250,000,000 bytes
- Default:
  - Junos OS Release 13.2X51-D10 or later—0 bytes
  - Junos OS Release 13.2X50-D15—1024 bytes (1 KB)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Statement in the `[edit services analytics resource-profiles]` hierarchy level introduced in Junos OS Release 13.2X51-D15.

```

Description

Specify the User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port to which a probe is sent. This statement is used only for TCP or UDP probe types.

The value for the `destination-port` can be only 7 when you configure the destination port along with hardware timestamping. A constraint check prevents you for configuring any other value for the destination port in this case.

This constraint does not apply when you are using one-way hardware timestamping along with `destination-port` and either `probe-type udp-ping` or `probe-type udp-ping-timestamp`.

For a managed TWAMP control connection (the default or configured with the `control-type managed` statement), the `destination-port` statement is required at the `[edit services rpm twamp control-connection control-connection-name]` hierarchy level (Junos OS) or the `[edit services monitoring twamp control-connection control-connection-name]` hierarchy level (Junos OS Evolved) and is not allowed at the individual test-session level, at `[edit services rpm twamp control-connection control-connection-name test-session test-session-name]` (Junos OS) or `[edit services monitoring twamp control-connection control-connection-name test-session test-session-name]` (Junos OS Evolved).

For a TWAMP control connection configuration that includes the `control-type light` statement, the `destination-port` statement is not allowed at the `[edit services rpm twamp control-connection control-connection-name]` hierarchy level (Junos OS) or the `[edit services monitoring twamp control-connection control-connection-name]` hierarchy level (Junos OS Evolved), but is required for each test session, at `[edit services rpm twamp control-connection control-connection-name test-session test-session-name]` (Junos OS) or `[edit services monitoring twamp control-connection control-connection-name test-session test-session-name]` (Junos OS Evolved).

Options

port—Port number 7 or from 862 through 65,535.

- **Default:** The default value for the port is 862 to which the TWAMP client establishes the control connection.

NOTE: The specified port numbers are recommended for RPM only.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

detect-loc

IN THIS SECTION

- Syntax | 1900
- Hierarchy Level | 1901
- Description | 1901
- Default | 1901
- Required Privilege Level | 1901
- Release Information | 1902

Syntax

```
detect-loc;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name mep mep-id remote-mep mep-id ]
```

```
[edit protocols oam ethernet link-fault-management interface interface-name ]
```

Description

Specify whether Ethernet OAM continuity checks are performed for an individual remote maintenance end point (MEP).

When you configure the `detect-loc` statement at [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level, a loss-of-continuity (LOC) defect is raised when the peer is not found within a period that is equal to 3 times the current keepalive pdu interval. When an LOC defect is raised, a syslog error message is generated .

NOTE: When you configure the `detect-loc` statement at the [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level, any `action-profile` configured to bring down the interface is executed when an LOC defect is detected. However, the `action-profile` is not executed if you have not configured `detect-loc` statement the `detect-loc` statement at the [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level.

To view the current LOC status of an interface, execute the `show oam ethernet link-fault-management` command.

Default

The MEP does not generate LOC defect messages by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

disable (Forwarding Options)

IN THIS SECTION

- Syntax | 1904
- Hierarchy Level | 1904
- Description | 1904

Required Privilege Level | 1904
Release Information | 1904

Syntax

```
disable;
```

Hierarchy Level

```
[edit forwarding-options port-mirror],
[edit forwarding-options port-mirror instance instance-name],
[edit forwarding-options sampling],
[edit forwarding-options sampling instance instance-name],
[edit forwarding-options sampling family  (inet | inet6 | mpls | vpls) ],
[edit forwarding-options sampling family (inet | inet6 | mpls | vpls) output file]
```

Description

Disable traffic accounting, port mirroring, or sampling.

NOTE: The `disable` statement at the `[edit forwarding-options sampling]` hierarchy level disables only Routing Engine-based sampling. To disable PIC-based sampling and inline sampling, include the `disable` statement at the `[edit forwarding-options sampling instance instance-name]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement added to `port-mirror` hierarchy in Junos OS Release 9.6.

NOTE: Beginning in Junos OS Release 15.1F5 and later 15.1 releases and Junos OS Release 16.1 and later, the `disable` option has been deprecated at the `forwarding-options sampling instance` *`instance-name`* `family (inet | inet6 | mpls)` hierarchy level on PTX3000 Series routers. When configured, the option does not take effect, so packets continue to be sampled. Instead of the `disable` option, use the `deactivate forwarding-options sampling instance` *`instance-name`* `family (inet | inet6 | mpls)` command to prevent sampling.

engine-id

IN THIS SECTION

- Syntax | 1914
- Hierarchy Level | 1914
- Description | 1914
- Options | 1914
- Required Privilege Level | 1915
- Release Information | 1915

Syntax

```
engine-id {
    (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level

```
[edit snmp]
```

Description

The local engine ID is defined as the administratively unique identifier of an SNMPv3 engine, and is used for identification, not for addressing. There are two parts of an engine ID: prefix and suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks*. You can configure the suffix here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated passwords and the engine ID. If you configure or change the engine ID, you must commit the new engine ID before you configure SNMPv3 users. Otherwise the keys generated from the configured passwords are based on the previous engine ID.

For the engine ID, we recommend using the MAC address of the management port.

Options

local *engine-id-suffix* Explicit setting for the engine ID suffix.

use-default-ip-address (Does not work on Junos OS Evolved) The engine ID suffix is generated from the default IP address.

- **Default:** `use-default-ip-address`

use-mac-address (Does not work on Junos OS Evolved) The SNMP engine identifier is generated from the MAC address of the management interface on the router.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Syntax | 1915
- Hierarchy Level | 1916
- Description | 1916
- Default | 1916
- Options | 1916
- Required Privilege Level | 1917
- Release Information | 1917

Syntax

```
engine-id {
    (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks* and cannot be configured. The suffix is configured here.

NOTE: SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.

By default the `use-mac-address` option is enabled. This causes the engine ID suffix to be based on a MAC address.

Starting with Junos OS release 14.1X53-D43, QFX Series switches use the chassis MAC address for the engine ID suffix. On OCX Series, the MAC address of the management interface continues to be used.

You can override the default behavior by using the `local` *`engine-id-suffix`* option, or by using the `use-default-ip-address` option.

Default

`use-mac-address`

Options

local *engine-id-suffix* The engine ID suffix is set based on the data entered.

use-default-ip-address The engine ID suffix is generated from the default IP address.

use-mac-address The engine ID suffix is generated from the MAC address of the management interface on the switch.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

[edit protocols oam]
```

Description

Provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support for Ethernet interfaces or configure connectivity fault management (CFM) for IEEE 802.1ag Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

`connectivity-fault-management` introduced in Junos OS Release 10.2 for EX Series switches.

    mep-id mep-id;
}
```

Hierarchy Level

```
[edit protocols oam ethernet evcs]
```

Description

Specify connectivity fault management (CFM) or virtual private LAN service (VPLS) as the Ethernet virtual connection (EVC) protocol.

Options

management-domain *domain-id*
(Optional) For CFM, specify the CFM management domain.

management-association *association-id*
(Optional) For CFM, specify the CFM management association.

routing-instance *instance-id*
(Optional) For VPLS, specify the VPLS routing instance.

mep-id *mep-id*
(Required for CFM) Identifier for the maintenance association endpoint

NOTE: This option is available on MX Series routers only.

- **Range:** 1 through 8191

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

            statistics {
                queue;
                traffic;
            }
            status {
                link;
                queue;
                traffic;
            }
        }
        stream-format format;
        system {
            information;
            status {
                queue;
                traffic;
            }
        }
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure an profile to specify the network analytics data being streamed to remote servers. Each profile is a template that defines the type of data being streamed.

NOTE: The `export-profile` statement is not available in Junos OS Releases prior to 13.2X51-D15.

Options

profile-name Name of the export profile containing the configuration of the data being streamed.

stream-format *format* Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

- Values:
  - **csv**—Comma-separated Values (CSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface.Each record contains either a “q” for a queue statistics, or a “t” for a traffic statistics.
  - **gpb**—Google Protocol Buffer (GPB). Data sent in this format has a hierachical format, and is categorized by resource type (system or interfaces), which is specified in the message header. You can generate data formatted in other formats (CSV, TSV, and JSON) from GPB-encoded data.

    Each message includes a 8-byte header containing the following information:

    - Bytes 0 to 3—Length of the message.
    - Byte 4—Message version.
    - Bytes 5 to 7—Reserved for future use.

    NOTE: A schema file called **analytics.proto** containing the definitions of the GPB messages is available for downloading from the following location: https://www.juniper.net/documentation/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt

- **json**—JavaScript Object Notation (JSON). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains either “queue-statistics” or “traffic-statistics” in the “record type” field.
- **tsv**—Tab-separated Values (TSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains a “q” for a queue statistics, or a “t” for a traffic statistics.

The remaining statements are explained separately. See CLI Explorer.

fast-aps-switch

IN THIS SECTION

Syntax | **1957**

- Hierarchy Level | **1957**
- Description | **1957**
- Required Privilege Level | **1958**
- Release Information | **1958**

Syntax

```
fast-aps-switch;
```

Hierarchy Level

```
[edit interfaces interface-name sonet-options aps]
```

Description

(M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only, EX Series switches, and MX series routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only using container interfaces) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits.

NOTE:

- The fast APS switching feature is supported only within a single chassis on a MX series router using a container interface.
- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the `fast-aps-switch` statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.

- The `fast-aps-switch` statement cannot be configured when the APS `annex-b` option is configured.
- The interfaces that have the `fast-aps-switch` statement configured cannot be used in virtual private LAN service (VPLS) environments.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

    }
}
```

Syntax: QFX Series Switches, EX4600 and NFX Series Devices

```
family
    ethernet-switching {
        output {
            interface interface-name {
            }
            no-filter-check;
            }
            vlan vlan-name {
                no-tag;
            }
        }
    inet
        output {
            ip-address address {
            }
            routing-instance instance-name {
                ip-address address {
            }
        }
```

Hierarchy Level

```
[edit forwarding-options port-mirroring]
```

Description

Specify the type of interface that will be used to forward port mirrored packet to an analyzer device. Configure the protocol family to be sampled. Only IPv4 (`inet`) and IPv6 (`inet6`) are supported.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4 .

}
```

Hierarchy Level

```
[edit forwarding-options port-mirroring],
[edit forwarding-options port-mirroring instance instance-name]
```

Description

Configure the address type family to sample for port mirroring.

Options

`ccc`—Sample Layer 2 VPN traffic.

`inet`—Sample IPv4 traffic.

`inet6`—Sample IPv6 traffic.

vpls—Sample VPLS traffic.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

vpls and ccc options introduced in Junos OS Release 9.3 for MX Series routers only.

vpls support extended to M7i, M10i, M120, and M320 routers in Junos OS Release 9.5.

ccc option introduced in Junos OS Release 9.6 for M120 and M320 routers only.

ccc option introduced in Junos OS Release 12.3R2 for EX Series switches.

next-hop-group option for family inet6 introduced in Junos OS Release 14.2 for MX Series routers only.

Configuring the Routing Engine Profile | 900

file (Analytics)

IN THIS SECTION

- Syntax | 1979
- Hierarchy Level | 1979
- Description | 1979
- Default | 1979
- Options | 1979
- Required Privilege Level | 1980
- Release Information | 1980

Syntax

```
file filename {
    files number-of-files;
    size size;
}
```

Hierarchy Level

```
[edit services analytics collector local]
[edit services analytics queue-statistics]
[edit services analytics traffic-statistics]
```

Description

Enable the logging of queue or traffic monitoring statistics in a local file. This statement does not enable monitoring.

Default

This feature is disabled by default.

Options

filename Specify a filename for storing queue and traffic monitoring statistics in the Comma-separated Values (CSV) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

> **NOTE**: In Junos OS Release 13.2X51-D15 or later, you configure a single filename to store both queue and traffic monitoring statistics. In Junos OS Release 13.2X51-D10 and earlier, you configure separate files for storing monitoring data, one for queue statistics, and another for traffic statistics.

files *number-of-files* Specify the number of files to store locally. After the number of files with the maximum file size is reached, the system starts over and writes the data to the first file.

- **Range:** 2 to 1,000 files.

size *size* Configure the file size in megabytes (MB).

- **Syntax:** `xm` to specify MB.
- **Range:** 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Release History Table

Release	Description
13.2X51-D15	In Junos OS Release 13.2X51-D15 or later, you configure a single filename to store both queue and traffic monitoring statistics.
13.2X51-D10	In Junos OS Release 13.2X51-D10 and earlier, you configure separate files for storing monitoring data, one for queue statistics, and another for traffic statistics.

file (System Logging)

IN THIS SECTION

- Syntax | 1986
- Hierarchy Level | 1986
- Description | 1986
- Options | 1986
- Required Privilege Level | 1987
- Release Information | 1987

Syntax

```
file filename {
    facility severity;
    archive {
        files number;
        size size;
        (no-world-readable | world-readable);
    }
    explicit-priority;
    match "regular-expression";
    match-strings string-name;
    structured-data {
        brief;
    }
}
```

Hierarchy Level

```
[edit system syslog]
```

Description

Configure the logging of system messages to a file.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see "Junos OS System Logging Facilities" on page 1459.

file *filename*—File in the **/var/log** directory in which to log messages from the specified facility. To log messages to more than one file, include more than one **file** statement.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see "System Log Message Severity Levels" on page 1459.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Directing System Log Messages to a Log File | 1519

files (syslog)

IN THIS SECTION

- Syntax | 1987
- Hierarchy Level | 1988
- Description | 1988
- Options | 1988
- Required Privilege Level | 1988
- Release Information | 1988

Syntax

```
files number;
```

Hierarchy Level

```
[edit system syslog archive],
[edit system syslog file filename archive]
```

Description

Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (for information about the maximum file size, see "size" on page 2442). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Options

number—Maximum number of archived files.

- **Range:** 1 through 1000
- **Default:** 10 files

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 1989
- Release Information | 1990

Syntax

```
files number;
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Specify the maximum number of log files to be used for accounting data.

Options

number—The maximum number of files. When a log file (for example, `profilelog`) reaches its maximum size, it is renamed `profilelog.0`, then `profilelog.1`, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for *number* is 3 and the default value is 10.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

filter (Security)

IN THIS SECTION

- Syntax | 1990
- Hierarchy Level | 1990
- Description | 1990
- Required Privilege Level | 1991
- Release Information | 1991

Syntax

```
filter threat-attack
```

Hierarchy Level

```
[edit security log stream stream-name]
```

Description

Configure the log stream filter to transmit only threat and attack logs to the ClearPass Policy Manager (CPPM). The integrated ClearPass authentication and enforcement feature sends to the CPPM threat and attack logs detected by the SRX Series device security modules. You can use these reports to inform

your approach to hardening the CPPM security policy. Setting the log stream filter to threat-attack ensures that the SRX Series device and the log server are not overburdened by irrelevant logs.

NOTE: Unlike for other features that use a filter for log streams, threat-attack is the only log stream filter supported for integrated ClearPass. Therefore, it is not shown here as an option.

Required Privilege Level

1. security—To view this statement in the configuration.
2. security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

- Options | **1993**
- Required Privilege Level | **1994**

Release Information | 1994

Syntax: MX, M, T, ACX, and PTX Series Routers and SRX Firewalls

```
filter-interfaces {
    interfaces {
        all-internal-interfaces;
        interface 1;
        interface 2;
    }
}
```

Syntax: QFX Series switches, QFabric, OCX1100 and EX4600

```
filter-interfaces {
    all-internal-interfaces;
    interfaces interface
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Configure the options available for the `filter-interfaces` statement to specify the interfaces that you want to exclude from the output of SNMP `Get` and `GetNext` requests performed on interface-related MIBs.

Options

`all-internal-interfaces`—Filters out all the internal interfaces from the output of SNMP `Get` and `GetNext` requests. Internal interfaces include all interfaces belonging to juniper private routing-instances.

`interfaces` *interfaces*—Specify the interfaces to filter them out from the output of SNMP `Get` and `GetNext` requests. Use regular expressions to specify the interface.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

filter-profile

IN THIS SECTION

- Syntax | 1994
- Hierarchy Level | 1995
- Description | 1995
- Options | 1995
- Required Privilege Level | 1995
- Release Information | 1995

Syntax

```
filter-profile profile-name {
    counters {
        counter-name;
    }
```

```
    file filename;
    interval minutes;
    start-time time;
}
```

Hierarchy Level

```
[edit accounting-options]
```

Description

Create a profile to filter and collect packet and byte count statistics and write them to a file in the `/var/log` directory. To apply the profile to a firewall filter, you include the `accounting-profile` statement at the `[edit firewall filter filter-name]` hierarchy level. For more information about firewall filters, see *Firewall Filters Overview*.

Options

profile-name Name of the filter profile.

start-time *time* (Optional) Specify the start time in *yyyy-mm-dd.hh:mm* local time format for the accounting profile. Sometimes, if the time at which the records are written to the accounting file is beyond the transfer interval window of the file, drifting of accounting records occurs. To prevent drifting and to have predictable timestamps of when accounting data is written to an accounting file, we can specify the start time option for the accounting profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

Determine how the device manages packet flow. The device can regulate packet flow in the following ways:

Options

advanced-options Flow configuration advanced options.

- Values:
  - drop-matching-link-local-address—Drop matching link local address.
  - drop-matching-reserved-ip-address—Drop matching reserved source IP address.
  - reverse-route-packet-mode-vr—Allow reverse route lookup with packet mode vr.

allow-dns-reply Allow unmatched incoming DNS reply packet.

allow-embedded-icmp Allow embedded ICMP packets not matching a session to pass through.

allow-reverse-ecmp Allow reverse ECMP route lookup.

enable-reroute-uniform-link-check Enable reroute check with uniform link.

- Values:
  - nat—Enable NAT check.

enhanced-routing-mode Enable enhanced route scaling.

force-ip-reassembly Force to reassemble IP fragments.

gre-performance-acceleration Accelerate the GRE traffic performance.

ipsec-performance-acceleration Accelerate the IPSec traffic performance.

mcast-buffer-enhance Allow to hold more packets during multicast session creation.

multicast-nh-resolve-retry You can use this command configure the multicast route next-hop resolve attempts. When a multicast route next-hop resolve is unsuccessful, the SRX Series device attempts to resolve the next-hop route based on the specified retry counts.

- **Default:** 0
- **Range:** 0 through 20

pending-sess-queue-length Maximum queued length per pending session.

- Values:
  - high—Maximum number of queued sessions.
  - moderate—Allow more queued sessions than normal.
  - normal—Normal number of sessions queued.

power-mode-ipsec Enable power mode ipsec processing.

preserve-incoming-fragment-size Preserve incoming fragment size for egress MTU.

route-change-timeout Timeout value for route change to nonexistent route (seconds).

- **Default:** 6
- **Range:** 6 through 1800

strict-packet-order You can use this command to maintain multicast traffic order and resolve packet drop issue.

syn-flood-protection-mode TCP SYN flood protection mode.

- Values:
  - syn-cookie—Enable SYN cookie protection.
  - syn-proxy—Enable SYN proxy protection.

sync-icmp-session Allow icmp sessions to sync to peer node.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.5. The `power-mode-ipsec` option added in Junos OS Release 18.3R1 for vSRX instances, in Junos OS Release 18.4R1 for SRX4100 and SRX4200 devices, and in Junos OS Release 18.2R2 for SRX5400, SRX5600, and SRX5800 devices. The `multicast-nh-resolve-retry` and the `strict-packet-order` options are added in Junos OS Release 20.2R2 for SRX345 and SRX1500 devices.The `gre-performance-acceleration` option added in Junos OS Release 21.1R1.

Description

Configure a unified forwarding table profile to allocate the amount of memory available for the following:

- MAC addresses.
- Layer 3 host entries.
- Longest prefix match table entries.

This feature enables you to select a profile that optimizes the amount of memory available for various types of forwarding-table entries based on the needs of your network. For example, for a switch that handles a great deal of Layer 2 traffic, such as a virtualized network with many servers and virtualized

machines, you would choose the `l2-profile-one`, which allocates the highest amount of memory to MAC addresses.

You configure the memory allocation for LPM table entries differently, depending on whether you using Junos OS Release 13.2X51-D10 or Junos OS Release 13.2X51-D15 and later. For more information about configuring memory allocation for LPM table entries, see Configuring the Unified Forwarding Table on Switches.

The `num-65-127-prefix` *`number`* statement is not supported on the `custom-profile` and the `lpm-profile`. The `prefix-65-127-disable` and `unicast-in-lpm` statements are supported only on the `lpm-profile`.

When you commit a configuration with a forwarding table profile change, in most cases the Packet Forwarding Engine restarts automatically to apply the new parameters, which brings the data interfaces down and then up again.

However, starting with Junos OS Releases 14.1X53-D40, 15.1R5, and 16.1R3, for a Virtual Chassis or Virtual Chassis Fabric (VCF) comprised of EX4600 or QFX5100 switches, the Packet Forwarding Engine in member switches does not automatically restart upon configuring and committing a unified forwarding table profile change. This behavior avoids having Virtual Chassis or VCF instability and a prolonged convergence period if a profile change is propagated to member switches and multiple Packet Forwarding Engines all restart at the same time. In this environment, instead of automatically restarting when you initially commit a profile configuration change, the message `Reboot required for configuration to take effect` is displayed at the primary switch CLI prompt, notifying you that the profile change does not take effect until the next time you restart the Virtual Chassis or VCF. The profile configuration change is propagated to member switches that support this feature, and a reminder that a reboot is required to apply this pending configuration change appears in the system log of the primary switch and applicable member switches. You then enable the profile change subsequently during a planned downtime period using the `request system reboot` command, which quickly establishes a stable Virtual Chassis or VCF with the new configuration.

NOTE: You should plan to make unified forwarding table profile changes only when you are ready to perform a Virtual Chassis or VCF system reboot *immediately* after committing the configuration update. Otherwise, in the intervening period between committing the configuration change and rebooting the Virtual Chassis or VCF, the system can become inconsistent if a member experiences a problem and restarts. In that case, the new configuration takes effect on the member that was restarted, while the change is not yet activated on all the other members.

The remaining statements are explained separately. See CLI Explorer.

Options

profile-name name of the profile to use for memory allocation in the unified forwarding table. Table 190 on page 2011 lists the profiles you can choose that have set values and the associated values for each type of entry.

On QFX5200 Series switches only, you can also select `custom-profile`. This profile enables you to allocate from one to four banks of shared hash memory to a specific type of forwarding-table entry. Each shared hash memory bank can store a maximum of the equivalent of 32,000 IPv4 unicast addresses.

Table 190: Unified Forwarding Table Profiles

Profile Name	MAC Table	Host Table (unicast and multicast addresses)					
	MAC Addresses	IPv4 unicast	IPv6 unicast	IPv4 (*, G)	IPv4 (S, G)	IPv6 (*, G)	IPv6 (S, G)
`l2-profile-one`	288K	16K	8K	8K	8K	4K	4K
`l2-profile-two`	224K	80K	40K	40K	40K	20K	20K
`l2-profile-three` (default)	160K	144K	72K	72K	72K	36K	36K
`l3-profile`	96K	208K	104K	104K	104K	52K	52K
`lpm-profile*`	32K	16K	8K	8K	8K	4K	4K

* This profile supports only IPv4 in Junos OS Release13.2X51-D10. Starting in Junos OS Relase13.2X51-D15, the `lpm-profile` supports IPv4 and IPv6 entries.

> **NOTE**: If the host stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see Understanding the Unified Forwarding Table.

l2-entries | l3-entries | lpm-entries

(`custom-profile only`) Select a type of forwarding-table entry—Layer 2, Layer 3, or LPM—to allocate a specific number of shared memory banks. You configure the amount of memory to allocate for each type of entry separately.

num-banks *number*

(`custom-profile only`) Specify the number of shared memory banks to allocate for a specific type of forwarding-table entry. Each shared memory bank stores the equivalent of 32,000 IPv4 unicast addresses.

- **Range:** 0 through 4.

> **NOTE**: There are four shared memory banks, which can be allocated flexibly among the three types of forwarding-table entries. To allocate no shared memory for a particular entry type, specify the number `0`. When you commit the configuration, the system issues a commit check to ensure that you have not configured more than four memory banks. You do not have to configure all four shared memory banks. By default, each entry type is allocated the equivalent of 32,000 IPv4 unicast addresses in shared memory.

egress-multicast enable

Enable egress sFlow sampling of known multicast traffic.

egress-multicast max-replication-rate *rate*

Specify the maximum sFlow sample replication rate per FPC for known multicast traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Hierarchy level [`edit vlans` *vlan-name*] introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

Hierarchy level [`edit bridge-domains` *bridge-domain-name*] introduced in Junos OS Release 14.1 for MX Series routers.

`custom-profile` option introduced in Junos OS Release 15.1x53-D30 for QFX5200 Series switches only.

interface                 interface-name                event-thresholds ]
```

Description

Configure the number of frame errors within the last N frames that has exceeded a threshold.

Frame errors occur on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value.

Currently, Junos does not generate `frame-period` event.

Options

count—Threshold count for frame errors per 100 frames.

- **Range:** 1 through 100 errors when executed at [edit protocols "oam" on page 2235 "ethernet" on page 1920 "link-fault-management" on page 2142 action-profile *ap-name* "event" on page 1942 *link-event-rate*] hierarchy level.

  0 through 100 errors when executed at [edit protocols "oam" on page 2235 "ethernet" on page 1920 "link-fault-management" on page 2142 *interface interface-name* "event-thresholds " on page 1945] hierarchy level. If you configure 0, then you have disabled the configuration.

frame-period-summary count;
```

Hierarchy Level

```
[edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface interface-name event-thresholds]
```

Description

Threshold for sending frame period summary error events or taking the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.

Options

count—Threshold count for frame period summary error events.

- **Range:** 0 through 100

free-fw-memory-watermark (Resource Monitor)

IN THIS SECTION

- Syntax | 2021
- Hierarchy Level | 2021
- Description | 2021
- Options | 2021
- Required Privilege Level | 2022
- Release Information | 2022

Syntax

```
free-fw-memory-watermark number;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Configure the percentage of free memory space used for firewall or filters to be monitored with a watermark value. You can configure the resource-monitoring capability on MX80, MX104, MX240, MX480, MX960, MX2010, and MX2020 routers with I-chip-based DPCs and Trio-based FPCs.

Options

number Percentage of free memory space used for firewall and filters to be monitored with a watermark value. When the configured watermark is exceeded, error logs are triggered. The default watermark values for the percentage of free ukernel or heap memory, next-hop memory, and firewall filter memory are 20.

- **Range:** 1 through 100

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

- Syntax | 2025
- Hierarchy Level | 2025
- Description | 2025
- Options | 2025
- Required Privilege Level | 2026
- Release Information | 2026

Syntax

```
global-threshold number;
```

Hierarchy Level

```
[edit chassis cluster redundancy-groupgroup-number ip-monitoring ]
```

Description

Define global threshold for IP monitoring. This is the number that needs to be met or exceeded by all of the cumulative weights of the monitored IP addresses to trigger a failover.

When a monitored address is marked as unreachable, the weight value associated with that address is deducted from the the redundancy group IP address monitoring global threshold. If the accumulated monitored address weight values surpass the global-threshold value, that is, when the global threshold reaches 0, the global weight is deducted from the redundancy group threshold. Every redundancy group has a default threshold of 255. If the threshold reaches 0, a failover is triggered

Options

number—Value at which the IP monitoring weight is applied against the redundancy group failover threshold.

- **Range:** 0 through 255
- **Default:** 255

Required Privilege Level

interface—To view this statement in the configuration.

- Syntax | **2026**
- Hierarchy Level | **2027**
- Description | **2027**
- Options | **2027**
- Required Privilege Level | **2027**
- Release Information | **2027**

Syntax

```
global-weight number;
```

Hierarchy Level

```
[edit chassis cluster redundancy-groupgroup-numberip-monitoring]
```

Description

Define global weight for IP monitoring. This is the weight that is subtracted from the redundancy group weight for all of the hosts being monitored. This number specifies the relative importance of IP address monitored objects in the operation of the redundancy group.

Every monitored IP address is assigned a weight. If the monitored address becomes unreachable, the weight of the object is deducted from the global-threshold of IP monitoring objects in its redundancy group. When the global-threshold reaches 0, the global-weight is deducted from the redundancy group. Every redundancy group has a default threshold of 255. If the threshold reaches 0, a failover is triggered. Failover is triggered even if the redundancy group is in manual failover mode and preemption is not enabled.

Options

number —Combined weight assigned to all monitored IP addresses. A higher weight value indicates a greater importance.

- **Range:** 0 through 255
- **Default:** 255

Required Privilege Level

interface—To view this statement in the configuration.

group (Configuring Group Name)

IN THIS SECTION

- Syntax | 2028
- Hierarchy Level | 2028
- Description | 2028
- Options | 2029
- Required Privilege Level | 2029
- Release Information | 2029

Syntax

```
group group-name {
    (default-context-prefix | context-prefix context-prefiix){
        security-model (any | usm | v1 | v2c) {
            security-level (authentication | none | privacy) {
                notify-view view-name;
                read-view view-name;
                write-view view-name;
            }
        }
    }
}
```

Hierarchy Level

```
[edit snmp v3 vacm access]
```

Description

Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The `default-context-prefix` statement, when included, adds all the contexts configured on the device to the

group, whereas the `context-prefix context-prefix` statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series and OCX Series.) When the context prefix is specified as default (for example, `context-prefix default`), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as `logical system/routing instance`. For example, to specify routing instance ri1 in logical system ls1, include `context-prefix ls1/ri1`.

The remaining statements under this hierarchy are explained separately.

Options

group-name—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

- Required Privilege Level | 2032
- Release Information | 2032

Syntax

```
grpc-replay <last minute|facility facility|priority priority>
```

Hierarchy Level

```
[edit system syslog]
```

Description

Configure this configuration statement to replay the events.

Options

- `last` *minute*–Use this configuration to replay the events. Specify the time in minutes. Once you configure this configuration statement, eventd starts storing the syslog events. Eventd streams upto one million events. Once the replaying of the old data is over, eventd starts streaming the live events. While eventd is replaying the old data as initial sync and any live event takes place, the system immediately streams the live event.
- `facility` *facility*–Use this option to filter the events as per facility. You can use this option to filter the live and replay events. This configuration has no relationship with the existing syslog configuration

for writing and sending events to file and remote host. Choose facility from the available options under this configuration.

- `priority` *priority*–Use this configuration to filter the events as per priority. You can use this configuration to filter the live and replay events. This configuration has no relationship with the existing syslog configuration for writing and sending events to file and remote host. Choose the priority from the available options under this configuration.

The remaining statements are explained separately. See CLI Explorer.

- Release Information | 2035

Syntax

```
hardware-assisted-timestamping;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
```

Description

For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.

By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.

Required Privilege Level

interface—To view this statement in the configuration.

Syntax

```
hardware-assisted-keepalives [enable | disable];
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
```

Description

For Ethernet interfaces on Modular Port Concentrators (MPCs) in MX Series routers only, delegate the transmission of the continuity check messages (CCMs) to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as Inline-KA.

By default, CCMs are transmitted by the CPU of the MPC and not by the hardware. If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, we recommend that you enable delegation of the transmission of CCMs to the hardware. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.

NOTE: Starting in Junos OS Release 16.1R1, the inline support for 1s interval is supported on MPC1 to MPC7 (except MPC3 and MPC4) line cards.

Default

Inline transmission is disabled by default.

Options

enable Enable inline transmission of CCMs.

NOTE: Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the `deactivate` command and then reactivate the CFM session using the `activate` command.

disable Disable inline transmission of CCMs.

NOTE: After disabling inline transmission of CCMs, you must reboot the router for the changes to take effect.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Description | 2042
- Options | 2042
- Required Privilege Level | 2043
- Release Information | 2043

Syntax

```
health-monitor {
    ifstate-clients {
        (peer-stuck | non-peer-stuck | all-clients-stuck);
    }
    threshold-level {
        (low | medium | high);
    }
    action {
        (alarm | alarm-with-cores | restart);
    }
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure the kernel health monitoring system (KHMS). The KHMS is used to detect and take action on stuck ifstate clients. Stuck ifstate clients can affect system performance. With this configuration statement you can configure a time interval in which the system can detect a stuck ifstate client. You also can configure the action the system takes when it finds a stuck ifstate client.

The ifstate clients receive states from the kernel. There are two kinds of ifstate clients:

- non-peer clients (for example, some daemons, or processes, on the Routing Engine)—ifstate non-peer clients open connections between programs and read states from or write states to the kernel.
- peer clients (for example, FPCs)—ifstate peer clients read peer messages and send updates to the peers.

An ifstate client is stuck if the kernel sends a message and the ifstate client does not send back an ACK. A rt_pfe_veto condition is a log message that indicates that states are sent but no ACK comes back. However, the system won't take the configured action until the configured time interval times outs, in case the ACK comes late.

Options

ifstate-clients Configure which ifstate clients you want to monitor and manage. There are three options:

- `peer-stuck`—Monitor and manage stuck peers.
- `non-peer-stuck`—Monitor and manage stuck processes.
- `all-clients-stuck`—Monitor and manage both stuck peers and stuck processes.

threshold-level Configure the time interval in which to detect if a given ifstate client is stuck:

- `high`—540 seconds
- `medium`—360 seconds; this is the default.
- `low`—180 seconds

action Configure the action to be taken on the stuck ifstate client once the configured time interval times out.

- `alarm`—Only an alarm will be raised about the stuck ifstate client; this is the default.
- `alarm-with-cores`—An alarm will be raised about the stuck ifstate client after collecting live cores from the primary Routing Engine kernel and the stuck peer.

  CAUTION: In the case of a stuck peer, collecting lives cores might result in the component being restarted or rebooted.

- `restart`—The stuck ifstate client will be disconnected after collecting live cores from the primary Routing Engine kernel and the stuck peer (depending on supportability).

  CAUTION: When choosing this action, be aware of the implications of restarting an ifstate client. For example, some FPCs don't simply restart; they reboot.

high-cos-queue-threshold number;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Configure the class-of-service (CoS) queue threshold by percentage.

NOTE: This feature is only available when you enable subscriber management. For more information on enabling subscriber management, see *Configuring Junos OS Enhanced Subscriber Management*.

This CoS resource monitoring feature bases admission decisions only on queues. Other CoS resources are not part of this criteria. This feature does not support throttling for subscribers arriving on pseudo-wire, logical tunnel, or redundant logical tunnel devices. The feature is supported on the following hardware:

- MX240, MX480, and MX960 routers
- MPC2E legacy, MPC2E-NG, MPC3E-NG, MPC5E, and MPC7E line cards

Options

number High-threshold percentage for CoS queue utilization per scheduler. When CoS queue utilization on a given FPC reaches that FPC's configured threshold level, further subscriber logins on that FPC are not allowed. This resource monitoring mechanism provides adjustable safety margins to

proactively avoid completely exhausting each FPC's available CoS queue resources. Starting in Junos OS Release 19.4R1, you can specify a value of 0, which means that no subscribers are throttled based on CoS queue throttling.

- **Range:** 0 through 90
- **Default:** 100

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name continuity-check]
```

Description

The time to wait in minutes before flushing the maintenance association end point (MEP) database, if no updates occur. The configurable range is 1 minute through 30240 minutes.The default value is 10 minutes.

NOTE: Hold timer based flushing is applicable only for auto discovered remote MEPs and not for statically configured remote MEPs.

Options

minutes—Time to wait, in minutes.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

host (Security Log)

IN THIS SECTION

- Syntax | 2053
- Hierarchy Level | 2054
- Description | 2054
- Options | 2054
- Required Privilege Level | 2054
- Release Information | 2054

Syntax

```
host {
    ip-address;
    port port-number;
}
```

Hierarchy Level

```
[edit security log stream stream-name]
[edit logical-systems name security log stream stream-name]
[edit tenants tenant-name security log stream stream-name]
```

Description

You can specify the IP address of the server to which the security logs are streamed.

The [edit `logical-systems` *name* security log stream *stream-name*] hierarchy level introduced in Junos OS Release 18.2R1.

The [edit `tenants` *tenant-name* security log stream *stream-name*] hierarchy levels introduced in Junos OS Release 18.3R1.

Options

- *ip-address*—Specify IP address of the host.
- `port` *port-number*—Specify host port number.
- **Default:** The default destination port is the system log port. For UDP or TCP, the default port is 514. For TLS, the default port is 6514.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

    port;
    source-address source-address
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name system syslog],
[edit system syslog]
```

Description

Configure the logging of system messages to a remote destination.

Options

facility—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements. For a list of the facilities, see "Junos OS System Logging Facilities" on page 1459.

hostname—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a `host` statement for each one.

`other-routing-engine`—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

NOTE: The `other-routing-engine` option is not applicable to the QFX Series and OCX Series.

`port`—Port number of the remote syslog server that can be modified.

`scc-master`—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

severity—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities of the specified level and higher are logged. For a list of the severities, see "System Log Message Severity Levels" on page 1459.

`sfc0-master`—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

inet (Port Mirroring)

IN THIS SECTION

- Syntax | 2063
- Hierarchy Level | 2064
- Description | 2064
- Required Privilege Level | 2064
- Release Information | 2064

Syntax

```
inet {
output {
    ip-addressaddress {
    }
    routing-instance instance-name {
        ip-address address {
    }
}
```

Hierarchy Level

```
[edit forwarding-options port-mirroring [instance name] family]
```

Description

Specify that the output interface will be of type `inet`. Use this statement so that you can send the mirrored packets to the IP address of the device running an analyzer application. The device can be on a remote network. When you use this feature, the mirrored packets are GRE-encapsulated. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

NOTE: An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.

NOTE: If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53.

ingress (Analyzer)

IN THIS SECTION

- Syntax | 2065

Syntax

```
ingress;
```

Hierarchy Level

```
[edit vlans  vlan-name vlan-id number interface interface-name]
```

Description

Specify that the member interface of the VLAN allows only ingress traffic.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

input

IN THIS SECTION

- Syntax | 2069
- Hierarchy Level | 2069
- Description | 2070
- Default | 2070
- Required Privilege Level | 2070
- Release Information | 2070

Syntax

```
input {
     ingress {
         interface (all | interface-name);
         vlan (vlan-id | vlan-name);
    }
     egress {
         interface (all | interface-name);
    }
}
```

Hierarchy Level

For platforms without ELS:

```
[edit ethernet-switching-options analyzer name]
```

For platforms with ELS:

```
[edit forwarding-options analyzer name]
```

Description

Define the traffic to be mirrored. The definition can be a combination of traffic entering or exiting specific ports or VLANs.

The remaining statements are explained separately. See CLI Explorer.

Default

No default.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

input (Analyzer)

IN THIS SECTION

- Syntax | 2071
- Hierarchy Level | 2071
- Description | 2071
- Default | 2072
- Required Privilege Level | 2072

- Release Information | 2072

Syntax

```
input {
    egress {
        bridge-domain bridge-domain-name;
        interface (all | interface-name);
        routing-instance {
            instance-name {
                bridge-domain bridge-domain-name;
            }
        }
    }
    ingress {
        bridge-domain bridge-domain-name;
        interface  (all | interface-name);
        routing-instance {
            instance-name {
                bridge-domain bridge-domain-name;
            }
            vlan (vlan-id | vlan-name);
        }
        vlan (vlan-id | vlan-name);
    }
    maximum-packet-length bytes;
    rate number;
}
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name]
```

Description

Define the traffic to be mirrored in a mirroring configuration—the definition can be a combination of:

- Packets entering or exiting a port
- Packets entering or exiting a VLAN
- Packets entering or exiting a bridge domain

The remaining statements are explained separately. See CLI Explorer.

Native analyzer sessions (that is, the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers) can be configured without specifying input parameters, which would mean that the instance uses default input values: rate = 1 and maximum-packet-length = 0.

Default

No default.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

- Syntax | 2074
- Hierarchy Level | 2075
- Description | 2075
- Options | 2075
- Required Privilege Level | 2077
- Release Information | 2077

Syntax

```
inputs {
    analytics {
        parameters {
            generate-tags value;
            sample-frequency value;
            sensors path;
        }
    }
    input-ipfix {
        parameters {
            maximum-connections number;
            tcp-port port-number;
            vrf-name name;
        }
    }
    input-jti-ipfix {
        parameters {
            record-group group-name {
                record ipfix-record-name;
```

```
                reporting-interval seconds;
            }
        }
    }
}
```

Hierarchy Level

```
[edit services analytics agent service-agents agent-name]
```

Description

Configure parameters for a Network Telemetry Framework (NTF) service agent input plug-in. For each service agent instance, you can configure more than one input plug-in to push data to the output plug-in.

NOTE: When you modify the input plug-in configuration of a service agent instance, the associated service agent daemon is restarted.

Options

analytics parameters Configure parameters to collect data from Junos Telemetry Interface (JTI) sensors.

generate-tags *value* (Optional) Enable tag generation.

- **Default:** Enabled

sample-frequency *value* Specify the frequency interval (in seconds) at which the JTI sensor generates data to export to the data collector. Range is from 0 to 24 hours.

- **Default:** 5 seconds

sensors *file-path* Specify the resource string associated with the JTI sensor for collecting JTI data from a specific resource. The format is a file path and must be entered exactly. For a list of available JTI resource string options, see the sensor configuration statement and Guidelines for gRPC and gNMI Sensors (Junos Telemetry Interface) documentation.

input-ipfix parameters Configure parameters for the IPFIX mediation service agent to gather and consolidate IPFIX records from downstream devices.

> **NOTE**: Any change you make to an existing `input-ipfix` plug-in configuration restarts the IPFIX service agent daemon to apply the changes.

> **NOTE**: Although each of the parameters has a default value, you must configure at least one of the parameters to enable the plug-in. If you configure only one parameter and want to use the default value, you must specify that value.

maximum-connections *number*

(Optional) Maximum number of TCP connections that the IPFIX mediator can support.

- **Range:** 1 through 500
- **Default:** 100

tcp-port *port-number*

(Optional) TCP port on the IPFIX mediator that receives TCP packets; the listening port.

- **Default:** 4739

vrf-name *name*

(Optional) Name of the VRF (routing instance) in which IPFIX packets are accepted.

- **Default:** default

input-jti-ipfix parameters

Configure parameters for the IPFIX mediation service agent to collect and report local sensor data from the BNG configured as an IPFIX mediator. For each group of records, the plug-in subscribes to the specific sensor data sets associated with each record.

When you remove a record group from the configuration, the sensor sets for the member records are unsubscribed. The template IDs for the associated IPFIX records are returned to the pool for re-use.

record *ipfix-record-name*

One of the following individual IPFIX records associated with a nonconfigurable set of local sensor data. See *Telemetry Data Collection on the IPFIX Mediator for Export to an IPFIX Collector* for the sensors collected by each record.

address-pool-utilization	port-statistics

chassis-inventory	resource-utilization
chassis-power	subscriber-statistics
dhcpv4-server-stats	thermal
interface-metadata	uptime
interface-queue-statistics	

BEST PRACTICE: We recommend that you configure the `interface-metadata` record whenever you configure the `interface-queue-statistics` record. The metadata information is essential for understanding details about the subscriber whose queue statistics are being collected.

record-group *group-name*

Name of a group of IPFIX records that subscribes to the sensor data sets associated with the individual records that comprise the record group. You can configure a maximum of 10 record groups.

reporting-interval *seconds*

(Optional) Interval in seconds between reports for the subscribed sensor data. The interval applies to all records (and all sensor sets) in the record group.

- **Range:** 60 through 86,400 seconds
- **Default:** 900 seconds

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 18.3R1.

`input-jti-ipfix` option added in Junos OS Release 18.4R1 on MX Series routers.

`analytics` option added in Junos OS Release 18.4R1 on MX Series and PTX Series routers.

```

Syntax: QFX Series Switches, EX4600 and NFX Series Devices

```
instance instance-name{
    family
        ethernet-switching {
            output {
                interface interface-name {
                }
                no-filter-check;
                }
                vlan vlan-name {
                    no-tag;
                }
            }
        inet
            output {
                ip-address address {
                }
                routing-instance instance-name {
                    ip-address address {
                }
            }
        }
    }
```

Hierarchy Level

```
[edit forwarding-options port-mirroring]
```

Description

Specify a port-mirroring configuration (instance). You do not specify an input for this instance. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This is useful for controlling which types of traffic should be mirrored.

The remaining statements are explained separately. See CLI Explorer.

Usage Guidelines

See *Configuring Sampling Instance on MX, M and T Series Routers or QFX Series Switches*.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

- Description | **2084**
- Options | **2084**
- Required Privilege Level | **2084**
- Release Information | **2084**

Syntax

```
interface (all | interface-name);
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name input egress],
[edit forwarding-options analyzer  analyzer-name input ingress],
[edit forwarding-options analyzer  analyzer-name output]
```

Description

Configure the interfaces for which traffic is mirrored.

Options

all	Apply mirroring to all interfaces on the network device. Mirroring a high volume of traffic can be performance intensive for the device. Therefore, you should generally select specific input interfaces in preference to using the `all` keyword, or use the `all` keyword in combination with setting a ratio for statistical sampling. The `all` keyword is not available for the `[edit forwarding-options analyzer analyzer-name output]` hierarchy level.
interface-name	Apply mirroring to the specified interface only.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10.

- Syntax | 2085
- Hierarchy Level | 2085
- Description | 2086
- Options | 2086
- Required Privilege Level | 2086
- Release Information | 2086

Syntax

```
interface {
    information;
    statistics {
        queue;
        traffic;
    }
    status {
        link;
        queue;
        traffic;
    }
}
```

Hierarchy Level

```
[edit services analytics export-profiles]
```

Description

Configure an export profile for streaming network analytics data for a specific interface to remote servers. Each profile is a template that defines the type of data being streamed for that interface.

NOTE: The `interface` statement is not available in Junos OS Releases prior to 13.2X51-D15.

Options

information Information about the specified interface, including SNMP index, interface index, slot, port number, media type, capability, and port type.

statistics Type of monitoring statistics to be streamed.

- Values:
  - **queue**
  - **traffic**

status Status information about the interface to be streamed.

- Values:
  - **link**
  - **queue**
  - **traffic**

Required Privilege Level

interface (IEEE 802.1ag OAM Connectivity-Fault Management)

IN THIS SECTION

- Syntax | 2087
- Hierarchy Level | 2087
- Description | 2087
- Options | 2088
- Required Privilege Level | 2088
- Release Information | 2088

Syntax

```
interface (interface-name | ((ge- | xe-) (fpc/pic/port | fpc/pic/port.unit-number | fpc/pic/
port.unit-number vlan vlan-id)));
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name mep mep-id]
```

Description

For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.1ag Operation, Administration, and Management (OAM) support.

For Gigabit Ethernet interfaces and 10-Gigabit Ethernet interfaces on MX Series routers, configure IEEE 802.1ag Connectivity Fault Management (CFM) support on trunk interface ports.

Starting in Junos OS 17.4R1, you can enable support for IEEE 802.1ag CFM on pseudowire service interfaces by configuring maintenance intermediate points (MIPs) on the pseudowire service interfaces.

NOTE: The CFM MIP session is supported only on the pseudowire services interface and not on the pseudowire services tunnel interface.

Options

`interface-name`—Interface to which the MEP is attached. It could be a physical Ethernet interface, logical Ethernet interface, pseudowire services interfaces, or on a specific VLAN of a trunk port interface (MX Series only).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

interface (Next-Hop Group)

IN THIS SECTION

- Syntax | 2089
- Hierarchy Level | 2089
- Description | 2089
- Options | 2089

Required Privilege Level | 2089
Release Information | 2089

Syntax

```
interface interface-name {
    next-hop address;
}
```

Hierarchy Level

```
[edit forwarding-options next-hop-group group-name]
```

Description

Specify the output interface for sending copies of packets elsewhere to be analyzed.

The commit operation fails when a next-hop group has only one interface configured. It is implicitly assumed that a subgroup is up only if more than one interface in the subgroup is up.

Options

interface-name—Name of the interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Description

Configure CFM to propagate the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages when the interface is down. When the status of the EVPN provider edge device is standby, the EVPN VPWS service is notified and it sets the interface status to CCC-down. When the interface status is CCC-down, it indicates that the provider edge service is down. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down.

Usually, when the interface goes down, CFM propagates the status of the provider edge device via the interface status TLV. If the customer edge device does not support the interface status TLV, you can use the RDI bit to propagate the status of the provider edge device.

Required Privilege Level

routing—To view this statement in the configuration.

        traffic-statistics;
        no-traffic-statistics;
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure physical interfaces for monitoring traffic and queue statistics by the network analytics processes running on the Packet Forwarding Engine and Routing Engine. You may specify one interface or all interfaces in your configuration.

NOTE: The configuration for a specific interface supersedes the global configuration for all interfaces. You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

NOTE: Disabling the queue or traffic monitoring (using the `no-queue-statistics` or `no-traffic-statistics` configuration statements) supersedes the configuration (enabling) of the feature.

Options

all — Configure all interfaces on the device for high-frequency monitoring.

interface-name — Name of the interface to configure for high-frequency monitoring.

no-queue-statistics — Disable the collection of queue statistics.

NOTE: The `no-queue-statistics` statement supersedes the `queue-statistics` statement.

no-traffic-statistics — Disable the collection of traffic statistics.

NOTE: The `no-traffic-statistics` statement supersedes the `traffic-statistics` statement.

queue-statistics — Enable the collection of queue statistics for a specific interface or all interfaces.

traffic-statistics Enable the collection of traffic statistics for a specific interface or all interfaces.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Syntax

```
interval (100ms | 10m | 10ms | 10s | 1m | 1s| 3.3ms);
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name continuity-check]
```

Description

Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the `loss-threshold` statement determines how many CCMs can be lost before the sending MEP is marked as down. The `hold-interval` statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.

NOTE: When the continuity-check interval is set to 3.3ms, the actual interval is 4ms (250 pps).

During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the `hardware-assisted-keepalives` statement, and configure the interval between CCMs to be 1 second with `interval` statement.

NOTE: For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the `no-delegate-processing` statement at the `[edit routing-options ppm]` hierarchy level.

NOTE: A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).

Options

`100ms`—100 milliseconds.

10m—10 minutes.

10ms—10 milliseconds.

10s—10 seconds.

1m—1 minute.

1s—1 second.

3.3ms—3.3 milliseconds.

ip-monitoring

IN THIS SECTION

- Syntax | 2121
- Hierarchy Level | 2122
- Description | 2122
- Options | 2122
- Required Privilege Level | 2123
- Release Information | 2123

Syntax

```
ip-monitoring {
    family {
        inet {
            ipv4-address {
                interface {
                    logical-interface-name;
                    secondary-ip-address ip-address;
                }
                weight number;
```

```
            }
        }
    }
    global-threshold number;
    global-weight number;
    retry-count number;
    retry-interval seconds;
}
```

Hierarchy Level

```
[edit chassis cluster redundancy-group group-number]
```

Description

Specify a global IP address monitoring threshold and weight, and the interval between pings (`retry-interval`) and the number of consecutive ping failures (`retry-count`) permitted before an IP address is considered unreachable for all IP addresses monitored by the redundancy group. Also specify IP addresses, a monitoring weight, a redundant Ethernet interface number, and a secondary IP monitoring ping source for each IP address, for the redundancy group to monitor.

Options

IPv4 address The address to be continually monitored for reachability. You also set up a secondary IP address to allow testing from the secondary node.

> **NOTE**: All monitored object failures, including IP monitoring, are deducted from the redundancy group threshold priority. Other monitored objects include interface monitor, SPU monitor, cold-sync monitor, and NPC monitor (on supported platforms).

interface *interface* secondary-ip-address *ip-address*; Define source address for monitoring packets on secondary link.

global-threshold Define global threshold for IP monitoring. See *global-threshold*.

- **Default:** `0`

- **Range:** 0-255

global-weight Define global weight for IP monitoring. See *global-weight*.

- **Default:** 255
- **Range:** 0-255

retry-count Number of retries needed to declare reachablity failure. See *retry-count (Chassis Cluster)*.

- **Default:** 5
- **Range:** 5-15

retry-interval Define the time interval in seconds between retries. See *retry-interval (Chassis Cluster)*.

- **Default:** 1
- **Range:** 1-30

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement updated in Junos OS Release 10.1.

        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure IP monitoring.

Options

withdraw—Remove the primary routes when RPM fails to probe the destination. So, the traffic can choose other routes in the route table. If no other route exists, then the traffic is dropped. When you run the `show services ip-monitoring status` command, in the output, the status of the route `WITHDRAWED` indicates that this route is removed. See "show services ip-monitoring status" on page 3039 for more details.

`direct-next-hop`-This configuration requests the next hop, which must be direct. This configuration ignores the other kind of hops.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Support added for the `discard` option starting from Junos OS Release 15.1X49-D60.

Support added for the `withdraw` option starting from Junos OS Release 20.3R1.

`direct-next-hop` is introduced in Junos OS Release 20.4R1.

latency-threshold

IN THIS SECTION

- Syntax | 2129
- Hierarchy Level | 2129
- Description | 2129
- Options | 2130
- Required Privilege Level | 2130
- Release Information | 2130

Syntax

```
latency-threshold {
    high number;
    low number;
}
```

Hierarchy Level

```
[edit services analytics interfaces]
[edit services analytics resource-profiles]
```

Description

If network analytics queue statistics monitoring is enabled, specify the high and low values (in microseconds) of the latency threshold of the queue. If you configure a latency threshold, you cannot configure the depth threshold. You can configure the latency threshold for one interface or all interfaces. Specify the high and low latency threshold numbers:

NOTE: The configuration for a specific interface supersedes the global configuration for all interfaces.

Options

high *number*

Specify the maximum value for the latency threshold.

- Range:
  - Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds (0.001 to 100,000 microseconds)
  - Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds
- Default:
  - Junos OS Release 13.2X51-D15 or later—1,000,000 nanoseconds (1000 microseconds or 1 millisecond)
  - Junos OS Release 13.2X51-D10—1000 microseconds
  - Junos OS Release 13.2X50-D15—900 microseconds

low *number*

Specify the minimum value for the latency threshold.

- Range:
  - Junos OS Release 13.2X51-D15 or later—1 to 100,000,000 nanoseconds
  - Junos OS Release 13.2X51-D10 or earlier—1 to 100,000 microseconds
- Default:
  - Junos OS Release 13.2X51-D15 or later—100 nanoseconds (0.1 microseconds)
  - Junos OS Release 13.2X51-D10—50 microseconds
  - Junos OS Release 13.2X50-D15—300 microseconds

Description

Configure the uplink interfaces to be monitored for uplink failure detection. The switch can monitor a maximum of 48 uplink interfaces in a group.

An interface can be configured as link-to-monitor in multiple groups.

Options

interface-name Name of the uplink interface or interface range in the group. The interface can be a physical interface or a logical interface.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

    }
    utc-timestamp;
}
```

Hierarchy Level

```
[edit security]
[edit logical-systems name security]
[edit tenants tenant-name security]
```

Description

Configure security log. Set the mode of logging (event for traditional system logging or stream for streaming security logs through a revenue port to a server). You can also specify all the other parameters for security logging.

Options

cache Cache security log events in the audit log buffer.

disable Disable the security logging for the device.

escape Escapes the stream log forwarding to avoid parsing errors. Stream mode supports escape in `sd-syslog` and `binary` format. Event mode supports escape only in `binary` format.

time-format Specify the year, the millisecond, or both in the timestamp.

event-rate *rate* Limit the rate at which logs are streamed per second.

- **Range:** 0 through 1500
- **Default:** 1500

facility-override Alternate facility for logging to remote host.

file Specify the security log file options for logs in binary format.

- Values:
  - *max-file-number*—Maximum number of binary log files.
    - The range is 2 through 10 and the default value is 10.
  - *file-name*—Name of binary log file.
  - *binary-log-file-path*—Path to binary log files.
  - *maximum-file-size*—Maximum size of binary log file in megabytes.
    - The range is 1 through 10 and the default value is 10.

format Set the security log format for the device.

max-database-record The following are the disk usage range limits for the database:

- Range:
  - SRX1500, SRX4100, and SRX4200: 0 through 15,000,000
  - vSRX: 0 through 1,000,000
- Default:
  - SRX1500, SRX4100, and SRX4200: 15,000,000
  - vSRX: 1,000,000

  Be sure there is enough free space in `/var/log/hostlogs/`, otherwise logs might be dropped when written into the database.

mode — Control how security logs are processed and exported.

rate-cap *rate-cap-value* — Work with event mode only. This option limits the rate at which data plane logs are generated per second.

- **Range:** 0 through 5000 logs per second
- **Default:** 5000 logs per second

root-streaming — Allows the user logical systems to generate the logs using the root logical system's stream configuration.

source-address *source-address* — Specify a source IP address or IP address used when exporting security logs, which is mandatory to configure *stream host*.

source-interface *interface-name* — Specify a source interface name, which is mandatory to configure *stream host*.

The `source-address` and `source-interface` are alternate values. Using one of the options is mandatory.

stream — Every stream can configure file or host.

traceoptions — Specify security log daemon trace options.

transport — Set security log transport settings.

utc-timestamp — Specify to use UTC time for security log timestamps.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

The [edit `logical-systems` *name* security] and [edit `tenants` *tenant-name* security] hierarchy levels introduced in Junos OS Release 19.1R1.

`escape` option added in Junos OS Release 20.2R1.

`root-streaming` option added in Junos OS Release 20.3R1.

log (Services)

IN THIS SECTION

- Syntax | **2157**
- Hierarchy Level | **2158**
- Description | **2158**
- Options | **2158**
- Required Privilege Level | **2158**
- Release Information | **2159**

Syntax

```
log {
    all;
    errors;
    info;
    sessions-allowed;
    sessions-dropped;
```

```
    sessions-ignored;
    sessions-whitelisted;
    warning;
}
```

Hierarchy Level

```
[edit services ssl proxy profile profile-name actions]
```

Description

Specify the logging actions. When configuring SSL proxy, you can choose to set the option to receive some or all of the logs.

SSL proxy logs contain the logical system name, SSL proxy allowlists, policy information, SSL proxy information, and other information that helps you troubleshoot when there is an error.

You can configure logging of all or specific events, such as error, warning, and information events. You can also configure logging of sessions that are allowlisted, dropped, ignored, or allowed after an error occurs.

Options

- `all`—Log all events.
- `errors`—Log all error events.
- `info`—Log all information events.
- `sessions-allowed`—Log SSL session allowed events after an error.
- `sessions-dropped`—Log only SSL session dropped events.
- `sessions-ignored`—Log session ignored events.
- `sessions-whitelisted`—Log SSL session allowlisted events.
- `warning`—Log all warning events.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

log-and-generate-ais

IN THIS SECTION

- Syntax | **2159**
- Hierarchy Level | **2160**
- Description | **2160**
- Options | **2160**
- Required Privilege Level | **2160**
- Release Information | **2160**

Syntax

```
log-and-generate-ais {
    interval (1m | 1s);
    level level;
    priority level;
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management action-profile action-profile-name
action]
```

Description

Configure the action be taken when an AIS alarm is detected. The action includes generating and logging the AIS statistics along with the interval between AIS messages, the server maintenance domain level, and the priority of the AIS message.

Options

The other statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Syntax

```
log-rotate-frequency frequency;
```

Hierarchy Level

```
[set system syslog]
```

Description

Configure the system log file rotation frequency by configuring the time interval for checking the log file size.

When the log file size has exceeded the configured limit, the old log file is archived and a new log file is created.

Options

frequency Frequency of rotation of the system log file.

- **Range:** 1 minute through 59 minutes
- **Default:** 15 minutes

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

        source-address address;
    }
}
```

Hierarchy Level

```
[edit snmp community community-name],
[edit snmp trap-group],
[edit snmp trap-options]
[edit snmp v3target-address target-address-name]
```

Description

Specify a logical system name for SNMP v1 and v2c clients.

Include at the `[edit snmp trap-options]` hierarchy level to specify a logical-system address as the source address of an SNMP trap.

Include at the `[edit snmp v3 target-address]` hierarchy level to specify a logical-system name as the destination address for an SNMPv3 trap or inform.

Options

logical-system-name–Name of the logical system.

`routing-instance` *routing-instance-name*–Statement to specify a routing instance associated with the logical system.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3

> **NOTE**: The `logical-system` statement replaces the `logical-router` statement, and is backward-compatible with Junos OS Release 8.3 and later.

- Required Privilege Level | 2169
- Release Information | 2169

Syntax

```
lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect | rem-err-xcon |
xcon)
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name mep mep-id]
```

Description

Specify the lowest priority defect that is allowed to generate a Fault Alarm whenever CFM detects a defect. This configuration is done at the MEP level.

Options

Specify one of the following lowest priority defect options:

all-defects	Allows all defects.
err-xcon	Allows only erroneous CCM and cross-connect CCM defects.
mac-rem-err-xcon	Allows only MAC, not receiving CCM, erroneous CCM, and cross-connect defects.
no-defect	Allows no defects.
rem-err-xcon	Allows only not receiving CCM, erroneous CCM, and cross-connect CCM defects.

`xcon`	Allows only cross-connect CCM defects.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

ip-address (Port Mirroring)

IN THIS SECTION

- Syntax | **2169**
- Hierarchy Level | **2170**
- Description | **2170**
- Required Privilege Level | **2170**
- Release Information | **2170**

Syntax

```
ip-address ip-address;
```

Hierarchy Level

```
[edit forwarding-options] analyzer name output]
[edit forwarding-options port-mirroring [instance name] family ethernet-switching output interface
name]
```

Description

Specify the IP address to which traffic should be mirrored (the IP address of the analyzer system). The device can be on a remote network. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.) This statement is not supported on QFabric systems.

NOTE: An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.

NOTE: If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
```

Description

Configure the name of the maintenance domain in IEEE-compliant format.

NOTE: For MX Series Routers, you can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance association name to monitor services provided on Virtual Private LAN Service (VPLS), bridge, circuit cross-connect (CCC), and IPv4 domains.

Options

domain-name—Name of the maintenance domain.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support for multiple down MEP introduced in Junos OS Release 15.1R1 for MX Series Routers.

major-event (System)

IN THIS SECTION

- Syntax | 2175
- Hierarchy Level | 2175
- Description | 2176
- Options | 2176
- Required Privilege Level | 2176
- Release Information | 2176

Syntax

```
major-event {
    threshold swap-usage value ;
    action [snmp-trap | live-vmcore];
}
```

Hierarchy Level

```
[edit system monitor memory system]
```

Description

Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic. At the system level you can monitor the overall free pages (cache and free pages), kernel memory allocations and compare them with threshold values. You can also monitor the swap usage and specify the threshold for swap space usage. Most devices have a swap partition that you can configure to provide additional transient memory. Ideally, the swap partition is used only under exceptional circumstances. In current dynamic systems, you can sporadically use the swap partition as long as the usage is not high or persistent. For instance, you could categorise a major event as one where the swap usage is greater than 50%. If the threshold value is crossed, then you can raise an SNMP trap or display a list of system core files created when the system failed which can be used to debug the issue.

You can only configure swap usage threshold for memory monitoring. If you do not configure the swap usage threshold, memory monitoring for swap usage is based on the default threshold. Memory monitoring for other features is based on the default threshold.

Options

threshold Specifies the process threshold level for a major event. You must specify the process name and the memory limit for the process.

swap-usage Specifies the swap usage in percentage.

action Specifies the action to be performed when the threshold is crossed. You can either

major-event (Process)

IN THIS SECTION

- Syntax | 2177
- Hierarchy Level | 2177
- Description | 2177
- Options | 2178
- Required Privilege Level | 2178
- Release Information | 2178

Syntax

```
major-event {
    threshold process name memory-limit value ;
    action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
}
```

Hierarchy Level

```
[edit system monitor memory process]
```

Description

Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic. You can specify the process threshold value for specific processes and their memory limit. When the threshold is crossed, you can configure the action to be performed. For instance, you can specify the threshold for the `rpd` process and the memory limit for that process which you would classify as a a major event.

Options

threshold Specifies the process threshold level for a major event. You must specify the process name and the memory limit for the process.

memory Specifies the permissible memory limit for the process after which the major event is triggered.

action Specifies the action to be performed when the threshold is crossed. For major events, you can raise an SNMP trap or terminate the process. You can also display a list of system core files created when the system failed which you can use to debug the issue.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

match

IN THIS SECTION

- Syntax | 2179
- Hierarchy Level | 2179
- Description | 2179
- Options | 2179

Required Privilege Level | 2180
Release Information | 2180

Syntax

```
match "regular-expression";
```

Hierarchy Level

```
[edit logical-systems logical-system-name system syslog file filename],
[edit logical-systems logical-system-name system syslog user (username | *)],
[edit system syslog file filename],
[edit system syslog host hostname | other-routing-engine| scc-master)],
[edit system syslog user (username | *)]
```

Description

Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.

If you configure both the `match` and `match-strings` statements for the same destination, Junos OS evaluates the `match-strings` condition first, and if the condition is satisfied, then the message is logged and the `match` condition is not evaluated. If the condition in the `match-strings` statement is not satisfied, then the system evaluates the regular expression in the `match` configuration statement.

Options

regular-expression Regular expression against which to match messages to log.

The regular expressions must use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions and must not contain a slash (/) or a percent sign (%).

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

match-strings | 2180

match-strings

IN THIS SECTION

- Syntax | 2180
- Hierarchy Level | 2181
- Description | 2181
- Options | 2181
- Required Privilege Level | 2181
- Release Information | 2181

Syntax

```
match-strings string;
```

```
match-strings [string1 string2];
```

Hierarchy Level

```
[edit system syslog file filename],
[edit system syslog host hostname],
[edit system syslog user username]
```

Description

Specify a text substring that must appear in a message that is logged to a destination. If multiple strings are configured, the message is logged to the given destination if any of the substrings are matched.

The `match-strings` statement performs a simple string comparison, and as a result, it is less CPU-intensive than using the `match` statement to match against complex regular expressions. If you configure both the `match` and `match-strings` statements for the same destination, Junos OS evaluates the `match-strings` condition first; if the message includes any of the configured substrings, then the message is logged and the `match` condition is not evaluated. If the `match-strings` condition is not satisfied, then the system evaluates the message against the regular expression in the `match` configuration statement.

Options

string String or list of strings against which to match messages to log.

- **Range:** 1 through 50 strings
- **Range:** 1 through 1020 characters per string

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

maximum-packet-length

IN THIS SECTION

- Syntax | 2183
- Hierarchy Level | 2183
- Description | 2184
- Options | 2184
- Required Privilege Level | 2184
- Release Information | 2184

Syntax

```
maximum-packet-length bytes;
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name input],
[edit forwarding-options port-mirroring input],
[edit forwarding-options port-mirroring instance instance-name input],
[edit forwarding-options sampling input],
[edit forwarding-options sampling instance instance-name input]
```

Description

Set the maximum packet length to be used for port mirroring or traffic sampling. Packets longer than the maximum are truncated. This statement cannot be used with inline flow monitoring (`[edit forwarding-options sampling instance instance-name family (inet | inet6) output inline-jflow]`.

NOTE: For MX Series routers with Modular Port Interface Concentrators (MPCs), when `maximum-packet-length` (clip length) is configured for port-mirrored packets and the mirror-destination interface is a next-hop-group, the clip length is effective only for the first member interface of the next-hop-group. The mirrored packet copy sent to the rest of the interfaces is not clipped.

In addition, native analyzer sessions (that is, the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers) can be configured without specifying input parameters. As such, these instances use the following input values by default: rate = 1, and maximum-packet-length = 0.

Options

bytes—Maximum length (in bytes) of the mirrored packet or the sampled packet.

Set the maximum-packet-length value to zero to disable truncation; that is, to mirror or sample the entire packet. Otherwise, Juniper recommends that you configure the packet length to be equal to, or greater than, the IP header length. For IPv4, set the maximum length to at least 20, and for IPv6, set the maximum length to at least 40.

- **Range:** 0 through 9216. For MX Series routers with MPCs, and for EX9200 switches, the range is 1 through 255 bytes.
- **Default:** 0

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

For MX Series routers except the MX 80, support at the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level was introduced in Junos OS Release 14.1

        }
}
```

Hierarchy Level

```
[edit system monitor]
```

Description

Configure the memory monitoring system on your PTX and MX Series routers. The memory monitoring system on your device monitors anomalies with respect to the memory utilization of Junos applications and overall system in the control plane of your device. Apart from monitoring the system memory, you can also configure the device to monitor the per-process memory footprint as well to help detect possible leaks and take configured action.

Memory can be exhausted when there is over scaling, for instance when you test a high scale on a device that does support the scale because of physical resource limitations. Memory can also be exhausted when there are temporary spikes for example when a new FIB object is added before the older FIB objects are deleted. These temporary spikes are usually transient and resolve after a while. Also, a memory leak in any one of the applications or even in the kernel can lead to memory exhaustion. So, it is necessary that you monitor memory usage across applications and the kernel.

The remaining statements are explained separately.

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name test name]
```

Description

Enable statistical calculation operations to be performed across a configurable number of the most recent samples.

Options

number—Number of samples to be used in calculations.

- **Range:** 0 through 255

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Statement at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

RELATED DOCUMENTATION

mpls (Security Forwarding Options)

IN THIS SECTION

- Syntax | **2205**
- Hierarchy Level | **2205**
- Description | **2205**
- Required Privilege Level | **2205**
- Release Information | **2205**

Syntax

```
mpls {
    mode packet-based;
}
```

Hierarchy Level

```
[edit security forwarding-options family]
```

Description

Enable the forwarding of MPLS traffic. By default, the device drops MPLS traffic.

CAUTION: Because MPLS operates in packet mode, security services are not available.

NOTE: Packet-based processing is not supported on the following SRX Series devices: SRX1500, SRX5600, and SRX5800.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

RELATED DOCUMENTATION

Syntax

```
name-format (character-string | none | dns | mac+2oct);
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name]
```

Description

Specify the format of the maintenance domain name.

Options

`character-string`—The name is an ASCII character string.

`none`—The maintenance domain name is not used.

`dns`—The name is in domain name service (DNS) format. For example: www.juniper.net.

`mac+2oct`—Name is the MAC address plus a two-octet maintenance association identifier. For example: 08:00:22:33:44:55.100.

- **Default:** `character-string`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

- Release Information | 2210

Syntax

```
next-hop next-hop;
```

Hierarchy Level

```
[edit services rpm probe owner test test-name]
```

Description

Specify the next-hop address to which the probe should be sent.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

RELATED DOCUMENTATION

probe

next-hop-group (Analyzer)

IN THIS SECTION

- Syntax | 2211
- Hierarchy Level | 2211
- Description | 2211
- Options | 2211
- Required Privilege Level | 2212
- Release Information | 2212

Syntax

```
next-hop-group next-hop-group-name;
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name ouput]
```

Description

Configure next-hop group through which the port-mirrored traffic is sent.

Options

next-hop-group-name Name of the next-hop group through which the port-mirrored traffic is sent.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

RELATED DOCUMENTATION

next-hop-group (Port Mirroring)

IN THIS SECTION

- Syntax | **2212**
- Hierarchy Level | **2213**
- Description | **2213**
- Options | **2213**
- Required Privilege Level | **2213**
- Release Information | **2213**

Syntax

```
next-hop-group group-name;
```

Hierarchy Level

```
[edit forwarding-options port-mirroring family (inet | vpls) output],
[edit forwarding-options port-mirroring instance instance-name family (inet | vpls) output]
```

Description

Specify the next-hop address for sending copies of packets to an analyzer. This configuration enables multipacket port mirroring on MX Series routers and EX Series switches without the use of a Tunnel PIC.

The commit operation fails when a next-hop group has only one interface configured. It is implicitly assumed that a subgroup is up only if more than one interface in the subgroup is up.

Options

group-name—Name of next-hop group.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

RELATED DOCUMENTATION

no-filter-check

IN THIS SECTION

- Syntax | 2216
- Hierarchy Level | 2216
- Description | 2217
- Required Privilege Level | 2217
- Release Information | 2217

Syntax

```
no-filter-check;
```

Hierarchy Level

```
[edit forwarding-options port-mirroring family (inet | inet6) output]
```

Description

Disable filter checking on the port-mirroring interface.

This statement is required when you send port-mirrored traffic to a Tunnel PIC that has a filter applied to it.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

no-filter-check

IN THIS SECTION

- Syntax | 2217
- Hierarchy Level | 2218
- Description | 2218
- Required Privilege Level | 2218
- Release Information | 2218

Syntax

```
no-filter-check;
```

Hierarchy Level

```
[edit forwarding-options port-mirroring output],
[edit forwarding-options port-mirroring family (inet | inet6 | ccc | vpls) output]
```

Description

Disable filter checking on the port-mirroring interface.

This statement is required when you send port-mirrored traffic to a Tunnel Services PIC that has a filter applied to it.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

no-load-throttle (Resource Monitor)

IN THIS SECTION

- Syntax | **2219**
- Hierarchy Level | **2219**
- Description | **2219**
- Required Privilege Level | **2219**
- Release Information | **2219**

Syntax

```
no-load-throttle;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

The no-load-throttle statement disables line card load-based throttling. Load-based throttling is also disabled when you configure the no-throttle statement.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

no-logging (Resource Monitor)

IN THIS SECTION

- Syntax | **2220**
- Hierarchy Level | **2220**
- Description | **2220**
- Options | **2220**
- Required Privilege Level | **2220**
- Release Information | **2220**

Syntax

```
no-logging;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Disable the generation of error log messages when the utilization of memory resources exceeds the threshold or checkpoint levels. By default, messages are written to /var/log/rsmonlog.

Options

no-logging Disable the generation of error log messages when the utilization of memory resources exceeds the configured level. By default, error logs are recorded when the resource level utilization is exceeded.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

no-tag

IN THIS SECTION

Syntax | 2221

- Hierarchy Level | 2221
- Description | 2221

no-throttle (Resource Monitor)

IN THIS SECTION

- Syntax | 2226
- Hierarchy Level | 2226
- Description | 2226
- Options | 2226
- Required Privilege Level | 2226
- Release Information | 2226

Syntax

```
no-throttle;
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Disable the throttling of subscriber services and sessions when the utilization of memory resources exceeds the threshold levels. For the subscriber service management, sessions are throttled based on line card resources, such as heap, counter memory, expansion memory, and firewall counter memory. If the resource has been used above a certain threshold, the subscribers and services are throttled to prevent the system from being overloaded and resulting in a breakdown. This feature gathers input from each of the line cards and transfers this statistical detail to the Routing Engine process using a well-known internal port. This information is scanned by the daemon on the Routine Engine and using the shared memory space built into the the session database, the existing active subscribers and sessions are throttled. You can configure the resource-monitoring capability on MX240, MX480, MX960, MX2010, and MX2020 routers with I-chip-based DPCs and Trio-based FPCs.

Options

no-throttle Disable the throttling of subscriber services and sessions when the utilization of memory resources exceeds the threshold levels. The throttling capability is enabled by default.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

nonvolatile

IN THIS SECTION

nonpersistent

IN THIS SECTION

- Syntax | 2228
- Hierarchy Level | 2228
- Description | 2229
- Required Privilege Level | 2229
- Release Information | 2229

Syntax

```
nonpersistent;
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Store log files used for accounting data in the **mfs/var/log** directory (located on DRAM) instead of the **cf/var/log** directory (located on the compact flash drive). This feature is useful for minimizing read/write traffic on the router's compact flash drive.

> **NOTE**: If log files for accounting data are stored on DRAM, these files are lost when you reboot the router. Therefore, you should back up these files periodically.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

        }
    }
}
```

Hierarchy Level

```
[edit services analytics agent service-agents agent-name]
```

Description

Configure parameters for the Network Telemetry Framework (NTF) agent output plug-in.

NOTE: When you modify the output plug-in configuration of a service agent instance, the associated service agent daemon is restarted.

Options

file parameters Configure parameters for sending data in a log file to a data collector.

path *pathname* Path for the log file to which to save the data. For example, `path /tmp/example_file.log`

kafka parameters Configure parameters for sending data to a Kafka data collector.

server *ip-address* IP address of the Kafka server.

topic *filename*

Kafka topic name. The naming convention of the topic is *server-name*.jti.*encoding-type*. The encoding type options are `avro`, `json`, or `msgpack`.

encoding *encoding-type*

Encoding type. Options are `avro`, `json`, or `msgpack`.

output-ipfix parameters

Configure parameters for the IPFIX mediation service agent to send the IPFIX records that have been consolidated on the router to the IPFIX collector.

You must configure the IP address of the upstream IPFIX collector. When you optionally configure at least one of the collector certificate options (`collector-ca-certificate`, `collector-certificate`, and `collector-certificate-key`), the IPFIX mediator attempts to use TLS to connect with the collector. Otherwise, the mediator uses a TCP connection.

> **NOTE**: Any change you make to an existing `output-ipfix` output plug-in configuration restarts the IPFIX service agent daemon to apply the changes.

collector-address *ip-address*

IP address of the upstream IPFIX collector.

collector-ca-certificate *file-path*

(Optional) Path for the certificate, provided by a trusted certificate authority (CA), that is used to sign the peer certificate at the peer (IPFIX collector) level. The certificate is expected to be in .pem container format.

collector-certificate *file-path*

(Optional) Path for the client certificate that the server (IPFIX collector) uses to authenticate the client and enable mutual authentication. The fully-qualified domain name (FQDN) of both the client and the server are stored in the certificate's Subject Alternative Name field when the client and server certificates are generated. The certificate is expected to be in .pem container format.

collector-certificate-key *file-path*

(Optional) Private key file that is loaded to decrypt the encrypted message sent from the peer.

collector-connection-retry-interval *seconds*

(Optional) Interval in seconds at which the output plug-in retries connecting to the IPFIX collector.

- **Range:** 1 through 25
- **Default:** 20

collector-tcp-port *port-number*

(Optional) Number of the TCP port used to connect to the IPFIX collector.

- **Default:** 4740

collector-vrf-name *vrf-name*

(Optional) Name of the VRF (routing instance) in which IPFIX packets are routed.

- **Default:** default

Required Privilege Level

system

Description

Specify performance monitoring support for Ethernet frame delay measurement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Configure—To enter configuration mode.

Control—To modify any configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

RELATED DOCUMENTATION

pic-services-logging

IN THIS SECTION

- Syntax | 2268
- Hierarchy Level | 2268
- Description | 2268
- Options | 2269
- Required Privilege Level | 2269
- Release Information | 2269

Syntax

```
pic-services-logging {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Enable PICs to send special logging information to the Routing Engine for archiving on a hard disk.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the PIC services logging process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

policer (CFM Global)

IN THIS SECTION

- Syntax | 2270
- Hierarchy Level | 2270
- Description | 2270
- Options | 2270

Required Privilege Level | 2270
Release Information | 2271

Syntax

```
policer {
    all cfm-policer-name;
    continuity-check cfm-policer-name;
    other cfm-policer-name;
    }
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
```

Description

Specify a policer at the global level to police the CFM traffic belonging to all sessions.

Options

continuity-check *cfm-policer-name*	Police all continuity check packets with the policer specified.
other *cfm-policer-name*	Police all non-continuity check packets with the policer specified.
all *cfm-policer-name*	Police all CFM packets with policer specified. If the `all` option is used, then you cannot specify above two options.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

policer (CFM Session)

IN THIS SECTION

- Syntax | 2271
- Hierarchy Level | 2272
- Description | 2272
- Options | 2272
- Required Privilege Level | 2272
- Release Information | 2272

Syntax

```
policer {
    all cfm-policer-name;
    continuity-check cfm-policer-name;
    other cfm-policer-name;
    }
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain name level number
maintenance-association name]
```

Description

Specify a separate policer to rate-limit packets specific to that session.

Options

- **continuity-check** *cfm-policer-name* — Police continuity check packets belonging to this session.

  other *cfm-policer-name* — Police all non-continuity check packets belonging to this session.

  all *cfm-policer-name* — Police all CFM packets belonging to this session. If the `all` option is used, then you cannot specify the above two options.

Required Privilege Level

[edit snmp v3 usm remote-engine engine-id user username privacy-des]
```

Description

Configure a privacy password for the SNMPv3 user.

Options

privacy-password—Password that a user enters. The password is then converted into a key that is used for encryption.

SNMPv3 has special requirements when you create plain-text passwords on a router or switch:

- The password must be at least eight characters long.
- The password can include alphabetic, numeric, and special characters, but it cannot include control characters.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit services rpm]
```

Description

Specify an owner name. The owner name combined with the test name represent a single RPM configuration instance.

Options

owner—Owner name up to 32 characters in length.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

probe-count

IN THIS SECTION

- Syntax | **2299**
- Junos OS Hierarchy Level | **2299**
- Junos OS Evolved Hierarchy Level | **2299**

- Description | 2299
- Options | 2299
- Required Privilege Level | 2299

Syntax

```
probe-count count;
```

Junos OS Hierarchy Level

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name test-session session-name]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the number of probes within a test.

Options

count 1 through 15 for RPM, for TWAMP 1 through 4,294,967,290.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

- Options | 2302
- Required Privilege Level | 2303
- Release Information | 2303

Syntax

```
probe-limit limit;
```

Hierarchy Level

```
[edit services rpm]
```

Description

Configure the maximum number of concurrent probes allowed.

Options

limit—Maximum number of concurrent probes allowed.

- **Range:** (MX Series routers only) Starting in Junos OS Release 17.2R2 and 17.3R1, 1 through 2000. In Junos releases earlier than 17.2R1, the range is 1 through 500.

- **Range:** (PTX Series Packet Transport routers only) 1 through 200
- **Range:** (Other platforms) 1 through 500
- **Default:** 100

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

process (Memory)

IN THIS SECTION

- Syntax | 2307
- Hierarchy Level | 2308
- Description | 2308
- Options | 2308
- Required Privilege Level | 2309
- Release Information | 2309

Syntax

```
process {
    frequency (minutes | hours | days) value;
    minor-event {
```

```
        threshold process name memory-limit value ;
        action snmp-trap;
    }
    major-event {
        threshold process name memory-limit value ;
        action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
    }
    critical-event {
        threshold process name memory-limit value ;
        action [snmp-trap | live-core | (terminate-process| terminate-process-force)];
    }
}
```

Hierarchy Level

```
[edit system monitor memory]
```

Description

Configure process level memory monitoring. Because you cannot specify a threshold for all processes, an algorithm (heuristics-based) is used to identify the processes that are likely to cross the threshold. The algorithm can identify the processes based on learning the memory growth pattern of the processes and comparing the memory usage of the processes with the baseline of the process. The algorithm measures the virtual memory footprint, increase in memory foot print since baseline, and memory growth pattern score to identify the processes. You can also specify exceptions. Learning is always on at the configured time interval for process monitoring. Also, prediction is possible only when the module is aware that the system is running low on memory.

The remaining statements are explained separately.

Options

frequency Specify the frequency of system level memory monitoring. You can specify the frequency in days, hours or minutes. Possible values: 1 through 65535.

minor-event Indicates a non-critical event that, if left unchecked, may cause an interruption in service or degradation in performance but does not significantly affect the device.

major-event Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic.

critical-event Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. In case a critical event is triggered, you can terminate the process but only if the device is running out of memory.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

protocol (Server MEP)

IN THIS SECTION

- Syntax | 2310
- Hierarchy Level | 2310
- Description | 2310
- Options | 2310
- Required Privilege Level | 2310
- Release Information | 2310

Syntax

```
protocol (l2circuit | l2vpn | ethernet) {
    interface interface-name;
}
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management]
```

Description

Configure the protocol as Layer 2 circuit, Layer 2 VPN, or Ethernet and associate the interface to the protocol that needs to be monitored for ETH-AIS.

Options

l2circuit	Configure the protocol for the server MEP as Layer 2 circuit.
l2vpn	Configure the protocol for the server MEP as Layer 2 VPN.
ethernet	Configure the protocol for the server MEP as Ethernet.
interface *interface-name*	The interface that is to be associated with the protocol that needs monitoring for ETH-AIS.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

proxy (snmp)

IN THIS SECTION

- Syntax | 2315
- Hierarchy Level | 2315
- Description | 2315

- Options | **2316**
- Required Privilege Level | **2316**
- Release Information | **2316**

Syntax

```
proxy proxy-name{
    device-name device-name;
    logical-system logical-system {
        routing-instance routing-instance;
    }
    routing-instance routing-instance;
    (version-v1 | version-v2c) {

        snmp-community community-name;

        no-default-comm-to-v3-config;
    }

    version-v3 {

        security-name security-name;

        context context-name;
    }
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Configure a device to act as a proxy SNMP agent, and specify a name for the proxy.

Options

context *context-name*
Specify the SNMPv3 context name as configured on the device specified at `edit snmp proxy` *`proxy-name`* `device-name` *`device-name`*.

For more information about this statement, see "context" on page 1863.

device-name *device-name*
Specify the name of the device to be managed through the proxy SNMP agent.

no-default-comm-to-v3-config
(Optional) Specify whether you have to manually configure the statements at the `[edit snmp v3 snmp-community` *`community-name`*`]` and `[edit snmp v3 vacm]` hierarchy levels.

If this statement is not included in the configuration, the `[edit snmp v3 snmp-community` *`community-name`*`]` and `[edit snmp v3 vacm]` hierarchy level configurations are automatically initialized.

proxy-name
Specify the name of the proxy.

security-name *security-name*
Specify the SNMPv3 security name as configured on the device specified at `edit snmp proxy` *`proxy-name`* `device-name` *`device-name`*.

For more information about this statement, see "security-name" on page 2428.

snmp-community *community-name*
Specify the name of the SNMP community. The community name you configure should match the `snmp-community` configuration on the device specified at `edit snmp proxy` *`proxy-name`* `device-name` *`device-name`*. For more information about this statement, see "snmp-community" on page 2454.

(version-v1 | version-v2c)
Specify the SNMP version, and add the relevant configuration.

version-v3
Add the SNMPv3 configuration.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

template (sd-wan | traditional-firewall | unified-ngfw);
}
```

Hierarchy Level

```
[edit security log]
```

Description

Configure the security log profile to define the policy related log format including fields selection and fields order for the log. You can apply the log profile to a policy to get the log in a predefined format. Configure the stream and the log server to send the logs to the destination before configuring the profile. You can specify the log profile only for the policy related logs. After configuring the policy

category, configure the field-name from the options that are available for the policy log per category. After you have selected the field name, select the field-extra name from the available options. You can apply the profile on the policy related logs mentioned in the Table 191 on page 2319.

Table 191: You can apply log profile on below policy related logs and their categories.

Category	Policy related logs
SESSION	RT_FLOW_SESSION_CREATE RT_FLOW_SESSION_CLOSE RT_FLOW_SESSION_DENY RT_FLOW_SESSION_UPDATE
WEBFILTER	WEBFILTER_URL_BLOCKED WEBFILTER_URL_PERMITTED WEBFILTER_URL_REDIRECTED
ANTIVIRUS	AV_VIRUS_DETECTED_MT
CONTENT-FILTER	CONTENT_FILTERING_BLOCKED_MT

Required Privilege Level

Release Information

Configuration statement `profile` is added in Junos OS Release 21.1R1.

queue-statistics

IN THIS SECTION

- Syntax | **2336**
- Hierarchy Level | **2336**
- Description | **2336**
- Default | **2336**
- Options | **2336**

Required Privilege Level | 2337
Release Information | 2337

Syntax

```
queue-statistics {
    file filename {
        files number-of-files;
        size size;
    }
    interval interval;
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Enable the logging of queue statistics in a local file. This statement does not enable queue statistics monitoring.

To enable queue monitoring, you must specify the `queue-statistics` configuration statement at the `[edit services analytics interfaces]` hierarchy level.

Default

This feature is disabled by default.

Options

interval *interval* Configure the polling interval in milliseconds.

> **NOTE**: You can configure the polling interval for queue statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

- Range:
  - Junos OS Release 13.2X50-D15—8 to 1000 milliseconds (8 milliseconds to 1 second)
  - Junos OS Release 13.2X51-D10 or later—10 to 1000 milliseconds (10 milliseconds to 1 second)

    > **NOTE**: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 10 milliseconds, the following warning messages appear during the commit process: `Queue statistics polling interval can not be less than 10 milliseconds` and `Setting Queue statistics polling interval to 10 milliseconds`. These messages do not stop the commit operation, but the interval is automatically set to 10 milliseconds.

- Default:
  - Junos OS Release 13.2X50-D15—8 milliseconds
  - Junos OS Release 13.2X51-D10 or later—10 milliseconds

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

RELATED DOCUMENTATION

rate (Forwarding Options)

IN THIS SECTION

- Syntax | 2338
- Hierarchy Level | 2338
- Description | 2338
- Options | 2339
- Required Privilege Level | 2339
- Release Information | 2339

Syntax

```
rate number;
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name input],
[edit forwarding-options port-mirroring family (inet | inet6) input],
[edit forwarding-options port-mirroring input],
[edit forwarding-options sampling input],
[edit forwarding-options sampling instance instance-name input]
```

Description

Set the ratio of the number of packets to be sampled. For example, if you specify a rate of 10, every tenth packet (1 packet out of 10) is sampled.

Native analyzer sessions (that is, the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers) can be configured without specifying input parameters, which means that the instance uses default input values: rate = 1 and maximum-packet-length = 0.

NOTE: The recommended sampling rate for the MX150 is 1000 or greater. If you configure less than 1000, a warning is issued.

Options

number—Denominator of the ratio.

- **Range:** 1 through 16000000 (16M)

  For QFX Series switches, the maximum sampling rate for inline Junos Traffic Vision (J-flow) is 65535.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the `[edit forwarding-options analyzer analyzer-name input]` hierarchy level for MX Series routers introduced in Junos OS Release 14.1.

rate-cap

IN THIS SECTION

- Syntax | 2340
- Hierarchy Level | 2340
- Description | 2340
- Options | 2340
- Required Privilege Level | 2341
- Release Information | 2341

Syntax

```
rate-cap <rate-cap-value>;
```

Hierarchy Level

```
[edit security log]
[edit logical-systems name security log]
[edit tenants tenant-name security log]
```

Description

Limits the rate at which data plane logs will be generated per second.

Options

`rate-cap` *rate-cap-value*—Works with event mode only. Limits the rate at which data plane logs will be generated per second

- **Range:** 0 through 5000 logs per second
- **Default:** 5000 logs per second

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

The [edit `logical-systems` *name* security log] and [edit `tenants` *tenant-name* security log] hierarchy levels introduced in Junos OS Release 19.1R1.

RELATED DOCUMENTATION

syslog (System) | 2478

rate-limit (Security Log)

IN THIS SECTION

- Syntax | 2341
- Hierarchy Level | 2342
- Description | 2342
- Required Privilege Level | 2342
- Release Information | 2342

Syntax

```
rate-limit rate-limit;
```

Hierarchy Level

```
[edit security log stream stream-name]
[edit logical-systems name security log stream stream-name]
[edit tenants tenant-name security log stream stream-name]
```

Description

The Integrated Authentication and Enforcement feature sends threat and attack logs generated by the SRX Series device security modules to the ClearPass Policy Manager (CPPM) to use in its security policy assessment.

The logs are sent in stream mode. To avoid overburdening the SRX Series device and the log server, you can control the rate at which these logs are sent. By setting a rate-limit value, you can constrain the number of logs that are sent in 1 second. After the limit is reached, no more logs are sent.

Range: 1 through 65,535.

NOTE: For devices with multicore systems that use SPUs, each SPU is programmed with the configured-rate, which results in an aggregate-rate proportional to the number of SPUs.

```
SPU configured-rate = aggregate-rate/number-of-SPUs
```

Rate limiting on SRX5400, SRX5600, and SRX5800 devices is generally not as accurate as it is on SRX100, SRX210, SRX220, SRX240, SRX650, SRX1400, SRX1500, SRX3400, SRX3600, SRX4100, and SRX4200 devices, because the generation of logs is not entirely balanced between SPUs.

Required Privilege Level

1. security—To view this statement in the configuration.
2. security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

The [edit `logical-systems` *name* security log stream] hierarchy level introduced in Junos OS Release 18.2R1.

The [edit tenants *tenant-name* security log stream] hierarchy level introduced in Junos OS Release 18.3R1.

rdi

IN THIS SECTION

- Syntax | 2343
- Hierarchy Level | 2343
- Description | 2343
- Required Privilege Level | 2343
- Release Information | 2344

Syntax

```
rdi;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management action-profile tlv-action event]
```

Description

Define a new event **rdi**. The remote defect indication (rdi) event is triggered whenever CCM packets are received from a remote location with the rdi bit set.

This event is cleared and action is reverted when none of the remote MEPs send the CCM packets with the RDI bit.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

```

Hierarchy Level

```
[edit security log]
[edit logical-systems name security log]
[edit tenants tenant-name security log]
```

Description

Set security log report settings.

On-box reporting offers a comprehensive reporting facility where your security management team can spot a security event when it occurs, immediately access and review pertinent details about the event, and quickly decide appropriate remedial action.

The on-box reporting feature is enabled by default on a SRX Series device with Junos OS Release 15.1X49-D100 or later.

If you are upgrading your SRX Series device from a Junos OS Release prior to Junos OS 15.1X49-D100, then on-box reporting feature is disabled by default. You need to run the `set security log report` command to enable the on-box reporting feature on the device.

Options

report Enable log report.

logs-per-table Log number for each table.

idp Log number of idp.

    interfaces {
        interface-name {
            resource-profile profile-name;
        }
    }
    system {
        polling-interval {
            queue-monitoring interval;
            traffic-monitoring interval;
        }
        resource-profile profile-name;
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure network analytics resources such as resource profiles (for interfaces and system), and polling intervals (for queue and traffic monitoring).

NOTE: The `resource` statement is not available in Junos OS Releases prior to 13.2X51-D15.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

resource-category jtree (Resource Monitor)

IN THIS SECTION

- Syntax | 2363
- Hierarchy Level | 2363
- Description | 2364
- Options | 2364
- Required Privilege Level | 2364
- Release Information | 2364

Syntax

```
resource-category jtree {
resource-type (contiguous-pages | free-dwords | free-pages) {
    low-watermark number;
    high-watermark number;
}
}
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Define the resource category that you want to monitor and analyze for ensuring system stability, especially the health and operating efficiency of I-chip-based line cards and Trio-based FPCs on MX Series routers. The resource category includes detailed CPU utilization, session rate, and session count statistics. You use the resource category statistics to understand the extent to which new attack objects or applications affect performance. The jtree memory on all MX Series router Packet Forwarding Engines has two segments: one segment primarily stores routing tables and related information, and the other segment primarily stores firewall-filter-related information. The Junos OS provides the memory-enhanced statement to reallocate the jtree memory for routes, firewall filters, and Layer 3 VPNs.

Options

`jtree` Specify the Jtree resource category for which you want to monitor the health (working condition), operating efficiency, traffic-handling capacity, and performance status.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

resource-profiles (Analytics)

IN THIS SECTION

- Syntax | 2365
- Hierarchy Level | 2365
- Description | 2366
- Options | 2366
- Required Privilege Level | 2366
- Release Information | 2366

Syntax

```
resource-profiles {
    profile-name {
        depth-threshold {
            high number;
            low number;
        }
        latency-threshold {
            high number;
            low number;
        }
        no-queue-monitoring;
        no-traffic-monitoring;
        queue-monitoring;
        traffic-monitoring;
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure resource profiles that are used as templates for specifying network analytics parameters. You use resource profiles to enable and disable queue and traffic monitoring, and specify depth and latency thresholds as applicable. Once you have defined a resource profile, you can apply it specifically to individual interfaces, or globally to a system.

NOTE: The `resource-profiles` statement is not available in Junos OS Releases prior to 13.2X51-D15.

The remaining statements are explained separately. See CLI Explorer.

Options

profile-name	Specify a name for the resource profile.
no-queue-monitoring	Disable queue monitoring.
no-traffic-monitoring	Disable traffic monitoring.
queue-monitoring	Enable queue monitoring.
traffic-monitoring	Enable traffic monitoring.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

routing-engine (SNMP Resource Level)

IN THIS SECTION

- Syntax | 2380
- Hierarchy Level | 2381
- Description | 2381
- Options | 2381
- Required Privilege Level | 2382
- Release Information | 2382

Syntax

```
routing-engine  {
    resource <cpu | memory | open-files-count | process-count  | storage | temperature |
traceoptions > ;
    {
        interval <interval in secs>;
        moderate-threshold <percentage level>;
        high-threshold <percentage level>;
        critical-threshold <percentage level>;
        action <monitor | prevent | recover>;
    }
}
```

Hierarchy Level

```
[edit snmp health-monitor routing-engine]
```

Description

Override the global configuration for a resource.

Options

- `interval`—Monitoring interval in seconds.

  Range: 1 through 604800 seconds

  Default: 300 seconds

- `moderate-threshold`—Percentage of moderate threshold level resource utilization.

  Range: 30 through 99 percent

  Default: 70 percent

- `high-threshold` —Percentage of high-threshold level resource utilization.

  Range: 30 through 99 percent

  Default: 80 percent

- `critical-threshold` —Percentage of critical threshold level resource utilization.

  Range: 30 through 99 percent

  Default: 90 percent

- `action`–Enable action for all resources.

  Default: If action is not enabled, the default action is prevent.

WARNING: If the system health management action for an affected resource is configured to recover, then certain instrusive operations necessary for preventing system breakdown are taken. Instrusive operations can include restarting or terminating processes, deleting files, and so on. Such action information is logged in the system health management history and system log.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. Statement modified in Junos OS Release 15.1X49-D10.

routing-engine-profile

IN THIS SECTION

- Syntax | 2382
- Hierarchy Level | 2383
- Description | 2383
- Options | 2383
- Required Privilege Level | 2383
- Release Information | 2383

Syntax

```
routing-engine-profile profile-name {
    fields {
        field-name;
    }
    file filename;
    interval minutes;
    start-time time;
}
```

Hierarchy Level

```
[edit accounting-options]
```

Description

Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the /var/log directory.

Options

profile-name Name of the Routing Engine statistics profile.

start-time *time* (Optional) Specify the start time in *yyyy-mm-dd.hh:mm* local time format for the accounting profile. Sometimes, if the time at which the records are written to the accounting file is beyond the transfer interval window of the file, drifting of accounting records occurs. To prevent drifting and to have predictable timestamps of when accounting data is written to an accounting file, we can specify the start time option for the accounting profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

routing-instance (Port Mirroring)

IN THIS SECTION

- Syntax | 2390
- Hierarchy Level | 2390
- Description | 2391
- Required Privilege Level | 2391
- Release Information | 2391

Syntax

```
routing-instance instance-name;
```

Hierarchy Level

```
[edit forwarding-options] analyzer name output]
[edit forwarding-options port-mirroring [instance name] family inet output interface name]
```

Description

Configure a port mirroring instance. You do not specify an input for this instance. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This instance type is useful for controlling which types of traffic should be mirrored.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

routing-instance

IN THIS SECTION

- Syntax | **2391**
- Hierarchy Level | **2392**
- Description | **2392**
- Options | **2392**
- Required Privilege Level | **2392**
- Release Information | **2392**

Syntax

```
routing-instance routing-instance-name{
    family inet {
        address ip-address;
    }
}
```

Hierarchy Level

```
[edit services app-engine compute-cluster compute-cluster-name local-management],
[edit services app-engine virtual-machines instance instance-name local-management]
```

Description

(Optional) Configure a routing instance for the JunosV App Engine infrastructure. Packets are restricted to the specified routing instance. By specifying the routing instance, the JunosV App Engine infrastructure can be made to operate in a non-default routing instance. This feature ensures that JunosV App Engine traffic can be segregated from other traffic.

If the `routing-instance` statement is absent from the `[edit services app-engine virtual-machines instance instance-name local-management]` hierarchy level, the virtual machine (VM) will inherit this routing instance from its `[edit services app-engine compute-cluster compute-cluster-name local-management]` hierarchy level.

NOTE: Additional configuration under the `[edit routing-instances]` hierarchy level is required to ensure that the Routing Engine interface address belongs to that particular routing instance on the routing engine. Each routing instance consists of sets of the following: Routing tables, interfaces that belong to these routing tables (optional, depending upon the routing instance type), and routing option configurations.

Options

routing-instance-name	Name of the routing instance.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

routing-instance (Syslog)

IN THIS SECTION

- Syntax | 2393
- Hierarchy Level | 2393
- Description | 2393
- Required Privilege Level | 2394
- Release Information | 2394

Syntax

```
routing-instance routing-instance-name;
```

Hierarchy Level

```
[edit system syslog],
[edit system syslog host ip-address]
```

Description

Configure the routing instance name for the routing instance that you want the syslog client to use. If you want to use the reserved non-default management routing instance mgmt_junos, make sure you configure the `management-instance` statement.

NOTE: You must also define the routing instance you want to use under the `[edit routing-instances]` hierarchy level.

Starting in Junos OS Evolved Release 20.1R1 and 19.4R2, if you are sending syslog messages to a remote host that is identified by its IP address at the `[edit system syslog host ip-address]` hierarchy, you only need to configure the `management-instance` statement to use the mgmt_junos routing instance. You do not need to configure the mgmt_junos routing instance at the `[edit system syslog host ip-address routing-instance]` hierarchy.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

- Hierarchy Level | 2396
- Description | 2396
- Options | 2396
- Required Privilege Level | 2396
- Release Information | 2396

Syntax

```
routing-instances instance-name;
```

Hierarchy Level

```
[edit services rpm bgp],
[edit services rpm bgp logical-system logical-system-name]
```

Description

Specify the routing instance used by the probes.

Options

instance-name—A routing instance configured at the `[edit routing-instances]` hierarchy level.

- **Default:** Internet routing table `inet.0`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

- Syntax | 2397
- Hierarchy Level | 2397
- Description | 2397
- Options | 2397
- Required Privilege Level | 2398
- Release Information | 2398

Syntax

```
rpm (client client | server server | twamp-client twamp-client | twamp-server twamp-server);
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number]
```

Description

Associate an RPM or TWAMP client (router or switch that originates RPM or TWAMP probes) or RPM or TWAMP server with a specified interface.

NOTE: The TWAMP client is applicable only for `si-` interfaces.

Options

client—Identifier for RPM client router or switch.

server—Identifier for RPM server.

twamp-client—Identifier for RPM TWAMP client router.

twamp-server—Identifier for RPM TWAMP server.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring]
```

Description

Configure real-time performance monitoring (RPM). RPM enables you to configure active probes to track and monitor traffic. Probes collect packets per destination and per application, including PING Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets. RPM provides Management Information Base (MIB) support with extensions for RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

Starting in Junos OS Evolved Release 20.1R1, you can configure RPM probes. For Junos OS Evolved, RPM is configured at the `[edit services monitoring rpm]` hierarchy level. The scope of support is limited to:

- Probe generation and reception (client) as well as reflection (server) for the following RPM probe types:
  - icmp-ping
  - icmp-timestamp
  - udp-ping
  - udp-timestamp
- Probe history management
- Reporting through syslog only

Starting in Junos OS Evolved 20.3R1, you can configure TWAMP probes. Starting in Junos OS Evolved 21.1R1, you can configure RFC 2544 benchmarking tests. For Junos OS Evolved, TWAMP is configured at the `[edit services monitoring twamp]` hierarchy level and RFC 2544 benchmarking tests are configured at the `[edit services monitoring rfc2544]` hierarchy level.

Starting in Junos OS Evolved Release 21.2R1, reporting through SNMP MIB objects is supported for RPM.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Evolved Release 20.1R1.

`traps` option introduced in Junos OS Evolved Release 21.2R1.

`source-address` option and the `local-link` sub-option of the `target-address` option for TWAMP Light test sessions introduced in Junos OS Release 21.4R1.

Release History Table

Release	Description
21.4R1	Starting in Junos OS Release 21.4R1, you can configure RPM and TWAMP probes for EX9200 switches.
21.4R1	Starting in Junos OS Release 21.4R1, for TWAMP LIght test-sessions on MX and PTX routers, you can configure IPv6 link-local target addresses and their corresponding source addresses.
21.3R1	Starting in Junos OS 21.3R1, you can configure RPM and TWAMP probes for QFX10000 Series switches.
21.2R1 Evo	Starting in Junos OS Evolved Release 21.2R1, reporting through SNMP MIB objects is supported for RPM.
21.1R1 Evo	Starting in Junos OS Evolved 21.1R1, you can configure RFC 2544 benchmarking tests.
20.3R1 Evo	Starting in Junos OS Evolved 20.3R1, you can configure TWAMP probes.
20.1R1 Evo	Starting in Junos OS Evolved Release 20.1R1, you can configure RPM probes. For Junos OS Evolved, RPM is configured at the [edit services monitoring rpm] hierarchy level.

run-length

IN THIS SECTION

- Syntax | 2412
- Hierarchy Level | 2412
- Description | 2412
- Options | 2413
- Required Privilege Level | 2413
- Release Information | 2413

Syntax

```
run-length number;
```

Hierarchy Level

```
[edit forwarding-options port-mirroring input],
[edit forwarding-options port-mirroring instance port-mirroring-instance-name input],
[edit forwarding-options  port-mirroring family (inet|inet6) input],
[edit forwarding-options sampling input],
[edit forwarding-options sampling instance instance-name input]
```

Description

Set the number of samples following the initial trigger event. The configuration enables you to sample packets following those already being sampled.

NOTE: The `run-length` statement is not supported when you configure inline flow monitoring (by including the `inline-jflow` statement at the `[edit forwarding-options sampling instance` *`instance-name`* `family (inet | inet6) output]` hierarchy level).

Options

`number`—Number of samples.

- **Range:** 0 through 20
- **Default:** 0

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

sample-type

IN THIS SECTION

Syntax | **2414**

Hierarchy Level | **2414**

- Description | 2414
- Options | 2414
- Required Privilege Level | 2414
- Release Information | 2414

Syntax

```
sample-type (absolute-value | delta-value);
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Method of sampling the selected variable.

Options

`absolute-value`—Actual value of the selected variable is used when comparing against the thresholds.

`delta-value`—Difference between samples of the selected variable is used when comparing against the thresholds.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 2416
- Release Information | 2416

Syntax

```
sample-type (absolute-value | delta-value);
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Configure the method of sampling the selected variable (monitored object). When you configure an SNMP RMON alarm, you can specify the sample type.

Options

`absolute-value`—Actual value of the selected variable is used when comparing against the thresholds.

`delta-value`—Difference between samples of the selected variable is used when comparing against the thresholds.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

security-level (Defining Access Privileges)

IN THIS SECTION

- Syntax | 2417
- Hierarchy Level | 2417
- Description | 2417
- Default | 2417
- Options | 2417
- Required Privilege Level | 2417
- Release Information | 2417

Syntax

```
security-level (authentication | none | privacy) {
    notify-view view-name;
    read-view view-name;
    write-view view-name;
}
```

Hierarchy Level

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c)]
```

Description

Define the security level used for access privileges.

Default

none

Options

authentication—Provide authentication but no encryption.

none—No authentication and no encryption.

privacy—Provide authentication and encryption.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Syntax | 2418
- Hierarchy Level | 2418
- Description | 2418
- Default | 2418
- Options | 2419
- Required Privilege Level | 2419
- Release Information | 2419

Syntax

```
security-level (authentication | none | privacy);
```

Hierarchy Level

```
[edit snmp v3 target-parameters target-parameters-name parameters]
```

Description

Configure the security level to use when generating SNMP notifications.

Default

none

Options

`authentication`—Provide authentication but no encryption.

`none`—No authentication and no encryption.

`privacy`—Provide authentication and encryption.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Syntax | 2420
- Hierarchy Level | 2420
- Description | 2420
- Options | 2420
- Required Privilege Level | 2420
- Release Information | 2421

Syntax

```
security-log {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the security log process.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable`—Disable the security log process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.
  - `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

- Release Information | 2427

Syntax

```
security-name security-name;
```

Hierarchy Level

```
[edit snmp v3 snmp-community community-index]
```

Description

Associate a community string with the security name of a user. The community string, which is used for SNMPv1 and SNMPv2c clients in an SNMPv3 system, is configured at the `[edit snmp v3 snmp-community community-index]` hierarchy level.

Options

security-name—Name that is used for messaging security and user access control.

NOTE: The security name must match the configured security name at the `[edit snmp v3 target-parameters target-parameters-name parameters]` hierarchy level when you configure traps or informs.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

severity (Security Log)

IN THIS SECTION

- Syntax | **2437**
- Hierarchy Level | **2437**
- Description | **2437**
- Options | **2438**
- Required Privilege Level | **2438**
- Release Information | **2438**

Syntax

```
severity (alert | critical | debug | emergency | error | info | notice | warning)
```

Hierarchy Level

```
[edit security log stream stream-name]
[edit logical-systems name security log stream stream-name]
[edit tenants tenant-name security log stream stream-name]
```

Description

Set severity threshold for security logs.

Options

- `alert`— Conditions that require immediate attention.
- `critical`—Critical conditions.
- `debug`—Information normally used in debugging.
- `emergency`—Conditions that cause security functions to stop.
- `error`—General error conditions.
- `info`—Information about normal security operations.
- `notice`—Nonerror conditions that are of interest.
- `warning`—General warning conditions.
- **Default:** debug.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The [edit `logical-systems` *name* security log stream *stream-name*] and [edit `tenants` *tenant-name* security log stream *stream-name*] hierarchy levels introduced in Junos OS Release 19.1R1.

short-name-format

IN THIS SECTION

- Syntax | 2439
- Hierarchy Level | 2439
- Description | 2439
- Options | 2439
- Required Privilege Level | 2440
- Release Information | 2440

Syntax

```
short-name-format (character-string | vlan | 2octet | rfc-2685-vpn-id);
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name
maintenance-association ma-name]
```

Description

Specify the name format of the maintenance association name.

Options

`character-string`—The name is an ASCII character string.

`vlan`—The primary VLAN identifier.

`2octet`—A number in the range 0 through 65,535.

`rfc-2685-vpn-id`—A VPN identifier that complies with RFC 2685.

- **Default:** `character-string`

NOTE: The PTX Series Packet Transport Routers support the `vlan` and `2octet` options only.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

size (Interface)

IN THIS SECTION

- Syntax | 2440
- Hierarchy Level | 2441
- Description | 2441
- Options | 2441
- Required Privilege Level | 2441
- Release Information | 2441

Syntax

```
size bytes;
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Specify attributes of an accounting-data log file.

Options

bytes—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, `profilelog`) reaches its maximum size, it is renamed `profilelog.0`, then `profilelog.1`, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.

- **Syntax:** *x* to specify bytes, *x*k to specify KB, *x*m to specify MB, *x*g to specify GB
- **Range:** 256 KB through 1 GB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 2443

Syntax

```
size size;
```

Hierarchy Level

```
[edit system syslog archive],
[edit system syslog file filename archive]
```

Description

Configure the maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***. For information about the number of archive files that the utility creates in this way, see "files" on page 1987.

Options

size—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

- **Syntax:** *x*k to specify the number of kilobytes, *x*m for the number of megabytes, or *x*g for the number of gigabytes

- **Range:** 64 KB through 1 GB
- **Default:** 1 MB for MX Series routers the QFX Series, and the OCX Series

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

source-address address;
```

Junos OS Hierarchy Level

```
[edit services rpm probe owner test test-name]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the source IP address used for probes. If the source IP address is not one of the router's or switch's assigned addresses, the packet uses the outgoing interface's address as its source. Only IPv4 addresses are supported for Junos OS Evolved.

The following addresses cannot be used for the source IP address used for probes:

- 0.0.0.0
- 127.0.0.0/8 (loopback)
- 224.0.0.0/4 (multicast)
- 255.255.255.255 (broadcast)

Options

address—Valid IP address. Only IPv4 addresses are supported for Junos OS Evolved.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

source-address (SNMP)

IN THIS SECTION

- Syntax | 2459
- Hierarchy Level | 2459
- Description | 2459
- Options | 2459
- Required Privilege Level | 2460
- Release Information | 2460

Syntax

```
source-address address;
```

Hierarchy Level

```
[edit snmp trap-options]
```

Description

Set the source address of every SNMP trap packet sent by this router to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.

Options

address—Source address of SNMP traps. You can configure the source address of trap packets two ways: `lo0` or a valid IPv4 address configured on one of the router interfaces. The value `lo0` indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface `lo0`.

- **Default:** Disabled. (The source address is the address of the outgoing interface.)

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 2461

Syntax

```
source-classes {
    source-class-name;
}
```

Hierarchy Level

```
[edit accounting-options class-usage-profile profile-name]
```

Description

Specify the source classes for which statistics are collected.

Options

source-class-name—Name of the source class to include in the class usage profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Required Privilege Level | 2462
Release Information | 2462

Syntax

```
start-time time;
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Specify the start time for transfer of an accounting-data log file.

Options

time—Start time for file transfer.

- **Syntax:** *YYYY-MM-DD.hh:mm*

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

startup-alarm

IN THIS SECTION

- Syntax | 2463
- Hierarchy Level | 2463
- Description | 2463
- Options | 2463
- Required Privilege Level | 2464
- Release Information | 2464

Syntax

```
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

The alarm that can be sent upon entry startup.

Options

`falling-alarm`—Generated if the first sample after the alarm entry becomes active is less than or equal to the falling threshold.

`rising-alarm`—Generated if the first sample after the alarm entry becomes active is greater than or equal to the rising threshold.

`rising-or-falling-alarm`—Generated if the first sample after the alarm entry becomes active satisfies either of the corresponding thresholds.

- **Default:** `rising-or-falling-alarm`

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm);
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.

Default

rising-or-falling-alarm

Options

falling-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the falling threshold.

rising-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the rising threshold.

rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active is equal to or greater than either the rising threshold or the falling threshold.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

    }
}
```

Hierarchy Level

```
[edit security log]
[edit logical-systems name security log]
[edit tenants tenant-name security log]
```

Description

Defines the TWAMP server configuration settings.

Options

stream Every stream can configure file or host.

- Values:
  - category— Type of events that may be logged.
    - all— All events are logged
    - content-security — Content security events are logged
    - fw-auth— Fw-auth events are logged.
    - screen— Screen events are logged.
    - alg— Alg events are logged.
    - nat— Nat events are logged.
    - flow— Flow events are logged.

- `sctp`— Sctp events are logged.
- `gtp`— Gtp events are logged.
- `ipsec`— IPsec events are logged.
- `idp`— Idp events are logged.
- `rtlog`— Rtlog events are logged.
- `pst-ds-lite`— Pst-ds-lite events are logged.
- `appqos`— Appqos events are logged.
- `secintel`— AAMW events are logged.

- `filter` *`threat-attack`*— Selects the filter to filter the threat attack security events to be logged
- `format` *`(binary | sd-syslog | syslog)`*— Specify the log stream format in binary or sd-syslog or syslog formats.
- `host` *`ip-address`*— Destination to send security logs.
  - `port`— Specify the host port number.
  - `routing-instance`— Specify the routing instance name.
- `rate-limit` *`rate`*— Specify the rate limit for security logs.
  - The range is 1 through 65535 logs per second and the default value is 65535
- `severity`— Specify the severity threshold for security logs.
  - `alert`— Specify the conditions that require immediate attention.
  - `critical`— Specify the critical conditions.
  - `debug`— Specify the information normally used in debugging.
  - `emergency`— Specify the conditions that cause security functions to stop.
  - `error`— Specify the general error conditions.
  - `info`— Specify the Information about normal security operations.

- `notice`— Specify the non error conditions that are of interest.
- `warning`— Specify the general warning conditions.

- `source-address`— Specify the source address to the stream log.
- `time-format` *(year | millisecond)*— Specify the year, the millisecond, or both in the timestamp.
- `transport`— Set the security log transport settings.
  - `protocol` *(tcp | tls | udp)*— Specify the security log transport protocol for the device. Values: tcp, tls, and udp.
  - `tcp-connections`— Specify the number of tcp connections per stream. Values: 1 through 5.

    NOTE: `tcp-connections` is not supported on logical and tenant systems.

  - `tls-profile`— Specify the tls profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The [edit `logical-systems` *name* security log] and [edit `tenants` *tenant-name* security log] hierarchy levels introduced in Junos OS Release 19.1R1.

`time-format`, `source-address`, and `transport` options are introduced in Junos OS Release 20.2R1.

category (Security Logging) | 1824

streaming-servers

IN THIS SECTION

- Syntax | 2470
- Hierarchy Level | 2470
- Description | 2470
- Options | 2471
- Required Privilege Level | 2471
- Release Information | 2472

Syntax

```
streaming-servers {
    address ip-address {
        port number {
            stream-format format;
            stream-type type
        }
    }
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure remote servers to receive streaming output for the network analytics monitoring of traffic and queue statistics. The streaming function supports TCP connections only, and sends records separated by a newline character.

NOTE: Before you use the remote server to receive streaming data, you must set up the TCP server software to process records that are separated by the newline character (\n).

You can configure multiple servers and multiple ports on each server to receive the streaming data. You can configure different streaming data types and formats for different ports on a server, but you can configure only one streaming type and one format for each port on a server.

Options

address *ip-address* — IP address of the remote server receiving the streaming data.

port *number* — Port number of the remote server receiving the streaming data.

stream-format *format* — Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

- Values:
  - **csv**—Comma-separated Values (CSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.
  - **json**—JavaScript Object Notification (JSON). Records sent in this format contain “queue-statistics” or “traffic-statistics” in the “record type” field.
  - **tsv**—Tab-separated Values (TSV). Records sent in this format contain a “q” for a queue statistics, or a “t” for a traffic statistics.

stream-type *type* — Type of streaming data sent to a port. You can specify different types of streaming data to be sent to different ports on the same server.

- Values:
  - **queue-statistics**
  - **traffic-statistics**

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

structured-data

IN THIS SECTION

- Syntax | 2472
- Hierarchy Level | 2472
- Description | 2473
- Required Privilege Level | 2473
- Release Information | 2473

Syntax

```
structured-data {
    brief;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name system syslog file filename],
[edit system syslog file filename]
```

Description

Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, *The syslog Protocol* (http://tools.ietf.org/html/draft-ietf-syslog-protocol-23).

Starting in Junos OS 19.2R1 release and later, after configuring this statement, you cannot configure any other statements that specify the format for messages written to the file. Commit error appears (the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level and the **time-format** statement at the **[edit system syslog]** hierarchy level) if you try to configure any other statement after configuring this statement. In releases prior to Junos OS 19.2R1 release, there is no commit error when you run the `request system software validate` command before an upgrade to validate the software package as a pre-requisiste.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

subscribers-limit (Resource Monitor)

IN THIS SECTION

- Syntax | **2474**
- Hierarchy Level | **2474**

Description | 2474
Required Privilege Level | 2475
Release Information | 2475

Syntax

```
subscribers-limit {
    client-type (any | dhcp | l2tp | pppoe) {
        chassis {
            limit limit;
        }
        fpc slot-number {
            limit limit;
            pic number {
                limit limit;
                port number {
                    limit limit;
                }
            }
        }
    }
}
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Configure the maximum number of subscribers of a specified client type allowed to be logged in on the chassis, per MPC, per MIC, and per port. When that number is reached, subsequent logins are denied until the current number of subscribers drops below the maximum allowed.

Limit the number of subscribers allowed to log in per chassis, MPC, MIC, or port.

system (Analytics Resource)

IN THIS SECTION

- Syntax | 2484
- Hierarchy Level | 2484
- Description | 2484
- Options | 2485
- Required Privilege Level | 2485
- Release Information | 2485

Syntax

```
system {
    polling-interval {
        queue-monitoring interval;
        traffic-monitoring interval;
    }
    resource-profile profile-name;
}
```

Hierarchy Level

```
[edit services analytics resource]
```

Description

Apply a network analytics resource profile to a system for which you wish to enable queue or traffic monitoring. The resource profile is a template that specifies the parameters for queue and traffic monitoring, as well as for the depth and latency thresholds.

NOTE: The `system` statement in the `[edit services analytics resource]` hierarchy is not available in Junos OS Releases prior to 13.2X51-D15.

Options

polling-interval Configure the polling interval for queue and traffic monitoring:

queue-monitoring *polling-interval* Configure the queue monitoring interval in milliseconds.

- **Range:** 1 to 1000 milliseconds (1 millisecond to 1 second) on devices other than EX4300 switches.

  8 to 1000 milliseconds (8 milliseconds to 1 second) on EX4300 switches.

traffic-monitoring *polling-interval* Configure the traffic monitoring interval in seconds.

- **Range:** 1 to 300 seconds (1 second to 5 minutes) on devices other than EX4300 switches.

  5 to 300 seconds (5 seconds to 5 minutes) on EX 4300 switches.

resource-profile *profile-name* Name of a resource profile containing the global analytics parameters that have been configured for the system. Information contained in a resource profile includes the configuration of queue and traffic monitoring (whether enabled or disabled), and values for the depth and latency thresholds (if applicable).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Syntax | **2488**

- Hierarchy Level | 2488
- Description | 2488
- Options | 2489
- Required Privilege Level | 2489
- Release Information | 2489

Syntax

```
system {
    frequency (minutes | hours | days) value;
    minor-event {
        threshold swap-usage value ;
        action snmp-trap;
    }
    major-event {
        threshold swap-usage value ;
        action [snmp-trap | live-vmcore];
    }
    critical-event {
        threshold swap-usage value ;
        action [snmp-trap | live-vmcore | (RE-restart | RE-switchover)];
    }
}
```

Hierarchy Level

```
[edit system monitor memory]
```

Description

Configure system level memory monitoring.

Options

frequency Specify the frequency of system level memory monitoring. You can specify the frequency in days, hours or minutes. Possible values: 1 through 65535.

minor-event Indicates a non-critical event that, if left unchecked, may cause an interruption in service or degradation in performance but does not significantly affect the device.

major-event Indicates an event that, if left unchecked, may result in significant loss of service or interruption of traffic.

critical-event Indicates an event that, if left unchecked, may result in serious loss of service or interruption of traffic. In case a critical event is triggered, you can either restart the Routing Engine or configure the primary Routing Engine to switchover gracefully to a backup Routing Engine without interruption in packet forwarding.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.1.

tag (Configuring Notification Targets)

IN THIS SECTION

- Syntax | 2491
- Hierarchy Level | 2491
- Description | 2491
- Options | 2491
- Required Privilege Level | 2492
- Release Information | 2492

Syntax

```
tag tag-name;
```

Hierarchy Level

```
[edit snmp v3 notify name]
```

Description

Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).

Options

tag-name—Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The ***tag-name*** is not included in the notification.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

}
```

Junos OS Hierarchy Level

```
[edit services rpm probe owner]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name]
```

Description

Specify the range of probes over which the standard deviation, average, and jitter are calculated. The test name combined with the owner name represent a single RPM configuration instance.

Options

`test` *`name`*—You can configure any name up to 32 characters in length. For Junos OS Evolved, if the owner name is one of the pre-defined names, then four pre-defined test names are available to choose from. For example, if the owner name is the pre-defined name `icmp-evo`, then these four pre-defined test names are available to configure: `icmp-evo-1`, `icmp-evo-2`, `icmp-evo-3`, and `icmp-evo-4`.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

thresholds (Junos OS)

IN THIS SECTION

- Syntax | **2507**
- Hierarchy Level | **2507**
- Description | **2507**
- Options | **2507**
- Required Privilege Level | **2508**
- Release Information | **2508**

Syntax

```
thresholds thresholds;
```

Hierarchy Level

```
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name]
```

Description

Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.

NOTE: If you configure a value of zero using the *thresholds* option for a certain probe parameter, the generation of SNMP traps is disabled for the corresponding probe attribute. For example, if you specify the `set thresholds jitter-egress 0` statement, it denotes that traps are not triggered when the jitter in egress time threshold is met or exceeded.

Options

thresholds—Specify one or more threshold measurements. The following options are supported:

- `egress-time`—Measures maximum source-to-destination time per probe.
- `ingress-time`—Measures maximum destination-to-source time per probe.
- `jitter-egress`—Measures maximum source-to-destination jitter per test.
- `jitter-ingress`—Measures maximum destination-to- source jitter per test.
- `jitter-rtt`—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.
- `rtt`—Measures maximum round-trip time per probe, in microseconds.
- `std-dev-egress`—Measures maximum source-to-destination standard deviation per test.
- `std-dev-ingress`—Measures maximum destination-to-source standard deviation per test.

- `std-dev-rtt`—Measures maximum standard deviation per test, in microseconds.
- `successive-loss`—Measures successive probe loss count, indicating probe failure.
- `total-loss`—Measures total probe loss count indicating test failure, from 0 through 15.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

time-format

IN THIS SECTION

- Syntax | **2509**
- Hierarchy Level | **2509**
- Description | **2509**
- Options | **2509**
- Required Privilege Level | **2510**
- Release Information | **2510**

Syntax

```
time-format (year | millisecond | year millisecond);
```

Hierarchy Level

```
[edit system syslog]
[edit security log]
```

Description

Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a `file`, `console`, or `user` statement at the `[edit system syslog]` hierarchy level, but not to destinations configured by a `host` statement.

However, in a Junos OS specific implementation using the FreeBSD console for a syslog destination, additional time information is available in system log messages for that destination when you configure the destination through a `host` statement.

By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, `Aug 21 12:36:30`.

The following example illustrates the format for a timestamp that includes both the millisecond (`401`) and the year (`2006`):

```
Aug 21 12:36:30.401 2006
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the `[edit system syslog time-format]` statement.

NOTE: When the `structured-data` statement is included at the `[edit system syslog file` *`filename`*`]` hierarchy level, this statement is ignored for the file.

Options

`millisecond`—Include the millisecond in the timestamp.

year—Include the year in the timestamp.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

                    }
                }
```

```
            }
        }
    }
}
```

Hierarchy Level

```
[edit system]
```

Description

Set system-wide tracing options for Junos OS Evolved. Tracing is a process about getting information regarding a program's execution. A programmer adds specific code to a program, called a *tracepoint*, which when enabled triggers a log event, which gives the programmer visibility into how the program is executing.

Options

application-name Name of the application for which tracing should be applied. You can see a list of the applications for Junos OS Evolved by issuing the `show system applications` command. If you want to enable tracing for all applications, use the value `all`.

enabled (on | off) Enter `on` to enable or `off` to to disable. This option has two locations in the hierarchy, one for enabling or disabling an entire group, and one for enabling or disabling specific tracepoints.

group *group-name* The name of the trace group for which the configuration should be applied.

level *level* Trace level of the application. The following levels are available, listed in the order of highest severity first:

- emergency—Trace emergency messages (system is unusable).
- alert—Trace alert messages (take immediate action).
- critical—Trace critical conditions.
- error—Trace error conditions.
- warning—Trace warning conditions.

- notice—Trace normal but significant conditions.
- info—Trace informational messages.
- debug—Trace debug messages.

You can configure the application's level here. The program determines the level of the tracepoints. If the application's level is at least as inclusive as (that is, the same as or of higher severity) the tracepoint's level, then the trace event is able to fire. If the application's level is less inclusive (of lower severity) than the tracepoint's level, then the trace event is not able to fire.

The default trace level is `info`.

node *node-name* — Name of a node. Node names can be `re0`, `re1`, `fpc0`, `fpc1`, and so on, depending on the system.

tracepoint *tracepoint-name* — Name of a tracepoint. A tracepoint is an event in the program, which can give the developer visibility into how the program is executing.

Required Privilege Level

admin

Release Information

Statement introduced in Junos OS Evolved 18.2R1.

traceoptions (Analytics)

IN THIS SECTION

- Syntax | **2516**
- Hierarchy Level | **2516**
- Description | **2516**
- Options | **2516**
- Required Privilege Level | **2517**

Release Information | 2517

Syntax

```
traceoptions {
    file filename;
    files number-of-files;
    size size;
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure traceoptions for the network analytics daemon (analyticsd) running on the Routing Engine.

Options

file *filename* Specify a filename for storing the traceoptions data. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

files *number-of-files* Specify the number of files to store locally. After the number files witsh the maximum file size is reached, the system starts over and writes the data to the first file.

- **Range:** 2 to 1,000 files.

size *size* Configure the file size in megabytes (MB).

- **Syntax:** *xm* to specify MB.
- **Range:** 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

traceoptions (Analytics Agent)

IN THIS SECTION

- Syntax | 2517
- Hierarchy Level | 2518
- Description | 2518
- Options | 2518
- Required Privilege Level | 2518
- Release Information | 2519

Syntax

```
traceoptions {
    file filename;
    flag (debug | error | info | trace);
}
```

Hierarchy Level

```
[edit services analytics agent]
```

Description

Configure tracing operations for Network Telemetry Framework (NTF) agent. You can specify the name of the file where the NTF agent log messages are stored. You can also specify a severity level for messages to be logged. The severity level that you configure depends on the issue that you are trying to resolve. In some cases you might be interested in seeing all messages relevant to the logged event, so you specify `trace`. As levels become more restrictive, fewer messages are logged.

NOTE: Although the syntax uses the keyword `flag`, its function in this statement corresponds to the `level` keyword used for other `traceoptions` statements.

Options

file *filename* Name of the file to receive the output of the tracing operation. The file is stored in the **/var/log/** directory of your device.

- **Default:** ntf-agent

flag (debug | error | info | trace) Specify the severity level for messages to be logged. The order of severity, from most to least severe is as follows:

error > info > debug > trace

- `debug`—Match debug messages.
- `error`—Match error messages. This is the most restrictive level.
- `info`—Match informational messages.
- `trace`—Match all messages.
- **Default:** error

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 18.3R1.

Syntax (Individual interfaces with PTX Series, EX Series, ACX Series)

```
traceoptions {
    file filename <files name> <size size> <world-readable | no-world-readable>;
    flag flag;
```

```
    match;
}
```

Syntax (Individual interfaces with QFX Series, OCX1100, EX4600, NFX Series)

```
traceoptions {
    flag flag;
}
```

Syntax (OAMLFM with EX Series, QFX Series, NFX Series)

```
traceoptions {
    file filename <files number> <match regex> <size size> <world-readable | no-world-readable>;
    flag flag ;
    no-remote-trace;
}
```

Syntax (Interface process with ACX Series, SRX Series, MX Series, M Series, T Series)

```
traceoptions {
    file <filename> <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag <disable>;
    no-remote-trace;
}
```

Hierarchy Level (Individual interfaces with PTX Series, EX Series, ACX Series, QFX Series, OCX1100, EX4600, NFX Series)

```
[edit interfaces interface-name]
```

Hierarchy Level (Interface process with ACX Series, SRX Series, MX Series, M Series, T Series)

```
[edit interfaces]
```

Description

Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple `flag` statements.

The interfaces `traceoptions` statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system `syslog` file in the directory */var/log/dcd* .

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

Default

If you do not include this statement, no interface-specific tracing operations are performed.

Options

Table 193 on page 2522 lists options for traceoption command for the following platforms:

Table 193: Options for traceoptions

Option	**Individual interfaces with PTX Series, ACX Series, EX Series**	**Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series**	**Interface Process with OAMLFM with EX Series, QFX Series, NFX Series**	**Interface process with ACX Series, SRX Series, MX Series, M Series, T Series**
`file` *filename*	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* . By default, interface process tracing output is placed in the file.		—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* .	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log/dcd* . By default, interface process tracing output is placed in the file `dcd`.

Table 193: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
files *number*	—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.		—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the size option.	—(Optional) Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option. *Range:* 2 through 1000 *Default:* 3 files

Table 193: Options for traceoptions *(Continued)*

Option	**Individual interfaces with PTX Series, ACX Series, EX Series**	**Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series**	**Interface Process with OAMLFM with EX Series, QFX Series, NFX Series**	**Interface process with ACX Series, SRX Series, MX Series, M Series, T Series**
flag	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. The following are the interface-specific tracing options. • `all`—All interface tracing operations • `event`—Interface events • `ipc`—Interface interprocess communication (IPC) messages • `media`—Interface media changes • `q921`—Trace ISDN Q.921 frames • `q931`—Trace ISDN Q.931 frames	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. The following are the interface-specific tracing options. • `all`—All interface tracing operations • `event`—Interface events • `ipc`—Interface interprocess communication (IPC) messages • `media`—Interface media changes • `q921`—Trace ISDN Q.921 frames • `q931`—Trace ISDN Q.931 frames	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. You can include the following flags: • `action-profile`—Trace action profile invocation events. • `all`—Trace all events. • `configuration`—Trace configuration events. • `protocol`—Trace protocol processing events. • `routing socket`—Trace routing socket events.	—Tracing operation to perform. To specify more than one tracing operation, include multiple *flag* statements. You can include the following flags: • `all` • `change-events`—Log changes that produce configuration events • `config-states`—Log the configuration state machine changes • `kernel`—Log configuration IPC messages to kernel • `kernel-detail`—Log details of configuration messages to kernel

Table 193: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
`match`	—(Optional) Regular expression for lines to be traced.		—(Optional) Refine the output to log only those lines that match the given regular expression.	

Table 193: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
size *size*	—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.		—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the files option. *Syntax: x*k to specify KB, *x*m to specify MB, or *x*g to specify GB *Range:* 10 KB through 1 GB *Default:* 128 KB *Default:* If you do not include this option, tracing output is appended	—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*`.0`. When the *trace-file* again reaches its maximum size, *trace-file*`.0` is renamed *trace-file*`.1` and *trace-file* is renamed *trace-file*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option. *Syntax: x*k to specify kilobytes, *x*m to specify megabytes, or *x*g to specify gigabytes

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
			to an existing trace file.	*Range:* 10 KB through the maximum file size supported on your router *Default:* 1 MB
`no-world-readable`	—(Optional) Prevent any user from reading the log file.		—(Optional) Restrict file access to the user who created the file.	—(Optional) Disallow any user to read the log file.
`world-readable`	—(Optional) Allow any user to read the log file.		—(Optional) Enable unrestricted file access.	—(Optional) Allow any user to read the log file.
`disable`				—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.
no-remote-trace			—(Optional) Disable the remote trace.	-

Table 193: Options for traceoptions *(Continued)*

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
`match` *regex*				—(Optional) Refine the output to include only those lines that match the given regular expression.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

traceoptions (Security Datapath Debug)

IN THIS SECTION

- Syntax | 2529
- Hierarchy Level | 2529
- Description | 2529
- Options | 2530
- Required Privilege Level | 2531
- Release Information | 2531

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security datapath-debug]
```

Description

Sets the trace options for datapath-debug.

NOTE: Data path debugging is supported on SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800.

Options

- `file`—Configure the trace file options.
  - `filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed to **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

    Syntax: x K to specify KB, x m to specify MB, or x g to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB
  - `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option
- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 9.6.

traceoptions (Resource Monitor)

IN THIS SECTION

- Syntax | **2531**
- Hierarchy Level | **2531**
- Description | **2532**
- Options | **2532**
- Required Privilege Level | **2532**
- Release Information | **2533**

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression > <size maximum-file-size> <world-
readable | no-world-readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit system services resource-monitor]
```

Description

Define tracing operations for the memory resource utilization processes.

Options

file *filename* Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

- **Default: rmopd**

files *number* (Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

match *regular-expression* (Optional) Refine the output to include lines that contain the regular expression.

`size` *`maximum-file-size`* (Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable` (Optional) Enable unrestricted file access.

`no-world-readable` (Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.

flag *flag* Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. You can include the following flags:

- `all`—Trace all operations.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

traceoptions (Security Log)

IN THIS SECTION

- Syntax | 2533
- Hierarchy Level | 2534
- Description | 2534
- Options | 2534
- Required Privilege Level | 2535
- Release Information | 2535

Syntax

```
traceoptions {
    file {
        filename;
        files number;
        match regular-expression;
        size maximum-file-size;
        (world-readable | no-world-readable);
    }
    flag (all | configuration | hpl | report | source);
    no-remote-trace;
}
```

Hierarchy Level

```
[edit security log]
[edit logical-systems name security log]
[edit tenants tenant-name security log]
```

Description

Configure security log tracing options.

Options

- file—Configure the trace file options.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, the name of the file is the name of the process being traced.
  - files *number*—Maximum number of trace files. When a trace file named *trace-file* reaches its maximum size, it is renamed to *trace-file*.0, then *trace-file*.1, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the size option and a filename.

    Range: 2 through 1000 files

    Default: 10 files
  - match *regular-expression*—Refine the output to include lines that contain the regular expression.
  - size *maximum-file-size*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the trace-file again reaches its maximum size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

    If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and a filename.

    Syntax: *x* K to specify KB, *x* m to specify MB, or *x* g to specify GB

    Range: 10 KB through 1 GB

    Default: 128 KB

    - `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple `flag` statements.
    - `all`—Trace with all flags enabled
    - `configuration`—Trace configuration events
    - `hpl`— Trace HPL logging
    - `report`— Trace report
    - `source`—Communicate with security log forwarder
- `no-remote-trace`—Set remote tracing as disabled.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

The [edit `logical-systems` *name* security log] and [edit `tenants` *tenant-name* security log] hierarchy levels introduced in Junos OS Release 19.1R1.

traceoptions (SNMP)

IN THIS SECTION

- Syntax | 2536
- Hierarchy Level | 2536
- Description | 2536
- Options | 2537
- Required Privilege Level | 2538
- Release Information | 2538

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Track the activities of SNMP agents on the switch and record the information in log files.

NOTE: The `traceoptions` statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the `traceoptions` statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options

file *filename*—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- **all**—Log all SNMP events.
- **configuration**—Log reading of configuration at the `[edit snmp]` hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.

- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

size *size*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

- **Range:** 10 KB through 1 GB
- **Default:** 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

RELATED DOCUMENTATION

Tracing SNMP Activity on a Device Running Junos OS | 784

traceoptions (SNMP)

IN THIS SECTION

- Syntax | 2539
- Hierarchy Level | 2539
- Description | 2539
- Options | 2540
- Required Privilege Level | 2541
- Release Information | 2541

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

The output of the tracing operations is placed into log files in the `/var/log` directory. Each log file is named after the SNMP agent that generates it. Currently, the following logs are created in the `/var/log` directory when the `traceoptions` statement is used:

- chassisd
- craftd
- ilmid

- mib2d
- rmopd
- serviced
- snmpd

Options

`file` *`filename`*—By default, the name of the log file that records trace output is the name of the process being traced (for example, `mib2d` or `snmpd`). Use this option to specify another name.

`files` *`number`*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, `snmpd`) reaches its maximum size, it is archived by being renamed to `snmpd.0`. The previous `snmpd.1` is renamed to `snmpd.2`, and so on. The oldest archived file is deleted.

- **Range:** 2 through 1000 files
- **Default:** 10 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- `all`—Log all SNMP events.
- `general`—Log general events.
- `interface-stats`—Log physical and logical interface statistics.
- `nonvolatile-sets`—Log nonvolatile SNMP set request handling.
- `pdu`—Log SNMP request and response packets.
- `protocol-timeouts`—Log SNMP response timeouts.
- `routing-socket`—Log routing socket calls.
- `subagent`—Log subagent restarts.
- `timer`—Log internally generated events.
- `varbind-error`—Log variable binding errors.

`match` *`regular-expression`*—(Optional) Refine the output to include lines that contain the regular expression.

`size` *`size`*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

- **Range:** 10 KB through 1 GB

- **Default:** 1000 KB

`world-readable | no-world-readable`—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`file` *`filename`* option added in Junos OS Release 8.1.

`world-readable | no-world-readable` option added in Junos OS Release 8.1.

`match` *`regular-expression`* option added in Junos OS Release 8.1.

Tracing SNMP Activity on a Device Running Junos OS | 784

traceoptions (System Accounting)

IN THIS SECTION

- Syntax | 2542
- Hierarchy Level | 2542
- Description | 2542
- Default | 2542
- Options | 2542
- Required Privilege Level | 2543
- Release Information | 2543

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all| config | events | radius | tacplus);
    no-remote-trace
}
```

Hierarchy Level

```
[edit system accounting]]
```

Description

Define tracing operations for System Accounting.

Default

Trace options are not enabled by default.

Options

`file` *filename*—Name of the file in which Junos OS stores the accounting logs. By default, this is created under the /var/log directory.

`files` *number*—(Optional) Maximum number of trace files. When a trace file reaches the size specified by the size option, the filename is appended with 0 and compressed. For example, when trace file named trace-file-log reaches size *<size>*, it is renamed and compressed to trace-file-log.0.gz. When trace-file-log reaches size *<size>* or the second time, the trace-file-log.0.gz is renamed to trace-file-log.1.gz and trace-file-log is renamed and compressed to trace-file-log.0.gz. This renaming shceme ensures that the older logs to have a greater index number. When number of trace files reach *<number>* then the oldest file is deleted.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000 files
- **Default:** 10

`flag` *flag*—Tracing operation to perform. You can include one or more of the following flags:

- `all`—Trace all operations.
- `config`—Trace configuration processing.
- `events`—Trace accounting events and their processing.
- `radius`—Trace RADIUS processing.
- `tacplus`—Trace TACPLUS processing.

`no-remote-trace`—(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or passed through the Juniper Networks device.

`no-world-readable`—Restrict access to the trace files to the owner.

- **Default:** no-world-readable

`size` *size*—(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files by using the files option and a filename by using the file option.

If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option.

- **Syntax:** size to specify bytes, sizek to specify KB, sizem to specify MB, or sizeg to specify GB.
- **Range:** 10 KB through 1 MB
- **Default:** 128 KB

`world-readable`—Enable any user to access the trace files.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

`tacplus` option introduced in Junos OS Release 15.1.

traceoptions (System Monitor)

IN THIS SECTION

- Syntax | 2544
- Hierarchy Level | 2544
- Description | 2544
- Options | 2545
- Required Privilege Level | 2546
- Release Information | 2546

Syntax

```
traceoptions {
    file {
        files files;
        size size;
    }
    level [ all | debug | info| warning| error | critical ];
}
```

Hierarchy Level

```
[edit system monitor]
```

Description

Configure the system memory monitoring trace options on your PTX and MX Series routers. The memory monitoring system on your device monitors anomalies with respect to the memory utilization of Junos applications and overall system in the control plane of your device. Apart from monitoring the system memory, you can also configure the device to monitor the per-process memory footprint as well to help detect possible leaks and take configured action.

Options

file *filename*
Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. The files are available at the **/var/log/jsysmon.log** .

files *number*
(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the size option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

Level
Specify the level for trace logging.

all Trace all messages.

critical Trace critical messages.

debug Trace debug messages.

error Trace error messages.

info Trace information messages.

warning Trace warning messages.

- **Default:** error

Size *size*
(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

- **Syntax:** xk to specify KB, xm to specify MB, and xg to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.2R1.

traceoptions (Uplink Failure Detection)

IN THIS SECTION

- Syntax | 2546
- Hierarchy Level | 2547
- Description | 2547
- Default | 2547
- Options | 2547
- Required Privilege Level | 2548
- Release Information | 2548

Syntax

```
traceoptions  {
    file filename <files number> <no-stamp> <replace> <size size> <world-readable | no-world-
readable>;
    flag flag;
}
```

Hierarchy Level

```
[edit protocols uplink-failure-detection]
```

Description

Define tracing operations for uplink failure detection.

Default

The `traceoptions` feature is disabled by default.

Options

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached (*`x`*`k` to specify KB, *`x`*`m` to specify MB, or *`x`*`g` to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000
- **Default:** 3 files

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- `all`—Trace everything.
- `dcd`—Trace ufdd interaction with dcd.
- `groups`—Trace uplink-failure-detection group handling.
- `interface`—Trace interface notifcation handlers of ufdd.
- `parse`—Trace configuration parsing.

`no-stamp`—(Optional) Do not place a timestamp on any trace file.

`no-world-readable`—(Optional) Restricted file access to the user who created the file.

`size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify gigabytes
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable`—(Optional) Enable unrestricted file access.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

tracing

IN THIS SECTION

- Syntax | 2549
- Hierarchy Level | 2549
- Description | 2549
- Options | 2549
- Required Privilege Level | 2549
- Release Information | 2550

Syntax

```
tracing {
    destination-override syslog host ip-address;
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure the router to enable remote tracing to a specified host IP address. The default setting is disabled.

The following processes are supported:

- chassisd—Chassis-control process
- eventd—Event-processing process
- cosd—Class-of-service process
- spd—Adaptive-services process

You can use the `no-remote-trace` statement, under the `[edit system process-name traceoptions]` hierarchy, to disable remote tracing.

Options

`destination-override syslog host` *ip-address*—Overrides the global config under `system tracing` and has no effect if `system tracing` is not configured.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

trap (Security PKI)

IN THIS SECTION

- Syntax | **2554**
- Hierarchy Level | **2554**
- Description | **2554**
- Default | **2554**
- Options | **2554**
- Required Privilege Level | **2554**
- Release Information | **2555**

Syntax

```
trap {
    all certificates number-of-days;
    ca-identity number-of-days;
    certificate-id number-of-days;
}
```

Hierarchy Level

```
[edit security pki]
```

Description

To configure certificate expiration trap and configure the number of days before to generate the trap.

how

Default

- `all certificates`—60 days
- `ca-identity`—60 days
- `certificate-id` —60 days

Options

`all certificates` *`number-of-days`* —Number of days to generate traps for all certificates. You can configure from *1 to 100* days.

`ca-identity` *`number-of-days`* —Number of days to generate traps for specified CA certificate. You can configure from *1 to 100* days.

`certificate-id` *`number-of-days`* —Number of days to generate for specified local certificate. You can configure from *1 to 100* days.

trap (Security IKE)

IN THIS SECTION

- Syntax | 2555
- Hierarchy Level | 2556
- Description | 2556
- Default | 2556
- Required Privilege Level | 2556
- Release Information | 2556

Syntax

```
trap {
    ipsec-tunnel-down ;
    peer-down ;
}
```

Hierarchy Level

```
[edit security ike trap]
```

Description

ipsec-tunnel-down— By enabling the `ipsec-tunnel-down` option, the traps are generated for IPsec tunnel going down only when the associated peer IKE SA is up.

peer-down—By enabling the `peer-down` option, the traps are generated when peer goes down. Traps for the corresponding IPsec tunnels going down for the peer are not generated.

Default

- `peer-down`—Disabled
- `ipsec-tunnel-down`—Disabled

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

- Hierarchy Level | 2560
- Description | 2560
- Default | 2560
- Options | 2560
- Required Privilege Level | 2560
- Release Information | 2560

Syntax: MX, M, T, ACX and PTX Series Routers, EX Series Switches and SRX Firewalls

```
trap-options {
    agent-address outgoing-interface;
    context-oid;
    enterprise-oid;
    logical-system logical-system-name {
        routing-instance routing-instance-name {
            source-address address;
        }
    }
    routing-instance routing-instance-name {
        source-address address;
    }
}
```

QFX Series Switches, EX4600, OCX1100

```
trap-options {
    agent-address outgoing-interface;
```

```
    source-address address;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.

Default

Disabled

Options

context-oid Add context oid in varbind of all traps originating from non-default logical system and routing instance. If your network management system is not able to handle prefixes such as `<routing-instance name>@<trap-group-name>` or `<logical-system name>/<routing-instance name>@<trap-group-name>`, setting the `context-oid` configuration statement will send only the `<trap-group-name>` and add `<logical-system name>/<routing-instance name>` as an additional varbind.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`context-oid` option introduced in Junos OS Release 17.1.

```
traps traps;
```

Junos OS Hierarchy Level

```
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name]
[edit services rpm twamp client control-connection control-client-name test-session session-name]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner test test-name]
[edit services monitoring twamp client control-connection control-client-name]
```

```
[edit services monitoring twamp client control-connection control-client-name test-session session-name]
```

Description

Set the trap bit to generate SNMP traps for probes. Traps are sent if the configured threshold is met or exceeded. For TWAMP, you can configure both control-connection and test-session traps for managed clients, but only test-session traps for light clients. See SNMP MIB Explorer to learn more about the SNMP MIB objects that Juniper supports.

Default: no traps are generated

Options

traps Specify one or more SNMP traps. The options are configured per test session, except for the `control-connection-closed` and the `test-iteration-done` options. These options are configured only for TWAMP, and only per control connection. The following options are supported:

- `control-connection-closed`—(TWAMP control-connection only) Generate traps when the control connection is closed.
- `egress-jitter-exceeded`—Generate traps when the jitter in egress time threshold is met or exceeded. (MIB object jnxPingEgressJitterThresholdExceeded)
- `egress-std-dev-exceeded`—(Junos OS only) Generate traps when the egress time standard deviation threshold is met or exceeded. (MIB object jnxPingEgressStdDevThresholdExceeded)
- `egress-time-exceeded`—Generate traps when the maximum egress time threshold is met or exceeded. (MIB object jnxPingEgressThresholdExceeded)
- `ingress-jitter-exceeded`—Generate traps when the jitter in ingress time threshold is met or exceeded. (MIB object jnxPingIngressJitterThresholdExceeded)
- `ingress-std-dev-exceeded`—(Junos OS only) Generate traps when the ingress time standard deviation threshold is met or exceeded. (MIB object jnxPingIngressStddevThresholdExceeded)
- `ingress-time-exceeded`—Generate traps when the maximum ingress time threshold is met or exceeded. (MIB object jnxPingIngressThresholdExceeded)
- `jitter-exceeded`—Generate traps when the jitter in round-trip time threshold is met or exceeded. (MIB object jnxPingRttJitterThresholdExceeded)

- `max-rtt-threshold`—(Junos OS only) Generate traps when the maximum round trip time threshold at the end of the test is met or exceeded. (MIB object jnxPingMaxRttThresholdExceeded)
- `probe-failure`—Generate traps when successive probe loss thresholds are crossed. (MIB object pingProbeFailed)
- `rtt-exceeded`—Generate traps when the maximum round-trip time threshold is met or exceeded. (MIB object jnxPingRttThresholdExceeded)
- `std-dev-exceeded`—(Junos OS only) Generate traps when the round-trip time standard deviation threshold is met or exceeded. (MIB object jnxPingRttStdDevThresholdExceeded)
- `test-completion`—Generate traps when a test is completed. (MIB object pingTestCompleted)
- `test-failure`—Generate traps when the total probe loss threshold is met or exceeded. (MIB object pingTestFailed)
- `test-iteration-done`—(TWAMP control-connection only) Generate traps when all test sessions under control connections complete one test iteration.

NOTE: To generate RPM traps, you must configure the `remote-operations` SNMP trap category by including the `categories` statement at the `[edit snmp trap-group` *`trap-group-name`*`]` hierarchy level.

Additional Information

(Junos OS Evolved only) The Juniper PING MIB does not support the following notifications, because the corresponding thresholds are not configurable for Junos OS Evolved and hence the traps are never generated:

- jnxPingRttStdDevThresholdExceeded
- jnxPingEgressStdDevThresholdExceeded
- jnxPingIngressStddevThresholdExceeded
- jnxPingMaxRttThresholdExceeded

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] and [`edit services rpm twamp client control-connection` *`control-client-name`* `test-session` *`session-name`*] hierarchy levels introduced in Junos OS Release 15.1 for MX Series routers.

Support at the [`edit services monitoring rpm owner test` *`test-name`*] hierarchy level introduced in Junos OS Evolved Release 21.2R1 for PTX Series routers.

Support at the [edit services monitoring twamp client control-connection *control-client-name*] and [edit services monitoring twamp client control-connection *control-client-name* test-session *session-name*] hierarchy levels introduced in Junos OS Evolved Release 21.3R1 for PTX Series routers.

traffic-statistics

IN THIS SECTION

- Syntax | 2566
- Hierarchy Level | 2566
- Description | 2566
- Default | 2567
- Options | 2567
- Required Privilege Level | 2568
- Release Information | 2568

Syntax

```
traffic-statistics {
    file filename {
        files number-of-files;
        size size;
    }
    interval interval;
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Enable the logging of traffic statistics in a local file. This statement does not enable traffic statistics monitoring.

To enable the monitoring of traffic statistics, configure the `traffic-statistics` configuration statement at the `[edit services analytics interfaces]` hierarchy level.

Default

This feature is disabled by default.

Options

file *filename* Specify a filename for storing the traffic statistics in the JavaScript Object Notification (JSON) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

files *number-of-files* Specify the number of files to store locally. After the number files with the maximum file size is reached, the system starts over and writes the data to the first file.

- **Range:** 2 to 1,000 files.

interval *interval* Configure the polling interval in seconds.

> **NOTE**: You can configure the polling interval for traffic statistics globally for all interfaces only. Due to limitations and variations in the hardware capability of different devices, you might see a difference in value between the actual interval and configured interval.

- Range:
  - Junos OS Release 13.2X51-D10 or later—2 to 300 seconds (2 seconds to 5 minutes)
  - Junos OS Release 13.2X50-D15—1 to 300 seconds (1 second to 5 minutes)

> **NOTE**: In Junos OS Release 13.2X51-D10 or later, if you configured an interval of less than 2 seconds, the following warning messages appear during the commit process:
>
> `Traffic statistics polling interval can not be less than 2 seconds`, and
>
> `Setting Traffic statistics polling interval to 2 seconds.`
>
> These messages do not stop the commit operation, but the interval is automatically set to 2 seconds.

- Default:
  - Junos OS Release 13.2X50-D15—1 second
  - Junos OS Release 13.2X51-D10 or later—2 seconds

size *size* Configure the file size in megabytes (MB).

- **Syntax:** `xm` to specify MB.
- **Range:** 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

type—Type of notification. It can be one of the following:

- **log**—Add an entry to the **logTable** object.
- **log-and-trap**—Send an SNMP trap and add a log entry.
- **none**—No notifications are sent.
- **snmptrap**—Send an SNMP trap.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

```

```
    }
}
```

Hierarchy Level

```
[edit services rpm twamp server]
```

Description

Defines the Two-Way Active Measurement Protocol (TWAMP) server configurations. This configuration describes a TWAMP server on the router that enables a TWAMP client to connect to the server using any media interface IP address. In such scenarios, the router functions as a TWAMP server and timestamping is performed in the ukernel of the media-facing Flexible PIC Concentrator (FPC).

Options

server TWAMP server configuration.

authentication-mode Set of authentication modes that the server can accept.

- **Default:** none

max-connection-duration Maximum time a connection can exist between the client and the server.

- **Default:** `24`
- **Range:** `0-120`

maximum-sessions Maximum number of test sessions for the server.

- **Default:** `64`
- **Range:** `1-2048`

maximum-sessions-per-connection Maximum number of test sessions per client connection.

- **Default:** `64`
- **Range:** `1-1024`

maximum-connections Maximum number of connections for the server.

- **Default:** 64
- **Range:** 1-1000

maximum-connections-per-client Maximum number of server connections per client.

- **Default:** 64
- **Range:** 1-500

port TWAMP server listening port used by the routing instance.

- **Default:** 862
- **Range:** 1-65535

client-list List of allowed control client hosts that can connect to this server. Each item in the list is a Classless Interdomain Routing (CIDR) address (ip address1/mask1) that represents the network of allowed hosts.

routing-instance-list List of allowed routing instances (a maximum of 31 characters). It configures the TWAMP servers on specific routing instances, instead of associating the TWAMP server at the system-level to apply to all routing instances configured on a router. The default routing instance is Internet routing table `inet.0`. If you do not specify a routing instance then the TWAMP probe applies to all routing instances. Up to 100 routing instances can be configured for a TWAMP server.

- **Range:** 1-65535

server-inactivity-timeout Maximum time the TWAMP server has to finish the TWAMP control protocol negotiation. Control packet idle timeout value in minutes, 0 to disable (minutes).

- **Default:** 15
- **Range:** 0-30

Required Privilege Level

system—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D110.

                test-iteration-done ;
            }
            }
    }
}
```

Hierarchy Level

```
[edit services rpm twamp client]
```

Description

Defines the Two-Way Active Measurement Protocol (TWAMP) client configuration. A client opens a TCP connection to the server on well-known port 862. The host that initiates the TCP connection takes the roles of control client and session sender. The host that acknowledges the TCP connection accepts the roles of server and session reflector.

Options

client TWAMP client configuration.

authentication-mode Set of authentication modes that the client can accept.

- **Default:** none

destination-port Either the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP) port to which a probe is sent.

- **Default:** 862

history-size Number of stored history entries.

- **Default:** `50`
- **Range:** `0-500`

moving-average-size Number of samples for making statistical calculations.

- **Default:** `0`
- **Range:** `0-1024`

routing-instance Routing instance used by test sessions.

target-address Destination address or URL used for the probes.

test-count Total number of test session iterations.

- **Default:** `0`
- **Range:** `0-4,294,967,290`

test-interval Number of seconds to wait between tests.

- **Default:** `1`
- **Range:** `1-255`

test-session Test session details.

data-fill-with-zeros If the option is defined, then the test packet value becomes zero. If the option is not defined, then a pseudorandom number is updated as data.

dscp-code-points DiffServ code point bits or alias used for UDP data of test probes or test packets in test sessions.

- **Default:** `0`

probe-count Total number of probes per test.

- **Default:** `1`
- **Range:** `1-4,294,967,290`

thresholds Test threshold values.

traps Trap to send if threshold is met or exceeded.

control-connection-closed Generate traps when the control connection is closed.

test-iteration-done Generate traps when all test sessions under control connections complete one test iteration.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D110.

[edit system syslog]
```

Description

Configure the logging of system messages to user terminals.

Options

***** (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see "Junos OS System Logging Facilities and Message Severity Levels" on page 1462.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities the specified level and higher are logged. For a list of the severities, see "Junos OS System Logging Facilities and Message Severity Levels" on page 1462.

username—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one **user** statement.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

- Required Privilege Level | 2600
- Release Information | 2601

Syntax

```
variable oid-variable;
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.

Options

oid-variable—OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, `1.3.6.1.2.1.2.1.2.2.1.10.1`). Alternatively, use the MIB object name (for example, `ifInOctets.1`).

view (Configuring a MIB View)

IN THIS SECTION

- Syntax | 2605
- Hierarchy Level | 2605
- Description | 2605
- Options | 2606
- Required Privilege Level | 2606
- Release Information | 2606

Syntax

```
view view-name {
    oid object-identifier <include | exclude>;
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The `view` statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the `view` statement at the `[edit snmp community community-name]` hierarchy level.

NOTE: To remove an OID completely, use the `delete view all oid oid-number` command but omit the `include` parameter.

Options

view-name—Name of the view.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 2607
- Release Information | 2607

Syntax

```
view view-name;
```

Hierarchy Level

```
[edit snmp community community-name]
```

Description

Associate a view with a community. A view represents a group of MIB objects.

Options

view-name—Name of the view. You must use a view name already configured in the `view` statement at the `[edit snmp]` hierarchy level.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

vlan (Mirroring)

IN THIS SECTION

- Syntax | 2608
- Hierarchy Level | 2608
- Description | 2608
- Options | 2608
- Required Privilege Level | 2609
- Release Information | 2609

Syntax

```
vlan (vlan-id | vlan-name);
```

Hierarchy Level

```
[edit forwarding-options analyzer analyzer-name input ingress],
[edit forwarding-options analyzer analyzer-name input ingress routing-instance instance-name],
[edit forwarding-options analyzer analyzer-name output],
[edit forwarding-options analyzer analyzer-name output routing-instance instance-name]
```

Description

Configure mirrored traffic to be sent to a VLAN for remote monitoring.

Options

vlan-id	Numeric VLAN identifier.
vlan-name	Name of the VLAN.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 (ELS).

RELATED DOCUMENTATION

vlan (Port Mirroring)

IN THIS SECTION

- Syntax | 2609
- Hierarchy Level | 2610
- Description | 2610
- Options | 2610
- Required Privilege Level | 2610
- Release Information | 2610

Syntax

```
vlan (vlan-name | vlan-ID);
```

Hierarchy Level

```
[edit forwarding-options port-mirroring family ethernet-switching output]
[edit forwarding-options port-mirroring instance instance-name family ethernet-switching output]
```

Description

Specify the VLAN name or ID for sending copies of packets to an analyzer. This configuration enables remote VLAN port mirroring on EX Series switches.

Options

vlan-name—Name of remote mirroring VLAN.

vlan-ID—ID of the remote mirroring VLAN.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

RELATED DOCUMENTATION

Example: Configuring Layer 2 Port Mirroring to Remote VLAN | **1420**

Layer 2 Port Mirroring to Remote Destination by Using Destination as VLAN | **1417**

vlan (Port Mirroring)

IN THIS SECTION

- Syntax | 2611
- Hierarchy Level | 2611
- Description | 2611
- Options | 2612
- Required Privilege Level | 2612
- Release Information | 2612

Syntax

```
vlan (vlan-id | vlan-name) {
    no-tag;
```

Hierarchy Level

For platforms without ELS:

```
[edit ethernet-switching-options analyzer name input ingress],
[edit ethernet-switching-options analyzer name output]
```

For platforms with ELS:

```
[edit forwarding-options analyzer name input (egress | ingress)]
[edit forwarding-options analyzer name output]
[edit forwarding-options port-mirroring [instance name] family ethernet-switching output]
```

Description

When used in an `input` statement, specifies that traffic entering or exiting a VLAN should be mirrored. (You can include this statement in an `ingress` statement or `egress` statement within the `input` statement. It

is not supported in an `egress` statement on all switches) When used in an `output` statement, specifies that mirrored traffic to be sent to a VLAN for remote monitoring.

On some switches, only one interface can be a member of the output (analyzer) VLAN. This limitation does not apply on the QFX10000 switch if traffic is mirrored on ingress. In this case, multiple QFX10000 interfaces can belong to the output VLAN, and traffic is mirrored to all of those interfaces. If traffic is mirrored on egress on a QFX10000 switch, only one interface can be a member of the analyzer VLAN.

Options

vlan-id—Numeric VLAN identifer.

vlan-name—Name of the VLAN.

`no-tag`—Specifies that remote mirrored packets are not tagged with the tag of the output (analyzer) VLAN.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Option`output vlan` added in Junos OS Release 12.1 for the QFX Series.

Option`no-tag` added in Junos OS Release 15.1X53-D10 for QFX10000 switches.

clear chassis cluster ip-monitoring failure-count

IN THIS SECTION

- Syntax | 2621
- Description | 2621
- Required Privilege Level | 2621
- Output Fields | 2621
- Sample Output | 2621
- Release Information | 2622

Syntax

```
clear chassis cluster ip-monitoring failure-count
```

Description

Clear the failure count for all IP addresses.

Required Privilege Level

clear

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count
```

command-name

```
node0:
--------------------------------------------------------------------------
Cleared failure count for all IPs

node1:
--------------------------------------------------------------------------
Cleared failure count for all IPs
```

Release Information

Command introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

Syntax

```
clear chassis cluster ip-monitoring failure-count ip-address IP-address
```

Description

Clear the failure count for a specified IP address.

> **NOTE**: Entering an IP address at the end of this command is optional. If you do not specify an IP address, the failure count for all monitored IP addresses is cleared.

Required Privilege Level

clear

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> clear chassis cluster ip-monitoring failure-count ip-address 10.1.1.1
```

clear chassis cluster ip-monitoring failure-count ip-address 10.1.1.1

```
node0:
--------------------------------------------------------------------------
Cleared failure count for IP: 10.1.1.1

node1:
--------------------------------------------------------------------------
Cleared failure count for IP: 10.1.1.1
```

Release Information

Command introduced in Junos OS Release 10.1.

clear interfaces statistics

IN THIS SECTION

- Syntax | 2625
- Description | 2626
- Options | 2626
- Required Privilege Level | 2626
- Output Fields | 2626
- Sample Output | 2626
- Release Information | 2627

Syntax

```
clear interfaces statistics (all | interface-name)
```

Description

Set interface statistics to zero. If you issue the `clear interfaces statistics` *interface-name* command and then perform a graceful Routing Engine switchover, the interface statistics are not cleared on the new primary node. Reissue the command to clear the interface statistics again.

Starting in Junos OS Release 17.3R1, this command supports the clearing of Packet Forwarding Engine accounting statistics on logical interfaces configured with accounting options. On these interfaces, the current statistics values are stored as the new current baseline values and then the counters are reset to zero. If the `allow-clear` statement is included in the interface profile, then the cleared statistics values are reported to the accounting options flat file associated with the interface. Reporting is disabled by default; if `allow-clear` is not configured, then the CLI displays cleared statistics counters, but they are not reported to the flat file.

Starting in Junos OS Release 19.1R1, this command supports the clearing of unicast Reverse Path Forwarding (RPF) statistics.

Starting in Junos OS Release 21.3R1, on MX Series Routers, this command supports the clearing of Reverse Path Forwarding (RPF) statistics of the Ethernet interfaces.

Options

all	Set statistics on all interfaces to zero.
interface-name	Set statistics on a particular interface to zero.

Required Privilege Level

clear

Output Fields

When you enter this command, you are provided no feedback on the status of your request.

Sample Output

clear interfaces statistics

```
user@host> clear interfaces statistics
```

Release Information

Command introduced before Junos OS Release 7.4.

Release History Table

Release	Description
17.3R1	Starting in Junos OS Release 17.3R1, this command supports the clearing of Packet Forwarding Engine accounting statistics on logical interfaces configured with accounting options.

Syntax

```
clear oam ethernet connectivity-fault-management delay-statistics
maintenance-association maintenance-association-name
maintenance-domain maintenance-domain-name
<logical-system logical-system-name>
<one-way>
<two-way>
```

Description

On MX Series routers and EX Series switches, clear ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) delay statistics and ETH-DM frame counts.

Options

maintenance-association *maintenance-association-name*	Clear ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association.
maintenance-domain *maintenance-domain-name*	Clear ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance domain.
logical-system *logical-system-name*	(MX Series routers only) (Optional) Clear ETH-DM delay statistics and ETH-DM frame counts for the specified logical system.
one-way	(Optional) Clear one-way ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association, maintenance domain, or (on the routers only) logical system.
two-way	(Optional) Clear two-way ETH-DM delay statistics and ETH-DM frame counts for the specified maintenance association, maintenance domain, or (on the routers only) logical system.

Output Fields

The following outputs are occurred in two conditions:

- Clear log stream file successfully, when there is log file.
- Clear log stream file error or does not exits, when there is no log file.

Sample Output

clear security log stream file LSYS_f1.bin logical-system LSYS1

```
user@host> clear security log stream file LSYS_f1.bin logical-system LSYS1
Request to clear log stream file succeeds
```

clear security log stream file TSYS_f1.bin tenant-system TSYS1

```
user@host> clear security log stream file TSYS_f1.bin tenant-system TSYS1
Request to clear log stream file succeeds
```

Release Information

Command introduced in Junos OS Release 15.1X49-D70.

The `logical-system` and `tenant` options are introduced in Junos OS Release 19.2R1.

clear services rpm twamp server connection

IN THIS SECTION

- Syntax | 2655
- Description | 2655
- Options | 2655
- Required Privilege Level | 2655
- Release Information | 2655

Syntax

```
clear services rpm twamp server connection
<connection-id>
```

Description

Clear connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients. By default all established connections are cleared (along with the sessions on those connections). To clear only a specific connection, specify the connection ID when you issue the command.

Options

connection-id	(Optional) Clears specific connection as per the ID mentioned.

Required Privilege Level

clear

Release Information

Command introduced in Junos OS Release 15.1.

clear sflow collector statistics (QFX Series)

IN THIS SECTION

- Syntax | **2656**
- Description | **2656**
- Required Privilege Level | **2656**
- Sample Output | **2656**
- Release Information | **2657**

Syntax

```
clear sflow collector statistics
```

Description

Clear the sample counters for all sFlow collectors.

Required Privilege Level

view

Sample Output

clear sflow collector statistics

The following example shows two output examples for the `show sflow collector` command, one before and one after the `clear sflow collector statistics` command was issued.

```
user@host> show sflow collector
Collector        Udp-port    No. of samples
   address
   10.1.1.1            6343        3174
   10.1.2.1            6343        3562
```

command-name

```
user@host> clear sflow collector statistics
```

command-name

```
user@host> show sflow collector
Collector        Udp-port    No. of samples
   address
   10.1.1.1             6343        0
   10.1.2.1             6343        0
```

Release Information

Command introduced in Junos OS Release 11.3.

monitor ethernet delay-measurement

IN THIS SECTION

- Syntax | 2662
- Description | 2662
- Options | 2663
- Required Privilege Level | 2664
- Output Fields | 2664
- Sample Output | 2666
- Release Information | 2667

Syntax

```
monitor ethernet delay-measurement maintenance-domain md-name maintenance-association ma-name
(one-way | two-way) (remote-mac-address | mep remote-mep-id) <count count>  <no-session-id-tlv>
<priority 802.1p value> <size size>  <wait time>
```

Description

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +C to explicitly quit the `monitor ethernet delay-measurement` command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the switch initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the `monitor ethernet delay-measurement` command and are also stored at both the initiator and receiver MEPs for

later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay	The difference, in microseconds, between the time a frame is sent and when it is received.
Frame delay variation	The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options

count *count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
mep *remote-mep-id*	Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
no-session-id-tlv	(Optional) Prevent insertion of the session ID TLV in the request frame.
one-way	Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (1DM) frame and the time at which the receiver MEP receives the frame.
priority *802.1p value*	(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in *nn:nn:nn:nn:nn:nn* format. Multicast MAC addresses are not supported.
size *size*	(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

two-way Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.

wait *time* (Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

Required Privilege Level

trace and maintenance

Output Fields

The `monitor ethernet delay-measurement` command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- Table 194 on page 2664 lists the run-time output fields for the `monitor ethernet delay-measurement one-way` command.
- Table 195 on page 2665 lists the run-time output fields for the `monitor ethernet delay-measurement two-way` command.

Output fields are listed in the approximate order in which they appear.

Table 194: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
1DM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of 1DM PDU frames sent to the remote MEP during this measurement session.

Table 194: monitor ethernet delay-measurement one-way Output Fields *(Continued)*

Output Field Name	Output Field Description
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

NOTE: For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 195: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as *jitter*.
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.

Table 195: monitor ethernet delay-measurement two-way Output Fields *(Continued)*

Output Field Name	Output Field Description
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

Description

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the `monitor ethernet delay-measurement` command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the `monitor ethernet delay-measurement` command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay — The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation — The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options

maintenance-domain *md-name* — Name of an existing CFM maintenance domain.

maintenance-association *ma-name* — Name of an existing CFM maintenance association.

one-way	Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (1DM) frame and the time at which the receiver MEP receives the frame.
two-way	Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.
mep *remote-mep-id*	Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.
count *frame-count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.
wait *interval-seconds*	(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
priority *802.1p value*	(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
size	(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
no-session-id-tlv	(Optional) Prevent insertion of the session ID TLV in the request frame.
xml	(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The `display xml` command does not work.

Additional Information

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`
- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer.

- `show oam ethernet connectivity-fault-management delay-statistics`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management statistics` command, described in the CLI Explorer.

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.

Required Privilege Level

trace and maintenance

Output Fields

The `monitor ethernet delay-measurement` command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- Table 196 on page 2672 lists the run-time output fields for the `monitor ethernet delay-measurement one-way` command.
- Table 197 on page 2672 lists the run-time output fields for the `monitor ethernet delay-measurement two-way` command.

Output fields are listed in the approximate order in which they appear.

Table 196: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
1DM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of 1DM PDU frames sent to the remote MEP during this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

NOTE: For one-way delay measurement, these CLI output fields display **NA** (“not applicable”) at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 197: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.

Table 197: monitor ethernet delay-measurement two-way Output Fields *(Continued)*

Output Field Name	Output Field Description
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter.
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

```

```
<no-session-id-tlv>
<xml>
```

Description

Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

NOTE: If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the `monitor ethernet loss-measurement` command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the `monitor ethernet loss-measurement` command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

Options

maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
mep *remote-mep-id*	Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

count *frame-count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.
local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
wait *interval-seconds*	(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
priority *802.1p value*	(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.
no-session-id-tlv	(Optional) Disable the **session id TLV** argument set in the request frame.
xml	(Optional) Allow the output of the command to be displayed in XML format.

Additional Information

To display the interator output for an LM session, run the following command:

- `show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>`

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management loss-statistics`
- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`
- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- `show oam ethernet connectivity-fault-management delay-statistics`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain` *md-name* `maintenance-association` *ma-name* command, as described in the CLI Explorer.

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.

Output Fields

Table 198 on page 2678 lists the output fields for the `monitor ethernet loss-measurement` command and their descriptions. Output fields are listed in the approximate order in which they appear.

Table 198: monitor ethernet loss-measurement output fields

Output Field Name	Output Field Description
Ethernet loss delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
LMR received from	Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
LMM packets transmitted	Total number of LMM PDU frames sent to the remote MEP in this measurement session.

Table 198: monitor ethernet loss-measurement output fields *(Continued)*

Output Field Name	Output Field Description
LMR packets received	Total number of LMR PDU frames received from the remote MEP in this measurement session.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case frame loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case frame loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.

Table 198: monitor ethernet loss-measurement output fields *(Continued)*

Output Field Name	Output Field Description
Far-end worst case frame loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

<priority 802.1p value>
<size>
<xml>
```

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the `monitor ethernet synthetic-loss-measurement` command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the `monitor ethernet synthetic-loss-measurement` command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
mep *remote-mep-id*	Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.
remote-mac-address	Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, `0011.2233.4455` or `00:11:22:33:44:55`. Multicast MAC addresses are not supported.
count *frame-count*	(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.
local-mep *mep-id*	(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.
wait *interval-milliseconds*	(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.
priority *802.1p value*	(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.
size	(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
xml	(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the `xml` argument. The `display xml` command does not work.

Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- `show oam ethernet connectivity-fault-management interfaces detail`
- `show oam ethernet connectivity-fault-management mep-database`

- `show oam ethernet connectivity-fault-management mep-statistics`

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer.

- `show oam ethernet connectivity-fault-management synthetic-loss-measurement`
- `show oam ethernet connectivity-fault-management mep-statistics`

To clear both the frame counts and the statistics collected for MEPs, use the `clear oam ethernet connectivity-fault-management statistics` command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.

Required Privilege Level

trace and maintenance

Output Fields

The `monitor ethernet synthetic-loss-measurement` command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- Table 199 on page 2685 lists the run-time output fields for the `monitor ethernet synthetic-loss-measurement` command.

Output fields are listed in the approximate order in which they appear.

Table 199: monitor ethernet synthetic-loss-measurement Output Fields

Output Field Name	Output Field Description
`ETH-SLM request to`	Unicast MAC address of the remote peer MEP.
`Interface`	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.

Table 199: monitor ethernet synthetic-loss-measurement Output Fields *(Continued)*

Output Field Name	Output Field Description
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

monitor ethernet synthetic-loss-measurement

```
user@host> monitor ethernet synthetic-loss-measurement 00:05:85:73:39:4a maintenance-domain md6
maintenance-association ma6 count 10
ETH-SLM request to 00:05:85:73:39:4a, interface ge-1/0/0.0
      Synthetic Loss measurement statistics:
       SLM packets sent                          : 100
       SLR packets received                      : 100
       Accumulated SLM statistics:
```

```
        Local TXFC1 value                       : 100
        Local RXFC1 value                       : 100
        Last Received SLR frame TXFCf(tc)       : 100
        Last Received SLR frame TXFCb(tc)       : 100
        SLM Frame Loss:
        Frame Loss (far-end)                    : 0 (0.00 %)
        Frame Loss (near-end)                   : 0 (0.00 %)
```

Sample Output | 2703
Release Information | 2711

Syntax

```
monitor traffic
<brief | detail | extensive>
<absolute-sequence>
<count count>
<interface interface-name>
<layer2-headers>
<matching matching>
<no-domain-names>
<no-promiscuous>
<no-resolve>
<no-timestamp>
<print-ascii>
<print-hex>
<read-file filename>
<resolve-timeout>
<size size>
<write-file filename>
```

Description

Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the `monitor-traffic` command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the `no-resolve` option.

NOTE: This command is not supported on the QFabric system.

Options

none — (Optional) Display packet headers transmitted through fxp0. On a TX Matrix Plus router, display packet headers transmitted through em0.

brief | detail | extensive — (Optional) Display the specified level of output.

absolute-sequence — (Optional) Display absolute TCP sequence numbers.

count *count* — (Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

interface *interface-name* — (Optional) Specify the interface on which the `monitor traffic` command displays packet data. If no interface is specified, the `monitor traffic` command displays packet data arriving on the lowest-numbered interface.

In Junos OS Evolved:

- If you modify an interface that you are monitoring with the `monitor traffic interface` command, the monitoring session ends with the message: pcap_loop: read: Device not configured. To continue monitoring the interface, rerun the `monitor traffic interface` command. However, if the monitored interface is removed, the command session continues, but there will be no packets or errors reported.
- When you use the command `monitor traffic interface *interface-name*` on a logical interface, the output displays all packets received or transmitted on that interface, including Layer 2 traffic. When you use this command on a physical interface, the output only displays packets received and transmitted on the physical interface and does not include traffic from the logical interface.

layer2-headers — (Optional) Display the link-level header on each line.

matching *matching* — (Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the `monitor traffic` command filters and displays packet data.

no-domain-names — (Optional) Suppress the display of the domain portion of hostnames. With the `no-domain-names` option enabled, the `monitor traffic` command displays only `team` for the hostname **team.company.net**.

no-promiscuous — (Optional) Do not put the interface into promiscuous mode.

no-resolve	(Optional) Suppress reverse lookup of the IP addresses.
no-timestamp	(Optional) Suppress timestamps on displayed packets.
print-ascii	(Optional) Display each packet in ASCII format.
print-hex	(Optional) Display each packet, except the link-level header, in hexadecimal format.
read-file *filename*	Read packets from the file specified.
resolve-timeout *timeout*	(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the `print-ascii`, `print-hex`, or `extensive` option.
size *size*	(Optional) Read but do not display up to the specified number of bytes for each packet. When set to `brief` output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to `detail` and `extensive` output, the default packet size is 1514. The `monitor traffic` command truncates displayed packets if the matched data exceeds the configured size.
write-file *filename*	Write packets to the file specified.

NOTE: Starting in Junos OS Evolved 20.4R1, the `write-file` option at the `monitor traffic interface` hierarchy level takes precedence over the `extensive` option when you configure them simultaneously. If you try to configure these options at the same time, Junos OS Evolved gives you a warning message that the options are not compatible, and it only runs the `monitor traffic interface write-file` command.

Additional Information

In the `monitor traffic` command, you can specify an expression to match by using the `matching` option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace *expression* with one or more of the match conditions listed in Table 202 on page 2697.

Table 202: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	`host [address | hostname]`	Matches packets that contain the specified address or hostname. The protocol match conditions `arp`, `ip`, or `rarp`, or any of the directional match conditions can be prepended to the `host` match condition.
	`net address`	Matches packets with source or destination addresses containing the specified network address.
	`net address mask mask`	Matches packets containing the specified network address and subnet mask.
	`port (port-number | port-name)`	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as `bgp` (179), `dhcp` (67), or `domain` (53) (the port numbers are also listed).
Directional	`dst`	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	`src`	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.

Table 202: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
	`src` and `dst`	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	`src` or `dst`	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	`less` *value*	Matches packets shorter than or equal to the specified value, in bytes.
	`greater` *value*	Matches packets longer than or equal to the specified value, in bytes.
Protocol	`amt`	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	`arp`	Matches all ARP packets.
	`ether`	Matches all Ethernet packets.
	`ether (broadcast | multicast)`	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with`src` and `dst`.

Table 202: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
	`ether` *protocol* (*address* | (`arp` | `ip` | `rarp`))	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The `ether` *protocol* arguments `arp`, `ip`, and `rarp` are also independent match conditions, so they must be preceded by a backslash (\) when used in the `ether` *protocol* match condition.
	`icmp`	Matches all ICMP packets.
	`ip`	Matches all IP packets.
	`ip (broadcast | multicast)`	Matches broadcast or multicast IP packets.
	`ip protocol` (*address* | (`icmp` | `igrp` | `tcp` | `udp`))	Matches packets with the specified address or protocol type. The `ip` *protocol* arguments `icmp`, `tcp`, and `udp` are also independent match conditions, so they must be preceded by a backslash (\) when used in the `ip` *protocol* match condition.
	`isis`	Matches all IS-IS routing messages.
	`proto` *ip-protocol-number*	Matches packets whose headers contain the specified IP protocol number.
	`rarp`	Matches all RARP packets.
	`tcp`	Matches all TCP datagrams.

Table 202: Match Conditions for the monitor traffic Command *(Continued)*

Match Type	Condition	Description
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in Table 203 on page 2700.

Table 203: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
||	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
( )	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0""arithmetic_expression relational_operator
arithmetic_expression"
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in Table 204 on page 2701.

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The `monitor traffic` command cannot apply match conditions to inbound traffic.
- The `monitor traffic interface` command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the `match` pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see Table 202 on page 2697.
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the `monitor traffic interface ae[x]` command for aggregated Ethernet interfaces (such as) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 204: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.

Table 204: Arithmetic and Relational Operators for the monitor traffic Command *(Continued)*

Arithmetic or Relational Operator	Description
*	Bitwise exclusive OR.
|	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

<ttl value>
<verbose>
<wait seconds>
```

Description

Check host reachability and network connectivity. The `ping` command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options

host	IP address or hostname of the remote system to ping.
bypass-routing	(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.
ce-ip *destination-ip-address* instance *routing-instance-name* source-ip *source-ip-address*	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the connectivity information of customer edge (CE) devices, such as reachability, attachment points, and MAC addresses, from a provider edge (PE) device in a virtual private LAN service (VPLS), hierarchical VPLS (H-VPLS), and Ethernet VPN (EVPN) network. The `ce-ip` option is based on the LSP ping infrastructure, where the `ping` utility is extended to use the CE device IP address as the target host and the PE device loopback address as the source for a specific VPLS or EVPN routing instance.
destination-ip-address	IPv4 address of the CE device to ping.
instance *routing-instance-name*	Name of the VPLS or EVPN routing instance. The command output displays the connectivity information of the CE device based on the configured routing instance type.
source-ip *source-ip-address*	Loopback address of the PE device.
count *requests*	(Optional) Number of ping requests to send. The range of values is `1` through `2,000,000,000`. The default value is an unlimited number of requests.
detail	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Include in the output the interface on which the ping reply was received.
do-not-fragment	(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For Junos OS Evolved Release 18.3R1, IPv6 `ping` does not have `do-not-fragment` support. The `ping` command is identified as IPv6 Ping when destination is IPv6 address or `inet6` option is used. For Junos OS IPv6 packets, this option disables fragmentation. **NOTE**: In Junos OS Release 11.1 and later, when issuing the `ping` command for an IPv6 route with the `do-not-fragment` option, the maximum

ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet — (Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6 — (Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface* — (Optional) Interface to use to send the ping requests.

interval *seconds* — (Optional) How often to send ping requests. The range of values, in seconds, is `1` through infinity. The default value is `1`.

logical-system *logical-system-name* — (Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the `set cli logical-system` *`logical-system-name`* command and then run the `ping` command. To return to the main router or switch, enter the `clear cli logical-system` command.

tenant *tenant-name* — (Optional) Name of tenant system from which to send the ping requests.

loose-source *value* — (Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address *mac-address* — (Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve — (Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern *string* — (Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid — (Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the `count` option.

record-route — (Optional) Record and report the packet's path (IPv4).

routing-instance *routing-instance-name* — (Optional) Name of the routing instance for the ping attempt. For Junos OS Evolved, the `routing-instance` option supports only `mgmt_junos`.

size *bytes* (Optional) Size of ping request packets. The range of values, in bytes, is `0` through `65,468`. The default value is `56`, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source *source-address* (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).

strict (Optional) Use the strict source route option (IPv4).

strict-source *value* (Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos *type-of-service* (Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is `0` through `255`.

If the device configuration includes the `dscp-code-point` *value* statement at the `[edit class-of-service host-outbound-traffic]` hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the `dscp-code-point` configuration statement instead of the value you specify in this command option.

ttl *value* (Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is `0` through `255`.

verbose (Optional) Display detailed output.

vpls *instance-name* (Optional) Ping the instance to which this VPLS belongs.

wait *seconds* (Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is `10` seconds. If this option is used without the count option, a default count of `5` packets is used.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

When pinging a nonexistant route, the display output of `ping` command does not print the number of packets sent or received or the packet loss.

Sample Output

ping ce-ip *destination-ip-address* instance *routing-instance-name* source-ip *source-ip-address* (EVPN)

```
user@host> ping ce-ip 10.0.0.4 instance foo source-ip 127.0.0.1

Release Information

Command introduced before Junos OS Release 7.4.

`ce-ip` option introduced in Junos OS Release 17.3 for MX Series routers with MPC and MIC interfaces.

The following options are deprecated for Junos OS Evolved Release 18.3R1: `detail`, `logical-system`, `loose-source`, `mac-address`, `strict`, `strict-source`, and `vpls`.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for SRX Series.

request debug information

IN THIS SECTION

- Syntax | **2721**
- Description | **2721**
- Options | **2721**
- Additional Information | **2721**
- Required Privilege Level | **2722**
- Sample Output | **2722**
- Release Information | **2724**

Syntax

```
request debug information
<mgd>
```

Description

Consolidate debugging information for the component specified. You can issue the command without a component specified

Using this command speeds up the initial information-gathering phase of debugging. The output includes the combined output of multiple member commands.

Options

mgd (Optional) Display debug information for the Mangement process (mgd) workflows.

Additional Information

The following commands are member commands executed by issuing the `request debug information mgd` command; the output of the `request debug information mgd` command consolidates the output of these member commands:

- show version no-forwarding
- show system uptime no-forwarding
- show system core-dumps no-forwarding
- show system storage no-forwarding
- show system processes extensive no-forwarding
- show mgd database-mappings
- show mgd database-mappings include-merge-view
- show mgd dop-refcount-statistics
- show mgd daemon-control-table
- show mgd database-statistics
- show mgd database-statistics committed

- show mgd ephemeral-instance-statistics
- show mgd expanded-configuration
- show mgd memory-statistics
- show system configuration database usage
- file list detail /var/rundb/
- file list detail /config/
- show system commit
- show system commit revision detail

NOTE: Because the `request debug information` command executes various CLI commands that do not fit into one particular structure, the `request debug information | display xml` command will simply emit the output within a single set of output tags.

Required Privilege Level

view

Sample Output

request debug information mgd

```
user@host> request debug information mgd
```

The following sample output gives only a subset of the output the command can display:

```
user@host> show system uptime no-forwarding

Current time: 2019-05-27 10:58:07 IST
Time Source:  LOCAL CLOCK
System booted: 2019-05-13 23:08:48 IST (1w6d 11:49 ago)

```

Release Information

Command introduced in Junos OS Release 19.4R1 with `mgd` component.

request packet-capture start

IN THIS SECTION

- Syntax | **2724**
- Description | **2725**
- Options | **2725**
- Required Privilege Level | **2726**
- Output Fields | **2726**
- Sample Output | **2728**
- Release Information | **2730**

Syntax

```
request packet-capture start
<bidirectional bidirectional>
<capture-file capture-file>
<count count>
<destination-port destination-port>
<destination-prefix destination-prefix>
<interface interface>
<maximum-capture-size maximum-capture-size>
<protocol protocol-number>
<size size>
```

```
<source-port source-port>
<source-prefix source-prefix>
```

Description

Captures packet information from the operational mode. You can execute the packet capture from the operational mode with minimal impact to the production system without committing the configurations. You can define the packet filter to trace the type of traffic based on your requirement.

You can request for only one packet capture at a time, and you need to stop each packet capture request before you give an another packet capture request. For each packet capture request, you need to give the respective show command to view the output.

In chassis cluster mode, you must request operational mode packet capture from the primary node. Operational mode packet capture does not function when executed from the secondary node.

Options

bidirectional — Allows to collect bidirectional information.

capture-file — Name of the capture file. It generates a pcap file, which can support Wireshark by adding the suffix '.pcap'.

count — Number of packets to capture.

- **Range:** 10 through 1000000
- **Default:** 100

destination-port — TCP/UDP destination port.

destination-prefix — Destination IPv4/IPv6 address prefix to filter the packets.

interface — Name of the logical interface.

maximum-capture-size — The maximum size of packet capture. The packet truncates if the capture size is more than the specified capture size.

- **Range:** 68 through 10000
- **Default:** 1514

protocol-number — Numeric protocol value.

- **Range:** 0 through 255
- **Default:** 0

size The maximum size of packet capture file.

- **Range:** 10240 through 1073741824
- **Default:** 50M

source-port TCP/UDP source port.

source-prefix Source IPv4/IPv6 address prefix to filter the packets.

Required Privilege Level

view

Output Fields

Table 205 on page 2726 lists the output fields for the `request packet-capture start` command. Output fields are listed in the approximate order in which they appear.

Table 205: request packet-capture start Output Fields

Field Name	Field Description
`packet capture is running`	Status of the packet capture session: • `0`: No packet capture is performing. • `1`: Packet capture is performing.
`counter of packet capture`	Number of packets captured.
`packet capture capture-file name`	Name, location, size and capture length of the packet capture file.

Table 205: request packet-capture start Output Fields *(Continued)*

Field Name	Field Description
Flag	Decimal value corresponding to the type of filter configured. Convert this value to binary or hexadecimal format such as: • 0x000 (No filters) • 0x001 (Source IP) • 0x002 (Destination IP) • 0x004 (Protocol) • 0x008 (Source port) • 0x010 (Destination port) • 0x040 (Filter is valid) • 0x200 (IPv6 Source IP) • 0x400 (IPv6 Destination IP) • 0x800 (Interface) For example if the flag value is 72, convert it to binary or hexadecimal format: 72 = 0x48 • 0x040 (Filter is valid) • 0x008 (Source port) This means that the filter is valid and only configured with the filter source port.
Source	Source IPv4/IPv6 address.
Destination	Destination IPv4/IPv6 address.
Interface	Name of the logical interface.

Table 205: request packet-capture start Output Fields *(Continued)*

Field Name	Field Description
bidirectional	Status of the bidirectional keyword configuration: • 0: Not configured. • 1: Configured.
Protocol	Numeric protocol value.
rotate	Number of capture files.
snap_len	The maximum packet capture size.
ifl	If index value of interface.

Sample Output

Packet capture using protocol, destination port, destination prefix, and bidirectional options

```
root@host> request packet-capture start protocol 17 destination-port 53 destination-prefix
203.0.113.0 bidirectional
{primary:node1}
root@host> show packet-capture status
    packet capture is running: 1
    counter of packet capture: 100
    packet capture capture-file name: /var/log/packet-capture.pcap size: 52428800 rotate: 0

request services ip-monitoring preempt-restore policy

IN THIS SECTION

- Syntax | 2735
- Description | 2735
- Options | 2735
- Required Privilege Level | 2736
- Output Fields | 2736
- Sample Output | 2736
- Release Information | 2736

Syntax

```
request services ip-monitoring preempt-restore policy
<policy-name>
```

Description

If the no–preempt option is specified, the policy will not perform preemptive failback when it is in a failover state, and when the RPM probe test recovers from failure. To manually revert to the failback state, run the `request services ip-monitoring preempt-restore policy` command.

NOTE: The `request services ip-monitoring preempt-restore policy` command takes effect only when the RPM probe is in the pass state, and when the policy is in a failover state.

Options

policy name	Name of the policy.

Required Privilege Level

maintenance

Output Fields

When you run this command, the policy is restored to the failback state.

Sample Output

run request services ip-monitoring preempt-restore policy <policy name>

```
user@host> run request services ip-monitoring preempt-restore policy policy1
Restore request succeeded: Policy policy1
```

Release Information

Command introduced in Junos OS Release 11.4.

- Options | 2737
- Required Privilege Level | 2737
- Output Fields | 2737
- Sample Output | 2738

- Release Information | **2738**

Syntax

```
request services rpm twamp  start client <control-connection-name>
```

Description

Start the probes of a Two-Way Active Measurement Protocol (TWAMP) client. You can start all sessions for all TWAMP clients, or start a session for a specific TWAMP client. When you start test session configured for a particular TWAMP client, the control client initiates all requested testing with a start-sessions message, and the server sends an acknowledgment. If the control connection is not active between the server and the client, the control connection is also established and the test connections are started later. If the control client name is not specified, all the configured test sessions are commenced.

Options

`start client`	Start the TWAMP session between the TWAMP client and the TWAMP server.
`control-connection-name`	(Optional) Start or stop the TWAMP session with the server only for the specified control connection or TWAMP control client.

Required Privilege Level

view

Output Fields

When you enter this command, you are not provided feedback on the status of your request.

Sample Output

request services rpm twamp start client

```
user@host> request services rpm twamp start client c1
```

Release Information

Command introduced in Junos OS Release 15.1X49-D110.

request services rpm twamp stop

IN THIS SECTION

request snmp spoof-trap

IN THIS SECTION

- Syntax | **2740**
- Description | **2740**

- Options | 2740
- Required Privilege Level | 2740
- Sample Output | 2741
- Release Information | 2747

Syntax

```
request snmp spoof-trap
<trap> variable-bindings <object> <instance> <value>
```

Description

Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.

Options

<*trap*>	Name of the trap to spoof.
variable-bindings <*object*> <*instance*> <*value*>	(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, **ifIndex[14] = 14**). Enclose the list of variable bindings in quotation marks (“ “) and use a comma to separate each object name, instance, and value definition (for example, **variable-bindings “ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2”**). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.
<*dummy name*>	A dummy trap name to display the list of available traps.
Question mark (?)	Question mark**?** to display possible completions.

Required Privilege Level

request

Sample Output

request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings “ifIndex[14] = 14, ifAdminStatus[14]
= 1, ifOperStatus[14] = 2”

request snmp utility-mib set instance

IN THIS SECTION

- Syntax | 2748
- Description | 2748
- Options | 2748
- Required Privilege Level | 2749
- Release Information | 2749

Syntax

```
request snmp utility-mib set instance name
object-type type
object-value value
```

Description

Store data in the specified container object in the SNMP Utility MIB. The data may be retrieved by SNMP operations.

Options

name Name of the SNMP instance that is used to identify the data stored in the container object.

object-type *type* Type of container object in which to store data. The following container object types are supported:

- **counter**—Stores a 32-bit counter value.
- **counter64**—Stores a 64-bit counter value.
- **integer**—Stores a 32-bit signed integer value.
- **unsigned-integer**—Stores a 32-bit unsigned integer value.

- **string**—Stores an octet string value.

object-value *value* — Data that is stored in the container object.

Required Privilege Level

request

Release Information

Command introduced in Junos OS Release 12.2.

request system debug-info

IN THIS SECTION

- Syntax | 2751
- Description | 2751
- Options | 2751
- Additional Information | 2751
- Required Privilege Level | 2753
- Sample Output | 2753
- Release Information | 2754

Syntax

```
request system debug-info
<node node-name>
```

Description

Collect debug information from Junos OS Evolved, such as logs. Logs are stored in the **/var/tmp/debug_collector_*timestamp*** directory. You need to know the root password of the device to use this command. Enter the root password and confirm it when requested.

Options

node ***node-name*** (Optional) Identifier of the node. If a value for `node` (for example, `re0`, `re1`, `fpc0`) is given, this command collects logs only from the given node. If the node option is not provided, log information is collected from all active nodes.

Additional Information

To view the **debug_collector.log** file:

1. Exit to the shell and go to the **/var/tmp/** directory.

```
root@host:~# cd /var/tmp
root@host:/var/tmp# ls
all_logs.2719  baseline-config.conf
all_logs.2767  debug_collector_2017-11-20_13_16_45.tar.gz
```

2. Uncompress the **/var/tmp/debug_collector_*timestamp*.tar.gz** file.

```
root@host:/var/tmp# tar -xf debug_collector_2017-11-20_13_16_45.tar.gz
root@host:/var/tmp# ls
all_logs.2719         debug_collector_2017-11-20_13_16_45
all_logs.2767         debug_collector_2017-11-20_13_16_45.tar.gz
baseline-config.conf
```

3. Go to the **/var/tmp/debug_collector_*timestamp*** directory.

```
root@host:/var/tmp# cd debug_collector_2017-11-20_13_16_45
root@host:/var/tmp/debug_collector_2017-11-20_13_16_45# ls
debug_collector.log
```

4. Look at the log file.

```
root@host:/var/tmp/debug_collector_2017-11-20_13_16_45# vi debug_collector.log

Syntax (TX Matrix Plus Router)

```
request support information
<brief>
<all-chassis | all-lcc | lcc number | sfc number>
```

Description

Display all configuration data for the system, including data hidden with the **apply-flags omit** command. Issue this command before contacting customer support, and then include the command output in your support request. Output from this command varies somewhat, depending on which platform you issue the command from. However, the command always executes a series of `show` commands, with the appropriate information for your device automatically included.

Options

brief (Optional) Display brief information for the command output. Without this option, display of the output can take a long time to complete.

all-chassis (TX Matrix and TX Matrix Plus routers) (Optional) Display system information for all chassis.

all-lcc (TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system information for all chassis for all T1600 or T4000 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members (EX Series switches and MX Series routers) (Optional) Display system information for all members of the Virtual Chassis configuration.

lcc *number* (TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for a specific T640 router that is connected to the TX Matrix

router. On a TX Matrix Plus router, display system storage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local — (EX Series switches and MX Series routers) (Optional) Display system information for the local Virtual Chassis member.

member *member-id* — (EX Series switches and MX Series routers) (Optional) Display system information for the specified member of the Virtual Chassis configuration. On EX Series switches, replace *member-id* with a value appropriate for that Virtual Chassis configuration. On MX Series routers, replace *member-id* with a value of 0 or 1.

scc — (TX Matrix routers) (Optional) Display system information for the TX Matrix router (or switch-card chassis).

sfc *number* — (TX Matrix Plus routers) (Optional) Display system information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with `0`.

secure-gateway — (SRX5400, SRX5600, and SRX5800 devices) (Optional) Display system information for secure gateway deployment scenarios.

security-component — (SRX Series) (Optional) Display information on security components.

- `ipsec-vpn`—Generate security report for IPsec VPN.

node — (SRX5400, SRX5600, and SRX5800 devices) (Optional) Display detailed system status report for all nodes or a specific node.

- *node-id*—Display detailed system status report for a specific node. Replace *node-id* with a value of 0 or 1.
- `all`—Display detailed system status report for all nodes.

- local—Display detailed system status report for the local node.
- primary—Display detailed system status report for the primary node.

Additional Information

The show commands issued as a result of this command vary depending on which platform you issue the command from. Output is always appropriate for the device. For example, Table 206 on page 2758 lists the show commands that are called when you issue request support information on an MX Series router.

Table 206: Sample show Commands Called by the request support information command on an MX Series Router

show chassis alarms no-forwarding	show interfaces extensive no-forwarding
show chassis environment no-forwarding	show krt queue
show chassis fabric degradation	show krt state
show chassis fabric destinations	show pfe statistics error
show chassis fabric fpcs	show pfe statistics traffic
show chassis fabric plane	show route summary
show chassis fabric reachability	show system boot-messages no-forwarding
show chassis fabric summary	show system buffer no-forwarding
show chassis fpc	show system commit
show chassis fpc detail	show system core-dumps no-forwarding
show chassis firmware no-forwarding	show system processes extensive no-forwarding

show chassis hardware detail no-forwarding	show system queues no-forwarding
show chassis hardware extensive no-forwarding	show system statistics no-forwarding
show pfe statistics traffic	show system storage no-forwarding
show chassis power	show system uptime no-forwarding
show chassis routing-engine no-forwarding	show system virtual-memory no-forwarding
show configuration | except SECRET-DATA	show version detail no-forwarding

NOTE: Show command `show interfaces extensive no-formwarding` is not supported for `request support information brief` command.

The `no-forwarding` option ensures that all mgd processes associated with the `show` command are properly halted if you break into the output (Ctrl+C) while the command is still running.

NOTE: The `no-forwarding` option ensures that all mgd processes associated with the `show` command are properly halted if you break into the output (Ctrl+C) while the command is still running.

Table 207 on page 2759 lists the `show` commands that are called when you issue `request support information ipsec-vpn` on a MX Series Router.

Table 207: Sample show commands called by the request support information ipsec-vpn command on an MX Series Router

plugin ha show junos-sync stats history	

Starting in Release 20.2R1, Junos OS introduces ipsec-vpn option to the existing request support information command. The request support information ipsec-vpn command displays all the configurations, states, and statistics at Routing Engine and Service Card level. This new option helps in debugging IPsec-VPN related issues. The information collection is streamlined and reduces the output file size.

Table 208 on page 2762 lists the show commands that are called when you issue request support information on an EX Series 9200 switch. The table does not include the no-forwarding option, which is used for purposes of the request support information, itself.

Table 208: Sample show Commands Called by the request support information command on an EX Series 9200 Switch

show chassis alarms	show interfaces extensive
show chassis environment	
show chassis firmware	show pfe statistics traffic
show chassis fpcdetail	show spanning-tree bridge detail
show chassis hardware detail	show spanning-tree interface
show chassis routing-engine	
show configuration | except SECRET-DATA | display omit	show system boot-messages
show dhcp-security binding	show system queues
show dhcp-security ipv6 binding	show system processes extensive
	show system queues
show ethernet-switching interface detail	show system statistics

show ethernet-switching table	show vlans extensive
	show vrrp summary

Table 209 on page 2763 lists the show commands that are called when you issue request support information on SRX Series devices.

Table 209: Sample show Commands Called by the request support information command on SRX Series devices

show pfe statistics traffic	show interfaces queue
show chassis environment no-forwarding	show security monitoring fpc 0
show chassis fpc detail	show system license
show system storage no-forwarding	show security policies hit-count no-forwarding
show system virtual-memory no-forwarding	show security policies information no-forwarding
show system buffer no-forwarding	show security dns-cache
show system queues no-forwarding	show security flow statistics
show chassis hardware extensive no-forwarding	show security flow status
show krt queue	show security flow session summary no-forwarding

Starting in Junos OS Release 15.1X49-D110, on SRX5400, SRX5600, and SRX5800 devices, a new option `secure-gateway` is added to the existing `request support information` command. This new option displays all the required information that is relevant for secure gateway deployment scenarios. In Junos OS Release 15.1X49-D100 and earlier, request support information displays the information about all features that might not be relevant for secure gateway deployments.

Starting in Junos OS Release 20.2R1, we've introduced the CLI `ipsec-vpn` option to the existing `request support information security-components` command. This new option displays all the configuration, states, and statistics information necessary for debugging IPsec VPN related issues.

Required Privilege Level

maintenance

Output Fields

For information about output fields, see the description for the specific command--listed in the output--in which you are interested.

Sample Output

  Flow errors: 0, Misc errors: 0
```

Release Information

Command introduced before Junos OS Release 7.4.

Option `brief` introduced in Junos OS Release 13.2.

Option `secure-gateway` introduced in Junos OS Release 15.1X49-D110 for SRX5400, SRX5600, and SRX5800 devices.

Options `security-components` and `ipsec-vpn` introduced in Junos OS Release 20.2R1.

show analyzer

IN THIS SECTION

- Syntax | 2775
- Description | 2775
- Options | 2775
- Required Privilege Level | 2775
- Output Fields | 2776
- Sample Output | 2776
- Release Information | 2777

Syntax

```
show analyzer analyzer-name
```

Description

Display information about analyzers configured for mirroring.

Options

analyzer-name	(Optional) Displays the status of a specific analyzer on the switch.

Required Privilege Level

view

Output Fields

Table 210 on page 2776 lists the output fields for the `command-name` command. Output fields are listed in the approximate order in which they appear.

Table 210: show analyzer Output Fields

Field Name	Field Description
Analyzer name	Displays the name of the analyzer.
Output interface	Specifies a local interface to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.
Output VLAN	Specifies a VLAN to which mirrored packets are sent. An analyzer can have output to either an interface or a VLAN, not both.
Mirror ratio	Displays the ratio of packets to be mirrored.
Egress monitored interfaces	Displays interfaces for which traffic exiting the interfaces is mirrored.
Ingress monitored interfaces	Displays interfaces for which traffic entering the interfaces is mirrored.
Ingress monitored VLANs	Displays VLANs for which traffic entering the VLAN is mirrored.

Sample Output

show analyzer

```
user@host> show analyzer
Analyzer name           : employee-monitor
  Output interface             : ge-0/0/10.0
  Output VLAN                  : remote-analyzer
  Mirror ratio                 : 1
  Loss priority                : High
  Egress monitored interfaces  : ge-0/0/3.0
```

```
  Ingress monitored interfaces : ge-0/0/0.0
  Ingress monitored interfaces : ge-0/0/1.0
```

Release Information

Command introduced in Junos OS Release 9.0.

show chassis alarms

IN THIS SECTION

- Syntax | 2777
- Description | 2777
- Options | 2777
- Additional Information | 2778
- Required Privilege Level | 2778
- Output Fields | 2778
- Sample Output | 2779
- Release Information | 2779

Syntax

```
show chassis alarms
```

Description

Display information about the conditions that have been configured to trigger alarms.

Options

This command has no options.

Additional Information

Chassis alarms are preset. You cannot modify them.

You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the device in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS Release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

Required Privilege Level

view

Output Fields

Table 211 on page 2778 lists the output fields for the `show chassis alarms` command. Output fields are listed in the approximate order in which they appear.

Table 211: show chassis alarms Output Fields

Field Name	Field Description
`Alarm time`	Date and time the alarm was first recorded.
`Class`	Severity class for this alarm: Minor or Major.
`Description`	Information about the alarm.

Sample Output

show chassis alarms

```
user@host> show chassis alarms
4 alarms currently active
Alarm time               Class  Description
2012-05-29 16:47:18 UTC  Major  /var partition usage crossed critical threshold
2012-05-29 16:47:18 UTC  Minor  /var partition usage crossed high threshold
2012-05-29 16:47:18 UTC  Major  /root partition usage crossed critical threshold
2012-05-29 16:47:18 UTC  Minor  /root partition usage crossed high threshold
```

Release Information

Command introduced in Junos OS Release 11.1.

- Description | 2780
- Options | 2780
- Required Privilege Level | 2780
- Output Fields | 2780
- Sample Output | 2782
- Sample Output | 2783
- Release Information | 2783

Syntax

```
show chassis cluster ip-monitoring status
  <redundancy-group  group-number>
```

Description

Display the status of all monitored IP addresses for a redundancy group.

Options

- none— Display the status of monitored IP addresses for all redundancy groups on the node.
- `redundancy-group` *group-number*— Display the status of monitored IP addresses under the specified redundancy group.

Required Privilege Level

view

Output Fields

Table 212 on page 2780 lists the output fields for the `show chassis cluster ip-monitoring status` command.

Table 212: show chassis cluster ip-monitoring status Output Fields

Field Name	Field Description
`Redundancy-group`	ID number (0 - 255) of a redundancy group in the cluster.
`Global threshold`	Failover value for all IP addresses monitored by the redundancy group.
`Current threshold`	Value equal to the global threshold minus the total weight of the unreachable IP address.
`IP Address`	Monitored IP address in the redundancy group.

Table 212: show chassis cluster ip-monitoring status Output Fields *(Continued)*

Field Name	Field Description
`Status`	Current reachability state of the monitored IP address. Values for this field are: `reachable`, `unreachable`, and `unknown`. The status is "unknown" if Packet Forwarding Engines (PFEs) are not yet up and running.
`Failure count`	Number of attempts to reach an IP address.
`Reason`	Explanation for the reported status. See Table 213 on page 2781.
`Weight`	Combined weight (0 - 255) assigned to all monitored IP addresses. A higher weight value indicates greater importance.

Expanded reason output fields for unreachable IP addresses added in Junos OS Release 10.1. You might see any of the following reasons displayed.

Table 213: show chassis cluster ip-monitoring status redundancy group Reason Fields

Reason	Reason Description
`No route to host`	The router could not resolve the ARP, which is needed to send the ICMP packet to the host with the monitored IP address.
`No auxiliary IP found`	The redundant Ethernet interface does not have an auxiliary IP address configured.
`Reth child not up`	A child interface of a redundant Ethernet interface is down.
`redundancy-group state unknown`	Unable to obtain the state (primary, secondary, secondary-hold, disable) of a redundancy-group.
`No reth child MAC address`	Could not extract the MAC address of the redundant Ethernet child interface.
`Secondary link not monitored`	The secondary link might be down (the secondary child interface of a redundant Ethernet interface is either down or non-functional).

Table 213: show chassis cluster ip-monitoring status redundancy group Reason Fields *(Continued)*

Reason	Reason Description
Unknown	The IP address has just been configured and the router still does not know the status of this IP. or Do not know the exact reason for the failure.

Sample Output

show chassis cluster ip-monitoring status

```
user@host> show chassis cluster ip-monitoring status
node0:
--------------------------------------------------------------------------

Redundancy group: 1
Global threshold: 200
Current threshold: -120

IP address               Status        Failure count  Reason    Weight
10.254.5.44              reachable       0            n/a       220
10.2.2.1                 reachable       0            n/a       100

node1:

Output Fields

Table 214 on page 2786 describes the output fields for the **show interfaces summary** command. Output fields are listed in the approximate order in which they appear.

Table 214: show interfaces summary Output Fields

Field Name	Field Description
`System's maximum logical interfaces`	Total number of logical interfaces in the device.

Table 214: show interfaces summary Output Fields *(Continued)*

Field Name	Field Description
Logical interfaces allocated	Number of allocated logical interfaces.
Logical interfaces available	Number of available logical interfaces.
Logical interface type	The type of logical interfaces. • LSI—Number of label-switched logical interfaces and their status. • Ethernet Untagged—Number of untagged logical interfaces and their status. • Ethernet VLAN—Number of tagged logical interfaces and their status. • Others—Number of dynamic and other logical interfaces, and their status.
System	Statistics on the global logical interfaces in the system.
FPC x	Statistics on the logical interfaces in a specific FPC.

Sample Output

show interfaces summary

```
user@host> show interfaces summary
Logical interfaces:
    System's maximum logical interfaces  : 262144
    Logical interfaces allocated         :     31
    Logical interfaces available         : 262113

    System:
    Logical interface type    Count         UP       DOWN
    Total                        28         28          0
    LSI                           0          0          0
    Ethernet Untagged            15         15          0
    Ethernet VLAN                 0          0          0
    Others                       13         13          0
```

```
FPC1:
Logical interface type    Count         UP       DOWN
Total                         3          3          0
LSI                           0          0          0
Ethernet Untagged             3          3          0
Ethernet VLAN                 0          0          0
Others                        0          0          0

FPC2:
Logical interface type    Count         UP       DOWN
Total                         0          0          0
LSI                           0          0          0
Ethernet Untagged             0          0          0
Ethernet VLAN                 0          0          0
Others                        0          0          0
```

Release Information

Command introduced in Junos OS Release 14.1R2.

show log

IN THIS SECTION

- Syntax | **2789**
- Syntax (QFX Series and OCX Series) | **2789**
- Syntax (TX Matrix Router) | **2789**
- Description | **2789**
- Options | **2789**
- Required Privilege Level | **2790**
- Sample Output | **2791**
- Release Information | **2795**

Syntax

```
show log
<filename / user <username>>
```

Syntax (QFX Series and OCX Series)

```
show log filename
<device-type (device-id | device-alias)>
```

Syntax (TX Matrix Router)

```
show log
<all-lcc | lcc number | scc>
<filename / user <username>>
```

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options

none List all log files.

<all-lcc | lcc *number* | scc> (Routing matrix only)(Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type (QFabric system only) (Optional) Display log messages for only one of the following device types:

- `director-device`—Display logs for Director devices.
- `infrastructure-device`—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- `interconnect-device`—Display logs for Interconnect devices.
- `node-device`—Display logs for Node devices.

NOTE: If you specify the `device-type` optional parameter, you must also specify either the `device-id` or `device-alias` optional parameter.

(*device-id* | *device-alias*) If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename (Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of **messages**.

user <*username*> (Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

Release Information

Command introduced before Junos OS Release 7.4.

Option *device-type (device-id | device-alias)* is introduced in Junos OS Release 13.1 for the QFX Series.

RELATED DOCUMENTATION

syslog (System)

show oam ethernet connectivity-fault-management delay-statistics

IN THIS SECTION

- Syntax | **2795**
- Description | **2796**
- Options | **2796**
- Required Privilege Level | **2796**
- Output Fields | **2796**
- Sample Output | **2798**
- Release Information | **2800**

Syntax

```
show oam ethernet connectivity-fault-management delay-statistics
<count entry-count>
<local-mep mep-id>
<maintenance-association ma-name>
<maintenance-domain md-name>
<remote-mep remote-mep-id>
```

Description

On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs), display ETH-DM delay statistics.

On EX Series switches, display delay measurement results.

Options

count *entry-count*	(Optional) Number of entries to display from the statistics table. The range of values is **1** through **100**. The default value is **100** entries.
local-mep *mep-id*	(Optional) Numeric identifier of the local MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
maintenance-domain *md-name*	Name of an existing connectivity fault management (CFM) maintenance domain.
remote-mep *remote-mep-id*	(Optional) Numeric identifier of the remote MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.

Output Fields

Table 215 on page 2796 lists the output fields for the `show oam ethernet connectivity-fault-management delay-statistics` command and the `show oam ethernet connectivity-fault-management mep-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 215: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.

Table 215: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields *(Continued)*

Output Field Name	Field Description
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.
Average one-way delay	Average one-way frame delay for the statistics displayed.
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.

Table 215: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields *(Continued)*

Output Field Name	Field Description
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.

show oam ethernet connectivity-fault-management forwarding-state

IN THIS SECTION

- Syntax | 2801
- Description | 2801
- Options | 2801
- Required Privilege Level | 2801
- Output Fields | 2801
- Sample Output | 2802
- Release Information | 2805

Syntax

```
show oam ethernet connectivity-fault-management forwarding-state
interface interface-name | instance instance-name
<brief | detail | extensive>
```

Description

On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

Options

interface *interface-name* Display forwarding state information for the specified Ethernet interface only.

instance *instance-name* Display forwarding state information for the specified forwarding instance only.

brief | detail | extensive (Optional) Display the specified level of output.

Required Privilege Level

Release Information

Command introduced in Junos OS Release 8.4.

show oam ethernet connectivity-fault-management forwarding-state

IN THIS SECTION

- Syntax | 2806
- Description | 2806
- Options | 2806
- Required Privilege Level | 2806
- Output Fields | 2807
- Sample Output | 2807
- Release Information | 2810

Syntax

```
show oam ethernet connectivity-fault-management forwarding-state
interface interface-name
<brief | detail | extensive>
```

Description

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

Options

interface *interface-name* Display forwarding state information for the specified Ethernet interface only.

brief | detail | extensive (Optional) Display the specified level of output.

Required Privilege Level

view

Output Fields

Table 217 on page 2807 lists the output fields for the `show oam ethernet connectivity-fault-management forwarding-state` command. Output fields are listed in the approximate order in which they appear.

Table 217: show oam ethernet connectivity-fault-management forwarding-state Output Fields

Field Name	Field Description	Level of Output
Interface name	Interface identifier.	All levels
Filter action	Filter action for messages at the level.	All levels
Nexthop type	Next-hop type.	All levels
Nexthop index	Next-hop index number.	**brief**
Level	Maintenance domain (MD) level.	**detail**
Direction	MEP direction configured.	none
CEs	Number of customer edge (CE) interfaces.	All levels

Sample Output

show oam ethernet connectivity-fault- management forwarding- state

```
user@host> show oam ethernet connectivity-fault-management forwarding-state
CEs: 3

  Maintenance domain forwarding state:

Syntax

```
show oam ethernet connectivity-fault-management interfaces
<ethernet-interface-name>
<level md-level>
<brief | detail | extensive>
```

Description

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

Options

brief | detail | extensive	(Optional) Display the specified level of output.
ethernet-interface-name	(Optional) Display CFM information only for CFM entities attached to the specified Ethernet interface.
level *md-level*	(Optional) Display CFM information for CFM identities enclosed within a maintenance domain of the specified level.

Required Privilege Level

Output Fields

Table 218 on page 2812 lists the output fields for the `show oam ethernet connectivity-fault-management interfaces` command. Output fields are listed in the approximate order in which they appear.

Table 218: show oam ethernet connectivity-fault-management interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Interface identifier.	All levels
Interface status	Local interface status.	All levels
Link status	Local link status. **Up**, **down**, or **oam-down**.	All levels
Maintenance domain name	Maintenance domain name.	**detail extensive**
Format (Maintenance domain)	Maintenance domain name format configured.	**detail extensive**
Level	Maintenance domain level configured.	All levels
Maintenance association name	Maintenance association name.	**detail extensive**
Format (Maintenance association)	Maintenance association name format configured.	**detail extensive**
Continuity-check status	Continuity-check status.	**detail extensive**

Table 218: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Interval	Continuity-check message interval.	**detail extensive**
Loss-threshold	Lost continuity-check message threshold.	**detail extensive**
MEP identifier	Maintenance association end point (MEP) identifier.	All levels
Neighbours	Number of MEP neighbors.	All levels
Direction	MEP direction configured.	**detail extensive**
MAC address	MAC address configured for the MEP.	**detail extensive**
MEP status	Indicates the status of the Connectivity Fault Management (CFM) protocol running on the MEP: **Running**, **inactive**, **disabled**, or **unsupported**.	**detail extensive**
Remote MEP not receiving CCM	Whether the remote MEP is not receiving connectivity check messages (CCMs).	**detail extensive**
Erroneous CCM received	Whether erroneous CCMs have been received.	**detail extensive**
Cross-connect CCM received	Whether cross-connect CCMs have been received.	**detail extensive**
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	**detail extensive**
CCMs sent	Number of CCMs transmitted.	**detail extensive**
CCMs received out of sequence	Number of CCMs received out of sequence.	**detail extensive**

Table 218: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
LBMs sent	Number of loopback request messages (LBMs) sent.	**detail extensive**
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	**detail extensive**
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	**detail extensive**
LBRs received with corrupted data	Number of LBRs received that were corrupted.	**detail extensive**
LBRs sent	Number of LBRs transmitted.	**detail extensive**
LTMs sent	Linktrace messages (LTMs) transmitted.	**detail extensive**
LTMs received	Linktrace messages received.	**detail extensive**
LTRs sent	Linktrace responses (LTRs) transmitted.	**detail extensive**
LTRs received	Linktrace responses received.	**detail extensive**
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	**detail extensive**
1DMs sent	If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**

Table 218: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Valid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
Invalid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
DMMs sent	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
DMRs sent	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.	**detail extensive**
Valid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Invalid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Remote MEP count	Number of remote MEPs.	**extensive**
Identifier (remote MEP)	MEP identifier of the remote MEP.	**extensive**

Table 218: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
MAC address (remote MEP)	MAC address of the remote MEP.	**extensive**
State (remote MEP)	State of the remote MEP.	**extensive**
Interface (remote MEP)	Interface of the remote MEP.	**extensive**

Syntax

```
show oam ethernet connectivity-fault-management path-database host maintenance-association ma-name
maintenance-domain md-name mac-address
```

Description

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

Options

mac-address	Display connectivity fault management path database information for the specified MAC address of the remote host.
maintenance-association *ma-name*	Display connectivity fault management path database information for the specified maintenance association.

maintenance-domain *md-name*	Display connectivity fault management path database information for the specified maintenance domain.

Output Fields

Table 219 on page 2821 lists the output fields for the `show oam ethernet connectivity-fault-management path-database` command. Output fields are listed in the approximate order in which they appear.

Table 219: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the 802.1ag node to which the linktrace message is targeted.
Interface	Interface used by the local MEP to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain identifier specified in the traceroute command.
Maintenance Association	Maintenance association identifier specified in the traceroute command.
Level	Maintenance domain level configured for the maintenance domain.
Local Mep	MEP identifier of the local MEP originating the linktrace.
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag maintenance intermediate point (MIP) that is forwarding the LTM.

Table 219: show oam ethernet connectivity-fault-management linktrace path-database Output Fields *(Continued)*

Field Name	Field Description
Next hop MAC address	MAC address of the 802.1ag node that is the next hop in the LTM path.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

Sample Output

show oam ethernet connectivity-fault- management path-database

```
user@host> show oam ethernet connectivity-fault-management path-database     maintenance-domain
MD1 maintenance-association MA1 00:01:02:03:04:05
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
       Maintenance Domain: MD1, Level: 7
       Maintenance Association: MA1, Local Mep: 1

Syntax

```
show oam ethernet connectivity-fault-management mep-database
maintenance-domain domain-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Description

Display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

Options

maintenance-association *ma-name*	Display connectivity fault management information for the specified maintenance association.
maintenance-domain *domain-name*	Display connectivity fault management information for the specified maintenance domain.
local-mep *local-mep-id*	(Optional) Display connectivity fault management information for the specified local MEP only.
remote-mep *remote-mep-id*	(Optional) Display connectivity fault management information for the specified remote MEP only.

Output Fields

Table 220 on page 2825 lists the output fields for the `show oam ethernet connectivity-fault-management mep-database` command. Output fields are listed in the approximate order in which they appear.

Table 220: show oam ethernet connectivity-fault-management mep-database Output Fields

Field Name	Field Description
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
MEP identifier	Maintenance association end point (MEP) identifier.
Direction	MEP direction configured.
MAC address	MAC address configured for the MEP.
Auto-discovery	Whether automatic discovery is enabled or disabled.
Priority	Priority used for CCMs and linktrace messages transmitted by the MEP.
Interface name	Interface identifier.

Table 220: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Interface status	Local interface status.
Link status	Local link status.
Remote MEP not receiving CCM	Whether the remote MEP is not receiving CCMs.
Erroneous CCM received	Whether erroneous CCMs have been received.
Cross-connect CCM received	Whether cross-connect CCMs have been received.
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
CCMs sent	Number of CCMs transmitted.
CCMs received out of sequence	Number of CCMs received out of sequence.
LBMs sent	Number of loopback messages (LBMs) sent.
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.
LBRs received with corrupted data	Number of LBRs received that were corrupted.

Table 220: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
LBRs sent	Number of LBRs transmitted.
LTMs sent	Linktrace messages (LTMs) transmitted.
LTMs received	Linktrace messages received.
LTRs sent	Linktrace responses (LTRs) transmitted.
LTRs received	Linktrace responses received.
Sequence number of next LTM request	Sequence number of the next linktrace message request to be transmitted.
1DMs sent	If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.
Valid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.
Invalid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.
DMMs sent	If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.

Table 220: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
DMRs sent	If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.
Valid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.
Invalid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: **idle**, **start**, **ok**, or **failed**.
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is **Last flapped:** ***year-month-day hours:minutes:seconds timezone*** **(*hours:minutes:seconds* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.

Table 220: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Port status TLV	• In the Maintenance domain section, displays the last transmitted port status TLV value. • In the Remote MEP section, displays the last value of port status TLV received from the remote MEP. In the Action profile section, displays, the last occurred event **port-status-tlv blocked** event. This event occurred due to the reception of **blocked** value in the port status TLV from remote MEP.
Interface status TLV	• In the Maintenance domain section, displays the last transmitted interface status TLV value. • In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP. In the Action profile section, if displays, the last occurred event interface-status-tlv event (either **lower-layer-down** or **down**). This event occurred due to the reception of either lower or **down** value in the interface status TLV from remote MEP.
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.
Action	Action taken and the corresponding time of the action occurrence.

Output Fields

Table 222 on page 2836 lists the output fields for the `show oam ethernet connectivity-fault-management sla-iterator-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 222: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields

Output Field Name	Output Field Description
Maintenance domain	Name of the maintenance domain.
Level	Level of the maintenance domain level configured.
Maintenance association	Name of the maintenance association.
Local MEP id	Numeric identifier of the local MEP.
Remote MEP id	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Iterator name	Name of iterator.
Iterator Id	Numeric identifier of the iterator.
Iterator cycle time	Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection
Iteration period	Maximum number of cycles per iteration
Iterator status	Current status of iterator whether running or stopped.
Infinite iterations	Status of iteration as infinite or finite.
Counter reset time	Date and time when the counter was reset.

Table 222: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields *(Continued)*

Output Field Name	Output Field Description
Reset reason	Reason to reset counter.
Delay weight	Calculation weight of delay.
Delay variation weight	Calculation weight of delay variation.
DMM sent	Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.
DMM skipped for threshold hit	Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.
DMM skipped for threshold hit window	Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.
DMR received	Number of delay measurement reply (DMR) frames received.
DMR out of sequence	Total number of DMR out of sequence packets received.
DMR received with invalid time stamps	Total number of DMR frames received with invalid timestamps.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Average one-way forward delay variation	Average one-way forward delay variation for the statistics displayed in microseconds.

Table 222: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields ***(Continued)***

Output Field Name	Output Field Description
Average one-way backward delay variation	Average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average two-way delay	Weighted average two-way delay for the statistics displayed in microseconds.
Weighted average two-way delay variation	Weighted average two-way delay variation for the statistics displayed in microseconds.
Weighted average one-way backward delay variation	Weighted average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average one-way forward delay variation	Weighted average one-way forward delay variation for the statistics displayed in microseconds.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
`SLM packets received`	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
`SLR packets sent`	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
`SLR packets received`	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
`Local TXFC1 value`	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.

Table 222: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields *(Continued)*

Output Field Name	Output Field Description
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

show oam ethernet connectivity-fault-management state - To verify the Connectivity Fault Management (CFM) state

The following command is to verify whether the CFM state is in enhanced-cfm mode or not.

```
user@router> show oam ethernet connectivity-fault-management state
Connectivity fault management state:
    CFM Mode Of Operation: Enhanced
    Enhanced IP Mode: Enabled
    CFM Config State: Ok
    CFM Cleanup State: Ok
    CFM Restart Timer State: Cleanup Timer State stopped Rebooting in 0 sec
    CFM CFMMAN Job State: Not Pending
    Number of sessions: 1
    Number of sessions created: 1
    Number of sessions deleted: 0
    Number of sessions freed: 0
    Number of sessions enqueued: 1
    Number of sessions dequeued: 1
    VPLS feature: enabled
    Token based forwarding feature: enabled
    Forwarding table filtering simulation feature: disabled
    Hardware assisted flooding feature: enabled
    Flood resynchronization for GRES feature: enabled
    Shared interface filter feature: disabled
    Hardware timestamping feature: disabled
    Marking of connection protection TLV feature: disabled
    CFMD config memory resource  limit(in bytes): 3221225472
    CFMD max resident set (peak) size (in bytes):  24158208

Packet processing state:
    State of the connection to packet processing daemon: down
    State of the flow to packet processing daemon: ready
    State of the packet processing job: ready
    Number of times the connection to packet processing daemon was blocked: 0
    State of the connection to cfmman: slots: 2 3 4 5
```

```
Filter state:
    State of the connection to firewall daemon: Connected
    Number of reconnects made to firewall daemon: 0
    Number of requests sent to firewall daemon: 13
    Number of requests accepted by firewall daemon: 13
    Number of requests rejected by firewall daemon: 0
    Number of requests lost due to disconnection: 0
```

Release Information

Command introduced in Junos OS Release 11.4 .

Syntax

```
show oam ethernet connectivity-fault-management interfaces
<ethernet-interface-name>
<level md-level>
<brief | detail | extensive>
```

Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

In addition, for Ethernet interfaces on MX Series routers , also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts when **detail** or **extensive** mode is specified.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

brief | detail | extensive	(Optional) Specified level of output.
ethernet-interface-name	(Optional) CFM information only for CFM entities attached to the specified Ethernet interface.
level *md-level*	(Optional) CFM information for CFM identities enclosed within a maintenance domain of the specified level.

Required Privilege Level

Output Fields

Table 223 on page 2850 lists the output fields for the `show oam ethernet connectivity-fault-management interfaces` command. Output fields are listed in the approximate order in which they appear.

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Interface identifier.	All levels
Interface status	Local interface status.	All levels
Link status	Local link status. **Up**, **down**, or **oam-down**.	All levels
Maintenance domain name	Maintenance domain name.	**detail extensive**
Format (Maintenance domain)	Maintenance domain name format configured.	**detail extensive**
Level	Maintenance domain level configured.	All levels
Maintenance association name	Maintenance association name.	**detail extensive**
Format (Maintenance association)	Maintenance association name format configured.	**detail extensive**
Continuity-check status	Continuity-check status.	**detail extensive**
Ethernet-ais status	Status of alarm indication signal (AIS). `active` or `in-active`.	**detail extensive**
Interval	Continuity-check message interval.	**detail extensive**
Loss-threshold	Lost continuity-check message threshold.	**detail extensive**

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Interface status TLV	Status of the interface status TLV, if configured on the MEP interface: **none**, **up**, **down**, **testing**, **unknown**, **dormant**, **notPresent**, **lowerLayerDown**	**detail extensive**
Port status TLV	Status of the port status TLV, if configured on the MEP interface: **none**, **no**, **yes**	**detail extensive**
Connection Protection TLV	Status of the connection protection TLV if configured on the MEP interface: **no**, **yes** If **yes**, then the transmitted connection protection TLV is decoded and the following three fields are displayed: **Prefer me**, **Protection in use**, **FRR Flag**	**detail extensive**
Prefer me	If set to **yes**, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side. Its value can be **yes** or **no**.	**detail extensive**
Protection in use	Used for protection decision coordination. Its value is set to **yes** if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path. Its value can be **yes** or **no**.	**detail extensive**
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be **yes** or **no**.	**detail extensive**
MEP identifier	Maintenance association end point (MEP) identifier.	All levels
Neighbors	Number of MEP neighbors.	All levels
Direction	MEP direction configured.	**detail extensive**

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
MAC address	MAC address configured for the MEP.	**detail extensive**
MEP status	Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: **Running**, **inactive**, **disabled**, or **unsupported**.	**detail extensive**
Remote MEP not receiving CCM	Whether the remote MEP is not receiving connectivity check messages (CCMs).	**detail extensive**
Erroneous CCM received	Whether erroneous CCMs have been received.	**detail extensive**
Cross-connect CCM received	Whether cross-connect CCMs have been received.	**detail extensive**
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	**detail extensive**
Some remote MEP's MAC in error state	Indicates whether the remote MEP's MAC is in error state.	**detail extensive**
Alarm Indication Signal	Indicates whether the AIS is triggered or is cleared.	**detail extensive**
CCMs sent	Number of CCMs transmitted.	**detail extensive**
CCMs received out of sequence	Number of CCMs received out of sequence.	**detail extensive**
LBMs sent	Number of loopback request messages (LBMs) sent.	**detail extensive**

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	**detail extensive**
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	**detail extensive**
LBRs received with corrupted data	Number of LBRs received that were corrupted.	**detail extensive**
LBRs sent	Number of LBRs transmitted.	**detail extensive**
LTMs sent	Linktrace messages (LTMs) transmitted.	**detail extensive**
LTMs received	Linktrace messages received.	**detail extensive**
LTRs sent	Linktrace responses (LTRs) transmitted.	**detail extensive**
LTRs received	Linktrace responses received.	**detail extensive**
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	**detail extensive**
1DMs sent	If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
Valid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Invalid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
Out of sync 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.	**detail extensive**
DMMs sent	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
Valid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.	**detail extensive**
Invalid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.	**detail extensive**
DMRs sent	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent. For all other cases, this field displays **0**.	**detail extensive**
Valid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Invalid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.	**detail extensive**

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.	**detail extensive**
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.	**detail extensive**
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.	**detail extensive**
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.	**detail extensive**
Valid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.	**detail extensive**
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.	**detail extensive**
Valid AIS frames transmitted	Number of valid AIS frames transmitted to the peer MEPs.	**detail extensive**
Valid AIS frames received	Number of valid AIS frames received from the peer MEPs.	**detail extensive**
`SLM sent`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.	`detail extensive`
`Valid SLM received`	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	`detail extensive`

Table 223: show oam ethernet connectivity-fault-management interfaces Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Invalid SLM received`	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	`detail extensive`
`SLR sent`	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.	`detail extensive`
`Valid SLR received`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.	`detail extensive`
`Invalid SLR received`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.	`detail extensive`
Remote MEP count	Number of remote MEPs.	**extensive**
Identifier (remote MEP)	MEP identifier of the remote MEP.	**extensive**
MAC address (remote MEP)	MAC address of the remote MEP.	**extensive**
State (remote MEP)	State of the remote MEP.	**extensive**
Interface (remote MEP)	Interface of the remote MEP.	**extensive**

Release Information

Command introduced in Junos OS Release 8.4.

Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.

Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for ACX Series and MX Series routers.

show oam ethernet connectivity-fault-management linktrace path-database

IN THIS SECTION

- Syntax | 2864
- Description | 2864
- Options | 2864
- Required Privilege Level | 2865
- Output Fields | 2865
- Sample Output | 2866
- Release Information | 2867

Syntax

```
show oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association ma-name maintenance-domain md-name
```

Description

On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

Options

mac-address	Display connectivity fault management path database information for the specified MAC address of the remote host.
maintenance-association *ma-name*	Display connectivity fault management path database information for the specified maintenance association.
maintenance-domain *md-name*	Display connectivity fault management path database information for the specified maintenance domain.

Output Fields

Table 224 on page 2865 lists the output fields for the `show oam ethernet connectivity-fault-management linktrace path-database` command. Output fields are listed in the approximate order in which they appear.

Table 224: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

Field Name	Field Description
`Linktrace to`	MAC address of the 802.1ag node to which the linktrace message is targeted.
`Interface`	Interface used by the local MEP to send the linktrace message (LTM).
`Maintenance Domain`	Maintenance domain identifier specified in the traceroute command.
`Maintenance Association`	Maintenance association identifier specified in the traceroute command.
`Level`	Maintenance domain level configured for the maintenance domain.
`Local Mep`	MEP identifier of the local MEP originating the linktrace.
`Hop`	Sequential hop count of the linktrace path.
`TTL`	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
`Source MAC address`	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.

Table 224: show oam ethernet connectivity-fault-management linktrace path-database Output Fields *(Continued)*

Field Name	Field Description
Next hop MAC address	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

Sample Output

Release Information

Command introduced in Junos OS Release 9.0.

show oam ethernet connectivity-fault-management loss-statistics

IN THIS SECTION

- Syntax | **2868**
- Description | **2868**
- Options | **2868**
- Required Privilege Level | **2868**
- Output Fields | **2868**
- show oam ethernet connectivity fault management loss statistics | **2871**
- Release Information | **2872**

Syntax

```
show oam ethernet connectivity-fault-management loss-statistics
maintenance-domain md-name
maintenance-association ma-name
<count entry-count>
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Description

On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.

Options

maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
count *entry-count*	(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.
local-mep *local-mep-id*	(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.
remote-mep *remote-mep-id*	(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.

Required Privilege Level

Output Fields

Table 225 on page 2869 lists the output fields for the `show oam ethernet connectivity-fault-management loss-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 225: show oam ethernet connectivity-fault-management loss-statistics Output Fields

Output Field Name	Field Description
`MEP identifier`	Maintenance association end point (MEP) numeric identifier.
`MAC address`	Unicast MAC address configured for the MEP.
`Remote MEP count`	Number of remote MEPs (unless you specify the `remote-mep` option).
`Remote MEP identifier`	Numeric identifier of the remote MEP.
`Remote MAC address`	Unicast MAC address of the remote MEP.
`Index`	Index number that corresponds to the ETH-LM entry in the CFM database.
`Near-end frame loss`	Count of frame loss associated with ingress data frames.
`Far-end frame loss`	Count of frame loss associated with egress data frames.
`Near-end loss ratio`	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
`Far-end loss ratio`	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
`Average near-end frame loss`	Average frame loss measured in this session associated with ingress data frames.
`Average near-end loss ratio`	Average frame loss ratio measured in this session associated with ingress data frames.

Table 225: show oam ethernet connectivity-fault-management loss-statistics Output Fields *(Continued)*

Output Field Name	Field Description
`Average far-end frame loss`	Average frame loss measured in this session associated with egress data frames.
`Average far-end loss ratio`	Average frame loss ratio measured in this session associated with egress data frames.
`Near-end best case loss`	Lowest frame loss measured in this session associated with ingress data frames.
`Near-end best case loss ratio`	Lowest frame loss ratio measured in this session associated with ingress data frames.
`Near-end worst case loss`	Highest frame loss measured in this session associated with ingress data frames.
`Near-end worst case loss ratio`	Highest frame loss ratio measured in this session associated with ingress data frames.
`Far-end best case frame loss`	Lowest frame loss measured in this session associated with egress data frames.
`Far-end best case loss ratio`	Lowest frame loss ratio measured in this session associated with egress data frames.
`Far-end worst case loss`	Highest frame loss measured in this session associated with egress data frames.
`Far-end worst case loss ratio`	Highest frame loss ratio measured in this session associated with egress data frames.

Syntax

```
show oam ethernet connectivity-fault-management mep-database
maintenance-domain domain-name
maintenance-association ma-name
<local-mep local-mep-id>
<remote-mep remote-mep-id>
extensive
```

Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.

In addition, for Ethernet interfaces on MX Series routers , also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

maintenance-association *ma-name*	Name of the maintenance association.
maintenance-domain *domain-name*	Name of the maintenance domain.
local-mep-id	(Optional) Numeric identifier of local MEP.
remote-mep-id	(Optional) Numeric identifier of the remote MEP.

Required Privilege Level

Output Fields

Table 226 on page 2874 lists the output fields for the `show oam ethernet connectivity-fault-management mep-database` command. Output fields are listed in the approximate order in which they appear.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields

Field Name	Field Description
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
Loss-threshold	Lost continuity-check message threshold.
Connection Protection TLV	Status of the connection protection TLV, if configured on the MEP interface: **no**, **yes** If **yes**, then the transmitted connection protection TLV is decoded and the following three fields are displayed: **Prefer me**, **Protection in use**, **FRR Flag**
Prefer me	If set to **yes**, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side. Its value can be **yes** or **no**.
Protection in use	Used for protection decision coordination. Its value is set to **yes** if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path. Its value can be **yes** or **no**.
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be **yes** or **no**.
MEP identifier	Maintenance association end point (MEP) identifier.
Direction	MEP direction configured.
MAC address	MAC address configured for the MEP.
Auto-discovery	Whether automatic discovery is enabled or disabled.
Priority	Priority used for CCMs and linktrace messages transmitted by the MEP.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Interface name	Interface identifier.
Interface status	Local interface status.
Link status	Local link status.
Remote MEP not receiving CCM	Whether the remote MEP is not receiving CCMs.
Erroneous CCM received	Whether erroneous CCMs have been received.
Cross-connect CCM received	Whether cross-connect CCMs have been received.
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
CCMs sent	Number of CCMs transmitted.
CCMs received out of sequence	Number of CCMs received out of sequence.
LBMs sent	Number of loopback messages (LBMs) sent.
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
1DMs sent	If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Valid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.
Invalid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.
Out of sync 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.
DMMs sent	If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.
Valid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.
Invalid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.
DMRs sent	If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.
Valid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.
Invalid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.
LBRs received with corrupted data	Number of LBRs received that were corrupted.
LBRs sent	Number of LBRs transmitted.
LTMs sent	Linktrace messages (LTMs) transmitted.
LTMs received	Linktrace messages received.
LTRs sent	Linktrace responses (LTRs) transmitted.
LTRs received	Linktrace responses received.
Sequence number of next LTM request	Sequence number of the next linktrace message request to be transmitted.
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.
Valid LMR received	If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.
`SLM sent`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.
`Valid SLM received`	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
`Invalid SLM received`	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
`SLR sent`	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.
`Valid SLR received`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.
`Invalid SLR received`	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: **idle**, **start**, **ok**, or **failed**.
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is **Last flapped:** ***year-month-day hours:minutes:seconds timezone*** **(*hours:minutes:seconds* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.
Port status TLV	• In the Maintenance domain section, displays the last transmitted port status TLV value. • In the Remote MEP section, displays the last value of port status TLV received from the remote MEP. In the Action profile section, displays, the last occurred event **port-status-tlv blocked** event. This event occurred due to the reception of **blocked** value in the port status TLV from remote MEP.
Interface status TLV	• In the Maintenance domain section, displays the last transmitted interface status TLV value. • In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP. In the Action profile section, if displays, the last occurred event interface-status-tlv event (either **lower-layer-down** or **down**). This event occurred due to the reception of either lower or **down** value in the interface status TLV from remote MEP.
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.

Table 226: show oam ethernet connectivity-fault-management mep-database Output Fields *(Continued)*

Field Name	Field Description
Action	Action taken and the corresponding time of the action occurrence.

Sample Output

show oam ethernet connectivity-fault- management mep-database (Connection Protection TLV Configured)

```
user@host>show oam ethernet connectivity-fault-management mep-database maintenance-domain md5
maintenance-association ma5
```

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

Release Information

Command introduced in Junos OS Release 8.4.

Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.

Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.

Support for ITU-T Y.1731 ethernet expected defect function (ETH-ED) added in Junos OS Release 19.1 for MX Series routers

NOTE: Ethernet expected defect function (ETH-ED) will be supported on all MX series routers only when `enhanced-ip` mode is enabled. ETH-ED will not be supported if CFM is running in centralized mode.

Syntax

```
show oam ethernet connectivity-fault-management mep-statistics
maintenance-domain md-name
maintenance-association ma-name
<mep mep-id>
<remote-mep remote-mep-id>
<count entry-count>
```

Description

On MX Series and ACX Series routers and EX Series switches with Ethernet interfaces, display ETH-DM statistics and ETH-DM frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

maintenance-domain *md-name*	Name of an existing CFM maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
mep *mep-id*	(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.
remote-mep *remote-mep-id*	(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

count *entry-count* (Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.

Required Privilege Level

view

Output Fields

Table 227 on page 2891 lists the output fields for the `show oam ethernet connectivity-fault-management mep-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 227: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
`CCMs sent`	Number of continuity check messages (CCMs) sent.
`CCMs received`	Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association.
`CCMs received out of sequence`	Number of continuity check messages (CCMs) received that were not in sequence.
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.

Table 227: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields *(Continued)*

Output Field Name	Field Description
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos OS Network Interfaces Library for Routing Devices.
Average one-way delay	Average one-way frame delay for the statistics displayed.
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.

Table 227: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields *(Continued)*

Output Field Name	Field Description
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Release Information

Command introduced in Junos OS Release 9.5.

Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for MX Series routers.

show oam ethernet connectivity-fault-management path-database

IN THIS SECTION

- Syntax | 2907
- Description | 2907
- Options | 2907
- Required Privilege Level | 2907
- Output Fields | 2907
- Sample Output | 2908
- Release Information | 2908

Syntax

```
show oam ethernet connectivity-fault-management path-database
<host-mac-address>
<maintenance-association ma-name>
<maintenance-domain domain-name>
```

Description

On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

Options

host-mac-address	(Optional) Display connectivity fault management path database information for a specified Ethernet host.
maintenance-association *ma-name*	(Optional) Display connectivity fault management path database information for the specified maintenance association.
maintenance-domain *domain-name*	(Optional) Display connectivity fault management path database information for the specified maintenance domain.

Required Privilege Level

Output Fields

Table 228 on page 2907 lists the output fields for the `show oam ethernet connectivity- fault-management path-database` command. Output fields are listed in the approximate order in which they appear.

Table 228: show oam ethernet connectivity-fault-management path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the remote MEPs in the path.

Table 228: show oam ethernet connectivity-fault-management path-database Output Fields *(Continued)*

Field Name	Field Description
Interface	Interface identifier.
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Local Mep	Local MEP identifier.

Sample Output

show oam ethernet connectivity-fault -management path-database

```
user@host> show oam ethernet connectivity-fault-management path-database maintenance-domain md1
maintenance-association ma1 00:05:85:79:39:ef
Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
      Maintenance Domain: md1, Level: 7
      Maintenance Association: ma1, Local Mep: 201
```

Release Information

Command introduced in Junos OS Release 8.4.

show oam ethernet connectivity-fault-management policer

IN THIS SECTION

- Syntax | 2909
- Description | 2909
- Options | 2909
- Required Privilege Level | 2910
- Output Fields | 2910
- Sample Output | 2911
- Release Information | 2912

Syntax

```
show oam ethernet connectivity-fault-management policer <maintenance-domain md-name> <maintenance-
association ma-name>
```

Description

On M120, M320, MX Series, T320, and T640 routers displays connectivity-fault-management policer statistics.

Options

This command has the following options:

maintenance-domain *md-name* Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.

maintenance-association *ma-name* Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

Required Privilege Level

Output Fields

Table 229 on page 2910 lists the output fields for the `show oam ethernet connectivity-fault-management policer` command. Output fields are listed in the approximate order in which they appear.

Table 229: show oam ethernet connectivity-fault-management policer Output Fields

Field Name	Field Description
Legend for Policer	Describes the symbols used under the **Scope** and **Type** headings: • G - Global scope • S - Service scope • cc - Continuity check (Type)
Maintenance Domain	Displays the maintenance domain name.
Level	Displays the maintenance domain level configured.
Maintenance association	Displays the maintenance association name.
Policer	Displays the policer name.
Type	Policer type. Value **cc** means this policer is used only to police continuity check CFM messages. Value **other** means this policer is used only to police non-continuity check CFM messages. Value **all** means this policer is used to police all CFM messages.
Scope	Policer scope. Displays whether the *global* (G) policer configuration is applicable or the session (S) specific policer config is applicable.
Drop count	Displays the number of packets dropped by the indicated policer.

Sample Output

show oam ethernet connectivity-fault -management policer

Displays the policer information for all maintenance associations and their maintenance domains.

```
show oam ethernet connectivity-fault-management policer
Legend for Policer
G - Global scope
S - Service scope
cc - Continuity check

Maintenance Domain: md1 Level: 1

show oam ethernet connectivity-fault-management sla-iterator-statistics

IN THIS SECTION

- Syntax | **2913**
- Description | **2913**
- Options | **2913**
- Required Privilege Level | **2914**

- Output Fields | **2914**
- Sample Output | **2917**
- Sample Output | **2918**
- Sample Output | **2919**
- Release Information | **2926**

Syntax

```
show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain md-name
maintenance-association ma-name
sla-iterator sla-iterator
<local-mep local-mep-id>
<remote-mep remote-mep-id>
```

Description

Display the Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics.

Options

maintenance-domain *md-name*	Name of an existing connectivity fault management (CFM) maintenance domain.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
sla-iterator *sla-iterator*	Name of the iterator profile.
local-mep *local-mep-id*	(Optional) Numeric identifier of the local MEP. The range of values is **1** through **8191**.
remote-mep *remote-mep-id*	(Optional) Numeric identifier of the remote MEP. The range of values is **1** through **8192**.

Output Fields

Table 230 on page 2914 lists the output fields for the `show oam ethernet connectivity-fault-management sla-iterator-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 230: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields

Output Field Name	Output Field Description
Maintenance domain	Name of the maintenance domain.
Level	Level of the maintenance domain level configured.
Maintenance association	Name of the maintenance association.
Local MEP id	Numeric identifier of the local MEP.
Remote MEP id	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Iterator name	Name of iterator.
Iterator Id	Numeric identifier of the iterator.
Iterator cycle time	Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection
Iteration period	Maximum number of cycles per iteration
Iterator status	Current status of iterator whether running or stopped.

Table 230: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields *(Continued)*

Output Field Name	Output Field Description
Infinite iterations	Status of iteration as infinite or finite.
Counter reset time	Date and time when the counter was reset.
Reset reason	Reason to reset counter.
Delay weight	Calculation weight of delay.
Delay variation weight	Calculation weight of delay variation.
DMM sent	Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.
DMM skipped for threshold hit	Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.
DMM skipped for threshold hit window	Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.
DMR received	Number of delay measurement reply (DMR) frames received.
DMR out of sequence	Total number of DMR out of sequence packets received.
DMR received with invalid time stamps	Total number of DMR frames received with invalid timestamps.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.

Table 230: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields *(Continued)*

Output Field Name	Output Field Description
Average one-way forward delay variation	Average one-way forward delay variation for the statistics displayed in microseconds.
Average one-way backward delay variation	Average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average two-way delay	Weighted average two-way delay for the statistics displayed in microseconds.
Weighted average two-way delay variation	Weighted average two-way delay variation for the statistics displayed in microseconds.
Weighted average one-way backward delay variation	Weighted average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average one-way forward delay variation	Weighted average one-way forward delay variation for the statistics displayed in microseconds.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
`SLM packets received`	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
`SLR packets sent`	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
`SLR packets received`	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.

Table 230: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields *(Continued)*

Output Field Name	Output Field Description
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

show oam ethernet connectivity-fault-management state - To verify the Connectivity Fault Management (CFM) state

The following command is to verify whether the CFM state is in enhanced-cfm mode or not.

```
user@router> show oam ethernet connectivity-fault-management state
Connectivity fault management state:
    CFM Mode Of Operation: Enhanced
    Enhanced IP Mode: Enabled
    CFM Config State: Ok
    CFM Cleanup State: Ok
    CFM Restart Timer State: Cleanup Timer State stopped Rebooting in 0 sec
    CFM CFMMAN Job State: Not Pending
    Number of sessions: 1
    Number of sessions created: 1
    Number of sessions deleted: 0
    Number of sessions freed: 0
    Number of sessions enqueued: 1
    Number of sessions dequeued: 1
    VPLS feature: enabled
    Token based forwarding feature: enabled
    Forwarding table filtering simulation feature: disabled
    Hardware assisted flooding feature: enabled
    Flood resynchronization for GRES feature: enabled
    Shared interface filter feature: disabled
    Hardware timestamping feature: disabled
    Marking of connection protection TLV feature: disabled
    CFMD config memory resource  limit(in bytes): 3221225472
    CFMD max resident set (peak) size (in bytes):  24158208

Packet processing state:
    State of the connection to packet processing daemon: down
```

```
    State of the flow to packet processing daemon: ready
    State of the packet processing job: ready
    Number of times the connection to packet processing daemon was blocked: 0
    State of the connection to cfmman: slots: 2 3 4 5

Filter state:
    State of the connection to firewall daemon: Connected
    Number of reconnects made to firewall daemon: 0
    Number of requests sent to firewall daemon: 13
    Number of requests accepted by firewall daemon: 13
    Number of requests rejected by firewall daemon: 0
    Number of requests lost due to disconnection: 0
```

Release Information

Command introduced in Junos OS Release 11.4 .

show oam ethernet connectivity-fault-management synthetic-loss-statistics

IN THIS SECTION

- Syntax | 2927
- Description | 2927
- Options | 2927
- Required Privilege Level | 2927
- Output Fields | 2928
- Sample Output | 2929

Release Information | 2930

Syntax

```
show oam ethernet connectivity-fault-management synthetic-loss-statistics
<local-mep local-mep-id>
maintenance-association ma-name
<count entry-count>
maintenance-domain md-name
<remote-mep remote-mep-id>
```

Description

On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.

Options

count *entry-count*	(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.
local-mep *local-mep-id*	(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.
maintenance-association *ma-name*	Name of an existing CFM maintenance association.
maintenance-domain *md-name*	Name of an existing connectivity fault management (CFM) maintenance domain.
remote-mep *remote-mep-id*	(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.

Required Privilege Level

view

Output Fields

Table 231 on page 2928 lists the output fields for the `show oam ethernet connectivity-fault-management synthetic-loss-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 231: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields

Output Field Name	Field Description
`MEP identifier`	Maintenance association end point (MEP) numeric identifier.
`MAC address`	Unicast MAC address configured for the MEP.
`Remote MEP count`	Number of remote MEPs (unless you specify the `remote-mep` option).
`Remote MEP identifier`	Numeric identifier of the remote MEP.
`Remote MAC address`	Unicast MAC address of the remote MEP.
`SLM packets sent`	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
`SLM packets received`	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
`SLR packets sent`	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
`SLR packets received`	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
`Local TXFC1 value`	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.

Table 231: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields *(Continued)*

Output Field Name	Field Description
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

show oam ethernet connectivity-fault- management synthetic-loss-statistics

```

Output Fields

Table 232 on page 2931 lists the output fields for the `show oam ethernet evc` command. Output fields are listed in the approximate order in which they appear.

Table 232: show oam ethernet evc Output Fields

Field Name	Field Description
EVC identifier	Header for the EVC information showing the EVC name, configuration, and active/inactive status.
UNI count	Number of configured and active UNIs.
Protocol	Protocol configured between the UNIs.
Local UNIs	Heading for the list of local UNIs
UNI Identifier	Name of the UNI.

Table 232: show oam ethernet evc Output Fields *(Continued)*

Field Name	Field Description
Interface	Interface type-dpc/pic/port.unit-number.
Status	Status operational or not operational.

Sample Output

show oam ethernet evc

```
user@host> show oam ethernet evc
EVC identifier: evc1, Point-to-Point, Active
  UNI count: Configured(2), Active(2)
  Protocol: cfm, Management domain: md, Management association: ma
  Local UNIs:
    UNI Identifier      Interface     Status
    uni1                ge-1/1/1      Operational
    uni2                ge-1/1/1      Not Operational
```

Release Information

Command introduced in Junos OS Release 9.5.

show oam ethernet fnp interface

IN THIS SECTION

- Syntax | **2933**
- Description | **2933**
- Options | **2933**
- Required Privilege Level | **2933**

Output Fields | 2933
Sample Output | 2934
Release Information | 2934

Syntax

```
show oam ethernet fnp interface
<ethernet-interface-name>
<routing-instance routing-instance-name>
```

Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

Options

interface-name	(Optional) Display Ethernet FNP information for the specified Ethernet interface only.
routing-instance-name	(Optional) Display FNP for the specified routing instance.

Required Privilege Level

Output Fields

Table 233 on page 2934 lists the output fields for the `show oam ethernet fnp interface` command. Output fields are listed in the approximate order in which they appear.

Table 233: show oam ethernet fnp interface Output Fields

Field Name	Field Description
Interface	Name of the interface for the displayed information.
VLAN	Name of the VLAN.
State	Displays state of the interface.
FNP Message Interface	Displays the message interface type.
FNP Message Source MAC	Displays the source MAC address.

Sample Output

show oam ethernet fnp interface

```
user@host> show oam ethernet fnp interface
  The FNP controlled interfaces are:

  Interface   VLAN   State   FNP message   FNP message
                             Interface     Source MAC

  ge-0/0/0.30  30     down   lsi.1054976   a0:aa:aa:aa:aa:aa
  ge-0/0/0.20  20     down   lsi.1054976   a0:aa:aa:aa:aa:aa
```

Release Information

Command introduced in Junos OS Release 11.4.

show oam ethernet fnp messages

IN THIS SECTION

Output Fields

Table 234 on page 2936 lists the output fields for the `show oam ethernet fnp messages` command. Output fields are listed in the approximate order in which they appear.

Table 234: show oam ethernet fnp messages Output Fields

Field Name	Field Description
Message from source MAC address	The source MAC address of the message.
Originating port number	Port number of the original message.
Time since last message	Elapsed time in hours, minutes, and seconds since the last message was received.
Time since last message update	Elapsed time in hours, minutes, and seconds since the last message was updated.
Total messages received	Number of messages received.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
Trigger Reason	The reason why the message was triggered.
Effected VLANs	Number of VLANs that are affected.
Disabled interfaces	Name of the interfaces that are disabled.

Sample Output

show oam ethernet fnp messages

```
user@host> show oam ethernet fnp messages
  Active FNP messages on interface lsi.1054465
  Message source MAC: a0:aa:aa:aa:aa:aa
    Originating port number: 141077
    Time since last message: 00:00:00
    Time since last message update: 00:00:00
    Total messages received: 1
    Domain ID: 0
    STP Root ID: 0.f0:ff:ff:ff:ff:ff
    Trigger reason: todo
    Effected VLANs: 10

Output Fields

Table 235 on page 2938 lists the output fields for the `show oam ethernet fnp status` command. Output fields are listed in the approximate order in which they appear.

Table 235: show oam ethernet fnp status Output Fields

Field Name	Field Description
FNP interval	The time interval between messages.

Table 235: show oam ethernet fnp status Output Fields *(Continued)*

Field Name	Field Description
Loss threshold	The number of messages that can be lost before FNP is marked as down.
FNP enabled interfaces	Displays interfaces that are enabled.
Interface	The name of the interface.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
FNP Messages	The total number of messages received.

Sample Output

show oam ethernet fnp status

```
user@host> show oam ethernet status
  FNP interval:
  Loss threshold
  FNP enabled interfaces
  Interface      Domain ID      STP Root ID              FNP Messages
  ge-0/0/0.1278        100      0.f0:ff:ff:ff:ff:ff                0

Output Fields

Table 236 on page 2941 lists the output fields for the `show oam ethernet link-fault-management` command. Output fields are listed in the approximate order in which they appear.

Table 236: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Indicates the status of the established link. • **Fail**—A link fault condition exists. • **Running**—A link fault condition does not exist.	All levels
Discovery state	State of the discovery mechanism: • **Passive Wait** • **Send Any** • **Send Local Remote** • **Send Local Remote Ok**	All levels
Peer address	Address of the OAM peer.	All levels

Table 236: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Flags	Information about the interface. • **Remote-Stable**—Indicates remote OAM client acknowledgment of, and satisfaction with local OAM state information. **False** indicates that remote DTE has either not seen or is unsatisfied with local state information. **True** indicates that remote DTE has seen and is satisfied with local state information. • **Local-Stable**—Indicates local OAM client acknowledgment of, and satisfaction with remote OAM state information. **False** indicates that local DTE either has not seen or is unsatisfied with remote state information. **True** indicates that local DTE has seen and is satisfied with remote state information. • **Remote-State-Valid**—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. **False** indicates that OAM client has not seen remote state information. **True** indicates that the OAM client has seen remote state information.	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels

Table 236: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Remote entity information	Remote entity information. • **Remote MUX action**—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. • **Remote parser action**—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. • **Discovery mode**—Indicates whether discovery mode is active or inactive. • **Unidirectional mode**—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes. • **Remote loopback mode**—Indicates whether remote loopback is supported or not supported. • **Link events**—Indicates whether interpreting link events is supported or not supported on the remote peer. • **Variable requests**—Indicates whether variable requests are supported or not supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.	All levels
OAM Receive Statistics		
Information	The number of information PDUs received.	**detail**
Event	The number of loopback control PDUs received.	**detail**
Variable request	The number of variable request PDUs received.	**detail**
Variable response	The number of variable response PDUs received.	**detail**

Table 236: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Loopback control	The number of loopback control PDUs received.	**detail**
Organization specific	The number of vendor organization specific PDUs received.	**detail**
OAM Transmit Statistics		
Information	The number of information PDUs transmitted.	**detail**
Event	The number of event notification PDUs transmitted.	**detail**
Variable request	The number of variable request PDUs transmitted.	**detail**
Variable response	The number of variable response PDUs transmitted.	**detail**
Loopback control	The number of loopback control PDUs transmitted.	**detail**
Organization specific	The number of vendor organization specific PDUs transmitted.	**detail**
OAM Received Symbol Error Event information		
Events	The number of symbol error event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the received PDU. The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**

Table 236: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Errors in period	The number of symbol errors in the period reported in the received event PDU.	**detail**
Total errors	The number of errored symbols that have been reported in received event TLVs after the OAM sublayer was reset. Symbol errors are coding symbol errors.	**detail**
OAM Received Frame Error Event Information		
Events	The number of errored frame event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**
Total errors	The number of errored frames that have been reported in received event TLVs after the OAM sublayer was reset. A frame error is any frame error on the underlying physical layer.	**detail**
OAM Received Frame Period Error Event Information		
Events	The number of frame seconds errors event TLVs that have been received after the OAM sublayer was reset.	**detail**
Window	The duration of the frame seconds window.	**detail**
Threshold	The number of frame seconds errors in the period.	**detail**

Table 236: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Errors in period	The number of frame seconds errors in the period.	**detail**
Total errors	The number of frame seconds errors that have been reported in received event TLVs after the OAM sublayer was reset.	**detail**
OAM Transmitted Symbol Error Event Information		
Events	The number of symbol error event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the transmitted PDU.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The number of symbol errors in the period reported in the transmitted event PDU.	**detail**
Total errors	The number of errored symbols reported in event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
OAM Transmitted Frame Error Event Information		
Events	The number of errored frame event TLVs that have been transmitted after the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**

Output Fields

Table 237 on page 2950 lists the output fields for the `show oam ethernet link-fault-management` command. Output fields are listed in the approximate order in which they appear.

Table 237: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Indicates the status of the OAM discovery state mechanism . • **Down**—Discovery mechanism is not running.. • **Running**—Discovery mechanism is running.	All levels
Discovery state	State of the discovery mechanism. If the status of the discovery mechanism is Down then the state of discovery mechanism is Fault. However, if the status of the discovery mechanism is Running then the state can be any one of the following: • **Passive Wait** • `Active Send Local` • **Send Any** • **Send Local Remote** • **Send Local Remote Ok** • **Fault**	All levels
`ISSU`	Specifies that the local end is undergoing a unified in-service software upgrade (ISSU).	All levels
Peer address	Address of the OAM peer.	All levels

Table 237: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Flags	Information about the interface. Possible values are described in the "Link Flags" section under *Common Output Fields Description*. • **Remote-Stable**—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. **False** indicates that remote DTE either has not seen or is unsatisfied with local state information.**True** indicates that remote DTE has seen and is satisfied with local state information. • **Local-Stable**—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. **False** indicates that local DTE either has not seen or is unsatisfied with remote state information. **True** indicates that local DTE has seen and is satisfied with remote state information. • **Remote-State-Valid**—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. **False** indicates that OAM client has not seen remote state information. **True** indicates that the OAM client has seen remote state information.	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels

Table 237: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Remote entity information	Remote entity information. • **Remote MUX action**—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. • **Remote parser action**—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. • **Discovery mode**—Indicates whether discovery mode is active or inactive. • **Unidirectional mode**—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes. • **Remote loopback mode**—Indicates whether remote loopback is supported or unsupported. • **Link events**—Indicates whether interpreting link events is supported or unsupported on the remote peer. • **Variable requests**—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer. • `Remote in ISSU`—Indicates that the remote end is undergoing a unified in-service software upgrade (ISSU).	All levels
`Loopback Tracking`	Indicates that loopback detection is enabled or disabled.	All levels
`Loop Status`	Indicates that a loopback issue is either found, not found, or unknown when loopback tracking is enabled.	All levels
`Detect LOC`	Indicates that loss-of-continuity (LOC) detection is enabled or disabled.	All levels

Table 237: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
LOC status	Indicates that a LOC issue is either found, not found, or unknown when Detect LOC is enabled. Status is unknown when LOC detection is disabled.	All levels
OAM Receive Statistics		
Information	The total number of information PDUs received.	**detail**
Event	The total number of loopback control PDUs received.	**detail**

Total errors	The number of errored symbols reported in event TLVs that have been transmitted since the OAM sublayer was reset.	**detail**
OAM Current Symbol Error Event Information		
Events	The number of symbol error TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
Window	The symbol error event window in the transmitted PDU.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The total number of symbol errors in the period reported.	**detail**
Total errors	The number of errored symbols reported in event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
OAM Transmitted Frame Error Event Information		
Events	The number of errored frame event TLVs that have been transmitted since the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**

Table 237: show oam ethernet link-fault-management Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Total errors	The number of errored frames that have been detected since the OAM sublayer was reset.	**detail**
OAM Current Frame Error Event Information		
Events	The number of errored frame event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of errored frames in the period.	**detail**
Total errors	The number of errored frames detected regardless of whether the threshold for transmitting event TLVs has been crossed.	**detail**

Sample Output

show oam ethernet link-fault-management brief

```

```

Release Information

Command introduced in Junos OS Release 8.2.

show oam ethernet lmi

IN THIS SECTION

- Syntax | 2961
- Description | 2961
- Options | 2961
- Required Privilege Level | 2962
- Output Fields | 2962
- Sample Output | 2963
- Release Information | 2963

Syntax

```
show oam ethernet lmi (interface <interface-name>)
```

Description

On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

Options

interface	(Optional) Display LMI information for a specified interface.
interface-name	(Optional) Display Ethernet LMI information for the specified interface only.

Required Privilege Level

View

Output Fields

Table 238 on page 2962 lists the output fields for the `show oam ethernet lmi` command. Output fields are listed in the approximate order in which they appear.

Table 238: show oam ethernet lmi Output Fields

Field Name	Field Description
Physical Interface	Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status.
UNI Identifier	Name of the UNI.
EVC map type	EVC configuration.
Polling verification timer	Polling verification timer status.
E-LMI state	Operational status of the E-LMI configuration in the interfaces or specified interface.
Priority/Untagged VLAN ID	To be provided.
Default EVC	The EVC set as the default EVC.
Associated EVCs	Heading for the list of configured EVCs.
EVC Indentifier	EVC name.
Reference ID	To be provided.
Status	Status active or not active.

Table 238: show oam ethernet lmi Output Fields *(Continued)*

Field Name	Field Description
CE VLAN IDs	Customer edge VLAN ID numbers.

Sample Output

show oam ethernet lmi interface

```
user@host> show oam ethernet lmi interface ge-1/1/1
Physical interface: ge-1/1/1, Physical link is Up
  UNI identifier: uni-ce1, EVC map type: Bundling
  Polling verification timer: Enabled, E-LMI state: Operational
  Priority/Untagged VLAN ID: 20, Default EVC: evc1
  Associated EVCs:
    EVC              Reference        Status              CE VLAN IDs
    Identifier     ID
    evc1                  1           Active (New)          1-2048
    evc2                   2        Not Active            2049-4096
```

Release Information

Command introduced in Junos OS Release 9.5.

show oam ethernet lmi statistics

IN THIS SECTION

- Syntax | **2964**
- Description | **2964**
- Options | **2964**
- Required Privilege Level | **2964**

- Output Fields | **2964**
- Sample Output | **2965**
- Release Information | **2966**

Syntax

```
show oam ethernet lmi statistics <interface interface-name>
```

Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

Options

interface (Optional) Display LMI statistics for a specified interface.

interface-name (Optional) Display Ethernet LMI information for the specified Ethernet interface only.

Required Privilege Level

Output Fields

Table 239 on page 2964 lists the output fields for the `show oam ethernet lmi statistics` command. Output fields are listed in the approximate order in which they appear.

Table 239: show oam ethernet lmi statistics Output Fields

Field Name	Field Description
Physical interface	Name of the interface for the displayed statistics.

Table 239: show oam ethernet lmi statistics Output Fields *(Continued)*

Field Name	Field Description
Reliability errors	Number of E-LMI reliability errors logged.
Protocol errors	Number of E-LMI protocol errorse.
Status check received	Number of E-LMI status check receive errors.
Status check sent	Number of E-LMI status check sent errors.
Full status received	Number of E-LMI full status receive errors.
Full status sent	Number of E-LMI full status sent errors.
Full status continued received	Number of E-LMI status continued received errors.
Full status continued sent	Number of E-LMI full status continued sent errors.
Asynchronous status sent	Number of E-LMI asynchronous status sent errors.

Sample Output

show oam ethernet lmi statistics

```
user@host> show oam ethernet lmi statistics interface ge-1/1/1
Physical interface: ge-1/1/1
  Reliability errors                    4  Protocol errors                    0
  Status check received                 0  Status check sent                  0
  Full status received                694  Full status sent                 694
  Full status continued received        0  Full status continued sent         0
  Asynchronous status sent              0
```

Release Information

Command introduced in Junos OS Release 9.5.

show pfe statistics bridge

IN THIS SECTION

- Syntax | 2966
- Description | 2966
- Options | 2966
- Required Privilege Level | 2967
- Output Fields | 2967
- Sample Output | 2968
- Release Information | 2972

Syntax

```
show pfe statistics bridge
<fpc slot>
```

Description

Display information about the number of packets discarded in the ingress pipeline of the Packet Forwarding Engine, packets discarded because of egress filtering or congestion filtering, number of control packets, and general counters for dropped packets. You can use this information to inform troubleshooting investigations.

Options

none Display bridge counter statistics for all Flexible PIC Concentrator (FPC) slots.

fpc *slot* (Optional) Display bridge counter statistics for a specific FPC slot.

Required Privilege Level

view

Output Fields

Table 240 on page 2967 lists the output fields for the `show pfe statistics bridge` command. Output fields are listed in the approximate order in which they appear.

Table 240: show pfe statistics bridge Output Fields

Field Name	Field Description
Ingress Counters	Information about ingress counters: • **Received**—Number of packets received by the bridge. • **VLAN Filtered**—Number of packets discarded because of VLAN filtering. • **Security Filtered**—Number of packets discarded because of security filtering. • **Other Discards**—Number of packets dropped by the bridge for reasons other than VLAN or security filtering.
Egress Counters	Information about egress counters: • **Unicast**—Number of unicast packets transmitted. • **Multicast**—Number of multicast packets transmitted. • **Broadcast**—Number of broadcast packets transmitted. • **Egress Filtered**—Number of egress-filtered packets (regardless of port, priority, or mode). • **TailDrop**—Number of packets filtered because of egress queue congestion. • **Forward Restrict**—Number of packets filtered because of egress forward restrictions. • **Congestion Filtered**—Number of packets filtered because of transmit queue (TxQ) congestion. • **Control Packets**—Number of control packets (sent to CPU, received from CPU, and sent to analyzer).

Table 240: show pfe statistics bridge Output Fields *(Continued)*

Field Name	Field Description
Drop Counters	Information about drop counters: • **Drop Mode**—Count mode of the counter. • **Drop Counter**—Counter value.
General Counters	Information about general counters: • **Drop Mode**—Count mode of the counter. • **Drop Counter**—Counter value. • **Source Not Learnt**—Number of source addresses that were not learnt because of internal congestion.
MUX PFE	Information about multiplexer PFE for oversubscribed cards: • **Drop Mode**—Count mode of the counter. • **Drop Count**—Counter value.

Sample Output

show pfe statistics bridge (EX3200 and EX4200 Switches)

```

Syntax

```
show pfe data
<”usp flow config”>
<”usp flow stats”>
```

Description

Displays the Packet Forwarding Engine data. The Packet Forwarding Engine is the central processing element of the forwarding plane, systematically moving the packets in and out of the device. In Junos OS, the Packet Forwarding Engine has a locally stored forwarding table.

The forwarding table is a synchronized copy of all the information from the Route Engine that the forwarding plane needs to handle each packet, including outgoing interfaces, addresses, and so on. Storing a local copy of this information allows the Packet Forwarding Engine to get its job done without going to the control plane every time that it needs to process a packet.

The locally stored forwarding table allows the Packet Forwarding Engine to continue forwarding packets, even when a disruption occurs to the control plane, such as when a routing or other process issue happens.

Options

”usp flow config”	Displays current flow configuration in logical system root-logical-system.
”usp flow stats”	Displays current flow statistics.

Output Fields

Table 241 on page 2974 lists the output fields for the `show pfe data` command. Output fields are listed in the approximate order in which they appear.

Table 241: show pfe data Output Fields

Field Name	Field Description
`Flow main Parameters`	Information about flow main parameters: • `allow-dns-reply`—Displays whether `allow-dns-reply` is enabled or disabled. • `allow-embedded-icmp`—Displays whether `allow-embedded-icmp` is enabled or disabled. • `mcast-buffer-enhance`—Displays whether `mcast-buffer-enhance` is enabled or disabled. • `allow-reverse-ecmp`—Displays whether `allow-reverse-ecmp` is enabled or disabled. • `no-local-favor-ecmp`—Displays whether `no-local-favor-ecmp` is enabled or disabled. • `Reordering-mixed-traffic`—Displays whether `Reordering-mixed-traffic` is enabled or disabled. • `Route-change-timeout`—Displays the route change timeout value. • `NH-resolve-timeout`—Displays next-hop resolve timeout value. • `Mcast-nh-resolve-retry`—Displays multicast next-hop resolve value. • `Pending-sess-queue-length`—Displays the pending session queue length. • `Syn-flood-protection tcp-syn-cookie`—Displays the synchronizing flood protection TCP synchronizing cookies. • `Syn-flood-dynamic-whitelist-time`—Displays the syncronizing floow dynamic allowlist time. • `no-inter-node-forwarding`—Displays whether `no-inter-node-forwarding` is enabled or disabled. • `no-inter-node-forwarding-ipv6`—Displays whether `no-inter-node-forwarding-ipv6` is enabled or disabled. • `enable-reroute-nat-check`—Displays whether `enable-reroute-nat-check` is enabled or disabled. • `force_ip_reassembly`—Displays whether `force_ip_reassembly` is enabled or disabled. • `fragment_limit`—Displays the fragment limit. • `frag_reassembly_timeout`—Displays the fragment reassembly timeout value. • `sync_icmp_session`—Displays whether `sync_icmp_session` is enabled or disabled. • `log dropped-icmp-packet`—Displays whether log `dropped-icmp-packet` is enabled or disabled.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
	• log dropped-illegal-packet—Displays whether log dropped-illegal-packet is enabled or disabled. • preserve incoming frag size—Displays whether preserve incoming fragment size is enabled or disabled. • log-extension—Displays whether log-extension is enabled or disabled. • advanced options drop_match_reserved_ip_address—Displays whether advanced options drop_match_reserved_ip_address is enabled or disabled. • advanced options drop_link_local_address—Displays whether advanced options drop_link_local_address is enabled or disabled. • advanced options reverse route packet mode vr option—Displays whether advanced options reverse route packet mode vr option is enabled or disabled. • advanced options close icmp session immediately—Displays whether advanced options close Internet Control Message Protocol session immediately is enabled or disabled. • load-distribution session-affinity ipsec—Displays whether load-distribution session-affinity ipsec is enabled or disabled.
Aging Parameters	Information about aging parameters: • early-ageout—Displays the number of early ageout. • low-watermark—Displays the low watermark value. • high-watermark—Displays the high watermark value.
TCP MSS Parameters	Information about TCP MSS Parameters: • all-tcp-mss—Displays whether all-tcp-mss is enabled or disabled. • ipsec-vpn-tcp-mss—Displays whether ipsec-vpn-tcp-mss is enabled or disabled. • gre-in-tcp-mss—Displays whether gre-in-tcp-mss is enabled or disabled. • gre-out-tcp-mss—Displays whether gre-out-tcp-mss is enabled or disabled.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
`TCP Session Parameters`	Information about TCP Session Parameters: • `rst-invalid-session`—Displays whether `rst-invalid-session` is enabled or disabled. • `fin-invalid-session`—Displays whether `fin-invalid-session` is enabled or disabled. • `rst-check-sequence`—Displays whether `rst-check-sequence` is enabled or disabled. • `syn-check`—Displays whether `syn-check` is enabled or disabled. • `syn-check-in-tunnel`—Displays whether `syn-check-in-tunnel` is enabled or disabled. • `sequence-check`—Displays whether `sequence-check` is enabled or disabled. • `strict-syn-check`—Displays whether `strict-syn-check` is enabled or disabled. • `tcp-initial-timeout`—Displays TCP initial timeout value. • `maximum-scale-window`—Displays the value of maximum scale window. • `time-wait-state-session-timeout`—Displays the wait time state and session timeout value.
`Flow traceoptions`	Information about flow traceoptions: • `trace flags`—Trace the flag option. • `trace level`—Trace level of the trace message. • `trace present`—Trace the present option. • `trace dst id`—Trace the specified destination ID. • `trace module buffer`—Trace the module buffer value.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
`Flow Modes`	Information about flow modes: • `Flow mode for inet`—Flow mode packets to an IPv4 destination. Displays configuration and running mode. • `Flow mode for inet6`—Displays the IPv6 flow mode informations such as the running mode, configuration mode, and the status of IPv6 security knob. • `Flow mode for mpls`—Flow mode packets to MPLS. Displays configuration and running mode. • `Flow mode for iso`—Flow mode to ISO. Displays configuration and running mode.
`Flow action flag`	Information about the flow action flag.
`Session distribution`	• `Config mode`—Displays configuration mode. • `Running mode`—Displays running mode. • `GTP-U distribution`—Displays whether the GTP-U distribution is enabled or disabled.
`Ipsec performance acceleration`	Accelerate the IPSec traffic performance. Displays whether IPSec performance acceleration is enabled or disabled.
`Packet ordering`	Information about packet ordering: • `Config mode`—Displays configuration mode. • `Running mode`—Displays running mode.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
Hash Bucket Size	Information about hash bucket size: • Ipv4—Display Packet Forwarding Engine IPv4 routes. • Ipv6—Display Packet Forwarding Engine IPv6 routes. • Flow packet log enable—Displays flow packet log enable. • Flow packet log index—Displays flow packet log index. • Flow packet log throttle-interval—Displays flow packet log throttle-interval. • Flow tap mode—Displays whether flow tap mode is enabled or disabled. • Flow power mode IPsec—Displays whether flow power mode IPsec is enabled or disabled. • Fat core group global switch—Displays whether fat core group global switch is on or off. • Fat core group size—Displays the fat core group size.
Ager Ring Statistics	Information about the ager ring statistics: • IPv4 and IPv6 Common Ager Ring—Displays whether batching is enabled or disabled. • current tick—Displays the current session timeout value. • insert—Displays the insert value. • update—Displays the update value. • callback invoked—Displays the callback invoked value. • remove—Displays the remove value. • update skipped—Displays the skipped update value. • max watchdog time—Displays maximum watchdog time. • timeout value larger—Displays larger timeout value. • ager update—Displays update ager value.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
`Session Scan stats`	Information about session scan statistics: • `Requests recvd`—Displays the number of requests received. • `Requests Processing Done`—Displays the number of processing requests completed. • `Request Done Time`—Displays the number of requests done time. • `Skip session scan`—Displays the number of skip session scan. • `Total sessions scanned`—Displays the total number of sessions scanned. • `Batched (active sess limit)`—Displays the number of active sessions limit. • `Pending Que added`—Displays the number of pending queue added. • `Pending Que add fail`—Displays the number of pending queue add failures. • `Response Done`—Displays the number of response completed. • `Response Failed`—Displays the number of responses failed. • `Response Done Time`—Displays the response time completed. • `Scan Handler Invoked`—Displays the number of scan handler invoked. • `PendQ Handler Invoked`—Displays the number of pending handler invoked. • `Session scan running time`—Displays the timer of session scan running. • `Session scan handler yield`—Displays the number of session scan handler yield. • `Scan post even failed`—Displays the number of scan post even failed.

Table 241: show pfe data Output Fields *(Continued)*

Field Name	Field Description
Flow Session Statistics	Information about flow session statistics: • Current flows—Displays the number of current flows. • IPv4 flow alloc—Displays the number of IPv4 flow allocation. • IPv4 flow free—Displays the number of IPv4 flow free. • IPv4 flow alloc failure—Displays the number of IPv4 flow allocation failures. • IPv4 flow route skip—Displays the number of IPv4 flow route skipped. • IPv4 flow fast reroute—Displays the number of IPv4 flow fast reroute. • IPv4 flow tunnel route skip—Displays the number of IPv4 flow tunnel route skipped. • ager phase1—Displays the number of ager phase1. • ager phase2—Displays the number of ager phase2. • cp sess del rexmitted—Displays the cp session delete rexmitted.
Flow Table Statistics	Information about the flow table statistics: • flow add—Displays number of flow add entries. • flow remove—Displays number of flow delete entries. • flow find—Displays number of flow find entries.

Sample Output

```

Release Information

Command introduced in Junos OS Release 18.2R3-S3.

Starting in Junos OS Release 18.2R3-S3, 19.1R3, 19.2R3, 19.3R3, 19.4R2, 20.1R2, you can now view the Packet Forwarding Engine data using the `usp flow config` and `usp flow stats` options for the `show pfe data` command.

Output Fields

Table 242 on page 2987 lists the output fields for the `show ilmi statistics` command. Output fields are listed in the approximate order in which they appear.

Table 242: show ilmi statistics Output Fields

Field Name	Field Description
Input	Information about received ILMI packets: • **Packets**—Total number of messages delivered to the ILMI entity from the transport service. • **Bad versions**—Total number of messages delivered to the ILMI entity that were for an unsupported ILMI version. • **Bad community names**—Total number of messages delivered to the ILMI entity that did not use an ILMI community name. • **Bad community uses**—Total number of messages delivered to the ILMI entity that represented an ILMI operation that was not allowed by the ILMI community named in the message. • **ASN parse errors**—Total number of ASN.1 or BER errors encountered by the ILMI entity when decoding received ILMI messages. • **Too bigs**—Total number of ILMI packets delivered to the ILMI entity with an error status field of **tooBig**. • **No such names**—Total number of ILMI packets delivered to the ILMI entity with an error status field of **noSuchName**. • **Bad values**—Total number of ILMI packets delivered to the ILMI entity with an error status field of **badValue.** • **Read onlys**—Total number of valid ILMI packets delivered to the ILMI entity with an error status field of **readOnly**. Only incorrect implementations of ILMI generate this error. • **General errors**—Total number of ILMI packets delivered to the ILMI entity with an error status field of **genErr**. • **Total request varbinds**—Total number of objects retrieved successfully by the ILMI entity as a result of receiving valid ILMI **GetRequest** and **GetNext** packets. • **Total set varbinds**—Total number of objects modified successfully by the ILMI entity as a result of receiving valid ILMI **SetRequest** packets. • **Get requests**—Total number of ILMI **GetRequest** packets that have been accepted and processed by the ILMI entity. • **Get nexts**—Total number of ILMI **GetNext** packets that have been accepted and processed by the ILMI entity.

Table 242: show ilmi statistics Output Fields *(Continued)*

Field Name	Field Description
	• **Set requests**—Total number of ILMI **SetRequest** packets that have been accepted and processed by the ILMI entity. • **Get responses**—Total number of ILMI **GetResponse** packets that have been accepted and processed by the ILMI entity. • **Traps**—Total number of ILMI traps received by the ILMI entity. • **Silent drops**—Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequest**, and **InformRequest** packets delivered to the ILMI entity that were silently dropped because the size of a reply containing an alternate response packet with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • **Proxy drops**—Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequest**, and **InformRequest** packets delivered to the ILMI entity that were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in such a way (other than a timeout) that no response packet could be returned.

Table 242: show ilmi statistics Output Fields *(Continued)*

Field Name	Field Description
Output	Information about transmitted ILMI packets: • **Packets**—Total number of messages passed from the ILMI entity to the transport service. • **Too bigs**—Total number of ILMI packets generated by the ILMI entity with an error status field of **tooBig**. • **No such names**—Total number of ILMI packets generated by the ILMI entity with an error status field of **noSuchName**. • **Bad values**—Total number of ILMI packets generated by the ILMI entity with an error status field of **badValue**. • **General errors**—Total number of ILMI packets generated by the ILMI entity with an error status field of **genErr**. • **Get requests**—Total number of ILMI **GetRequest** packets that have been generated by the ILMI entity. • **Get nexts**—Total number of ILMI **GetNext** packets that have been generated by the ILMI entity. • **Set requests**—Total number of ILMI **SetRequest** packets that have been generated by the ILMI entity. • **Get responses**—Total number of ILMI **GetResponse** packets that have been generated by the ILMI entity. • **Traps**—Total number of ILMI traps generated by the ILMI entity.

Sample Output

show ilmi statistics

```
user@host> show ilmi statistics
   ILMI statistics:
    Input:
      Packets: 0, Bad versions: 0, Bad community names: 0,
      Bad community uses: 0, ASN parse errors: 0,
      Too bigs: 0, No such names: 0, Bad values: 0,
```

```
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 0, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0
```

Release Information

Command introduced before Junos OS Release 7.4.

show security alarms

IN THIS SECTION

- Syntax | 2991
- Description | 2991
- Options | 2991
- Required Privilege Level | 2992
- Output Fields | 2992
- Sample Output | 2993
- Release Information | 2996

Syntax

```
show security alarms
<detail>
<alarm-id id-number>
<alarm-type [ types ]>
<newer-than YYYY-MM-DD.HH:MM:SS>
<older-than YYYY-MM-DD.HH:MM:SS>
<process process>
<severity severity>
```

Description

Display the alarms that are active on the device. Run this command when the CLI prompt indicates that a security alarm has been raised, as shown here:

```
[1 SECURITY ALARM] user@host#
```

Options

none — Display all active alarms.

detail — (Optional) Display detailed output.

alarm-id *id-number* — (Optional) Display the specified alarm.

alarm-type [*types*] — (Optional) Display the specified alarm type or a set of types.

You can specify one or more of the following alarm types:

- `authentication`
- `cryptographic-self-test`
- `decryption-failures`
- `encryption-failures`
- `ike-phase1-failures`
- `ike-phase2-failures`

- key-generation-self-test
- non-cryptographic-self-test
- policy
- replay-attacks

newer-than *YYYY-MM-DD.HH:MM:SS* — (Optional) Display active alarms that were raised after the specified date and time.

older-than *YYYY-MM-DD.HH:MM:SS* — (Optional) Display active alarms that were raised before the specified date and time.

process *process* — (Optional) Display active alarms that were raised by the specified system process.

severity *severity* — (Optional) Display active alarms of the specified severity.

You can specify the following severity levels:

- alert
- crit
- debug
- emerg
- err
- info
- notice
- warning

Required Privilege Level

security—To view this statement in the configuration.

Output Fields

Table 243 on page 2993 lists the output fields for the `show security alarms` command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the `detail` keyword is used.

Table 243: show security alarms

Field Name	Field Description	Level of Output
ID	Identification number of the alarm.	All levels
Alarm time	Date and time the alarm was raised..	All levels
Message	Information about the alarm, including the alarm type, username, IP address, and port number.	All levels
Process	System process (For example, login or sshd) and process identification number associated with the alarm.	detail
Severity	Severity level of the alarm.	detail

Sample Output

show security alarms

```
[3 SECURITY ALARMS] user@router> show security alarms

ID    Alarm time               Message
1     2010-01-19 13:41:36 PST  SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1)
for user 'user' reached from '203.0.113.2'
2     2010-01-19 13:41:52 PST  SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1)
for user 'user' reached from '203.0.113.2'
3     2010-01-19 13:42:13 PST  SSHD_LOGIN_FAILED_LIMIT: Specified number of login failures (1)
for user 'user' reached from '203.0.113.2'

show security log

IN THIS SECTION

- Syntax | 3000
- Description | 3000
- Options | 3000
- Required Privilege Level | 3001
- Output Fields | 3001
- Sample Output | 3002
- Release Information | 3004

Syntax

```
show security log {all| destination-address| destination-port| event-id| failure|interface-name|
newer-than| older-than| process| protocol|report| severity| sort-by| source-address| source-
port| success| user}
```

Description

Display security event logs. This command continuously displays security events on the screen. To stop the display, press Ctrl+c.

Options

all	Display all audit event logs stored in the device memory.
destination-address	Display audit event logs with the specified destination address.
destination-port	Display audit event logs with the specified destination port.
event-id	Display audit event logs with the specified event identification number.
failure	Display failed audit event logs.

interface-name	Display audit event logs with the specified interface.
newer-than	Display audit event logs newer than the specified date and time.
older-than	Display audit event logs older than the specified date and time.
process	Display audit event logs with the specified process that generated the event.
protocol	Display audit event logs generated through the specified protocol.
report	Display on-box reports for system traffic logs.
severity	Display audit event logs generated with the specified severity.
sort-by	Display audit event logs generated sorted with the specified options.
source-address	Display audit event logs with the specified source address.
source-port	Display audit event logs with the specified source port.
success	Display successful audit event logs.
username	Display audit event logs generated for the specified user.

view

Output Fields

Table 244 on page 3002 lists the output fields for the `show security log` command. Output fields are listed in the approximate order in which they appear.

Table 244: show security log Output Fields

Field Name	Field Description
Event time	The timestamp of the events received. Security logs were always timestamped using the UTC time zone by running `set system time-zone utc` and `set security log utc-timestamp` CLI commands. Now, time zone can be defined using the local time zone by running the `set system time-zone` **`time-zone`** command to specify the local time zone that the system should use when timestamping the security logs.
Message	Security events are listed.

Sample Output

show security log

```
user@host> show security log
Event time               Message

Release Information

Command introduced in Junos OS Release 12.1.

RELATED DOCUMENTATION

show security log | 3000

show security log profile

IN THIS SECTION

- Syntax | 3012
- Description | 3012
- Required Privilege Level | 3012
- Sample Output | 3012
- Release Information | 3021

Syntax

```
show security log profile <config|template>
```

Description

Use this command to see the log template details.

Required Privilege Level

view

Sample Output

show security log profile traditional-firewall

```

Show Security Log Query

```
show security log query {category all | utm | idp | alg | appqos | flow | fw-auth | gtp | ipsec
| nat | pst-ds-lite | rtlog | screen | sctp | secintel} count < count>
[src-ip <src-ip>]
[dst-ip <dst-ip>]
[src-port <src-port>]
[dst-port <dst-port>]
[application <application>]
[user <user>]
[event-type <event-type>]
[service <service>]
[start-time <start-time>]
[stop-time <stop-time>]
```

Show Security Log Stream

```
show security log stream
file <filename>
```

Description

- `show security log query`—View the security log from the database with query conditions.
- `show security log stream file`—View all the security log messages in the specified log file. Use the `/var/log/ hostlogs` directory to search the specified log file, and use the `show security log stream file` command to view logs in log files in the `/var/log/hostlogs` directory.

Options

- count—The log number to output.
- scr-ip—The source IP address of log messages.
- dst-ip—The destination IP address of log messages.
- src-port—The source port of log messages.
- dst-port—The destination port of log messages.
- application—The application of log messages.
- user—The user of log messages.
- event-type—The event type of log messages.
- service—The service of log messages.
- start-time—The earliest timestamp of log messages; the format for time is YYYY-MM-DDTHH:MM:SS.
- stop-time—The latest timestamp of log messages.

- show security monitoring (vSRX in a Chassis Cluster) | **3028**
- Release Information | **3028**

Syntax

```
show security monitoring
```

Description

Displays a count of security flow and central point (CP) sessions, CPU utilization (as a percentage of maximum), and memory in use (also as a percentage of maximum) at the moment the command is run. This command is supported on SRX1400, SRX1500, SRX5400, SRX5600, and SRX5800 devices and vSRX.

show security monitoring fpc fpc-number

IN THIS SECTION

- Syntax | 3029

- Description | 3029
- Options | 3029
- Additional Information | 3030
- Required Privilege Level | 3030
- Output Fields | 3030
- Sample Output | 3031
- Sample Output | 3031
- Sample Output | 3032
- Release Information | 3032

Syntax

```
show security monitoring fpc                    fpc-number
<node (          node-id         | all | local | primary)>
```

Description

Display security monitoring information about the FPC slot.

Options

- *fpc-number* —Display security monitoring information for the specified FPC slot. It can be in the range from 0 to 11.
- node—(Optional) For chassis cluster configurations, display security monitoring information for the specified FPC on a specific node (device) in the cluster.
  - *node-id* —Identification number of the node. It can be 0 or 1.
  - all—Display information about all nodes.
  - local—Display information about the local node.
  - primary—Display information about the primary node.

Additional Information

For complete list of slot numbering, physical port, and logical interface numbering for SRX Series devices in chassis cluster, see Chassis Cluster User Guide for SRX Series Devices.

Output Fields

Table 247 on page 3030 lists the output fields for the `show security monitoring fpc` *`fpc-number`* command. Output fields are listed in the approximate order in which they appear.

Table 247: show security monitoring fpc fpc-number Output Fields

Field Name	Field Description
`FPC`	Slot number in which the FPC is installed.
`PIC`	Slot number in which the PIC is installed.
`CPU Utilization (%)`	Total percentage of CPU being used by the PIC's processors.
`Memory Utilization (%)`	Percentage of heap space (dynamic memory) being used by the PIC's processor. If this number exceeds 80 percent, there might be a software problem (memory leak).
`Current flow session`	The current number of flow sessions. When SRX Series devices operate in packet mode, flow sessions will not be created and this field will remain zero.
`Max flow session`	The maximum number of flow sessions allowed. This number will differ from one device to another.
`SPU current cp session`	The current number of cp sessions for the SPU (on SRX5600, and SRX5800 devices only).

Table 247: show security monitoring fpc fpc-number Output Fields *(Continued)*

Field Name	Field Description
SPU max cp session	The maximum number of cp sessions allowed for the SPU (on SRX5600, and SRX5800 devices only).

Sample Output

show security monitoring fpc 0

```
user@host> show security monitoring fpc 0

show security monitoring performance session

IN THIS SECTION

- Syntax | 3033
- Description | 3033
- Options | 3033
- Required Privilege Level | 3034
- show security monitoring performance session | 3034
- Release Information | 3034

Syntax

```
show security monitoring performance session
<fpc slot-number>
<pic slot-number>
```

Description

Display the current session (total number of sessions at that time) for the last 60 seconds.

Options

- `fpc slot-number` — Display information about the FPC slot. Use this option to filter the output based on the slot number.
- `pic slot-number` — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

> **NOTE**: The fpc slot-number and pic slot-number options are not available on SRX300, SRX320, and SRX340 devices.

show security monitoring performance spu

IN THIS SECTION

- Syntax | 3035
- Description | 3035
- Options | 3036
- Required Privilege Level | 3036
- show security monitoring performance spu | 3036
- show security monitoring performance spu (vSRX and vSRX 3.0) | 3037
- show security monitoring performance spu summary fpc 1 pic 0 (SRX5400, SRX5600, and SRX5800) | 3037
- show security monitoring performance spu summary fpc 1 pic 1 thread 8 (SRX5400, SRX5600, and SRX5800) | 3038
- Release Information | 3038

Syntax

```
show security monitoring performance spu
<fpc slot-number>
<pic slot-number>
```

Description

Display the services processing unit (SPU) percent utilization for all FPC slots over the last 60 seconds. Use this command to track the percent utilization statistics per second for the past 60 seconds for each FPC slot and PIC.

Starting in Junos OS Release 20.2R1, you can use the following operational commands to monitor the average CPU usage information for the last minute, hour, or day of an SPC3 card:

- `show security monitoring performance spu summary fpc` *`fpc-slot-number`* `pic` *`pic-slot-number`*
- `show security monitoring performance spu summary fpc` *`fpc-slot-number`* `pic` *`pic-slot-number`* `thread` *`thread-number`*

You can monitor the CPU usage information only when the PIC is online.

Options

- `fpc slot-number` — Display information about the FPC slot. Use this option to filter the output based on the slot number.
- `pic slot-number` — Display information about existing PIMs or Mini-PIMs in a particular PIC slot. Use this option to filter the output based on PIC slot.

> **NOTE**: The fpc slot-number and pic slot-number options are not available on SRX300, SRX320, or SRX340 devices or on vSRX instances.

Syntax

```
show services ip-monitoring status
```

Description

Display a brief summary of IP monitoring status along with the current state for a given policy.

Required Privilege Level

view

Output Fields

Table 248 on page 3040 lists the output fields for the `show services ip-monitoring status` command. Output fields are listed in the approximate order in which they appear.

Table 248: show services ip-monitoring status Output Fields

Field Name	Field Description
`Policy`	Name of the policy configured.
`Probe Name`	Name of the probe configured.
`Address`	Displays the configured target address.
`Status`	Displays the status of the probe on the target address. If the status is PASS, then the target address is reached.
`Route-Action`	Displays route injection information configured for the policy and its failover status.
`Route-Instance`	Displays the routing instance of the route to be injected during failover.
`Route`	Routing address of the route to be injected during failover.
`Next-Hop`	Specifies the next-hop address of the route to be injected during failover. P2P interfaces only.
`State`	Display the state of the route injection action. If the state is APPLIED, then the ip-monitoring policy is in failover state.
`Interface Action`	Displays the interface action type as enable or disable.
`Policy Action`	Displays the policy action type as enable or disable.
`Admin State`	Displays the current admin state of the interface.

Table 248: show services ip-monitoring status Output Fields *(Continued)*

Field Name	Field Description
Action Status	Displays the current action status of the interface.

Sample Output

show services ip-monitoring status

```
user@host> show services ip-monitoring status

Policy - policy1 (Non-preemptive. Status: FAIL)
  RPM Probes:
    Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
    probe_a                a1              15.1.1.10        FAIL
    probe_a                a2              200.1.1.1        FAIL
  Route-Action:
    route-instance    route             next-hop         State
    ----------------- ----------------- ---------------- -------------
    inet.0            200.1.1.0         150.1.1.1        APPLIED
  Interface-Action:
    interface         policy action   admin state action status
    ----------------- --------------- ----------- -----------------
    fe-0/0/5.2        Enable          UP          FAILOVER
    fe-0/0/5.4        Disable         DOWN        FAILOVER
    t1-1/0/0          Enable          UP          FAILOVER
    dl0               Enable          UP          FAILOVER
    ge-0/0/1          Enable          UP          FAILOVER
```

Sample Output

show services ip-monitoring status

In this example, the policy is in the failback state, and the no-preempt option is not configured.

```
user@host> show services ip-monitoring status

Policy - policy1 (Status: PASS)
  RPM Probes:
    Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
    probe1                 a1              99.1.1.2         PASS
  Route-Action:
    route-instance    route             next-hop         state
    ----------------- ----------------- ---------------- -------------
    inet.0            99.1.1.0          12.12.12.2       NOT-APPLIED
  Interface-Action:
    interface         policy action   admin state action status
    ----------------- --------------- ----------- -----------------
    at-2/0/0          Enable          DOWN        MARKED-DOWN
    ge-0/0/2.2        Enable          DOWN        MARKED-DOWN
    ge-0/0/2.3        Enable          DOWN        MARKED-DOWN
```

Sample Output

show services ip-monitoring status

In this example, the policy is in the failover state, and the primary is restored. The no-preempt option is configured.

```
user@host> show services ip-monitoring status

Policy - policy1 (Non-preemptive. Status: FAILOVER-NO-PREEMPT)
  RPM Probes:
     Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
     probe1                 a1              99.1.1.2         PASS
  Route-Action:
    route-instance    route             next-hop         state
```

```
    ---------------- ---------------- --------------- -------------
    inet.0           99.1.1.0         12.12.12.2      APPLIED
  Interface-Action:
    interface        policy action   admin state action status
    ---------------- -------------- ----------- -----------------
    at-2/0/0         Enable         UP          FAILOVER
    ge-0/0/2.2       Enable         UP          FAILOVER
    ge-0/0/2.3       Enable         UP          FAILOVER
```

Sample Output

show services ip-monitoring status

When the probe succeeds and the policy is not applied, the output is as follows:

```
user@host> show services ip-monitoring status
Policy payment (Status: PASS)
 RPM Probes:
     Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
     Probe-Payment-Server   paysvr          9.9.9.2          PASS
 Route-Action:
    route-instance    route             next-hop         state
    ---------------- ----------------- ---------------- -------------
    inet.0           9.9.9.0/24        e1-6/0/0.0       NOT-APPLIED
```

Sample Output

show services ip-monitoring status

When the probe fails and the policy is applied, the output is as follows:

```
user@host> show services ip-monitoring status
Policy payment (Status: FAIL)
 RPM Probes:
     Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
     Probe-Payment-Server   paysvr          9.9.9.2          FAIL
 Route-Action:
```

```
    route-instance    route             next-hop         state
    ----------------- ----------------- ---------------- -------------
    inet.0            9.9.9.0/24        e1-6/0/0.0       APPLIED
```

Sample Output

show services ip-monitoring status

When the probe fails and the policy is applied, the output is as follows. The status of the route `WITHDRAWED` indicates that this route is removed.

```
user@host> show services ip-monitoring status
Policy - p1 (Status: FAIL)
  RPM Probes:
    Probe name             Test Name       Address          Status
    ---------------------- --------------- ---------------- ---------
    p1                     t1              200.20.2.2       FAIL
  Route-Action:
    route-instance    route             next-hop         state
    ----------------- ----------------- ---------------- -------------
     inet.0         111.111.111.1/32   10.208.128.1     WITHDRAWED
```

Release Information

Command modified in Junos OS Release 11.4 R2. Next-hop functionality added in Junos OS Release 12.1X46-D15.

- Release Information | 3046

Syntax

```
show services rpm active-servers
```

Description

Display the protocols and corresponding ports for which a router or switch is configured as a real-time performance monitoring (RPM) server.

Options

This command has no options.

Required Privilege Level

view

Output Fields

Table 249 on page 3046 lists the output fields for the `show services rpm active-servers` command. Output fields are listed in the approximate order in which they appear.

Table 249: show services rpm active-servers Output Fields

Field Name	Field Description
Protocol	Protocol configured on the receiving probe server. The protocol can be the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP).
Port	Port configured on the receiving probe server.
Destination interface name	Output interface name for the probes.

Sample Output

show services rpm active-servers

```
user@host> show services rpm active-servers
    Protocol: TCP, Port: 50000, Destination interface name: lt-0/0/0.0
    Protocol: UDP, Port: 50001, Destination interface name: lt-0/0/0.0
```

Release Information

Command introduced before Junos OS Release 7.4.

show services rpm history-results

IN THIS SECTION

- Syntax | 3047
- Description | 3047
- Options | 3047
- Required Privilege Level | 3048
- Output Fields | 3048

Sample Output | 3050
Release Information | 3052

Syntax

```
show services rpm history-results
<brief | detail>
<dst-interface interface-name>
<owner owner>
<limit number>
<since time>
<source-address address>
<target-address address>
<test name>
```

Description

Display the results stored for the specified real-time performance monitoring (RPM) probes.

Options

none (Optional) Display the results of the last 50 probes for all RPM instances.

brief | detail (Optional) Display the specified level of output.

dst-interface *interface-name* (Optional) Display information only for RPM probes that are generated on this MS-MPC or MS-MIC services interface. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface. You must also configure the `owner` option.

limit *number* (Optional) Limit the number of results that are displayed. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface. You must also configure the `owner` option.

- **Range:** 1 through 4,294,967,295
- **Default:** 100

owner *owner* (Optional) Display information only for probes with the specified probe owner. You must configure `owner` if you configure any of the following options: `dst-interface`, `limit`, `source-address`, or `target-address`.

since *time* (Optional) Display information from the specified time. Specify time as *yyyy-mm-dd.hh:mm:ss*.

source-address *address* (Optional) Display information only for probes with the specified source address. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface. You must also configure the `owner` option.

target-address *address* (Optional) Display information only for probes with the specified target address. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface. You must also configure the `owner` option.

test *name* (Optional starting in Junos OS Release 18.1R1) Display information only for the specified test.

Do not configure `test` if you configure any of the following options: `dst-interface`, `limit`, `source-address`, or `target-address`. These options do not work when you configure `test`.

Output Fields

Table 250 on page 3048 lists the output fields for the `show services rpm history-results` command. Output fields are listed in the approximate order in which they appear.

Table 250: show services rpm history-results Output Fields

Field Name	Field Description	Level of Output
`Owner`	Probe owner.	All levels
`Test`	Name of a test for a probe instance.	All levels
`Probe received`	Timestamp when the probe result was determined.	All levels

Table 250: show services rpm history-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Round trip time`	Average ping round-trip time (RTT), in microseconds.	All levels
`Probe results`	Result of a particular probe performed by a remote host. The following information is contained in the results: • `Response received`—Timestamp when the probe result was determined. • `Rtt`—Average ping round-trip time (RTT), in microseconds.	`detail`
`Results over current test`	Displays the results for the current test by probe at the time each probe was completed, as well as the status of the current test at the time the probe was completed.	`detail`
`Probes sent`	Number of probes sent with the current test.	`detail`
`Probes received`	Number of probe responses received within the current test.	`detail`
`Loss percentage`	Percentage of lost probes for the current test.	`detail`

Table 250: show services rpm history-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Measurement	Increment of measurement. Possible values are round-trip time delay and, for the probe type icmp-pin-timestamp, the egress and ingress delay: • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Jitter—Difference, in microseconds, between the maximum and minimum RTT measured over the course of the current test. • Stddev—Standard deviation of the round-trip time, in microseconds, measured over the course of the current test.	detail

Sample Output

show services rpm history-results owner test

```
user@host> show services rpm history-results owner p1 test t1
     Owner, Test                 Probe received              Round trip time
    p1, t1                      Wed Aug 12 01:02:35 2009             315 usec

Release Information

Command introduced before Junos OS Release 7.4.

`dst-interface`, `limit`, `source-address`, and `target-address` options introduced in Junos OS Release 18.1R1 on MX Series.

`owner` and `test` options became optional in Junos OS Release 18.1R1 on MX Series.

show services rpm probe-results

IN THIS SECTION

- Syntax | **3053**
- Description | **3053**

- Options | 3053
- Required Privilege Level | 3054
- Output Fields | 3054
- Sample Output | 3063
- Release Information | 3068

Syntax

```
show services rpm probe-results
<dst-interface interface-name>
<limit number>
<owner owner>
<source-address address>
<status (fail | pass) >
<target-address address>
<terse>
<test name>
```

Description

Display the results of the most recent real-time performance monitoring (RPM) probes.

Options

All the following options require that you also configure the `owner` option.

dst-interface *interface-name* (Optional) Display information only for RPM probes that are configured on this MS-MPC or MS-MIC services interface. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface.

limit *number* (Optional) Limit the number of results that are displayed. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface.

- **Range:** 1 through 4,294,967,295
- **Default:** 100

none	Display information for all of the most recent RPM probes.
owner *owner*	(Optional) Display information only for probes with the specified probe owner. You must configure `owner` if you configure any other options.
source-address *address*	(Optional) Display information only for probes with the specified source address. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface.
status	(Optional) Display information only for probes with the specified type of test result. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface. Specify one of the following: **fail** — Failed tests **pass** — Passed tests
target-address *address*	(Optional) Display information only for probes with the specified target address. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface.
terse	(Optional) Display summary information. This option works only for RPM probes generated on an MS-MPC or MS-MIC services interface.
test *name*	(Optional) Display information only for the specified test. Do not configure `test` if you configure any of the following options: `dst-interface`, `source-address`, or `target-address`. These options do not work when you configure `test`.

Output Fields

Table 251 on page 3055 lists the output fields for the `show services rpm probe-results` command. Output fields are listed in the approximate order in which they appear.

Table 251: show services rpm probe-results Output Fields

Field Name	Field Description	Level of Output
Owner	Owner name. When you configure the probe owner statement at the [edit services rpm] hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-Bgp-Owner.	none dst-interface limit owner source-address target-address test
Test	Name of a test representing a collection of probes. When you configure the test test-name statement at the [edit services rpm probe owner] hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-BGP-Test- *n*, where *n* is a cumulative number.	All levels
Target address	Destination IPv4 address used for the probes. This field is displayed when the probes are sent to the configured IPv4 or IPv6 targets or RPM servers.	none dst-interface limit owner source-address target-address terse test
Target inet6-address	Destination IPv6 address used for the probes. This field is displayed when the probes are sent to the configured IPv6 targets or RPM servers.	none dst-interface limit owner source-address target-address terse test
Source address	Source address used for the probes.	none dst-interface limit owner source-address target-address test
Probe type	Protocol configured on the receiving probe server: http-get, http-metadata-get, icmp-ping, icmp-ping-timestamp, tcp-ping, udp-ping, or udp-ping-timestamp.	none dst-interface limit owner source-address target-address test
Test size	Number of probes within a test.	none dst-interface limit owner source-address target-address test

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Routing Instance Name`	(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured: • When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash (/) is used to separate the two entities. For example, if the routing instance called `R1` is configured within the logical system called `LS`, the name in the output field is `LS/R1`. • When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance. • When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by `default`. A slash (/) is used to separate the two entities. For example, `LS/default`.	none `dst-interface` `limit` `owner` `source-address` `target-address` `test`

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output

`Probe results`	Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:
	• `Response received`
	  • `Probe sent time`—Timestamp when the probe's results was sent.
	  • `Probe rcvd/timeout time`—Timestamp when the probe's results was received.
	• `Client and server hardware timestamps`—If timestamps are configured, an entry appears at this point.
	• `Rtt`—Average ping round-trip time (RTT), in microseconds.
	• `Egress jitter`—Egress jitter, in microseconds.
	• `Ingress jitter`—Ingress jitter, in microseconds.
	• `Round trip jitter`—Round-trip jitter, in microseconds.
	• `Egress interarrival jitter`—Egress interarrival jitter, in microseconds.
	• `Ingress interarrival jitter`—Ingress interarrival jitter, in microseconds.
	• `Round trip interarrival jitter`—Round-trip interarrival jitter, in microseconds.
		none `dst-interface limit owner source-address target-address test`

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Results over current test`	Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes. • `Probes sent`—Number of probes sent within the current test. • `Probes received`—Number of probe responses received within the current test. • `Loss percentage`—Percentage of lost probes for the current test. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type `icmp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • `Average`—Average RTT, ingress delay, or egress delay measured over the course of the current test.	none `dst-interface` `limit` `owner` `source-address` `target-address` `test`

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
	• `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.	

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Results over last test`	Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed • `Probes sent`—Number of probes sent for the most recently completed test. • `Probes received`—Number of probe responses received for the most recently completed test. • `Loss percentage`—Percentage of lost probes for the most recently completed test. • `Test completed`—Time the most recent test was completed. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type `icmp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. • `Average`—Average RTT, ingress delay, or egress delay measured for the most recently completed test.	none `dst-interface limit owner source-address target-address test`

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
	• `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.	

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Results over all tests`	Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test. • `Probes sent`—Number of probes sent in all tests. • `Probes received`—Number of probe responses received in all tests. • `Loss percentage`—Percentage of lost probes in all tests. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types `icmp-ping-timestamp` and `udp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • `Average`—Average RTT, ingress delay, or egress delay measured over the course of the current test. • `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.	none `dst-interface` `limit` `owner` `source-address` `target-address` `test`

Table 251: show services rpm probe-results Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Error Stats`	Displays error statistics for each probe. • `Invalid client recv timestamp`—Number of client receive timestamp less than client send timestamp. • `Invalid server send timestamp`—Number of server send timestamp less than server receive timestamp. • `Invalid server processing time`—Number of server side spent time greater than RTT. **NOTE**: `Error Stats` is displayed in the output only if non-zero statistics exists.	none `dst-interface limit owner source-address target-address test`
`Last Probe Status`	Status of the last probe that was sent for the current test (`fail` or `pass`).	`status`
`Status`	Status of the last completed test (`up` or `down`).	`status terse`
`Source-IF`	The MS-MPC or MS-MIC services interface that generates the RPM probes.	`terse`

Sample Output

show services rpm probe-results (IPv4 Targets)

Syntax

```
show services rpm twamp client connection
<connection-name>
```

Description

Display information about the connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients. By default, all established sessions are displayed, unless you specify a control connection name when you issue the command.

Options

connection-name (Optional) Display information about the specified control connection or TWAMP control client.

Required Privilege Level

view

Output Fields

Table 252 on page 3069 lists the output fields for the `show services rpm twamp client connection` command. Output fields are listed in the approximate order in which they appear.

Table 252: show services rpm twamp client connection Output Fields

Field Name	Field Description
Connection Name	Connection name that uniquely identifies the connection between the TWAMP server and a particular client.
Client address	Client IP address.
Client port	Client port number.

Table 252: show services rpm twamp client connection Output Fields *(Continued)*

Field Name	Field Description
Server address	Server IP address.
Server port	Server port number.
Session count	Session count.
Auth mode	Authentication mode.

Sample Output

show services rpm twamp client connection

```
user@host> show services rpm twamp client connection
Connection      Client          Client Server          Server Session Auth
Name            address         port   address         port   count   mode
c1              123.0.0.2        60530 123.0.0.1         1862       1 Unauthenticated
```

Release Information

Command introduced in Junos OS Release 15.1X49-D110.

show services rpm twamp client history-results

IN THIS SECTION

- Syntax | **3071**
- Description | **3071**
- Options | **3071**

- Required Privilege Level | 3071
- Output Fields | 3072
- Sample Output | 3072
- Release Information | 3073

Syntax

```
show services rpm history-results
<brief | detail>
<control-connection control-connection-name>
<since time>
<test-session test-session-name>
```

Description

Display standard information about the results of the last 50 probes for each real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) instance. You can also view the historical results of the probes or test packets sent from a TWAMP client to a TWAMP server for a particular control connection, or a test session associated with a control connection.

Options

brief | detail	(Optional) Display the specified level of output.
control-connection *control-connection-name*	(Optional) Display information for the specified control connection between a TWAMP client and a TWAMP server.
since *time*	(Optional) Display information from the specified time. Specify time as *yyyy-mm-dd.hh:mm:ss*.
test-session *test-session-name*	(Optional) Display information for the specified test session associated with a control connection between a TWAMP client and a TWAMP server.

Required Privilege Level

Output Fields

Table 253 on page 3072 lists the output fields for the `show services rpm twamp client history-results` command. Output fields are listed in the approximate order in which they appear.

Table 253: show services rpm twamp client history-results Output Fields

Field Name	Field Description
`Owner`	Probe owner or the TWAMP client.
`Test`	Name of a test for a TWAMP probe instance.
`Probe received`	Timestamp when the probe result was received.
`Round trip time`	Average ping round-trip time (RTT), in microseconds.
`Probes sent`	Timestamp when the probe result was sent.
`Round trip time`	Average ping RTT, in microseconds.

Sample Output

show services rpm twamp client history-results

```
user@host> show services rpm twamp client history-results

Syntax

```
show services rpm twamp client probe-results
<control-connection control-connection-name>
<test-session test-session-name>
```

Description

Display the results of the most recent real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) probes sent from the TWAMP client to the TWAMP server. You can also view the results of the probes or test packets sent from a TWAMP client to a TWAMP server for a particular control connection, or a test session associated with a control connection.

Options

control-connection *control-connection-name*	(Optional) Display information for the specified control connection between a TWAMP client and a TWAMP server.

Output Fields

Table 254 on page 3074 lists the output fields for the `show services twamp client probe-results` command. Output fields are listed in the approximate order in which they appear.

Table 254: show services twamp client probe-results Output Fields

Field Name	Field Description
`Owner`	Name of the session-sender or the control client, which is the TWAMP client. When you configure the *control-client-name* option at the `[edit services twamp client control-connection]` hierarchy level, this field displays the configured owner name or the client name.

Table 254: show services twamp client probe-results Output Fields *(Continued)*

Field Name	Field Description
`Test`	Name of a test representing a collection of probes. When you configure the `test-session` *`test-name`* statement at the `[edit services owner]` hierarchy level, the field displays the configured test name.
`server-address`	Destination address used for the probes.
`server-port`	Destination port used for the probes.
`Client address`	Source or TWAMP client address used for the probes.
`Client port`	Source or TWAMP client port used for the probes.
`Reflector address`	Session reflector or TWAMP server address used for the probes.
`Reflector port`	Session reflector or TWAMP server port used for the probes.
`Test size`	Number of probes within a test.

Table 254: show services twamp client probe-results Output Fields *(Continued)*

Field Name	Field Description
`Probe results`	Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement: • `Response received`—Timestamp when the probe result was determined. • `Client and server hardware timestamps`—If timestamps are configured, an entry appears at this point. • `Rtt`—Average ping round-trip time (RTT), in microseconds. • `Egress jitter`—Egress jitter, in microseconds. • `Ingress jitter`—Ingress jitter, in microseconds. • `Round trip jitter`—Round-trip jitter, in microseconds. • `Egress interarrival jitter`—Egress interarrival jitter, in microseconds. • `Ingress interarrival jitter`—Ingress interarrival jitter, in microseconds. • `Round trip interarrival jitter`—Round-trip interarrival jitter, in microseconds.

Table 254: show services twamp client probe-results Output Fields *(Continued)*

Field Name	Field Description
`Results over current test`	Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes. • `Probes sent`—Number of probes sent within the current test. • `Probes received`—Number of probe responses received within the current test. • `Loss percentage`—Percentage of lost probes for the current test. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type `icmp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individual calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • `Average`—Average RTT, ingress delay, or egress delay measured over the course of the current test. • `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.

Table 254: show services twamp client probe-results Output Fields *(Continued)*

Field Name	Field Description
`Results over last test`	Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed: • `Probes sent`—Number of probes sent for the most recently completed test. • `Probes received`—Number of probe responses received for the most recently completed test. • `Loss percentage`—Percentage of lost probes for the most recently completed test. • `Test completed`—Time the most recent test was completed. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type `icmp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individually calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. • `Average`—Average RTT, ingress delay, or egress delay measured for the most recently completed test. • `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.

Table 254: show services twamp client probe-results Output Fields *(Continued)*

Field Name	Field Description
`Results over all tests`	Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test. • `Probes sent`—Number of probes sent in all tests. • `Probes received`—Number of probe responses received in all tests. • `Loss percentage`—Percentage of lost probes in all tests. • `Measurement`—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types `icmp-ping-timestamp` and `udp-ping-timestamp`, the egress delay and ingress delay. For each measurement type, the following individually calculated results are provided: • `Samples`—Number of probes. • `Minimum`—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • `Maximum`—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • `Average`—Average RTT, ingress delay, or egress delay measured over the course of the current test. • `Peak to peak`—Peak-to-peak difference, in microseconds. • `Stddev`—Standard deviation, in microseconds. • `Sum`—Statistical sum.

Sample Output

show services rpm twamp client probe-results

```

Release Information

Command introduced in Junos OS Release 15.1X49-D110.

show services rpm twamp client session

IN THIS SECTION

- Syntax | **3081**
- Description | **3082**
- Options | **3082**
- Required Privilege Level | **3082**
- Output Fields | **3082**
- Sample Output | **3083**
- Release Information | **3083**

Syntax

```
show services rpm twamp client session
<control-connection control-connection-name>
<test-session test-session-name>
```

Description

Display information about the sessions established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients for control packets and data packets. By default, all established control connection and data connection or test sessions are displayed, unless you specify a control connection name or a test session name when you issue the command.

Options

control-connection *control-connection-name*	(Optional) Display information about the specified control connection, which is established for control packets exchanged between a TWAMP client and a TWAMP server.
test-session *test-session-name*	(Optional) Display information about the specified test session, which is established for data packets transmitted between a TWAMP client and a TWAMP server, associated with a control connection.

Output Fields

Table 258 on page 3089 lists the output fields for the `show sflow` command. Output fields are listed in the approximate order in which they appear.

Table 258: show sflow Output Fields

Field Name	Field Description
`sFlow`	Status of the feature: `Enabled` or `Disabled`.
`Adaptive fallback`	Reverts back to the previously configured adaptive sample rate. Adaptive fallback is triggered when the number of samples per second for each FPC is less than the sample-limit threshold value. This option is disabled by default.
`Sample limit`	Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second.
`Sample limit threshold`	Threshold value that you explicitly configure for adaptive sampling fallback.
`Polling interval`	Interval at which the sFlow agent polls the interface.
`Sample rate egress`	Rate at which egress packets are sampled.
`Sample rate ingress`	Rate at which ingress packets are sampled.
`Agent ID`	IP address assigned to the sFlow agent.
`Source IP address`	Source IP address for the sFlow packets.
`Agent ID IPv6`	IPv6 address assigned to the sFlow agent.

Table 258: show sflow Output Fields *(Continued)*

Field Name	Field Description
Source IPv6 address	Source IPv6 address for the sFlow packets.

Sample Output

show sflow

```
user@host> show sflow
sFlow                    : Enabled
Adaptive fallback                          : Disabled
Sample limit             : 300 packets/second
Sample limit threshold   : 150 packets/second
Polling interval         : 20 second
Sample rate egress       : 1:2048: Disabled
Sample rate ingress      : 1:1000: Enabled
Agent ID                 : 10.93.54.7
Source IP address        : 10.93.54.7
```

Release Information

Command introduced in Junos OS Release 9.3.

show sflow collector

IN THIS SECTION

- Syntax | 3091
- Description | 3091
- Required Privilege Level | 3091
- Output Fields | 3091
- Sample Output | 3092
- Release Information | 3093

Syntax

```
show sflow collector
<brief | detail>
<address>
```

Description

Display a list of configured sFlow collectors and their properties. Use the `address` option to display the information for a single collector address.

Required Privilege Level

view

Output Fields

Table 259 on page 3092 lists the output fields for the `show sflow collector` command. Output fields are listed in the approximate order in which they appear.

Table 259: show sflow collector Output Fields

Field Name	Field Description	Level of Output
Collector address	IP address of the collector.	All levels
Udp-Port	UDP port number of the collector.	All levels
Dscp	Differentiated Services Code Point (DSCP) values applied to all packets for the collector.	All levels
Forwarding-Class	Forwarding-class values applied to all packets destined for the collector.	All levels
No. of samples	Number of samples collected.	All levels
Number of Counter Samples	Number of counter samples collected.	detail
Number of Flow Sample	Number of flow samples collected.	detail
Number of Datagrams	Number of datagrams collected.	detail

Sample Output

show sflow collector brief

```
user@host> show sflow collector brief
Collector            Udp-port    Dscp     Forwarding-Class     No. of samples
 address
10.213.0.191         6343        0        best-effort          23259
```

You get the same output for `show sflow collector address 10.213.0.191 brief`.

show sflow collector detail

```
user@host> show sflow collector detail
  Sflow Collector Information
    Collector Address: 10.213.0.191, Collector UDP Port: 6343
    DSCP Value: 0, Forwarding Class: best-effort
    Number of Counter Samples: 2724, Number of Flow Samples: 11
    Number of Samples: 23306, Number of Datagrams: 1509
```

You get the same output for `show sflow collector address 10.213.0.191 detail`.

Release Information

Command introduced in Junos OS Release 9.3.

Output Fields

Table 260 on page 3094 lists the output fields for the `show sflow interface` command. Output fields are listed in the approximate order in which they appear.

Table 260: show sflow interface Output Fields

Field Name	Field Description	Level of Output
`Interface`	Interface on which sFlow technology is enabled.	All levels
`Status Egress`	Indicates whether an egress sample rate is enabled.	All levels
`Status Ingress`	Indicates whether an ingress sample rate is enabled.	All levels

Table 260: show sflow interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Sample rate Egress	Rate at which egress packets are sampled.	All levels
Sample rate Ingress	Rate at which ingress packets are sampled.	All levels
Adapted sample rate Egress	Adapted rate at which egress packets are sampled.	All levels
Adapted sample rate Ingress	Adapted rate at which ingress packets are sampled.	All levels
Polling-interval	Interval at which the sFlow agent polls the interface.	All levels

Sample Output

show sflow interface interface-name

```
user@host> show sflow interface interface-name et-0/0/1
Interface       Status           Sample            Adapted          Polling
                                 rate              sample rate      interval

Output Fields

Table 261 on page 3099 describes the output fields for the `show snmp health-monitor` command. Output fields are listed in the approximate order in which they appear.

Table 261: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 261: show snmp health-monitor Output Fields *(Continued)*

Field Name	Field Description	Level of Output

State	State of the alarm or event entry:
	• Alarms:
	  • **active**—Entry is fully configured and activated.
	  • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit.
	  • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit.
	  • **under creation**—Entry is being configured and is not yet activated.
	  • **startup**—Alarm is waiting for the first sample of the monitored variable.
	  • **object not available**—Monitored variable of that type is not available to the health monitor agent.
	  • **instance not available**—Monitored variable's instance is not available to the health monitor agent.
	  • **object type invalid**—Monitored variable is not a numeric value.
	  • **object processing errored**—An error occurred when the monitored variable was processed.
	  • **unknown**—State is not one of the above.
		All levels

Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Table 261: show snmp health-monitor Output Fields *(Continued)*

Field Name	Field Description	Level of Output

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  • Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  • Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  • Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**Health Monitor**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	**detail**
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**

Table 261: show snmp health-monitor Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Falling event index	Event triggered when the falling threshold is crossed.	**detail**

Sample Output

Release Information

Command introduced in Junos OS Release 8.0.

show snmp inform-statistics

IN THIS SECTION

- Syntax | **3109**
- Description | **3109**
- Options | **3109**
- Required Privilege Level | **3109**
- Output Fields | **3109**
- Sample Output | **3110**
- Release Information | **3110**

Syntax

```
show snmp inform-statistics
```

Description

Display information about Simple Network Management Protocol (SNMP) inform requests.

Options

This command has no options.

Required Privilege Level

view

Output Fields

Table 262 on page 3109 describes the output fields for the `show snmp inform-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 262: show snmp inform-statistics Output Fields

Field Name	Field Description
`Target Name`	Name of the device configured to receive and respond to SNMP informs.
`Address`	IP address of the target device.
`Sent`	Number of informs sent to the target device and acknowledged by the target device.
`Pending`	Number of informs held in memory pending a response from the target device.
`Discarded`	Number of informs discarded after the specified number of retransmissions to the target device were attempted.

Table 262: show snmp inform-statistics Output Fields *(Continued)*

Field Name	Field Description
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

show snmp inform-statistics

```
user@host> show snmp inform-statistics
Inform Request Statistics:
    Target Name: TA1_v3_md5_none Address: 172.17.20.184
        Sent: 176, Pending: 0
        Discarded: 0, Timeouts: 0, Probe Failures: 0
    Target Name: TA2_v3_sha_none Address: 192.168.110.59
        Sent: 0, Pending: 4
        Discarded: 84, Timeouts: 0, Probe Failures: 258
    Target Name: TA5_v2_none Address: 172.17.20.184
        Sent: 0, Pending: 0
        Discarded: 2, Timeouts: 10, Probe Failures: 0
```

Release Information

Command introduced in Junos OS Release 7.4.

show snmp mib

IN THIS SECTION

- Syntax | 3111
- Description | 3111
- Options | 3112
- Required Privilege Level | 3112
- Output Fields | 3112
- Sample Output | 3113
- Release Information | 3123

Syntax

```
show snmp mib (get | get-next | walk) (ascii | decimal | hex) object-id
```

Description

Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.

NOTE: Starting in Junos OS Release 18.3R1, SNMP queue statistics reporting for static interface-sets configured over Aggregate Ethernet (AE) interfaces is supported.

Starting in Junos OS Release 19.1R1, the sysName.0 MIB object displays the fully qualified domain name. That is, if the hostname and domain name are configured on the system, both will show up for the sysName.0 MIB object.

Starting in Junos OS Release 20.2R1, We've introduced the new SNMP MIBs `jnxJsSPUMonitoringSPUThreadsNumber`, `jnxJsSPUMonitoringSPUThreadIndex`, `jnxJsSPUMonitoringSPUThreadLastMinUsage`, `jnxJsSPUMonitoringSPUThreadLastHourUsage`, and `jnxJsSPUMonitoringSPUThreadLastDayUsage` to monitor the CPU usage information of an SPC3 card.

Options

get Retrieve and display one or more SNMP object values.

get-next Retrieve and display the next SNMP object values.

walk Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.

> **NOTE**: As of Junos OS Release 18.4R1, the CLI configuration command `set snmp customization ether-stats-ifd-only` is introduced. When `ether-stats-ifd-only` is configured, the `show snmp mib walk etherstatsTable` command displays data only for physical interfaces (IFDs). See "customization (SNMP)" on page 1870.

ascii Display the SNMP object's string indices as an ASCII-key representation.

decimal Display the SNMP object values in the decimal (default) format. The `decimal` option is the default option for this command. Therefore, issuing the `show snmp mib (get | get-next | walk) decimal object-id` and the `show snmp mib (get | get-next | walk) object-id` commands display the same output.

hex Display the SNMP object values in the hexadecimal format.

object-id The object can be represented by a sequence of dotted integers (such as `1.3.6.1.2.1.2`) or by its subtree name (such as `interfaces`). When entering multiple objects, enclose the objects in quotation marks.

Required Privilege Level

snmp To view this statement in the configuration.

Output Fields

Table 263 on page 3113 describes the output fields for the `show snmp mib` command. Output fields are listed in the approximate order in which they appear.

Table 263: show snmp mib Output Fields

Field Name	Field Description
name	Object name and numeric instance value.
object value	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

show snmp mib get (Routing Engine)

```
user@router> show snmp mib get jnxFruName.9.1.0.0

jnxFruName.9.1.0.0 = Routing Engine 0
```

show snmp mib get (Routing Engine, PTX10003)

```
user@router> show snmp mib get jnxFruName.9.1.0.0

jnxFruName.9.1.0.0 = Routing Engine slot 0
```

show snmp mib get (Multiple Objects)

```
user@host> show snmp mib get “sysObjectID.0 sysUpTime.0”
sysObjectID.0 = jnxProductNameM20
sysUpTime.0 = 1640992
```

show snmp mib get (Layer 2 Policer)

```
user@host> show snmp mib get ifInOctets.25970
ifInOctets.25970 = 7545720
```

show snmp mib get-next

```
user@host> show snmp mib get-next jnxMibs
jnxBoxClass.0 = jnxProductLineM20.0
```

show snmp mib get-next (Specify an OID)

```
user@host> show snmp mib get-next 1.3.6.1

```

show snmp mib walk (Queue Statistics)

To get interface-set queue statistics from jnxCosQstatQedPkts MIB with using interface-set SNMP index, use the following command:

```
show snmp mib walk jnxCosQstatQedPkts.interface-set snmp index
```

For example, if the interface-set SNMP index is 67108866

```
user@host> show snmp mib walk jnxCosQstatQedPkts.67108866
jnxCosQstatQedPkts.67108866.0 = 10
jnxCosQstatQedPkts.67108866.1 = 0
jnxCosQstatQedPkts.67108866.2 = 0
jnxCosQstatQedPkts.67108866.3 = 0
jnxCosQstatQedPkts.67108866.4 = 0
jnxCosQstatQedPkts.67108866.5 = 0
jnxCosQstatQedPkts.67108866.6 = 0
jnxCosQstatQedPkts.67108866.7 = 0
```

To get interface-set queue statistics from jnxCosIfsetQstatQedPkts MIB with using interface-set SNMP index, use the following command:

```
show snmp mib walk jnxCosIfsetQstatQedPkts.interface-set snmp index
```

For example, if the interface-set snmp index is 67108866

```
user@host> show snmp mib walk jnxCosIfsetQstatQedPkts.67108866
jnxCosIfsetQstatQedPkts.67108866.0 = 10
jnxCosIfsetQstatQedPkts.67108866.1 = 0
jnxCosIfsetQstatQedPkts.67108866.2 = 0
jnxCosIfsetQstatQedPkts.67108866.3 = 0
jnxCosIfsetQstatQedPkts.67108866.4 = 0
jnxCosIfsetQstatQedPkts.67108866.5 = 0
jnxCosIfsetQstatQedPkts.67108866.6 = 0
jnxCosIfsetQstatQedPkts.67108866.7 = 0
```

To get Interface-set queue statistics from jnxCosIfsetQstatQedPkts MIB using interface-set member IFL SNMP index, use the following command:

```
show snmp mib walk jnxCosIfsetQstatQedPkts.interface-set member IFL SNMP index
```

For example, if the interface-set member IFL SNMP is 519

```
user@host> show snmp mib walk jnxCosIfsetQstatQedPkts.519
jnxCosIfsetQstatQedPkts.519.0 = 10
jnxCosIfsetQstatQedPkts.519.1 = 0
jnxCosIfsetQstatQedPkts.519.2 = 0
jnxCosIfsetQstatQedPkts.519.3 = 0
jnxCosIfsetQstatQedPkts.519.4 = 0
jnxCosIfsetQstatQedPkts.519.5 = 0
jnxCosIfsetQstatQedPkts.519.6 = 0
jnxCosIfsetQstatQedPkts.519.7 = 0
```

show snmp mib walk bgp (MX Series)

Use the `show snmp mib walk bgp` to see the BGP versions.

```
user@host> show snmp mib walk bgp

bgpVersion.0  = 10
bgpLocalAs.0  = 1
bgpPeerIdentifier.2.2.2.2 = 2.2.2.2

```

show snmp mib walk (PTX10003)

On PTX10003-80C and PTX10003-160C devices, the `show snmp mib walk jnxFilledDescr` output shows only the fan tray number. This output does not show the number of fan slots present in each tray.

```
user@router> show snmp mib walk jnxFilledDescr

jnxFilledDescr.1.0.0.0 = Chassis
jnxFilledDescr.4.2.0.0 = Fan Tray 1
jnxFilledDescr.4.3.0.0 = Fan Tray 2
jnxFilledDescr.4.4.0.0 = Fan Tray 3
[...Output truncated...]
```

show snmp mib walk usmUserAuthProtocol (MX-Series and SRX-Series)

Use `show snmp mib walk usmUserAuthProtocol`to see the SHA authentication type.

```
user@router> show snmp mib walk usmUserAuthProtocol
usmUserAuthProtocol.< usmUserEngineID>.<usmUserName> =
usmHMAC128SHA224AuthProtocol

        New possible set of values for ‘usmUserAuthProtocol’ are:
            usmHMAC128SHA224AuthProtocol
            usmHMAC192SHA256AuthProtocol
            usmHMAC256SHA384AuthProtocol
            usmHMAC384SHA512AuthProtocol
```

show snmp mib walk ascii jnxWlanWAPStatusTable (SRX320, SRX340, SRX345, and SRX550M)

Use the `show snmp mib walk ascii jnxWlanWAPStatusTable` command to monitor the Wi-Fi Mini-Physical Interface Module (Mini-PIM) status.

```
user@host> show snmp mib walk ascii jnxWlanWAPStatusTable

jnxWAPStatusIfdIndex.161 = 161
jnxWAPStatusIfdIndex.162 = 162

[...Output truncated...]
```

show snmp mib walk jnxJsSPUMonitoringSPUThreadsNumber (SRX5400, SRX5600, and SRX5800)

Use the `show snmp mib walk jnxJsSPUMonitoringSPUThreadsNumber` command to list the indices of flow threads in an SPU.

```
user@host> show snmp mib walk jnxJsSPUMonitoringSPUThreadsNumber

jnxJsSPUMonitoringSPUThreadsNumber.4 = 26
jnxJsSPUMonitoringSPUThreadsNumber.5 = 26
jnxJsSPUMonitoringSPUThreadsNumber.16 = 0
jnxJsSPUMonitoringSPUThreadsNumber.17 = 0
jnxJsSPUMonitoringSPUThreadsNumber.18 = 0
jnxJsSPUMonitoringSPUThreadsNumber.19 = 0
```

show snmp mib walk jnxJsSPUMonitoringSPUThreadIndex (SRX5400, SRX5600, and SRX5800)

Use the `show snmp mib walk jnxJsSPUMonitoringSPUThreadIndex` command to list the indices of flow threads in an SPU.

```
user@host> show snmp mib walk jnxJsSPUMonitoringSPUThreadIndex

jnxJsSPUMonitoringSPUThreadIndex.4.0 = 0
jnxJsSPUMonitoringSPUThreadIndex.4.1 = 1
jnxJsSPUMonitoringSPUThreadIndex.4.2 = 2
jnxJsSPUMonitoringSPUThreadIndex.4.3 = 3

... ...

jnxJsSPUMonitoringSPUThreadIndex.5.22 = 22
jnxJsSPUMonitoringSPUThreadIndex.5.23 = 23
jnxJsSPUMonitoringSPUThreadIndex.5.24 = 24
jnxJsSPUMonitoringSPUThreadIndex.5.25 = 25
```

show snmp mib get jnxJsSPUMonitoringSPUThreadLastMinUsage.5.8 (SRX5400, SRX5600, and SRX5800)

Use the `show snmp mib get jnxJsSPUMonitoringSPUThreadLastMinUsage.5.8` command to monitor the average CPU usage for the last minute on the specified thread.

```
user@host> show snmp mib get jnxJsSPUMonitoringSPUThreadLastMinUsage.5.8

jnxJsSPUMonitoringSPUThreadLastMinUsage.5.8 = 0
```

show snmp mib get jnxJsSPUMonitoringSPUThreadLastHourUsage.5.8 (SRX5400, SRX5600, SRX5800)

Use the `show snmp mib get jnxJsSPUMonitoringSPUThreadLastHourUsage.5.8` command to monitor the average CPU usage for the last hour on the specified thread.

```
user@host> show snmp mib get jnxJsSPUMonitoringSPUThreadLastHourUsage.5.8

jnxJsSPUMonitoringSPUThreadLastHourUsage.5.8 = 0
```

show snmp mib get jnxJsSPUMonitoringSPUThreadLastDayUsage.5.8 (SRX5400, SRX5600, and SRX5800)

Use the `show snmp mib get jnxJsSPUMonitoringSPUThreadLastDayUsage.5.8` command to monitor the average CPU usage for the last 24 hours on the specified thread.

```
user@host> show snmp mib get jnxJsSPUMonitoringSPUThreadLastDayUsage.5.8

jnxJsSPUMonitoringSPUThreadLastDayUsage.5.8 = 0
```

Release Information

Command introduced before Junos OS Release 7.4.

`ascii` and `decimal` options introduced in Junos OS Release 9.6.

`ascii` and `decimal` options introduced in Junos OS Release 9.6 for EX Series switches.

`hex` option introduced in Junos OS Release 19.2R2.

Behavior in regard to sysName.0 MIB object changed in Junos OS Release 19.1R1.

show snmp rmon

Output Fields

Table 264 on page 3125 describes the output fields for the `show snmp rmon` command. Output fields are listed in the approximate order in which they appear.

Table 264: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 264: show snmp rmon Output Fields *(Continued)*

Field Name	Field Description	Level of Output
State	State of the alarm or event entry: Alarms: • **active**—Entry is fully configured and activated. • **falling threshold crossed**—Value of the variable has crossed the lower threshold limit. • **rising threshold crossed**—Value of the variable has crossed the upper threshold limit. • **under creation**—Entry is being configured and is not yet activated. • **startup**—Alarm is waiting for the first sample of the monitored variable. • **object not available**—Monitored variable of that type is not available to the SNMP agent. • **instance not available**—Monitored variable's instance is not available to the SNMP agent. • **object type invalid**—Monitored variable is not a numeric value. • **object processing errored**—An error occurred when the monitored variable was processed. • **unknown**—State is not one of the above. Events: • **active**—Entry has been fully configured and activated. • **under creation**—Entry is being configured and is not yet activated. • **unknown**—State is not one of the above.	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels

Table 264: show snmp rmon Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Type	Type of notification made when an event is triggered. It can be one of the following: • **log**—A system log message is generated and an entry is made to the log table. • **snmptrap**—An SNMP trap is sent to the configured destination. • **log and trap**—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • **none**—Neither log nor trap will be sent.	**detail**
Last Event	Date and time of the last event. It has the format *yyyy-mm-dd hh:mm:ss timezone*.	**brief**
Community	Trap group used for sending the SNMP trap.	**detail**
Variable OID	Object ID to which the variable name is resolved. The format is **x.x.x.x**.	**detail**
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of **absolute value** or **delta value**.	**detail**

Table 264: show snmp rmon Output Fields *(Continued)*

Field Name	Field Description	Level of Output

Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria:
	• Alarm is sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is either **rising alarm** or **rising or falling alarm.**
	  • Value of the alarm is below or equal to the falling threshold and the startup type is either **falling alarm** or **rising or falling alarm**.
	• Alarm is *not* sent when one of the following situations exists:
	  • Value of the alarm is above or equal to the rising threshold and the startup type is **falling alarm**.
	  • Value of the alarm is below or equal to the falling threshold and the startup type is **rising alarm**.
	  • Value of the alarm is between the thresholds.
		detail

Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has **monitor** prepended to it.	**detail**
Creator	Mechanism by which the entry was configured (**CLI** or **SNMP**).	**detail**
Sample interval	Time period between samples (in seconds).	**detail**
Rising threshold	Upper limit threshold value configured by the user.	**detail**
Falling threshold	Lower limit threshold value configured by the user.	**detail**
Rising event index	Event triggered when the rising threshold is crossed.	**detail**
Falling event index	Event triggered when the falling threshold is crossed.	**detail**

Table 264: show snmp rmon Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Current value	Current value of the monitored variable in the most recent sample interval.	**detail**

Output Fields

Table 265 on page 3132 lists the output fields for the `show smp rmon history` command. Output fields are listed in the approximate order in which they appear.

Table 265: show smp rmon history Output Fields

Field Name	Field Description
History Index	Identifies this RMON history entry within the RMON history group.
Owner	The entity that configured this entry. Range is 0 to 32 alphanumeric characters.
Status	The status of the RMON history entry.

Table 265: show smp rmon history Output Fields *(Continued)*

Field Name	Field Description
Interface or **Data Source**	The ifndex object that identifies the interface that is being monitored.
Interval	The interval (in seconds) configured for this RMON history entry.
Buckets Requested	The requested number of buckets (**intervals**) configured for this RMON history entry.
Buckets Granted	The number of buckets granted for this RMON history entry.

Table 265: show smp rmon history Output Fields *(Continued)*

Field Name	Field Description
Sample Index	The sample statistics taken at the specified interval. • **Drop Events**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Octets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Packets**—Total number of packets. • **Broadcast Packets**—Number of broadcast packets. • **Multicast Packets**—Number of multicast packets. • **CRC errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS error) or a bad FCS with a nonintegral number of octets (alignment error). • **Undersize Pkts**—Number of packets received during this sampling interval that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed. • **Oversize Pkts**—Number of packets received during the sampling interval that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed. • **Fragments**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **Jabbers**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.

Table 265: show smp rmon history Output Fields *(Continued)*

Field Name	Field Description
	• **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Utilization(%)**—The best estimate of the mean physical layer network utilization on this interface during this sampling interval, in hundredths of a percent.

Sample Output

show snmp rmon history 1

```
user@host> show snmp rmon history 1

 History Index 1:
 Interface                           171

Table 266 on page 3139 describes the output fields for the `show snmp statistics` command. Output fields are listed in the approximate order in which they appear.

Table 266: show snmp statistics Output Fields

Field Name	Field Description
Input	Information about received packets: • **Packets(snmpInPkts)**—Total number of messages delivered to the SNMP entity from the transport service. • **Bad versions**—**(snmpInBadVersions**) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • **Bad community names**—**(snmpInBadCommunityNames)** Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • **Bad community uses**—**(snmpInBadCommunityUses)** Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • **ASN parse errors**—**(snmpInASNParseErrs)** Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • **Too bigs**—**(snmpInTooBigs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **tooBig**. • **No such names**—**(snmpInNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values**—**(snmpInBadValues)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **badValue**. • **Read onlys**—**(snmpInReadOnlys)** Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of **readOnly**. Only incorrect implementations of SNMP generate this error.

Table 266: show snmp statistics Output Fields *(Continued)*

Field Name	Field Description
Input (continued)	• **General errors**—**(snmpInGenErrs)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **genErr**. • **Total requests varbinds**—**(snmpInTotalReqVars)** Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP **GetRequest** and **GetNext** PDUs. • **Total set varbinds**—**(snmpInSetVars)** Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP **SetRequest** PDUs. • **Get requests**—**(snmpInGetRequests)** Total number of SNMP **GetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get nexts**—**(snmpInGetNexts)** Total number of SNMP **GetNext** PDUs that have been accepted and processed by the SNMP entity. • **Set requests**—**(snmpInSetRequests)** Total number of SNMP **SetRequest** PDUs that have been accepted and processed by the SNMP entity. • **Get responses**—**(snmpInGetResponses)** Total number of SNMP **GetResponse** PDUs that have been accepted and processed by the SNMP entity. • **Traps**—**(snmpInTraps)** Total number of SNMP traps generated by the SNMP entity. • **Silent drops**—**(snmpSilentDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • **Proxy drops**—**(snmpProxyDrops)** Total number of **GetRequest**, **GetNextRequest**, **GetBulkRequest**, **SetRequests**, and **InformRequest** PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.

Table 266: show snmp statistics Output Fields *(Continued)*

Field Name	Field Description
	• **Commit pending drops**—Number of SNMP packets for **Set** requests dropped because of a previous pending SNMP **Set** request on the committed configuration. • **Throttle drops**—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 266: show snmp statistics Output Fields *(Continued)*

Field Name	Field Description
V3 Input	Information about SNMP version 3 packets: • **Unknown security models—(snmpUnknownSecurityModels)** Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • **Invalid messages—(snmpInvalidMsgs)** Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • **Unknown pdu handlers—(snmpUnknownPDUHandlers)** Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • **Unavailable contexts—(snmpUnavailableContexts)** Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • **Unknown contexts—(snmpUnknownContexts)** Total number of requests received for a context that is unknown to the SNMP engine. • **Unsupported security levels—(usmStatsUnsupportedSecLevels)** Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • **Not in time windows—(usmStatsNotInTimeWindows)** Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • **Unknown user names—(usmStatsUnknownUserNames)** Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • **Unknown engine ids—(usmStatsUnknownEngineIDs)** Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine.

Table 266: show snmp statistics Output Fields *(Continued)*

Field Name	Field Description
	• **Wrong digests—(usmStatsWrongDigests)** Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • **Decryption errors—(usmStatsDecryptionErrors)** Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.
Output	Information about transmitted packets: • **Packets—(snmpOutPkts)** Total number of messages passed from the SNMP entity to the transport service. • **Too bigs—(snmpOutTooBigs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **tooBig**. • **No such names—(snmpOutNoSuchNames)** Total number of SNMP PDUs delivered to the SNMP entity with an error status field of **noSuchName**. • **Bad values—(snmpOutBadValues)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **badValue**. • **General errors—(snmpOutGenErrs)** Total number of SNMP PDUs generated by the SNMP entity with an error status field of **genErr**. • **Get requests—(snmpOutGetRequests)** Total number of SNMP **GetRequest** PDUs generated by the SNMP entity. • **Get nexts—(snmpOutGetNexts)** Total number of SNMP **GetNext** PDUs generated by the SNMP entity. • **Set requests—(snmpOutSetRequests)** Total number of SNMP **SetRequest** PDUs generated by the SNMP entity. • **Get responses—(snmpOutGetResponses)** Total number of SNMP **GetResponse** PDUs generated by the SNMP entity. • **Traps—(snmpOutTraps)** Total number of SNMP traps generated by the SNMP entity.

Table 267 on page 3144 describes the output fields for the `show snmp statistics subagents` command. Output fields are listed in the approximate order in which they appear.

Table 267: show snmp statistics subagents Output Fields

Field Name	Field Description
Subagent	Location of the SNMP subagent.
Request PDUs	Number of PDUs requested by the SNMP manager.
Response PDUs	Number of response PDUs sent by the SNMP subagent.
Request Variables	Number of variable bindings on the PDUs requested by the SNMP manager.
Response Variables	Number of variable bindings on the PDUs sent by the SNMP subagent.
Average Response Time	Average time taken by the SNMP subagent to send statistics response.
Maximum Response Time	Maximum time taken by the SNMP subagent to send the statistics response.

Sample Output

show snmp statistics

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 246213, Bad versions: 12, Bad community names: 12,
    Bad community uses: 0, ASN parse errors: 96,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 227084, Total set varbinds: 67,
    Get requests: 44942, Get nexts: 190371, Set requests: 10712,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
    Throttle drops: 0,
  V3 Input:
```

```
    Unknown security models: 0, Invalid messages: 0
    Unknown pdu handlers: 0, Unavailable contexts: 0
    Unknown contexts: 0, Unsupported security levels: 1
    Not in time windows: 0, Unknown user names: 0
    Unknown engine ids: 44, Wrong digests: 23, Decryption errors: 0
  Output:
    Packets: 246093, Too bigs: 0, No such names: 31561,
    Bad values: 0, General errors: 2,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 246025, Traps: 0
```

Release Information

Command introduced before Junos OS Release 7.4.

Option `subagents` introduced in Junos OS Release 14.2.

show snmp stats-response-statistics

IN THIS SECTION

- Syntax | **3148**
- Description | **3148**
- Options | **3148**
- Required Privilege Level | **3148**
- Output Fields | **3148**

Sample Output | 3149
Release Information | 3151

Syntax

```
show snmp stats-response-statistics
```

Description

Display statistics of SNMP statistics responses sent from the Packet Forwarding Engine during the MIB II process (mib2d).

Options

This command has no options.

Required Privilege Level

view

Output Fields

Table 268 on page 3149 describes the output fields for the `show snmp stats-response-statistics` command. Output fields are listed in the approximate order in which they appear.

Table 268: show snmp stats-response-statistics Output Fields

Field Name	Field Description
`Average response time statistics`	Display the average response time in milliseconds per protocol data unit (PDU) by snmpd. It includes the following information: • `Stats Type`—Type of SNMP statistics. • `Stats Responses`—Number of SNMP statistics responses received from the Packet Forwarding Engine. • `Average Response Time`—Average time taken to receive the statistics response from the Packet Forwarding Engine in milliseconds.
`Bucket statistics`	Information about SNMP statistics responses: • `Bucket Type`—Category of time intervals in which SNMP statistics responses are received from the Packet Forwarding Engine. • `Stats Responses`—Number of SNMP statistics responses received from the Packet Forwarding Engine.
`Bad responses`	Information about top 20 bad responses from a subagent: • `Response`—Time taken to receive the SNMP statistics response from the Packet Forwarding Engine in milliseconds. • `Request Time`—Date and time of SNMP request. • `Key`—Display the attribute of SNMP `Stats Type`. For example, in the case of SNMP statistics responses for interfaces, the Key value is SNMP ifIndex, and for firewalls, the Key value is the filter name.

Sample Output

show snmp stats-response-statistics

```
user@host> show snmp stats-response-statistics
Average response time statistics:
Stats               Stats                   Average
Type                Responses               Response
```

Release Information

Command introduced in Junos OS Release 14.2.

show snmp v3

IN THIS SECTION

- Syntax | **3151**
- Description | **3151**
- Options | **3152**
- Additional Information | **3152**
- Required Privilege Level | **3152**
- Output Fields | **3152**
- Sample Output | **3155**
- Release Information | **3155**

Syntax

```
show snmp v3
<access <brief | detail> | community | general | groups | notify <filter> | target <address |
parameters> | users>
```

Description

Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.

Options

none	Display all of the SNMPv3 operating configuration.
access	(Optional) Display SNMPv3 access information.
brief | detail	(Optional) Display brief or detailed information about SNMPv3 access information.
community	(Optional) Display SNMPv3 community information.
general	(Optional) Display SNMPv3 general information.
groups	(Optional) Display SNMPv3 security-to-group information.
notify <filter>	(Optional) Display SNMPv3 notify and, optionally, notify filter information.
target <address | parameters>	(Optional) Display SNMPv3 target and, optionally, either target address or target parameter information.
users	(Optional) Display SNMPv3 user information.

Additional Information

To edit the default display of the `show snmp v3` command, specify options in the `show` statement at the `[edit snmp v3]` hierarchy level.

Required Privilege Level

Output Fields

Table 269 on page 3153 describes the output fields for the `show snmp v3` command. Output fields are listed in the approximate order in which they appear.

Table 269: show snmp v3 Output Fields

Field Name	Field Description
Access control	Information about access control: • **Group**—Group name for which the configured access privileges apply. The group, together with the context prefix and the security model and security level, forms the index for this table. • **Context prefix**—SNMPv3 context for which the configured access privileges apply. • **Security model/level**—Security model and security level for which the configuration access privileges apply. • **Read view**—Identifies the MIB view applied to SNMPv3 read operations. • **Write view**—Identifies the MIB view applied to SNMPv3 write operations. • **Notify view**—Identifies the MIB view applied to outbound SNMP notifications.
Engine	Information about local engine configuration: • **Local engine ID**—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate.

Table 269: show snmp v3 Output Fields *(Continued)*

Field Name	Field Description
Engine ID	Information about engine ID: • **Local engine ID**—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • **Engine boots**—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • **Engine time**—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • **Max msg size**—Maximum message size the sender can accommodate. • **Engine ID**—SNMPv3 engine ID associated with each user. • **User**—SNMPv3 user. • **Auth/Priv**—Authentication and encryption algorithm available for use by each user. • **Storage**—Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • **Status**—Status of the conceptual row. Only rows with an active status are used by the SNMPv3 engine.
Group name	Name of the group to which this entry belongs.
Security model	Identifies the security model context for the security name.
Security name	Used with the security model; identifies a specific security name instance. Each security model/security name combination can be assigned to a specific group.
Storage type	Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status.
Status	Status of the conceptual row. Only rows with active status are used by the SNMPv3 engine.

Sample Output

show snmp v3

```
user@host> show snmp v3
Local engine ID: 80 00 0a 4c e04 31 32 33 34
Engine boots:          38
Engine time:        64583 seconds
Max msg size:        2048 bytes

Engine ID: local
    User                            Auth/Priv   Storage      Status
    user1                            md5/des    nonvolatile  active
    user2                            sha/none   nonvolatile  active
    user3                           none/none   nonvolatile  active

Engine ID: 81 00 0a 4c 04 64 64 64 64

```

Release Information

Command introduced before Junos OS Release 7.4.

show system errors

IN THIS SECTION

- Syntax | 3156
- Description | 3156
- Options | 3157
- Required Privilege Level | 3157
- Output Fields | 3157
- Sample Output | 3158
- Release Information | 3160

Syntax

```
show system errors
<cb slot| ccg slot | fan slot | fpc slot | psm slot | re slot | sib slot>
```

Description

Display information about faults in the system. You can display all errors or the errors for one system component. Use this command to understand about faults and their correlation with other events. First, top level root causes are listed, with board level faults followed by component level faults. Next, details for affected faults are listed.

The show output represents five faults, F1 through F5. F4 and F5 are top level faults, where F4 is affected by F1, F2, and F3; and F3 is affected by F1 and F2. The lowest level (leaf) faults, F1, F2, and F5, have no affected events.

NOTE: For Junos OS Evolved, only the QFX5200 supports this command. For all other Junos OS Evolved platforms, use the No Link Title, No Link Title, No Link Title, No Link Title, or No Link Title command.

Output Fields

Table 270 on page 3157 lists the output fields for the `show system errors` command. Output fields are listed in the approximate order in which they appear.

Table 270: show system errors Output Fields

Field Name	Field Description
`Top level root causes`	Display of the top level faults with board level faults followed by component level faults.
F*x*	Fault number F1 to Fn, where F1 is the first fault and n is the last fault generated by the system.
(*module*, *error-id*, *board-name*, *component-name*)	Information about the fault. Component level faults include the component name.
Group	Fault severity level is Fatal, Major, or Minor.
Scope	Affected scope of fault is System, Component, Board, or Link.
Corr-enabled	Correlation with fault is always enabled, Y.
Time	Time in the format yyyy-mm-dd hh:nn:ss.lll TMZ, where nn is minutes, lll is milliseconds, and TMZ is time zone.
Desc	Description of the fault.

Table 270: show system errors Output Fields *(Continued)*

Field Name	Field Description
Actions	List of errors that caused the fault.
Root-causes	List of faults that caused this error.
Affected	List of faults that correlate to this root cause.
Details for affected errors	Display the affected errors listed in top level faults.

Sample Output

show system errors

```
user@host> show system errors
Top level root-causes:
F4: {pciesw, 1, fpc0} Group: Fatal Scope: Board Corr-enabled: Y

show system errors history

IN THIS SECTION

- Syntax | 3161
- Description | 3161

- Options | 3161
- Required Privilege Level | 3161
- Output Fields | 3161
- Sample Output | 3162
- Release Information | 3163

Syntax

```
show chassis errors history
<cb slot| ccg slot | fan slot | fpc slot | psm slot | re slot | sib slot>
```

Description

Display information about cleared faults in the error history buffer. You can display history for all errors or the errors for one system component. The error history is displayed in chronological order and includes a description of each PFE and FCHIP fault and when the fault was raised and cleared.

NOTE: For Junos OS Evolved, only the QFX5200 supports this command. For all other Junos OS Evolved platforms, use the show system errors active, show system errors count, show system errors error-id, or show system errors fru command.

Options

This command has no options.

Output Fields

Table 271 on page 3162 lists the output fields for the `show system errors history` command. Output fields are listed in the approximate order in which they appear.

Table 271: show system errors history Output Fields

Field Name	Field Description
Fault (*module*, *error-id*, *board-name/component-name*, *PFE-or-FCHIP*)	Information about the fault.
Group	Fault severity level is Fatal, Major, or Minor.
Scope	Affected scope of fault is System, Component, Board, or Link.
Corr-enabled	Correlation with fault is always enabled, Y.
Raised	Time the fault was raised, in the format yyyy-mm-dd hh:nn:ss.lll TMZ, where nn is minutes, lll is milliseconds, and TMZ is time zone.
Desc	Description of the fault.
Cleared	Time the fault was cleared, in the format yyyy-mm-dd hh:nn:ss.lll TMZ, where nn is minutes, lll is milliseconds, and TMZ is time zone.

Sample Output

show system errors history

```
user@host> show system errors history
Fault: {pechip, 1487, /Chassis[0]/Fpc[4], Fchip[0]}
 Group:   Major             Scope: Link           Corr-enabled: Y
 Raised:  2017-04-19 18:18:48.652000 PDT
 Desc:    Fabric Down condition on PFE
 Cleared: 2017-04-19 18:18:49.474975 PDT
 Fault: {pechip, 1487, /Chassis[0]/Fpc[4], Fchip[1]}
 Group:   Major             Scope: Link           Corr-enabled: Y
 Raised:  2017-04-19 18:18:48.653000 PDT

Release Information

Command introduced in Junos OS 19.3R1.

show system monitor memory actions

IN THIS SECTION

- Syntax | 3171
- Description | 3171
- Options | 3171
- Required Privilege Level | 3172
- Output Fields | 3172
- Sample Output | 3172
- Release Information | 3173

Syntax

```
show system monitor memory actions (all | system | process)
```

Description

Displays the history of actions performed when the threshold level for any event is crossed. You can view the history of actions for a process or for a system or both.

Options

all Display the history of actions performed when the threshold level for any event is crossed for the entire system as well as per process.

system Display the history of actions performed when the threshold level for any event is crossed at the system level.

process Display the history of actions performed when the threshold level for any event is crossed at the process level.

Required Privilege Level

admin

Output Fields

Table 272 on page 3172 lists the output fields for the `show system monitor memory actions` command. Output fields are listed in the approximate order in which they appear.

Table 272: show system monitor memory action Output Fields

Field Name	Field Description	Level of Output

Category	Specifies if the action is generated at the system level or at the process level.	`all`
		`process`
		`system`

process	Name of the process that has crossed the threshold value and process identification number used to identify the process that crossed the threshold value.	`all` `process`

Action	The actions performed when a threshold is crossed either at the system level or at the process level.	`all`
		`process`
		`system`

Sample Output

show system monitor memory actions all

```
user@host> show system monitor memory actions all

May 08 10:56:00 [process-action]: process: ('xxxxx', 'xxx') action: snmp-trap
May 08 10:56:02 [process-action]: process: ('xxxxx', 'xxx') action: snmp-trap
```

show system monitor memory actions process

```
user@host> show system monitor memory actions process

May 08 10:56:00 [process-action]: process: ('11727', 'dcd') action: snmp-trap
May 08 10:56:02 [process-action]: process: ('11716', 'jkhmd') action: snmp-trap
```

Release Information

Command introduced in Junos OS Release 20.2R1

show system monitor memory events

IN THIS SECTION

- Syntax | 3173
- Description | 3173
- Options | 3174
- Required Privilege Level | 3174
- Output Fields | 3174
- Sample Output | 3175
- Release Information | 3175

Syntax

```
show system monitor memory events (all | system | process)
```

Description

Displays the history of events, whether they are major, minor, or critical. The events can be either for the system or per process. Use this command to view all the recorded events. When the condition is first detected, an event is raised. If the condition persists with the same severity, the event is not

reported multiple times. However, if the condition persists with a changed severity or is detected after a reset, the event is reported again.

Options

all Display the history of events for the entire system as well as per process.

system Display the history of events at the system level.

process Display the history of events per process.

Required Privilege Level

admin

Output Fields

Table 273 on page 3174 lists the output fields for the `show system monitor memory events` command. Output fields are listed in the approximate order in which they appear.

Table 273: show system monitor memory events Output Fields

Field Name	Field Description	Level of Output

Category	Specifies if the event is generated at the system level or at the process level.	`all`
		`process`
		`system`

Event	The Event that is raised when a threshold is crossed either at the system level or at the process level.	`all`
		`process`
		`system`

Type	Type of event. Values are: major, minor, and critical.	`all`
		`process`
		`system`

for process	Name of the process that has crossed the threshold value.	`all` `process`

Table 273: show system monitor memory events Output Fields *(Continued)*

Field Name	Field Description	Level of Output
with pid	Process identification number used to identify the process that crossed the threshold value.	all process

Sample Output

show system monitor memory events all

```
user@host> show system monitor memory events all

Feb 24 10:08:21 [system] Event: free_page_event Type minor
Feb 24 13:42:13 [process-threshold] Event: critical-event for process: xxxxx with pid xxxxx
Feb 24 17:15:32 [system] Event: free_page_event Type minor
Feb 25 11:47:50 [process-threshold] Event: critical-event for process: xxxxx with pid xxxxx
```

show system monitor memory events process

```
user@host> show system monitor memory events process
Feb 24 10:08:21 [system] Event: free_page_event Type minor
Feb 24 17:15:32 [system] Event: free_page_event Type minor
```

show system monitor memory events system

```
user@host> show system monitor memory events system
Feb 24 13:42:13 [process-threshold] Event: critical-event for process: xxxxx with pid xxxxx
Feb 25 11:47:50 [process-threshold] Event: critical-event for process: xxxxx with pid xxxxx
```

Release Information

Command introduced in Junos OS Release 20.1R1.

Output Fields

Table 274 on page 3177 lists the output fields for the `show system monitor memory` command. Output fields are listed in the approximate order in which they appear.

Table 274: show system monitor memory Output Fields

Field Name	Field Description	Level of Output
No.	Number	`all` `process`
Resource	Resource that is monitored. For instance, Cache and free pages, memory utilization at the kernel level, swap usage, and others.	`all` `system`
processID	The Process identification number of the process that has crossed the threshold value.	`all` `process`
processName	Name of the process that has crossed the threshold value.	`all` `process`
Alarm-Type	The type of alarm generated. Values are: major-event, minor-event, and critical-event.	`all` `process`
Event-Type	The type of event raised. Values are: major-event, minor-event, and critical-event.	`all` `system`

Sample Output

show system monitor memory status all

```
user@host> show system monitor memory status all
-----------------------------------------------
```

```
No.      (processID, processName)  Alarm-Type
-----------------------------------------------
1.       ('xxxxx', 'xxxxx')        critical-event
-----------------------------------------------
Resource                       Event-Type
-----------------------------------------------
Free pages:                    minor-event
```

show system monitor memory status process

RELATED DOCUMENTATION

show system monitor memory events | 3173

show system resource-monitor fpc

IN THIS SECTION

- Syntax | 3179
- Description | 3179
- Options | 3179
- Additional Information | 3180
- Required Privilege Level | 3180
- Output Fields | 3180
- Sample Output | 3181
- Release Information | 3183

Syntax

```
show system resource-monitor fpc
<slot slot-number>
```

Description

Display the utilization of memory resources on the Packet Forwarding Engines for all FPCs or a specific FPC. The filter memory denotes the filter counter memory used for firewall filter counters. The asterisk (*) displayed next to each of the memory regions denotes the ones for which the configured threshold is being currently exceeded.

Options

slot *slot-number*	Display the Junos OS utilization information of memory resources for the specified slot number in which the FPC (or MPC) is installed.

> **NOTE**: On the MX80 router, the MPCs are built into the chassis and are represented in the CLI as either `FPC 0` or `FPC 1`. This command supports only FPC 1 for the MX80 router.

Additional Information

The filter memory denotes the filter counter memory used for firewall filter counters. From the Ukern perspective, MPC5E contains only one Packet Forwarding Engine instance. The `show chassis fabric plane` command output displays the state of fabric plane connections to the Packet Forwarding Engine. Because two Packet Forwarding Engines exist, you notice PFE-0 and PFE-1 in the output.

Required Privilege Level

view

Output Fields

Table 275 on page 3180 lists the output fields for the `show system resource-monitor fpc` command. Output fields are listed in the approximate order in which they appear.

Table 275: show system resource-monitor fpc Output Fields

Field Name	Field Description
`Free Heap Memory Watermark`	Configured watermark value for the percentage of free memory space used for ukernel or heap memory to be monitored
`Free FW Memory Watermark`	Configured watermark value for the percentage of free memory space used for firewall or filter memory to be monitored
`Free NH Memory Watermark`	Configured watermark value for the percentage of free memory space used for next-hop memory to be monitored

Table 275: show system resource-monitor fpc Output Fields *(Continued)*

Field Name	Field Description
* - watermark reached	An asterisk (*) displayed beside any of the memory regions denotes the memory types for which the configured threshold is being currently exceeded.
Slot #	Slot number in which the line card is installed
PFE #	Number or identifier of the Packet Forwarding Engine in the specified line card slot
Heap % free	Percentage of free space associated with heap or ukernel memory
Encap mem % free	Percentage of free space associated with encapsulation memory
NH mem % free	Percentage of free space associated with next-hop memory
Filter / FW mem % free	Percentage of free space associated with firewall or filter memory

Sample Output

show system resource-monitor fpc (All Slots)

```
show system resource-monitor fpc

Syntax

```
show uplink-failure-detection
<group  group-name>
```

Description

Display information about the uplink-failure-detection group, the member interfaces, and their status.

Options

none	Display information about all groups configured for uplink failure detection.
group *group-name*	(Optional) Display information about the specified group only.

Required Privilege Level

view

Output Fields

Table 276 on page 3184 lists the output fields for the `show uplink-failure-detection` command. Output fields are listed in the approximate order in which they appear.

Table 276: show uplink-failure-detection Output Fields

Field Name	Field Description
Group	Name of the group.
Uplink	The uplink interface or interfaces configured as link-to-monitor. **NOTE**: The asterisk (*) indicates that the link is up.
Downlink	The downlink interface or interfaces configured as link-to-disable. **NOTE**: The asterisk (*) indicates that the link is up.
Failure Action	Status of uplink failure detection: • Active—The switch has detected an uplink failure and has brought the downlink down. • Inactive—The uplink or uplinks are up.

Sample Output

show uplink-failure-detection

```
user@switch> show uplink-failure-detection
Group              : group1
Uplink             :  ge-0/0/0*
Downlink           :  ge-0/0/1*
Failure Action     :  Inactive

Group              : group2
Uplink             :  ge-0/0/3.0
Downlink           :  ge-0/0/4.0
Failure Action     :  Active
```

<overlay>
<port>
<propagate-ttl host>
<routing-instance routing-instance-name>
<source source-address>
<tos value>
<ttl value>
<wait seconds>
```

Description

Display the route that packets take to a specified network host. Use `traceroute` as a debugging tool to locate points of failure in a network.

Options

host	IP address or name of remote host.
as-number-lookup	(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.
bypass-routing	(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.
ce-ip *IPv4 or IPv6 address*	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the route to a customer edge (CE) IP address in a virtual private LAN service (VPLS) and Ethernet VPN (EVPN) network.
clns	(Optional) Trace the route belonging to Connectionless Network Service (CLNS).
ethernet *host*	(Optional) Trace the route to an Ethernet host using unicast MAC address.

extension	(Optional) Trace ICMP extensions
gateway *address*	(Optional) Address of a router or switch through which the route transits.
inet | inet6	(Optional) Trace the route belonging to IPv4 or IPv6, respectively.
interface *interface-name*	(Optional) Name of the interface over which to send packets.
logical-system (all | *logical-system-name*)	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Perform this operation on all logical systems or on a particular logical system.
tenant *tenant-name*	(Optional) Name of a particular tenant system for traceroute attempt.
monitor *host*	(Optional) Display real-time monitoring information for the specified host.
mpls (ldp *FEC address* **| rsvp** *label-switched-path name*)	(Optional) See `traceroute mpls ldp` and `traceroute mpls rsvp`.
next-hop	The next-hop through which to send packets to a destination.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
overlay	(Optional) Traceroute overlay path.
port	(Optional) Base port number to use in traceroute probes.
propagate-ttl	(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the `no-proagate-ttl` configuration statement. **NOTE**: Using `propagate-ttl` with `traceroute` on the CE router does not show hop-by-hop information.
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the traceroute attempt.
source *source-address*	(Optional) Source address of the outgoing traceroute packets.

tos *value*	(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is `0` through `255`.
ttl *value*	(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is `0` through `128`.
wait *seconds*	(Optional) Maximum time to wait for a response to the traceroute request.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

network

Output Fields

Table 277 on page 3189 describes the output fields for the `traceroute` command. Output fields are listed in the approximate order in which they appear.

Table 277: traceroute Output Fields

Field Name	Field Description
`traceroute to`	IP address of the receiver.
`hops max`	Maximum number of hops allowed.
`byte packets`	Size of packets being sent.
`number-of-hops`	Number of hops from the source to the named router or switch.
`router-name`	Name of the router or switch for this hop.
`address`	Address of the router or switch for this hop.
`Round trip time`	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to host1.example.com (10.156.169.254), 30 hops max, 40 byte packets
 1  blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2  red14  (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms
 3  yellow (10.156.169.254)  7.737 ms  89.905 ms  0.834 ms
```

traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1  10.39.1.1 (10.39.1.1)  0.779 ms  0.728 ms  0.562 ms
 2  10.39.1.6 (10.39.1.6) [AS  32]  0.657 ms  0.611 ms  0.617 ms
 3  10.100.1.1 (10.100.1.1) [AS  10, 40, 50]  0.880 ms  0.808 ms  0.774 ms

user@host> traceroute as-number-lookup 1::1
traceroute6 to 1::1 (1::1) from 2001:b8::7, 64 hops max, 12 byte packets
user@host> traceroute 2001:b8::7 as-number-lookup
traceroute6 to 2001:b8::7 (2001:b8::7) from 2001:db8::9, 64 hops max, 12 byte packets

```

traceroute (Between CE Routers, Layer 3 VPN)

```
user@host> traceroute vpn09
traceroute to host2.example.com (10.255.14.179), 30 hops max, 40
      byte packets
       1  10.39.10.21 (10.39.10.21)  0.598 ms  0.500 ms  0.461 ms
       2  10.39.1.13 (10.39.1.13)  0.796 ms  0.775 ms  0.806 ms
           MPLS Label=100006 CoS=0 TTL=1 S=1
       3  host2.example.com (10.255.14.179)  0.783 ms  0.716 ms  0.686
```

traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
     MPLS Label=1024 CoS=0 TTL=1
 2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms
```

traceroute routing-instance no-resolve (Through an MPLS LSP)

```
user@host> traceroute routing-instance VRF-1 198.51.100.1 no-resolve
traceroute to 198.51.100.1 (198.51.100.1), 30 hops max, 40 byte packets
 1  198.51.100.20  20.243 ms  13.256 ms  24.194 ms
```

```
     MPLS Label=299792 CoS=0 TTL=1 S=0
     MPLS Label=16 CoS=0 TTL=1 S=1
 2  198.51.100.21  14.126 ms  13.090 ms  29.082 ms
     MPLS Label=16 CoS=0 TTL=1 S=0
     MPLS Label=16 CoS=0 TTL=2 S=1
 3  198.51.100.22  16.419 ms  11.564 ms  17.068 ms
     MPLS Label=16 CoS=0 TTL=1 S=1
 4  198.51.100.1  12.794 ms  12.939 ms  17.123 ms
```

traceroute (Junos OS Evolved, Through an MPLS LSP)

The Junos OS Evolved `traceroute` command parses MPLS data in the same way as the Linux `traceroute` command: L=label, E=exp_use, S=stack_bottom, and T=TTL. In the example below, `T=1/L=16` indicates the TTL with label 16.

```
user@host> traceroute 192.0.2.50 ttl 255
traceroute to 192.0.2.50 (192.0.2.50), 255 hops max, 60 byte packets
 1  192.0.2.60 (192.0.2.60)  13.565 ms  11.696 ms  11.448 ms
 2  192.0.2.61 (192.0.2.61) <MPLS:L=17,E=0,S=0,T=1/L=16,E=0,S=1,T=1>  34.034 ms  31.538 ms
27.697 ms
 3  192.0.2.62 (192.0.2.62) <MPLS:L=299776,E=0,S=0,T=1/L=16,E=0,S=1,T=2>  23.174 ms  24.393 ms
21.009 ms
 4  192.0.2.63 (192.0.2.63)  24.553 ms  19.698 ms  25.648 ms
 5  192.0.2.50 (192.0.2.50)  33.322 ms  29.514 ms  24.706 ms
```

traceroute no-resolve extension (QFX5100)

```
user@host> traceroute 48.1.1.2 no-resolve extension
traceroute to 10.255.255.255 (10.255.255.255), 30 hops max, 52 byte packets
1  10.168.1.254  7.776 ms  8.108 ms  8.131 ms
    rx intf ae1.0(560) 10.168.1.254 mtu 1500

    next-hop intf ae2.0(562) 10.255.255.255 mtu 1500
    !
2  10.255.255.255  7.122 ms  8.599 ms  8.267 ms
    rx intf ae2.0(556) 10.255.255.255 mtu 1500
    !
```

Release Information

Command introduced before Junos OS Release 7.4.

`mpls` option introduced in Junos OS Release 9.2.

`propagate-ttl` option introduced in Junos OS Release 12.1.

Support for IPv6 traceroute with `as-number-lookup` introduced with Junos OS Release 18.3R1.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for the SRX Series.

`no-resolve extension` option introduced in Junos OS Release 21.4R1.

The following options are deprecated in Junos OS Evolved Release 18.3R1: `logical-system` and `propagate-ttl`.
