When the Packet Forwarding Engine performs encapsulation for a keyed GRE IPv4 tunnel, the process constructs the first two octets of the GRE header as 0x0000. When the Packet Forwarding Engine performs encapsulation for a non-keyed GRE IPv4 tunnel, the process constructs the first two octets of the GRE header as 0x2000.

## Example: Transporting IPv6 Traffic Across IPv4 Using Filter-Based Tunneling

### IN THIS SECTION

- Requirements | [1392](#)
- Overview | [1393](#)
- Configuration | [1397](#)
- Verification | [1407](#)

This example shows how to configure a unidirectional generic routing encapsulation (GRE) tunnel to transport IPv6 unicast transit traffic across an IPv4 transport network. To provide network connectivity to the two disjoint IPv6 networks, two MX Series 5G Universal Routing Platforms are configured with interfaces that can originate and understand both IPv4 and IPv6 packets. The configuration does not require the creation of tunnel interfaces on Tunnel Services physical interface cards (PICs) or on MPC3E Modular Port Concentrators (MPCs). Instead, you attach firewall filters to Ethernet logical interfaces hosted on Modular Interface Cards (MICs) or MPCs in the two MX Series routers.

**NOTE:** Filter-based GRE tunneling is supported on PTX Series routers only when network services is set to enhanced-mode. For more information, see [enhanced-mode](#).

### Requirements

This example uses the following Juniper Networks hardware and Junos OS software:

- Transport network—An IPv4 network running Junos OS Release 12.3R2 or later.
- PE routers—Two MX80 routers installed as provider edge (PE) routers that connect the IPv4 network to two disjoint IPv6 networks that require a logical path from one network to the other.
- Encapsulating interface—On the encapsulator (the ingress PE router), one Ethernet logical interface configured on the built-in 10-Gigabit Ethernet MIC.
- De-encapsulating interfaces—On the de-encapsulator (the egress PE router), Ethernet logical interfaces configured on three ports of the built-in 10-Gigabit Ethernet MIC.

Before you begin configuring this example:

1. On each PE router, use the **show chassis fpc pic-status** operational mode command to determine which router line cards support filter-based GRE IPv4 tunneling and then use the `interfaces` configuration statement to configure encapsulating and de-encapsulating interfaces.
  - At PE1, the encapsulator, configure *one encapsulating interface* on a supported line card.
  - At PE2, the de-encapsulator, configure *three de-encapsulating interfaces* on a supported line card.
2. Check that IPv4 routing protocols are enabled across the network to support routing paths from the encapsulator to the de-encapsulator.

Configure routing information by manually adding static routes to route tables or by configuring static or dynamic route-sharing protocols. For more information, see [Transport and Internet Protocols User Guide](#).

3. At PE1, [ping](#) the PE2 IPv4 loopback address to verify that the de-encapsulator is reachable from the encapsulator.
4. At PE2, [ping](#) the CE2 router IPv6 loopback address to verify that the destination customer edge router is reachable from the de-encapsulator..

IPv6 routing paths from PE2 to CE2 can be provided by static routes manually added to routing tables or by static or dynamic route-sharing protocols.

- By default, PE2 forwards packets based on interface routes (direct routes) imported from the primary routing table.
- As an option, the de-encapsulating filter can specify that the Packet Forwarding Engine uses an alternate routing table to forward payload packets to the destination customer network. In an optional configuration task in this example, you specify an alternate routing table by installing static routes from PE2 to C1 in the routing instance **blue**. You configure the routing information base (RIB) group **blue\_group** to specify that the route information of **inet6.0** is shared with **blue.inet6.0**, then you associate the PE2 interfaces with routes stored in both the default routes and the routing instance.

## Overview

### IN THIS SECTION

- [Topology](#) | 1394

In this example you configure a unidirectional filter-based GRE IPv4 tunnel from Router PE1 to Router PE2, providing a logical path from IPv6 network C1 to IPv6 network C2.

**NOTE:** To enable *bidirectional*/filter-based GRE tunneling, you must configure a second tunnel in the reverse direction.

As an optional task in this example, you can create a RIB group, which specifies the sharing of routing information (including routes learned from peers, local routes resulting from the application of protocol policies to the learned routes, and the routes advertised to peers) of multiple routing tables.

Topology

Figure 63 on page 1394 shows the path of IPv6 traffic transported from network C1 to network C2, across an IPv4 transport network using a filter-based tunnel from PE1 to PE2 and without requiring tunnel interfaces.

Figure 63: Filter-Based Tunnel from PE1 to PE2 in an IPv4 Network

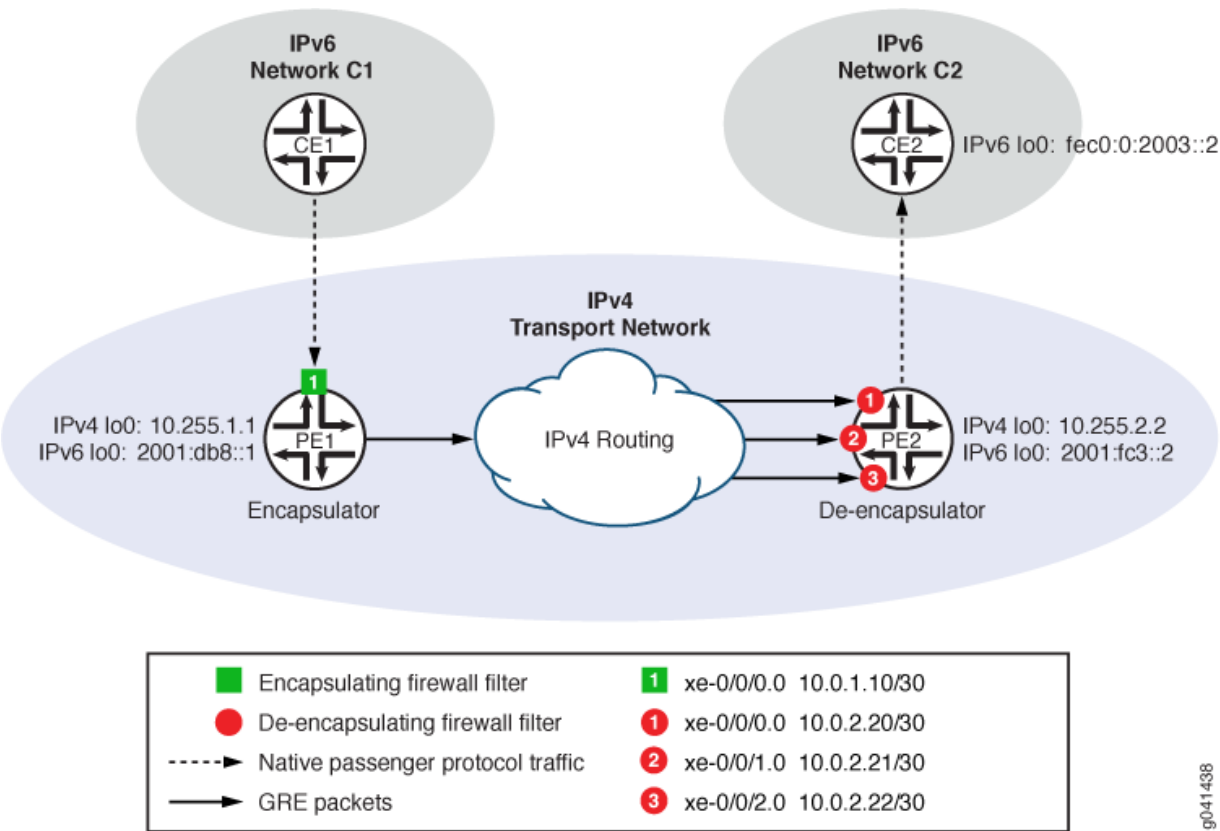

Table 68 on page 1395 summarizes the configuration of Router PE1 as the encapsulator. Table 69 on page 1396 summarizes the configuration of Router PE2 as the de-encapsulator.

**Table 68: Encapsulator Components on PE1**

The filter action causes the Packet Forwarding Engine to de-encapsulate matched packets.<br><br>De-encapsulation consists of removing the outer GRE header and then forwarding the inner IPv6 payload packet to its original destination on the destination IPv6 network by performing destination lookup on the default routing table. |
| Tunnel egress interface     | Interface name:<br>IPv4 address:<br>IPv6 address:                                                                | xe-0/0/3.0<br>10.0.2.23/30<br>::20.34.2.23/120                                                 | Customer-facing interface through which the router forwards de-encapsulated IPv6 packets to the destination IPv6 network C2.                                                                                                                                                                                                                                                                                            |

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1397](#)
- [Configuring PE1 to Encapsulate IPv6 Packets | 1398](#)
- [Configuring PE2 to De-Encapsulate GRE Packets | 1401](#)
- [Optional: Configuring PE2 with an Alternate Routing Table | 1405](#)

To transport IPv6 packets from CE1 to CE2 across an IPv4 transport network using a filter-based tunnel from PE1 to PE2 and without configuring tunnel interfaces, perform these tasks:

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

#### Configuring PE1 to Encapsulate IPv6 Packets

```
set interfaces lo0 unit 0 family inet address 10.255.1.1
set interfaces lo0 unit 0 family inet6 address 2001:db8::1
set interfaces xe-0/0/0 unit 0 family inet address 10.0.1.10/30
set interfaces xe-0/0/0 unit 0 family inet6 address 2001::10.34.1.10/120
set interfaces xe-0/0/0 unit 0 family inet6 filter input gre_encap_1
set interfaces xe-0/0/2 unit 0 family inet address 10.0.1.12/30
set firewall family inet6 filter gre_encap_1 term t1 then count c_gre_encap_1
set firewall family inet6 filter gre_encap_1 term t1 then encapsulate tunnel_1
set firewall tunnel-end-point tunnel_1 ipv4 source-address 10.255.1.1
set firewall tunnel-end-point tunnel_1 ipv4 destination-address 10.255.2.2
set firewall tunnel-end-point tunnel_1 gre
```

#### Configuring PE2 to De-Encapsulate GRE Packets

```
set interfaces lo0 unit 0 family inet address 10.255.2.2
set interfaces lo0 unit 0 family inet6 address 2001:fc3::2
set interfaces xe-0/0/0 unit 0 family inet address 10.0.2.20/30
```

```

set interfaces xe-0/0/1 unit 0 family inet address 10.0.2.21/30
set interfaces xe-0/0/2 unit 0 family inet address 10.0.2.22/30
set interfaces xe-0/0/3 unit 0 family inet address 10.0.2.23/30
set interfaces xe-0/0/3 unit 0 family inet6 address ::20.34.2.23/120
set forwarding-options family inet filter input gre_decap_1
set firewall family inet filter gre_decap_1 term t1 from source-address 10.255.1.1/32
set firewall family inet filter gre_decap_1 term t1 from destination-address 10.255.2.2/32
set firewall family inet filter gre_decap_1 term t1 then count c_gre_decap_1
set firewall family inet filter gre_decap_1 term t1 then decapsulate gre

```

### Optional: Configuring PE2 with an Alternate Routing Table

```

set routing-instances blue instance-type forwarding
set routing-instances blue routing-options rib blue.inet6.0 static route 0::/0 next-hop
fec0:0:2003::2
set routing-options passive
set routing-options rib inet6.0
set routing-options rib-groups blue_group import-rib inet6.0
set routing-options rib-groups blue_group import-rib blue.inet6.0
set routing-options interface-routes rib-group inet6 blue_group
set firewall family inet filter gre_decap_1 term t1 then decapsulate gre routing-instance blue

```

### Configuring PE1 to Encapsulate IPv6 Packets

#### Step-by-Step Procedure

To configure Router PE1 to encapsulate IPv6 packets arriving from CE1:

1. Configure the router loopback addresses.

```

[edit]
user@PE1# set interfaces lo0 unit 0 family inet address 10.255.1.1
user@PE1# set interfaces lo0 unit 0 family inet6 address 2001:db8::1

```

2. Configure the encapsulating interface IPv4 and IPv6 addresses and attach the encapsulating filter to the IPv6 input.

```

[edit]
user@PE1# set interfaces xe-0/0/0 unit 0 family inet address 10.0.1.10/30

```

```

user@PE1# set interfaces xe-0/0/0 unit 0 family inet6 address ::10.34.1.10/120
user@PE1# set interfaces xe-0/0/0 unit 0 family inet6 filter input gre_encap_1

```

3. Configure the core-facing egress interface to the tunnel.

```

[edit]
user@PE2# set interfaces xe-0/0/2 unit 0 family inet address 10.0.1.12/30

```

4. Define an IPv6 firewall filter that causes the Packet Forwarding Engine to encapsulate all packets.

```

[edit]
user@PE1# set firewall family inet6 filter gre_encap_1 term t1 then count c_gre_encap_1
user@PE1# set firewall family inet6 filter gre_encap_1 term t1 then encapsulate tunnel_1

```

**NOTE:** The **encapsulate** firewall filter action is a *terminating* filter action. A filter-terminating action halts all evaluation of a firewall filter for a specific packet. The router performs the specified action, and no additional terms are examined.

5. Define a GRE IPv4 tunnel template named tunnel\_1 that specifies the host IP addresses of the one tunnel source interface and three tunnel destination interfaces.

```

[edit]
user@PE1# set firewall tunnel-end-point tunnel_1 ipv4 source-address 10.255.1.1
user@PE1# set firewall tunnel-end-point tunnel_1 ipv4 destination-address 10.255.2.2
user@PE1# set firewall tunnel-end-point tunnel_1 gre

```

**NOTE:** You can tunnel multiple but distinct flows from 10.0.1.10 (the tunnel source interface on PE1) to 10.0.2.20 – 10.0.2.22 (the de-encapsulating interfaces on PE2) if you use the GRE option **key number** to uniquely identify each tunnel.

6. If you are done configuring the device, commit the configuration.

```

[edit]
user@PE1# commit

```

## Results

From configuration mode, confirm your configuration by entering the `show firewall` and `show interfaces` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Router PE1

Confirm the firewall filter and tunnel template on the encapsulator.

```
user@PE2# show firewall
family inet6 {
 filter gre_encap_1 {
 term t1 {
 then {
 count c_gre_encap_1;
 encapsulate tunnel_1;
 }
 }
 }
}
tunnel-end-point tunnel_1 {
 ipv4 {
 source-address 10.255.1.1;
 destination-address 10.255.2.2;
 }
 gre;
}
```

### Router PE1

Confirm the interfaces on the encapsulator.

```
user@PE1# show interfaces
lo0 {
 unit 0 {
 family inet {
 address 10.255.1.1;
 }
 family inet6 {
 address 2001:db8::1;
 }
 }
}
```

```

 }
}
xe-0/0/0 {
 unit 0 {
 family inet {
 address 10.0.1.10/30;
 }
 family inet6 {
 address ::10.34.1.10/120;
 filter input gre_encap_1;
 }
 }
}
xe-0/0/2 {
 unit 0 {
 family inet {
 address 10.0.1.12/30;
 }
 }
}
}

```

## Configuring PE2 to De-Encapsulate GRE Packets

### Step-by-Step Procedure

To configure Router PE2 to de-encapsulate GRE packets arriving from the IPv4 tunnel:

1. Configure the router loopback address.

```

[edit]
user@PE2# set interfaces lo0 unit 0 family inet address 10.255.2.2
user@PE2# set interfaces lo0 unit 0 family inet6 address 2001:fc3::2

```

2. Configure the de-encapsulating interfaces.

```

[edit]
user@PE2# set interfaces xe-0/0/0 unit 0 family inet address 10.0.2.20/30
user@PE2# set interfaces xe-0/0/1 unit 0 family inet address 10.0.2.21/30
user@PE2# set interfaces xe-0/0/2 unit 0 family inet address 10.0.2.22/30

```

3. Configure the customer-facing egress interface to CE2.

```
[edit]
user@PE2# set interfaces xe-0/0/3 unit 0 family inet address 10.0.2.23/30
user@PE2# set interfaces xe-0/0/3 unit 0 family inet6 address ::20.34.2.23/120
```

4. Apply the ingress de-encapsulating firewall filter to all forwarded packets.

```
[edit]
user@PE2# set forwarding-options family inet filter input gre_decap_1
```

5. Define IPv4 filter **gre\_decap\_1**.

Define an IPv4 filter that de-encapsulates and forwards all GRE packets.

```
[edit]
user@PE2# set firewall family inet filter gre_decap_1
```

6. Configure term **t1** to match packets transported across the tunnel **tunnel\_1** defined on Router PE1. The tunnel sends packets from Router PE1 (configured with IPv4 loopback address 10.255.1.1) to Router PE2 (configured with IPv4 loopback address 10.255.2.2).

```
[edit firewall family inet filter gre_decap_1]
user@PE2# set term t1 from source-address 10.255.1.1
user@PE2# set term t1 from destination-address 10.255.2.2
```

7. Configure term **t1** to count and de-encapsulate matched packets.

```
[edit firewall family inet filter gre_decap_1]
user@PE2# set term t1 then count c_gre_decap_1
user@PE2# set term t1 then decapsulate gre
```

If the de-encapsulating filter action **decapsulate** references the **blue** routing instance, make sure that the routing instance is configured and that the RIB group **blue\_group** defines the sharing of the alternate routes into the primary table.

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@PE2# commit
```

## Results

From configuration mode, confirm your configuration by entering the `show firewall`, `show forwarding-options`, and `show interfaces` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Router PE2

Confirm the firewall filter on the de-encapsulator.

```
user@PE2# show firewall
family inet {
 filter gre_decap_1 {
 term t1 {
 from {
 source-address 10.255.1.1;
 destination-address 10.255.2.2;
 }
 then {
 count c_gre_decap_1;
 decapsulate gre routing-instance blue;
 }
 }
 }
}
```

**NOTE:** If the de-encapsulating filter action **decapsulate** references the **blue** routing instance, make sure that the routing instance is configured and that the RIB group **blue\_group** defines the sharing of the alternate routes into the primary table.

### Router PE2

Confirm the forwarding options (for attaching the de-encapsulating firewall filter to all input forwarded packets) on the de-encapsulator.

```
user@PE2# show forwarding-options
forwarding-options {
 family inet {
 filter {
 input gre_decap_1;
 }
 }
}
```

## Router PE2

Confirm the interfaces on the de-encapsulator.

```
user@PE2# show interfaces
lo0 {
 unit 0 {
 family inet {
 address 10.255.2.2;
 }
 family inet6 {
 address 2001:fc3::2;
 }
 }
}
xe-0/0/0 {
 unit 0 {
 family inet {
 address 10.0.2.20/30;
 filter input gre_decap_1;
 }
 }
}
xe-0/0/1 {
 unit 0 {
 family inet {
 address 10.0.2.21/30;
 filter input gre_decap_1;
 }
 }
}
```

```

}
xe-0/0/2 {
 unit 0 {
 family inet {
 address 10.0.2.22/30;
 filter input gre_decap_1;
 }
 }
}
xe-0/0/3 {
 unit 0 {
 family inet {
 address 10.0.2.23/30;
 }
 family inet6 {
 address ::20.34.2.23/120;
 }
 }
}
}

```

### Optional: Configuring PE2 with an Alternate Routing Table

#### Step-by-Step Procedure

To configure Router PE2 with an alternate routing table:

1. Configure the routing instance **blue**, and add static routes to CE2.

```

[edit]
user@PE2# set routing-instances blue instance-type forwarding
user@PE2# set routing-instances blue routing-options rib blue.inet6.0 static route 0::/0 next-
hop fec0:0:2003::2

```

The Junos OS software generates the routing table **blue.inet6.0** using the routing information learned within the instance.

2. Enable routes to remain in routing and forwarding tables, even if the routes become inactive. This allows a static route to remain in the table if the next hop is unavailable.

```
[edit]
user@PE2# set routing-options passive
```

3. Create a RIB group by explicitly creating the default routing table.

```
[edit]
user@PE2# set routing-options rib inet6.0
```

4. Define the RIB group **blue\_group**.

```
[edit]
user@PE2# set routing-options rib-groups blue_group import-rib inet6.0
user@PE2# set routing-options rib-groups blue_group import-rib blue.inet6.0
```

In the **import-rib** statement, specify the primary routing table first.

5. Associate the router interfaces with routing information specified by the RIB group.

```
[edit]
user@PE2# set routing-options interface-routes rib-group inet6 blue_group
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@PE2# commit
```

## Results

From configuration mode, confirm your configuration by entering the `show firewall`, `show routing-instances`, and `show routing-options` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Router PE2

If you configured an alternate routing table on Router PE2, confirm the routing instance configuration.

```
user@PE2# show routing-instances
blue {
 instance-type forwarding;
 routing-options {
 static route 0::/0 next-hop fec0:0:2003::2;
 }
}
```

### Router PE2

If you configured an alternate routing table on Router PE2, confirm the RIB group and direct routing configurations.

```
user@PE2# show routing-options
interface-routes {
 rib-group blue_group;
}
passive;
rib inet6.0;
rib-groups {
 blue_group {
 import-rib [inet6.0 blue.inet6.0];
 }
}
```

## Verification

### IN THIS SECTION

- [Verifying Routing Information | 1408](#)
- [Verifying Encapsulation on PE1 | 1409](#)
- [Verifying De-Encapsulation on PE2 | 1411](#)

Confirm that the configurations are working properly.

## Verifying Routing Information

### Purpose

Verify that the direct routes include the alternate routing table information.

### Action

To perform the verification:

1. (Optional) To verify the routing instance **blue** on PE2, use the **show route instance** operational mode command to display the primary table and number of routes for that routing instance.

```
user@PE2> show route instance blue summary
```

| Instance | Type         | Active/holddown/hidden |
|----------|--------------|------------------------|
|          | Primary RIB  |                        |
| blue     | forwarding   |                        |
|          | blue.inet6.0 | 2/0/0                  |

2. (Optional) To view the routing table associated with the routing instance **blue** on PE2, use the **show route table** operational mode command

```
user@PE2> show route table blue.inet6.0
```

blue.inet6.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
2001:db8::192:168:239:17/128
 *[Direct/0] 00:02:26
 > via lo0.0
fe80::2a0:a50f:fc64:e032/128
 *[Direct/0] 00:02:26
 > via lo0.0
```

3. (Optional) To verify that the alternate routes from routing instance blue have been imported to the PE2 forwarding table, use the **show route forwarding-table** operational mode command to display the contents of the router forwarding table and the routing instance forwarding table.

```

user@PE2> show route forwarding-table blue
Routing table: blue.inet
Internet:
Destination Type RtRef Next hop Type Index NhRef Netif
default perm 0 rjct 689 1
0.0.0.0/32 perm 0 dscd 687 1

ff02::1/128 perm 0 ff02::1 mcst 697 1

```

## Verifying Encapsulation on PE1

### Purpose

Verify the encapsulating interface on PE1.

### Action

To perform the verification:

1. Use the **show interfaces filters** operational mode command to verify that the encapsulating firewall filter is attached to the ingress of the encapsulating interface.

```
user@PE1> show interfaces filters xe-0/0/0.0
```

| Interface  | Admin | Link | Proto | Input Filter | Output Filter |
|------------|-------|------|-------|--------------|---------------|
| xe-0/0/0.0 | up    | down | inet6 | gre_encap_1  |               |

2. Use the **show interfaces** operational mode command to verify that the encapsulating interface is receiving packets.

```
user@PE1> show interfaces xe-0/0/0.0 detail | filter "Ingress traffic"
```

```
...
```

Physical interface: xe-0/0/0, Enabled, Physical link is Up

```
...
```

Ingress traffic statistics at Packet Forwarding Engine:

|       |          |   |            |  |       |
|-------|----------|---|------------|--|-------|
| Input | bytes    | : | 6970299398 |  | 0 bps |
| Input | packets: |   | 81049992   |  | 0 pps |
| Drop  | bytes    | : | 0          |  | 0 bps |
| Drop  | packets: |   | 0          |  | 0 pps |

```
...
```

3. Use the **show firewall filter** operational mode command to verify that ingress passenger protocol traffic triggers the encapsulating filter.

```
user@PE1> show firewall filter gre_encap_1
```

Filter: gre\_encap\_1

Counters:

| Name          | Bytes      | Packets  |
|---------------|------------|----------|
| c_gre_encap_1 | 6970299398 | 81049992 |

## Meaning

If the encapsulating filter is attached to the encapsulating interface, and the encapsulating interface receives passenger protocol traffic, and the firewall filter statistics show that ingress passenger protocol traffic is being encapsulated, then GRE packets are being forwarded through the tunnel.

## Verifying De-Encapsulation on PE2

### Purpose

Verify the de-encapsulating interfaces on PE2.

### Action

To perform the verification:

1. On PE1, use the **ping** operational mode command to verify that PE2 is reachable.

```
user@PE1> ping 10.255.2.2
PING 10.255.2.2 (10.255.2.2): 56 data bytes
64 bytes from 10.255.2.2: icmp_seq=0 ttl=64 time=0.576 ms
64 bytes from 10.255.2.2: icmp_seq=1 ttl=64 time=0.269 ms
^C [abort]
```

2. On PE2, use the **show interfaces filter** operational mode command to verify that the de-encapsulating firewall filter is attached to the ingress of the de-encapsulating interfaces.

```
user@PE2> show interfaces filter | match xe-
Interface Admin Link Proto Input Filter Output Filter
xe-0/0/0.0 up down inet gre_decap_1
xe-0/0/1.0 up down inet gre_decap_1
xe-0/0/2.0 up down inet gre_decap_1
```

3. On PE2, use the **show interfaces** operational mode command to verify that the de-encapsulating interfaces are receiving packets.

```
user@PE2> show interfaces xe-0/0/0.0 detail | filter "Ingress traffic"
Physical interface: xe-0/0/0, Enabled, Physical link is Up
...
Ingress traffic statistics at Packet Forwarding Engine:
 Input bytes : 6970299398 0 bps
 Input packets: 81049992 0 pps
 Drop bytes : 0 0 bps
 Drop packets: 0 0 pps
...
```

```
user@PE2> show interfaces xe-0/0/1.0 detail | filter "Ingress traffic"
```

```
Physical interface: xe-0/0/2, Enabled, Physical link is Up
```

```
...
```

```
user@PE2> show interfaces xe-0/0/2.0 detail | filter "Ingress traffic"
```

```
Physical interface: xe-0/0/2, Enabled, Physical link is Up
```

```
...
```

Depending on how routing is configured and which links are up and which links are down, some of the de-encapsulating interfaces might not be receiving packets although the tunnel is operating properly.

4. On PE2, use the **show firewall filter** operational mode command to verify that ingress GRE traffic triggers the de-encapsulating filter.

```
user@PE2> show firewall filter gre_decap_1
```

```
Filter: gre_decap_1
```

```
Counters:
```

| Name          | Bytes      | Packets  |
|---------------|------------|----------|
| c_gre_decap_1 | 6970299398 | 81049992 |

## Meaning

The verification confirms the following operational states and activities of the encapsulator:

- PE2 is reachable from the PE1.
- The de-encapsulating filter is attached to the input of all de-encapsulating interfaces.
- The de-encapsulator is receiving traffic at de-encapsulating interfaces as expected.
- GRE packets received at the de-encapsulating interfaces trigger the de-encapsulating firewall filter action.

## Service Filter Overview

### IN THIS SECTION

- [Services | 1414](#)
- [Service Rules | 1415](#)
- [Service Rule Refinement | 1415](#)
- [Service Filter Counters | 1415](#)

### Services

The Adaptive Services Physical Interface Cards (PICs), Multiservices PICs, and Multiservices Dense Port Concentrators (DPCs) provide *adaptive services interfaces*. Adaptive services interfaces enable you to coordinate a special range of services on a single PIC or DPC by configuring a set of services and applications.

**NOTE:** Service filters are not supported on T4000 routers.

## Service Rules

A *service set* is an optional definition you can apply to the traffic at an adaptive services interface. A service set enables you to configure combinations of directional rules and default settings that control the behavior of each service in the service set.

## Service Rule Refinement

When you apply a service set to the traffic at an adaptive services interface, you can optionally use *service filters* to refine the target of the set of services and also to process traffic. Service filters enable you to manipulate traffic by performing packet filtering to a defined set of services on an adaptive services interface before the traffic is delivered to its destination. You can apply a service filter to traffic before packets are accepted for input or output service processing or after packets return from input service processing.

## Service Filter Counters

Like standard firewall filters, service filters support counting of matched packets. When you display counters for a service filter, however, the syntax for specifying the filter name includes the name of the *service set* to which the service filter is applied.

- To enable counting of the packets matched by a service filter term, specify the count *counter-name* nonterminating action in that term.
- To display counters for service filters, use the `show firewall filter filter-name <counter counter-name>` *operational mode command*, and specify the *filter-name* as follows:

```
__service-service-set-name:service-filter-name
```

For example, suppose you configure a service filter named `out_filter` with a counter named `out_counter` and apply that service filter to a *logical interface* to direct certain packets for processing by the output

services associated with the service set `nat_set`. In this scenario, the syntax for using the `show firewall` operational mode command to display the counter is as follows:

```
[edit]
user@host> show firewall filter __service-nat_set:out_filter counter out_counter
```

## How Service Filters Evaluate Packets

### IN THIS SECTION

- [Service Filters That Contain a Single Term | 1416](#)
- [Service Filters That Contain Multiple Terms | 1417](#)
- [Service Filter Terms That Do Not Contain Any Match Conditions | 1417](#)
- [Service Filter Terms That Do Not Contain Any Actions | 1417](#)
- [Service Filter Default Action | 1417](#)

### Service Filters That Contain a Single Term

For a service filter that consists of a single term, the policy framework software evaluates a packet as follows:

- If the packet matches all the conditions, the actions are taken.
- If the packet matches all the conditions and no actions are specified, the packet is accepted.
- If the packet does not match all the conditions, it is discarded.

## Service Filters That Contain Multiple Terms

For a service filter that consists of multiple terms, the policy framework software evaluates a packet against the terms in the filter sequentially, beginning with the first term in the filter, until either the packet matches all the conditions in one of the terms or there are no more terms in the filter.

- If the packet matches all the conditions in a term, the actions in that term are performed and evaluation of the packet ends at that term. Any subsequent terms in the filter are not used.
- If the packet does not match all the conditions in the term, evaluation of the packet proceeds to the next term in the filter.

## Service Filter Terms That Do Not Contain Any Match Conditions

For service filters with a single term and for filters with multiple terms, if a term does not contain any match conditions, the actions are taken on any packet evaluated.

## Service Filter Terms That Do Not Contain Any Actions

If a term does not contain any actions, and if the packet matches the conditions in the term, the packet is accepted.

## Service Filter Default Action

Each service filter has an *implicit* skip action at the end of the filter, which is equivalent to including the following example term `explicit_skip` as the final term in the service filter:

```
term explicit_skip {
 then skip;
}
```

By default, if a packet matches none of the terms in a service filter, the packet bypasses service processing.

## RELATED DOCUMENTATION

- [Service Filter Overview | 1414](#)

## Guidelines for Configuring Service Filters

### IN THIS SECTION

- [Statement Hierarchy for Configuring Service Filters | 1418](#)
- [Service Filter Protocol Families | 1419](#)
- [Service Filter Names | 1419](#)
- [Service Filter Terms | 1419](#)
- [Service Filter Match Conditions | 1419](#)
- [Service Filter Terminating Actions | 1420](#)

## Statement Hierarchy for Configuring Service Filters

To configure a service filter, include the `service-filter service-filter-name` statement at the `[edit firewall family (inet | inet6)]` hierarchy level:

```
[edit]
firewall {
 family (inet | inet6) {
 service-filter service-filter-name {
 term term-name {
 from {
 match-conditions;
 }
 then {
 actions;
 }
 }
 }
 }
}
```

```

 }
 }
}

```

Individual statements supported under the `service-filter service-filter-name` statement are described separately in this topic and are illustrated in the example of configuring and applying a service filter.

## Service Filter Protocol Families

You can configure service filters to filter IPv4 traffic (family `inet`) and IPv6 traffic (family `inet6`) only. No other protocol families are supported for service filters.

## Service Filter Names

Under the `family inet` or `family inet6` statement, you can include `service-filter service-filter-name` statements to create and name service filters. The filter name can contain letters, numbers, and hyphens (-) and be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

## Service Filter Terms

Under the `service-filter service-filter-name` statement, you can include `term term-name` statements to create and name filter terms.

- You must configure at least one term in a *firewall filter*.
- You must specify a unique name for each term within a firewall filter. The term name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").
- The order in which you specify terms within a firewall filter configuration is important. Firewall filter terms are evaluated in the order in which they are configured. By default, new terms are always added to the end of the existing filter. You can use the [insert](#) configuration mode command to reorder the terms of a firewall filter.

## Service Filter Match Conditions

Service filter terms support only a subset of the IPv4 and IPv6 match conditions that are supported for standard stateless firewall filters.

If you specify an IPv6 address in a match condition (the `address`, `destination-address`, or `source-address` match conditions), use the syntax for text representations described in RFC 4291, *IP Version 6 Addressing*

*Architecture.* For more information about IPv6 addresses, see “[IPv6 Overview](#)” in the [Junos OS Routing Protocols Library for Routing Devices](#).

## Service Filter Terminating Actions

When configuring a service filter term, you must specify one of the following filter-terminating actions:

- `service`
- `skip`

**NOTE:** These actions are unique to service filters.

Service filter terms support only a subset of the IPv4 and IPv6 nonterminating actions that are supported for standard stateless firewall filters:

- `count` *counter-name*
- `log`
- `port-mirror`
- `sample`

Service filters do not support the **next** action.

## Guidelines for Applying Service Filters

### IN THIS SECTION

- [Restrictions for Adaptive Services Interfaces | 1421](#)
- [Statement Hierarchy for Applying Service Filters | 1422](#)
- [Associating Service Rules with Adaptive Services Interfaces | 1422](#)
- [Filtering Traffic Before Accepting Packets for Service Processing | 1423](#)
- [Postservice Filtering of Returning Service Traffic | 1424](#)

### Restrictions for Adaptive Services Interfaces

The following restrictions apply to adaptive services interfaces and service filters.

#### Adaptive Services Interfaces

You can apply a service filter to IPv4 or IPv6 traffic associated with a service set at an *adaptive services interface* only. Adaptive services interfaces are supported for the following hardware only:

- Adaptive Services (AS) PICs on M Series and T Series routers
- Multiservices (MS) PICs on M Series and T Series routers
- MS DPCs on MX Series routers and EX Series switches
- MS MPCs and MICs on MX Series routers

#### System Logging to a Remote Host from M Series Routers

Logging of adaptive services interfaces messages to an external server by means of the `fxp0` or `em0` port is not supported on M Series routers. The architecture does not support system logging traffic out of a management interface. Instead, access to an external server is supported on a Packet Forwarding Engine interface.

## Statement Hierarchy for Applying Service Filters

You can enable packet filtering of IPv4 or IPv6 traffic before a packet is accepted for input or output service processing. To do this, apply a service filter to the adaptive services interface input or output in conjunction with an interface service set.

You can also enable packet filtering of IPv4 or IPv6 traffic that is returning to the Packet Forwarding Engine after input service processing completes. To do this, apply a post-service filter to the adaptive services interface input.

The following configuration shows the hierarchy levels at which you can apply the service filters to adaptive services interfaces:

```
[edit]
interfaces {
 interface-name {
 unit unit-number {
 family (inet | inet6) {
 service {
 input {
 service-set service-set-name service-filter service-filter-name;
 post-service-filter service-filter-name;
 }
 output {
 service-set service-set-name service-filter service-filter-name;
 }
 }
 }
 }
 }
}
```

## Associating Service Rules with Adaptive Services Interfaces

To define and group the service rules be applied to an adaptive services interface, you define an *interface service set* by including the `service-set service-set-name` statement at the `[edit services]` hierarchy level.

To apply an interface service set to the input and output of an adaptive services interface, you include the `service-set service-set-name` at the following hierarchy levels:

- `[edit interfaces interface-name unit unit-number input]`

- [edit interfaces *interface-name* unit *unit-number* output]

If you apply a service set to one direction of an adaptive services interface but do not apply a service set to the other direction, an error occurs when you commit the configuration.

The adaptive services PIC performs different actions depending on whether the packet is sent to the PIC for input service or for output service. For example, you can configure a single service set to perform Network Address Translation (NAT) in one direction and destination NAT (dNAT) in the other direction.

## Filtering Traffic Before Accepting Packets for Service Processing

To filter IPv4 or IPv6 traffic before accepting packets for input or output service processing, include the `service-set service-set-name service-filter service-filter-name` at one of the following interfaces:

- [edit interfaces *interface-name* unit *unit-number* family (inet | inet6) service input]
- [edit interfaces *interface-name* unit *unit-number* family (inet | inet6) service output]

For the *service-set-name*, specify a service set configured at the [edit services `service-set`] hierarchy level.

The service set retains the input interface information even after services are applied, so that functions such as filter-class forwarding and destination class usage (DCU) that depend on input interface information continue to work.

The following requirements apply to filtering inbound or outbound traffic before accepting packets for service processing:

- You configure the same service set on the input and output sides of the interface.
- If you include the `service-set` statement without an optional `service-filter` definition, the Junos OS assumes the match condition is true and selects the service set for processing automatically.
- The service filter is applied only if a service set is configured and selected.

You can include more than one service set definition on each side of an interface. The following guidelines apply:

- If you include multiple service sets, the router (or switch) software evaluates them in the order in which they appear in the configuration. The system executes the first service set for which it finds a match in the service filter and ignores the subsequent definitions.
- A maximum of six service sets can be applied to an interface.
- When you apply multiple service sets to an interface, you must also configure and apply a service filter to the interface.

## Postservice Filtering of Returning Service Traffic

As an option to filtering of IPv4 or IPv6 input service traffic, you can apply a service filter to IPv4 or IPv6 traffic that is returning to the services interface after the service set is executed. To apply a service filter in this manner, include the `post-service-filter service-filter-name` statement at the `[edit interfaces interface-name unit unit-number family (inet | inet6) service input]` hierarchy level.

## Example: Configuring and Applying Service Filters

### IN THIS SECTION

- [Requirements | 1424](#)
- [Overview | 1425](#)
- [Configuration | 1426](#)
- [Verification | 1430](#)

This example shows how to configure and apply service filters.

### Requirements

This example use the logical interface `xe-0/1/0.0` on any of the following hardware components:

- Adaptive Services (AS) PIC on an M Series or T Series router

- Multiservices (MS) PIC on an M Series or T Series router
- Multiservices (MS) DPC on an MX Series router
- EX Series switch

Before you begin, make sure that you have:

- Installed your supported router (or switch) and PICs or DPCs and performed the initial router (or switch) configuration.
- Configured basic Ethernet in the topology, and verified that traffic is flowing in the topology and that IPv4 traffic is flowing through logical interface xe-0/1/0.0.
- Configured the service set vrf\_svcs with service input and output rules and default settings for services at a service interface.

For guidelines for configuring service sets, see [Configuring Service Sets to be Applied to Services Interfaces](#).

## Overview

### IN THIS SECTION

- [Topology](#) | 1425

In this example, you create three types of service filters for IPv4 traffic: one input service filter, one postservice input filter, and one output service filter. Different service-filters can be applied to the same service-set. See also: [Configuring Service Sets to be Applied to Services Interfaces](#)

### Topology

You apply the input service filter and postservice input filter to input traffic at logical interface xe-0/1/0.0, and you apply the output service filter to the output traffic at the same logical interface.

- Filtering IPv4 traffic before it is accepted for input service processing—At logical interface xe-0/1/0.0, you use the service filter in\_filter\_presvc to filter IPv4 input traffic before the traffic can be accepted for processing by services associated with service set vrf\_svcs. The in\_filter\_presvc service filter counts packets sent from ICMP port 179, directs these packets to the input services associated with the service set vrf\_svcs, and discards all other packets.
- Filtering IPv4 traffic after it has completed input service processing—At logical interface xe-0/1/0.0, you use the service filter in\_filter\_postsvc to filter traffic that is returning to the services interface

after the input service set `in_filter_presvc` is executed. The `in_filter_postsvc` service filter counts packets sent from ICMP port 179 and then discards them.

- Filtering IPv4 traffic before it is accepted for output service processing—At logical interface `xe-0/1/0.0`, you use the service-filter `out_filter_presvc` to filter IPv4 output traffic before the traffic can be accepted for processing by the services associated with service set `vrf_svcs`. The `out_filter_presvc` service filter counts packets destined for TCP port 179 and then directs the packets to the output services associated with the service set `vrf_svcs`.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1426](#)
- [Configuring the Three Service Filters | 1427](#)
- [Applying the Three Service Filters | 1429](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the `[edit]` hierarchy level.

```
set firewall family inet service-filter in_filter_presvc term t1 from protocol tcp
set firewall family inet service-filter in_filter_presvc term t1 from source-port bgp
set firewall family inet service-filter in_filter_presvc term t1 then count svc_in_pkts
set firewall family inet service-filter in_filter_presvc term t1 then service
set firewall family inet service-filter in_filter_postsvc term t2 from protocol tcp
set firewall family inet service-filter in_filter_postsvc term t2 from source-port bgp
set firewall family inet service-filter in_filter_postsvc term t2 then count svc_in_pkts_rtn
set firewall family inet service-filter in_filter_postsvc term t2 then skip
set firewall family inet service-filter out_filter_presvc term t3 from protocol icmp
set firewall family inet service-filter out_filter_presvc term t3 from destination-port bgp
set firewall family inet service-filter out_filter_presvc term t3 then count svc_out_pkts
set firewall family inet service-filter out_filter_presvc term t3 then service
```

```
set interfaces xe-0/1/0 unit 0 family inet service input service-set vrf_svcs service-filter
in_filter_presvc
set interfaces xe-0/1/0 unit 0 family inet service input post-service-filter in_filter_postsvc
set interfaces xe-0/1/0 unit 0 family inet service output service-set vrf_svcs service-filter
out_filter_presvc
```

## Configuring the Three Service Filters

### Step-by-Step Procedure

To configure the three service filters:

1. Configure the input service filter.

```
[edit]
user@host# edit firewall family inet service-filter in_filter_presvc

[edit firewall family inet service-filter in_filter_presvc]
user@host# set term t1 from protocol tcp
user@host# set term t1 from source-port bgp
user@host# set term t1 then count svc_in_pkts
user@host# set term t1 then service
```

2. Configure the postservice input filter.

```
[edit]
user@host# edit firewall family inet service-filter in_filter_postsvc

[edit firewall family inet service-filter in_filter_postsvc]
user@host# set term t2 from protocol tcp
user@host# set term t2 from source-port bgp
user@host# set term t2 then count svc_in_pkts_rtn
user@host# set term t2 then skip
```

3. Configure the output service filter.

```
[edit]
user@host# edit firewall family inet service-filter out_filter_presvc
```

```
[edit firewall family inet service-filter out_filter_presvc]
user@host# set term t3 from protocol icmp
user@host# set term t3 from destination-port bgp
user@host# set term t3 then count svc_out_pkts
user@host# set term t3 then service
```

## Results

Confirm the configuration of the input and output service filters and the postservice input filter by entering the `show firewall configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
 service-filter in_filter_presvc {
 term t1 {
 from {
 protocol tcp;
 source-port bgp;
 }
 then {
 count svc_in_pkts;
 service;
 }
 }
 }
 service-filter in_filter_postsvc {
 term t2 {
 from {
 protocol tcp;
 source-port bgp;
 }
 then {
 count svc_in_pkts_rtn;
 skip;
 }
 }
 }
 service-filter out_filter_presvc {
 term t3 {
```

```

 from {
 protocol icmp;
 destination-port bgp;
 }
 then {
 count svc_out_pkts;
 service;
 }
 }
}
}

```

## Applying the Three Service Filters

### Step-by-Step Procedure

To apply the three service filters:

1. Access the IPv4 protocol on the input interface xe-0/1/0.0.

```

[edit]
user@host# edit interfaces xe-0/1/0 unit 0 family inet

```

2. Apply the input service filter and the postservice input filter.

```

[edit interfaces xe-0/1/0 unit 0 family inet]
user@host# set service input service-set vrf_svcs service-filter in_filter_presvc
user@host# set service input post-service-filter in_filter_postsvc
user@host# set service output service-set vrf_svcs service-filter out_filter_presvc

```

## Results

Confirm the configuration of the interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
xe-0/1/0 {

```

```

unit 0 {
 family inet {
 service {
 input {
 service-set vrf_svcs service-filter in_filter_presvc;
 post-service-filter in_filter_postsvc;
 }
 output {
 service-set vrf_svcs service-filter out_filter_presvc;
 }
 }
 }
}

```

When you are done configuring the device, commit your candidate configuration.

## Verification

### IN THIS SECTION

- [Verifying That Inbound Traffic Is Filtered Before Input Service | 1430](#)
- [Verifying That Inbound Traffic Is Filtered After Input Service Processing | 1431](#)
- [Verifying That Outbound Traffic Is Filtered Before Output Service Processing | 1431](#)

Confirm that the configuration is working properly.

### Verifying That Inbound Traffic Is Filtered Before Input Service

#### Purpose

Verify that inbound packets sent from TCP port 179 are sent for processing by the *input* services associated with the service set *vrf\_svcs*.

## Action

Display the count of packets sent for processing by the *input* services associated with the service set *vrf\_svcs*.

```
[edit]
user@host> show firewall filter in_filter_presvc-vrf_svcs counter svc_in_pkts
```

## Verifying That Inbound Traffic Is Filtered After Input Service Processing

### Purpose

Verify that inbound packets sent from TCP port 179 are returned from processing by the *input* services associated with the service set *vrf\_svcs*.

## Action

Display the count of packets returned from processing by the *input* services associated with the service set *vrf\_svcs*.

```
[edit]
user@host> show firewall filter in_filter_postsvc-vrf_svcs counter svc_in_pkts_rtn
```

## Verifying That Outbound Traffic Is Filtered Before Output Service Processing

### Purpose

Verify that outbound packets sent to ICMP port 179 are sent for processing by the *output* services associated with the service set *vrf\_svcs*.

## Action

Display the count of packets sent for processing by the *output* services associated with the service set *vrf\_svcs*.

```
[edit]
user@host> show firewall filter out_filter_presvc-vrf_svcs counter svc_out_pkts
```

## Service Filter Match Conditions for IPv4 or IPv6 Traffic

Service filters support only a subset of the stateless firewall filter match conditions for IPv4 and IPv6 traffic. [Table 70 on page 1432](#) describes the service filter match conditions.

**Table 70: Service Filter Match Conditions for IPv4 or IPv6 Traffic**

| Match Condition                      | Description                                                                                                                  | Protocol Families                                                                   |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <code>address address</code>         | Match the IP source or destination address field.                                                                            | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <code>address address except</code>  | Do not match the IP source or destination address field.                                                                     | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <code>ah-spi spi-value</code>        | (M Series routers, except M120 and M320) Match on the IPsec authentication header (AH) security parameter index (SPI) value. | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <code>ah-spi-except spi-value</code> | (M Series routers, except M120 and M320) Do not match on the IPsec AH SPI value.                                             | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |

Table 70: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*Continued*)

| Match Condition                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Protocol Families                                                                   |

| destination-port<br><i>number</i>            | <p>Match the UDP or TCP destination port field.</p> <p>You cannot specify both the port and destination-port match conditions in the same term.</p> <p>If you configure this match condition for IPv4 traffic, we recommend that you also configure the <code>protocol udp</code> or <code>protocol tcp</code> match statement in the same term to specify which protocol is being used on the port.</p> <p>If you configure this match condition for IPv6 traffic, we recommend that you also configure the <code>next-header udp</code> or <code>next-header tcp</code> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <code>afs</code> (1483), <code>bgp</code> (179), <code>biff</code> (512), <code>bootpc</code> (68), <code>bootps</code> (67), <code>cmd</code> (514), <code>cvspserver</code> (2401), <code>dhcp</code> (67), <code>domain</code> (53), <code>eklogin</code> (2105), <code>ekshell</code> (2106), <code>exec</code> (512), <code>finger</code> (79), <code>ftp</code> (21), <code>ftp-data</code> (20), <code>http</code> (80), <code>https</code> (443), <code>ident</code> (113), <code>imap</code> (143), <code>kerberos-sec</code> (88), <code>klogin</code> (543), <code>kpasswd</code> (761), <code>krb-prop</code> (754), <code>krbupdate</code> (760), <code>kshell</code> (544), <code>ldap</code> (389), <code>ldp</code> (646), <code>login</code> (513), <code>mobileip-agent</code> (434), <code>mobileip-mn</code> (435), <code>msdp</code> (639), <code>netbios-dgm</code> (138), <code>netbios-ns</code> (137), <code>netbios-ssn</code> (139), <code>nfsd</code> (2049), <code>nntp</code> (119), <code>ntalk</code> (518), <code>ntp</code> (123), <code>pop3</code> (110), <code>pptp</code> (1723), <code>printer</code> (515), <code>radacct</code> (1813), <code>radius</code> (1812), <code>rip</code> (520), <code>rkinit</code> (2108), <code>smtp</code> (25), <code>snmp</code> (161), <code>snmptrap</code> (162), <code>snpp</code> (444), <code>socks</code> (1080), <code>ssh</code> (22), <code>sunrpc</code> (111), <code>syslog</code> (514), <code>tacacs</code> (49), <code>tacacs-ds</code> (65), <code>talk</code> (517), <code>telnet</code> (23), <code>tftp</code> (69), <code>timed</code> (525), <code>who</code> (513), or <code>xmcp</code> (177).</p> | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |

Table 70: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*Continued*)

| Match Condition                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Protocol Families                                                                   |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| destination-port-except <i>number</i> | Do not match the UDP or TCP destination port field. For details, see the destination-port match description.                                                                                                                                                                                                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| destination-prefix-list <i>name</i>   | Match the list of destination prefixes. The prefix list is defined at the [edit policy-options prefix-list <i>prefix-list-name</i> ] hierarchy level.                                                                                                                                                                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| esp-spi <i>value</i>                  | Match the IPsec encapsulating security payload (ESP) SPI value. Specify a single value or a range of values. You can specify a <i>value</i> in hexadecimal, binary, or decimal form. To specify the value in hexadecimal form, include 0x as a prefix. To specify the value in binary form, include b as a prefix.                                                                                                                                                                            | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| esp-spi-except <i>value</i>           | Do not match the IPsec ESP SPI value or range of values. For details, see the esp-spi match condition.                                                                                                                                                                                                                                                                                                                                                                                        | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| first-fragment                        | <p>Match if the packet is the first fragment of a fragmented packet. Do not match if the packet is a trailing fragment of a fragmented packet. The first fragment of a fragmented packet has a fragment offset value of 0.</p> <p>This match condition is an alias for the bit-field match condition fragment-offset 0 match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions: first-fragment and is-fragment.</p> | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |

Table 70: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*Continued*)

| Match Condition              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    | Protocol Families                                                                   |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| forwarding-class             | <p>Match one or more of the following specified packet forwarding classes:</p> <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> <li><i>user-defined-name</i></li> </ul> <p>For information about forwarding classes and router-internal output queues, see <a href="#">Understanding How Forwarding Classes Assign Classes to Output Queues</a>.</p> | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| forwarding-class-except      | <p>Do not match one or more of the following specified packet forwarding classes:</p> <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> <li><i>user-defined-name</i></li> </ul>                                                                                                                                                                       | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| fragment-flags <i>number</i> | <p>(Ingress only) Match the three-bit IP fragmentation flags field in the IP header.</p> <p>In place of the numeric field value, you can specify one of the following keywords (the field values are also listed): dont-fragment (0x4), more-fragments (0x2), or reserved (0x8).</p>                                                                                                                                                           | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |

Table 70: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*Continued*)

| Match Condition                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Protocol Families                                                                   |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| fragment-offset <i>number</i>              | <p>Match the 13-bit fragment offset field in the IP header. The value is the offset, in 8-byte units, in the overall datagram message to the data fragment. Specify a numeric value, a range of values, or a set of values. An offset value of 0 indicates the first fragment of a fragmented packet.</p> <p>The first-fragment match condition is an alias for the fragment-offset 0 match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions (first-fragment and is-fragment).</p> | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| fragment-offset-except <i>number</i>       | Do not match the 13-bit fragment offset field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| interface-group <i>group-number</i>        | <p>Match the interface group (set of one or more logical interfaces) on which the packet was received. For <i>group-number</i>, specify a value from 0 through 255.</p> <p>For information about configuring interface groups, see <a href="#">"Filtering Packets Received on a Set of Interface Groups Overview"</a> on page 1355.</p>                                                                                                                                                                                                                       | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| interface-group-except <i>group-number</i> | Do not match the interface group on which the packet was received. for details, see the interface-group match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |

| Match Condition          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Protocol Families |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| ip-options <i>values</i> | <p>Match the 8-bit IP option field, if present, to the specified value or list of values.</p> <p>In place of a numeric value, you can specify one of the following text synonyms (the option values are also listed): loose-source-route (131), record-route (7), router-alert (148), security (130), stream-id (136), strict-source-route (137), or timestamp (68).</p> <p>To match <i>any</i> value for the IP option, use the text synonym any. To match on <i>multiple</i> values, specify the list of values within square brackets '[' and ']'). To match a <i>range</i> of values, use the value specification [ <i>value1-value2</i> ].</p> <p>For example, the match condition ip-options [ 0-147 ] matches on an IP options field that contains the loose-source-route, record-route, or security values, or any other value from 0 through 147. However, this match condition does not match on an IP options field that contains only the router-alert value (148).</p> <p>For most interfaces, a filter term that specifies an ip-option match on one or more <i>specific</i> IP option values (a value other than any) causes packets to be sent to the Routing Engine so that the kernel can parse the IP option field in the packet header.</p> <ul style="list-style-type: none"> <li>For a firewall filter term that specifies an ip-option match on one or more specific IP option values, you cannot specify the count, log, or syslog nonterminating actions <i>unless</i> you also specify the discard terminating action in the same term. This behavior prevents double-counting of packets for a filter applied to a transit interface on the router (or switch).</li> <li>Packets processed on the kernel might be dropped in case of a system bottleneck. To ensure that matched packets are instead sent to the Packet Forwarding Engine (where packet processing is implemented in hardware), use the ip-options any match condition.</li> </ul> <p>The 10-Gigabit Ethernet Modular Port Concentrator (MPC), 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, 60-Gigabit Ethernet Enhanced Queuing MPC on MX Series routers and EX Series switches are capable of parsing the IP option field of the IPv4 packet header. This capability is supported on EX Series switches also. For interfaces</p> | family inet       |

## Service Filter Nonterminating Actions

Service filters support different sets of terminating actions for each protocol family.

**NOTE:** Service filters do not support the `next term` action.

Table 71 on page 1443 describes the nonterminating actions you can configure in a service filter term.

**Table 71: Nonterminating Actions for Service Filters**

| Nonterminating Action                  | Description                                                                                                                                                                                                   | Protocol Families                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>count</code> <i>counter-name</i> | Count the packet in the named counter.                                                                                                                                                                        | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>log</code>                       | Log the packet header information in a buffer within the Packet Forwarding Engine. You can access this information by issuing the <code>show firewall log</code> command at the command-line interface (CLI). | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>port-mirror</code>               | Port-mirror the packet based on the specified family. Supported on M120 routers, M320 routers configured with Enhanced III FPCs, MX Series routers, and EX Series switches only.                              | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>sample</code>                    | Sample the packet.                                                                                                                                                                                            | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |

## Service Filter Terminating Actions

Service filters support different sets of terminating actions than standard stateless firewall filters or simple filters.

**NOTE:** Service filters do not support the `next term` action.

Table 72 on page 1444 describes the terminating actions you can configure in a service filter term.

Table 72: Terminating Actions for Service Filters

| Terminating Action | Description                               | Protocol Families                                                  |
|--------------------|-------------------------------------------|--------------------------------------------------------------------|
| service            | Direct the packet to service processing.  | <ul style="list-style-type: none"><li>inet</li><li>inet6</li></ul> |
| skip               | Let the packet bypass service processing. | <ul style="list-style-type: none"><li>inet</li><li>inet6</li></ul> |

- [Guidelines for Applying Simple Filters | 1453](#)
- [Example: Configuring and Applying a Simple Filter | 1454](#)

## Simple Filter Overview

Simple filters are supported on Gigabit Ethernet intelligent queuing 2 (IQ2) and Enhanced Queuing Dense Port Concentrator (DPC) interfaces only.

Simple filters are recommended for metropolitan Ethernet applications.

## How Simple Filters Evaluate Packets

### IN THIS SECTION

- [Simple Filters That Contain a Single Term | 1447](#)
- [Simple Filters That Contain Multiple Terms | 1447](#)
- [Simple Filter Terms That Do Not Contain Any Match Conditions | 1447](#)
- [Simple Filter Terms That Do Not Contain Any Actions | 1448](#)
- [Simple Filter Default Action | 1448](#)

### Simple Filters That Contain a Single Term

For a simple filter that consists of a single term, the policy framework software evaluates a packet as follows:

- If the packet matches all the conditions, the actions are taken.
- If the packet matches all the conditions and no actions are specified, the packet is accepted.
- If the packet does not match all the conditions, it is discarded.

### Simple Filters That Contain Multiple Terms

For a simple filter that consists of multiple terms, the policy framework software evaluates a packet against the terms in the filter sequentially, beginning with the first term in the filter, until either the packet matches all the conditions in one of the terms or there are no more terms in the filter.

- If the packet matches all the conditions in a term, the actions in that term are performed and evaluation of the packet ends at that term. Any subsequent terms in the filter are not used.
- If the packet does not match all the conditions in the term, evaluation of the packet proceeds to the next term in the filter.

### Simple Filter Terms That Do Not Contain Any Match Conditions

For simple filters with a single term and for filters with multiple terms, if a term does not contain any match conditions, the actions are taken on any packet evaluated.

## Simple Filter Terms That Do Not Contain Any Actions

If a simple filter term does not contain any actions, and if the packet matches the conditions in the term, the packet is accepted.

## Simple Filter Default Action

Each simple filter has an *implicit* discard action at the end of the filter, which is equivalent to including the following example term `explicit_discard` as the final term in the simple filter:

```
term explicit_discard {
 then discard;
}
```

By default, if a packet matches none of the terms in a simple filter, the packet is discarded.

## Guidelines for Configuring Simple Filters

### IN THIS SECTION

- [Statement Hierarchy for Configuring Simple Filters | 1449](#)
- [Simple Filter Protocol Families | 1449](#)
- [Simple Filter Names | 1449](#)
- [Simple Filter Terms | 1449](#)
- [Simple Filter Match Conditions | 1450](#)
- [Simple Filter Terminating Actions | 1452](#)
- [Simple Filter Nonterminating Actions | 1452](#)

## Statement Hierarchy for Configuring Simple Filters

To configure a simple filter, include the `simple-filter simple-filter-name` statement at the `[edit firewall family inet]` hierarchy level.

```
[edit]
firewall {
 family inet {
 simple-filter simple-filter-name {
 term term-name {
 from {
 match-conditions;
 }
 then {
 actions;
 }
 }
 }
 }
}
```

Individual statements supported under the `simple-filter simple-filter-name` statement are described separately in this topic and are illustrated in the example of configuring and applying a simple filter.

## Simple Filter Protocol Families

You can configure simple filters to filter IPv4 traffic (`family inet`) only. No other protocol family is supported for simple filters.

## Simple Filter Names

Under the `family inet` statement, you can include `simple-filter simple-filter-name` statements to create and name simple filters. The filter name can contain letters, numbers, and hyphens (-) and be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

## Simple Filter Terms

Under the `simple-filter simple-filter-name` statement, you can include `term term-name` statements to create and name filter terms.

- You must configure at least one term in a *firewall filter*.

- You must specify a unique name for each term within a firewall filter. The term name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").
- The order in which you specify terms within a firewall filter configuration is important. Firewall filter terms are evaluated in the order in which they are configured. By default, new terms are always added to the end of the existing filter. You can use the `insert` configuration mode command to reorder the terms of a firewall filter.

Simple filters do *not* support the `next term` action.

### Simple Filter Match Conditions

Simple filter terms support only a subset of the IPv4 match conditions that are supported for standard stateless firewall filters.

Unlike standard stateless firewall filters, the following restrictions apply to simple filters:

- On MX Series routers with the Enhanced Queuing DPC and on EX Series switches, simple filters do *not* support the `forwarding-class` match condition.
- Simple filters support only one source-address and one destination-address prefix for each filter term. If you configure multiple prefixes, only the last one is used.
- Simple filters do *not* support multiple source addresses and destination addresses in a single term. If you configure multiple addresses, only the last one is used.
- Simple filters do *not* support negated match conditions, such as the `protocol-except` match condition or the `exception` keyword.
- Simple filters support a range of values for source-port and destination-port match conditions only. For example, you can configure source-port `400-500` or destination-port `600-700`.
- Simple filters do *not* support noncontiguous mask values.

[Table 73 on page 1450](#) lists the simple filter match conditions.

**Table 73: Simple Filter Match Conditions**

| Match Condition                                      | Description                   |
|------------------------------------------------------|-------------------------------|
| <code>destination-address destination-address</code> | Match IP destination address. |

Table 73: Simple Filter Match Conditions *(Continued)*

| Match Condition                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination-port <i>number</i>          | <p>TCP or UDP destination port field.</p> <p>If you configure this match condition, we recommend that you also configure the protocol match statement to determine which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the following text aliases (the port numbers are also listed): afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cmd (514), cvspserver (2401), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), tacacs-ds (65), talk (517), telnet (23), tftp (69), timed (525), who (513), or xdmcp (177).</p> |
| forwarding-class <i>class</i>           | <p>Match the forwarding class of the packet.</p> <p>Specify assured-forwarding, best-effort, expedited-forwarding, or network-control.</p> <p>For information about forwarding classes and router-internal output queues, see <a href="#">Understanding How Forwarding Classes Assign Classes to Output Queues</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| protocol <i>number</i>                  | <p>IP protocol field. In place of the numeric value, you can specify one of the following text aliases (the field values are also listed): ah (51), dstopts (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (58), icmpv6 (58), igmp (2), ipip (4), ipv6 (41), ospf (89), pim (103), rsvp (46), sctp (132), tcp (6), udp (17), or vrrp (112).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| source-address <i>ip-source-address</i> | <p>Match the IP source address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 73: Simple Filter Match Conditions (*Continued*)

| Match Condition           | Description                                                                                                                                                                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source-port <i>number</i> | <p>Match the UDP or TCP source port field.</p> <p>If you configure this match condition, we recommend that you also configure the protocol match statement to determine which protocol is being used on the port.</p> <p>In place of the numeric field, you can specify one of the text aliases listed for destination-port.</p> |

## Simple Filter Terminating Actions

Simple filters do *not* support explicitly configurable terminating actions, such as accept, reject, and discard. Terms configured in a simple filter always accept packets.

Simple filters do *not* support the next action.

## Simple Filter Nonterminating Actions

Simple filters support only the following nonterminating actions:

- forwarding-class (*forwarding-class* | assured-forwarding | best-effort | expedited-forwarding | network-control)

**NOTE:** On the MX Series routers and EX Series switches with the Enhanced Queuing DPC, the forwarding class is not supported as a from match condition.

- loss-priority (high | low | medium-high | medium-low)

Simple filters do not support actions that perform other functions on a packet (such as incrementing a counter, logging information about the packet header, sampling the packet data, or sending information to a remote host using the system log functionality).

## Guidelines for Applying Simple Filters

### IN THIS SECTION

- [Statement Hierarchy for Applying Simple Filters | 1453](#)
- [Restrictions for Applying Simple Filters | 1453](#)

### Statement Hierarchy for Applying Simple Filters

You can apply a simple filter to the IPv4 ingress traffic at a *logical interface* by including the `simple-filter` input *simple-filter-name* statement at the `[edit interfaces interface-name unit unit-number family inet]` hierarchy level.

```
[edit]
interfaces {
 interface-name {
 unit logical-unit-number {
 family inet {
 simple-filter {
 input filter-name;
 }
 }
 }
 }
}
```

### Restrictions for Applying Simple Filters

You can apply a simple filter to the ingress IPv4 traffic at a logical interface configured on the following hardware only:

- Gigabit Ethernet intelligent queuing (IQ2) PICs installed on M120, M320, or T Series routers.

- Enhanced Queuing Dense Port Concentrators (EQ DPCs) installed on MX Series routers and EX Series switches.

The following additional restrictions pertain to applying simple filters:

- Simple filters are not supported on Modular Port Concentrator (MPC) interfaces, including Enhanced Queuing MPC interfaces.
- Simple filters are not supported for interfaces in an aggregated-Ethernet bundle.
- You can apply simple filters to `family inet` traffic only. No other protocol family is supported.
- You can apply simple filters to ingress traffic only. Egress traffic is not supported.
- You can apply only a single simple filter to a supported logical interface. Input lists are not supported.

## Example: Configuring and Applying a Simple Filter

### IN THIS SECTION

- [Requirements | 1454](#)
- [Overview | 1455](#)
- [Configuration | 1455](#)
- [Verification | 1459](#)

This example shows how to configure a simple filter.

### Requirements

This example uses one of the following hardware components:

- One Gigabit Ethernet intelligent queuing (IQ2) PIC installed on an M120, M320, or T Series router
- One Enhanced Queuing Dense Port Concentrator (EQ DPC) installed on an MX Series router or an EX Series switch

Before you begin, make sure that you have:

- Installed your supported router (or switch) and PIC or DPC and performed the initial router (or switch) configuration.
- Configured basic Ethernet in the topology, and verified that traffic is flowing in the topology and that ingress IPv4 traffic is flowing into logical interface `ge-0/0/1.0`.

## Overview

### IN THIS SECTION

- [Topology | 1455](#)

This simple filter sets the loss priority to low for TCP traffic with source address 172.16.1.1, sets the loss priority to high for HTTP (Web) traffic with source addresses in the 172.16.4.0/8 range, and sets the loss priority to low for all traffic with destination address 172.16.6.6.

## Topology

The simple filter is applied as an input filter (arriving packets are checking for destination address 6.6.6.6, not queued output packets) on interface `ge-0/0/1.0`.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1456](#)
- [Configuring the Simple Firewall Filter | 1456](#)
- [Applying the Simple Filter to the Logical Interface Input | 1458](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set firewall family inet simple-filter sf_classify_1 term 1 from source-address 172.16.1.1/32
set firewall family inet simple-filter sf_classify_1 term 1 from protocol tcp
set firewall family inet simple-filter sf_classify_1 term 1 then loss-priority low
set firewall family inet simple-filter sf_classify_1 term 2 from source-address 172.16.4.0/8
set firewall family inet simple-filter sf_classify_1 term 2 from protocol tcp
set firewall family inet simple-filter sf_classify_1 term 2 from source-port http
set firewall family inet simple-filter sf_classify_1 term 2 then loss-priority high
set firewall family inet simple-filter sf_classify_1 term 3 from destination-address 6.6.6.6/32
set firewall family inet simple-filter sf_classify_1 term 3 then loss-priority low
set firewall family inet simple-filter sf_classify_1 term 3 then forwarding-class best-effort
set interfaces ge-0/0/1 unit 0 family inet simple-filter input sf_classify_1
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
```

### Configuring the Simple Firewall Filter

#### Step-by-Step Procedure

To configure the simple filter:

1. Create the simple filter sf\_classify\_1.

```
[edit]
user@host# edit firewall family inet simple-filter sf_classify_1
```

2. Configure classification of TCP traffic based on the source IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 1 from source-address 172.16.1.1/32
user@host# set term 1 from protocol tcp
user@host# set term 1 then loss-priority low
```

### 3. Configure classification of HTTP traffic based on the source IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 2 from source-address 172.16.4.0/8
user@host# set term 2 from protocol tcp
user@host# set term 2 from source-port http
user@host# set term 2 then loss-priority high
```

### 4. Configure classification of other traffic based on the destination IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 3 from destination-address 6.6.6.6/32
user@host# set term 3 then loss-priority low
user@host# set term 3 then forwarding-class best-effort
```

## Results

Confirm the configuration of the simple filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
 simple-filter sf_classify_1 {
 term 1 {
 from {
 source-address {
 172.16.1.1/32;
 }
 protocol {
 tcp;
 }
 }
 then loss-priority low;
 }
 term 2 {
 from {
 source-address {
 172.16.4.0/8;
 }
 }
 }
 }
}
```

```

 }
 source-port {
 http;
 }
 protocol {
 tcp;
 }
 }
 then loss-priority high;
}
term 3 {
 from {
 destination-address {
 6.6.6.6/32;
 }
 }
 then {
 loss-priority low;
 forwarding-class best-effort;
 }
}
}
}
}

```

## Applying the Simple Filter to the Logical Interface Input

### Step-by-Step Procedure

To apply the simple filter to the logical interface input:

1. Configure the logical interface to which you will apply the simple filter.

```

[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet

```

2. Configure the interface address for the logical interface.

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30

```

### 3. Apply the simple filter to the logical interface input.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set simple-filter input sf_classify_1
```

## Results

Confirm the configuration of the interface by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
 unit 0 {
 family inet {
 simple-filter {
 input sf_classify_1;
 }
 address 10.1.2.3/30;
 }
 }
}
```

When you are done configuring the device, commit your candidate configuration.

## Verification

### IN THIS SECTION

- [Displaying the Mapping of Forwarding Class Maps and Names to Queue Numbers | 1460](#)
- [Displaying CoS Queue Counters for the Interface | 1460](#)
- [Displaying CoS Queue Counter Details for the Physical Interface | 1461](#)

Confirm that the configuration is working properly.

## Displaying the Mapping of Forwarding Class Maps and Names to Queue Numbers

### Purpose

Display the mapping of forwarding class names to queue numbers.

### Action

Enter the `show class-of-service forwarding-class` operational mode command.

```
[edit]
user@host> show class-of-service forwarding-class
```

For information about the command output, see “[show class-of-service forwarding-class](#)” in the [CLI Explorer](#).

## Displaying CoS Queue Counters for the Interface

### Purpose

Verify that the class-of-service (CoS) queue counters for the interface reflect the simple filter applied to the logical interface.

### Action

Enter the `show interfaces` command for the physical interface on which the simple filter is applied, and specify `detail` or `extensive` output level.

```
[edit]
user@host> show interfaces ge-0/0/1 detail
```

In the `Physical interface` section, under `Ingress queues`, the `Queue counters` section displays ingress queue counters for each forwarding class.

For more detailed information about the command output, see “[show interfaces](#)” in the [CLI Explorer](#).

## Displaying CoS Queue Counter Details for the Physical Interface

### Purpose

Verify that the CoS queue counter details for the physical interface reflect the simple filter applied to the logical interface.

### Action

Enter the `show interfaces queue` command for the physical interface on which the simple filter is applied, and specify the `ingress` option.

```
[edit]
user@host> show interfaces queue ge-0/0/1 ingress
```

For information about the command output, see “[show interfaces queue](#)” in the [CLI Explorer](#).

## Understanding Firewall Filters Used to Control Traffic Within Bridge Domains and VPLS Instances

Juniper Networks MX Series 5G Universal Routing Platforms support firewall filters for the bridge and vpls protocol families. You configure these firewall filters to control traffic within bridge domains and VPLS instances. This topic explores some of the ways that filters can be used in a Layer 2 environment to control traffic.

MX Series router firewall filters can be applied to:

- Input interfaces
- Output interfaces
- Input to the Layer 2 forwarding table

You use a *firewall filter* after taking the following two steps:

1. You configure any policers and the firewall filter at the [edit firewall] hierarchy level.
2. You apply the properly configured firewall filter to an interface or bridge domain.

**NOTE:** If the chassis is running in Enhanced IP mode, a single shared filter instance is created for a filter applied across bridge domains. Otherwise, separate filter instances are created for each bridge domain that the filter is applied to.

## RELATED DOCUMENTATION

[Example: Configuring Policing and Marking of Traffic Entering a VPLS Core | 1468](#)

[Example: Configuring Filtering of Frames by MAC Address | 1463](#)

[Example: Configuring Filtering of Frames by IEEE 802.1p Bits | 1465](#)

[Example: Configuring Filtering of Frames by Packet Loss Priority | 1466](#)

## Example: Configuring Filtering of Frames by MAC Address

This example firewall filter finds frames with a certain source MAC address (**88:05:00:29:3c:de/48**), then counts and silently discards them. For more information about configuring firewall filter match conditions, see the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#). The filter is applied to the VLAN configured as **vlan100200** as an input filter on Router 1.

**NOTE:** This example does not present exhaustive configuration listings for all routers in the figures. However, you can use this example with a broader configuration strategy to complete the MX Series router network Ethernet Operations, Administration, and Maintenance (OAM) configurations.

To configure filtering of frames by MAC address:

1. Configure **evil-mac-address**, the firewall filter:

```
[edit firewall]
family bridge {
 filter evil-mac-address {
 term one {
 from {
 source-mac-address 88:05:00:29:3c:de/48;
 }
 }
 }
}
```

```

 then {
 count evil-mac-address; # Counts frame with the bad source MAC address
 discard;
 }
 term two {
 then accept; # Make sure to accept other traffic
 }
 }
}
}

```

2. Apply **evil-mac-address** as an input filter to **vlan100200** on Router 1:

```

[edit routing-instances]
virtual-switch-R1-1 {
 bridge-domains {
 vlan100200 {
 domain-type bridge;
 forwarding-options {
 filter {
 input evil-mac-address;
 }
 }
 }
 }
}
}

```

## RELATED DOCUMENTATION

[Understanding Firewall Filters Used to Control Traffic Within Bridge Domains and VPLS Instances](#) | **1462**

[Example: Configuring Policing and Marking of Traffic Entering a VPLS Core](#) | **1468**

[Example: Configuring Filtering of Frames by IEEE 802.1p Bits](#) | **1465**

[Example: Configuring Filtering of Frames by Packet Loss Priority](#) | **1466**

## Example: Configuring Filtering of Frames by IEEE 802.1p Bits

For the **bridge** and **vpls** protocol families only, MX Series router firewall filters can be configured to provide matching on IEEE 802.1p priority bits in packets with VLAN tagging:

- To configure a firewall filter term that includes matching on IEEE 802.1p learned VLAN priority (in the outer VLAN tag), use the **learn-vlan-1p-priority** or **learn-vlan-1p-priority-except** match condition.
- To configure a firewall filter term that includes matching on IEEE 802.1p user priority (in the inner VLAN tag), use the **user-vlan-1p-priority** or **user-vlan-1p-priority-except** match condition.

For more detailed information about configuring firewall filters and configuring filter match conditions for Layer 2 bridging traffic on the MX Series routers, see the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

**NOTE:** Layer 2 bridging is supported only on the MX Series routers. For more information about how to configure Layer 2 bridging, see the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

This example Layer 2 bridging firewall filter finds any incoming frames with an IEEE 802.1p learned VLAN priority level of either 1 or 2, and then classifies the packet in the **best-effort** default forwarding class.

**NOTE:** This example does not present exhaustive configuration listings for all routers in the figures. However, you can use this example with a broader configuration strategy to complete the MX Series router network Ethernet Operations, Administration, and Maintenance (OAM) configurations.

To configure filtering of frames by IEEE 802.1p bits:

1. Configure the firewall filter **filter-learn-vlan-configure-forwarding**:

```
[edit firewall]
family bridge {
 filter filter-learn-vlan-configure-forwarding {
 term 0 {
 from {
 learn-vlan-1p-priority [1 2];
 }
 then forwarding-class best-effort;
```

```
 }
 }
}
```

2. Apply the firewall filter **filter-learn-vlan-configure-forwarding** as an input filter to **ge-0/0/0**:

```
[edit interfaces]
ge-0/0/0 {
 unit 0 {
 family bridge {
 filter {
 input filter-learn-vlan-configure-forwarding;
 }
 }
 }
}
```

## RELATED DOCUMENTATION

[Understanding Firewall Filters Used to Control Traffic Within Bridge Domains and VPLS Instances](#) | **1462**

[Example: Configuring Policing and Marking of Traffic Entering a VPLS Core](#) | **1468**

[Example: Configuring Filtering of Frames by MAC Address](#) | **1463**

[Example: Configuring Filtering of Frames by Packet Loss Priority](#) | **1466**

## Example: Configuring Filtering of Frames by Packet Loss Priority

To configure an MX Series router firewall filter to provide matching on the packet loss priority (PLP) level carried in the frame, use the **loss-priority** or **loss-priority-except** match condition. Packet loss priority matching is available for all protocols. For more detailed information about configuring firewall filters and configuring filter match conditions for Layer 2 bridging traffic on the MX Series routers, see the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

**NOTE:** Layer 2 bridging is supported only on the MX Series routers. For more information about how to configure Layer 2 bridging, see the [Junos OS Routing Protocols Library for Routing Devices](#).

This example Layer 2 bridging firewall filter finds any incoming frames with a packet loss priority (PLP) level of **medium-high**, and then classifies the packet in the **expedited-forwarding** default forwarding class.

**NOTE:** This example does not present exhaustive configuration listings for all routers in the figures. However, you can use this example with a broader configuration strategy to complete the MX Series router network Ethernet Operations, Administration, and Maintenance (OAM) configurations.

To configure filtering of frames by packet loss priority:

1. Configure the firewall filter **filter-plp-configure-forwarding**:

```
[edit firewall]
family bridge {
 filter filter-plp-configure-forwarding {
 term 0 {
 from {
 loss-priority medium-high;
 }
 then forwarding-class expedited-forwarding;
 }
 }
}
```

2. Configure a Layer 2 bridging domain **bd** for the **ge-0/0/0** interface (that has already been configured at the [edit interfaces] hierarchy level):

```
[edit bridge-domains]
bd {
 domain-type bridge {
 interface ge-0/0/0;
```

```
 }
}
```

3. Apply the filter **filter-plp-configure-forwarding** as an input filter to the **ge-0/0/0** interface:

```
[edit interfaces]
ge-0/0/0 {
 unit 0 {
 family bridge {
 filter {
 input filter-plp-configure-forwarding;
 }
 }
 }
}
```

## Example: Configuring Policing and Marking of Traffic Entering a VPLS Core

This example firewall filter allows a service provider to limit the aggregate broadcast traffic entering the virtual private LAN service (VPLS) core. The broadcast, unknown unicast, and non-IP multicast traffic received from one of the service provider's customers on a logical interface has a policer applied. The service provider has also configured a two-rate, three-color policer to limit the customer's IP multicast traffic. For more information on the configuration of policers, see the [Junos OS Class of Service User Guide for Routing Devices](#).

The position of the router is shown in [Figure 64 on page 1469](#).

**Figure 64: Policing and Marking Traffic Entering a VPLS Core**

There are four major parts to the configuration:

- The policer for broadcast, unknown unicast, and non-IP multicast traffic. This example marks the loss priority as high if this type of traffic exceeds 50 Kbps.
- The two-rate, three-color policer for IP multicast traffic. This example configures a committed information rate (CIR) of 4 Mbps, a committed burst size of 256 Kbytes, a peak information rate of 4.1 Mbps, and a peak burst size of 256 Kbytes (the same as the CIR).
- The filter that applies the two policers to VPLS.
- The application of the filter to the customer interface configuration as an input filter.

**NOTE:** This example does not present exhaustive configuration listings for all routers in the figures. However, you can use this example with a broader configuration strategy to complete the MX Series router network Ethernet Operations, Administration, and Maintenance (OAM) configurations.

To configure policing and marking of traffic entering a VPLS core:

1. Configure **policer bcast-unknown-unicast-non-ip-mcast-policer**, a firewall policer to limit the aggregate broadcast, unknown unicast, and non-IP multicast to 50 kbps:

```
[edit firewall]
policer bcast-unknown-unicast-non-ip-mcast-policer {
 if-exceeding {
 bandwidth-limit 50k;
 burst-size-limit 150k;
 }
 then loss-priority high;
}
```

2. Configure **three-color-policer ip-multicast-traffic-policer**, a three-color policer to limit the IP multicast traffic:

```
[edit firewall]
three-color-policer ip-multicast-traffic-policer {
 two-rate {
 color-blind;
 committed-information-rate 4m;
 committed-burst-size 256k;
 peak-information-rate 4100000;
 peak-burst-size 256k;
 }
}
```

3. Configure **customer-1**, a firewall filter that uses the two policers to limit and mark customer traffic. The first term marks the IP multicast traffic based on the destination MAC address, and the second term polices the broadcast, unknown unicast, and non-IP multicast traffic:

```
[edit firewall]
family vpls {
 filter customer-1 {
 term t0 {
 from {
 destination-mac-address {
 01:00:5e:00:00:00/24;
 }
 }
 then {
 three-color-policer {
 two-rate ip-multicast-traffic-policer;
 }
 forwarding-class expedited-forwarding;
 }
 }
 term t1 {
 from {
 traffic-type [broadcast unknown-unicast multicast];
 }
 then policer bcast-unknown-unicast-non-ip-mcast-policer;
 }
 }
}
```

```
 }
}
```

4. Apply the firewall filter as an input filter to the customer interface at **ge-2/1/0**:

```
[edit interfaces]
ge-2/1/0 {
 vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit 5 {
 encapsulation vlan-vpls;
 vlan-id 9;
 family vpls {
 filter {
 input customer-1;
 }
 }
 }
}
```

## Understanding Firewall Filters on OVSDB-Managed Interfaces

When you use a Contrail controller to manage VXLANs on a QFX switch (through the Open vSwitch Database—OVSDB—management protocol), the VXLAN interfaces are automatically configured with the `flexible-vlan-tagging` and `encapsulation extended-vlan-bridge` statements. Starting with Junos OS Release 14.1X53-D30, you can create `family ethernet-switching` logical units (subinterfaces) on these interfaces. This enables you to apply Layer 2 (`family ethernet-switching`) firewall filters to these subinterfaces, which means that you apply firewall filters to OVSDB-managed interfaces. These filters support all the same match conditions and actions as any other Layer 2 filter.

**WARNING:** Firewall filters are the only supported configuration items on family ethernet-switching subinterfaces of OVSDB-managed interfaces. Layer 2 (port) filters are the only allowed filters.

Because a Contrail controller can create subinterfaces dynamically, you need to apply firewall filters in such a way that the filters will apply to subinterfaces whenever the controller creates them. You accomplish this by using configuration groups to configure and apply the firewall filters. See ["Example: Applying a Firewall Filter to OVSDB-Managed Interfaces" on page 1472](#) for more information.

## Example: Applying a Firewall Filter to OVSDB-Managed Interfaces

### IN THIS SECTION

- [Requirements | 1473](#)
- [Overview | 1473](#)
- [Configuration | 1473](#)

Starting with Junos OS Release 14.1X53-D30, you can create family ethernet-switching logical units (subinterfaces) on VXLAN interfaces managed by a Contrail controller. (The controller and switch communicate through the Open vSwitch Database—OVSDB—management protocol). This support enables you to apply Layer 2 (family ethernet-switching) firewall filters to these subinterfaces, which means that you apply firewall filters to OVSDB-managed interfaces. Because a Contrail controller can create subinterfaces dynamically, you need to apply firewall filters in such a way that the filters will apply to subinterfaces whenever the controller creates them. You accomplish this by using configuration groups

to configure and apply the firewall filters. (You must use configuration groups for this purpose—that is, you cannot apply a firewall filter directly to these subinterfaces.)

**NOTE:** Firewall filters are the only supported configuration items on family ethernet-switching subinterfaces of OVSDB-managed interfaces. Layer 2 (port) filters are the only allowed filters.

## Requirements

This example uses the following hardware and software components:

- A QFX5100 switch
- Junos OS Release 14.1X53-D30 or later

## Overview

This example assumes that interfaces xe-0/0/0 and xe-0/0/1 on the switch are VXLAN interfaces managed by a Contrail controller, which means that the controller has applied the `flexible-vlan-tagging` and `encapsulation extended-vlan-bridge` statements to these interfaces. You want to apply a firewall filter that accepts traffic from the Web to any subinterfaces that the controller creates dynamically. To apply a firewall filter Layer 2 (port) firewall filter to any dynamically created subinterfaces, you must create and apply the filter as shown in this example.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1473](#)
- [Procedure | 1474](#)

To configure a firewall filter to be automatically applied to subinterfaces created dynamically by a Contrail controller, perform these tasks:

### CLI Quick Configuration

```
[edit]
set groups vxlan-filter-group interfaces xe-0/0/0 unit <*> family ethernet-switching filter
input vxlan-filter
set groups vxlan-filter-group interfaces xe-0/0/1 unit <*> family ethernet-switching filter
```

```
input vxlan-filter
set groups vxlan-filter-group firewall family ethernet-switching filter vxlan-filter term t1
from destination-port 80
set groups vxlan-filter-group firewall family ethernet-switching filter vxlan-filter term t1
then accept
set apply-groups vxlan-filter-group
```

## Procedure

### Step-by-Step Procedure

1. Create configuration group vxlan-filter-group to apply firewall filter vxlan-filter to any subinterface of interface xe-0/0/0. The filter applies to any subinterface because you specify unit <\*>:

```
[edit]
user@switch# set groups vxlan-filter-group interfaces xe-0/0/0 unit <*> family ethernet-
switching filter input vxlan-filter
```

2. Create the same configuration for interface xe-0/0/1:

```
[edit]
user@switch# set groups vxlan-filter-group interfaces xe-0/0/1 unit <*> family ethernet-
switching filter input vxlan-filter
```

3. Configure the group to include a family ethernet-switching filter that matches on outgoing traffic to the web:

```
[edit]
user@switch# set groups vxlan-filter-group firewall family ethernet-switching filter vxlan-
filter term t1 from destination-port 80
```

4. Configure the group to accept the traffic that matches the filter:

```
[edit]
user@switch# set groups vxlan-filter-group firewall family ethernet-switching filter vxlan-
filter term t1 then accept
```

5. Apply the group to enable its configuration:

```
[edit]
user@switch# set apply-groups vxlan-filter-group
```

## Filter-Based Forwarding Overview

### IN THIS SECTION

- [Filters That Classify Packets or Direct Them to Routing Instances | 1477](#)
- [Input Filtering to Classify and Forward Packets Within the Router or Switch | 1478](#)
- [Output Filtering to Forward Packets to Another Routing Table | 1478](#)
- [Restrictions for Applying Filter-Based Forwarding | 1478](#)

Firewall filters can be used to block specific packets. They can also be used to affect how specific packets are forwarded.

## Filters That Classify Packets or Direct Them to Routing Instances

For IPv4 or IPv6 traffic only, you can use stateless firewall filters in conjunction with forwarding classes and routing instances to control how packets travel in a network. This is called *filter-based forwarding* (FBF).

You can define a filtering term that matches incoming packets based on source address and then classifies matching packets to a specified forwarding class. This type of filtering can be configured to grant certain types of traffic preferential treatment or to improve load balancing. To configure a stateless *firewall filter* to classify packets to a forwarding class, configure a term with the *nonterminating action* forwarding-class *class-name*.

You can also define a filtering term that directs matching packets to a specified routing instance. This type of filtering can be configured to route specific types of traffic through a firewall or other security device before the traffic continues on its path. To configure a stateless firewall filter to direct traffic to a routing instance, configure a term with the *terminating action* routing-instance *routing-instance-name* <topology *topology-name*> to specify the routing instance to which matching packets will be forwarded.

**NOTE:** Unicast Reverse Path Forwarding (uRPF) check is compatible with FBF actions. uRPF check is processed for source address checking before any FBF actions are enabled for static and dynamic interfaces. This applies to both IPv4 and IPv6 families.

**NOTE:** Services Offload (SOF) and Power Mode Ipsec (PMI) path will not be followed by the packets which are forwarded with FBF.

- SOF - Even if SOF is enabled , the packets will not go through SOF if they are forwarded with FBF.
- PMI - If PMI is configured, the direction to which the filter is configured, the packets in that direction will not go through the PMI. The returning packets will go through the PMI, provided the returning packets are not forwarded with FBF.

To forward traffic to the master routing instance, reference *routing-instance default* in the firewall configuration, as shown here:

```
[edit firewall]
family inet {
 filter test {
 term 1 {
 then {
```

```

 routing-instance default;
 }
}
}
}

```

**NOTE:** Do not reference routing-instance master. This does not work.

## Input Filtering to Classify and Forward Packets Within the Router or Switch

You can configure filters to classify packets based on source address and specify the forwarding path the packets take within the router or switch by configuring a filter on the ingress interface.

For example, you can use this filter for applications to differentiate traffic from two clients that have a common access layer (for example, a Layer 2 switch) but are connected to different Internet service providers (ISPs). When the filter is applied, the router or switch can differentiate the two traffic streams and direct each to the appropriate network. Depending on the media type the client is using, the filter can use the source IP address to forward the traffic to the corresponding network through a tunnel. You can also configure filters to classify packets based on IP protocol type or IP precedence bits.

## Output Filtering to Forward Packets to Another Routing Table

You can also forward packets based on output filters by configuring a filter on the egress interfaces. In the case of *port mirroring*, it is useful for port-mirrored packets to be distributed to multiple monitoring PICs and collection PICs based on patterns in packet headers. FBF on the port-mirroring egress interface must be configured.

Packets forwarded to the output filter have been through at least one route lookup when an FBF filter is configured on the egress interface. After the packet is classified at the egress interface by the FBF filter, it is redirected to another routing table for further route lookup.

## Restrictions for Applying Filter-Based Forwarding

An interface configured with filter-based forwarding does not support source-class usage (SCU) filter matching or source-class and destination-class usage (SCU/DCU) accounting.

## RELATED DOCUMENTATION

[Example: Configuring Filter-Based Forwarding on the Source Address | 1480](#)

## Firewall Filters That Handle Fragmented Packets Overview

You can create stateless firewall filters that handle fragmented packets destined for the Routing Engine. By applying these policies to the Routing Engine, you protect against the use of IP fragmentation as a means to disguise TCP packets from a *firewall filter*.

For example, consider an IP packet that is fragmented into the smallest allowable fragment size of 8 bytes (a 20-byte IP header plus an 8-byte payload). If this IP packet carries a TCP packet, the first fragment (fragment offset of 0) that arrives at the device contains only the TCP source and destination ports (first 4 bytes), and the sequence number (next 4 bytes). The TCP flags, which are contained in the next 8 bytes of the TCP header, arrive in the second fragment (fragment offset of 1).

See RFC 1858, *Security Considerations for IP Fragment Filtering*.

[Understanding How to Use Standard Firewall Filters | 779](#)

[Example: Configuring a Stateless Firewall Filter to Handle Fragments | 1178](#)

## Stateless Firewall Filters That Reference Policers Overview

Policing, or rate limiting, is an important component of firewall filters that lets you limit the amount of traffic that passes into or out of an interface.

A *firewall filter* that references a policer can provide protection from denial-of-service (DOS) attacks. Traffic that exceeds the rate limits configured for the policer is either discarded or marked as lower priority than traffic that conforms to the configured rate limits. Packets can be marked for a lower priority by being set to a specific output queue, set to a specific packet loss priority (PLP) level, or both. When necessary, low-priority traffic can be discarded to prevent congestion.

A policer specifies two types of rate limits on traffic:

- Bandwidth limit—The average traffic rate permitted, specified as a number of bits per second.
- Maximum burst size—The packet size permitted for bursts of data that exceed the bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can use policing to define specific classes of traffic on an interface and

apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then apply the policer in an interface configuration or, to rate-limit packet-filtered traffic only, in a firewall filter configuration.

For an IPv4 firewall filter term only, you can also specify a *prefix-specific action* as a nonterminating action that applies a policer to the matched packets. A prefix-specific action applies additional matching criteria on the filter-matched packets based on specified address prefix bits and then associates the matched packets with a counter and policer instance for that filter term or for all terms in the firewall filter.

To apply a policer or a prefix action to packet-filtered traffic, you can use the following firewall filter nonterminating actions:

- policer *policer-name*
- three-color-policer (single-rate | two-rate) *policer-name*
- prefix-action *action-name*

**NOTE:** The packet lengths that a policer considers depends on the address family of the firewall filter. See ["Understanding the Frame Length for Policing Packets" on page 1903](#).

## Example: Configuring Filter-Based Forwarding on the Source Address

### IN THIS SECTION

- [Requirements | 1481](#)
- [Overview | 1481](#)
- [Configuration | 1484](#)
- [Verification | 1492](#)

This example shows how to configure filter-based forwarding (FBF), which is sometimes also called Policy Based Routing (PBR). The filter classifies packets to determine their forwarding path within the ingress routing device.

Filter-based forwarding is supported for IP version 4 (IPv4) and IP version 6 (IPv6).

## Requirements

No special configuration beyond device initialization is required for this example.

## Overview

### IN THIS SECTION

- [Topology | 1483](#)

In this example, we use FBF for service provider selection when customers have Internet connectivity provided by different ISPs yet share a common access layer. When a shared media (such as a cable modem) is used, a mechanism on the common access layer looks at Layer 2 or Layer 3 addresses and distinguishes between customers. You can use filter-based forwarding when the common access layer is implemented using a combination of Layer 2 switches and a single router.

With FBF, all packets received on an interface are considered. Each packet passes through a filter that has match conditions. If the match conditions are met for a filter and you have created a routing instance, FBF is applied to the packet. The packet is forwarded based on the next hop specified in the routing instance. For static routes, the next hop can be a specific LSP.

**NOTE:** Source-class usage filter matching and unicast reverse-path forwarding checks are not supported on an interface configured for FBF.

To configure FBF, perform the following tasks:

- Create a match filter on the ingress device. To specify a match filter, include the filter *filter-name* statement at the [edit firewall] hierarchy level. A packet that passes through the filter is compared against a set of rules to classify it and to determine its membership in a set. Once classified, the packet is forwarded to a routing table specified in the accept action in the filter description language. The routing table then forwards the packet to the next hop that corresponds to the destination address entry in the table.

- Create routing instances that specify the routing table(s) to which a packet is forwarded, and the destination to which the packet is forwarded at the [edit routing-instances] hierarchy level. For example:

```
[edit]
routing-instances {
 routing-table-name1 {
 instance-type forwarding;
 routing-options {
 static {
 route 0.0.0.0/0 next-hop 172.16.0.14;
 }
 }
 }
 routing-table-name2 {
 instance-type forwarding;
 routing-options {
 static {
 route 0.0.0.0/0 next-hop 172.16.0.18;
 }
 }
 }
}
```

- Create a RIB group to share interface routes with the forwarding routing instances used in filter-based forwarding (FBF). This part of the configuration resolves the routes installed in the routing instances to directly connected next hops on that interface. Create the routing table group at the [edit routing-options] hierarchy level.

```
[edit]
routing-options {
 interface-routes {
 rib-group;
 inet {
 int-routes;
 }
 }
}
routing-options {
 rib-groups {
```

```
int-routes {
 import-rib {
 inet.0;
 webtraffic.inet.0;
 }
}
}
```

This example shows a packet filter that directs customer traffic to a next-hop router in the domains, SP1 or SP2, based on the packet's source address.

If the packet has a source address assigned to an SP1 customer, destination-based forwarding occurs using the `sp1-route-table.inet.0` routing table. If the packet has a source address assigned to an SP2 customer, destination-based forwarding occurs using the `sp2-route-table.inet.0` routing table. If a packet does not match either of these conditions, the filter accepts the packet, and destination-based forwarding occurs using the standard `inet.0` routing table.

### Topology

[Figure 65 on page 1484](#) shows the topology used in this example.

On Device P1, an input filter classifies packets received from Device PE3 and Device PE4. The packets are routed based on the source addresses. Packets with source addresses in the 10.1.1.0/24 and

10.1.2.0/24 networks are routed to Device PE1. Packets with source addresses in the 10.2.1.0/24 and 10.2.2.0/24 networks are routed to Device PE2.

**Figure 65: Filter-Based Forwarding**

To establish connectivity, OSPF is configured on all of the interfaces. For demonstration purposes, loopback interface addresses are configured on the routing devices to represent networks in the clouds.

The ["CLI Quick Configuration" on page 1485](#) section shows the entire configuration for all of the devices in the topology. The ["Configuring Filter-Based Forwarding on Device P1" on page 1488](#) section shows the step-by-step configuration of the ingress routing device, Device P1.

set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

## Configuring the Firewall Filter on P1

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [Using the CLI Editor in Configuration Mode](#) in the [Junos OS CLI User Guide](#).

To configure the firewall filter on the main router or switch:

1. Configure the source addresses for SP1 customers.

```
[edit firewall filter classify-customers term sp1-customers]
user@host# set from source-address 10.1.1.0/24
user@host# set from source-address 10.1.2.0/24
```

2. Configure the actions that are taken when packets are received with the specified source addresses; they are logged, and they are passed to the sp1-route-table routing instance for routing via the sp1-route-table.inet.0 routing table.

```
[edit firewall filter classify-customers term sp1-customers]
user@host# set then log
user@host# set then routing-instance sp1-route-table
```

3. Configure the source addresses for SP2 customers.

```
[edit firewall filter classify-customers term sp2-customers]
user@host# set from source-address 10.2.1.0/24
user@host# set from source-address 10.2.2.0/24
```

4. Configure the actions that are taken when packets are received with the specified source addresses; they are logged, and they are passed to the sp2-route-table routing instance for routing via the sp2-route-table.inet.0 routing table.

```
[edit firewall filter classify-customers term sp2-customers]
user@host# set then log
user@host# set then routing-instance sp2-route-table
```

5. Configure the action to take when packets are received from any other source address; they are accepted and routed using the default IPv4 unicast routing table, inet.0.

```
[edit firewall filter classify-customers term default]
user@host# set then accept
```

## Configuring Filter-Based Forwarding on Device P1

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [Using the CLI Editor in Configuration Mode](#) in the [Junos OS CLI User Guide](#).

To configure the routing instances:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0]
user@host# set unit 0 family inet address 172.16.0.10/30
[edit interfaces fe-1/2/1]
user@host# set unit 0 family inet address 172.16.0.13/30
[edit interfaces fe-1/2/2]
user@host# set unit 0 family inet address 172.16.0.17/30
```

2. Assign the `classify-customers` firewall filter to router interface `fe-1/2/0.0` as an input packet filter.

```
[edit interfaces fe-1/2/0]
user@host# set unit 0 family inet filter input classify-customers
```

3. Configure connectivity, using either a routing protocol or static routing.

As a best practice, disable routing on the management interface.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface all
user@host# set interface fxp0.0 disable
```

4. Create the routing instances that are referenced in the `classify-customers` firewall filter. The forwarding instance type provides support for filter-based forwarding, where interfaces are not associated with instances.

```
[edit routing-instances]
user@host# set sp1-route-table instance-type forwarding
user@host# set sp2-route-table instance-type forwarding
```

- For each routing instance, define a default route to forward traffic to the specified next hop (PE1 and PE2 in this example).

```
[edit routing-instances]
user@host# set sp1-route-table routing-options static route 0.0.0.0/0 next-hop 172.16.0.14
user@host# set sp2-route-table routing-options static route 0.0.0.0/0 next-hop 172.16.0.18
```

- Associate the routing tables to form a routing table group. The first routing table, inet.0, is the primary routing table, and the others are secondary routing tables. The primary routing table determines the address family of the routing table group, in this case IPv4.

```
[edit routing-options]
user@host# set rib-groups fbf-group import-rib inet.0
user@host# set rib-groups fbf-group import-rib sp1-route-table.inet.0
user@host# set rib-groups fbf-group import-rib sp2-route-table.inet.0
```

- Specify the fbf-group routing table group within the OSPF configuration to install OSPF routes into the three routing tables.

```
[edit protocols ospf]
user@host# set rib-group fbf-group
```

- Commit the configuration when you are done.

```
[edit]
user@host# commit
```

## Results

Confirm your configuration by issuing the `show interfaces`, `show firewall`, `show protocols`, `show routing-instances`, and `show routing-options` commands.

```
user@host# show interfaces
fe-1/2/0 {
 unit 0 {
 family inet {
 filter {
 input classify-customers;
```

```

 }
 address 172.16.0.10/30;
 }
}
fe-1/2/1 {
 unit 0 {
 family inet {
 address 172.16.0.13/30;
 }
 }
}
fe-1/2/2 {
 unit 0 {
 family inet {
 address 172.16.0.17/30;
 }
 }
}

```

```

user@host# show firewall

## Verification

### IN THIS SECTION

- [Pinging with Specified Source Addresses | 1492](#)
- [Verifying the Firewall Filter | 1493](#)

Confirm that the configuration is working properly.

### Pinging with Specified Source Addresses

#### Purpose

Send some ICMP packets across the network to test the firewall filter.

#### Action

1. Run the `ping` command, pinging the `lo0.0` interface on Device PE1.

The address configured on this interface is 172.16.1.1.

Specify the source address 10.1.2.1, which is the address configured on the `lo0.0` interface on Device PE3.

```
user@PE3> ping 172.16.1.1 source 10.1.2.1
PING 172.16.1.1 (172.16.1.1): 56 data bytes
64 bytes from 172.16.1.1: icmp_seq=0 ttl=62 time=1.444 ms
```

```

64 bytes from 172.16.1.1: icmp_seq=1 ttl=62 time=2.094 ms
^C
--- 172.16.1.1 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.444/1.769/2.094/0.325 ms

```

2. Run the ping command, pinging the lo0.0 interface on Device PE2.

The address configured on this interface is 172.16.2.2.

Specify the source address 10.2.1.1, which is the address configured on the lo0.0 interface on Device PE4.

```

user@PE4> ping 172.16.2.2 source 10.2.1.1
PING 172.16.2.2 (172.16.2.2): 56 data bytes
64 bytes from 172.16.2.2: icmp_seq=0 ttl=62 time=1.473 ms
64 bytes from 172.16.2.2: icmp_seq=1 ttl=62 time=1.407 ms
^C
--- 172.16.2.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.407/1.440/1.473/0.033 ms

```

## Meaning

Sending these pings activates the firewall filter actions.

## Verifying the Firewall Filter

### Purpose

Make sure the firewall filter actions take effect.

### Action

1. Run the show firewall log command on Device P1.

```

user@P1> show firewall log
Log :
Time Filter Action Interface Protocol Src Addr Dest Addr
13:52:20 pfe A fe-1/2/0.0 ICMP 10.2.1.1 172.16.2.2

```

|          |     |   |            |      |          |            |
|----------|-----|---|------------|------|----------|------------|
| 13:52:19 | pfe | A | fe-1/2/0.0 | ICMP | 10.2.1.1 | 172.16.2.2 |
| 13:51:53 | pfe | A | fe-1/2/0.0 | ICMP | 10.1.2.1 | 172.16.1.1 |
| 13:51:52 | pfe | A | fe-1/2/0.0 | ICMP | 10.1.2.1 | 172.16.1.1 |

## Understanding Filter-Based Forwarding to a Specific Outgoing Interface or Destination IP Address

Policy-based routing (also known as filter-based forwarding) refers to the use of firewall filters that are applied to an interface to match certain IP header characteristics and to route only those matching packets differently than the packets would normally be routed.

Starting in Junos OS Release 12.2, you can use `then next-interface`, `then next-ip`, or `then next-ip6` as an action in a *firewall filter*. From specific match conditions, IPv4 and IPv6 addresses or an interface name can be specified as the response action to a match.

The set of match conditions can be as follows:

- Layer-3 properties (for example, the source or destination IP address or the TOS byte)

- Layer-4 properties (for example, the source or destination port)

The route for the given IPv4 or IPv6 address has to be present in the routing table for policy-based routing to take effect. Similarly, the route through the given interface has to be present in the forwarding table for `next-interface` action to take effect. This can be achieved by configuring an interior gateway protocol (IGP), such as OSPF or IS-IS, to advertise Layer 3 routes.

The firewall filter matches the conditions and forwards the packet to one of the following:

- An IPv4 address (using the `next-ip` firewall filter action)
- An IPv6 address (using the `next-ip6` firewall filter action)
- An interface (using the `next-interface` firewall filter action)

Suppose, for example, that you want to offer services to your customers, and the services reside on different servers. An example of a service might be hosted DNS or hosted FTP. As customer traffic arrives at the Juniper Networks routing device, you can use filter-based forwarding to send traffic to the servers by applying a match condition on a MAC address or an IP address or simply an incoming interface and send the packets to a certain outgoing interface that is associated with the appropriate server. Some of your destinations might be IPv4 or IPv6 addresses, in which case the `next-ip` or `next-ip6` action is useful.

Optionally, you can associate the outgoing interfaces or IP addresses with routing instances.

For example:

```
firewall {
 filter filter1 {
 term t1 {
 from {
 source-address {
 10.1.1.3/32;
 }
 }
 then {

 next-interface {
 xe-0/1/0.1;
 routing-instance rins1;
 }
 }
 }
 term t2 {
 from {
```

This example shows how to use the `next-interface` as an action in a firewall filter.

## Requirements

This example has the following hardware and software requirements:

- MX Series 5G Universal Routing Platform as the routing device with the firewall filter configured.
- Junos OS Release 12.2 running on the routing device with the firewall filter configured.
- The filter with the `next-interface` (or `next-ip`) action can only be applied to an interface that is hosted on a Trio MPC. If you apply the filter to an I-chip based DPC, the commit operation fails.
- The outgoing interface referred to in the `next-interface interface-name` action can be hosted on a Trio MPC or an I-chip based DPC.

## Overview

### IN THIS SECTION

- [Topology | 1498](#)

In this example, Device R1 has two loopback interface addresses configured: 172.16.1.1 and 172.16.2.2.

On Device R2, a firewall filter has multiple terms configured. Each term matches one of the source addresses in incoming traffic, and routes the traffic to specified outgoing interfaces. The outgoing interfaces are configured as VLAN-tagged interfaces between Device R2 and Device R3.

IS-IS is used for connectivity among the devices.

[Figure 66 on page 1497](#) shows the topology used in this example.

**Figure 66: Filter-Based Forwarding to Specified Outgoing Interfaces**

This example shows the configuration on Device R2.

*Topology***Configuration****IN THIS SECTION**

- [Procedure | 1498](#)

*Procedure***CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

**Device R2**

```

set interfaces ge-2/1/0 unit 0 family inet filter input filter1
set interfaces ge-2/1/0 unit 0 family inet address 10.0.0.10/30
set interfaces ge-2/1/0 unit 0 description to-R1
set interfaces ge-2/1/0 unit 0 family iso
set interfaces ge-2/1/1 vlan-tagging
set interfaces ge-2/1/1 description to-R3
set interfaces ge-2/1/1 unit 0 vlan-id 1001
set interfaces ge-2/1/1 unit 0 family inet address 10.0.0.13/30
set interfaces ge-2/1/1 unit 0 family iso
set interfaces ge-2/1/1 unit 1 vlan-id 1002
set interfaces ge-2/1/1 unit 1 family inet address 10.0.0.25/30
set interfaces ge-2/1/1 unit 1 family iso
set interfaces lo0 unit 0 family inet address 10.255.4.4/32
set interfaces lo0 unit 0 family iso address 49.0001.0010.0000.0404.00
set firewall family inet filter filter1 term t1 from source-address 172.16.1.1/32
set firewall family inet filter filter1 term t1 then next-interface ge-2/1/1.0
set firewall family inet filter filter1 term t2 from source-address 172.16.2.2/32
set firewall family inet filter filter1 term t2 then next-interface ge-2/1/1.1
set protocols isis interface all level 1 disable

```

```
set protocols isis interface fxp0.0 disable
set protocols isis interface lo0.0
```

## Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#) in the [Junos OS CLI User Guide](#).

To configure Device R2:

### 1. Configure the interfaces.

```
[edit interfaces]
user@R2# set ge-2/1/0 unit 0 family inet filter input filter1
user@R2# set ge-2/1/0 unit 0 family inet address 10.0.0.10/30
user@R2# set ge-2/1/0 unit 0 description to-R1
user@R2# set ge-2/1/0 unit 0 family iso
user@R2# set ge-2/1/1 vlan-tagging
user@R2# set ge-2/1/1 description to-R3
user@R2# set ge-2/1/1 unit 0 vlan-id 1001
user@R2# set ge-2/1/1 unit 0 family inet address 10.0.0.13/30
user@R2# set ge-2/1/1 unit 0 family iso
user@R2# set ge-2/1/1 unit 1 vlan-id 1002
user@R2# set ge-2/1/1 unit 1 family inet address 10.0.0.25/30
user@R2# set ge-2/1/1 unit 1 family iso
user@R2# set lo0 unit 0 family inet address 10.255.4.4/32
user@R2# set lo0 unit 0 family iso address 49.0001.0010.0000.0404.00
```

### 2. Configure the firewall filter.

```
[edit firewall family inet filter filter1]
user@R2# set term t1 from source-address 172.16.1.1/32
user@R2# set term t1 then next-interface ge-2/1/1.0
user@R2# set term t2 from source-address 172.16.2.2/32
user@R2# set term t2 then next-interface ge-2/1/1.1
```

### 3. Enable IS-IS on the interfaces.

```
[edit protocols is-is]
user@R2# set interface all level 1 disable
user@R2# set interface fxp0.0 disable
user@R2# set interface lo0.0
```

## Results

From configuration mode, confirm your configuration by entering the `show interfaces`, `show firewall`, and `show protocols` commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
ge-2/1/0 {
 unit 0 {
 description to-R1;
 family inet {
 filter {
 input filter1;
 }
 address 10.0.0.10/30;
 }
 family iso;
 }
}
ge-2/1/1 {
 description to-R3;
 vlan-tagging;
 unit 0 {
 vlan-id 1001;
 family inet {
 address 10.0.0.13/30;
 }
 family iso;
 }
 unit 1 {
 vlan-id 1002;
 family inet {
 address 10.0.0.25/30;
 }
 }
}
```

```

 }
 family iso;
 }
}
lo0 {
 unit 0 {
 family inet {
 address 10.255.4.4/32;
 }
 family iso {
 address 49.0001.0010.0000.0404.00;
 }
 }
}
}

```

```

user@R2# show firewall
family inet {
 filter filter1 {
 term t1 {
 from {
 source-address {
 172.16.1.1/32;
 }
 }
 then {
 next-interface {
 ge-2/1/1.0;
 }
 }
 }
 term t2 {
 from {
 source-address {
 172.16.2.2/32;
 }
 }
 then {
 next-interface {
 ge-2/1/1.1;
 }
 }
 }
 }
}

```

```
}
}
```

```
user@R2# show protocols
isis {
 interface all {
 level 1 disable;
 }
 interface fxp0.0 {
 disable;
 }
 interface lo0.0;
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Checking the Paths Used | 1502](#)

Confirm that the configuration is working properly.

### *Checking the Paths Used*

## Purpose

Make sure that the expected paths are used when sending traffic from Device R1 to Device R4.

## Action

On Device R1, enter the `traceroute` command.

```
user@R1> traceroute 10.255.6.6 source 172.16.1.1
traceroute to 10.255.6.6 (10.255.6.6) from 172.16.1.1, 30 hops max, 40 byte packets
 1 10.0.0.10 (10.0.0.10) 0.976 ms 0.895 ms 0.815 ms
```

```

2 10.0.0.14 (10.0.0.14) 0.868 ms 0.888 ms 0.813 ms
3 10.255.6.6 (10.255.6.6) 1.715 ms 1.442 ms 1.382 ms

```

```

user@R1> traceroute 10.255.6.6 source 172.16.2.2
traceroute to 10.255.6.6 (10.255.6.6) from 172.16.2.2, 30 hops max, 40 byte packets
1 10.0.0.10 (10.0.0.10) 0.973 ms 0.907 ms 0.782 ms
2 10.0.0.26 (10.0.0.26) 0.844 ms 0.890 ms 0.852 ms
3 10.255.6.6 (10.255.6.6) 1.384 ms 1.516 ms 1.462 ms

```

## Meaning

The output shows that the second hop changes, depending on the source address used in the traceroute command.

To verify this feature, a traceroute operation is performed on Device R1 to Device R4. When the source IP address is 172.16.1.1, packets are forwarded out the ge-2/1/1.0 interface on Device R2. When the source IP address is 172.16.2.2, packets are forwarded out the ge-2/1/1.1 interface on Device R2.

## Example: Configuring Filter-Based Forwarding to a Specific Destination IP Address

### IN THIS SECTION

- [Requirements | 1504](#)
- [Overview | 1504](#)
- [Configuration | 1505](#)
- [Verification | 1514](#)

This example shows how to use the `next-ip` as an action in a firewall filter.

## Requirements

This example has the following hardware and software requirements:

- MX Series 5G Universal Routing Platform as the routing device with the firewall filter configured.
- Junos OS Release 12.2 running on the routing device with the firewall filter configured.
- The filter with the `next-interface` (or `next-ip`) action can only be applied to an interface that is hosted on a Trio MPC. If you apply the filter to an I-chip based DPC, the commit operation fails.
- The outgoing interface referred to in the `next-interface` interface-name action can be hosted on a Trio MPC or an I-chip based DPC.

## Overview

### IN THIS SECTION

- [Topology | 1505](#)

In this example, Device R2 has two routing instances that are interconnected with physical links. Traffic from certain sources is required to be directed across the upper link for inspection by a traffic optimizer, which acts transparently on the IP layer. When the traffic optimizer fails, the traffic moves to the lower link. Flows in direction R1>R3 and R3>R1 follow identical paths.

[Figure 67 on page 1504](#) shows the topology used in this example.

**Figure 67: Filter-Based Forwarding to Specified Outgoing Interfaces**

On Device R2, a firewall filter is applied to interface `ge-1/0/8` in the input direction. The second term matches the specific source addresses `10.0.0.0/24`, and routes the traffic to address `192.168.0.3`. This

address resolves to next-hop 192.168.20.2. If the link connected to interface ge-1/1/0 goes down, the address 192.168.0.3 will resolve to next-hop 192.168.30.2.

On Device R2, a firewall filter is applied to interface ge-1/0/0 in the input direction. The second term matches the specific destination addresses 10.0.0.0/24, and routes the traffic to address 192.168.0.2. This address resolves to next-hop 192.168.20.1. If the link connected to interface ge-1/3/8 goes down, the address 192.168.0.2 will resolve to next-hop 192.168.30.1.

**NOTE:** The address configured using the `next-ip` action is not automatically resolved. On Ethernet interfaces, it is assumed that the configured address is resolved using a routing protocol or static routes.

Internal BGP (IBGP) is used between Device R2-VR1 and Device R2-VR2. External BGP (EBGP) is used between Device R1 and Device R2-VR1, as well as between Device R2-VR2 and Device R3.

BGP operations proceed as follows:

- R2-VR1 learns 10/8 from R1, and 0/0 from R2-VR2.
- R2-VR2 learns 0/0 from R3, and 10/8 from R2-VR1.
- R1 advertises 10/8, and receives 0/0 from R2-VR1.
- R3 advertises 0/0, and receives 10/8 from R2-VR2.

The firewall filter applied to Device R2 needs to allow control-plane traffic for the directly connected interfaces, in this case the EBGP sessions.

This example shows the configuration on Device R2.

set routing-instances VR2 interface ge-1/3/9.0
set routing-instances VR2 routing-options static route 192.168.0.2/32 next-hop 192.168.20.1
set routing-instances VR2 routing-options static route 192.168.0.2/32 qualified-next-hop
192.168.30.1 metric 100
set routing-instances VR2 routing-options autonomous-system 64502
set routing-instances VR2 protocols bgp group eBGP neighbor 192.168.40.2 peer-as 64503
set routing-instances VR2 protocols bgp group iBGP neighbor 192.168.30.1 peer-as 64502
set routing-instances VR2 protocols bgp group iBGP neighbor 192.168.30.1 export AcceptExternal
set firewall family inet filter SteerDstTrafficOptimizer term 0 from source-address
192.168.40.0/24
set firewall family inet filter SteerDstTrafficOptimizer term 0 then accept
set firewall family inet filter SteerDstTrafficOptimizer term 1 from destination-address
10.0.0.0/24
set firewall family inet filter SteerDstTrafficOptimizer term 1 then next-ip 192.168.0.2 routing-
instance VR2
set firewall family inet filter SteerDstTrafficOptimizer term 2 from destination-address
10.0.0.0/8
set firewall family inet filter SteerDstTrafficOptimizer term 2 then accept
set policy-options policy-statement AcceptExternal term 1 from route-type external
set policy-options policy-statement AcceptExternal term 1 then accept

```

### Device R3

```

set interfaces lo0 unit 0 family inet address 10.11.0.1/32
set interfaces ge-1/0/0 unit 0 family inet address 192.168.40.2/24
set routing-options autonomous-system 64503
set protocols bgp group eBGP neighbor 192.168.40.1 peer-as 64502
set protocols bgp group eBGP export Announce0
set policy-options policy-statement Announce0 term 1 from route-filter 0.0.0.0/0 exact
set policy-options policy-statement Announce0 term 1 then accept
set policy-options policy-statement Announce0 term 2 then reject

```

## Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#) in the [Junos OS CLI User Guide](#).

To configure Device R2:

### 1. Configure the interfaces.

```
[edit interfaces]
user@R2# set ge-1/0/8 unit 0 family inet address 192.168.10.2/24
user@R2# set ge-1/0/8 unit 0 family inet filter input SteerSrcTrafficOptimizer
user@R2# set ge-1/1/0 unit 0 family inet address 192.168.20.1/24
user@R2# set ge-1/1/1 unit 0 family inet address 192.168.30.1/24
user@R2# set ge-1/0/0 unit 0 family inet address 192.168.40.1/24
user@R2# set ge-1/0/0 unit 0 family inet filter input SteerDstTrafficOptimizer
user@R2# set ge-1/3/8 unit 0 family inet address 192.168.20.2/24
user@R2# set ge-1/3/9 unit 0 family inet address 192.168.30.2/24
```

### 2. Configure the routing instance.

```
[edit routing-instances]
user@R2# set VR1 instance-type virtual-router
user@R2# set VR1 interface ge-1/0/8.0
user@R2# set VR1 interface ge-1/1/0.0
user@R2# set VR1 interface ge-1/1/1.0
user@R2# set VR2 instance-type virtual-router
user@R2# set VR2 interface ge-1/0/0.0
user@R2# set VR2 interface ge-1/3/8.0
user@R2# set VR2 interface ge-1/3/9.0
```

### 3. Configure the static and BGP routing.

```
[edit routing-instances]
user@R2# set VR1 routing-options static route 192.168.0.3 next-hop 192.168.20.2
user@R2# set VR1 routing-options static route 192.168.0.3 qualified-next-hop 192.168.30.2
metric 100
user@R2# set VR1 routing-options autonomous-system 64502
user@R2# set VR1 protocols bgp group eBGP neighbor 192.168.10.1 peer-as 64501
user@R2# set VR1 protocols bgp group iBGP neighbor 192.168.30.2 peer-as 64502
```

```

user@R2# set VR1 protocols bgp group iBGP neighbor 192.168.30.2 export AcceptExternal
user@R2# set VR2 routing-options static route 192.168.0.2/32 next-hop 192.168.20.1
user@R2# set VR2 routing-options static route 192.168.0.2/32 qualified-next-hop 192.168.30.1
metric 100
user@R2# set VR2 routing-options autonomous-system 64502
user@R2# set VR2 protocols bgp group eBGP neighbor 192.168.40.2 peer-as 64503
user@R2# set VR2 protocols bgp group iBGP neighbor 192.168.30.1 peer-as 64502
user@R2# set VR2 protocols bgp group iBGP neighbor 192.168.30.1 export AcceptExternal

```

#### 4. Configure the firewall filters.

```

[edit firewall family inet]
user@R2# set filter SteerSrcTrafficOptimizer term 0 from source-address 192.168.10.0/24
user@R2# set filter SteerSrcTrafficOptimizer term 0 then accept
user@R2# set filter SteerSrcTrafficOptimizer term 1 from source-address 10.0.0.0/24
user@R2# set filter SteerSrcTrafficOptimizer term 1 then next-ip 192.168.0.3 routing-instance
VR1
user@R2# set filter SteerSrcTrafficOptimizer term 2 from source-address 10.0.0.0/8
user@R2# set filter SteerSrcTrafficOptimizer term 2 then accept
user@R2# set filter SteerDstTrafficOptimizer term 0 from source-address 192.168.40.0/24
user@R2# set filter SteerDstTrafficOptimizer term 0 then accept
user@R2# set filter SteerDstTrafficOptimizer term 1 from destination-address 10.0.0.0/24
user@R2# set filter SteerDstTrafficOptimizer term 1 then next-ip 192.168.0.2 routing-instance
VR2
user@R2# set filter SteerDstTrafficOptimizer term 2 from destination-address 10.0.0.0/8
user@R2# set filter SteerDstTrafficOptimizer term 2 then accept

```

#### 5. Configure the routing policy.

```

[edit policy-options policy-statement AcceptExternal term 1]
user@R2# set from route-type external
user@R2# set term 1 then accept

```

## Results

From configuration mode, confirm your configuration by entering the `show interfaces`, `show firewall`, and `show protocols` commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
ge-1/0/0 {
 unit 0 {
 family inet {
 filter {
 input SteerDstTrafficOptimizer;
 }
 address 192.168.40.1/24;
 }
 }
}
ge-1/0/8 {
 unit 0 {
 family inet {
 filter {
 input SteerSrcTrafficOptimizer;
 }
 address 192.168.10.2/24;
 }
 }
}
ge-1/1/0 {
 unit 0 {
 family inet {
 address 192.168.20.1/24;
 }
 }
}
ge-1/1/1 {
 unit 0 {
 family inet {
 address 192.168.30.1/24;
 }
 }
}
ge-1/3/8 {
```

```

 unit 0 {
 family inet {
 address 192.168.20.2/24;
 }
 }
}
ge-1/3/9 {
 unit 0 {
 family inet {
 address 192.168.30.2/24;
 }
 }
}
}

```

```

user@R2# show firewall
family inet {
 filter SteerSrcTrafficOptimizer {
 term 0 {
 from {
 source-address {
 192.168.10.0/24;
 }
 }
 then accept;
 }
 term 1 {
 from {
 source-address {
 10.0.0.0/24;
 }
 }
 then {
 next-ip 192.168.0.3/32 routing-instance VR1;
 }
 }
 term 2 {
 from {
 source-address {
 10.0.0.0/8;
 }
 }
 }
 }
}

```

```

 then accept;
 }
}
filter SteerDstTrafficOptimizer {
 term 0 {
 from {
 source-address {
 192.168.40.0/24;
 }
 }
 then accept;
 }

 export NextHopSelf;
 peer-as 64502;
 }
 }
 }
}
}

```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Checking the Paths Used | 1515](#)

Confirm that the configuration is working properly.

## Checking the Paths Used

### Purpose

Make sure that the expected paths are used when sending traffic from Device R1 to Device R3.

### Action

On Device R1, enter the traceroute command before and after the link failure

#### Before Failure of the Traffic Optimizer

```
user@R1> traceroute 10.11.0.1 source 10.0.0.1
traceroute to 10.11.0.1 (10.11.0.1) from 10.0.0.1, 30 hops max, 40 byte packets
 1 192.168.10.2 (192.168.10.2) 0.519 ms 0.403 ms 0.380 ms
 2 192.168.20.2 (192.168.20.2) 0.404 ms 0.933 ms 0.402 ms
 3 10.11.0.1 (10.11.0.1) 0.709 ms 0.656 ms 0.644 ms
```

```
user@R1> traceroute 10.11.0.1 source 10.1.0.1
traceroute to 10.11.0.1 (10.11.0.1) from 10.1.0.1, 30 hops max, 40 byte packets
 1 192.168.10.2 (192.168.10.2) 0.524 ms 0.396 ms 0.380 ms
 2 192.168.30.2 (192.168.30.2) 0.412 ms 0.410 ms 0.911 ms
 3 10.11.0.1 (10.11.0.1) 0.721 ms 0.639 ms 0.659 ms
```

#### After Failure of the Traffic Optimizer

```
user@R1> traceroute 10.11.0.1 source 10.0.0.1
traceroute to 10.11.0.1 (10.11.0.1) from 10.0.0.1, 30 hops max, 40 byte packets
 1 192.168.10.2 (192.168.10.2) 0.506 ms 0.400 ms 0.378 ms
 2 192.168.30.2 (192.168.30.2) 0.433 ms 0.550 ms 0.415 ms
 3 10.11.0.1 (10.11.0.1) 0.723 ms 0.638 ms 0.638 ms
```

```
user@R1> traceroute 10.11.0.1 source 10.1.0.1
traceroute to 10.11.0.1 (10.11.0.1) from 10.1.0.1, 30 hops max, 40 byte packets
 1 192.168.10.2 (192.168.10.2) 0.539 ms 0.411 ms 0.769 ms
 2 192.168.30.2 (192.168.30.2) 0.426 ms 0.413 ms 2.429 ms
```

```
3 10.11.0.1 (10.11.0.1) 10.868 ms 0.662 ms 0.647 ms
```

## Meaning

The output shows that the second hop changes, depending on the source address used in the traceroute command.

To verify this feature, a traceroute operation is performed on Device R1 to Device R3. When the source IP address is 10.0.0.1, packets are forwarded out the ge-1/1/0.0 interface on Device R2. When the source IP address is 10.1.0.1, packets are forwarded out the ge-1/1/1.0 interface on Device R2.

When the link between ge-1/1/0 and ge-1/3/8 fails, packets with source IP address 10.0.0.1 are forwarded out the ge-1/1/1.0 interface on Device R2.

## Firewall Filters for EX Series Switches Overview

### IN THIS SECTION

- [Firewall Filter Types | 1518](#)
- [Firewall Filter Components | 1519](#)
- [Firewall Filter Processing | 1521](#)

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a Juniper Networks EX Series Ethernet Switch from a source address to a destination address. You configure firewall filters to determine whether to permit, deny, or forward traffic before it enters or exits a port, VLAN, or Layer 3 (routed) interface to which the *firewall filter* is applied. To apply a firewall filter, you must first configure the filter and then apply it to an port, VLAN, or Layer 3 interface.

You can apply firewall filters to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), loopback interfaces, management interfaces, virtual management Ethernet interfaces (VMEs), and routed VLAN interfaces (RVIs). For information on EX Series switches that support a firewall filter on these interfaces, see [EX Series Switch Software Features Overview](#).

An *ingress* firewall filter is a filter that is applied to packets that are entering a network. An *egress* firewall filter is a filter that is applied to packets that are exiting a network. You can configure firewall filters to subject packets to filtering, class-of-service (CoS) marking (grouping similar types of traffic together, and treating each type of traffic as a class with its own level of service priority), and traffic policing (controlling the maximum rate of traffic sent or received on an interface).

**NOTE:** Policers on network port, layer 2 and layer 3, or IRB interfaces do not police host-bound traffic. But if you want to prevent DDoS attacks, then you can create a firewall filter on the lo0 that protects the routing engine.

### Firewall Filter Types

The following firewall filter types are supported for EX Series switches:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 switch ports. You can apply port firewall filters in both ingress and egress directions on a physical port.

- **VLAN firewall filter**—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN. You can apply VLAN firewall filters in both ingress and egress directions on a VLAN. VLAN firewall filters are applied to all packets that are forwarded to or forwarded from the VLAN.
- **Router (Layer 3) firewall filter**—You can apply a router firewall filter in both ingress and egress directions on Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs). You can apply a router firewall filter in the ingress direction on the loopback interface (**lo0**) also. Firewall filters configured on loopback interfaces are applied only to packets that are sent to the Routing Engine CPU for further processing.

You can apply port, VLAN, or router firewall filters to *both* IPv4 and IPv6 traffic on these switches:

- EX2200 switch
- EX3300 switch
- EX3200 switch
- EX4200 switch
- EX4300 switch
- EX4500 switch
- EX4550 switch
- EX6200 switch
- EX8200 switch

For information on firewall filters supported on different switches, see ["Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches"](#) on page 1554.

## Firewall Filter Components

In a firewall filter, you first define the family address type (**ethernet-switching**, **inet**, or **inet6**), and then you define one or more terms that specify the filtering criteria (specified as terms with match conditions) and the action (specified as actions or action modifiers) to take if a match occurs.

The maximum number of terms allowed per firewall filter for EX Series switches is:

- 512 for EX2200 switches
- 1436 for EX3300 switches

**NOTE:** On EX3300 switches, if you add and delete filters with a large number of terms (on the order of 1000 or more) in the same commit operation, not all the filters are installed. You must add filters in one commit operation, and delete filters in a separate commit operation.

- 7,042 for EX3200 and EX4200 switches—as allocated by the dynamic allocation of ternary content addressable memory (TCAM) for firewall filters.
- On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3500 terms for firewall filters configured on a port
    - 3500 terms for firewall filters configured on a VLAN
    - 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For EX4300-MP devices, ingress support is the same as the above with the following exception:
    - 3072 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

- 1200 for EX4500 and EX4550 switches
- 1400 for EX6200 switches
- 32,768 for EX8200 switches

**NOTE:** The on-demand dynamic allocation of the shared space TCAM in EX8200 switches is achieved by assigning free space blocks to firewall filters. Firewall filters are categorized into two different pools. Port and VLAN filters are pooled together (the memory threshold for this pool is 22K) while router firewall filters are pooled separately (the threshold for this pool is 32K). The assignment happens based on the filter pool type. Free space blocks can be shared only among the firewall filters belonging to the same filter pool type. An error message is generated when you try to configure a firewall filter beyond the TCAM threshold.

Each term consists of the following components:

- **Match conditions**—Specify the values or fields that the packet must contain. You can define various match conditions, including the IP source address field, IP destination address field, Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) source port field, IP protocol field, Internet Control Message Protocol (ICMP) packet type, TCP flags, and interfaces.
- **Action**—Specifies what to do if a packet matches the match conditions. Possible actions are to accept or discard the packet or to send the packet to a specific virtual routing interface. In addition, packets can be counted to collect statistical information. If no action is specified for a term, the default action is to accept the packet.
- **Action modifier**—Specifies one or more actions for the switch if a packet matches the match conditions. You can specify action modifiers such as count, mirror, rate limit, and classify packets.

## Firewall Filter Processing

The order of the terms within a firewall filter configuration is important. Packets are tested against each term in the order in which the terms are listed in the firewall filter configuration. For information on how firewall filters process packets, see ["Understanding How Firewall Filters Are Evaluated" on page 1533](#).

## Understanding Planning of Firewall Filters

Before you create a *firewall filter* and apply it to an interface, determine what you want the firewall filter to accomplish and how to use its match conditions and actions to achieve your goals. You must understand how packets are matched to match conditions, the default and configured actions of the firewall filter, and proper placement of the firewall filter.

You can configure and apply no more than one firewall filter per port, VLAN, or router interface, per direction. The following limits apply for the number of firewall filter terms allowed per filter on various switch models:

- On EX3300 switches, the number of terms per filter cannot exceed 1436.
- On EX3200 and EX4200 switches, the number of terms per filter cannot exceed 7042.
- On EX2300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 256 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN
    - 256 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 256 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 128 terms for firewall filters configured on a VLAN
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

On EX3400 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:

- For ingress traffic:

- 512 terms for firewall filters configured on a port
- 512 terms for firewall filters configured on a VLAN
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
- For egress traffic:
  - 512 terms for firewall filters configured on a port
  - 256 terms for firewall filters configured on a VLAN
  - 1024 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
  - 1024 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:

- For ingress traffic:
  - 3500 terms for firewall filters configured on a port
  - 3500 terms for firewall filters configured on a VLAN
  - 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
  - 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** The ternary content addressable memory (TCAM) limit for ingress traffic on the EX4300 switch is 256 entries.

- For egress traffic:
  - 512 terms for firewall filters configured on a port
  - 256 terms for firewall filters configured on a VLAN
  - 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
  - 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

- On EX4500 and EX4550 switches, the number of terms per filter cannot exceed 1200.
- On EX6200 switches, the number of terms per filter cannot exceed 1400.
- On EX8200 switches, the number of terms per filter cannot exceed 32,768.

In addition, try to be conservative in the number of terms (rules) that you include in each firewall filter because a large number of terms requires longer processing time during a commit and also can make firewall filter testing and troubleshooting more difficult. Similarly, applying firewall filters across many switch and router interfaces can make testing and troubleshooting the rules of those filters difficult.

Before you configure and apply firewall filters, answer the following questions for each of those firewall filters:

**1. What is the purpose of the firewall filter?**

For example, you can use a firewall filter to limit traffic to source and destination MAC addresses, specific protocols, or certain data rates or to prevent denial of service (DoS) attacks.

**2. What are the appropriate match conditions?**

**a.** Determine the packet header fields that the packet must contain for a match. Possible fields include:

- Layer 2 header fields—Source and destination MAC addresses, dot1q tag, Ethernet type, and VLAN
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, TTL type)
- TCP header fields—Source and destination ports and flags
- ICMP header fields—Packet type and code

**b.** Determine the port, VLAN, or router interface on which the packet was received.

**3. What are the appropriate actions to take if a match occurs?**

Possible actions to take if a match occurs are accept, discard, and forward to a routing instance.

**4. What additional action modifiers might be required?**

Determine whether additional actions are required if a packet matches a match condition; for example, you can specify an action modifier to count, analyze, or police packets.

#### 5. On what interface should the firewall filter be applied?

Start with the following basic guidelines:

- If all the packets entering a port need to be exposed to filtering, then use port firewall filters.
- If all the packets that are bridged need filtering, then use VLAN firewall filters.
- If all the packets that are routed need filtering, then use router firewall filters.

Before you choose the interface on which to apply a firewall filter, understand how that placement can impact traffic flow to other interfaces. In general, apply a firewall filter that filters on source and destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP and UDP port numbers—nearest to the source devices. However, typically apply a firewall filter that filters only on a source IP address nearest to the destination devices. When applied too close to the source device, a firewall filter that filters only on a source IP address could potentially prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

#### 6. In which direction should the firewall filter be applied?

You can apply firewall filters to ports on the switch to filter packets that are entering a port. You can apply firewall filters to VLANs, and Layer 3 (routed) interfaces to filter packets that are entering or exiting a VLAN or routed interface. Typically, you configure different sets of actions for traffic entering an interface than you configure for traffic exiting an interface.

## Understanding Firewall Filter Match Conditions

### IN THIS SECTION

- [Filter Match Conditions | 1526](#)
- [Numeric Filter Match Conditions | 1526](#)
- [Interface Filter Match Conditions | 1527](#)
- [IP Address Filter Match Conditions | 1528](#)
- [MAC Address Filter Match Conditions | 1529](#)
- [Bit-Field Filter Match Conditions | 1530](#)

Before you define terms for firewall filters, you must understand how the match conditions that you specify in a term are handled and how to specify various types of match conditions to achieve the desired filtering results. A match condition consists of a string (called a match statement) that defines the match condition. Match conditions are the values or fields that a packet must contain.

### Filter Match Conditions

In the `from` statement of a *firewall filter* term, you specify the packet conditions that trigger the action in one of the `then` statements: **then** with various options, **then interface** or **then vlan**. All conditions in the `from` statement must match for the action to be taken. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify no match conditions in a term, that term matches all packets.

An individual condition in a `from` statement cannot contain a list of values. For example, you cannot specify numeric ranges or multiple source or destination addresses.

Individual conditions in a `from` statement cannot be negated. A negated condition is an explicit mismatch.

### Numeric Filter Match Conditions

Numeric filter conditions match packet fields that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify a keyword that identifies the condition and a single value that a field in a packet must match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example:

```
source-port 25;
```

- Text synonym for a single number— A match occurs if the value of the field matches the number that corresponds to the synonym. For example:

```
source-port http;
```

To specify more than one value in a filter term, you enter each value in its own match statement, which is a string that defines a match condition. For example, a match occurs in the following term if the value of **vlan** is 10 or 30.

```
[edit firewall family family-name filter filter-name term term-name from]
vlan 10;
vlan 30;
```

The following restrictions apply to numeric filter match conditions:

- You cannot specify a range of values.
- You cannot specify a list of comma-separated values.
- You cannot exclude a specific value in a numeric filter match condition. For example, you cannot specify a condition that would match only if the match condition was not equal to a given value.

## Interface Filter Match Conditions

Interface filter match conditions can match interface name values in a packet. For interface filter match conditions, you specify the name of the interface, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/1
```

Port and VLAN interfaces do not use logical unit numbers. However, a firewall filter that is applied to a router interface can specify the logical unit number in the interface filter match condition, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/1/0.0
```

You can include the `*` wildcard as part of the interface name, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/1
user@switch# set interface ge-0/1/*
user@switch# set interface ge-*
```

## IP Address Filter Match Conditions

Address filter match conditions can match prefix values in a packet, such as IP source and destination prefixes. For address filter match conditions, you specify a keyword that identifies the field and one prefix of that type that a packet must match.

You specify the address as a single prefix. A match occurs if the value of the field matches the prefix. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/28;
```

Each prefix contains an implicit `0/0` except statement, which means that any prefix that does not match the prefix that is specified is explicitly considered not to match.

To specify the address prefix, use the notation `prefix/prefix-length`. If you omit `prefix-length`, it defaults to `/32`. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
[edit firewall family family-name filter filter-name term term-name from]
user@switch# show destination-address
10.0.0.0/32;
```

To specify more than one IP address in a filter term, you enter each address in its own match statement. For example, a match occurs in the following term if the value of the **source-address** field matches either of the following source-address prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.0.0.0/8
user@switch# set source-address 10.1.0.0/16
```

## MAC Address Filter Match Conditions

MAC address filter match conditions can match source and destination MAC address values in a packet. For MAC address filter match conditions, you specify a keyword that identifies the field and one value of that type that a packet must match.

You can specify the MAC address as six hexadecimal bytes in the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 001122334455
```

To specify more than one MAC address in a filter term, you enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the **source-mac-address** field matches either of the following addresses.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
user@switch# set source-mac-address 00:11:22:33:20:15
```

## Bit-Field Filter Match Conditions

Bit-field filter conditions match packet fields if particular bits in those fields are or are not set. You can match the IP options, TCP flags, and IP fragmentation fields. For bit-field filter match conditions, you specify a keyword that identifies the field and tests to determine that the option is present in the field.

To specify the bit-field value to match, enclose the value in double quotation marks. For example, a match occurs if the **RST** bit in the TCP flags field is set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "rst"
```

Typically, you specify the bits to be tested by using keywords. Bit-field match keywords always map to a single bit value. You also can specify bit fields as hexadecimal or decimal numbers.

To match multiple bit-field values, use the logical operators, which are described in [Table 74 on page 1530](#). The operators are listed in order from highest precedence to lowest precedence. Operations are left-associative.

**Table 74: Logical Operators for Matching Multiple Bit-Field Operators**

| Logical Operators | Description  |
|-------------------|--------------|
| !                 | Negation.    |
| &                 | Logical AND. |
|                   | Logical OR.  |

To negate a match, precede the value with an exclamation point. For example, a match occurs only if the RST bit in the TCP flags field is not set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "!rst"
```

In the following example of a logical AND operation, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&!ack"
```

In the following example of a logical OR operation, a match occurs if the packet is part of TCP session establishment or tear down:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn|fin"
```

For a logical OR operation, you can specify a maximum of two match conditions in a single term. If you need to match more than two bit-field values in a logical OR operation, configure the same match condition in consecutive terms with additional bit-field values. In the following example, the two terms configured match the SYN, ACK, FIN, or RST bit in the TCP flags field:

```
[edit firewall family family-name filter filter-name term term-name1 from]
user@switch# set tcp-flags "syn|ack"
[edit firewall family family-name filter filter-name term term-name2 from]
user@switch# set tcp-flags "fin|rst"
```

You can use text synonyms to specify some common bit-field matches. You specify these matches as a single keyword. In the following example of a text synonym, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags tcp-initial
```

## Understanding How Firewall Filters Control Packet Flows

Juniper Networks EX Series Ethernet Switches support firewall filters that allow you to control flows of data packets and local packets. *Data packets* are chunks of data that transit the switch as they are forwarded from a source to a destination. *Local packets* are chunks of data that are destined for or sent by the switch. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP).

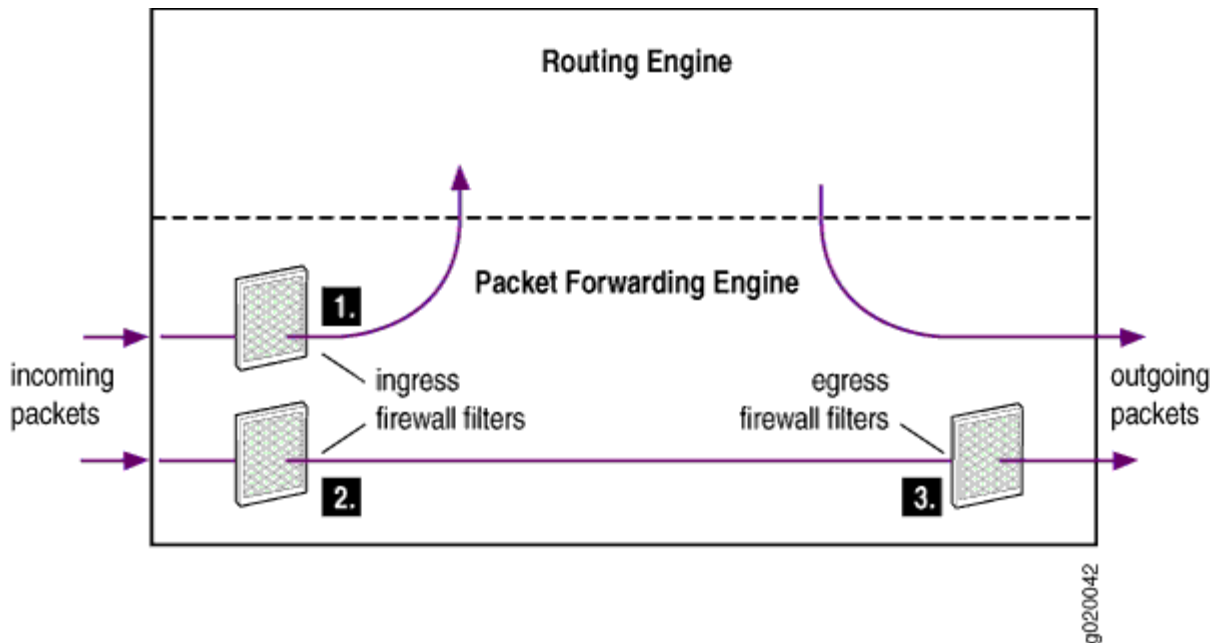

You create firewall filters to protect your switch from excessive traffic transiting the switch to a network destination or destined for the Routing Engine on the switch. Firewall filters that control local packets can also protect your switch from external incidents such as denial-of-service (DoS) attacks.

Firewall filters affect packet flows entering in to or exiting from the switch's interfaces:

- Ingress firewall filters affect the flow of data packets that are received by the switch's interfaces. The Packet Forwarding Engine handles this flow. When a switch receives a data packet on an interface, the switch determines where to forward the packet by looking in the forwarding table for the best route (Layer 2 switching, Layer 3 routing) to a destination. Data packets are forwarded to their destination through an outgoing interface. Locally destined packets are forwarded to the Routing Engine.
- Egress firewall filters affect the flow of data packets that are transmitted from the switch's interfaces but do not affect the flow of locally generated control packets from the Routing Engine. The Packet Forwarding Engine handles the flow of data packets that are transmitted from the switch, and egress firewall filters are applied here. The Packet Forwarding Engine also handles the flow of control packets from the Routing Engine.

Figure 68 on page 1533 illustrates the application of ingress and egress firewall filters to control the flow of packets through the switch.

Figure 68: Application of Firewall Filters to Control Packet Flow

1. Ingress *firewall filter* applied to control locally destined packets that are received on the switch's interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to control incoming packets on the switch's interfaces.
3. Egress firewall filter applied to control packets that are transiting the switch's interfaces.

[Understanding How Firewall Filters Are Evaluated | 1533](#)

## Understanding How Firewall Filters Are Evaluated

A *firewall filter* consists of one or more terms, and the order of the terms within a firewall filter is important. Before you configure firewall filters, you should understand how Juniper Networks EX Series

Ethernet Switches evaluate the terms within a firewall filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the `then` statement is taken.
- If the packet matches all the conditions, and no action is specified in the `then` statement, the default action **accept** is taken.

When a firewall filter consists of more than one term, the firewall filter is evaluated sequentially:

1. The packet is evaluated against the conditions in the `from` statement in the first term.
2. If the packet matches all the conditions in the term, the action in the `then` statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the `from` statement in the second term.

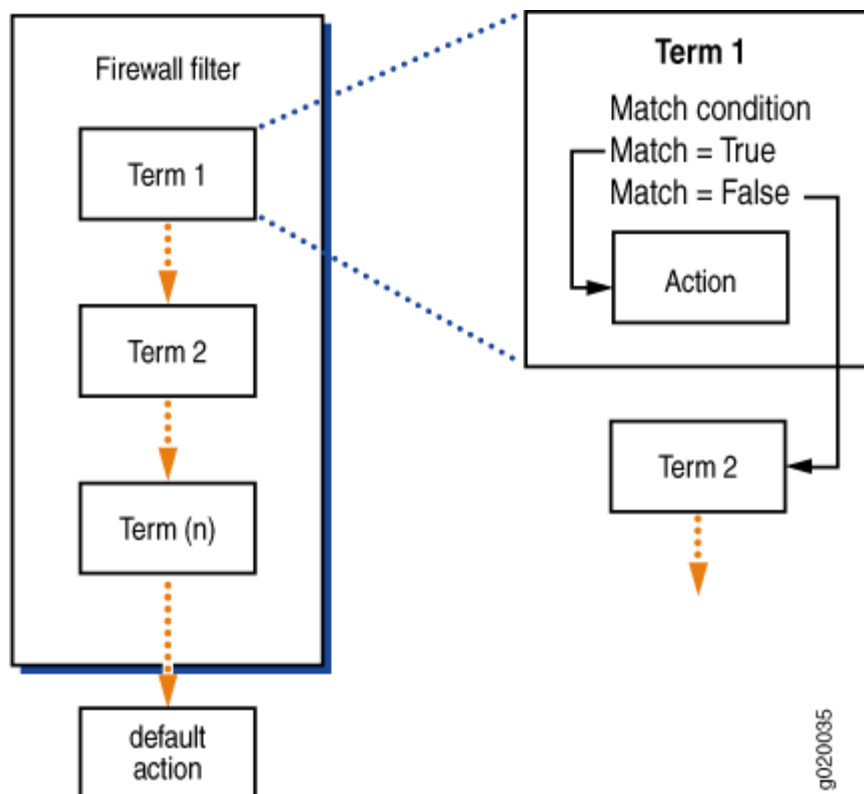

This process continues until either the packet matches the conditions in the `from` statement in one of the subsequent terms or there are no more terms in the filter.

4. If a packet passes through all the terms in the filter without a match, the packet is discarded.

Figure 69 on page 1535 shows how an EX Series switch evaluates the terms within a firewall filter.

Figure 69: Evaluation of Terms Within a Firewall Filter

If a term does not contain a `from` statement, the packet is considered to match and the action in the `then` statement of the term is taken.

If a term does not contain a `then` statement, or if an action has not been configured in the `then` statement, and the packet matches the conditions in the `from` statement of the term, the packet is accepted.

Every firewall filter contains an implicit `deny` statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
 then discard;
}
```

Consequently, if a packet passes through all the terms in a filter without matching any conditions, the packet is discarded. If you configure a firewall filter that has no terms, all packets that pass through the filter are discarded.

## Understanding Firewall Filter Processing Points for Bridged and Routed Packets on EX Series Switches

Juniper Networks EX Series Ethernet Switches are multilayered switches that provide Layer 2 switching and Layer 3 routing. You apply firewall filters at multiple processing points in the packet forwarding path on EX Series switches. At each processing point, the action to be taken on a packet is determined based on the results of the lookup in the switch's forwarding table. A table lookup determines which exit port on the switch to use to forward the packet.

For both bridged unicast packets and routed unicast packets, firewall filters are evaluated and applied hierarchically. First, a packet is checked against the port *firewall filter*, if present. If the packet is permitted, it is then checked against the VLAN firewall filter, if present. If the packet is permitted, it is then checked against the router firewall filter, if present. The packet must be permitted by the router firewall filter before it is processed.

Figure 70 on page 1537 shows the various firewall filter processing points in the packet forwarding path in a multilayered switching platform.

Figure 70: Firewall Filter Processing Points in the Packet Forwarding Path

For a multicast packet that results in replications, an egress firewall filter is applied to each copy of the packet based on its corresponding egress VLAN.

For Layer 2 (bridged) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter
- Egress port firewall filter
- Egress VLAN firewall filter

For Layer 3 (routed and multilayer-switched) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter (Layer 2 CoS)
- Ingress router firewall filter (Layer 3 CoS)
- Egress router firewall filter
- Egress VLAN firewall filter

## Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches

### IN THIS SECTION

- [Firewall Filter Elements | 1539](#)
- [Match Conditions Supported on Switches | 1539](#)
- [Actions for Firewall Filters | 1550](#)
- [Action Modifiers for Firewall Filters | 1551](#)

When you define a firewall filter for an EX Series switch, you define filtering criteria (*terms*, with *match conditions*) for the packets and an *action* (and, optionally, an *action modifier*) for the switch to take if the packets match the filtering criteria. You can define a firewall filter to monitor IPv4, IPv6, or non-IP traffic.

This topic describes in detail the various match conditions, actions, and action modifiers that you can define in a firewall filter. For information about support for match conditions on various EX Series

switches, see ["Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches" on page 1554.](#)

## Firewall Filter Elements

A firewall filter configuration contains a term, a match condition, an action, and, optionally, an action modifier. [Table 75 on page 1539](#) describes each element in a firewall filter configuration.

**Table 75: Elements of a Firewall Filter Configuration**

| Element Name    | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Term            | Defines the filtering criteria for the packets. Each term in the firewall filter consists of match conditions and an action. You can define a single term or multiple terms in the firewall filter. If you define multiple terms, each term must have a unique name.                                                                                                                    |
| Match condition | Consists of a string (called a <i>match statement</i> ) that defines the match condition. Match conditions are the values or fields that a packet must contain. You can define a single match condition or multiple match conditions for a term. You can also opt not to define a match condition. If no match conditions are specified for a term, all packets are matched by default. |
| Action          | Specifies the action that the switch takes if a packet matches all the criteria specified in the match conditions.                                                                                                                                                                                                                                                                      |
| Action modifier | Specifies one or more actions that the switch takes if a packet matches the match conditions for the specific term.                                                                                                                                                                                                                                                                     |

## Match Conditions Supported on Switches

Based on the type of traffic that you want to monitor, you can configure a firewall filter to monitor IPv4, IPv6, or non-IP traffic. When you configure a firewall filter to monitor a particular type of traffic, ensure that you specify match conditions that are supported for that type of traffic. For information about match conditions supported for a specific type of traffic and switches on which they are supported, see ["Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches" on page 1554.](#)

[Table 76 on page 1540](#) describes all the match conditions that are supported for firewall filters on EX Series Switches.

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches

| Match Condition                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>destination-address <i>ip-address</i></code>      | IP destination address field, which is the address of the final destination node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>ip-destination-address <i>ip-address</i></code>   | IP destination address field, which is the address of the final destination node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>ip6-destination-address <i>ip-address</i></code>  | IP destination address field, which is the address of the final destination node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>destination-mac-address <i>mac-address</i></code> | <p>Destination media access control (MAC) address of the packet.</p> <p>You can define a destination MAC address with a prefix, such as <b>destination-mac-address 00:01:02:03:04:05/24</b>. If no prefix is specified, the default value 48 is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>destination-port <i>number</i></code>             | <p>TCP or UDP destination port field. Typically, you specify this match condition in conjunction with the protocol or <b>ip-protocol</b> match condition to determine which protocol is used on the port. For <i>number</i>, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p><b>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cmd (514), cvspserver (2401), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), tacacs-ds (65), talk (517), telnet (23), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)</b></p> |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-prefix-list</b> <i>prefix-list</i> | <p>IP destination prefix list field.</p> <p>You can define a list of IP address prefixes under a prefix-list alias for frequent use. You define this match condition at the [edit policy-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| dot1q-tag <i>number</i>                           | The tag field in the Ethernet header. The tag values range from 1 through 4095. The dot1q-tag match condition and the <b>vlan</b> match condition are mutually exclusive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| user-vlan-id <i>number</i>                        | The tag field in the Ethernet header. The tag values range from 1 through 4095. The user-vlan-id match condition and the learn-vlan-id match condition are mutually exclusive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>dot1q-user-priority</b> <i>number</i>          | <p>User-priority field of the tagged Ethernet packet. User-priority values can range from 0 through 7.</p> <p>For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>background (1)</b>—Background</li> <li>• <b>best-effort (0)</b>—Best effort</li> <li>• <b>controlled-load (4)</b>—Controlled load</li> <li>• <b>excellent-load (3)</b>—Excellent load</li> <li>• <b>network-control (7)</b>—Network control reserved traffic</li> <li>• <b>standard (2)</b>—Standard or spare</li> <li>• <b>video (5)</b>—Video</li> <li>• <b>voice (6)</b>—Voice</li> </ul> |

| <b>fragment-flags</b> <i>fragment-flags</i> | <p>IP fragmentation flags, specified in symbolic or hexadecimal formats. You can specify one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>dont-fragment</b> (0x4000)</li> <li>• <b>more-fragments</b> (0x2000)</li> <li>• <b>reserved</b> (0x8000)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| gbp-dst-tag                                 | Match the destination tag, for use with micro-segmentation on a VXLAN, as described here: <a href="#">Example: Micro and Macro Segmentation using Group Based Policy in a VXLAN</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| gbp-src-tag                                 | Match the source tag, for use with micro-segmentation on a VXLAN, as described here: <a href="#">Example: Micro and Macro Segmentation using Group Based Policy in a VXLAN</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>icmp-code</b> <i>number</i>              | <p>ICMP code field. This value or option provides more specific information than <b>icmp-type</b>. Because the value's meaning depends upon the associated <b>icmp-type</b>, you must specify <b>icmp-type</b> along with <b>icmp-code</b>. For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed). The options are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <b>parameter-problem—ip-header-bad</b> (0), <b>required-option-missing</b> (1)</li> <li>• <b>redirect—redirect-for-host</b> (1), <b>redirect-for-network</b> (0), <b>redirect-for-tos-and-host</b> (3), <b>redirect-for-tos-and-net</b> (2)</li> <li>• <b>time-exceeded—ttl-eq-zero- during-reassembly</b> (1), <b>ttl-eq-zero- during-transit</b> (0)</li> <li>• <b>unreachable—communication-prohibited-by-filtering</b> (13), <b>destination-host-prohibited</b> (10), <b>destination-host-unknown</b> (7), <b>destination-network-prohibited</b> (9), <b>destination-network-unknown</b> (6), <b>fragmentation-needed</b> (4), <b>host-precedence-violation</b> (14), <b>host-unreachable</b> (1), <b>host-unreachable-for-TOS</b> (12), <b>network-unreachable</b> (0), <b>network-unreachable-for-TOS</b> (11), <b>port-unreachable</b> (3), <b>precedence-cutoff-in-effect</b> (15), <b>protocol-unreachable</b> (2), <b>source-host-isolated</b> (8), <b>source-route-failed</b> (5)</li> </ul> |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type</b> <i>number</i>         | <p>ICMP packet type field. Typically, you specify this match condition in conjunction with the <code>protocol</code> or <code>ip-protocol</code> match condition to determine which protocol is being used on the port. For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>echo-reply</b> (0), <b>echo-request</b> (8), <b>info-reply</b> (16), <b>info-request</b> (15), <b>mask-request</b> (17), <b>mask-reply</b> (18), <b>parameter-problem</b> (12), <b>redirect</b> (5), <b>router-advertisement</b> (9), <b>router-solicit</b> (10), <b>source-quench</b> (4), <b>time-exceeded</b> (11), <b>timestamp</b> (13), <b>timestamp-reply</b> (14), <b>unreachable</b> (3)</p> |
| <b>interface</b> <i>interface-name</i> | <p>Interface on which the packet is received. You can specify the wildcard character (*) as part of an interface name.</p> <p><b>NOTE:</b> The <b>interface</b> match condition is not supported for egress traffic on an EX8200 Virtual Chassis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ip-options</b>                      | Presence of the options field in the IP header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>ip-version</b> <i>version match_condition(s)</i> | <p>Version of the IP protocol for port and VLAN firewall filters. The value for <i>version</i> can be <b>ipv4</b> or <b>ipv6</b>.</p> <p>For <i>match_condition(s)</i>, you can specify one or more of the following match conditions:</p> <ul style="list-style-type: none"> <li>• destination-address, ip-destination-address, or ip6-destination-address</li> <li>• <b>destination-port</b></li> <li>• <b>destination-prefix-list</b></li> <li>• <b>dscp</b></li> <li>• <b>fragment-flags</b></li> <li>• <b>icmp-code</b></li> <li>• <b>icmp-type</b></li> <li>• <b>is-fragment</b></li> <li>• precedence or ip-precedence</li> <li>• protocol or ip-protocol</li> <li>• source-address or ip-source-address</li> <li>• <b>source-port</b></li> <li>• <b>source-prefix-list</b></li> <li>• <b>tcp-established</b></li> <li>• <b>tcp-flags</b></li> <li>• <b>tcp-initial</b></li> </ul> |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>is-fragment</b>                | <p>If the packet is a trailing fragment, this match condition does not match the first fragment of a fragmented packet. Use two terms to match both first and trailing fragments.</p> <p><b>NOTE:</b> Due to a limitation on the EX2300, EX3400, and EX4300 switches, this match condition does not match the last fragment of a fragmented packet when applied to "family ethernet-switching."</p>                                                                                           |
| <b>l2-encap-type llc-non-snap</b> | Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>next-header bytes</b>          | <p>8-bit protocol field that identifies the type of header immediately following the IPv6 header. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>ah (51), dstops (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (1), igmp (2), ipip (4), ipv6 (41), no-next-header (59), ospf (89), pim (103), routing (43), rsvp (46), sctp (132), tcp (6), udp (17), vrrp (112)</b></p> |
| <b>packet-length bytes</b>        | <p>Length of the received packet, in bytes.</p> <p>The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.</p>                                                                                                                                                                                                                                                                                                         |
| <b>precedence precedence</b>      | <p>IP precedence. For <i>precedence</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>critical-ecp (5), flash (3), flash-override (4), immediate (2), internet-control (6), net-control (7), priority (1), routine (0)</b></p>                                                                                                                                                                                                            |
| <b>ip-precedence precedence</b>   | <p>IP precedence. For <i>precedence</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>critical-ecp (5), flash (3), flash-override (4), immediate (2), internet-control (6), net-control (7), priority (1), routine (0)</b></p>                                                                                                                                                                                                            |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>protocol</code> <i>list of protocol</i>                      | <p>IPv4 protocol value. For <i>protocols</i>, you can specify one of the following text synonyms:</p> <p><b>egp (8), esp (50), gre (47), icmp (1), igmp (2), ipip (4), ospf (89), pim (103), rsvp (46), tcp (6), udp (17)</b></p>                                                                                                                                                                                                                   |
| <code>ip-protocol</code> <i>list of protocol</i>                   | <p>IPv4 protocol value. For <i>protocols</i>, you can specify one of the following text synonyms:</p> <p><b>egp (8), esp (50), gre (47), icmp (1), igmp (2), ipip (4), ospf (89), pim (103), rsvp (46), tcp (6), udp (17)</b></p>                                                                                                                                                                                                                   |
| <b>source-address</b> <i>ip-address</i>                            | <p>IP source address field, which is the address of the source node sending the packet. For IPv6, the source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in <a href="#">RFC 2373</a>, <i>IP Version 6 Addressing Architecture</i>.</p>                                                                                                               |
| <code>ip-source-address</code> ( <i>ip-address / ip6-address</i> ) | <p>IP source address field, which is the address of the source node sending the packet. You can specify either an IPv4 address (<i>ip-address</i>) or an IPv6 address (<i>ip6-address</i>). For IPv6, the <i>ip-source-address</i> field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in <a href="#">RFC 2373</a>, <i>IP Version 6 Addressing Architecture</i>.</p> |
| <b>source-mac-address</b> <i>mac-address</i>                       | <p>Source MAC address.</p> <p>You can define a source MAC address with a prefix, such as <b>source-mac-address 00:01:02:03:04:05/24</b>. If no prefix is specified, the default value 48 is used.</p>                                                                                                                                                                                                                                               |
| <b>source-port</b> <i>number</i>                                   | <p>TCP or UDP <b>source-port</b> field. Typically, you specify this match in conjunction with the <code>protocol</code> or <b>ip-protocol</b> match condition to determine which protocol is being used on the port. For <i>number</i>, you can specify one of the text synonyms listed under <b>destination-port</b>.</p>                                                                                                                          |

Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (*Continued*)

| Match Condition                               | Description                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source-prefix-list</b> <i>prefix-list</i>  | <p>IP source prefix list field.</p> <p>You can define a list of IP address prefixes under a prefix-list alias for frequent use. You define this match condition at the [edit policy-options] hierarchy level.</p>                                                                                                                                                  |
| <b>tcp-established</b>                        | <p>TCP packets of an established TCP connection. This condition matches packets other than the first packet of a connection. <b>tcp-established</b> is a synonym for the bit names "(ack   rst)".</p> <p><b>tcp-established</b> does not implicitly check whether the protocol is TCP. To do so, specify the <b>next-header tcp</b> match condition.</p>           |
| <b>tcp-flags</b> ( <i>flags tcp-initial</i> ) | <p>One or more TCP flags:</p> <ul style="list-style-type: none"> <li>• bit-name—<b>fin, syn, rst, push, ack, urgent</b></li> <li>• logical operators—&amp; (logical AND),   (logical OR), ! (negation)</li> <li>• numerical value—0x01 through 0x20</li> <li>• text synonym—<b>tcp-initial</b></li> </ul> <p>To specify multiple flags, use logical operators.</p> |
| <b>tcp-initial</b>                            | <p>Matches the first TCP packet of a connection. <b>tcp-initial</b> is a synonym for the bit names "(syn&amp;!ack)".</p> <p><b>tcp-initial</b> does not implicitly check whether the protocol is TCP. To do so, specify the protocol <b>tcp</b> or <b>ip-protocol tcp</b> match condition.</p>                                                                     |
| <b>traffic-class</b> <i>number</i>            | Specifies the DSCP code point for a packet.                                                                                                                                                                                                                                                                                                                        |
| <b>ttl</b> <i>value</i>                       | TTL type to match. The value ranges from 1 through 255.                                                                                                                                                                                                                                                                                                            |
| <b>vlan</b> ( <i>vlan-name   vlan-id</i> )    | The VLAN that is associated with the packet. For <i>vlan-id</i> , you can specify either the VLAN ID or a VLAN range. The <b>vlan</b> match condition and the <b>dot1q-tag</b> match condition are mutually exclusive.                                                                                                                                             |

**Table 76: Firewall Filter Match Conditions Supported on EX Series Switches (Continued)**

| Match Condition                                  | Description                                                                                                                                                                                                               |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>learn-vlan-id (vlan-name   vlan-id)</code> | The VLAN that is associated with the packet. For <i>vlan-id</i> , you can specify either the VLAN ID or a VLAN range. The <b>vlan</b> match condition and the <b>user-vlan-id</b> match condition are mutually exclusive. |

## Actions for Firewall Filters

You can define an action for the switch to take if a packet matches the filtering criteria defined in a match condition. [Table 77 on page 1550](#) describes the actions supported in a firewall filter configuration.

**Table 77: Actions for Firewall Filters**

| Action                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>accept</b>                     | Accept a packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>discard</b>                    | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>reject <i>message-type</i></b> | <p>Discard a packet, and send the ICMPv4 message (type 3) <b>destination unreachable</b>. You can log the rejected packets if you configure the <b>syslog</b> action modifier.</p> <p>You can specify one of the following message codes: <b>administratively-prohibited</b> (default), <b>bad-host-tos</b>, <b>bad-network-tos</b>, <b>host-prohibited</b>, <b>host-unknown</b>, <b>host-unreachable</b>, <b>network-prohibited</b>, <b>network-unknown</b>, <b>network-unreachable</b>, <b>port-unreachable</b>, <b>precedence-cutoff</b>, <b>precedence-violation</b>, <b>protocol-unreachable</b>, <b>source-host-isolated</b>, <b>source-route-failed</b>, <b>tcp-reset</b>.</p> <p>If you specify <b>tcp-reset</b>, a TCP reset is returned if the packet is a TCP packet. Otherwise nothing is returned.</p> <p>If you do not specify a message type, the ICMP notification <b>destination unreachable</b> is sent with the default message <b>communication administratively filtered</b>.</p> |

Table 77: Actions for Firewall Filters (*Continued*)

| Action                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>routing-instance</b> <i>routing-instance-name</i> | Forward matched packets to a virtual routing instance.<br><br><b>NOTE:</b> EX4200 switches do not support firewall-filter-based redirection to the default routing instance.                                                                                                                                                                                                                                                      |
| <b>vlan</b> <i>vlan-name</i>                         | Forward matched packets to a specific VLAN. Ensure that you specify the VLAN name or VLAN ID and not a VLAN range, because the <b>vlan</b> action does not support the <i>vlan-range</i> option.<br><br><b>NOTE:</b> If you have defined a VLAN that is enabled for dot1q tunneling, then that particular VLAN is not supported as an action (using the <b>vlan</b> <i>vlan-name</i> action) for an ingress VLAN firewall filter. |

## Action Modifiers for Firewall Filters

In addition to the actions described in [Table 77 on page 1550](#), you can define action modifiers in a firewall filter configuration for a switch if packets match the filtering criteria defined in the match condition. [Table 78 on page 1551](#) describes the action modifiers supported in a firewall filter configuration.

Table 78: Action Modifiers for Firewall Filters

| Action Modifier                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>analyzer</b> <i>analyzer-name</i> | Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. Mirroring copies all packets seen on one switch port to a network monitoring connection on another switch port. The analyzer name must be configured under [edit ethernet-switching-options analyzer].<br><br><b>NOTE:</b> <b>analyzer</b> is not a supported action modifier for a management interface.<br><br><b>NOTE:</b> On EX4500 switches, you can configure only one analyzer and include it in a firewall filter. If you configure multiple analyzers, you cannot include any one of those analyzers in a firewall filter. |

Table 78: Action Modifiers for Firewall Filters (*Continued*)

| Action Modifier                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dscp number</code>                          | <p>Change the DSCP value for matched packets to the DSCP value specified with this action modifier. <i>number</i> specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>ef (46)</b>—as defined in <a href="#">RFC 2598</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38)</b></li> </ul> <p>These four classes, with three drop precedences in each class, are defined for 12 code points in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB Group</i>.</p> |
| <code>count counter-name</code>                   | <p>Count the number of packets that pass this filter, term, or policer. A policer enables you to specify rate limits on traffic that enters an interface on a switch.</p> <p><b>NOTE:</b> On EX4300 switches, you can configure the same number of counters and policers as the number of terms in the ternary content addressable memory (TCAM).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>forwarding-class class</code>               | <p>Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>assured-forwarding</b></li> <li>• <b>best-effort</b></li> <li>• <b>expedited-forwarding</b></li> <li>• <b>network-control</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>gbp-src-tag (EX4400 and EX4650 only)</code> | <p>Set the group based policy source tag (0..65535) for use with micro-segmentation on VXLAN, as described here: <a href="#">Example: Micro and Macro Segmentation using Group Based Policy in a VXLAN</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 78: Action Modifiers for Firewall Filters (*Continued*)

| Action Modifier                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b> <i>interface-name</i>    | Forward the traffic to the specified interface bypassing the switching lookup.                                                                                                                                                                                                                                                                                                                                             |
| <b>log</b>                                | <p>Log the packet's header information in the Routing Engine. To view this information, issue the <code>show firewall log</code> command in the CLI.</p> <p><b>NOTE:</b> If the <b>log</b> or the <b>syslog</b> action modifier is configured along with a <b>vlan</b> action or an <b>interface</b> action modifier, the events might not be logged. However, the redirect interface functionality works as expected.</p> |
| <b>loss-priority</b> (high   low)         | Set the packet loss priority (PLP).                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>policer</b> <i>policer-name</i>        | <p>Apply rate limits to the traffic.</p> <p>You can specify a policer in a firewall filter only for ingress traffic on a port, VLAN, and router.</p> <p><b>NOTE:</b> A counter for a policer is not supported on EX8200 switches.</p> <p><b>NOTE:</b> On EX4300 switches, you can configure the same number of counters and policers as the number of terms in the TCAM.</p>                                               |
| port-mirror                               | Mirror packets to the interface defined in the [edit forwarding-options analyzer] hierarchy.                                                                                                                                                                                                                                                                                                                               |
| port-mirror-instance <i>instance-name</i> | Mirror packets to the instance defined in the [edit forwarding-options analyzer] hierarchy.                                                                                                                                                                                                                                                                                                                                |
| <b>syslog</b>                             | <p>Log an alert for this packet. You can specify that the log be sent to a server for storage and analysis.</p> <p><b>NOTE:</b> If the <b>log</b> or the <b>syslog</b> action modifier is configured along with a <b>vlan</b> action or an <b>interface</b> action modifier, the events might not be logged. However, the redirect interface functionality works as expected.</p>                                          |
| <b>three-color-policer</b>                | Apply a three-color policer.                                                                                                                                                                                                                                                                                                                                                                                               |

After you define a firewall filter on an EX Series switch, you must associate the filter to a bind point so that the filter can filter the packets that enter or exit the bind point. Port firewall filters, VLAN firewall filters, and Layer 3 (or router) firewall filters are the different types of firewall filters you can apply on a switch, depending on the bind points the filters are associated with. While a port firewall filter applies to Layer 2 interfaces, a VLAN firewall filter applies to packets that enter or leave a VLAN and also to packets that are bridged within a VLAN. A Layer 3 firewall filter applies to Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs).

**NOTE:** If you want to control the traffic that enters the Routing Engine of the switch, you must configure a firewall filter on the loopback interface (lo0) of the switch. For information about match conditions, actions, and action modifiers supported on the loopback interface of a switch, see ["Support for Match Conditions and Actions for Loopback Firewall Filters on Switches" on page 1617](#).

This topic describes the supported switches and bind points for match conditions, actions, and action modifiers for firewall filters supported on EX Series switches. For descriptions of the match conditions, actions, and action modifiers, see ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 1538](#). For information about the EX4600 switch, see [Firewall Filter Match Conditions and Actions](#).

### Firewall Filter Types and Their Bind Points

You can apply a firewall filter at specific bind points to filter IPv4, IPv6, or non-IP traffic. See the remaining sections in this topic for information about support on individual switches for different traffic types.

[Table 79 on page 1555](#) lists the firewall filter types and their associated bind points that are supported on the switches.

**Table 79: Bind Points Associated with Firewall Filter Types**

| Bind Points                                                                       | Firewall Filter Type   |
|-----------------------------------------------------------------------------------|------------------------|
| Ports (Layer 2 interfaces)                                                        | Port firewall filter   |
| VLANs                                                                             | VLAN firewall filter   |
| Layer 3 interfaces (Layer 3 (routed) interfaces or routed VLAN interfaces (RVIs)) | Router firewall filter |

### Support for IPv4 and IPv6 Firewall Filters on Switches

On EX2200, EX2300/EX3400, EX3200/EX4200, EX3300, EX4500, and EX6200 switches port and VLAN filters on IPv6 traffic can match only layer 2 header fields. On an EX8200 switch, port and VLAN

traffic can match on layer 3 and layer 4 header fields, in addition to layer 2 header fields, of IPv6 traffic. On an EX4300 switch, port and VLAN filters on IPv6 traffic can match layer 3 and layer 4 header fields.

[Table 80 on page 1556](#) briefly summarizes the support for IPv4 and IPv6 firewall filters on different switches. The support for port, VLAN, and router firewall filters on different switches is further discussed in the subsequent sections in this topic.

**Table 80: Support for IPv4 and IPv6 Firewall Filters on Switches**

| Switch            | Support for IPv4 Firewall Filter | Support for IPv6 Firewall Filter |
|-------------------|----------------------------------|----------------------------------|
| EX2200            | Yes                              | Yes                              |
| EX2300 and EX3400 | Yes                              | Yes                              |
| EX3200 and EX4200 | Yes                              | Yes                              |
| EX3300            | Yes                              | Yes                              |
| EX4300            | Yes                              | Yes                              |
| EX4500            | Yes                              | Yes                              |
| EX6200            | Yes                              | Yes                              |
| EX8200            | Yes                              | Yes                              |

## Platform Support for Match Conditions for IPv4 Traffic

You can define port, VLAN, and router firewall filters for ingress and egress IPv4 traffic on all EX Series switches. [Table 81 on page 1557](#) summarizes the support for match conditions on different bind points for ingress and egress IPv4 traffic on different switches.

**Table 81: Firewall Filter Match Conditions Supported for IPv4 Traffic on Switches**

| Match Condition                            | Switch            | Supported Bind Points                |                                                    |
|--------------------------------------------|-------------------|--------------------------------------|----------------------------------------------------|
|                                            |                   | Ingress                              | Egress                                             |
| destination-address <i>ip-address</i>      | EX2200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces               |
|                                            | EX2300 and EX3400 | Layer 3 interfaces                   | Layer 3 interfaces                                 |
|                                            | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces               |
|                                            | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces               |
|                                            | EX4300            | Layer 3 interfaces                   | Layer 3 interfaces                                 |
|                                            | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces               |

## Platform Support for Match Conditions for IPv6 Traffic

Table 82 on page 1576 summarizes support for match conditions on different bind points for ingress and egress IPv6 traffic on different switches.

**Table 82: Firewall Filter Match Conditions Supported for IPv6 Traffic on Switches**

| Match Condition                   | Switch            | Supported Bind Points |                                  |
|-----------------------------------|-------------------|-----------------------|----------------------------------|
|                                   |                   | Ingress               | Egress                           |
| destination-address<br>ip-address | EX2200            | Layer 3 interfaces    | Layer 3 interfaces               |
|                                   | EX2300 and EX3400 | Layer 3 interfaces    | Layer 3 interfaces               |
|                                   | EX3200 and EX4200 | Layer 3 interfaces    | Layer 3 (routed) interfaces only |
|                                   | EX3300            | Layer 3 interfaces    | Layer 3 interfaces               |

**Table 82: Firewall Filter Match Conditions Supported for IPv6 Traffic on Switches (Continued)**

| Match Condition                            | Switch            | Supported Bind Points                |                                  |
|--------------------------------------------|-------------------|--------------------------------------|----------------------------------|
|                                            |                   | Ingress                              | Egress                           |
|                                            | EX4300            | Layer 3 interfaces                   | Layer 3 (routed) interfaces only |
|                                            | EX4500            | Layer 3 interfaces                   | Layer 3 interfaces               |
|                                            | EX6200            | Layer 3 interfaces                   | Layer 3 interfaces               |
|                                            | EX8200            | Ports, VLANs, and Layer 3 interfaces | Layer 3 interfaces               |
| destination-mac-address <i>mac-address</i> | EX2200            | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX2300 and EX3400 | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX3200 and EX4200 | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX3300            | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX4300            | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX4500            | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX6200            | Ports and VLANs                      | Ports and VLANs                  |
|                                            | EX8200            | Ports and VLANs                      | Ports and VLANs                  |
| destination-port <i>number</i>             | EX2200            | Layer 3 interfaces                   | Layer 3 interfaces               |

Table 82: Firewall Filter Match Conditions Supported for IPv6 Traffic on Switches *(Continued)*

| Match Condition                            | Switch            | Supported Bind Points                |                                                                                  |

|                                            | EX4300            | Not supported                        | Not supported                        |
|                                            | EX4500            | Ports and VLANs                      | Ports and VLANs                      |
|                                            | EX6200            | Ports and VLANs                      | Ports and VLANs                      |
|                                            | EX8200            | Ports and VLANs                      | Not supported                        |

## Platform Support for Match Conditions for Non-IP Traffic

You can define port, VLAN, and router firewall filters for ingress and egress non-IP traffic on all EX Series switches. [Table 83 on page 1591](#) summarizes support for match conditions on different bind points for ingress and egress non-IP traffic on different switches.

**Table 83: Firewall Filter Match Condition Supported for Non-IP Traffic on Switches**

| Match Condition            | Switch            | Supported Bind Points |                 |
|----------------------------|-------------------|-----------------------|-----------------|
|                            |                   | Ingress               | Egress          |
| l2-encap-type llc-non-snap | EX2200            | Ports and VLANs       | Ports and VLANs |
|                            | EX2300 and EX3400 | Not supported         | Not supported   |
|                            | EX3200 and EX4200 | Ports and VLANs       | Ports and VLANs |
|                            | EX3300            | Ports and VLANs       | Ports and VLANs |
|                            | EX4300            | Not supported         | Not supported   |
|                            | EX4500            | Ports and VLANs       | Ports and VLANs |
|                            | EX6200            | Ports and VLANs       | Ports and VLANs |
|                            | EX8200            | Ports and VLANs       | Ports and VLANs |

## Platform Support for Actions for IPv4 Traffic

[Table 84 on page 1591](#) summarizes the support for actions on different bind points for ingress and egress IPv4 traffic on different switches.

**Table 84: Firewall Filter Actions Supported for IPv4 Traffic on Switches**

| Action | Switch | Supported Bind Points                |                                      |
|--------|--------|--------------------------------------|--------------------------------------|
|        |        | Ingress                              | Egress                               |
| accept | EX2200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |

Table 84: Firewall Filter Actions Supported for IPv4 Traffic on Switches *(Continued)*

| Action  | Switch            | Supported Bind Points                |                                      |
|---------|-------------------|--------------------------------------|--------------------------------------|
|         |                   | Ingress                              | Egress                               |
|         | EX2300 and EX3400 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX4300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX6200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX8200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
| discard | EX2200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX2300 and EX3400 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|         | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |

Table 84: Firewall Filter Actions Supported for IPv4 Traffic on Switches *(Continued)*

| Action                     | Switch            | Supported Bind Points                |                                      |
|----------------------------|-------------------|--------------------------------------|--------------------------------------|
|                            |                   | Ingress                              | Egress                               |
|                            | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                            | EX4300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                            | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                            | EX6200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                            | EX8200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
| reject <i>message-type</i> | EX2200            | Layer 3 interfaces                   | Not supported                        |

**Table 85: Firewall Filter Actions Supported for IPv6 Traffic on Switches (Continued)**

| Action | Switch | Supported Bind Points                                                                                                                                                                   |               |
|--------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
|        |        | Ingress                                                                                                                                                                                 | Egress        |
|        | EX8200 | Ports and VLANs<br><br><b>NOTE:</b> Supported only when used in conjunction with the interface action modifier. On EX8200 Virtual Chassis, the vlan action is supported only for VLANs. | Not supported |

## Platform Support for Action Modifiers for IPv4 Traffic

[Table 86 on page 1599](#) summarizes support for action modifiers on different bind points for ingress and egress IPv4 traffic on different switches.

**Table 86: Firewall Filter Action Modifiers Supported for IPv4 Traffic on Switches**

| Action Modifier | Switch            | Supported Bind Points                |               |
|-----------------|-------------------|--------------------------------------|---------------|
|                 |                   | Ingress                              | Egress        |
| analyzer        | EX2200            | Ports, VLANs, and Layer 3 interfaces | Not supported |
|                 | EX2300 and EX3400 | Not supported                        | Not supported |
|                 | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Not supported |
|                 | EX3300            | Ports, VLANs, and Layer 3 interfaces | Not supported |
|                 | EX4300            | Not supported                        | Not supported |

**Table 86: Firewall Filter Action Modifiers Supported for IPv4 Traffic on Switches (Continued)**

| Action Modifier | Switch            | Supported Bind Points                              |                                          |
|-----------------|-------------------|----------------------------------------------------|------------------------------------------|
|                 |                   | Ingress                                            | Egress                                   |

## Support for Match Conditions and Actions for Loopback Firewall Filters on Switches

On EX Series Ethernet switches, a loopback interface is a gateway for all the control traffic that enters the Routing Engine of the switch. If you want to monitor this control traffic, you must configure a firewall filter on the loopback interface (lo0). Loopback firewall filters are applied only to packets that are sent to the Routing Engine CPU for further processing. Therefore, you can apply a firewall filter only in the ingress direction on the loopback interface.

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the values or fields that a packet must contain. You can define multiple, single, or no match conditions. If no match conditions are specified for the term, all packets are matched by default. The string that defines a match condition is called a *match statement*. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Action modifiers are optional and specify one or more actions that the switch takes if a packet matches the match conditions for the specific term.

The following tables list match conditions, actions, and action modifiers that are supported for a firewall filter configured on a loopback interface on a switch:

- [Table 88 on page 1618](#)
- [Table 89 on page 1620](#)
- [Table 90 on page 1621](#)

For information on match conditions, actions, and action modifiers supported for a firewall filter configured on a network interface, see ["Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches"](#) on page 1554.

| traffic-class      | ✓      | ✓                 | ✓      | ✓      | ✓      | ✓      |

**Table 89: Actions for Firewall Filters on Loopback Interfaces for IPv4 and IPv6 Traffic—Support per Switch**

| Action                    | EX2200 | EX3200,<br>EX4200 | EX3300 | EX4500 | EX6200 | EX8200 |
|---------------------------|--------|-------------------|--------|--------|--------|--------|
| Actions for IPv4 traffic: |        |                   |        |        |        |        |
| accept                    | ✓      | ✓                 | ✓      | ✓      | ✓      | ✓      |
| discard                   | ✓      | ✓                 | ✓      | ✓      | ✓      | ✓      |
| Actions for IPv6 traffic: |        |                   |        |        |        |        |
| accept                    | ✓      | ✓                 | ✓      | ✓      | ✓      | ✓      |
| discard                   | ✓      | ✓                 | ✓      | ✓      | ✓      | ✓      |

**Table 90: Action Modifiers for Firewall Filters on Loopback Interfaces for IPv4 and IPv6 Traffic—Support per Switch**

| Action | EX2200 | EX3200,<br>EX4200 | EX3300 | EX4500 | EX6200 | EX8200 |
|--------|--------|-------------------|--------|--------|--------|--------|
|--------|--------|-------------------|--------|--------|--------|--------|

Action modifiers for IPv4 traffic:

|                  |   |   |   |   |   |   |
|------------------|---|---|---|---|---|---|
| count            | - | ✓ | - | ✓ | ✓ | - |
| forwarding-class | ✓ | ✓ | ✓ | ✓ | - | ✓ |
| loss-priority    | ✓ | ✓ | ✓ | ✓ | - | ✓ |

Action modifiers for IPv6 traffic:

|                  |   |   |   |   |   |   |
|------------------|---|---|---|---|---|---|
| count            | - | ✓ | - | ✓ | - | - |
| forwarding-class | ✓ | ✓ | ✓ | ✓ | - | ✓ |
| loss-priority    | ✓ | ✓ | ✓ | ✓ | - | ✓ |

**NOTE:** On EX8200 switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the neighbor discovery IPv6 resolve packets to pass through the switch.

## Configuring Firewall Filters (CLI Procedure)

### IN THIS SECTION

- [Configuring a Firewall Filter | 1622](#)
- [Configuring a Term Specifically for IPv4 or IPv6 Traffic | 1627](#)
- [Applying a Firewall Filter to a Port on a Switch | 1628](#)
- [Applying a Firewall Filter to a Management Interface on a Switch | 1629](#)
- [Applying a Firewall Filter to a VLAN on a Network | 1630](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface | 1632](#)

You configure firewall filters on EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

### Configuring a Firewall Filter

Before you can apply a firewall filter to a port, VLAN, or Layer 3 interface, you must configure a firewall filter with the required details, such as type of family for the firewall filter, firewall filter name, and match conditions. A match condition in the firewall filter configuration can contain multiple terms that define the criteria for the match condition. For each term, you must specify an action to be performed if a packet matches the conditions in the term. For information on different match conditions and actions, see ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches"](#) on page 1538.

To configure a firewall filter:

1. Configure the family address type for the firewall filter:

- For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching** to filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets, for example:

```
[edit firewall]
user@switch# set family ethernet-switching
```

- For a firewall filter that is applied to a Layer 3 (routed) interface:
  - To filter IPv4 packets, specify the family address type **inet**, for example:

```
[edit firewall]
user@switch# set family inet
```

- To filter IPv6 packets, specify the family address type **inet6**, for example:

```
[edit firewall]
user@switch# set family inet6
```

**NOTE:** You can configure firewall filters for both IPv4 and IPv6 traffic on the same Layer 3 interface.

## 2. Specify the filter name:

```
[edit firewall family ethernet-switching]
user@switch# set filter ingress-port-filter
```

The filter name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters. Each filter name must be unique.

- ## 3. If you want to apply a firewall filter to multiple interfaces and name individual firewall counters specific to each interface, configure the **interface-specific** option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

#### 4. Specify a term name:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set term term-one
```

The term name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters.

A firewall filter can contain one or more terms. Each term name must be unique within a filter.

**NOTE:** The maximum number of terms allowed per firewall filter for EX Series switches is:

- 512 for EX2200 switches
- 1,436 for EX3300 switches

**NOTE:** On EX3300 switches, if you add and delete filters with a large number of terms (on the order of 1000 or more) in the same commit operation, not all the filters are installed. You must add filters in one commit operation, and delete filters in a separate commit operation.

- 7,168 for EX3200 and EX4200 switches
- On EX4300 switches, following are the number of terms supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3,500 terms for firewall filters configured on a port
    - 3,500 terms for firewall filters configured on a VLAN
    - 7,000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3,500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port

- 256 terms for firewall filters configured on a VLAN
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure these maximum number of terms only when you configure one type of firewall filter (Port, VLAN, or Router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on all interfaces in the switch.

- 1,200 for EX4500 and EX4550 switches
- 1,400 for EX6200 switches
- 32,768 for EX8200 switches

If you attempt to configure a firewall filter that exceeds these limits, the switch returns an error message when you commit the configuration.

5. For each firewall filter term, specify the match condition(s) that you want to include. The example below shows how to match packets from a given IP address and port:

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one]
user@switch# set from source-address 192.0.2.0
user@switch# set from source-port 80
```

You can specify one or more match conditions in a single `from` statement. For a match to occur, the packet must match all the conditions in the term.

The `from` statement is optional, but if included in a term, the `from` statement cannot be empty. If you omit the `from` statement, all packets are considered to match.

6. For each firewall filter term, specify the action to take if the packet matches all the conditions in that term.

You can specify an action and/or action modifiers:

- To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one]
user@switch# set then discard
```

You can specify no more than one action per filter term.

- To specify an action modifier, for example, to count and classify packets in a forwarding class:

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one]
user@switch# set then count counter-one
user@switch# set then forwarding-class expedited-forwarding
```

In a then statement, you can specify the following action modifiers:

- **analyzer** *analyzer-name*—Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. An **analyzer** must be configured under the **ethernet-switching** family address type. See [Configuring Port Mirroring to Analyze Traffic \(CLI Procedure\)](#).
- **count** *counter-name*—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

- **forwarding-class** *class*—Classify packets in a forwarding class.
- **loss-priority** *priority*—Set the priority for dropping a packet.
- **policer** *policer-name*—Apply rate limiting to the traffic.
- **interface** *interface-name*—Forward the traffic to the specified interface, bypassing the switching lookup.
- **log**—Log the packet's header information in the Routing Engine.

If you omit the then statement or do not specify an action, packets that match all the conditions in the from statement are accepted. However, you must always explicitly configure an action and/or action modifier in the then statement. You can include no more than one action, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the from statement must match.

**NOTE:** Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

On Juniper Networks EX8200 Ethernet Switches, if an implicit or explicit **discard** action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the next hop IPv6 resolve packets to pass through the switch.

## Configuring a Term Specifically for IPv4 or IPv6 Traffic

To configure a term in a firewall filter configuration specifically for IPv4 traffic:

1. Verify that neither `ether-type ipv6` nor `ip-version ipv6` is specified in the term in the configuration. By default, a configuration that does not contain either `ether-type ipv6` or `ip-version ipv6` in a term applies to IPv4 traffic.
2. (Optional) Perform one of these tasks:
  - Define `ether-type ipv4` in a term in the configuration.
  - Define `ip-version ipv4` in a term in the configuration.
  - Define both `ether-type ipv4` and `ip-version ipv4` in a term in the configuration.
  - Verify that neither `ether-type ipv6` nor `ip-version ipv6` is specified in a term in the configuration—by default, a configuration that does not contain either `ether-type ipv6` or `ip-version ipv6` in a term applies to IPv4 traffic if it does not contain `ether-type ipv6` or `ip-version ipv6`.
3. Ensure that other match conditions in the term are valid for IPv4 traffic.

To configure a term in a firewall filter configuration specifically for IPv6 traffic:

1. Perform one of these tasks:
  - Define `ether-type ipv6` in a term in the configuration.
  - Define `ip-version ipv6` in a term in the configuration.
  - Define both `ether-type ipv6` and `ip-version ipv4` in a term in the configuration.

**NOTE:** By default, a configuration that does not contain either `ether-type ipv6` or `ip-version ipv6` in a term applies to IPv4 traffic.

2. Ensure that other match conditions in the term are valid for IPv6 traffic.

**NOTE:** If the term contains either of the match conditions `ether-type ipv6` or `ip-version ipv6`, with no other IPv6 match condition specified, all IPv6 traffic is matched.

**NOTE:** To configure a firewall filter for both IPv4 and IPv6 traffic, you must include two separate terms, one for IPv4 traffic and the other for IPv6 traffic.

## Applying a Firewall Filter to a Port on a Switch

You can apply a firewall filter to a port on a switch to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 1538](#). The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a port to filter ingress or egress traffic:

**NOTE:** For applying a firewall filter to a management interface, see ["Applying a Firewall Filter to a Management Interface on a Switch" on page 1629](#)

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/0/1 description "filter to limit tcp traffic filter at trunk port for
employee-vlan and voice-vlan applied on the interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number and family address type for the interface:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

3. To apply a firewall filter to filter packets that are entering a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter output egress-port-filter
```

**NOTE:** You can apply no more than one firewall filter per port, per direction.

## Applying a Firewall Filter to a Management Interface on a Switch

You can configure and apply a firewall filter to a management interface to control traffic that is entering or exiting the interface on a switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch. Similar to configuring a firewall filter on other types of interfaces, you can configure a firewall filter on a management interface using any match condition, action, and action modifier specified in ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 1538](#) except for the following action modifiers:

- **loss-priority**
- **forwarding-class**

You can apply a firewall filter to the management Ethernet interface on any EX Series switch. You can also apply a firewall filter to the virtual management Ethernet (VME) interface on the EX4200 switch. For more information on the management Ethernet interface and the VME interface, see [Interfaces Overview for Switches](#).

To apply a firewall filter on the management interface to filter ingress or egress traffic:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set me0 description "filter to limit tcp traffic filter at management interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number and family address type for the management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet
```

**NOTE:** For firewall filters that are applied to management interfaces, the family address type can be either **inet** or **inet6**.

3. To apply a firewall filter to filter packets that are entering a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter output egress-port-filter
```

**NOTE:** You can apply no more than one firewall filter per management interface, per direction.

## Applying a Firewall Filter to a VLAN on a Network

You can apply a firewall filter to a VLAN on a network to filter ingress or egress traffic on the network. To apply a firewall filter to a VLAN, specify the VLAN name and ID, and then apply the firewall filter to the VLAN. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 1538](#). The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a VLAN:

1. Specify the VLAN name and VLAN ID and provide a meaningful description of the firewall filter and the VLAN to which the filter is applied:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 vlan-description "filter to rate limit traffic
applied on employee-vlan"
```

**NOTE:** Providing the description is optional.

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:
  - To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter input ingress-vlan-filter
```

(On EX4300 switches) To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options input ingress-vlan-filter
```

- To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter output egress-vlan-filter
```

(On EX4300 switches) To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options output egress-vlan-filter
```

**NOTE:** You can apply no more than one firewall filter per VLAN, per direction.

## Applying a Firewall Filter to a Layer 3 (Routed) Interface

You can apply a firewall filter to a Layer 3 (routed) interface to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in ["Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches" on page 1538](#). The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a Layer 3 interface on a switch:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter to count and monitor employee-vlan traffic
applied on layer 3 interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number, family address type, and address for the interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24
```

For firewall filters applied to Layer 3 interfaces, the family address type must be **inet** (for IPv4 traffic) or **inet6** (for IPv6 traffic).

3. You can apply firewall filters to filter packets that are entering or exiting a Layer 3 (routed) interface:
  - To apply a firewall filter to filter packets that are entering a Layer 3 interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter input ingress-
router-filter
```

- To apply a firewall filter to filter packets that are exiting a Layer 3 interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter output egress-
router-filter
```

**NOTE:** When you apply a filter to an IRB interface associated with a given VLAN, the filter is executed on any Layer 3 interface with a matching VLAN ID. This is because the filter matches on all Layer 3 interfaces with the corresponding VLAN tag.

**NOTE:** You can apply no more than one firewall filter per Layer 3 interface, per direction.

## Understanding How Firewall Filters Test a Packet's Protocol

When examining match conditions, Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches tests only the field that is specified. The software does not implicitly test the IP header to determine whether a packet is an IP packet. Therefore, in some cases, you must specify **protocol** field match conditions in conjunction with other match conditions to ensure that the filters are performing the expected matches.

If you specify a protocol match condition or a match of the ICMP type or TCP flags field, there is no implied protocol match. For the following match conditions, you must explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify the match **protocol tcp** or **protocol udp**.
- **source-port**—Specify the match **protocol tcp** or **protocol udp**.

If you do not specify the protocol when using the preceding fields, design your filters carefully to ensure that they perform the expected matches. For example, if you specify a match of **destination-port ssh**, the switch deterministically matches any packets that have a value of **22** in the two-byte field that is two bytes beyond the end of the IP header without ever checking the IP protocol field.

## Understanding Filter-Based Forwarding for EX Series Switches

Administrators of Juniper Networks EX Series Ethernet Switches can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature, which is called filter-based forwarding, you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or security device before the traffic continues on its path. You can also use filter-based forwarding to give certain types of traffic preferential treatment or to improve load balancing of switch traffic.

- [Overview | 1635](#)
- [Configuring an Ingress Port Firewall Filter to Prioritize Voice Traffic and Rate-Limit TCP and ICMP Traffic | 1640](#)
- [Configuring a VLAN Ingress Firewall Filter to Prevent Rogue Devices from Disrupting VoIP Traffic | 1648](#)

- [Configuring a VLAN Firewall Filter to Count, Monitor, and Analyze Egress Traffic on the Employee VLAN | 1652](#)
- [Configuring a VLAN Firewall Filter to Restrict Guest-to-Employee Traffic and Peer-to-Peer Applications on the Guest VLAN | 1655](#)
- [Configuring a Router Firewall Filter to Give Priority to Egress Traffic Destined for the Corporate Subnet | 1658](#)
- [Verification | 1660](#)

This example shows how to configure and apply firewall filters to control traffic that is entering or exiting a port on the switch, a VLAN on the network, and a Layer 3 interface on the switch. Firewall filters define the rules that determine whether to forward or deny packets at specific processing points in the packet flow.

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 9.0 or later for EX Series switches.
- Two Juniper Networks EX3200-48T switches: one to be used as an access switch, the other to be used as a distribution switch
- One Juniper Networks EX-UM-4SFP uplink module
- One Juniper Networks J-series router

Before you configure and apply the firewall filters in this example, be sure you have:

- An understanding of firewall filter concepts, policers, and CoS
- Installed the uplink module in the distribution switch. See [Installing an Uplink Module in an EX3200 Switch](#).

## Overview

### IN THIS SECTION

- [Network Topology | 1638](#)

This configuration example show how to configure and apply firewall filters to provide rules to evaluate the contents of packets and determine when to discard, forward, classify, count, and analyze packets that are destined for or originating from the EX Series switches that handle all voice-vlan, employee-vlan, and guest-vlan traffic. [Table 91 on page 1636](#) shows the firewall filters that are configured for the EX Series switches in this example.

**Table 91: Configuration Components: Firewall Filters**

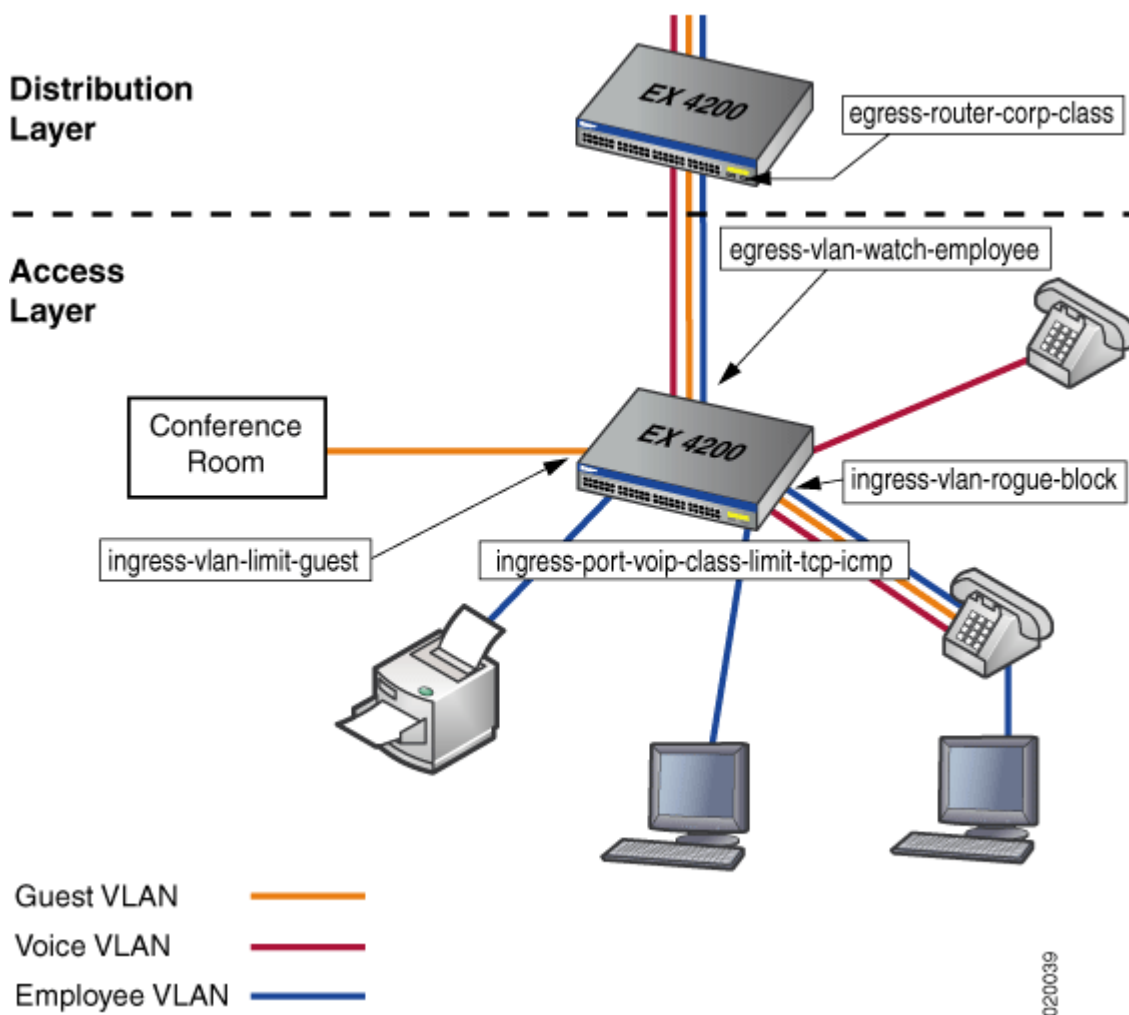

| Component                                                    | Purpose/Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port firewall filter, ingress-port-voip-class-limit-tcp-icmp | <p>This firewall filter performs two functions:</p> <ul style="list-style-type: none"> <li>Assigns priority queueing to packets with a source MAC address that matches the phone MAC addresses. The forwarding class expedited-forwarding provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service for all voice-vlan traffic.</li> <li>Performs rate limiting on packets that enter the ports for employee-vlan. The traffic rate for TCP and ICMP packets is limited to 1 Mbps with a burst size up to 30,000 bytes.</li> </ul> <p>This firewall filter is applied to port interfaces on the access switch.</p> |
| VLAN firewall filter, ingress-vlan-rogue-block               | <p>Prevents rogue devices from using HTTP sessions to mimic the gatekeeper device that manages call registration, admission, and call status for VoIP calls. Only TCP or UDP ports should be used; and only the gatekeeper uses HTTP. That is, all voice-vlan traffic on TCP ports should be destined for the gatekeeper device. This firewall filter applies to all phones on voice-vlan, including communication between any two phones on the VLAN and all communication between the gatekeeper device and VLAN phones.</p> <p>This firewall filter is applied to VLAN interfaces on the access switch.</p>                               |
| VLAN firewall filter, egress-vlan-watch-employee             | <p>Accepts employee-vlan traffic destined for the corporate subnet, but does not monitor this traffic. Employee traffic destined for the Web is counted and analyzed.</p> <p>This firewall filter is applied to vlan interfaces on the access switch.</p>                                                                                                                                                                                                                                                                                                                                                                                    |
| VLAN firewall filter, ingress-vlan-limit-guest               | <p>Prevents guests (non-employees) from talking with employees or employee hosts on employee-vlan. Also prevents guests from using peer-to-peer applications on guest-vlan, but allows guests to access the Web.</p> <p>This firewall filter is applied to VLAN interfaces on the access switch.</p>                                                                                                                                                                                                                                                                                                                                         |

| Component                                        | Purpose/Description                                                                                                                                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router firewall filter, egress-router-corp-class | <p>Prioritizes employee-vlan traffic, giving highest forwarding-class priority to employee traffic destined for the corporate subnet.</p> <p>This firewall filter is applied to a routed port (Layer 3 uplink module) on the distribution switch.</p> |

Figure 71 on page 1637 shows the application of port, VLAN, and Layer 3 routed firewall filters on the switch.

Figure 71: Application of Port, VLAN, and Layer 3 Routed Firewall Filters

## Network Topology

The topology for this configuration example consists of one EX-3200-48T switch at the access layer, and one EX-3200-48T switch at the distribution layer. The distribution switch's uplink module is configured to support a Layer 3 connection to a J-series router.

The EX Series switches are configured to support VLAN membership. [Table 92 on page 1638](#) shows the VLAN configuration components for the VLANs.

**Table 92: Configuration Components: VLANs**

| VLAN Name     | VLAN ID | VLAN Subnet and Available IP Addresses                                                                | VLAN Description                                                                                                                                                                                                                                                                                                     |
|---------------|---------|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| employee-vlan | 20      | 192.0.2.16/28 192.0.2.17<br>through 192.0.2.30<br>192.0.2.31 is the subnet's<br>broadcast address     | VLAN standalone PCs,<br>PCs connected to the<br>network through the hub<br>in VoIP telephones,<br>wireless access points,<br>and printers. This VLAN<br>completely includes the<br>voice VLAN. Two VLANs<br>(voice-vlan and employee-<br>vlan) must be configured<br>on the ports that connect<br>to the telephones. |

**Table 92: Configuration Components: VLANs (Continued)**

| VLAN Name   | VLAN ID | VLAN Subnet and Available IP Addresses                                                      | VLAN Description                                                                                                                                                                                                                                                   |
|-------------|---------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| guest-vlan  | 30      | 192.0.2.32/28 192.0.2.33 through 192.0.2.46<br>192.0.2.47 is the subnet's broadcast address | VLAN for guests' data devices (PCs). The scenario assumes that the corporation has an area open to visitors, either in the lobby or in a conference room, that has a hub to which visitors can plug in their PCs to connect to the Web and to their company's VPN. |
| camera-vlan | 40      | 192.0.2.48/28 192.0.2.49 through 192.0.2.62<br>192.0.2.63 is the subnet's broadcast address | VLAN for the corporate security cameras.                                                                                                                                                                                                                           |

Ports on the EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. [Table 93 on page 1639](#) shows the switch ports that are assigned to the VLANs and the IP and MAC addresses for devices connected to the switch ports:

**Table 93: Configuration Components: Switch Ports on a 48-Port All-PoE Switch**

| Switch and Port Number | VLAN Membership           | IP and MAC Addresses                                                                                       | Port Devices                                   |
|------------------------|---------------------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------|

| ge-0/0/6, ge-0/0/7     | camera-vlan     | 192.0.2.49 through<br>192.0.2.50                               | Two security cameras                                                                                                                 |
| ge-0/0/9               | voice-vlan      | IP address: 192.0.2.14<br><br>MAC<br>address:00.05.5E.00.53.0E | Gatekeeper device. The gatekeeper manages call registration, admission, and call status for VoIP phones.                             |
| ge-0/1/0               |                 | IP address: 192.0.2.65                                         | Layer 3 connection to a router; note that this is a port on the switch's uplink module                                               |

## Configuring an Ingress Port Firewall Filter to Prioritize Voice Traffic and Rate-Limit TCP and ICMP Traffic

### IN THIS SECTION

- Procedure | [1641](#)

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

## Procedure

### CLI Quick Configuration

To quickly configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the `employee-vlan` subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
 set firewall policer tcp-connection-policer if-exceeding burst-size-
limit 30k bandwidth-limit 1m
 set firewall policer tcp-connection-policer then
discard
 set firewall policer icmp-connection-policer if-exceeding burst-size-
limit 30k bandwidth-limit 1m
 set firewall policer icmp-connection-policer then
discard
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term voip-high from source-mac-address 00.00.5E.00.53.01
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term voip-high from source-mac-address 00.00.5E.00.53.02
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term voip-high from protocol udp
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term voip-high then forwarding-class expedited-forwarding
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term voip-high then loss-priority low
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term network-control from precedence net-control
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term network-control then forwarding-class network-control
 set firewall family ethernet-switching filter ingress-port-voip-class-
limit-tcp-icmp term network-control then loss-priority low
 set firewall family ethernet-switching filter ingress-port-voip-class-

10
 set class-of-service schedulers net-control priority
high
 set class-of-service schedulers best-effort buffer-size percent
75
 set class-of-service schedulers best-effort priority
low
 set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-
class expedited-forwarding scheduler voice-high
 set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-
class network-control scheduler net-control

```

```
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-
class best-effort scheduler best-effort
```

## Step-by-Step Procedure

To configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the `employee-vlan` subnet:

1. Define the policers `tcp-connection-policer` and `icmp-connection-policer`:

```
[edit]
user@switch# set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k
bandwidth-limit 1m
user@switch# set firewall policer tcp-connection-policer then discard
user@switch# set firewall policer icmp-connection-policer if-exceeding burst-size-limit 30k
bandwidth-limit 1m
user@switch# set firewall policer icmp-connection-policer then
discard
```

2. Define the firewall filter `ingress-port-voip-class-limit-tcp-icmp`:

```
[edit firewall]
user@switch# set family ethernet-switching filter ingress-port-voip-class-limit-tcp-
icmp
```

3. Define the term `voip-high`:

```
[edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term voip-high from source-mac-address 00.00.5E.00.53.01
user@switch# set term voip-high from source-mac-address 00.00.5E.00.53.02
user@switch# set term voip-high from protocol udp
user@switch# set term voip-high then forwarding-class expedited-forwarding
user@switch# set term voip-high then loss-priority low
```

4. Define the term `network-control`:

```
[edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term network-control from precedence net-control
```

```

user@switch# set term network-control then forwarding-class network-control
user@switch# set term network-control then loss-priority low

```

5. Define the term `tcp-connection` to configure rate limits for TCP traffic:

```

[edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term tcp-connection from destination-address 192.0.2.16/28
user@switch# set term tcp-connection from protocol tcp
user@switch# set term tcp-connection then policer tcp-connection-policer
user@switch# set term tcp-connection then count tcp-counter
user@switch# set term tcp-connection then forwarding-class best-effort
user@switch# set term tcp-connection then loss-priority high

```

6. Define the term `icmp-connection` to configure rate limits for ICMP traffic:

```

[edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term icmp-connection from destination-address 192.0.2.16/28
user@switch# set term icmp-connection from protocol icmp
user@switch# set term icmp-connection then policer icmp-policer
user@switch# set term icmp-connection then count icmp-counter
user@switch# set term icmp-connection then forwarding-class best-effort
user@switch# set term icmp-connection then loss-priority high

```

7. Define the term `best-effort` with no match conditions for an implicit match on all packets that did not match any other term in the firewall filter:

```

[edit firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term best-effort then forwarding-class best-effort
user@switch# set term best-effort then loss-priority high

```

8. Apply the firewall filter `ingress-port-voip-class-limit-tcp-icmp` as an input filter to the port interfaces for `employee-vlan`:

```

[edit interfaces]
user@switch# set ge-0/0/0 description "voice priority and tcp and icmp traffic rate-
limiting filter at ingress port"
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input ingress-port-voip-
class-limit-tcp-icmp
user@switch# set ge-0/0/1 description "voice priority and tcp and icmp traffic rate-

```

```
limiting filter at ingress port"
```

```
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-voip-
class-limit-tcp-icmp
```

9. Configure the parameters that are desired for the different schedulers.

**NOTE:** When you configure parameters for the schedulers, define the numbers to match your network traffic patterns.

```
[edit class-of-service]
user@switch# set schedulers voice-high buffer-size percent 15
user@switch# set schedulers voice-high priority high
user@switch# set schedulers network-control buffer-size percent 10
user@switch# set schedulers network-control priority high
user@switch# set schedulers best-effort buffer-size percent 75
user@switch# set schedulers best-effort priority low
```

10. Assign the forwarding classes to schedulers with a scheduler map:

```
[edit class-of-service]
user@switch# set scheduler-maps ethernet-diffsrv-cos-map
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class expedited-
forwarding scheduler voice-high
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class network-control
scheduler net-control
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort
scheduler best-effort
```

11. Associate the scheduler map with the outgoing interface:

```
[edit class-of-service]
user@switch# set interfaces ge-0/1/0 scheduler-map ethernet-diffsrv-cos-
map
```

## Results

Display the results of the configuration:

```
user@switch# show
firewall {
 policer tcp-connection-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 30k;
 }
 then {
 discard;
 }
 }
 policer icmp-connection-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 30k;
 }
 then {
 discard;
 }
 }
 family ethernet-switching {
 filter ingress-port-voip-class-limit-tcp-icmp {
 term voip-high {
 from {
 destination-mac-address 00.00.5E.00.53.01;
 destination-mac-address 00.00.5E.00.53.02;
 protocol udp;
 }
 then {
 forwarding-class expedited-forwarding;
 loss-priority low;
 }
 }
 }
 term network-control {
 from {
 precedence net-control ;
 }
 then {
```

```

 input ingress-port-voip-class-limit-tcp-icmp;
 }
}
}
}
ge-0/0/1 {
 description "voice priority and tcp and icmp traffic rate-limiting filter at ingress
port";
 unit 0 {
 family ethernet-switching {
 filter {
 input ingress-port-voip-class-limit-tcp-icmp;
 }
 }
 }
}
}
scheduler-maps {
 ethernet-diffsrv-cos-map {
 forwarding-class expedited-forwarding scheduler voice-high;
 forwarding-class network-control scheduler net-control;
 forwarding-class best-effort scheduler best-effort;
 }
}
interfaces {
 ge/0/1/0 {
 scheduler-map ethernet-diffsrv-cos-map;
 }
}
}

```

## Configuring a VLAN Ingress Firewall Filter to Prevent Rogue Devices from Disrupting VoIP Traffic

### IN THIS SECTION

- Procedure | 1649

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

## Procedure

### CLI Quick Configuration

To quickly configure a VLAN firewall filter on voice-vlan to prevent rogue devices from using HTTP sessions to mimic the gatekeeper device that manages VoIP traffic, copy the following commands and paste them into the switch terminal window:

```
[edit]
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term to-gatekeeper from destination-address 192.0.2.14
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term to-gatekeeper from destination-port 80
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term to-gatekeeper then accept
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term from-gatekeeper from source-address 192.0.2.14
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term from-gatekeeper from source-port 80
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term from-gatekeeper then accept
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term not-gatekeeper from destination-port 80
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term not-gatekeeper then count rogue-counter
 set firewall family ethernet-switching filter ingress-vlan-rogue-block
term not-gatekeeper then discard
 set vlans voice-vlan description "block rogue devices on voice-
vlan"
 set vlans voice-vlan filter input ingress-vlan-rogue-
block
```

### Step-by-Step Procedure

To configure and apply a VLAN firewall filter on voice-vlan to prevent rogue devices from using HTTP to mimic the gatekeeper device that manages VoIP traffic:

1. Define the firewall filter `ingress-vlan-rogue-block` to specify filter matching on the traffic you want to permit and restrict:

```
[edit firewall]
user@switch# set family ethernet-switching filter ingress-vlan-rogue-
block
```

2. Define the term `to-gatekeeper` to accept packets that match the destination IP address of the gatekeeper:

```
[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term to-gatekeeper from destination-address 192.0.2.14
user@switch# set term to-gatekeeper from destination-port 80
user@switch# set term to-gatekeeper then accept
```

3. Define the term `from-gatekeeper` to accept packets that match the source IP address of the gatekeeper:

```
[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term from-gatekeeper from source-address 192.0.2.14
user@switch# set term from-gatekeeper from source-port 80
user@switch# set term from-gatekeeper then accept
```

4. Define the term `not-gatekeeper` to ensure all voice-vlan traffic on TCP ports is destined for the gatekeeper device:

```
[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term not-gatekeeper from destination-port 80
user@switch# set term not-gatekeeper then count rogue-counter
user@switch# set term not-gatekeeper then discard
```

5. Apply the firewall filter `ingress-vlan-rogue-block` as an input filter to the VLAN interface for the VoIP telephones:

```
[edit]
user@switch# set vlans voice-vlan description "block rogue devices on voice-vlan"
user@switch# set vlans voice-vlan filter input ingress-vlan-rogue-block
```

## Results

Display the results of the configuration:

```
user@switch# show
firewall {
 family ethernet-switching {
 filter ingress-vlan-rogue-block {
 term to-gatekeeper {
 from {
 destination-address 192.0.2.14/32
 destination-port 80;
 }
 then {
 accept;
 }
 }
 term from-gatekeeper {
 from {
 source-address 192.0.2.14/32
 source-port 80;
 }
 then {
 accept;
 }
 }
 term not-gatekeeper {
 from {
 destination-port 80;
 }
 then {
 count rogue-counter;
 discard;
 }
 }
 }
 }
}
vlangs {
 voice-vlan {
 description "block rogue devices on voice-vlan";
 filter {
 input ingress-vlan-rogue-block;
 }
 }
}
```

```
}
}
```

## Configuring a VLAN Firewall Filter to Count, Monitor, and Analyze Egress Traffic on the Employee VLAN

### IN THIS SECTION

- [Procedure | 1652](#)

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

### Procedure

#### CLI Quick Configuration

A firewall filter is configured and applied to VLAN interfaces to filter `employee-vlan` egress traffic. Employee traffic destined for the corporate subnet is accepted but not monitored. Employee traffic destined for the Web is counted and analyzed.

To quickly configure and apply a VLAN firewall filter, copy the following commands and paste them into the switch terminal window:

```
[edit]
 set firewall family ethernet-switching filter egress-vlan-watch-
employee term employee-to-corp from destination-address 192.0.2.16/28
 set firewall family ethernet-switching filter egress-vlan-watch-
employee term employee-to-corp then accept
 set firewall family ethernet-switching filter egress-vlan-watch-
employee term employee-to-web from destination-port 80
 set firewall family ethernet-switching filter egress-vlan-watch-
employee term employee-to-web then count employee-web-counter
 set firewall family ethernet-switching filter egress-vlan-watch-
employee term employee-to-web then analyzer employee-monitor
 set vlans employee-vlan description "filter at egress VLAN to count and
analyze employee to Web traffic"
 set vlans employee-vlan filter output egress-vlan-watch-
employee
```

## Step-by-Step Procedure

To configure and apply an egress port firewall filter to count and analyze employee-vlan traffic that is destined for the Web:

1. Define the firewall filter egress-vlan-watch-employee:

```
[edit firewall]
user@switch# set family ethernet-switching filter egress-vlan-watch-employee
```

2. Define the term employee-to-corp to accept but not monitor all employee-vlan traffic destined for the corporate subnet:

```
[edit firewall family ethernet-switching filter egress-vlan-watch-employee]
user@switch# set term employee-to-corp from destination-address 192.0.2.16/28
user@switch# set term employee-to-corp then accept
```

3. Define the term employee-to-web to count and monitor all employee-vlan traffic destined for the Web:

```
[edit firewall family ethernet-switching filter egress-vlan-watch-employee]
user@switch# set term employee-to-web from destination-port 80
user@switch# set term employee-to-web then count employee-web-counter
user@switch# set term employee-to-web then analyzer employee-monitor
```

**NOTE:** See [Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on EX Series Switches](#) for information about configuring the employee-monitor analyzer.

4. Apply the firewall filter egress-vlan-watch-employee as an output filter to the port interfaces for the VoIP telephones:

```
[edit]
user@switch# set vlans employee-vlan description "filter at egress VLAN to count and analyze employee to Web traffic"
user@switch# set vlans employee-vlan filter output egress-vlan-watch-employee
```

## Results

Display the results of the configuration:

```
user@switch# show
 firewall {
 family ethernet-switching {
 filter egress-vlan-watch-employee {
 term employee-to-corp {
 from {
 destination-address 192.0.2.16/28
 }
 then {
 accept;
 }
 }
 term employee-to-web {
 from {
 destination-port 80;
 }
 then {
 count employee-web-counter;
 analyzer employee-monitor;
 }
 }
 }
 }
 }
 vlans {
 employee-vlan {
 description "filter at egress VLAN to count and analyze employee to Web traffic";
 filter {
 output egress-vlan-watch-employee;
 }
 }
 }
}
```

## Configuring a VLAN Firewall Filter to Restrict Guest-to-Employee Traffic and Peer-to-Peer Applications on the Guest VLAN

### IN THIS SECTION

- Procedure | [1655](#)

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

### Procedure

#### CLI Quick Configuration

In the following example, the first filter term permits guests to talk with other guests but not employees on `employee-vlan`. The second filter term allows guests Web access but prevents them from using peer-to-peer applications on `guest-vlan`.

To quickly configure a VLAN firewall filter to restrict guest-to-employee traffic, blocking guests from talking with employees or employee hosts on `employee-vlan` or attempting to use peer-to-peer applications on `guest-vlan`, copy the following commands and paste them into the switch terminal window:

```
[edit]
 set firewall family ethernet-switching filter ingress-vlan-limit-guest
term guest-to-guest from destination-address 192.0.2.33/28
 set firewall family ethernet-switching filter ingress-vlan-limit-guest
term guest-to-guest then accept
 set firewall family ethernet-switching filter ingress-vlan-limit-guest
term no-guest-employee-no-peer-to-peer from destination-mac-address
00.05.5E.00.00.DF
 set firewall family ethernet-switching filter ingress-vlan-limit-guest
term no-guest-employee-no-peer-to-peer then accept
 set vlans guest-vlan description "restrict guest-to-employee traffic
and peer-to-peer applications on guest VLAN"
 set vlans guest-vlan filter input ingress-vlan-limit-
guest
```

## Step-by-Step Procedure

To configure and apply a VLAN firewall filter to restrict guest-to-employee traffic and peer-to-peer applications on guest-vlan:

1. Define the firewall filter ingress-vlan-limit-guest:

```
[edit firewall]
set firewall family ethernet-switching filter ingress-vlan-limit-guest
```

2. Define the term guest-to-guest to permit guests on the guest-vlan to talk with other guests but not employees on the employee-vlan:

```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term guest-to-guest from destination-address 192.0.2.33/28
user@switch# set term guest-to-guest then accept
```

3. Define the term no-guest-employee-no-peer-to-peer to allow guests on guest-vlan Web access but prevent them from using peer-to-peer applications on the guest-vlan.

**NOTE:** The destination-mac-address is the default gateway, which for any host in a VLAN is the next-hop router.

```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.5E.00.00.DF
user@switch# set term no-guest-employee-no-peer-to-peer then accept
```

4. Apply the firewall filter ingress-vlan-limit-guest as an input filter to the interface for guest-vlan :

```
[edit]
user@switch# set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications on guest VLAN"
user@switch# set vlans guest-vlan filter input ingress-vlan-limit-guest
```

## Results

Display the results of the configuration:

```
user@switch# show
 firewall {
 family ethernet-switching {
 filter ingress-vlan-limit-guest {
 term guest-to-guest {
 from {
 destination-address 192.0.2.33/28;
 }
 then {
 accept;
 }
 }
 term no-guest-employee-no-peer-to-peer {
 from {
 destination-mac-address 00.05.5E.00.00.DF;
 }
 then {
 accept;
 }
 }
 }
 }
 }
 vlans {
 guest-vlan {
 description "restrict guest-to-employee traffic and peer-to-peer applications on
guest VLAN";
 filter {
 input ingress-vlan-limit-guest;
 }
 }
 }
}
```

## Configuring a Router Firewall Filter to Give Priority to Egress Traffic Destined for the Corporate Subnet

### IN THIS SECTION

- [Procedure](#) | 1658

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

### Procedure

#### CLI Quick Configuration

To quickly configure a firewall filter for a routed port (Layer 3 uplink module) to filter employee-vlan traffic, giving highest forwarding-class priority to traffic destined for the corporate subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
 set firewall family inet filter egress-router-corp-class term corp-
expedite from destination-address 192.0.2.16/28
 set firewall family inet filter egress-router-corp-class term corp-
expedite then forwarding-class expedited-forwarding
 set firewall family inet filter egress-router-corp-class term corp-
expedite then loss-priority low
 set firewall family inet filter egress-router-corp-class term not-to-
corp then accept
 set interfaces ge-0/1/0 description "filter at egress router to
expedite destined for corporate network"
 set ge-0/1/0 unit 0 family inet address 203.0.113.0
 set interfaces ge-0/1/0 unit 0 family inet filter output egress-router-
corp-class
```

### Step-by-Step Procedure

To configure and apply a firewall filter to a routed port (Layer 3 uplink module) to give highest priority to employee-vlan traffic destined for the corporate subnet:

1. Define the firewall filter egress-router-corp-class:

```
[edit]
user@switch# set firewall family inet filter egress-router-corp-class
```

2. Define the term corp-expedite:

```
[edit firewall]
user@switch# set family inet filter egress-router-corp-class term corp-expedite from
destination-address 192.0.2.16/28
user@switch# set family inet filter egress-router-corp-class term corp-expedite then
forwarding-class expedited-forwarding
user@switch# set family inet filter egress-router-corp-class term corp-expedite then loss-
priority low
```

3. Define the term not-to-corp:

```
[edit firewall]
user@switch# set family inet filter egress-router-corp-class term not-to-corp then
accept
```

4. Apply the firewall filter egress-router-corp-class as an output filter for the port on the switch's uplink module, which provides a Layer 3 connection to a router:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter at egress router to expedite employee traffic
destined for corporate network"
user@switch# set ge-0/1/0 unit 0 family inet address 203.0.113.0
user@switch# set ge-0/1/0 unit 0 family inet filter output egress-router-corp-
class
```

## Results

Display the results of the configuration:

```
user@switch# show
firewall {
```

```

family inet {
 filter egress-router-corp-class {
 term corp-expedite {
 from {
 destination-address 192.0.2.16/28;
 }
 then {
 forwarding-class expedited-forwarding;
 loss-priority low;
 }
 }
 term not-to-corp {
 then {
 accept;
 }
 }
 }
}

interfaces {
 ge-0/1/0 {
 unit 0 {
 description "filter at egress router interface to expedite employee traffic
destined for corporate network";
 family inet {
 source-address 203.0.113.0
 filter {
 output egress-router-corp-class;
 }
 }
 }
 }
}

```

## Verification

### IN THIS SECTION

- [Verifying that Firewall Filters and Policers are Operational | 1661](#)
- [Verifying that Schedulers and Scheduler-Maps are Operational | 1662](#)

To confirm that the firewall filters are working properly, perform the following tasks:

## Verifying that Firewall Filters and Policers are Operational

### Purpose

Verify the operational state of the firewall filters and policers that are configured on the switch.

### Action

Use the operational mode command:

```
user@switch> show firewall
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name Packets
icmp-counter 0
tcp-counter 0
Policers:
Name Packets
icmp-connection-policer 0
tcp-connection-policer 0

Filter: ingress-vlan-rogue-block

Filter: egress-vlan-watch-employee
Counters:
Name Packets
employee-web-counter 0
```

### Meaning

The `show firewall` command displays the names of the firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for all configured counters and the packet count for all policers.

## Verifying that Schedulers and Scheduler-Maps are Operational

### Purpose

Verify that schedulers and scheduler-maps are operational on the switch.

### Action

Use the operational mode command:

```
user@switch> show class-of-service scheduler-
map

Scheduler map: default, Index: 2

Scheduler: default-be, Forwarding class: best-effort, Index: 20
 Transmit rate: 95 percent, Rate Limit: none, Buffer size: 95 percent,
 Priority: low
 Drop profiles:
 Loss priority Protocol Index Name
 Low non-TCP 1 default-drop-profile
 Low TCP 1 default-drop-profile
 High non-TCP 1 default-drop-profile
 High TCP 1 default-drop-profile

Scheduler: default-nc, Forwarding class: network-control, Index: 22
 Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
 Priority: low
 Drop profiles:
 Loss priority Protocol Index Name
 Low non-TCP 1 default-drop-profile
 Low TCP 1 default-drop-profile
 High non-TCP 1 default-drop-profile
 High TCP 1 default-drop-profile
Scheduler map: ethernet-diffsrv-
cos-map, Index: 21657

Scheduler: best-effort, Forwarding class: best-effort, Index: 61257
 Transmit rate: remainder, Rate Limit: none, Buffer size: 75 percent,
 Priority: low
 Drop profiles:
 Loss priority Protocol Index Name
 Low non-TCP 1 <default-drop-profile>
```

|      |         |   |                        |
|------|---------|---|------------------------|
| Low  | TCP     | 1 | <default-drop-profile> |
| High | non-TCP | 1 | <default-drop-profile> |
| High | TCP     | 1 | <default-drop-profile> |

Scheduler: voice-high, Forwarding class: expedited-forwarding, Index: 3123

Transmit rate: remainder, Rate Limit: none, Buffer size: 15 percent,

Priority: high

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | non-TCP  | 1     | <default-drop-profile> |
| Low           | TCP      | 1     | <default-drop-profile> |
| High          | non-TCP  | 1     | <default-drop-profile> |
| High          | TCP      | 1     | <default-drop-profile> |

Scheduler: net-control, Forwarding class: network-control, Index: 2451

Transmit rate: remainder, Rate Limit: none, Buffer size: 10 percent,

Priority: high

Drop profiles:

| Loss priority | Protocol | Index | Name                   |
|---------------|----------|-------|------------------------|
| Low           | non-TCP  | 1     | <default-drop-profile> |
| Low           | TCP      | 1     | <default-drop-profile> |
| High          | non-TCP  | 1     | <default-drop-profile> |
| High          | TCP      | 1     | <default-drop-profile> |

## Meaning

Displays statistics about the configured schedulers and schedulers-maps.

## RELATED DOCUMENTATION

[Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches | 1538](#)

## Example: Configuring a Firewall Filter on a Management Interface on an EX Series Switch

### IN THIS SECTION

- [Requirements | 1664](#)
- [Overview and Topology | 1664](#)
- [Configuration | 1665](#)
- [Verification | 1668](#)

You can configure a firewall filter on a management interface on an EX Series switch to filter ingress or egress traffic on the management interface on the switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch.

This example discusses how to configure a firewall filter on a management interface to filter SSH packets egressing from an EX Series switch:

### Requirements

This example uses the following hardware and software components:

- One EX Series switch and one management PC
- Junos OS Release 10.4 or later for EX Series switches

### Overview and Topology

#### IN THIS SECTION

- [Topology | 1665](#)

## Topology

In this example, a management PC establishes an SSH connection with the management interface on a switch to remotely manage the switch. The IP address configured for the management interface is 10.204.33.103/20. A firewall filter is configured on the management interface to count the number of packets egressing from a source SSH port on the management interface. When the management PC establishes the SSH session with the management interface, the management interface returns SSH packets to the management PC to confirm that the session is established. These SSH packets are filtered based on the match condition specified in the firewall filter before they are forwarded to the management PC. As these packets are generated from the source SSH port on the management interface, they fulfill the match condition specified for the management interface. The number of matched SSH packets provides a count of the number of packets that have traversed the management interface. A system administrator can use this information to monitor the management traffic and take any action if required.

Figure 72 on page 1665 shows the topology for this example in which a management PC establishes an SSH connection with the switch.

**Figure 72: SSH Connection From a Management PC to an EX Series Switch**

## Configuration

### IN THIS SECTION

● | 1666

To configure a firewall filter on a management interface, perform these tasks:

## CLI Quick Configuration

To quickly create and configure a firewall filter on the management interface to filter SSH packets egressing from the management interface, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter mgmt_fil1 term t1 from source-port ssh
set firewall family inet filter mgmt_fil1 term t1 then count c1
set firewall family inet filter mgmt_fil1 term t2 then accept
set interfaces me0 unit 0 family inet filter output mgmt_fil1
```

## Step-by-Step Procedure

To configure a firewall filter on the management interface to filter SSH packets:

1. Configure the firewall filter that matches SSH packets from the source port:

```
[edit]
user@switch# set firewall family inet filter (Firewall Filters) mgmt_fil1 term t1 from source-
port ssh
user@switch# set firewall family inet filter mgmt_fil1 term t1 then count c1
user@switch# set firewall family inet filter mgmt_fil1 term t2 then accept
```

These statements set a counter **c1** to count the number of SSH packets that egress from the source SSH interface on the management interface.

2. Set the firewall filter for the management interface:

```
[edit]
user@switch# set interfaces me0 unit 0 family inet filter output mgmt_fil1
```

**NOTE:** You can also set the firewall filter for a VME interface.

## Results

Check the results of the configuration:

```
[edit]
user@switch# show

interfaces {
 me0 {
 unit 0 {
 family inet {
 filter {
 output mgmt_fil1;
 }
 address 10.93.54.6/24;
 }
 }
 }
}

firewall {
 family inet {
 filter mgmt_fil1 {
 term t1 {
 from {
 source-port ssh;
 }
 then count c1;
 }
 term t2 {
 then accept;
 }
 }
 }
}
```

## Verification

### IN THIS SECTION

- [Verifying That the Firewall Filter Is Configured on a Management Interface | 1668](#)

To confirm that the configuration is working properly, perform these tasks:

### Verifying That the Firewall Filter Is Configured on a Management Interface

#### Purpose

Verify that the firewall filter has been enabled on the management interface on the switch.

#### Action

1. Verify that the firewall filter is applied to the management interface:

```
[edit]
user@switch# show interfaces me0
unit 0 {
 family inet {
 filter {
 output mgmt_fil1;
 }
 address 10.204.33.103/20;
 }
}
```

2. Check the counter value that is associated with the firewall filter:

```
user@switch> show firewall
Filter: mgmt_fil1
Counters:
Name Bytes Packets
c1 0 0
```

3. From the management PC, establish a secure shell session with the switch:

```
[user@management-pc ~]$ ssh user@10.204.33.103
```

4. Check counter values after SSH packets are generated from the switch in response to the secure shell session request by the management PC:

```
user@switch> show firewall
Filter: mgmt_fil1
Counters:
Name Bytes Packets
c1 3533 23
```

### Meaning

The output indicates that the firewall filter has been applied to the management interface and the counter value indicates that 23 SSH packets were generated from the switch.

### RELATED DOCUMENTATION

[Configuring Firewall Filters \(CLI Procedure\) | 1622](#)

[Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches | 1634](#)

## Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device

### IN THIS SECTION

- [Requirements | 1670](#)
- [Overview and Topology | 1670](#)
- [Configuration | 1670](#)
- [Verification | 1674](#)

This example describes how to set up filter-based forwarding on EX Series switches or a QFX10000. You can configure filter-based forwarding by using a firewall filter to forward matched traffic to a specific virtual routing instance.

## Requirements

This example applies to both EX Series switches running Junos OS Release 9.4 or later, and QFX10000 switches running Junos OS Release 15.1X53-D10 or later.

## Overview and Topology

In this example, we create a firewall filter to match traffic being sent from one application server to another according to the destination address (192.168.0.1) of packets egressing the source application server. Matching packets are routed to a virtual routing instance which forwards the traffic to a security device, which then forwards the traffic on to the destination application server.

**NOTE:** Filter-based forwarding does not work with IPv6 interfaces on some Juniper switches.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1670](#)
- [Procedure | 1671](#)
- [Results | 1672](#)

To configure filter-based forwarding:

### CLI Quick Configuration

To use this example on your own device, copy the following commands into a text file, remove the line breaks, and change the necessary details to fit your configuration. Then copy and paste the commands into your CLI at the [edit] hierarchy level.

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address
10.1.0.1/24
set interfaces xe-0/0/3 unit 0 family inet address
```

```

10.1.3.1/24
 set firewall family inet filter f1 term t1 from source-address
10.1.0.50/32
 set firewall family inet filter f1 term t1 from protocol
tcp
 set interfaces xe-0/0/0 unit 0 family inet filter input f1
 set routing-instances vrf01 instance-type virtual-router
 set routing-instances vrf01 interface xe-0/0/3.0
 set routing-instances vrf01 routing-options static route 192.168.0.1/24
next-hop 10.1.3.254
 set firewall family inet filter f1 term t1 then routing-instance
vrf01

```

## Procedure

### Step-by-Step Procedure

To configure filter-based forwarding:

1. Configure an interface to connect to the application server:

```

[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet address 10.1.0.1/24

```

2. Configure an interface to connect to the security device:

```

[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 10.1.3.1/24

```

3. Create a firewall filter that matches packets based on the address of the application server that the traffic will be sent from. Also configure the filter so that it matches only TCP packets:

```

[edit firewall]
user@switch# set family inet filter f1 term t1 from source-address 10.1.0.50/32
user@switch# set firewall family inet filter f1 term t1 from protocol
tcp

```

4. Apply the filter to the interface that connects to the source application server and configure it to match incoming packets:

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet filter input f1
```

5. Create a virtual router:

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```

6. Associate the virtual router with the interface that connects to the security device:

```
[edit routing-instances]
user@switch# set vrf01 interface xe-0/0/3.0
```

7. Configure the routing information for the virtual routing instance:

```
[edit routing-instances]
user@switch# set vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
```

8. Set the filter to forward packets to the virtual router:

```
[edit firewall]
user@switch# set family inet filter f1 term t1 then routing-instance
vrf01
```

## Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
 xe-0/0/0 {
 unit 0 {
 family inet {
 filter {
```

```

 input f1;
 }
 address 10.1.0.1/24;
}
}
xe-0/0/3 {
 unit 0 {
 family inet {
 address 10.1.3.1/24;
 }
 }
}
}
firewall {
 family inet {
 filter f1 {
 term t1 {
 from {
 source-address {
 10.1.0.50/32;
 }
 protocol tcp;
 }
 then {
 routing-instance vrf01;
 }
 }
 }
 }
}
}
routing-instances {
 vrf01 {
 instance-type virtual-router;
 interface xe-0/0/3.0;
 routing-options {
 static {
 route 192.168.0.1/24 next-hop 10.1.3.254;
 }
 }
 }
}
}

```

## Verification

### IN THIS SECTION

- [Verifying That Filter-Based Forwarding Was Configured | 1674](#)

To confirm that the configuration is working properly, perform these tasks:

### Verifying That Filter-Based Forwarding Was Configured

#### Purpose

Verify that filter-based forwarding was properly enabled on the switch.

#### Action

1. Use the `show interfaces filters` command:

```
user@switch> show interfaces filters
xe-0/0/0.0
Interface Admin Link Proto Input Filter Output Filter
xe-0/0/0.0 up down inet fil
```

2. Use the `show route forwarding-table` command:

```
user@switch> show route forwarding-table

Routing table: default.inet
Internet:
Destination Type RtRef Next hop Type Index NhRef Netif
default user 1 0:12:f2:21:cf:0 ucst 331 4 me0.0

## Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

### IN THIS SECTION

- [Requirements | 1676](#)
- [Overview and Topology | 1677](#)
- [Configuration | 1679](#)
- [Verification | 1682](#)

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.5 or later for EX Series switches
- One EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch](#).
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See [Configuring 802.1X Interface Settings \(CLI Procedure\)](#) and [Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch](#).
- Configured users on the RADIUS authentication server.

## Overview and Topology

### IN THIS SECTION

- [Topology](#) | 1677

### Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in [Figure 73 on page 1678](#),

when User1 is authenticated by the EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User2 is authenticated, another term is added to the firewall filter, and so on.

Figure 73: Conceptual Model: Dynamic Filter Updated for Each New User

This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface **ge-0/0/2** to the file server, which is located on subnet **192.0.2.16/28**, and

set policer definitions to rate limit the traffic. [Figure 74 on page 1679](#) shows the network topology for this example.

**Figure 74: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server**

g020308

## Configuration

### IN THIS SECTION

- [Configuring Firewall Filters on Interfaces with Multiple Supplicants | 1680](#)

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

## Configuring Firewall Filters on Interfaces with Multiple Supplicants

### CLI Quick Configuration

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant
multiple
set firewall family ethernet-switching filter filter1 term term1 from
destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term term1 then
count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

### Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface **ge-0/0/2** for multiple supplicant mode authentication:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/2 supplicant multiple
```

2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

## Results

Check the results of the configuration:

```
user@switch> show configuration

firewall {
 family ethernet-switching {
 filter filter1 {
 term term1 {
 from {
 destination-address {
 192.0.2.16/28;
 }
 }
 then count counter1;
 }
 term term2 {
 from {
 destination-address {
 192.0.2.16/28;
 }
 }
 then policer p1;
 }
 }
 }
}

policer p1 {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 1k;
 }
 then discard;
}
```

```
 }
 }
 protocols {
 dot1x {
 authenticator
 interface ge-0/0/2 {
 suppliant multiple;
 }
 }
 }
 }
}
```

## Verification

### IN THIS SECTION

- [Verifying Firewall Filters on Interfaces with Multiple Supplicants | 1682](#)

To confirm that the configuration is working properly, perform these tasks:

### Verifying Firewall Filters on Interfaces with Multiple Supplicants

#### Purpose

Verify that firewall filters are functioning on the interface with multiple supplicants.

#### Action

1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:

```
user@switch> show dot1x firewall

Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```

2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:

```
user@switch> show dot1x firewall

Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

## Meaning

The results displayed by the `show dot1x firewall` command output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

## RELATED DOCUMENTATION

[Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches | 1634](#)

[Filtering 802.1X Supplicants by Using RADIUS Server Attributes](#)

## Verifying That Policers Are Operational

### IN THIS SECTION

- [Purpose | 1683](#)
- [Action | 1684](#)
- [Meaning | 1684](#)

## Purpose

After you configure policers and include them in firewall filter configurations, you can perform the following tasks to verify that the policers configured on EX Series switches are working properly.

## Action

Use the operational mode command to verify that the policers on the switch are working properly:

```
user@switch> show policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
Name Packets
icmp-connection-policer 0
tcp-connection-policer 0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

## Meaning

The `show policer` command displays the names of all firewall filters and policers that are configured on the switch. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

### IN THIS SECTION

- [Do Not Combine Match Conditions for Different Layers | 1685](#)
- [Layer 2 Packets Cannot be Discarded with Firewall Filters | 1685](#)
- [Protect-RE \(loopback\) Firewall Filter Does Not Filter Packets Applied to EM0 Interfaces | 1686](#)

This section describes issues specific to QFX10000 switches:

### Do Not Combine Match Conditions for Different Layers

On QFX10000 switches, do not combine match conditions for Layer 2 and any other layer in a family ethernet-switching filter. (For example, do not include conditions that match MAC addresses and IP addresses in the same filter.) If you do so, the filter will commit successfully but will not work. You will also see the following log message: L2 filter *filter-name* doesn't support mixed L2 and L3/L4 match conditions. Please re-config.

### Layer 2 Packets Cannot be Discarded with Firewall Filters

#### IN THIS SECTION

- [Problem | 1685](#)
- [Solution | 1686](#)

#### *Problem*

#### Description

Layer 2 (L2) control packets such as Link Layer Discovery Protocol (LLDP) and bridge protocol data unit (BPDU) cannot be discarded with firewall filters.

***Solution***

Configure distributed denial-of-service (DDoS) protection on the L2 control packet and set the aggregate policer bandwidth and burst values to the minimum value of 1. For example,

```
[edit system ddos-protection protocols protocol name]
```

```
user@host# set aggregate bandwidth 1
```

```
[edit system ddos-protection protocols protocol name]
```

```
user@host# set aggregate burst 1
```

**Protect-RE (loopback) Firewall Filter Does Not Filter Packets Applied to EM0 Interfaces****IN THIS SECTION**

- [Problem | 1686](#)

- [Solution | 1686](#)

***Problem*****Description**

On QFX10000 switches, the Protect-RE (loopback) firewall filter does not filter packets applied to EM0 interfaces including SNMP, Telnet, and other services.

***Solution***

This is expected behavior.

### Firewall Filter Configuration Returns a No Space Available in TCAM Message

#### IN THIS SECTION

- [Problem | 1687](#)
- [Solution | 1688](#)

#### *Problem*

#### Description

When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following syslogd message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

### ***Solution***

When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN , or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on employee-
vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter `new-ingress-vlan-rogue-block`.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

## Filter Counts Previously Dropped Packet

### IN THIS SECTION

- [Problem | 1690](#)
- [Solution | 1691](#)

### *Problem*

#### Description

If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:

- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the `admin` VLAN in the output direction, and interface `xe-0/0/1` is a member of that VLAN.
- You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to `xe-0/0/1` in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter

### 3. Port (Layer 2) filter

#### *Solution*

This is expected behavior.

#### Matching Packets Not Counted

##### IN THIS SECTION

- Problem | [1691](#)
- Solution | [1691](#)

#### *Problem*

#### Description

If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.

For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the `adminVLAN`, and interface xe-0/0/1 is a member of that VLAN.
- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

#### *Solution*

This is expected behavior.

## Counter Reset When Editing Filter

### IN THIS SECTION

- [Problem | 1692](#)
- [Solution | 1692](#)

### *Problem*

#### Description

If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has term1, term2, and term3, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has term1 and term2. Also assume that term2 has a policer action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit term1 or term2 in any way, the counter for the policer referenced by term2 is reset to 0.

### *Solution*

This is expected behavior.

## Cannot Include loss-priority and policer Actions in Same Term

### IN THIS SECTION

- [Problem | 1693](#)
- [Solution | 1693](#)

### *Problem*

#### **Description**

You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- loss-priority
- policer

If you do so, you see the following error message when you attempt to commit the configuration:  
“cannot support policer action if loss-priority is configured.”

#### *Solution*

This is expected behavior.

#### **Cannot Egress Filter Certain Traffic Originating on QFX Switch**

##### **IN THIS SECTION**

- [Problem | 1693](#)
- [Solution | 1693](#)

### *Problem*

#### **Description**

On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

#### *Solution*

This is expected behavior.

## Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

### IN THIS SECTION

- [Problem | 1694](#)
- [Solution | 1694](#)

### *Problem*

#### Description

If you create a firewall filter that includes a match condition of `dot1q-tag` or `dot1q-user-priority` and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

### *Solution*

This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the `[edit ethernet-switching-options]` hierarchy level. You must also configure the other end of the link to use the same EtherType.

## Egress Firewall Filters with Private VLANs

### IN THIS SECTION

- [Problem | 1695](#)
- [Solution | 1695](#)

## ***Problem***

### **Description**

If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

### ***Solution***

These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

## Egress Filtering of L2PT Traffic Not Supported

### IN THIS SECTION

- [Problem | 1696](#)
- [Solution | 1696](#)

### *Problem*

#### Description

Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

### *Solution*

This is expected behavior.

## Cannot Drop BGP Packets in Certain Circumstances

### IN THIS SECTION

- [Problem | 1696](#)
- [Solution | 1697](#)

### *Problem*

#### Description

BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

### *Solution*

This is expected behavior.

#### Invalid Statistics for Policer

##### IN THIS SECTION

● Problem | [1697](#)

● Solution | [1697](#)

### *Problem*

#### Description

If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the `show firewall` command displays incorrect data for the policer.

### *Solution*

This is expected behavior.

#### Policers can Limit Egress Filters

##### IN THIS SECTION

● Problem | [1697](#)

● Solution | [1698](#)

### *Problem*

#### Description

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry

TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

### ***Solution***

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Overview of Firewall Filters (QFX Series)

### IN THIS SECTION

- [Where You Can Apply Filters | 1700](#)
- [What Makes up a Firewall Filter | 1701](#)
- [How Firewall Filters are Processed | 1701](#)

Firewall filters, sometimes called *access control lists* (ACLs), provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure more actions on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received).

You can configure firewall filters to determine where to accept or discard a packet before it enters or exits a port, VLAN, Layer 2 CCC, Layer 3 (routed) interface, Routed VLAN interface (RVI), or MPLS interface.

An *ingress (input) firewall filter* is applied to packets that are entering an interface or VLAN, and an *egress (output) firewall filter* is applied to packets that are exiting an interface or VLAN.

**NOTE:** Policers on network port, layer 2 and layer 3, or IRB interfaces do not police host-bound traffic. But if you want to prevent DDoS attacks, then you can create a firewall filter on the lo0 that protects the routing engine.

### Where You Can Apply Filters

After you configure the firewall filter, you can apply it to the following:

- Port—Filters Layer 2 traffic transiting system ports.
- VLAN—Filters and provides access control for Layer 2 packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN.
- Layer 3 (routed) interface—Filters traffic on IPv4 and IPv6 interfaces, routed VLAN interfaces (RVI), and the loopback interface. The loopback interface filters traffic sent to the switch itself or generated by the switch.

- Layer 2 CCC interface—Filters Layer 2 circuit cross-connect (CCC) interfaces.
- MPLS—Filters MPLS interfaces.

You can also apply a firewall filter to a management interface (for example, me0) on a QFX and EX4600 standalone switch. You can't apply a filter to a management interface on a QFX3000-G or QFX3000-M system.

**NOTE:** You can apply only one firewall filter to a port, VLAN, or Layer 2 CCC interface for a given direction. For example, for interface ge-0/0/6.0, you can apply one filter for the ingress direction and one for the egress direction.

- (QFX Series) Starting with Junos OS Release 13.2X51-D15, you can apply a filter to a loopback interface in the egress direction.
- (QFX10000) Starting with Junos OS Release 18.2R1, you can apply ingress and egress firewall filters with count and discard as policer actions on Layer 2 circuit interfaces.
- (QFX10002-36Q, QFX10002-72Q, QFX10002-60C, QFX10008, QFX10016, PTX10008, PTX10016) Starting with Junos OS Release 19.2R1, you can apply the interface, forwarding-class, and loss-priority match conditions in the egress direction on IPv4 and IPv6 interfaces.

## What Makes up a Firewall Filter

When you configure a firewall filter, you define the family address type (ethernet-switching, inet (for IPv4), inet6 (for IPv6), circuit cross-connect (CCC), or MPLS), the filtering criteria (terms, with match conditions,) and the action to take if a match occurs.

Each term consists of the following

- Match condition—Values that a packet must contain to be considered a match. You can specify values for most fields in the IP, TCP, UDP, or ICMP headers. You can also match on interface names.
- Action—Action taken if a packet matches a match condition. You can configure a firewall filter to accept, discard, or reject a matching packet and then perform more actions, such as counting, classifying, and policing. The default action is accept.

## How Firewall Filters are Processed

If there are multiple terms in a filter, the order of the terms is important. If a packet matches the first term, the switch takes the action defined by that term, and no other terms are evaluated. If the switch doesn't find a match between the packet and the first term, it compares the packet to the next term. If no match occurs between the packet and the second term, the system continues to compare the packet

to each successive term in the filter until a match is found. If no terms are matched, the switch discards the packet by default.

#### Release History Table

| Release     | Description                                                                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.2R1      | (QFX10002-36Q, QFX10002-72Q, QFX10002-60C, QFX10008, QFX10016, PTX10008, PTX10016) Starting with Junos OS Release 19.2R1, you can apply the interface, forwarding-class, and loss-priority match conditions in the egress direction on IPv4 and IPv6 interfaces. |
| 18.2R1      | (QFX10000) Starting with Junos OS Release 18.2R1, you can apply ingress and egress firewall filters with count and discard as policer actions on Layer 2 circuit interfaces.                                                                                     |
| 13.2X51-D15 | (QFX Series) Starting with Junos OS Release 13.2X51-D15, you can apply a filter to a loopback interface in the egress direction.                                                                                                                                 |

## Understanding Firewall Filter Planning

Before you create a *firewall filter* and apply it, determine what you want the filter to accomplish and how to use its match conditions and actions to achieve your goals. It is important that you understand how packets are matched, the default and configured actions of the firewall filter, and where to apply the firewall filter.

You can apply no more than one firewall filter per port, VLAN, or router interface per direction (input and output). For example, for a given port you can apply at most one filter in the input direction and one

filter in the output direction. You should try to be conservative in the number of terms (rules) that you include in each firewall filter, because a large number of terms requires longer processing time during a commit operation and can make testing and troubleshooting more difficult.

Before you configure and apply firewall filters, answer the following questions for each of them:

**1. What is the purpose of the filter?**

For example, the system can drop packets based on header information, rate-limit traffic, classify packets into forwarding classes, log and count packets, or prevent denial-of-service attacks.

**2. What are the appropriate match conditions? Determine the packet header fields that the packet must contain for a match. Possible fields include:**

- Layer 2 header fields—Source and destination MAC addresses, 802.1Q tag, Ethernet type, or VLAN.
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, or TTL type).
- TCP header fields—Source and destination ports and flags.
- ICMP header fields—Packet type and code.

**3. What are the appropriate actions to take if a match occurs?**

The system can accept, discard, or reject packets.

**4. What additional action modifiers might be required?**

For example, you can configure the system to mirror (copy) packets to a specified port, count matching packets, apply traffic management, or police packets.

**5. On what port, router interface, or VLAN should the firewall filter be applied?**

Start with the following basic guidelines:

- If packets entering or leaving a Layer 2 interface (port) need to be filtered, apply the filter at the [edit family ethernet switching filter] hierarchy level. This is a port filter.
- If packets entering or leaving any port in a specific VLAN need to be filtered, use a VLAN filter.
- If packets entering or leaving a Layer 3 (routed) interface or *routed VLAN interface (RVI)* need to be filtered, use a router firewall filter. Apply the filter to the interface at the [edit family inet] hierarchy level. You can also apply a router firewall filter on a loopback interface.

Before you choose the interface or VLAN on which to apply a firewall filter, understand how that placement can affect traffic flow to other interfaces. In general, apply a filter close to the source device if the filter matches on source or destination IP addresses, IP protocols, or protocol

information—such as ICMP message types, and TCP or UDP port numbers. However, you should apply a filter close to the destination device if the filter matches *only* on a source IP address. When you apply a filter too close to the source device, the filter could prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You typically configure different actions for traffic entering an interface than you configure for traffic exiting an interface.

7. How many filters should I create?

See "[Planning the Number of Firewall Filters to Create](#)" on page 1704 for information about how many firewall filters you can apply.

## Maximum Number of Supported Firewall Filters

Table 94 on page 1705 shows the maximum number of *firewall filters* that each switch supports. The total number of filters are applied in aggregate. For example, on the QFX5200 and QFX5210 switches, you can apply a total of 768 terms in the input direction and 1024 terms in the output direction. The actual number of filters that a switch supports depends on how the filters are stored in ternary content addressable memory (TCAM).

For for QFX5120-48Y and EX4650 switches running Junos OS Release 20.3R1 or later, you can enable the [set chassis [loopback-firewall-optimization](#) command to increase the default system limit for loopback filter terms to 768 for IPv6, and 1152 terms for IPv4.

**Table 94: Maximum Number of Supported Firewall Filters**

| Filter Type | QFX3500,<br>QFX3600 | QFX5100,<br>EX4600 | QFX5120,<br>EX4650 | QFX5110         | QFX5200,<br>QFX5210,<br>QFX5220 | QFX10000 |
|-------------|---------------------|--------------------|--------------------|-----------------|---------------------------------|----------|
| Ingress     | 768                 | 1536               | 1536               | 6144            | 768                             | 8192     |
| Egress      | 1024                | 1024               | 2048               | 1024 or<br>2048 | 1024<br><br>512<br>(QFX5220)    | 8192     |

## How to Increase the Number of Firewall Filters

You can increase the number of firewall filters on your device several ways:

- (QFX5220) To create more than 512 egress VLAN filters, specify the first VLAN ID as 6, the second VLAN ID as 7, the third VLAN ID as 5 and so forth. For each VLAN that you configure, the number increases by 1 and continues through VLAN ID 1029. If you want to create fewer than 512 egress VLAN filters, but want the total number of terms in those filters to be more than 512, make sure that you number your VLAN IDs this same way. Otherwise, the total number of allowed terms or filters will be less than 1024 and will remain at 512.

- Starting in Junos OS Release 19.1R1, you can increase the number of egress VLAN firewall filters on the QFX5110 from 1024 to 2048 by using the `egress-to-ingress` option. You include this option under the `from` statement at the `[edit firewall]` hierarchy.

Starting in Junos OS Evolved Release 19.4R2, you can configure up to 2000 egress firewall filters on the QFX5220 by including the `egress-scale` option under the `erACL-profile` statement at the `[edit system packet-forwarding-option firewall]` hierarchy level. This feature is supported only in the egress direction (routed traffic exiting the device).

Consider this following when configuring this feature:

- You cannot apply filters with the same match conditions to different egress VLANs or Layer 3 interfaces.
- You cannot apply egress scaling on GRE interfaces.
- If a packet matches multiple filters with different qualifiers and you apply on different egress interfaces, this can lead to unpredictable behavior.
- You can only configure the `egress-scale` option in global mode. The new cli configuration will be provided in global mode. Once a user configures ERACL group in `egress-scale` (egress to ingress) mode, he will not be able to configure ERACL the older way i.e., without using IFP tcam space. In other words, ERACL in mixed mode will not be supported.

## TCAM

Ternary content addressable memory (TCAM) for firewall filters is divided into slices that accommodate 256 terms. When you configure a firewall filter, all terms in a memory slice must be in filters of the same type and applied in the same direction. A memory slice is reserved as soon as you commit a filter. For example, if you create a port filter and apply it in the input direction, a memory slice is reserved that only stores ingress port filters. If you create and apply only one ingress port filter and that filter has only one term, the rest of this slice is unused and is unavailable for other filter types.

**NOTE:** In an EVPN environment, QFX5200 Series switches support up to 512 TCAM entries.

For example, let's say that you create and apply 256 ingress port filters with one term each so that one memory slice is filled. This leaves two more memory slices available for ingress filters. (In this case, the maximum number of ingress terms is 768.) If you then create and apply an ingress Layer 3 filter with one term, another memory slice is reserved for ingress Layer 3 filters. As before, the rest of the slice is unused and is unavailable for different filter types. Now there is one memory slice available for any ingress filter type.

Now assume that you create and apply a VLAN ingress filter. The final memory slice is reserved for VLAN ingress filters. Memory allocation for ingress filters (once again assuming one term per filter) is:

- Slice 1: Filled with 256 ingress port filters. You cannot commit any more ingress port filters.
- Slice 2: Contains one ingress Layer 3 filter with one term. You can commit 255 more terms in ingress Layer 3 filters.
- Slice 3: Contains one ingress VLAN filter with one term. You can commit 255 more terms in ingress VLAN filters.

Here is another example. Assume that you create 257 ingress port filters with one term per filter—that is, you create one more term than a single memory slice can accommodate. When you apply the filters and commit the configuration, the filter memory allocation is:

- Slice 1: Filled with 256 ingress port filters. You cannot apply any more ingress port filters.
- Slice 2: Contains one ingress port filter. You can apply 255 more terms in ingress port filters.
- Slice 3: This slice is unassigned. You can create and apply 256 terms in ingress filters of any type (port, Layer 3, or VLAN), but all the filters must be of the same type.

**NOTE:** All of the above examples also apply to egress filters. The difference is that four memory slices are used because IPv4 and IPv6 Layer 3 filters are stored in separate slices. The memory slices for egress filters are the same size as those for ingress filters, so the maximum number of filters will be the same (1024).

## Avoid Configuring too Many Filters

If you violate any of these restrictions and commit a configuration that is not in compliance, Junos OS rejects the excessive filters. For example, if you configure 300 ingress port filters and 300 ingress Layer 3 filters and try to commit the configuration, Junos OS does the following (again assuming one term per filter):

- Accepts the 300 ingress port filters (storing them in two memory slices).
- Accepts the first 256 ingress Layer 3 filters it processes (storing them in the third memory slice).
- Rejects the remaining 44 ingress Layer 3 filters.

**NOTE:** Make sure that you delete the excessive filters (for example, the remaining 44 ingress Layer 3 filters) from the configuration before you reboot the device. If you reboot a device that has a noncompliant configuration, it's hard to predict which filters were installed after the reboot. Using the example above, the 44 ingress Layer 3 filters that were originally rejected might be installed, and 44 of the port filters that were originally accepted might be rejected.

## Configuring TCAM Error Messages

If you lack TCAM space and are unable to install a firewall filter, you can configure your switch to send error messages the following ways:

- Enter `set system syslog file filename pfe emergency` to send error messages to a syslog file.
- Enter `set system syslog console pfe emergency` to send error messages to the console.
- Enter `set system syslog user user-login pfe emergency` to send error messages to an SSH terminal session.

## How to Increase the Scale of Firewall Filters Using Profiles

When you configure a firewall filter, the term statement in the firewall filter configuration provides an extensive set of match conditions. Match conditions are the fields and values that a packet must contain to be considered a match. You can define a single or multiple match conditions based on your requirement. When a packet matches a filter, the device takes the action specified in the term. The scalability of firewall filters generally depends on the number of match conditions used.

In typical deployment scenarios, you will only need to use a subset of match conditions. With the introduction of profiles, you can use one of the available firewall filter profiles with pre-defined match conditions to increase the number of firewall filters used to achieve maximum scale.

You can configure firewall filters profiles for family inet and Ethernet-based switching. Use the profiles configuration statement at the [edit system packet-forwarding-options firewall] hierarchy level to configure firewall filter profiles.

**NOTE:** When you make changes to the firewall filter profiles, either by selecting a profile, or moving from one profile to another, the packet forwarding engine is restarted, which causes disruption to the traffic flow.

The following table describes the firewall filter profiles and the pre-defined match conditions for inet and Ethernet-based switching.

Table 95: Firewall Filter Profile and Match Conditions

| Family Type      | Firewall Filter Profiles | Match Condition (pre-defined)                                                                                                                                                                                      | Configuration Hierarchy                                                       |
|------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|

|             |                          |                                                                                                                                                                            |                                                                                       |

**NOTE:** When you select a firewall filter profile, you must apply a match condition that is part of the pre-defined match condition subset. If you apply a match condition that is not part of the pre-defined match condition subset of the firewall filter profile, then a commit error occurs. For example, if you select profile1 for inet filter and apply the match condition as ip-destination-address, which is not part of the pre-defined match condition, then you will see an error during the commit operation stating that the ip-destination-address match is not part of profile1 for inet filter.

You can use the `show pfe filter hw profile-info` CLI command to view the details of the firewall filter profiles.

To achieve maximum firewall filter scale, it is recommended to apply interface level (Layer 2 or Layer 3) filters and distribute the filters equally across the interfaces of different packet processing pipelines. Each set of interfaces is mapped to a packet processing pipeline which handles the packets received on those interfaces. In this case, the firewall filters are installed to the packet processing pipeline's TCAM memory space mapped to the respective interface.

When a packet enters an interface, the firewall filter performs filtering actions on the packet in the packet processing pipeline based on the match conditions before exiting an egress interface. In the case of multiple packet processing pipelines, when packets enter a device through multiple interfaces, the

firewall filter performs filtering actions on the packets passing through the respective packet processing pipelines. Having the interface level filters distributed equally across the interfaces of different packet processing pipelines gives better scale

You can use the `show pfe filter hw port-pipe-info` CLI command to view the details of the packet processing pipeline that each physical interface is mapped to. The output of this CLI command also provides information about the firewall filters installed on a packet processing pipeline. You can use this information to plan and distribute firewall filters across pipelines to achieve maximum scale.

The following sample output of the `show pfe filter hw port-pipe-info` CLI command shows the details of the packet processing pipeline that each physical interface is mapped to:

```
user@host> show pfe filter hw port-pipe-info
IFD Pipe
et-0/0/0 1
et-0/0/1 1
...
et-0/0/10 0
```

## How Policers can Limit Egress Filters

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some more examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.

- Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can stop this problem from happening by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Planning for Filter-Specific Policers

You can configure policers to be filter-specific. This means that Junos OS creates only one policer instance no matter how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from happening, use the information about TCAM slices above to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Planning for Filter-Based Forwarding

You can use firewall filters along with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature—called filter-based forwarding, you specify a filter and match criteria and then specify the virtual routing instance to send packets to. Filters used in this way also consume memory in an additional TCAM. See [Understanding FIP Snooping, FBF, and MVR Filter Scalability](#) for more information. The section *FBF Filter VFP TCAM Consumption* in this topic specifically addresses the number of supported filters when using filter-based forwarding.

**NOTE:** Filter-based forwarding does not work with IPv6 interfaces on some Juniper switches.

Release History Table

| Release    | Description                                                                                                                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.4R2-EVO | Starting in Junos OS Evolved Release 19.4R2, you can configure up to 2000 egress firewall filters on the QFX5220 by including the egress-scale option under the <a href="#">eracl-profile</a> statement at the [edit system packet-forwarding-option firewall] hierarchy level. |
| 19.1R1     | Starting in Junos OS Release 19.1R1, you can increase the number of egress VLAN firewall filters on the QFX5110 from 1024 to 2048 by using the egress-to-ingress option.                                                                                                        |

Firewall Filter Match Conditions and Actions (QFX and EX Series Switches)

IN THIS SECTION

- Firewall Filter Match Conditions and Actions (EX4400, EX4600, EX4650, QFX5100, QFX5110, QFX5120, QFX5200, QFX5210, QFX5700) | 1715
- Firewall Filter Match Conditions and Actions (QFX5220 and the QFX5130-32CD) | 1740

## Firewall Filter Match Conditions and Actions (EX4400, EX4600, EX4650, QFX5100, QFX5110, QFX5120, QFX5200, QFX5210, QFX5700)

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, a switch takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the switch accepts the packet by default.

- [Table 96 on page 1716](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.
- [Table 97 on page 1735](#) shows the actions that you can specify in a term.
- [Table 98 on page 1737](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

For match conditions on specific switches, these limitations apply:

---

(QFX5100, QFX5110, QFX5200) When using filter-based forwarding on IPv6 interfaces, only these match conditions are supported in the (ingress direction): source-address, destination-address, source-prefix-list, destination-prefix-list, source-port, destination-port, hop-limit, icmp-type, and next-header.

---

(QFX5110) When you enable the egress-to-ingress option under the [edit firewall] hierarchy, only accept, discard, and count actions are supported.

---

(QFX5100, QFX5110, QFX5120, QFX5130-32CD, QFX5220, QFX5700) In an EVPN-VXLAN environment, only these match conditions are supported: source-address, destination-address, source-port, destination-port, ttl, ip-protocol, and user-vlan-id.

---

(QFX5100, QFX5110, QFX5200) You cannot apply a firewall filter in the egress direction on a EVPN-VXLAN IRB interface.

---

(QFX5700) You cannot apply a firewall filter in the egress direction on a loopback interface.

---

(QFX5100, QFX5110) If you are using firewall filters to implement MAC filtering in an EVPN-VXLAN environment, see [MAC Filtering, Storm Control, and Port Mirroring Support in an EVPN-VXLAN Environment](#) for the supported match conditions.

(QFX5100, QFX5110) For each firewall filter that you apply to a VXLAN, you can specify family ethernet-switching to filter Layer 2 (Ethernet) packets, or family inet to filter on IRB interfaces. You cannot apply a firewall filter in the egress direction on IRB interfaces.

On switches that do not support Layer 2 features, use only those match conditions that are valid for IPv4 and IPv6 interfaces.

(QFX5120, EX4650) Starting with Junos Release 21.4R1, the following match conditions are supported in an EVPN-VXLAN environment on QFX5120, and EX4650: gbp-src-tag, and gbp-dst-tag.

Starting in Junos OS Release 21.4R1, the source-port-range-optimize and the destination-port-range-optimize conditions are supported under [edit firewall family ethernet-switching filter <filter-name> term <term-name> from] hierarchy level. This considerably reduces the TCAM space usage. In QFX5100 switches with source-port-range-optimize and destination-port-range-optimize match conditions configured, upto 24 non-contiguous source-port range and destination-port range match conditions are supported. If more than 24 non-contiguous match conditions are configured, it might throw an error.

**Table 96: Supported Match Conditions for Firewall Filters**

| Match Condition                            | Description                                                                       | Direction and Interface                                                                                                                       |
|--------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| arp-type                                   | ARP request packet or ARP reply packet.                                           | Egress and ingress interfaces.                                                                                                                |

|                        | <p>network-prohibited (9),<br/> destination-host-prohibited (10),<br/> network-unreachable-for-TOS (11),<br/> host-unreachable-for-TOS (12),<br/> communication-prohibited-by-filtering (13), host-precedence-violation (14), precedence-cutoff-in-effect (15)</p> <ul style="list-style-type: none"> <li>• <i>IPv6</i>: unreachable—address-unreachable (3), administratively-prohibited (1), no-route-to-destination (0), port-unreachable (4)</li> </ul> |                                                                                                                                                                                                 |
| hop-limit <i>value</i> | Match the specified hop limit or set of hop limits. Specify a single value or a range of values from 0 through 255.                                                                                                                                                                                                                                                                                                                                         | <p>Ingress and egress IPv6 (inet6) interfaces.</p> <p><b>NOTE:</b> Not supported in the egress direction on the QFX3500, QFX3600, QFX5100, QFX5120, QFX5110, QFX5200, and QFX5210 switches.</p> |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Direction and Interface                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>icmp-type value</code> | <p>ICMP message type field. Typically, you specify this match in conjunction with the protocol match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4</i>: echo-reply (0), destination unreachable (3), source-quench (4), redirect (5), echo-request (8), IPv4 (inet)-advertisement (9), IPv4 (inet)-solicit (10), time-exceeded (11), parameter-problem (12), timestamp (13), timestamp-reply (14), info-request (15), info-reply (16), mask-request (17), mask-reply (18)</p> <p><i>IPv6</i>: destination-unreachable (1), packet-too-big (2), time-exceeded (3), parameter-problem (4), echo-request (128), echo-reply (129), membership-query (130), membership-report (131), membership-termination (132), router-solicit (133), router-advertisement (134), neighbor-solicit (135), neighbor-advertisement (136), redirect (137), router-renumbering (138), node-information-request (139), node-information-reply (140)</p> <p>See also <code>icmp-code variable</code>.</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition                          | Description                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                                                                             |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| interface <i>interface-name</i>          | <p>Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.</p> <p><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.</p>                                             | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p> |
| ip-destination-address <i>address</i>    | IPv4 address that is the final destination node address for the packet.                                                                                                                                                                                                                                              | Ingress ports and VLANs.                                                                                                                            |
| ip6-destination-address <i>address</i>   | IPv6 address that is the final destination node address for the packet.                                                                                                                                                                                                                                              | Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.)   |
| ip-options                               | Specify any to create a match if anything is specified in the options field in the IP header.                                                                                                                                                                                                                        | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                      |
| ip-precedence <i>ip-precedence-field</i> | <p>IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): critical-ecp (0xa0), flash (0x60), flash-override (0x80), immediate (0x40), internet-control (0xc0), net-control (0xe0), priority (0x20), or routine (0x00).</p> | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                      |

**Table 96: Supported Match Conditions for Firewall Filters (*Continued*)**

| Match Condition                         | Description                                                                                                                                   | Direction and Interface                                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ip-protocol number</code>         | IP protocol field.                                                                                                                            | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                                           |
| <code>ip-source-address address</code>  | IPv4 address of the source node sending the packet.                                                                                           | Ingress ports and VLANs.                                                                                                                          |
| <code>ip6-source-address address</code> | IPv6 address of the source node sending the packet.                                                                                           | Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.) |
| <code>ip-version address</code>         | IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface. | Ingress ports and VLANs.                                                                                                                          |
| <code>is-fragment</code>                | Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.             | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                                           |
| <code>l2-encap-type llc-non-snap</code> | Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.                          | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                           |
| <code>label</code>                      | Match on MPLS label bits.                                                                                                                     | Ingress MPLS interfaces.<br><br>Egress MPLS interfaces.                                                                                           |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition             | Description                                                                                                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| learn-vlan-id <i>number</i> | <p>Matches the ID of a normal VLAN or the ID of the outer (service) VLAN (for Q-in-Q VLANs). The acceptable values are 1-4095.</p> <p><b>NOTE:</b> Not supported on QFX3600, QFX5100, QFX5110, QFX5120, QFX5200, QFX5210, QFX5220, EX4600, EX4650, EX4400, EX4100 and EX4300-MP switches. Use the user-vlan-id match condition to match the outer VLAN ID.</p>                                                                       | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                               |
| next-header                 | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</p> | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>             |
| packet-length               | <p>Packet length in bytes. You must enter a value between 0 and 65535.</p>                                                                                                                                                                                                                                                                                                                                                           | <p>Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Direction and Interface                                                                                      |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| payload-protocol | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</p> <p><b>NOTE:</b> Not supported on the QFX3500, QFX3600, QFX5100, QFX5110, QFX5200, QFX5210 switches.</p> | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>             |
| Port qualifier   | <p>The port qualifier will install two entries in the packet forwarding engine. One with the source-port and second one with the destination-port.</p>                                                                                                                                                                                                                                                                                                                                                                                       | <p>Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| precedence <i>value</i> | <p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <ul style="list-style-type: none"> <li>• routine (0)</li> <li>• priority (1)</li> <li>• immediate (2)</li> <li>• flash (3)</li> <li>• flash-override (4)</li> <li>• critical-ecp (5)</li> <li>• internet-control (6)</li> <li>• net-control (7)</li> </ul> | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| protocol <i>type</i>    | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6, igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</p>                                                                                      | <p>Ingress ports, VLANs and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>  |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Direction and Interface                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| <code>rat-type tech-type-value</code> | <p>Match the radio-access technology (RAT) type specified in the 8-bit Tech-Type field of Proxy Mobile IPv4 (PMIPv4) access technology type extension. The technology type specifies the access technology through which the mobile device is connected to the access network. Specify a single value, a range of values, or a set of values. You can specify a technology type as a numeric value from 0 through 255 or as a system keyword.</p> <ul style="list-style-type: none"> <li>• Numeric value 1 matches IEEE 802.3.</li> <li>• Numeric value 2 matches IEEE 802.11a/b/g.</li> <li>• Numeric value 3 matches IEEE 802.16e</li> <li>• Numeric value 4 matches IEEE 802.16m.</li> <li>• Text string eutran matches 4G.</li> <li>• Text string geran matches 2G.</li> <li>• Text string utran matches 3G.</li> <li>•</li> </ul> | Egress and ingress IPv4 (inet) interfaces. |
| <code>sample</code>                   | Sample the packet traffic. Apply this option only if you have enabled traffic sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Egress and ingress IPv4 (inet) interfaces. |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition                         | Description                                                                                                                                                                                                                                                | Direction and Interface                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| source-address <i>ip-address</i>        | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                            | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| source-mac-address <i>mac-address</i>   | Source media access control (MAC) address of the packet.                                                                                                                                                                                                   | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                          |
| source-port <i>value</i>                | TCP or UDP source port. Typically, you specify this match in conjunction with the protocol match statement. In place of the numeric field, you can specify one of the text synonyms listed under destination-port.                                         | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| source-port range-optimize <i>range</i> | Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual source ports. (Not supported with filter-based forwarding.) | Ingress ports, VLANs, IPv4 (inet) interfaces.                                                                    |
| source-prefix-list <i>prefix-list</i>   | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the [edit policy-options] hierarchy level.                                                                             | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Direction and Interface                                                                                                 |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| tcp-established        | <p>Matches packets of an established TCP three-way handshake connection (SYN, SYN-ACK, ACK). The only packet not matched is the first packet of the handshake since only the SYN bit is set. For this packet, you must specify <code>tcp-initial</code> as the match condition.</p> <p>When you specify <code>tcp-established</code>, the switch does not implicitly verify that the protocol is TCP. You must also specify the protocol <code>tcp</code> match condition.</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| tcp-flags <i>value</i> | <p>One or more TCP flags:</p> <ul style="list-style-type: none"> <li>• <code>ack (0x10)</code></li> <li>• <code>fin (0x01)</code></li> <li>• <code>push (0x08)</code></li> <li>• <code>rst (0x04)</code></li> <li>• <code>syn (0x02)</code></li> <li>• <code>urgent (0x20)</code></li> </ul>                                                                                                                                                                                   | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| tcp-initial            | <p>Match the first TCP packet of a connection. A match occurs when the TCP flag SYN is set and the TCP flag ACK is not set.</p> <p>When you specify <code>tcp-initial</code>, a switch does not implicitly verify that the protocol is TCP. You must also specify the protocol <code>tcp</code> match condition.</p>                                                                                                                                                           | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 96: Supported Match Conditions for Firewall Filters (*Continued*)

| Match Condition                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| traffic-class                      | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</p> | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p> |
| ttl <i>value</i>                   | <p>IP Time-to-live (TTL) field in decimal. The value can be 1-255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                     |
| user-vlan-1p-priority <i>value</i> | <p>Matches the specified 802.1p VLAN priority in the range 0-7.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Ingress and egress ports and VLANs.</p>                                                       |

**Table 96: Supported Match Conditions for Firewall Filters *(Continued)***

| Match Condition            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Direction and Interface             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| user-vlan-id <i>number</i> | <p>Matches the ID of the inner (customer) VLAN for a Q-in-Q VLAN. The acceptable values are 1-4095.</p> <p><b>NOTE:</b> For QFX3600, QFX5100, QFX5110, QFX5120, QFX5200, QFX5210, EX4600, EX4650, EX4400, EX4100 and EX4300-MP switches, use user-vlan-id to match the ID of the outer VLAN.</p> <p>For QFX5220 Series switches, and MX and ACX Series routers, use <i>learn-vlan-id</i> to match the ID of the outer VLAN, and user-vlan-id to match the ID of the inner VLAN.</p> <p>Previously, you could use user-vlan-id to match the outer VLAN ID.</p> | Ingress and egress ports and VLANs. |

Use then statements to define actions that should occur if a packet matches all conditions in a from statement. [Table 97 on page 1735](#) shows the actions that you can specify in a term. (If you do not include a then statement, the system accepts packets that match the filter.)

**Table 97: Actions for Firewall Filters**

| Action  | Description                                                                                    |
|---------|------------------------------------------------------------------------------------------------|
| accept  | Accept a packet. This is the default action for packets that match a term.                     |
| discard | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message. |

Table 97: Actions for Firewall Filters (*Continued*)

| Action                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reject <i>message-type</i>            | <p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the syslog action modifier.</p> <p>You can specify one of the following message types: administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unknown, host-unreachable, network-prohibited, network-unknown, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed, or tcp-reset.</p> <p>If you specify tcp-reset, the system sends a TCP reset if the packet is a TCP packet; otherwise nothing is sent.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The reject action is supported on ingress interfaces only.</p> |
| routing-instance <i>instance-name</i> | Forward matched packets to a virtual routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| vlan <i>VLAN-name</i>                 | <p>Forward matched packets to a specific VLAN.</p> <p><b>NOTE:</b> The vlan action is supported on ingress interfaces only.</p> <p><b>NOTE:</b> This action is not supported on OCX series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

You can also specify the action modifiers listed in [Table 98 on page 1737](#) to count, mirror, rate-limit, and classify packets.

Table 98: Action Modifiers for Firewall Filters

| Action Modifier                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| analyzer <i>analyzer-name</i>                | <p>(Non-ELS platforms) Mirror traffic (copy packets) to an analyzer configured at the [edit ethernet-switching-options analyzer] hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| count <i>counter-name</i>                    | Count the number of packets that match the term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| decapsulate [gre   <i>routing-instance</i> ] | De-encapsulate GRE packets or forward de-encapsulated GRE packets to the specified routing instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| dscp <i>value</i>                            | <p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• be—best effort (default)</li> <li>• ef (46)—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• af11 (10), af12 (12), af13 (14);<br/>af21 (18), af22 (20), af23 (22);<br/>af31 (26), af32 (28), af33 (30);<br/>af41 (34), af42 (36), af43 (38)</li> </ul> <p>These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</p> <ul style="list-style-type: none"> <li>• cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</li> </ul> |

# Firewall Filter Match Conditions and Actions (QFX5220 and the QFX5130-32CD)

This topic describes the supported firewall filter match conditions, actions, and action modifiers for the QFX5220-CD, QFX5220-128C, and QFX5130-32CD switches.

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, a switch takes the action specified in the term. If you apply no match condition, the switch accepts the packet by default.

- [Table 99 on page 1740](#) shows the match conditions for IPv4 (*inet*) and the IPv6 (*inet6*) interfaces. It also contains the match conditions for ports and VLANs (*ethernet-switching*).
- [Table 100 on page 1755](#) shows the actions and the action modifiers that you can specify in a term.

**NOTE:** For match conditions, some of the numeric range and the bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches)

| Match Condition                           | Description                                                                       | Direction and Interface                                                    |
|-------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| arp-type                                  | ARP request packet or an ARP reply packet.                                        | Ingress and egress ports and VLANs                                         |
| destination-addresses <i>ip-addresses</i> | IP destination address field, which is the address of the final destination node. | Ingress and egress IPv4 and IPv6 interfaces<br><br>Ingress ports and VLANs |

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) *(Continued)*

| Match Condition                                | Description                            | Direction and Interface            |
|------------------------------------------------|----------------------------------------|------------------------------------|
| destination-mac-addresses <i>mac-addresses</i> | Destination MAC address of the packet. | Ingress and egress ports and VLANs |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Direction and Interface                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| destination-port <i>value</i> | <p>TCP or UDP destination port field. You must specify this match with the protocol match statement for IPv4 traffic, or the next-header match statement for IPv6 traffic.</p> <p>For the following well-known ports and port numbers you can specify text synonyms.</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cmd (514), cvspserver (2401),</p> <p>dhcp (67), domain (53),</p> <p>eklogin (2105), ekshell (2106), exec (512),</p> <p>finger (79), ftp (21), ftp-data (20),</p> <p>http (80), https (443),</p> <p>ident (113), imap (143),</p> <p>kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544),</p> <p>ldap (389), login (513),</p> <p>mobileip-agent (434), mobilip-mn (435), msdp (639),</p> <p>netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123),</p> <p>pop3 (110), pptp (1723), printer (515),</p> <p>radacct (1813), radius (1812), rip (520), rkinit (2108),</p> <p>smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514),</p> <p>tacacs-ds (65), talk (517), telnet (23), tftp (69), timed (525),</p> <p>who (513),</p> | <p>Ingress and egress IPv4 interfaces</p> <p>Ingress IPv6 interfaces.</p> <p>Ingress ports and VLANs</p> |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition                       | Description                                                                                                                                                                                                                                                         | Direction and Interface                                                 |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
|                                       | xdmcp (177),<br>zephyr-clt (2103), zephyr-hm (2104)                                                                                                                                                                                                                 |                                                                         |
| destination-port-range-optimize-range | Match a range of the TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual destination ports. (Not supported with filter-based forwarding.) | Ingress IPv4 interfaces                                                 |
| destination-prefix-list-prefix-list   | IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the [edit policy-options] hierarchy level.                                                                           | Ingress and egress IPv4 and IPv6 interfaces<br>Ingress ports and VLANs. |

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)

| Match Condition | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Direction and Interface                                                  |

| ether-type value | <p>Ethernet type field of a packet. The EtherType value specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify one of the following text synonyms. The field values are also listed.</p> <ul style="list-style-type: none"> <li>• aarp (0x80F3)—EtherType value AARP</li> <li>• appletalk (0x809B)—EtherType value AppleTalk</li> <li>• arp (0x0806)—EtherType value ARP</li> <li>• fcoe (0x8906)—EtherType value FCoE</li> <li>• fip (0x8914)—EtherType value FIP</li> <li>• ipv4 (0x0800)—EtherType value IPv4</li> <li>• ipv6 (0x08DD)—EtherType value IPv6</li> <li>• mpls-multicast (0x8848)—EtherType value MPLS multicast</li> <li>• mpls-unicast (0x8847)—EtherType value MPLS unicast</li> <li>• oam (0x88A8)—EtherType value OAM</li> <li>• ppp (0x880B)—EtherType value PPP</li> <li>• pppoe-discovery (0x8863)—EtherType value PPPoE Discovery Stage</li> <li>• pppoe-session (0x8864)—EtherType value PPPoE Session Stage</li> <li>• sna (0x80D5)—EtherType value SNA</li> </ul> | Ingress and egress ports and VLANs |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Direction and Interface |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| first-fragment  | <p>Match if the packet is the first fragment of a fragmented packet. Avoiding matching the packet if it is a trailing fragment of a fragmented packet. The first fragment of a fragmented packet has a fragment offset value of 0.</p> <p>This match condition is an alias for the bit-field match condition fragment-offset 0 match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions: first-fragment and is-fragment.</p> | Ingress IPv4 interfaces |

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)

| Match Condition | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Direction and Interface                                                                                 |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| icmp-code value | <p>ICMP code field. Because the meaning of the value depends upon the associated icmp-type, you must specify a value for icmp-type along with a value for icmp-code. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <i>IPv4</i>: parameter-problem—ip-header-bad (0), required-option-missing (1)</li> <li>• <i>IPv6</i>: parameter-problem—ip6-header-bad (0), unrecognized-next-header (1), unrecognized-option (2)</li> <li>• redirect—redirect-for-network (0), redirect-for-host (1), redirect-for-tos-and-net (2), redirect-for-tos-and-host (3)</li> <li>• time-exceeded—ttl-eq-zero- during-reassembly (1), ttl-eq-zero-during-transit (0)</li> <li>• <i>IPv4</i>: unreachable—network-unreachable (0), host-unreachable (1), protocol-unreachable (2), port-unreachable (3), fragmentation-needed (4), source-route-failed (5), destination-network-unknown (6), destination-host-unknown (7), source-host-isolated (8), destination-network-prohibited (9), destination-host-prohibited (10), network-unreachable-for-TOS (11), host-unreachable-for-TOS (12), communication-prohibited-by-filtering (13), host-precedence-violation (14), precedence-cutoff-in-effect (15)</li> <li>• <i>IPv6</i>: unreachable—address-unreachable (3), administratively-prohibited (1), no-route-to-destination (0), port-unreachable (4)</li> </ul> | <p>Ingress and egress IPv4 interfaces</p> <p>Ingress IPv6 interfaces</p> <p>Ingress ports and VLANs</p> |

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)

| Match Condition             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Direction and Interface                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| icmp-type<br>value          | <p>ICMP message type field. You must specify this match along with the protocol match statement. This match determines which protocol is being used on the port for IPv4 traffic, or the next-header match statement for IPv6 traffic.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4:</i> echo-reply (0), destination unreachable (3), source-quench (4), redirect (5), echo-request (8), IPv4 (inet)-advertisement (9), IPv4 (inet)-solicit (10), time-exceeded (11), parameter-problem (12), timestamp (13), timestamp-reply (14), info-request (15), info-reply (16), mask-request (17), mask-reply (18)</p> <p><i>IPv6:</i> destination-unreachable (1), packet-too-big (2), time-exceeded (3), parameter-problem (4), echo-request (128), echo-reply (129), membership-query (130), membership-report (131), membership-termination (132), router-solicit (133), router-advertisement (134), neighbor-solicit (135), neighbor-advertisement (136), redirect (137), router-renumbering (138), node-information-request (139), node-information-reply (140)</p> <p>See also icmp-code <i>variable</i>.</p> | <p>Ingress and egress IPv4 interfaces</p> <p>Ingress IPv6 interfaces</p> <p>Ingress ports and VLANs</p> |
| interface<br>interface-name | <p>Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.</p> <p><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Ingress ports and VLANs                                                                                 |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                   | Direction and Interface |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| ip-destination-addresses          | IPv4 address that is the final destination node address for the packet.                                                                                                                                                                                                                                       | Ingress ports and VLANs |
| ip-options                        | Specify any to create a match if anything is specified in the options field in the IP header.                                                                                                                                                                                                                 | Ingress IPv4 interfaces |
| ip-protocol-number                | IP protocol field.                                                                                                                                                                                                                                                                                            | Ingress ports and VLANs |
| ip-precedence-ip-precedence-field | IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): critical-ecp (0xa0), flash (0x60), flash-override (0x80), immediate (0x40), internet-control (0xc0), net-control (0xe0), priority (0x20), or routine (0x00). | Ingress ports and VLANs |
| ip-source-addresses               | IPv4 address of the source node sending the packet.                                                                                                                                                                                                                                                           | Ingress ports and VLANs |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition              | Description                                                                                                                                                                                                                                                                                                                                                                                                                 | Direction and Interface                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| ip-version address           | IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface.                                                                                                                                                                                                                                                                               | Ingress ports and VLANs                                                               |
| is-fragment                  | Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.                                                                                                                                                                                                                                                                                           | Ingress and egress IPv4 interfaces (QX5220)<br><br>Ingress IPv4 interfaces (QFX5130)  |
| learn-vlan-id number         | VLAN identifier for MAC learning.                                                                                                                                                                                                                                                                                                                                                                                           | Ingress and egress ports and VLANs (QFX5220)<br><br>Ingress ports and VLANs (QFX5130) |
| learn-vlan-1p-priority value | Match on the IEEE 802.1p learned VLAN priority bits in the provider VLAN tag (the only tag in a single-tag frame with 802.1Q VLAN tags or the outer tag in a dual-tag frame with 802.1Q VLAN tags). Specify a single value or multiple values from 0 through 7.                                                                                                                                                             | Ingress ports and VLANs                                                               |
| next-header                  | IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):<br><br>hop-by-hop (0),icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44),rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132) | Ingress and egress IPv6 interfaces                                                    |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                             |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| packet - length  | Packet length in bytes. You must enter a value between 0 and 65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Ingress IPv4 and IPv6 interfaces                                                    |
| precedence value | <p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <ul style="list-style-type: none"> <li>• routine (0)</li> <li>• priority (1)</li> <li>• immediate (2)</li> <li>• flash (3)</li> <li>• flash-override (4)</li> <li>• critical-ecp (5)</li> <li>• internet-control (6)</li> <li>• net-control (7)</li> </ul> | Ingress and egress IPv4 interfaces                                                  |
| protocol type    | <p>IP protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6, igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132) tcp (4)</p>                                                                                        | <p>Ingress and egress IPv4 interfaces.</p> <p>Ingress IPv4 interfaces and VLANs</p> |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition                           | Description                                                                                                                                                                                                                                                                               | Direction and Interface                                                                          |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| source - address <i>ip-address</i>        | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                                                           | Ingress and egress IPv4 interfaces<br><br>Ingress IPv6 interfaces<br><br>Ingress ports and VLANs |
| source - mac-address <i>mac-address</i>   | Source media access control (MAC) address of the packet.                                                                                                                                                                                                                                  | Ingress and egress IPv4 interfaces and VLANs                                                     |
| source - port <i>value</i>                | TCP or UDP source port. You must specify this match in conjunction with the protocol match statement for IPv4 traffic, or the next-header match statement for IPv6 traffic.<br><br>In place of the numeric field, you can specify one of the text synonyms listed under destination-port. | Ingress and egress IPv4 interfaces<br><br>Ingress IPv6 interfaces<br><br>Ingress ports and VLANs |
| source - port range-optimize <i>range</i> | Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual source ports. (Not supported with filter-based forwarding.)                                | Ingress IPv4 interfaces                                                                          |
| source - prefix-list <i>prefix-list</i>   | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the [edit policy-options] hierarchy level.                                                                                                            | Ingress and egress IPv4 interfaces<br><br>Ingress IPv6 interfaces<br><br>Ingress ports and VLANs |

Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)

| Match Condition | Description                                                                                                                                                                                                                                                                                                   | Direction and Interface                                                                                                                          |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| tcp-established | <p>Match TCP packets of an established TCP session (packets other than the first packet of a connection). This is an alias for tcp-flags "(ack   rst)".</p> <p>This match condition does not implicitly check that the protocol is TCP. To check this, specify the protocol tcp match condition.</p>          | <p>Ingress and egress IPv4 interfaces (QFX5220)</p> <p>Ingress and egress IPv4 interfaces (QFX5130)</p> <p>Ingress IPv6 interfaces (QFX5130)</p> |
| tcp-flags value | <p>TCP flags (only one value is supported):</p> <ul style="list-style-type: none"> <li>• ack (0x10)</li> <li>• fin (0x01)</li> <li>• push (0x08)</li> <li>• rst (0x04)</li> <li>• syn (0x02)</li> <li>• urgent (0x20)</li> </ul>                                                                              | <p>Ingress and egress IPv4 interfaces</p> <p>Ingress IPv6 interfaces</p> <p>Ingress ports and VLANs</p>                                          |
| tcp-initial     | <p>Match the first TCP packet of a connection. A match occurs when the TCP flag SYN is set and the TCP flag ACK is not set.</p> <p>When you specify tcp-initial, a switch does not implicitly verify that the protocol is TCP. You must also specify the protocol tcp match condition. See protocol type.</p> | <p>Ingress and egress IPv4 interfaces (QFX5220)</p> <p>Ingress and egress IPv4 interfaces, Ingress IPv6 interfaces (QFX5130)</p>                 |

**Table 99: Supported Match Conditions (QFX5220 and QFX5130-32CD Switches) (Continued)**

| Match Condition             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface            |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| traffic-class               | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</p> | Ingress and egress IPv6 interfaces |
| ttl value                   | IP Time-to-live (TTL) field in decimal. The value can be 1-255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Ingress and egress IPv4 interfaces |
| user-vlan-id number         | Matches the ID of the inner (customer) VLAN for a Q-in-Q VLAN. The acceptable values are 1-4095.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Ingress ports and VLANs (QFX5130)  |
| user-vlan-1p-priority value | Matches the specified 802.1p VLAN priority in the range 0-7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Ingress ports and VLANs (QFX5130)  |

Use then statements to define actions that should occur if a packet matches all conditions in a from statement. [Table 100 on page 1755](#) shows the actions that you can specify in a term. (If you do not include a then statement, the system accepts packets that match the filter.)

**NOTE:** For egress IPv4 interfaces, IPv6 interfaces, and egress ports, you can only apply the accept, discard, and count actions. For egress VLANs, you can only apply the accept action.

**Table 100: Actions and Action Modifiers**

| Action                        | Description                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accept                        | Accept a packet. This is the default action for packets that match a term.                                                                                                                                                                                                                                                                                       |
| apply-groups-except           | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                                                                                                                                           |
| count <i>counter-name</i>     | Count the number of packets that match the term.                                                                                                                                                                                                                                                                                                                 |
| discard                       | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                                                                   |
| forwarding-class <i>class</i> | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• mcast</li> <li>• network-control</li> <li>• no-loss</li> </ul> <p><b>NOTE:</b> To configure a forwarding class, you must also configure loss priority.</p> |
| log                           | Log the packet's header information in the Routing Engine. To view this information, enter the <code>show firewall log operational</code> mode command.                                                                                                                                                                                                          |

Table 100: Actions and Action Modifiers (*Continued*)

| Action                                                | Description                                                                                                                                                                                                                                                   |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| loss-priority (low   medium-low   medium-high   high) | <p>Set the packet loss priority (PLP).</p> <p><b>NOTE:</b> The loss-priority action modifier is supported on ingress IPv4 interfaces only.</p> <p><b>NOTE:</b> The loss-priority action modifier is not supported in combination with the policer action.</p> |
| policer <i>policer-name</i>                           | <p>Send packets to a policer (for the purpose of applying rate limiting).</p> <p><b>NOTE:</b> The policer action modifier is not supported in combination with the loss-priority action.</p>                                                                  |
| port-mirror                                           | <p>Mirror traffic (copy packets) to an output interface configured in a port-mirroring instance at the [edit forwarding-options port-mirroring] hierarchy level.</p>                                                                                          |
| port-mirror-instance <i>port-mirror-instance-name</i> | <p>Mirror traffic to a port-mirroring instance configured at the [edit forwarding-options port-mirroring] hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>                           |

Table 100: Actions and Action Modifiers (*Continued*)

| Action                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>reject</code> <i>message-type</i>                          | <p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the syslog action modifier.</p> <p>You can specify one of the following message types: administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unknown, host-unreachable, network-prohibited, network-unknown, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The reject action is supported on ingress IPv4 interfaces only.</p> |
| <code>three-color-policer</code> <i>three-color-policer-name</i> | <p>Send packets to a three-color policer (for the purpose of applying rate limiting).</p> <p><b>NOTE:</b> The policer action modifier is not supported in combination with the loss-priority action.</p> <p><b>NOTE:</b> The color-aware and color-blind policers are not supported. By default, traffic is treated as color-blind.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>vlan</code> <i>VLAN-name</i>                               | <p>Forward matched packets to a specific VLAN.</p> <p><b>NOTE:</b> The vlan action is only supported on ingress ports and VLANs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Firewall Filter Match Conditions and Actions (QFX10000 Switches)

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, the switch takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the switch accepts the packet by default.

This topic describes the various match conditions, actions, and action modifiers that you can define in firewall filters on QFX10000 switches. For similar information about other QFX switches, see ["Firewall Filter Match Conditions and Actions \(QFX and EX Series Switches\)" on page 1714](#).

- [Table 101 on page 1758](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.
- [Table 102 on page 1772](#) shows the actions that you can specify in a term.
- [Table 103 on page 1773](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

**Table 101: Supported Match Conditions (QFX10000 Switches)**

| Match Condition                            | Description                                                                       | Direction and Interface                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| destination-address <i>ip-address</i>      | IP destination address field, which is the address of the final destination node. | Ingress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Ingress IRB interface for EVPN/VXLAN fabric, where applicable |
| destination-mac-address <i>mac-address</i> | Destination media access control (MAC) address of the packet.                     | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                                                                             |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Direction and Interface                                                                                                                                                                                                                 |

| ether-type <i>value</i> | <p>Ethernet type field of a packet. The EtherType value specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• aarp (0x80F3)—EtherType value AARP</li> <li>• appletalk (0x809B)—EtherType value AppleTalk</li> <li>• arp (0x0806)—EtherType value ARP</li> <li>• fcoe (0x8906)—EtherType value FCoE</li> <li>• fip (0x8914)—EtherType value FIP</li> <li>• ipv4 (0x0800)—EtherType value IPv4</li> <li>• ipv6 (0x86DD)—EtherType value IPv6</li> <li>• mpls-multicast (0x8848)—EtherType value MPLS multicast</li> <li>• mpls-unicast (0x8847)—EtherType value MPLS unicast</li> <li>• oam (0x88A8)—EtherType value OAM</li> <li>• ppp (0x880B)—EtherType value PPP</li> <li>• pppoe-discovery (0x8863)—EtherType value PPPoE Discovery Stage</li> <li>• pppoe-session (0x8864)—EtherType value PPPoE Session Stage</li> <li>• sna (0x80D5)—EtherType value SNA</li> </ul> | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p> |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition               | Description                                                                                                                                                                                                                                                                                                                  | Direction and Interface                           |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| forwarding-class <i>class</i> | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• network-control</li> <li>• no-loss</li> </ul>                                                                          | Egress IPv4 (inet) and IPv6 (inet6) interfaces.   |
| fragment-flags <i>value</i>   | <p>IP fragmentation flags. In place of the numeric value, you can specify one of the following text synonyms (the hexadecimal values are also listed):</p> <ul style="list-style-type: none"> <li>• is-fragment</li> <li>• dont-fragment (0x4000)</li> <li>• more-fragments (0x2000)</li> <li>• reserved (0x8000)</li> </ul> | Ingress ports, VLANs, and IPv4 (inet) interfaces. |
| hop-limit <i>value</i>        | <p>Match the specified hop limit or set of hop limits. Specify a single value or a range of values from 0 through 255.</p>                                                                                                                                                                                                   | Ingress and egress IPv6 (inet6) interfaces.       |

Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)

| Match Condition        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Direction and Interface                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| icmp-code <i>value</i> | <p>ICMP code field. Because the meaning of the value depends upon the associated icmp-type, you must specify a value for icmp-type along with a value for icmp-code. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <i>IPv4</i>: parameter-problem—ip-header-bad (0), required-option-missing (1)</li> <li>• <i>IPv6</i>: parameter-problem—ip6-header-bad (0), unrecognized-next-header (1), unrecognized-option (2)</li> <li>• redirect—redirect-for-network (0), redirect-for-host (1), redirect-for-tos-and-net (2), redirect-for-tos-and-host (3)</li> <li>• time-exceeded—ttl-eq-zero- during-reassembly (1), ttl-eq-zero-during-transit (0)</li> <li>• <i>IPv4</i>: unreachable—network-unreachable (0), host-unreachable (1), protocol-unreachable (2), port-unreachable (3), fragmentation-needed (4), source-route-failed (5), destination-network-unknown (6), destination-host-unknown (7), source-host-isolated (8), destination-network-prohibited (9), destination-host-prohibited (10), network-unreachable-for-TOS (11), host-unreachable-for-TOS (12), communication-prohibited-by-filtering (13), host-</li> </ul> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces</p> |

Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)

| Match Condition        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Direction and Interface                                                                                                                                            |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <p>precedence-violation (14), precedence-cutoff-in-effect (15)</p> <ul style="list-style-type: none"> <li>• <i>IPv6</i>: unreachable—address-unreachable (3), administratively-prohibited (1), no-route-to-destination (0), port-unreachable (4)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                    |
| icmp-type <i>value</i> | <p>ICMP message type field. Typically, you specify this match in conjunction with the protocol match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4</i>: echo-reply (0), destination unreachable (3), source-quench (4), redirect (5), echo-request (8), IPv4 (inet)-advertisement (9), IPv4 (inet)-solicit (10), time-exceeded (11), parameter-problem (12), timestamp (13), timestamp-reply (14), info-request (15), info-reply (16), mask-request (17), mask-reply (18)</p> <p><i>IPv6</i>: destination-unreachable (1), packet-too-big (2), time-exceeded (3), parameter-problem (4), echo-request (128), echo-reply (129), membership-query (130), membership-report (131), membership-termination (132), router-solicit (133), router-advertisement (134), neighbor-solicit (135), neighbor-advertisement (136), redirect (137), router-renumbering (138), node-information-request (139), node-information-reply (140)</p> <p>See also icmp-code <i>variable</i>.</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition                          | Description                                                                                                                                                                                                                                                                                                   | Direction and Interface                                                                                                                      |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| interface <i>interface-name</i>          | Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.<br><br><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.                                             | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| ip-destination-address <i>address</i>    | IPv4 address that is the final destination node address for the packet.                                                                                                                                                                                                                                       | Ingress ports, egress ports, and VLANs.<br><br>Ingress IRB interface for EVPN/VXLAN fabric, where applicable                                 |
| ip-options                               | Specify any to create a match if anything is specified in the options field in the IP header.                                                                                                                                                                                                                 | Ingress ports, VLANs, and IPv4 (inet) interfaces.                                                                                            |
| ip-precedence <i>ip-precedence-field</i> | IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): critical-ecp (0xa0), flash (0x60), flash-override (0x80), immediate (0x40), internet-control (0xc0), net-control (0xe0), priority (0x20), or routine (0x00). | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                      |
| ip-protocol <i>number</i>                | IP protocol field.                                                                                                                                                                                                                                                                                            | Ingress ports and VLANs.<br><br>Egress ports and VLANs.<br><br>Ingress IRB interface for EVPN/VXLAN fabric, where applicable                 |
| ip-source-address <i>address</i>         | IPv4 address of the source node sending the packet.                                                                                                                                                                                                                                                           | Ingress ports and VLANs.<br><br>Egress ports and VLANs.<br><br>Ingress IRB interface for EVPN/VXLAN fabric, where applicable                 |

Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)

| Match Condition                                                    | Description                                                                                                                                                                                                                                                                                                                   | Direction and Interface                                                                                                      |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>ip-version <i>address</i></code>                             | IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface.                                                                                                                                                                                 | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                      |
| <code>is-fragment</code>                                           | Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.                                                                                                                                                                                             | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                      |
| <code>learn-1p-priority <i>number</i></code>                       | Matches the specified IEEE 802.1p VLAN priority bits in the range 0-7.                                                                                                                                                                                                                                                        | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                      |
| <code>learn-vlan-id <i>number</i></code>                           | Matches the ID of a normal VLAN or the ID of the outer (service) VLAN (for Q-in-Q VLANs). To use filter memory most efficiently and maximize the number of possible filters, use this condition in addition to <code>user-id</code> when you want to match on the inner (customer) VLAN ID. The acceptable values are 1-4095. | Ingress ports and VLANs.<br><br>Egress ports and VLANs.<br><br>Ingress IRB interface for EVPN/VXLAN fabric, where applicable |
| <code>loss-priority (low   medium-low   medium-high   high)</code> | Set the packet loss priority (PLP).<br><br><b>NOTE:</b> The <code>loss-priority</code> action modifier is not supported in combination with the <code>policer</code> action.                                                                                                                                                  | Egress IPv4 (inet) and IPv6 (inet6) interfaces.                                                                              |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                                      |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| next-header <i>value</i>    | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</p>                                                                                 | <p>Ingress IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>                               |
| packet-length <i>number</i> | <p>Packet length in bytes. You must enter a number between 0 and 65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| precedence <i>value</i>     | <p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <ul style="list-style-type: none"> <li>• routine (0)</li> <li>• priority (1)</li> <li>• immediate (2)</li> <li>• flash (3)</li> <li>• flash-override (4)</li> <li>• critical-ecp (5)</li> <li>• internet-control (6)</li> <li>• net-control (7)</li> </ul> | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                 |

Table 101: Supported Match Conditions (QFX10000 Switches) *(Continued)*

| Match Condition                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Direction and Interface                                                                                                                                                                                                                 |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>protocol type</code>                  | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6, igmp (2),<br/>         ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46),<br/>         gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89),<br/>         pim (103), vrrp (112), sctp (132)</p> | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                                                                                                                            |
| <code>source-address ip-address</code>      | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                                                                                                                                                                                                                                        | <p>Ingress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p> <p>Ingress IRB interface for EVPN/VXLAN fabric, where applicable</p>                               |
| <code>source-mac-address mac-address</code> | Source media access control (MAC) address of the packet.                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                                                                                                                                          |
| <code>source-port value</code>              | TCP or UDP source port. Typically, you specify this match in conjunction with the <code>protocol</code> match statement. In place of the numeric field, you can specify one of the text synonyms listed under <code>destination-port</code> .                                                                                                                                                                                                                          | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Ingress IRB interface for EVPN/VXLAN fabric, where applicable</p> |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition                       | Description                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                                                                                     |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source-prefix-list <i>prefix-list</i> | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the [edit policy-options] hierarchy level.                                                                                                                                                                       | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |
| tcp-established                       | Match packets of an established TCP connection. This condition matches packets other than those used to set up a TCP connection—that is, three-way handshake packets are not matched.<br><br>When you specify tcp-established, a switch does not implicitly verify that the protocol is TCP. You must also specify the protocol tcp match condition. | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                            |
| tcp-flags <i>value</i>                | One or more TCP flags: <ul style="list-style-type: none"> <li>• ack (0x10)</li> <li>• fin (0x01)</li> <li>• push (0x08)</li> <li>• rst (0x04)</li> <li>• syn (0x02)</li> <li>• urgent (0x20)</li> </ul>                                                                                                                                              | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                            |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface                                                                                                                           |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>tcp-initial</code>         | <p>Match the first TCP packet of a connection. A match occurs when the TCP flag SYN is set and the TCP flag ACK is not set.</p> <p>When you specify <code>tcp-initial</code>, a switch does not implicitly verify that the protocol is TCP. You must also specify the protocol <code>tcp</code> match condition.</p>                                                                                                                                                                                                                                                                                                                                               | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                           |
| <code>traffic-class value</code> | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</p> | <p>Ingress IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>                                                                    |
| <code>ttl value</code>           | <p>IP Time-to-live (TTL) field in decimal. The value can be 1-255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> <p>Ingress IRB interface for EVPN/VXLAN fabric, where applicable</p> |

**Table 101: Supported Match Conditions (QFX10000 Switches) (Continued)**

| Match Condition            | Description                                                                                                                                                                                                                                                    | Direction and Interface                             |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| user-vlan-id <i>number</i> | Matches the ID of the inner (customer) VLAN in a Q-in-Q VLAN. To use filter memory most efficiently and maximize the number of possible filters, use in combination with learn-vlan-id to match the outer (service) VLAN ID. The acceptable values are 1-4095. | Ingress ports and VLANs.<br>Egress ports and VLANs. |

Use then statements to define actions that should occur if a packet matches all conditions in a from statement. [Table 102 on page 1772](#) shows the actions that you can specify in a term. (If you do not include a then statement, the system accepts packets that match the filter.)

**Table 102: Actions**

| Action  | Description                                                                                    |
|---------|------------------------------------------------------------------------------------------------|
| accept  | Accept a packet. This is the default action for packets that match a term.                     |
| discard | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message. |

**Table 102: Actions (Continued)**

| Action                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>reject message-type</code>            | <p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the syslog action modifier.</p> <p>You can specify one of the following message types: administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unknown, host-unreachable, network-prohibited, network-unknown, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed, or tcp-reset.</p> <p>If you specify tcp-reset, the system sends a TCP reset if the packet is a TCP packet; otherwise nothing is sent.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The reject action is supported on ingress interfaces only.</p> |
| <code>routing-instance instance-name</code> | Forward matched packets to a virtual routing instance. (The only supported instance type is virtual-router.) Packets can be forwarded to the default instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>vlan VLAN-name</code>                 | <p>Forward matched packets to a specific VLAN.</p> <p><b>NOTE:</b> The vlan action is supported on ingress interfaces only.</p> <p><b>NOTE:</b> This action is not supported on OCX series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

You can also specify the action modifiers listed in [Table 103 on page 1773](#) to count, mirror, rate-limit, and classify packets.

**Table 103: Action Modifiers**

| Action Modifier                 | Description                                      |
|---------------------------------|--------------------------------------------------|
| <code>count counter-name</code> | Count the number of packets that match the term. |

Table 103: Action Modifiers (*Continued*)

| Action Modifier                                                    | Description                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>forwarding-class class</code>                                | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• mcast</li> <li>• network-control</li> <li>• no-loss</li> </ul> <p><b>NOTE:</b> To configure a forwarding class, you must also configure loss priority.</p> |
| <code>log</code>                                                   | <p>Log the packet's header information in the Routing Engine. To view this information, enter the <code>show firewall log operational</code> mode command.</p> <p><b>NOTE:</b> The log action modifier is supported on ingress interfaces only.</p>                                                                                                              |
| <code>loss-priority (low   medium-low   medium-high   high)</code> | <p>Set the packet loss priority (PLP).</p> <p><b>NOTE:</b> The loss-priority action modifier is supported on ingress interfaces only.</p> <p><b>NOTE:</b> The loss-priority action modifier is not supported in combination with the policer action.</p>                                                                                                         |
| <code>policer policer-name</code>                                  | <p>Send packets to a policer (for the purpose of applying rate limiting).</p> <p>You can specify a policer for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p> <p><b>NOTE:</b> The policer action modifier is not supported in combination with the loss-priority action.</p>                                                 |

Table 103: Action Modifiers (*Continued*)

| Action Modifier                                       | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| port-mirror                                           | <p>(ELS platforms) Mirror traffic (copy packets) to an output interface configured in a port-mirroring instance at the [edit forwarding-options port-mirroring] hierarchy level.</p> <p>You can specify port mirroring for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p>                   |
| port-mirror-instance <i>port-mirror-instance-name</i> | <p>(ELS platforms) Mirror traffic to a port-mirroring instance configured at the [edit forwarding-options port-mirroring] hierarchy level.</p> <p>You can specify port mirroring for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p> <p><b>NOTE:</b></p>                                     |
| syslog                                                | <p>Log an alert for this packet.</p> <p><b>NOTE:</b> The syslog action modifier is supported on ingress interfaces only.</p>                                                                                                                                                                                                    |

## Firewall Filter Match Conditions and Actions (PTX10003 and PTX10008)

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, the router takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the router accepts the packet by default.

On the PTX10003, you can apply multiple firewall filters to a single interface as a single input list or output list (filter input-list and output-list). In this way, you only manage the configuration for a filtering task in a single firewall filter. This gives you flexibility in large environments when you have a device configured with many interfaces. You can do the same on the PTX10008, but the router only supports applying multiple firewall filters to a single input-list.

- [Table 104 on page 1776](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.
- [Table 105 on page 1791](#) shows the actions and action modifiers that you can specify in a term.

**Table 104: Supported Match Conditions (PTX10003 and PTX10008)**

| Match Condition                   | Description                                                                         | Supported Interfaces                                |
|-----------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------|
| address <i>address</i> [ except ] | Match the source or destination address field unless the except option is included. | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                                                            | Description                                                                                                                                                                        | Supported Interfaces                                |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| <code>destination-address <i>address</i></code><br><code>[ except ]</code> | <p>Match the destination address field unless the except option is included.</p> <p>You cannot specify both address and destination-address match conditions in the same term.</p> | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Supported Interfaces                                 |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <code>destination-port <i>number</i></code>        | <p>Match the UDP or TCP destination port field. You must also configure the <code>protocol udp</code> or <code>protocol tcp</code> match statement in the same term to specify which protocol is being used on the port.</p> <p>You cannot specify both the <code>port</code> and <code>destination-port</code> match conditions in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cmd (514), cvspserver (2401), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), ldp (646), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), tacacs (49), tacacs-ds (65), talk (517), telnet (23), tftp (69), timed (525), who (513), or xdmcp (177).</p> | IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |
| <code>destination-port-except <i>number</i></code> | Do not match the UDP or TCP destination port field. For details, see the <code>destination-port</code> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Supported Interfaces                                 |

| Match Condition                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Supported Interfaces                            |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| dscp-except <i>number</i>            | Do not match on the DSCP number. For more information, see the dscp match condition.                                                                                                                                                                                                                                                                                                                                                                                                          | IPv4 (inet) and IPv6 (inet6) interfaces.        |
| first-fragment                       | <p>Match if the packet is the first fragment of a fragmented packet. Do not match if the packet is a trailing fragment of a fragmented packet. The first fragment of a fragmented packet has a fragment offset value of 0.</p> <p>This match condition is an alias for the bit-field match condition fragment-offset 0 match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions: first-fragment and is-fragment.</p> | IPv4 (inet) interfaces.                         |
| forwarding-class <i>class</i>        | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• network-control</li> <li>• no-loss</li> </ul>                                                                                                                                                                                                                                           | IPv4 (inet), IPv6 (inet6), and MPLS interfaces. |
| forwarding-class-except <i>class</i> | Do not match the forwarding class of the packet. For details, see the forwarding-class match condition.                                                                                                                                                                                                                                                                                                                                                                                       | IPv4 (inet), IPv6 (inet6), and MPLS interfaces. |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Supported Interfaces    |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <code>fragment-flags <i>number</i></code>         | <p>Match the three-bit IP fragmentation flags field in the IP header.</p> <p>In place of the numeric field value, you can specify one of the following keywords (the field values are also listed): <code>dont-</code> (0x4), <code>more-s</code> (0x2), or <code>reserved</code> (0x8).</p>                                                                                                                                                                                                                                                                                                                      | IPv4 (inet) interfaces. |
| <code>fragment-offset <i>value</i></code>         | <p>Match the 13-bit fragment offset field in the IP header. The value is the offset, in 8-byte units, in the overall datagram message to the data fragment. Specify a numeric value, a range of values, or a set of values. An offset value of 0 indicates the first fragment of a fragmented packet.</p> <p>The <code>first-fragment</code> match condition is an alias for the <code>fragment-offset 0</code> match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions (<code>first-fragment</code> and <code>is-fragment</code>).</p> | IPv4 (inet) interfaces. |
| <code>fragment-offset-except <i>number</i></code> | Do not match the 13-bit fragment offset field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | IPv4 (inet) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Supported Interfaces                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| icmp-code <i>message-code</i> | <p>Match the ICMP message code field.</p> <p>If you configure this match condition, we recommend that you also configure the next-header icmp or next-header icmp6 match condition in the same term.</p> <p>If you configure this match condition, you must also configure the icmp-type <i>message-type</i> match condition in the same term. An ICMP message code provides more specific information than an ICMP message type, but the meaning of an ICMP message code is dependent on the associated ICMP message type.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>parameter-problem: ip-header-bad (0), required-option-missing (1)</li> <li>redirect: redirect-for-host (1), redirect-for-network (0), redirect-for-tos-and-host (3), redirect-for-tos-and-net (2)</li> <li>time-exceeded: ttl-eq-zero-during-reassembly (1), ttl-eq-zero-during-transit (0)</li> <li>unreachable: communication-prohibited-by-filtering (13), destination-host-prohibited (10), destination-host-unknown (7), destination-network-prohibited (9), destination-network-unknown (6), fragmentation-needed (4), host-precedence-violation (14), host-</li> </ul> | IPv4 (inet) and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Supported Interfaces                     |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
|                                            | <p>unreachable (1), host-unreachable-for-TOS (12), network-unreachable (0), network-unreachable-for-TOS (11), port-unreachable (3), precedence-cutoff-in-effect (15), protocol-unreachable (2), source-host-isolated (8), source-route-failed (5)</p>                                                                                                                                                                                                                                                                                                                                                                                                |                                          |
| <code>icmp-code-except message-code</code> | Do not match the ICMP message code field. For details, see the <code>icmp-code</code> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | IPv4 (inet) and IPv6 (inet6) interfaces. |
| <code>icmp-type number</code>              | <p>Match the ICMP message type field. You must also configure <code>icmp</code> or <code>icmpv6</code> as protocol <i>next-header</i> match type in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): echo-reply (0), echo-request (8), info-reply (16), info-request (15), mask-request (17), mask-reply (18), parameter-problem (12), redirect (5), router-advertisement (9), router-solicit (10), source-quench (4), time-exceeded (11), timestamp (13), timestamp-reply (14), or unreachable (3).</p> <p>See also <code>icmp-code variable</code>.</p> | IPv4 (inet) and IPv6 (inet6) interfaces. |
| <code>icmp-type-except message-type</code> | Do not match the ICMP message type field. For details, see the <code>icmp-type</code> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | IPv4 (inet) and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Supported Interfaces                                 |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| interface <i>interface-name</i> | <p>For ingress filters, match the interface on which the packet was received.</p> <p>For egress filters, match the interface on which the packet was sent.</p> <p><b>NOTE:</b> PTX5000 series routers do not support attaching the <code>em0.0</code> interface (the internal link between the routing and packet forwarding engines) to <code>lo0</code> (the loopback interface), for example to filter self-originating traffic such as Telnet and SSH by creating a firewall filter on <code>lo0</code> to match traffic on <code>em0.0</code>. The following code snippet provides context:</p> <pre> firewall   filter core-protect {     term Telnet {       from {         protocol tcp;         destination-port telnet;         interface em0.0;       }       then accept;     }   } </pre> | IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |
| interface-except <i>number</i>  | Do not match the logical interface on which the packet was received. For details, see the interface match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Supported Interfaces                            |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| is-fragment                       | <p>Match if the packet is a trailing fragment of a fragmented packet. Do not match the first fragment of a fragmented packet.</p> <p><b>NOTE:</b> To match both first and trailing fragments, you can use two terms that specify different match conditions (first-fragment and is-fragment).</p> <p>For PTX10003 routers running Junos OS Evolved, all fragmented packets including the first fragment of fragmented packets will match on any firewall filter term containing an "is-fragment" match.</p> | IPv4 (inet) interfaces.                         |
| loss-priority <i>level</i>        | <p>Match the packet loss priority (PLP).</p> <p>Specify a single level or multiple levels: low, medium-low, medium-high, or high.</p> <p><b>NOTE:</b> The loss-priority action modifier is not supported in combination with the policer action.</p>                                                                                                                                                                                                                                                        | IPv4 (inet), IPv6 (inet6), and MPLS interfaces. |
| loss-priority-except <i>level</i> | Do not match the PLP level. For details, see the loss-priority match condition.                                                                                                                                                                                                                                                                                                                                                                                                                             | IPv4 (inet), IPv6 (inet6), and MPLS interfaces. |
| next-header <i>header-type</i>    | <p>Match the first 8-bit next header field in the packet.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): ah (51), dstops (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (58), icmpv6 (58), igmp (2), ipip (4), ipv6 (41), mobility (135), no-next-header (59), ospf (89), pim (103), routing (43), rsvp (46), sctp (132), tcp (6), udp (17), or vrrp (112).</p>                            | IPv6 (inet6) interfaces.                        |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Supported Interfaces                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| <code>next-header-except header-type</code> | Do not match the 8-bit Next Header field that identifies the type of header between the IPv6 header and payload. For details, see the next-header match type.                                                                                                                                                                                                                                                                                                              | IPv6 (inet6) interfaces                   |
| <code>packet-length bytes</code>            | Match the length of the received packet, in bytes. The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead. You can also specify a range of values to be matched.                                                                                                                                                                                                                                    | IPv4 (inet), and IPv6 (inet6) interfaces. |
| <code>packet-length-except bytes</code>     | Do not match the length of the received packet, in bytes. For details, see the packet-length match type.                                                                                                                                                                                                                                                                                                                                                                   | IPv4 (inet), and IPv6 (inet6) interfaces. |
| <code>port number</code>                    | <p>Match the UDP or TCP source or destination port field. You must also configure the <code>protocol udp</code> or <code>protocol tcp</code> match statement in the same term to specify which protocol is being used on the port.</p> <p>You cannot configure the destination-port match condition or the source-port match condition in the same term.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed under destination-port.</p> | IPv4 (inet), and IPv6 (inet6) interfaces. |
| <code>port-except number</code>             | Do not match either the source or destination UDP or TCP port field. For details, see the port match condition.                                                                                                                                                                                                                                                                                                                                                            | IPv4 (inet), and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                            | Supported Interfaces    |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <code>precedence ip-precedence-value</code>        | <p>Match the IP precedence field.</p> <p>In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): critical-ecp (0xa0), flash (0x60), flash-override (0x80), immediate (0x40), internet-control (0xc0), net-control (0xe0), priority (0x20), or routine (0x00). You can specify precedence in hexadecimal, binary, or decimal form.</p>                              | IPv4 (inet) interfaces. |
| <code>precedence-except ip-precedence-value</code> | Do not match the IP precedence field.                                                                                                                                                                                                                                                                                                                                                                                                  | IPv4 (inet) interfaces. |
| <code>protocol number</code>                       | <p>Match the IPv4 protocol type field. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p>hop-by-hop (0), icmp (1), icmp6, igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</p> | IPv4 (inet) interfaces. |
| <code>protocol-except number</code>                | <p>Do not match the IP protocol type field. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): ah (51), dstopts (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (58), icmpv6 (58), igmp (2), ipip (4), ipv6 (41), ospf (89), pim (103), rsvp (46), sctp (132), tcp (6), udp (17), or vrrp (112).</p>                              | IPv4 (inet) interfaces. |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                             | Description                                                                                                                                                                                                                                                                                                  | Supported Interfaces                                |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| source-address <i>ip-address</i>            | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                                                                              | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| source-address <i>address</i><br>[ except ] | <p>Match the IP address of the source node sending the packet unless the except option is included. If the option is included, do not match the IP address of the source node sending the packet.</p> <p>You cannot specify both the address and source-address match conditions in the same term.</p>       | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| source-port <i>value</i>                    | <p>Match the TCP or UDP source port. You must also configure the protocol <code>udp</code> or protocol <code>tcp</code> match statement in the same term.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed with the destination-port <i>number</i> match condition.</p> | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| source-port-except <i>number</i>            | Do not match the UDP or TCP source port field. For details, see the source-port match condition.                                                                                                                                                                                                             | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| source-prefix-list <i>prefix-list</i>       | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the [edit policy-options] hierarchy level.                                                                                                                               | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |

Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)

| Match Condition        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Supported Interfaces                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| tcp-flags <i>value</i> | <p>Match one or more of the low-order 6 bits in the 8-bit TCP flags field in the TCP header.</p> <p>To specify individual bit fields, you can specify the following text synonyms or hexadecimal values:</p> <ul style="list-style-type: none"> <li>• fin (0x01)</li> <li>• syn (0x02)</li> <li>• rst (0x04)</li> <li>• push (0x08)</li> <li>• ack (0x10)</li> <li>• urgent (0x20)</li> </ul> <p>In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet.</p> <p>You can string together multiple flags using the bit-field logical operators.</p> <p>If you configure this match condition, we recommend that you also configure the <code>protocol tcp</code> match statement in the same term to specify that the TCP protocol is being used on the port.</p> <p>For IPv4 traffic only, this match condition does not implicitly check whether the datagram contains the first fragment of a fragmented packet. To check for this condition for IPv4 traffic only, use the <code>first-fragment</code> match condition.</p> | IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |

**Table 104: Supported Match Conditions (PTX10003 and PTX10008) (Continued)**

| Match Condition                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Supported Interfaces                     |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <code>traffic-class value</code>         | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</p> | IPv6 (inet6) interfaces.                 |
| <code>traffic-class-except number</code> | Do not match the 8-bit field that specifies the CoS priority of the packet. For details, see the traffic-class match description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | IPv6 (inet6) interfaces.                 |
| <code>ttl number</code>                  | Match the IPv4 or IPv6 time-to-live number. Specify a TTL value or a range of TTL values. For <i>number</i> , you can specify one or more values from 0 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | IPv4 (inet) and IPv6 (inet6) interfaces. |
| <code>ttl-except number</code>           | Do not match on the IPv4 or IPv6 TTL number. For details, see the ttl match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | IPv4 (inet) and IPv6 (inet6) interfaces. |

Use then statements to define actions that should occur if a packet matches all conditions in a from statement. [Table 105 on page 1791](#) shows the actions that you can specify in a term. (If you do not include a then statement, the system accepts packets that match the filter.)

**Table 105: Actions and Action Modifiers (PTX10003 and PTX10008, or as noted)**

| Action                        | Description                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accept                        | Accept a packet. This is the default action for packets that match a term.                                                                                                                                                                                                                                                                                            |
| discard                       | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                                                                        |
| count <i>counter-name</i>     | Count the number of packets that match the term.                                                                                                                                                                                                                                                                                                                      |
| forwarding-class <i>class</i> | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• mcast</li> <li>• network-control</li> <li>• no-loss</li> </ul> <p><b>NOTE:</b> The forwarding-class action is supported on IPv4, IPv6, and MPLS interfaces.</p> |
| log                           | <p>Log the packet's header information in the Routing Engine. To view this information, enter the <code>show firewall log operational mode</code> command.</p> <p><b>NOTE:</b> The log action modifier is only supported on IPv4 and IPv6 ingress interfaces.</p>                                                                                                     |
| loss-priority <i>level</i>    | Set the packet loss priority (PLP).                                                                                                                                                                                                                                                                                                                                   |

Table 105: Actions and Action Modifiers (PTX10003 and PTX10008, or as noted) (Continued)

| Action                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>policer <i>policer-name</i></code>           | <p>Send packets to a policer (for the purpose of applying rate limiting). The PTX10003 supports two-color, single-rate three-color (srTCM), and two-rate three-color marker (trTCM) policers.</p> <p><b>NOTE:</b> The policer action modifier is not supported in combination with the loss-priority action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>redirect <i>instance-name</i></code>         | <p>(Supported on PTX10004, PTX10008, and PTX10016 devices running Junos Evolved OS Release 22.1R1 only.)</p> <p>Send packets to the P4 controller, as specified in the instance defined at the <b>[services inline-monitoring instance <i>instance-name</i> No Link Title p4]</b> level of the Junos hierarchy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>reject <i>message-type</i></code>            | <p>Discard a packet and send a “destination unreachable” ICMPv4 or ICMPv6 message (type 3). To log rejected packets, configure the syslog action modifier.</p> <p>You can specify one of the following message types: administratively-prohibited (default), bad-host-tos, bad-network-tos, host-prohibited, host-unknown, host-unreachable, network-prohibited, network-unknown, network-unreachable, port-unreachable, precedence-cutoff, precedence-violation, protocol-unreachable, source-host-isolated, source-route-failed, .</p> <p><b>NOTE:</b> The tcp-reset message type is not supported.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> |
| <code>syslog</code>                                | Log an alert for this packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>routing-instance <i>instance-name</i></code> | <p>Forward matched packets to a virtual routing instance. Packets can be forwarded to the default instance.</p> <p>Supported on virtual-router and forwarding instance-types.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## IPv6 Firewall Filter Match Conditions and Actions (PTX10001-20C)

This topic describes the IPv6 firewall filter match conditions, actions, and action modifiers for PTX10001-20C routers.

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include the *no match statement*, in which case the term matches all packets.

When a packet matches a filter, the router takes the action specified in the term. You can also specify action modifiers to count, mirror, and classify packets. If no match conditions are specified for the term, the router accepts the packet by default.

**NOTE:** On PTX10001-20C routers, you can only apply a firewall filter on IPv6 interfaces in the ingress direction.

- [Table 106 on page 1793](#) describes the supported match conditions.
- [Table 107 on page 1799](#) shows the actions that you can specify in a term. If you don't include a then statement, the system accepts packets that match the filter.
- [Table 108 on page 1799](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

**Table 106: IPv6 Supported Match Conditions**

| Match Condition                      | Description                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <i>address</i><br>[ except ] | Match the IPv6 source or destination address field unless the except option is included. If the option is included, do not match the IPv6 source or destination address field.                                                                       |
| apply-groups                         | Specify which groups to inherit configuration data from. You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups. |
| apply-groups-except                  | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                               |

Table 106: IPv6 Supported Match Conditions (*Continued*)

| Match Condition                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>destination-address<br/>address [ except ]</code>                  | <p>Match the IPv6 destination address field unless the except option is included. If the option is included, do not match the IPv6 destination address field.</p> <p>You cannot specify both the address and destination-address match conditions in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <i>message-type</i>                                  | <p>Match the ICMP message type field.</p> <p>You must also configure <code>icmp</code> or <code>next-header icmp6</code> match condition in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): certificate-path-advertisement (149), certificate-path-solicitation (148), destination-unreachable (1), echo-reply (129), echo-request (128), home-agent-address-discovery-reply (145), home-agent-address-discovery-request (144), inverse-neighbor-discovery-advertisement (142), inverse-neighbor-discovery-solicitation (141), membership-query (130), membership-report (131), membership-termination (132), mobile-prefix-advertisement-reply (147), mobile-prefix-solicitation (146), neighbor-advertisement (136), neighbor-solicit (135), node-information-reply (140), node-information-request (139), packet-too-big (2), parameter-problem (4), private-experimentation-100 (100), private-experimentation-101 (101), private-experimentation-200 (200), private-experimentation-201 (201), redirect (137), router-advertisement (134), router-renumbering (138), router-solicit (133), or time-exceeded (3).</p> <p>For private-experimentation-201 (201), you can also specify a range of values within square brackets.</p> |
| <code>icmp-type-except</code><br><i>message-type</i> | Do not match the ICMP message type field. For details, see the <code>icmp-type</code> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>next</code>                                    | Continue to the next term in a filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>next-header</code> <i>header-type</i>          | <p>Match the first 8-bit Next Header field in the packet.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): ah (51), dstops (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (58), icmpv6 (58), igmp (2), ipip (4), ipv6 (41), mobility (135), no-next-header (59), ospf (89), pim (103), routing (43), rsvp (46), sctp (132), tcp (6), udp (17), or vrrp (112).</p> <p><b>NOTE:</b> <code>next-header icmp6</code> and <code>next-header icmpv6</code> match conditions perform the same function. <code>next-header icmp6</code> is the preferred option. <code>next-header icmpv6</code> is hidden in the Junos OS CLI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 106: IPv6 Supported Match Conditions (*Continued*)

| Match Condition                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| next-header-except <i>header-type</i>          | Do not match the 8-bit Next Header field that identifies the type of header between the IPv6 header and payload. For details, see the next-header match type.                                                                                                                                                                                                                                                                                                                                                                                            |
| port <i>number</i>                             | <p>Match the UDP or TCP source or destination port field.</p> <p>If you configure this match condition, you cannot configure the destination-port match condition or the source-port match condition in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the next-header udp or next-header tcp match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed under destination-port.</p> |
| port-except <i>number</i>                      | Do not match the UDP or TCP source or destination port field. For details, see the port match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| port-mirror <i>instance-name</i>               | Port-mirror the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| port-mirror-instance <i>instance-name</i>      | Port mirror a packet for an instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| prefix-list <i>prefix-list-name</i> [ except ] | <p>Match the prefixes of the source or destination address fields to the prefixes in the specified list unless the except option is included. If the option is included, do not match the prefixes of the source or destination address fields to the prefixes in the specified list.</p> <p>The prefix list is defined at the [edit policy-options prefix-list <i>prefix-list-name</i>] hierarchy level.</p>                                                                                                                                            |
| sample                                         | Sample the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 106: IPv6 Supported Match Conditions (*Continued*)

| Match Condition                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| source-address <i>address</i><br>[ except ]  | <p>Match the IPv6 address of the source node sending the packet unless the except option is included. If the option is included, do not match the IPv6 address of the source node sending the packet.</p> <p>You cannot specify both the address and source-address match conditions in the same term.</p>                                                                                                                                                                                                                                                                                                                                |
| source-port <i>number</i>                    | <p>Match the UDP or TCP source port field.</p> <p>You cannot specify the port and source-port match conditions in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the next-header udp or next-header tcp match condition in the same term to specify which protocol is being used on the port.</p> <p><b>NOTE:</b> For Junos OS Evolved, you must configure the next-header udp or next-header tcp match statement in the same term.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed with the destination-port <i>number</i> match condition.</p> |
| source-port-except<br><i>number</i>          | <p>Do not match the UDP or TCP source port field. For details, see the source-port match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| source-prefix-list <i>name</i><br>[ except ] | <p>Match the IPv6 address prefix of the packet source field unless the except option is included. If the option is included, do not match the IPv6 address prefix of the packet source field.</p> <p>Specify a prefix list name defined at the [edit policy-options prefix-list <i>prefix-list-name</i>] hierarchy level.</p>                                                                                                                                                                                                                                                                                                             |

**NOTE:** If you specify an IPv6 address in a match condition (the address, destination-address, or source-address match conditions), use the syntax for text representations described in RFC 4291, *IP Version 6 Addressing Architecture*. For more information about IPv6 addresses, see [IPv6 Overview](#) and [Supported IPv6 Standards](#).

**Table 107: Actions for IPv6 Firewall Filters**

| Action                           | Description                                                                                                                                                                                                                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accept                           | Accept a packet. This is the default action for packets that match a term.                                                                                                                                                                                                                                       |
| discard                          | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                   |
| redirect<br><i>instance-name</i> | <p>(Supported on PTX10004, PTX10008, and PTX10016 devices running Junos Evolved OS Release 22.1R1 only.)</p> <p>Send packets to the P4 controller, as specified in the instance defined at the <b>[services inline-monitoring instance <i>instance-name</i> controller p4]</b> level of the Junos hierarchy.</p> |

**Table 108: Action Modifiers for IPv6 Firewall Filters**

| Action Modifier               | Description                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| count<br><i>counter-name</i>  | Count the number of packets that match the term.                                                                                                                                                                                                                                                                                                                 |
| forwarding-class <i>class</i> | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• best-effort</li> <li>• fcoe</li> <li>• mcast</li> <li>• network-control</li> <li>• no-loss</li> </ul> <p><b>NOTE:</b> To configure a forwarding class, you must also configure loss priority.</p> |

**Table 108: Action Modifiers for IPv6 Firewall Filters** *(Continued)*

| Action Modifier                                                   | Description                         |
|-------------------------------------------------------------------|-------------------------------------|
| loss-priority<br>(low  <br>medium-low  <br>medium-high  <br>high) | Set the packet loss priority (PLP). |

## Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers

This topic provides a list of firewall and policier features available on PTX Packet Transport Routers and compares them with firewall and policing features on T Series routers.

### Firewall Filters

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers do not support:
  - Egress Forwarding Table Filters
  - Forwarding Table Filters for MPLS/CCC
  - Family VPLS

- PTX Series Packet Transport Routers do not support nested firewall filters. The filter statement at the [edit firewall family *family-name* filter *filter-name* term *term-name*] hierarchy level is disabled.
- Because no service PICs are present in PTX Series Packet Transport Routers, service filters are not supported for both IPv4 and IPv6 traffic. The service-filter statement at [edit firewall family (inet | inet6)] hierarchy level is disabled.
- The PTX Series Packet Transport Routers exclude simple filters. These filters are supported on Gigabit Ethernet intelligent queuing (IQ2) and Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only. The simple-filter statement at the [edit firewall family inet)] hierarchy level is disabled.
- Physical interface filtering is not supported. The physical-interface-filter statement at the [edit firewall family *family-name* filter *filter-name*] hierarchy level is disabled.
- The prefix action feature is not supported on PTX Series Packet Transport Routers. The prefix-action statement at [edit firewall family inet] hierarchy level is disabled.
- On T Series routers, you can collect a variety of information about traffic passing through the device by setting up one or more accounting profiles that specify some common characteristics of the data. The PTX Series Packet Transport Routers do not support accounting configurations for firewall filters. The accounting-profile statement at the [edit firewall family *family-name* filter *filter-name*] hierarchy level is disabled.
- The reject action is not supported on the loopback (lo0) interface. If you apply a filter to the lo0 interface and the filter includes a reject action, an error message appears.
- PTX Series Packet Transport Routers do not support aggregated ethernet logical interface match conditions. However, child link interface matching is supported.
- PTX Series Packet Transport Routers displays both counts if two different terms in a filter have the same match condition but they have different counts. T Series routers display one count only.
- PTX Series Packet Transport Routers do not have separate policer instances when a filter is bound to multiple interfaces. Use the interface-specific configuration statement to create the configuration.
- On PTX Series Packet Transport Routers, when an ingress interface has CCC encapsulation, packets coming in through the ingress CCC interface will not be processed by the egress filters.
- For CCC encapsulation, the PTX Series Packet Transport Routers append an extra 8 bytes for egress Layer 2 filtering. The T Series routers do not. Therefore, egress counters on PTX Series Packet Transport Routers show an extra eight bytes for each packet which impacts policer accuracy.
- On PTX Series Packet Transport Routers, output for the show pfe statistics traffic CLI command includes the packets discarded by DMAC and SMAC filtering. On T Series routers, the command

output does not include these discarded packets because MAC filters are implemented in the PIC and not in the FPC.

- The last-fragment packet that goes through a PTX firewall cannot be matched by the `is-fragment` matching condition. This feature is supported on T Series routers.

A possible workaround on PTX Series Packet Transport Routers is to configure two separate terms with same the actions: one term contains a match to `is-fragment` and the other term contains a match to `fragment-offset -except 0`.

- On PTX Series Packet Transport Routers, MAC pause frames are generated when packet discards exceed 100 Mbps. This occurs only for frame sizes that are less than 105 bytes.

#### Traffic Policiers

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers support ARP policing. T Series routers do not.
- PTX Series Packet Transport Routers do not support LSP policing.
- PTX Series Packet Transport Routers do not support the `hierarchical-policer` configuration statement. .
- PTX Series Packet Transport Routers do not support the `interface-set` configuration statement. This statement groups a number of interfaces into a single, named interface set.
- PTX Series Packet Transport Routers do not support the following policer types for both normal policers and three-color policers:
  - `logical-bandwidth-policer` — Policer uses logical interface bandwidth.
  - `physical-interface-policer` — Policer is a physical interface policer.
  - `shared-bandwidth-policer` — Share policer bandwidth among bundle links.
- When a policer action and forwarding-class, loss-priority actions are configured within the same rule (a *Multifield Classification*), the PTX Series Packet Transport Routers work differently than T Series routers. As shown below, you can configure two rules in the filter to make the PTX filter behave the same as the T Series filter:

PTX Series configuration:

```
rule-1 {
 match: {x, y, z}
 action: {forwarding-class, loss-prio, next}
```

```

}
rule-2 {
 match: {x, y, z}
 action: {policer}
}

```

T Series configuration:

```

rule-1 {
 match: {x, y, z}
 action: {forwarding-class, loss-prio, policer}
}

```

## Configuring Firewall Filters

### IN THIS SECTION

- [Configuring a Firewall Filter | 1803](#)
- [Configuring Enhanced Egress Firewall Filters \(QFX5110 and QFX5220 Switches\) | 1807](#)
- [Applying a Firewall Filter to a Port | 1808](#)
- [Applying a Firewall Filter to a VLAN | 1809](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface | 1809](#)
- [Applying a Firewall Filter to a Layer 2 CCC \(QFX10000 Switches\) | 1811](#)

Follow the steps in the following sections to configure and apply a firewall filter on your switch.

### Configuring a Firewall Filter

To configure a firewall filter:

1. Configure the family address type, filter name, term name, and at least one match condition—for example, match on packets that contain a specific source address.

```
[edit]
user@switch# set firewall family ethernet-switching filter ingress-port-filter term term-one
from source-address 192.0.2.14
```

- To filter Layer 2 traffic (port or VLAN), specify the family address type `ethernet-switching`.
- To filter Layer 3 (routed) traffic, specify the family address type (`inet` for IPv4) or (`inet6` for IPv6).
- To filter Layer 2 circuit interface traffic, specify the family address type `ccc`.

The filter and term names can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. Each filter name must be unique. A filter can contain one or more terms, and each term name must be unique within a filter.

2. Configure additional match conditions. For example:

In this configuration, the filter matches on Layer 2 packets that contain source port 80.

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one from]
user@switch# set source-port 80
```

In this configuration, the filter matches on VLANs that contain interface `ge-0/0/6.0`.

```
[edit firewall family inet filter ingress-interface-match-condition term term-one from]
user@switch# set interface ge-0/0/6.0.
```

You can specify one or more match conditions in a single `from` statement. For a match to occur, the packet must match all the conditions in the term. The `from` statement is optional, but if you include it in a term, it can't be empty. If you omit the `from` statement, all packets are considered to match.

3. If you want to apply a firewall filter to multiple interfaces and be able to see counters specific to each interface, configure the `interface-specific` option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

4. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term. You can specify an action and action modifiers:

- To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one then]
user@switch# set discard
```

You can specify only one action per term (accept, discard, flood, reject, routing-instance, or vlan).

- To specify a filter action, for example, to flood packets that match the MAC address on QFX5100/QFX5110/ QFX5120-32C/QFX5200/QFX5210:

```
[edit firewall family ethernet-switching filter f1 term t2 then]
user@switch# set flood
```

You can configure the ingress port-based firewall filters to flood or discard the following BPDUs by using the destination MAC address as the match condition.

| Protocols                                                | Destination Media Access Control (DMAC) Address | Firewall Action     |
|----------------------------------------------------------|-------------------------------------------------|---------------------|
| Link Aggregation Control Protocol (LACP)                 | 01:80:c2:00:00:02                               | Flood/Discard/Count |
| Link Layer Discovery Protocol (LLDP)                     | 01:80:c2:00:00:0E                               | Flood/Discard/Count |
| Extensible Authentication Protocol over LAN (EAPOL)      | 01:80:c2:00:00:03                               | Flood/Discard/Count |
| Spanning Tree Protocol (STP)                             | 01:80:c2:00:00:00                               | Flood/Discard/Count |
| VLAN Spanning Tree Protocol (VSTP)                       | 01:00:0c:cc:cc:cd                               | Flood/Discard/Count |
| Cisco Discovery Protocol (CDP)/VLAN Trunk Protocol (VTP) | 01:00:0c:cc:cc:cc                               | Discard/Count       |
| ISIS L1                                                  | 01:80:c2:00:00:14                               | Discard/Count       |
| ISIS L2                                                  | 01:80:c2:00:00:15                               | Discard/Count       |

**NOTE:**

- CDP/VTP, ISIS L1/L2 protocols flood by using the default dynamic filter. Therefore, configuring additional filters for these protocols is not necessary.
  - As ingress port-based firewall filters are applied at the port level, only one filter can be applied for a physical interface in the service provider style configuration.
  - The native VLAN must be configured to ensure flooding of the untagged BPDUs received on the trunk port. If the native VLAN is not configured, then the untagged BPDUs will be flooded on all the interfaces in the local FPC.
  - When IGMP snooping or multicast listener discovery (MLD) snooping is enabled then, the flood functionality does not work.
  - When the firewall filter with flood action is applied on an interface and later if the interface goes down, then the BPDUs received on that interface will be flooded if it satisfies the match conditions.
- To specify action modifiers, for example, to count and classify packets to a forwarding class:

```
[edit firewall family ethernet-switching filter ingress-port-filter term term-one then]
user@switch# set count counter-one
user@switch# set forwarding-class expedited-forwarding
user@switch# set loss-priority high
```

You can specify any of the following action modifiers in a then statement:

- analyzer *analyzer-name*—Mirror port traffic to a specified analyzer, which you must configure at the [ethernet-switching-options] level.
- count *counter-name*—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

**NOTE:** On QFX3500 and QFX3600 switches, filters automatically count packets that were dropped in the ingress direction because of cyclic redundancy check (CRC) errors.

- forwarding-class *class*—Assign packets to a forwarding class.
- log—Log the packet header information in the Routing Engine.
- loss-priority *priority*—Set the priority of dropping a packet.
- policer *policer-name*—Apply rate-limiting to the traffic.
- flood—Flood the packets.
- syslog—Log an alert for this packet.

If you omit the then statement or don't specify an action, packets matching all the conditions in the from statement are accepted. But make sure that you always configure an action in the then statement. You can only include one action statement, but can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the from statement must match.

**NOTE:** The implicit discard action applicable to a firewall filter applied to the loopback interface, lo0.

## Configuring Enhanced Egress Firewall Filters (QFX5110 and QFX5220 Switches)

Due to a hardware limitation, the QFX5110 and QFX5220 can only support a maximum of 1000 egress firewall filters (eRACLs). You can increase this number to 2000, by configuring the switch in scaled mode. In this mode, the switch uses ingress TCAM space (IFP) to achieve the higher scale.

To configure the egress filter, specify the family address type (*inet* for IPv4) or (*inet6* for IPv6), filter name, and term name. Include the applicable scaling option for your switch and specify a match condition and action to take if a match occurs. Then apply the filter in the output direction on the interface.

After configuring, modifying, or deleting a scaling option, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

To increase the number of egress filters on the QFX5110, include the *egress-to-ingress* option in your configuration. You can add this option under any term. The following is a sample configuration:

```
set firewall family inet filter f1 term t1 from egress-to-ingress
set firewall family inet filter f1 term t1 from source-port 1500
set firewall family inet filter f1 term t1 then accept
set interfaces irb unit 100 family inet filter output f1
```

To increase the number of egress filters on the QFX5220, include the *eracl-scale* option under the *egress-profile* statement. The following is a sample configuration:

**NOTE:** The `eracl-scale` option comes configured in global mode. When enabled, existing egress filters will be automatically reinstalled in scaled mode.

```
set system packet-forwarding-options firewall eracl-profile eracl-scale
set firewall family inet filter f1 term t1 from source-port 1500
set firewall family inet filter f1 term t1 then accept
set interfaces irb unit 100 family inet filter output f1
```

When you enable scaled mode, these limitations apply:

- You can only apply a filter in the egress direction (traffic exiting the VLAN).
- Only `inet` and `inet6` protocol families are supported.
- Generic Routing Encapsulation (GRE) interfaces are not supported.
- Only use the scaling options for egress firewall filters.
- You cannot apply filters with the same match condition to different egress VLANs or Layer 3 interfaces. The only supported actions are `accept`, `discard`, and `count`.
- Match conditions are programmed in the ingress firewall filter TCAM. This means that any counters attached to the filter counts traffic on any incoming VLANs.

## Applying a Firewall Filter to a Port

To apply a firewall filter to a port:

1. Provide a meaningful and descriptive name for the firewall filter. The name is what you use to apply the filter to the port.

```
[edit]
user@switch# set interfaces ge-0/0/6 description "filter to limit tcp traffic at trunk port
for employee-vlan"
```

2. Apply the filter to the interface, specifying the unit number, family address type (`ethernet-switching`), the direction of the filter (for packets entering the port), and the filter name:

```
[edit]
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input ingress-port-filter
```

**NOTE:** You can apply only one filter to a port in the ingress direction.

## Applying a Firewall Filter to a VLAN

**NOTE:** VLAN firewall filters are not supported on QFX5100, QFX5100 Virtual Chassis, QFX5110, and QFX5120 switches in an EVPN-VXLAN environment.

To apply a firewall filter to a VLAN:

1. Provide a meaningful and descriptive name for the firewall filter. This name is what you use to apply the filter to the VLAN.

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 description "filter to block rogue devices on
employee-vlan"
```

2. Apply firewall filters to filter packets entering or exiting the VLAN:

- To apply a filter to match packets entering the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter input ingress-vlan-rogue-block
```

- To apply a firewall filter to match packets exiting the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter output egress-vlan-filter
```

**NOTE:** You can apply only one filter to a VLAN for a given direction (ingress or egress).

## Applying a Firewall Filter to a Layer 3 (Routed) Interface

You can apply a firewall filter to IPv4 and IPv6 interfaces, routed VLAN interfaces (RVI) (also known as an integrated routing and bridging (IRB) interface), and the loopback interface. These are all considered Layer 3 routed interfaces.

**NOTE:** (QFX5100 and QFX5110 switches) In an EVPN-VXLAN environment, you can use an IRB interface to provide layer 3 connectivity to the switch. To configure an IRB interface, see [Example: Configuring IRB Interfaces in an EVPN-VXLAN Environment to Provide Layer 3 Connectivity for Hosts in a Data Center](#). You can then apply a firewall filter to the IRB interface by following the steps below (only the ingress direction is supported). For a list of supported match conditions, see ["Firewall Filter Match Conditions and Actions \(QFX5100, QFX5110, QFX5120, QFX5200, EX4600, EX4650\)"](#) on page 1715.

**NOTE:** When you apply a filter to an IRB interface associated with a given VLAN, the filter is executed on any Layer 3 interface with a matching VLAN ID. This is because the filter matches on all Layer 3 interfaces with the corresponding VLAN tag.

To apply a firewall filter to a Layer 3 interface:

1. Provide a meaningful and descriptive name for the firewall filter. This name is what you use to apply the filter to the interface.

```
[edit]
user@switch# set interfaces ge-0/1/6 description "filter to count and monitor traffic on
layer 3 interface"
```

2. Apply the firewall filters.

- To filter packets entering the interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter input ingress-router-filter
```

- To filter packets exiting the interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter output egress-router-filter
```

The family address type can either be (inet for IPv4) or (inet6 for IPv6).

**NOTE:** You can apply only one filter to an interface for a given direction (ingress or egress).

## Applying a Firewall Filter to a Layer 2 CCC (QFX10000 Switches)

You can apply firewall filters with count and policer actions on Layer 2 circuit cross-connect (CCC) traffic on QFX10000 switches. This lets you count and monitor the policer activity set at the [edit firewall family ccc] hierarchy level.

In this example, count is the policer action.

```
set firewall policer traffic-cnt if-exceeding bandwidth-limit 1g
set firewall policer traffic-cnt if-exceeding burst-size-limit 100m
set firewall policer traffic-cnt then loss-priority low
set firewall family ccc filter srTCM-cnt term t1 then policer traffic-cnt
set firewall family ccc filter srTCM-cnt term t1 then count traffic-counter
```

In this example, discard is the policer action.

```
set firewall policer discard-traffic if-exceeding bandwidth-limit 1g
set firewall policer discard-traffic if-exceeding burst-size-limit 500m
set firewall policer discard-traffic then discard
set firewall family ccc filter srTCM1 term t1 then policer discard-traffic
```

## Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the filter statement when configuring a logical interface at the `[edit interfaces]` hierarchy level:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family family-name filter (input |
output) filter-name
```

In the input statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the output statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface `lo0`, you include the `apply-groups` statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including `lo0` and other loopback interfaces.

### RELATED DOCUMENTATION

[Configuring Firewall Filters](#) | 1803

## Overview of MPLS Firewall Filters on Loopback Interface

### IN THIS SECTION

- [Benefits of Adding MPLS Firewall Filters on the Loopback Interface](#) | 1813
- [Guidelines and Limitations](#) | 1813

Although all interfaces are important, the loopback interface might be the most important because it is the link to the Routing Engine, which runs and manages all the routing protocols. The loopback interface is a gateway for all the control traffic that enters the Routing Engine of the switch. You can control this

traffic by configuring a firewall filter on the loopback interface (lo0) on family mpls. Loopback firewall filters affect only traffic destined for the Routing Engine CPU. You can apply a loopback firewall filter only in the *ingress* direction (packets entering the interface). Starting with Junos OS Release 19.2R1, you can apply an MPLS firewall filter to a loopback interface on a label switch router (LSR) on QFX5100, QFX5110, QFX5200, and QFX5210 switches.

When you configure an MPLS firewall filter, you define filtering criteria (*terms, with match conditions*) for the packets and an *action* for the switch to take if the packets match the filtering criteria. Because you apply the filter to a loopback interface, you must explicitly specify the time to live (TTL) match condition under family mpls and set its TTL value to 1 (ttl=1). The TTL is an 8-bit (IPv4) header field that signifies the remaining time an IP packet has left before its life ends and is dropped. You can also match packets with other MPLS qualifiers such as label, exp, Layer 4 source port, and Layer 4 destination port.

## Benefits of Adding MPLS Firewall Filters on the Loopback Interface

- Protects the Routing Engine by ensuring that it accepts traffic only from trusted networks.
- Helps protect the Routing Engine from denial-of-service attacks.
- Gives you the flexibility to match packets on the source port and destination port. For example, if you run a traceroute, you can selectively filter traffic by choosing either TCP or UDP.

## Guidelines and Limitations

- You can apply a loopback firewall filter only in the *ingress* direction
- Only MPLS fields label, exp, ttl=1 and Layer 4 fields tcp and udp port numbers are supported.
- Only accept, discard, and count actions are supported.
- You must explicitly specify ttl=1 under family mpls to match on TLL packets.
- Filters applied on the loopback interface cannot be matched on the destination port (inner payload) of an IPv6 packet.
- You cannot apply a filter on packets that have more than two MPLS labels.
- You cannot specify a port range for TCP or UDP match conditions.
- Only 255 firewall terms are supported.

### Release History Table

| Release | Description                                                                                                                                                                             |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.2R1  | Starting with Junos OS Release 19.2R1, you can apply an MPLS firewall filter to a loopback interface on a label switch router (LSR) on QFX5100, QFX5110, QFX5200, and QFX5210 switches. |

## Configuring MPLS Firewall Filters and Policers on Switches

### IN THIS SECTION

- [Configuring an MPLS Firewall Filter | 1814](#)
- [Applying an MPLS Firewall Filter to an MPLS Interface | 1815](#)
- [Applying an MPLS Firewall Filter to a Loopback Interface | 1815](#)
- [Configuring Policers for LSPs | 1816](#)

You can configure firewall filters to filter MPLS traffic. To use an MPLS firewall filter, you must first configure the filter and then apply it to an interface you have configured for forwarding MPLS traffic. You can also configure a policer for the MPLS filter to police (that is, rate-limit) the traffic on the interface to which the filter is attached.

When you configure an MPLS firewall filter, you define the filtering criteria (terms, with match conditions) and an action for the switch to take if the packets match the filtering criteria.

**NOTE:** You can only configure MPLS filters in the ingress direction. Egress MPLS firewall filters are not supported.

### Configuring an MPLS Firewall Filter

To configure an MPLS firewall filter:

1. Configure the filter name, term name, and at least one match condition—for example, match on MPLS packets with EXP bits set to either 0 or 4:

```
[edit firewall family mpls]
user@switch# set filter ingress-exp-filter term term-one from exp 0,4
```

2. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term—for example, count MPLS packets with EXP bits set to either 0 or 4:

```
[edit firewall family mpls filter ingress-exp-filter term term-one then]
user@switch# set count counter0
user@switch# set accept
```

3. When you are finished, follow the steps below to apply the filter to an interface.

## Applying an MPLS Firewall Filter to an MPLS Interface

To apply the MPLS firewall filter to an interface you have configured for forwarding MPLS traffic (using the family mpls statement at the [edit interfaces *interface-name* unit *unit-number*] hierarchy level):

**NOTE:** You can apply firewall filters only to filter MPLS packets that enter an interface.

1. Apply the firewall filter to an MPLS interface—for example, apply the firewall filter to interface xe-0/0/5:

```
[edit interfaces]
user@switch# set xe-0/0/5 unit 0 family mpls filter input ingress-exp-filter
```

2. Review your configuration and issue the commit command:

```
[edit interfaces]
user@switch# commit
commit complete
```

## Applying an MPLS Firewall Filter to a Loopback Interface

To apply an MPLS firewall filter to a loopback interface (lo0):

1. First, specify the packet format by using the ["packet-format-match" on page 2433](#) command. You must restart the PFE every time you configure this command.

2. Configure the firewall filter match conditions and actions as described in ["Configuring an MPLS Firewall Filter" on page 1814](#). You must explicitly set the TTL match condition to (ttl=1). You can also match packets with other MPLS qualifiers such as label, exp, and Layer 4 source port, and destination port.
3. Apply the filter to the loopback interface as an input filter.

```
[edit interfaces]
user@switch# set lo0 unit 0 family mpls filter input ingress-exp-filter
```

4. Review your configuration and issue the commit command:

```
[edit interfaces]
user@switch# commit
commit complete
```

The following is an example configuration.

```
set groups lo_mpls_filter interfaces lo0 unit 0 family mpls filter input mpls_lo
set groups lo_mpls_filter firewall family mpls filter mpls_lo term mpls_lo_term from ttl 1
set groups lo_mpls_filter firewall family mpls filter mpls_lo term mpls_lo_term from ip-version ipv4
protocol udp source-port 10
set groups lo_mpls_filter firewall family mpls filter mpls_lo term mpls_lo_term from ip-version ipv4
protocol udp destination-port 11
set groups lo_mpls_filter firewall family mpls filter mpls_lo term mpls_lo_term then count c1
set groups lo_mpls_filter firewall family mpls filter mpls_lo term mpls_lo_term then accept
```

## Configuring Policers for LSPs

Starting with Junos OS 13.2X51-D15, you can send traffic matched by an MPLS filter to a two-color policer or three-color policer. MPLS LSP policing allows you to control the amount of traffic forwarded through a particular LSP. Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. LSP policing is supported on regular LSPs, LSPs configured with DiffServ-aware traffic engineering, and multiclass LSPs. You can configure multiple policers for each multiclass LSP. For regular LSPs, each LSP policer is applied to all of the traffic traversing the LSP. The policer's bandwidth limitations become effective as soon as the total sum of traffic traversing the LSP exceeds the configured limit.

You configure the multiclass LSP and DiffServ-aware traffic engineering LSP policers in a filter. The filter can be configured to distinguish between the different class types and apply the relevant policer to each class type. The policers distinguish between class types based on the EXP bits.

You configure LSP policers under the `family any` filter. The `family any` filter is used because the policer is applied to traffic entering the LSP. This traffic might be from different families: IPv6, MPLS, and so on. You do not need to know what sort of traffic is entering the LSP, as long as the match conditions apply to all types of traffic.

When configuring MPLS LSP policers, be aware of the following limitations:

- LSP policers are supported for packet LSPs only.
- LSP policers are supported for unicast next hops only. Multicast next hops are not supported.
- The LSP policer runs before any output filters.
- Traffic sourced from the Routing Engine (for example, ping traffic) does not take the same forwarding path as transit traffic. This type of traffic cannot be policed.

## Configuring MPLS Firewall Filters and Policers on Routers

### IN THIS SECTION

- [Configuring MPLS Firewall Filters | 1817](#)
- [Examples: Configuring MPLS Firewall Filters | 1818](#)
- [Configuring Policers for LSPs | 1819](#)
- [Example: Configuring an LSP Policer | 1821](#)
- [Configuring Automatic Policers | 1822](#)
- [Writing Different DSCP and EXP Values in MPLS-Tagged IP Packets | 1826](#)

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can also configure policers for MPLS LSPs.

The following sections discuss MPLS firewall filters and policers:

### Configuring MPLS Firewall Filters

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can then apply this filter to a specific interface. You can also configure a policer for the MPLS filter to police (that is, rate-limit) the traffic on the interface to which the filter is attached. You cannot apply MPLS firewall filters to Ethernet (fxp0) or loopback (lo0) interfaces.

You can configure the following match criteria attributes for MPLS filters at the [edit firewall family mpls filter *filter-name* term *term-name* from] hierarchy level:

- exp
- exp-except

These attributes can accept EXP bits in the range 0 through 7. You can configure the following choices:

- A single EXP bit—for example, exp 3;
- Several EXP bits—for example, exp 0, 4;
- A range of EXP bits—for example, exp [0-5];

If you do not specify a match criterion (that is, you do not configure the from statement and use only the then statement with the count action keyword), all the MPLS packets passing through the interface on which the filter is applied will be counted.

You also can configure any of the following action keywords at the [edit firewall family mpls filter *filter-name* term *term-name* then] hierarchy level:

- count
- accept
- discard
- next
- policer

For more information about how to configure firewall filters, see the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#). For more information about how to configure interfaces, see the [Junos OS Network Interfaces Library for Routing Devices](#) and the [Junos OS Services Interfaces Library for Routing Devices](#).

## Examples: Configuring MPLS Firewall Filters

The following examples illustrate how you might configure an MPLS firewall filter and then apply the filter to an interface. This filter is configured to count MPLS packets with EXP bits set to either 0 or 4.

The following shows a configuration for an MPLS firewall filter:

```
[edit firewall]
family mpls {
 filter expf {
```

```

 term expt0 {
 from {
 exp 0,4;
 }
 then {
 count counter0;
 accept;
 }
 }
}

```

The following shows how to apply the MPLS firewall filter to an interface:

```

[edit interfaces]
so-0/0/0 {
 mtu 4474;
 encapsulation ppp;
 sonet-options {
 fcs 32;
 }
 unit 0 {
 point-to-point;
 family mpls {
 filter {
 input expf;
 output expf;
 }
 }
 }
}

```

The MPLS firewall filter is applied to the input and output of an interface (see the input and output statements in the preceding example).

## Configuring Policers for LSPs

MPLS LSP policing allows you to control the amount of traffic forwarded through a particular LSP. Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. LSP policing is supported on regular LSPs, LSPs configured with DiffServ-aware traffic engineering, and multiclass LSPs. You can configure multiple policers for each multiclass LSP. For regular LSPs, each LSP policer is applied to all of the traffic traversing the LSP. The

police's bandwidth limitations become effective as soon as the total sum of traffic traversing the LSP exceeds the configured limit.

**NOTE:** The PTX10003 router only supports regular LSPs.

You configure the multiclass LSP and DiffServ-aware traffic engineering LSP police's in a filter. The filter can be configured to distinguish between the different class types and apply the relevant police to each class type. The police's distinguish between class types based on the EXP bits.

You configure LSP police's under the `family any` filter. The `family any` filter is used because the police is applied to traffic entering the LSP. This traffic might be from different families: IPv6, MPLS, and so on. You do not need to know what sort of traffic is entering the LSP, as long as the match conditions apply to all types of traffic.

You can configure only those match conditions that apply across all types of traffic. The following are the supported match conditions for LSP police's:

- forwarding-class
- packet-length
- interface
- interface-set

To enable a police on an LSP, first you need to configure a policing filter and then include it in the LSP configuration. For information about how to configure police's, see the [Routing Policies, Firewall Filters, and Traffic Police's User Guide](#).

To configure a police for an LSP, specify a filter by including the `filter` option to the policing statement:

```
policing {
 filter filter-name;
}
```

You can include the policing statement at the following hierarchy levels:

- [edit protocols mpls `label-switched-path lsp-name`]
- [edit protocols mpls `static-label-switched-path lsp-name`]
- [edit logical-systems `logical-system-name` protocols mpls `label-switched-path lsp-name`]
- [edit logical-systems `logical-system-name` protocols mpls `static-label-switched-path lsp-name`]

## LSP Policer Limitations

When configuring MPLS LSP policers, be aware of the following limitations:

- LSP policers are supported for packet LSPs only.
- LSP policers are supported for unicast next hops only. Multicast next hops are not supported.
- LSP policers are not supported on aggregated interfaces.
- The LSP policer runs before any output filters.
- Traffic sourced from the Routing Engine (for example, ping traffic) does not take the same forwarding path as transit traffic. This type of traffic cannot be policed.
- LSP policers work on all T Series routers and on M Series routers that have the Internet Processor II application-specific integrated circuit (ASIC).
- LSP policers are not supported for point-to-multipoint LSPs.

**NOTE:** Starting with Junos OS Release 12.2R2, on T Series routers only, you can configure an LSP policer for a specific LSP to be shared across different protocol family types. To do so, you must configure the ["logical-interface-policer" on page 2539](#) statement at the [edit firewall policer *policer-name*] hierarchy level.

## Example: Configuring an LSP Policer

The following example shows how you can configure a policing filter for an LSP:

```
[edit firewall]
policer police-ct1 {
 if-exceeding {
 bandwidth-limit 50m;
 burst-size-limit 1500;
 }
 then {
 discard;
 }
}
policer police-ct0 {
 if-exceeding {

```

## Configuring Automatic Policers

Automatic policing of LSPs allows you to provide strict service guarantees for network traffic. Such guarantees are especially useful in the context of Differentiated Services for traffic engineered LSPs, providing better emulation for ATM wires over an MPLS network. For more information about Differentiated Services for LSPs, see [DiffServ-Aware Traffic Engineering Introduction](#).

Differentiated Services for traffic engineered LSPs allow you to provide differential treatment to MPLS traffic based on the EXP bits. To ensure these traffic guarantees, it is insufficient to simply mark the traffic appropriately. If traffic follows a congested path, the requirements might not be met.

LSPs are guaranteed to be established along paths where enough resources are available to meet the requirements. However, even if the LSPs are established along such paths and are marked properly, these requirements cannot be guaranteed unless you ensure that no more traffic is sent to an LSP than there is bandwidth available.

It is possible to police LSP traffic by manually configuring an appropriate filter and applying it to the LSP in the configuration. However, for large deployments it is cumbersome to configure thousands of different filters. Configuration groups cannot solve this problem either, since different LSPs might have

different bandwidth requirements, requiring different filters. To police traffic for numerous LSPs, it is best to configure automatic policers.

When you configure automatic policers for LSPs, a policer is applied to all of the LSPs configured on the router. However, you can disable automatic policing on specific LSPs.

**NOTE:** When you configure automatic policers for DiffServ-aware traffic engineering LSP, GRES is not supported.

**NOTE:** You cannot configure automatic policing for LSPs carrying CCC traffic.

The following sections describe how to configure automatic policers for LSPs:

### Configuring Automatic Policers for LSPs

To configure automatic policers for standard LSPs (neither DiffServ-aware traffic engineered LSPs nor multiclass LSPs), include the auto-policing statement with either the class *all* *policer-action* option or the class *ct0* *policer-action* option:

```
auto-policing {
 class all policer-action;
 class ct0 policer-action;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls]
- [edit logical-systems *logical-system-name* protocols mpls]

You can configure the following policer actions for automatic policers:

- drop—Drop all packets.
- loss-priority-high—Set the packet loss priority (PLP) to high.
- loss-priority-low—Set the PLP to low.

These policer actions are applicable to all types of LSPs. The default policer action is to do nothing.

Automatic policers for LSPs police traffic based on the amount of bandwidth configured for the LSPs. You configure the bandwidth for an LSP using the bandwidth statement at the [edit protocols mpls label-

switched-path *lsp-path-name*] hierarchy level. If you have enabled automatic policers on a router, change the bandwidth configured for an LSP, and commit the revised configuration, the change does not take effect on the active LSPs. To force the LSPs to use the new bandwidth allocation, issue a `clear mpls lsp` command.

**NOTE:** You cannot configure automatic policers for LSPs that traverse aggregated interfaces or Multilink Point-to-Point Protocol (MLPPP) interfaces.

## Configuring Automatic Policers for DiffServ-Aware Traffic Engineering LSPs

To configure automatic policers for DiffServ-aware traffic engineering LSPs and for multiclass LSPs, include the auto-policing statement:

```
auto-policing {
 class all policer-action;
 class ctnumber policer-action;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls]
- [edit logical-systems *logical-system-name* protocols mpls]

You include either the `class all policer-action` statement or a `class ctnumber policer-action` statement for each of one or more classes (you can configure a different policer action for each class). For a list of the actions that you can substitute for the *policer-action* variable, see ["Configuring Automatic Policers for LSPs" on page 1823](#). The default policer action is to do nothing.

**NOTE:** You cannot configure automatic policers for LSPs that traverse aggregated interfaces or MLPPP interfaces.

## Configuring Automatic Policers for Point-to-Multipoint LSPs

You can configure automatic policers for point-to-multipoint LSPs by including the auto-policing statement with either the `class all policer-action` option or the `class ct0 policer-action` option. You only need to configure the auto-policing statement on the primary point-to-multipoint LSP (for more information on primary point-to-multipoint LSPs, see [Configuring the Primary Point-to-Multipoint LSP](#)). No additional configuration is required on the subLSPs for the point-to-multipoint LSP. Point-to-

multipoint automatic policing is applied to all branches of the point-to-multipoint LSP. In addition, automatic policing is applied to any local VRF interfaces that have the same forwarding entry as a point-to-multipoint branch. Feature parity for automatic policers for MPLS point-to-multipoint LSPs on the Junos Trio chipset is supported in Junos OS Releases 11.1R2, 11.2R2, and 11.4.

The automatic policer configuration for point-to-multipoint LSPs is identical to the automatic policer configuration for standard LSPs. For more information, see ["Configuring Automatic Policers for LSPs" on page 1823](#).

## Disabling Automatic Policing on an LSP

When you enable automatic policing, all of the LSPs on the router or logical system are affected. To disable automatic policing on a specific LSP on a router where you have enabled automatic policing, include the policing statement with the `no-auto-policing` option:

```
policing no-auto-policing;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls `label-switched-path` *lsp-name*]
- [edit logical-systems *logical-system-name* protocols mpls `label-switched-path` *lsp-name*]

## Example: Configuring Automatic Policing for an LSP

Configure automatic policing for a multiclass LSP, specifying different actions for class types `ct0`, `ct1`, `ct2`, and `ct3`.

```
[edit protocols mpls]
diffserv-te {
 bandwidth-model extended-mam;
}
auto-policing {
 class ct1 loss-priority-low;
 class ct0 loss-priority-high;
 class ct2 drop;
 class ct3 loss-priority-low;
}
traffic-engineering bgp-igp;
label-switched-path sample-lsp {
 to 3.3.3.3;
 bandwidth {
```

```

 ct0 11;
 ct1 1;
 ct2 1;
 ct3 1;
 }
}
interface fxp0.0 {
 disable;
}
interface t1-0/5/3.0;
interface t1-0/5/4.0;

```

## Writing Different DSCP and EXP Values in MPLS-Tagged IP Packets

You can selectively set the DiffServ code point (DSCP) field of MPLS-tagged IPv4 and IPv6 packets to 0 without affecting output queue assignment, and continue to set the MPLS EXP field according to the configured rewrite table, which is based on forwarding classes. You can accomplish this by configuring a firewall filter for the MPLS-tagged packets.

## Configuring MPLS Firewall Filters and Policers

### IN THIS SECTION

- [Configuring MPLS Firewall Filters | 1826](#)
- [Examples: Configuring MPLS Firewall Filters | 1827](#)
- [Configuring Policers for LSPs | 1828](#)

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can also configure policers for MPLS LSPs.

The following sections discuss MPLS firewall filters and policers:

### Configuring MPLS Firewall Filters

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can then apply this filter to a specific interface on input or output. You can also

configure a policer for the MPLS filter to police (that is, rate-limit) the traffic on the interface to which the filter is attached. You cannot apply MPLS firewall filters to loopback interfaces.

You can configure the following match conditions for MPLS filters at the [edit firewall family mpls filter *filter-name* term *term-name* from] hierarchy level:

- exp
- label

These exp match condition can accept EXP bits in the range 0 through 7. You can configure the following choices:

- A single EXP bit—for example, exp 3;
- Several EXP bits—for example, exp 0, 4;
- A range of EXP bits—for example, exp [0-5];

The label match condition can accept a range of values from 0 to 1048575.

If you do not specify a match criterion (that is, you do not configure the from statement and use only the then statement with the count action keyword), all the MPLS packets passing through the interface on which the filter is applied will be counted.

You also can configure any of the following action keywords at the [edit firewall family mpls filter *filter-name* term *term-name* then] hierarchy level:

- accept
- count
- discard
- policer
- three-color-policer

## Examples: Configuring MPLS Firewall Filters

The following examples illustrate how you might configure an MPLS firewall filter and then apply the filter to an interface. This filter is configured to count MPLS packets with EXP bits set to either 0 or 4.

The following shows a configuration for an MPLS firewall filter:

```
[edit firewall]
family mpls {
```

```

filter expf {
 term expt0 {
 from {
 exp 0,4;
 }
 then {
 count counter0;
 accept;
 }
 }
}

```

## Configuring Policers for LSPs

MPLS LSP policing allows you to control the amount of traffic forwarded through a particular LSP. Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. LSP policing is supported on regular LSPs, LSPs configured with DiffServ-aware traffic engineering, and multiclass LSPs. You can configure multiple policers for each multiclass LSP. For regular LSPs, each LSP policer is applied to all of the traffic traversing the LSP. The policer's bandwidth limitations become effective as soon as the total sum of traffic traversing the LSP exceeds the configured limit.

You configure the multiclass LSP and DiffServ-aware traffic engineering LSP policers in a filter. The filter can be configured to distinguish between the different class types and apply the relevant policer to each class type. The policers distinguish between class types based on the EXP bits.

You configure LSP policers under the `family any` filter. The `family any` filter is used because the policer is applied to traffic entering the LSP. This traffic might be from different families: IPv6, MPLS, and so on. You do not need to know what sort of traffic is entering the LSP, as long as the match conditions apply to all types of traffic.

## LSP Policer Limitations

When configuring MPLS LSP policers, be aware of the following limitations:

- LSP policers are supported for packet LSPs only.
- LSP policers are supported for unicast next hops only. Multicast next hops are not supported.
- LSP policers are not supported on aggregated interfaces.
- The LSP policer runs before any output filters.

- Traffic sourced from the Routing Engine (for example, ping traffic) does not take the same forwarding path as transit traffic. This type of traffic cannot be policed.
-

[Overview of Policers](#) | 2157

## Understanding How a Firewall Filter Tests a Protocol

When examining match conditions in a *firewall filter*, a switch tests only the fields that you specify. It does not implicitly test any fields that you do not explicitly configure. For example, if you specify a match condition of `source-port ssh`, there is no implied test to determine if the protocol is TCP. In this case, the switch considers any packet that has a value of 22 (decimal) in the 2-byte field that follows a *presumed* IP header to be a match. To ensure that the term matches on TCP packets, you also specify an `ip-protocol tcp` match condition.

For the following match conditions, you should explicitly specify the protocol match condition in the same term:

- `destination-port`—Specify `protocol tcp` or `protocol udp`.
- `icmp-code`—Specify `protocol icmp` and `icmp-type`.
- `icmp-type`—Specify `protocol icmp` or `protocol icmp6`.
- `source-port`—Specify `protocol tcp` or `protocol udp`.
- `tcp-flags`—Specify `protocol tcp`.

## Understanding Firewall Filter Processing Points for Bridged and Routed Packets

You apply firewall filters at multiple processing points in the forwarding path. At each processing point, the action to be taken on a packet is determined by the configuration of the filter and the results of the lookup in the forwarding or routing table.

For both bridged (Layer 2) unicast packets and routed (Layer 3) unicast packets, firewall filters are applied in the prescribed order shown below (assuming that each filter is present and a packet is accepted by each one).

Bridged packets:

1. Ingress port filter
2. Ingress VLAN filter
3. Egress VLAN filter
4. Egress port filter

Routed packets:

1. Ingress port firewall filter
2. Ingress VLAN firewall filter (Layer 2 CoS)
3. Ingress router firewall filter (Layer 3 CoS)
4. Egress router firewall filter
5. Egress VLAN firewall filter
6. Egress port filter

**NOTE:** MAC learning occurs before filters are applied, so switches learn the MAC addresses of packets that are dropped by ingress filters.

# Understanding Filter-Based Forwarding

IN THIS SECTION

- [Benefits of Filter-Based Forwarding | 1831](#)

For IPv4 or IPv6 traffic, you can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. This feature is called filter-based forwarding (FBF), and is also known as policy-based routing (PBR).

You might want to use FBF to route specific types of traffic through a firewall or other security device before the traffic continues on its path. You can also use FBF to give certain types of traffic preferential treatment. For example, you might want to ensure that the highest-priority traffic is forwarded over a 40-Gigabit Ethernet link.

To set up FBF, you specify a firewall filter match condition and action and then specify the virtual routing instance to send packets to.

**NOTE:** You can create as many as 128 filters or terms that direct packets to a given virtual routing instance.

(QFX5100, QFX5110, QFX5200 switches) Starting in Junos OS Release 19.1R1, filter-based forwarding is supported on IPv6 interfaces (ingress direction only).

## Benefits of Filter-Based Forwarding

- Allows you to have more control over load balancing than dynamic routing protocols typically provide.

Release History Table

| Release | Description                                                                                                                                                 |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.1R1  | (QFX5100, QFX5110, QFX5200 switches) Starting in Junos OS Release 19.1R1, filter-based forwarding is supported on IPv6 interfaces (ingress direction only). |

[Understanding Virtual Router Routing Instances](#)

## Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device

### IN THIS SECTION

- [Requirements | 1832](#)
- [Overview and Topology | 1832](#)
- [Configuration | 1833](#)
- [Verification | 1836](#)

This example describes how to set up filter-based forwarding on EX Series switches or a QFX10000. You can configure filter-based forwarding by using a firewall filter to forward matched traffic to a specific virtual routing instance.

### Requirements

This example applies to both EX Series switches running Junos OS Release 9.4 or later, and QFX10000 switches running Junos OS Release 15.1X53-D10 or later.

### Overview and Topology

In this example, we create a firewall filter to match traffic being sent from one application server to another according to the destination address (192.168.0.1) of packets egressing the source application server. Matching packets are routed to a virtual routing instance which forwards the traffic to a security device, which then forwards the traffic on to the destination application server.

**NOTE:** Filter-based forwarding does not work with IPv6 interfaces on some Juniper switches.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1833](#)
- [Procedure | 1834](#)
- [Results | 1835](#)

To configure filter-based forwarding:

### CLI Quick Configuration

To use this example on your own device, copy the following commands into a text file, remove the line breaks, and change the necessary details to fit your configuration. Then copy and paste the commands into your CLI at the [edit] hierarchy level.

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address
10.1.0.1/24
set interfaces xe-0/0/3 unit 0 family inet address
10.1.3.1/24
set firewall family inet filter f1 term t1 from source-address
10.1.0.50/32
set firewall family inet filter f1 term t1 from protocol
tcp
set interfaces xe-0/0/0 unit 0 family inet filter input f1
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface xe-0/0/3.0
set routing-instances vrf01 routing-options static route 192.168.0.1/24
next-hop 10.1.3.254
set firewall family inet filter f1 term t1 then routing-instance
vrf01
```

## Procedure

### Step-by-Step Procedure

To configure filter-based forwarding:

1. Configure an interface to connect to the application server:

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet address 10.1.0.1/24
```

2. Configure an interface to connect to the security device:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 10.1.3.1/24
```

3. Create a firewall filter that matches packets based on the address of the application server that the traffic will be sent from. Also configure the filter so that it matches only TCP packets:

```
[edit firewall]
user@switch# set family inet filter f1 term t1 from source-address 10.1.0.50/32
user@switch# set firewall family inet filter f1 term t1 from protocol
tcp
```

4. Apply the filter to the interface that connects to the source application server and configure it to match incoming packets:

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet filter input f1
```

5. Create a virtual router:

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```

6. Associate the virtual router with the interface that connects to the security device:

```
[edit routing-instances]
user@switch# set vrf01 interface xe-0/0/3.0
```

7. Configure the routing information for the virtual routing instance:

```
[edit routing-instances]
user@switch# set vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
```

8. Set the filter to forward packets to the virtual router:

```
[edit firewall]
user@switch# set family inet filter f1 term t1 then routing-instance
vrf01
```

## Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
 xe-0/0/0 {
 unit 0 {
 family inet {
 filter {
 input f1;
 }
 address 10.1.0.1/24;
 }
 }
 }
 xe-0/0/3 {
 unit 0 {
 family inet {
 address 10.1.3.1/24;
 }
 }
 }
}
```

```

}
firewall {
 family inet {
 filter f1 {
 term t1 {
 from {
 source-address {
 10.1.0.50/32;
 }
 protocol tcp;
 }
 then {
 routing-instance vrf01;
 }
 }
 }
 }
}
routing-instances {
 vrf01 {
 instance-type virtual-router;
 interface xe-0/0/3.0;
 routing-options {
 static {
 route 192.168.0.1/24 next-hop 10.1.3.254;
 }
 }
 }
}

```

## Verification

### IN THIS SECTION

- [Verifying That Filter-Based Forwarding Was Configured | 1837](#)

To confirm that the configuration is working properly, perform these tasks:

## Verifying That Filter-Based Forwarding Was Configured

### Purpose

Verify that filter-based forwarding was properly enabled on the switch.

### Action

1. Use the `show interfaces filters` command:

```
user@switch> show interfaces filters
xe-0/0/0.0
Interface Admin Link Proto Input Filter Output Filter
xe-0/0/0.0 up down inet fil
```

2. Use the `show route forwarding-table` command:

```
user@switch> show route forwarding-table

Routing table: default.inet
Internet:
Destination Type RtRef Next hop Type Index NhRef Netif

## Meaning

The output indicates that the filter was created on the interface and that the virtual routing instance is forwarding matching traffic to the correct IP address.

## Configuring a Firewall Filter to De-Encapsulate GRE or IPIP Traffic

### IN THIS SECTION

- [Configuring a Filter to De-Encapsulate GRE Traffic | 1839](#)
- [Configuring a Filter to De-Encapsulate IPIP Traffic | 1841](#)
- [Applying the Filter to an Interface | 1842](#)

Generic routing encapsulation (GRE) and IP over IP (IPIP) both provide a private, secure path for transporting packets through a network by encapsulating (or tunneling) the packets. The tunneling is performed by tunnel endpoints that encapsulate or de-encapsulate traffic.

You can use a firewall filter to de-encapsulate tunnel traffic on the switch. This feature provides significant benefits in terms of scalability, performance, and flexibility because you don't need to create a tunnel interface to perform the de-encapsulation. For example, you can terminate many tunnels from multiple source IP addresses with one firewall term.

**NOTE:** The EX4600, QFX5100 and OCX switches support as many as 512 GRE tunnels, including tunnels created with a firewall filter. That is, you can create a total of 512 GRE tunnels, regardless of which method you use.

### Configuring a Filter to De-Encapsulate GRE Traffic

To configure a firewall filter to de-encapsulate GRE traffic:

1. Create an IPv4 firewall filter and (optionally) specify a source address for the tunnel:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from source-address
address
```

You must create an IPv4 filter by using `family inet` because the outer header of a GRE packet must be IPv4. If you specify a source address, it should be an address on a device that will encapsulate traffic into GRE packets.

**NOTE:** To terminate many tunnels from multiple source IP addresses with one firewall term, do not configure a source address. In this case, the filter will de-encapsulate any GRE packets received by the interface that you apply the filter to.

2. Specify a destination address for the tunnel:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from destination-
address address
```

This should be an address on an interface of the switch on which you want the tunnel or tunnels to terminate and the GRE packets to be de-encapsulated. You should also configure this address as a tunnel endpoint on all the tunnel source routers that you want to form tunnels with on the switch.

3. Specify that the filter should match and accept GRE traffic:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from protocol gre
```

4. Specify that the filter should de-encapsulate GRE traffic:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate gre
```

Based on the configuration you have performed so far, the switch forwards the de-encapsulated packets by comparing the inner header to the default routing table (*inet0*). If you want the switch to use a virtual routing instance to forward the de-encapsulated packets, perform the following steps:

5. Specify the name of the virtual routing instance:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate
routing-instance instance-name
```

6. Specify that the virtual routing instance is a virtual router:

```
[edit]
user@switch# set routing-instances instance-name instance-type virtual-router
```

7. Specify the interfaces that belong to the virtual router:

```
[edit]
user@switch# set routing-instances instance-name interface interface-name
```

## Configuring a Filter to De-Encapsulate IPIP Traffic

To configure a firewall filter to de-encapsulate IPIP traffic::

1. Create an IPv4 firewall filter and (optionally) specify a source address for the tunnel:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from source-address
address
```

You must create an IPv4 filter by using `family inet` because the outer header of an IPIP packet must be IPv4. If you specify a source address, it should be an address on a device that will encapsulate traffic into IPIP packets.

**NOTE:** To terminate many tunnels from multiple source IP addresses with one firewall term, do not configure a source address. In this case, the filter will de-encapsulate any IPIP packets received by the interface that you apply the filter to.

2. Specify a destination address for the tunnel:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from destination-
address address
```

This should be an address on an interface of the switch on which you want the tunnel or tunnels to terminate and the IPIP packets to be de-encapsulated. You should also configure this address as a tunnel endpoint on all the tunnel source routers that you want to form tunnels with on the switch.

3. Specify that the filter should match and accept IPIP traffic:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name from protocol ipip
```

#### 4. Specify that the filter should de-encapsulate IPIP traffic:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate ipip
```

Based on the configuration you have performed so far, the switch forwards the de-encapsulated packets by comparing the inner header to the default routing table (inet0). If you want the switch to use a virtual routing instance to forward the de-encapsulated packets, perform the following steps:

#### 5. Specify the name of the virtual routing instance:

```
[edit]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate
routing-instance instance-name
```

#### 6. Specify that the virtual routing instance is a virtual router:

```
[edit]
user@switch# set routing-instances instance-name instance-type virtual-router
```

#### 7. Specify the interfaces that belong to the virtual router:

```
[edit]
user@switch# set routing-instances instance-name interface interface-name
```

## Applying the Filter to an Interface

After you create the firewall filter, you must also apply it to an interface that will receive GRE or IPIP traffic. Be sure to apply it in the input direction. For example, enter

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet filter input filter-name
```

Because the outer header of a GRE or IPIP packet must be IPv4, you must apply the filter to an IPv4 interface and specify family inet.

## Verifying That Firewall Filters Are Operational

### IN THIS SECTION

- Purpose | 1843
- Action | 1843
- Meaning | 1844

### Purpose

After you configure and apply firewall filters to ports, VLANs, or Layer 3 interfaces, you can perform the following task to verify that the firewall filters configured on EX Series switches are working properly.

### Action

Use the operational mode command to verify that the firewall filters on the switch are working properly:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name Bytes Packets
counter-employee-web 0 0
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name Bytes Packets
icmp-counter 0 0
Policers:
Name Packets
icmp-connection-policer 0
tcp-connection-policer 0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

## Meaning

The `show firewall` command displays the names of all firewall filters, policers, and counters that are configured on the switch. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.

- [Monitoring Traffic for a Specific Policer | 1846](#)

You can monitor firewall filter traffic on EX Series switches.

## Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch

### IN THIS SECTION

- [Purpose | 1845](#)
- [Action | 1845](#)

● Meaning | 1845

## Purpose

Perform the following task to monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

## Action

Use the operational mode command:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name Bytes Packets
counter-employee-web 3348 27
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name Bytes Packets
icmp-counter 4100 49
Policers:
Name Packets
icmp-connection-policer 0
tcp-connection-policer 0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

## Meaning

The `show firewall` command displays the names of all firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for counters and packet count for policers.

## Monitoring Traffic for a Specific Firewall Filter

IN THIS SECTION

- Purpose | 1846
- Action | 1846
- Meaning | 1846

### Purpose

Perform the following task to monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded the policer rate limits.

### Action

Use the operational mode command:

```
user@switch> show firewall filter ingress-vlan-rogue-block
Filter: ingress-vlan-rogue-block
Counters:
Name Bytes Packets
rogue-counter 2308 20
```

### Meaning

The `show firewall filter filter-name` command displays the name of the firewall filter, the packet and byte count for all counters configured with the filter, and the packet count for all policers configured with the filter.

## Monitoring Traffic for a Specific Policer

IN THIS SECTION

- Purpose | 1847
- Action | 1847

● [Meaning | 1847](#)

## Purpose

Perform the following task to monitor the number of packets that exceeded policer rate limits:

## Action

Use the operational mode command:

```
user@switch> show policer tcp-connection-policer
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
Name Packets
tcp-connection-policer 0
```

## Meaning

The `show policer policer-name` command displays the name of the firewall filter that specifies the policer-action and displays the number of packets that exceeded rate limits for the specified filter.

Use the following information to troubleshoot your firewall filter configuration.

### Firewall Filter Configuration Returns a No Space Available in TCAM Message

#### IN THIS SECTION

- [Problem | 1849](#)
- [Solution | 1849](#)

## Problem

## Description

When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following syslogd message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

## Solution

When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN , or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on employee-
vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter `new-ingress-vlan-rogue-block`.

### 3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

## Filter Counts Previously Dropped Packet

### IN THIS SECTION

- [Problem | 1851](#)
- [Solution | 1852](#)

### Problem

#### Description

If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:

- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the `admin` VLAN in the output direction, and interface `xe-0/0/1` is a member of that VLAN.
- You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to `xe-0/0/1` in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

### Solution

This is expected behavior.

## Matching Packets Not Counted

### IN THIS SECTION

- [Problem | 1852](#)
- [Solution | 1853](#)

### Problem

### Description

If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.

For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the `adminVLAN`, and interface xe-0/0/1 is a member of that VLAN.
- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

## Solution

This is expected behavior.

## Counter Reset When Editing Filter

### IN THIS SECTION

- [Problem | 1853](#)
- [Solution | 1853](#)

## Problem

### Description

If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has term1, term2, and term3, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has term1 and term2. Also assume that term2 has a policer action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit term1 or term2 in any way, the counter for the policer referenced by term2 is reset to 0.

## Solution

This is expected behavior.

## Cannot Include loss-priority and policer Actions in Same Term

### IN THIS SECTION

- [Problem | 1854](#)
- [Solution | 1854](#)

## Problem

## Description

You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- loss-priority
- policer

If you do so, you see the following error message when you attempt to commit the configuration:  
“cannot support policer action if loss-priority is configured.”

## Solution

This is expected behavior.

## Cannot Egress Filter Certain Traffic Originating on QFX Switch

### IN THIS SECTION

- [Problem | 1854](#)
- [Solution | 1854](#)

## Problem

## Description

On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

## Solution

This is expected behavior.

## Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

### IN THIS SECTION

- [Problem | 1855](#)
- [Solution | 1855](#)

### Problem

### Description

If you create a firewall filter that includes a match condition of `dot1q-tag` or `dot1q-user-priority` and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

### Solution

This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the `[edit ethernet-switching-options]` hierarchy level. You must also configure the other end of the link to use the same EtherType.

## Egress Firewall Filters with Private VLANs

### IN THIS SECTION

- [Problem | 1855](#)
- [Solution | 1856](#)

### Problem

### Description

If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

## Solution

These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

## Egress Filtering of L2PT Traffic Not Supported

### IN THIS SECTION

 [Problem | 1857](#)

● [Solution | 1857](#)

## Problem

## Description

Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

## Solution

This is expected behavior.

## Cannot Drop BGP Packets in Certain Circumstances

### IN THIS SECTION

● [Problem | 1857](#)

● [Solution | 1857](#)

## Problem

## Description

BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

## Solution

This is expected behavior.

## Invalid Statistics for Policer

### IN THIS SECTION

- [Problem | 1858](#)
- [Solution | 1858](#)

### Problem

### Description

If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the `show firewall` command displays incorrect data for the policer.

### Solution

This is expected behavior.

## Policers can Limit Egress Filters

### IN THIS SECTION

- [Problem | 1858](#)
- [Solution | 1859](#)

### Problem

### Description

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries

for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

### Solution

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

[Configuring Firewall Filters](#)

# Configuring Firewall Filter Accounting and Logging (EX9200 Switches)

## IN THIS CHAPTER

- [Example: Configuring Logging for a Stateless Firewall Filter Term | 1860](#)
- [Use the CLI Editor in Configuration Mode | 1866](#)

## Example: Configuring Logging for a Stateless Firewall Filter Term

## IN THIS SECTION

- [Requirements | 1860](#)
- [Overview | 1860](#)
- [Configuration | 1861](#)
- [Verification | 1865](#)

This example shows how to configure a standard stateless firewall filter to log packet headers.

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you use a stateless firewall filter that logs and counts ICMP packets that have **192.168.207.222** as either their source or destination.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1861](#)
- [Configure the Syslog Messages File for the Firewall Facility | 1861](#)
- [Configure the Stateless Firewall Filter | 1862](#)
- [Apply the Stateless Firewall Filter to a Logical Interface | 1863](#)
- [Confirm and Commit Your Candidate Configuration | 1863](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set system syslog file ICMP_filter firewall info
set system syslog file ICMP_filter archive no-world-readable
set firewall family inet filter icmp_syslog term icmp_match from address 192.168.207.222/32
set firewall family inet filter icmp_syslog term icmp_match from protocol icmp
set firewall family inet filter icmp_syslog term icmp_match then count packets
set firewall family inet filter icmp_syslog term icmp_match then syslog
set firewall family inet filter icmp_syslog term icmp_match then accept
set firewall family inet filter icmp_syslog term default_term then accept
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input icmp_syslog
```

### Configure the Syslog Messages File for the Firewall Facility

### Step-by-Step Procedure

To configure a syslog messages file for the **firewall** facility:

1. Configure a messages file for all syslog messages generated for the **firewall** facility.

```
user@host# set system syslog file ICMP_filter firewall info
```

2. Restrict permission to the archived **firewall** facility syslog files to the root user and users who have the Junos OS maintenance permission.

```
user@host# set system syslog file ICMP_filter archive no-world-readable
```

## Configure the Stateless Firewall Filter

### Step-by-Step Procedure

To configure the stateless firewall filter **icmp\_syslog** that logs and counts ICMP packets that have **192.168.207.222** as either their source or destination:

1. Create the stateless firewall filter **icmp\_syslog**.

```
[edit]
user@host# edit firewall family inet filter icmp_syslog
```

2. Configure matching on the ICMP protocol and an address.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term icmp_match from address 192.168.207.222/32
user@host# set term icmp_match from protocol icmp
```

3. Count, log,, and accept matching packets.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term icmp_match then count packets
user@host# set term icmp_match then syslog
user@host# set term icmp_match then accept
```

4. Accept all other packets.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term default_term then accept
```

## Apply the Stateless Firewall Filter to a Logical Interface

### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input icmp_syslog
```

## Confirm and Commit Your Candidate Configuration

### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the syslog message file for the **firewall** facility by entering the `show system configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show system
```

```

syslog {
 file ICMP_filter {
 firewall info;
 archive no-world-readable;
 }
}

```

2. Confirm the configuration of the stateless firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show firewall
family inet {
 filter icmp_syslog {
 term icmp_match {
 from {
 address {
 192.168.207.222/32;
 }
 protocol icmp;
 }
 then {
 count packets;
 log;
 accept;
 }
 }
 term default_term {
 then accept;
 }
 }
}

```

3. Confirm the configuration of the interface by entering the `show interfaces` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {

```

```

unit 0 {
 family inet {
 filter {
 input icmp_syslog;
 }
 address 10.1.2.3/30;
 }
}

```

4. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, enter the `show log` filter command:

```

user@host> show log ICMP_filter
Mar 20 08:03:11 hostname feb FW: ge-0/1/0.0 A icmp 192.168.207.222
192.168.207.223 0 0 (1 packets)

```

This output file contains the following fields:

- **Date and Time**—Date and time at which the packet was received (not shown in the default).
- **Filter action**:
  - **A**—Accept (or next term)
  - **D**—Discard
  - **R**—Reject
- **Protocol**—Packet's protocol name or number.
- **Source address**—Source IP address in the packet.
- **Destination address**—Destination IP address in the packet.

**NOTE:** If the protocol is ICMP, the ICMP type and code are displayed. For all other protocols, the source and destination ports are displayed.

The last two fields (both zero) are the source and destination TCP/UDP ports, respectively, and are shown for TCP or UDP packets only. This log message indicates that only one packet for this match has been detected in about a one second interval. If packets arrive faster, the system log function compresses the information so that less output is generated, and displays an output similar to the following:

```

user@host> show log filename
Mar 20 08:18:45 hostname feb FW: ge-0/1/0.0 A icmp 192.168.207.222
192.168.207.223 0 0 (515 packets)

```

## Use the CLI Editor in Configuration Mode

This topic describes basic commands that you can use to enter configuration mode in the CLI editor. The topic also describes commands that you use to navigate the configuration hierarchy, get help, and commit or revert the changes that you make during the configuration session.

| Task                    | Command/<br>Statement | Example |
|-------------------------|-----------------------|---------|
| Edit Your Configuration |                       |         |

*(Continued)*

| Task                                                                                                                                                                                                                                                                                                 | Command/<br>Statement                          | Example                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Enter configuration mode.</p> <p>When you start the CLI, the device is in operational mode. You must explicitly enter configuration mode. When you do, the CLI prompt changes from <code>user@host&gt;</code> to <code>user@host#</code>, and the hierarchy level appears in square brackets.</p> | <p><code>configure</code></p>                  | <p><code>user@host&gt; configure</code></p> <p><code>[edit]</code><br/><code>user@host#</code></p>                                                                                         |
| <p>Create a statement hierarchy.</p> <p>You can use the <code>edit</code> command to simultaneously create a hierarchy and move to that new level in the hierarchy. You cannot use the <code>edit</code> command to change the value of identifiers.</p>                                             | <p><code>edit hierarchy-level value</code></p> | <p><code>[edit]</code><br/><code>user@host# edit security zones security-zone myzone</code></p> <p><code>[edit security zones security-zone myzone]</code><br/><code>user@host#</code></p> |
| <p>Create a statement hierarchy, and set identifier values.</p> <p>The <code>set</code> command is like <code>edit</code>, except that your current level in the hierarchy does not change.</p>                                                                                                      | <p><code>set hierarchy-level value</code></p>  | <p><code>[edit]</code><br/><code>user@host# set security zones security-zone myzone</code></p> <p><code>[edit]</code><br/><code>user@host#</code></p>                                      |

## Policer Implementation Overview

The Juniper Networks® Junos® operating system (Junos OS) supports three types of policers:

- *Single-rate two-color policer* — The most common policer. Single-rate means that there is only a single bandwidth and burst rate referenced in the policer. The two colors associated with this policer are red (nonconforming) and green (conforming).
- *Single-rate three-color policer* — Similar to the single-rate two-color policer with the addition of the color yellow. This type also introduces the *committed information rate* (CIR) and a *committed burst rate* (CBR).
- *Two-rate three-color policer* — Builds off of the single-rate three-color policer by adding a second rate tier. *Two-rate* means there is an upper bandwidth limit and associated burst size as well as a *peak information rate* (PIR) and a *peak burst rate* (PBS).

There are two types of token bucket algorithms that can be used, depending on the type of policer that is applied to network traffic. Single-rate two-color policers use the *single token bucket algorithm* to measure traffic flow conformance to a two-color policer rate limit. Single-rate three-color policers and two-rate three-color policers both use the *dual token bucket algorithm* to measure traffic flow conformance to a three-color policer rate. The main difference between these two token bucket algorithms is that the single token bucket algorithm allows bursts of traffic for short periods, whereas the dual token bucket algorithm allows more sustained bursts of traffic. (The remainder of this topic discusses the single token bucket algorithm.)

To configure a policer, you need to set two parameters:

- Bandwidth limit configured in bps (using the **bandwidth-limit** statement)
- Burst size configured in bytes (using the **burst-size-limit** statement)

**NOTE:** For single-rate two-color policers only, you can also specify the bandwidth limit as a percentage of either the physical interface port speed or the configured *logical interface* shaping rate by using the **bandwidth-percent percentage** statement. You cannot configure a policer to use bandwidth percentage for aggregate, tunnel, or software interfaces.

Use the following command to set the policer conditions:

```
user@router# set firewall policer <policer name> if-exceeding ?
Possible completions:
 <[Enter]> Execute this command
+ apply-groups Groups from which to inherit configuration data
+ apply-groups-except Don't inherit configuration data from these groups
```

|                         |                                                             |
|-------------------------|-------------------------------------------------------------|
| <b>bandwidth-limit</b>  | <b>Bandwidth limit (8000..100000000000 bits per second)</b> |
| bandwidth-percent       | Bandwidth limit in percentage (1..100 percent)              |
| <b>burst-size-limit</b> | <b>Burst size limit (1500..100000000000 bytes)</b>          |
|                         | Pipe through a command                                      |

The bandwidth limit parameter is used to determine the average rate limit applied to the traffic, while the burst-size parameter is used to allow for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Once you apply a set of policer configuration settings (bandwidth limit and burst size), the configured values are adjusted to hardware programmable values. The conversion adjustment introduced is normally less than 1 percent of the configured bandwidth limit. This adjustment is needed because the software allows you to configure the bandwidth limit and burst size to any value within the specified ranges, but those values must be adjusted to the nearest value that can be programmed in the hardware.

The policer bandwidth limit configuration in the hardware is represented by two values: the *credit update frequency* and the *credit size*. The credit update frequency is used by the hardware to determine how frequently tokens (bits of unused bandwidth) are added to the token bucket. The credit size is based on the number of tokens that can fit in the token bucket. The MX Series, M120, M320 routers, and EX Series switches contain a set of credit update frequencies instead of having a single credit update frequency to minimize the adjustment difference from the configured bandwidth limit and to support a wide range of policer bandwidth rates (from 40 Kbps to 40 Gbps). One of the frequencies is used to program the policer (bandwidth limit and burst size) in the hardware.

The burst size is based on the overall traffic load and allows bursts of traffic to exceed the configured bandwidth limit. A policer with a large burst size effectively disables the configured bandwidth limit function, so the burst size must be relative to the configured bandwidth limit. You need to consider the traffic patterns in your network before determining the burst size. For more information about determining burst size, see ["Determining Proper Burst Size for Traffic Policers" on page 1886](#).

The configured burst size is adjusted in the hardware to a value that is based on the configured bandwidth limit. The burst size extends the configured bandwidth limit for bursty traffic that exceeds the configured bandwidth limit.

When a policer is applied to the traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified in the **burst-size-limit** statement.

[Figure 75 on page 1875](#) represents how a policer is implemented using the token bucket algorithm. The token allocator allocates tokens to the policer based on the configured bandwidth limit, which is the token size multiplied by the token arrival rate.

token size x token arrival rate = policer rate (configured bandwidth limit)

Figure 75: Token Bucket Algorithm

When a packet arrives at an interface configured with a policer, tokens that represent the number of bits that correspond to the length of the packet are used (or “cached in”) from the token bucket. If the token arrival rate is higher than the rate of traffic so that there are tokens not being used, the token bucket is filled to capacity, and arriving tokens “overflow” the bucket and are lost. The token bucket depth represents the single user-configured burst size for the policer.

If there are tokens in the token bucket and the incoming traffic rate is higher than the token rate (the configured policer rate, bandwidth limit), the traffic can use the tokens until the bucket is empty. The token consumption rate can be as high as the incoming traffic rate, which creates the burst of traffic shown in [Figure 76 on page 1876](#).

By using the token bucket algorithm, the average bandwidth rate being allowed is close to the configured bandwidth limit while simultaneously supporting bursty traffic, as shown in [Figure 76 on page 1876](#).

**Figure 76: Traffic Behavior Using Policer and Burst Size**

**NOTE:** The measured length of a packet changes according to the family type that the policer applies to. If the policer is applied under the `family inet` hierarchy, the policer considers only the IPv4 packet length. If the policer is applied under the `family vpls` hierarchy, the entire Ethernet frame (including the Ethernet MAC header) is included in the packet length.

The major factor that affects the policer shaping result is not the conversion adjustment, but the traffic pattern since most network traffic is not consistent and is not sent at a constant rate. Due to the fluctuation of the incoming traffic rate, some of the allocated tokens are not used. As a result, the shaped traffic rate is lower than you might expect, and the TCP connection behavior discussed in ["Understanding the Benefits of Policers and Token Bucket Algorithms" on page 1883](#) is a typical example of this. To alleviate this effect of the lower shaped traffic rate, a proper burst size configuration is required.

## ARP Policer Overview

### IN THIS SECTION

- [Benefits of the ARP Policer](#) | 1878

Sending IP packets on a multi access network requires mapping from an IP address to a media access control (MAC) address (the physical or hardware address).

In an Ethernet environment, Address Resolution Protocol (ARP) is used to map a MAC address to an IP address. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before sending unicast IP packets, ARP discovers the MAC address used for the Ethernet interface where the IP address is configured.

Hosts that use ARP maintain a cache of discovered Internet-to-Ethernet address mappings to minimize the number of ARP broadcast messages. To keep the cache from growing too large, an entry is removed if it is not used within a certain period of time. Before sending a packet, the host searches its cache for Internet-to-Ethernet address mapping. If you cannot find the mapping, the host sends an ARP request.

Starting in Junos OS Release 18.4R1, you can apply policers on ARP traffic on SRX Series devices. Support for ARP policers on pseudowire interfaces on MX Series routers is available in Junos OS Release 20.2R1. The configuration principles are the same.

You can configure rate limiting for the policer by specifying the bandwidth and the burst-size limit. Packets exceeding the policer limits are discarded. The traffic to the Routing Engine is controlled by applying the policer on ARP traffic. Using policers helps prevent network congestion caused by broadcast storms. You can use policers to specify rate limits on traffic. A firewall filter configured with a policer permits only traffic within a specified set of rate limits, thereby providing protection from denial-of-service (DoS) attacks. Traffic that exceeds the rate limits specified by the policer is either discarded immediately or is marked as lower priority than traffic that is within the rate limits. The switch discards the lower-priority traffic when there is traffic congestion.

A policer applies two types of rate limits on traffic:

- Bandwidth—The number of bits per second permitted, on average
- Maximum burst size—The maximum size permitted for bursts of data that exceed the given bandwidth limit

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can define specific classes of traffic on an interface and apply a set of rate

limits to each class. After you name and configure a policer, it is stored as a template. You can then use the policer in a firewall filter configuration.

**NOTE:** On SRX5400, SRX5600, and SRX5800 devices, ARP policer actions are applied on the SPUs as well as on the Routing Engine. For example, SPU A handles 15000 packets of ARP traffic, and SPU B handles 5000 packets. A policer is configured as rate-limit 10K, discard and applied to the ARP protocol. As a result, SPU A discards 5000 packets of ARP traffic and forwards 10000 packets to the Routing Engine, and SPU B forwards 5000 packets of ARP the Routing Engine. The Routing Engine therefore receives a total of 15000 packets of ARP traffic.

## Benefits of the ARP Policer

- Prevents network congestion caused by broadcast storms
- Protects Routing Engines on SRX Series devices that are impacted by broadcast storms
- Provides protection from denial-of-service (DoS) attacks

## Example: Configuring ARP Policer

### IN THIS SECTION

- [Requirements | 1879](#)
- [Overview | 1879](#)
- [Configuration | 1880](#)
- [Verification | 1882](#)

This example shows how to configure an Address Resolution Protocol (ARP) policer on SRX Series devices.

Support for ARP policers on pseudowire interfaces on MX Series routers is available in Junos OS Release 20.2R1. The configuration principles are the same as shown here.

### Requirements

This example uses the following hardware and software components:

- SRX Series device.
- Junos OS Release 18.4R1 or later.

Before you begin, see "[ARP Policer Overview](#)" on page 1877.

### Overview

ARP is used to map a MAC address to an IP address. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before IP unicast packets can be sent, ARP discovers the MAC address used by the Ethernet interface where the IP address is configured. This feature is supported on all SRX Series devices. The traffic to the Routing Engine on the SRX Series device is controlled by applying the policer on ARP. This prevents network congestion caused by broadcast storms.

**NOTE:** A default ARP policer named `__default_arp_policer__` is used and shared by all Ethernet interfaces with family `inet` configured, by default.

On MX Series routers, you can create policers for ARP traffic on pseudowire interfaces. (You configure rate limiting for the policer by specifying the bandwidth and the burst-size limit of a firewall policer and attaching the policy to a pseudowire interface, just like you would any other interface, and apply the

ARP policer to a pseudowire interface at the [edit interfaces interface-name unit unit-number family inet policer arp policy-name] level of the hierarchy. Traffic that exceeds the specified rate limits can be dropped or marked as low priority and delivered when congestion permits.

## Configuration

### IN THIS SECTION

- [Configuring ARP Policer on Interface | 1880](#)

This example shows how to configure rate limiting for the policer by specifying the bandwidth and the burst-size limit.

### Configuring ARP Policer on Interface

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the [edit] hierarchy level, and then enter `commit` from configuration mode.

```
set firewall policer arp_limit if-exceeding bandwidth-limit 1m
set firewall policer arp_limit if-exceeding burst-size-limit 1m
set firewall policer arp_limit then discard
set interfaces ge-0/0/7 unit 0 family inet policer arp arp_limit
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see ["Use the CLI Editor in Configuration Mode" on page 1866](#) in the [CLI User Guide](#).

To configure the ARP policer:

1. Specify the name of the policer.

```
[edit firewall]
user@host# set policer arp-limit
```

2. Configure rate limiting for the policer.

- Specify the bandwidth limit in bits per second (bps) to control the traffic rate on an interface:

```
[edit firewall policer arp_limit]
user@host# set if-exceeding bandwidth-limit 1m
```

The range for the bandwidth limit is 1 through 150,000 bps.

- Specify the burst-size limit (the maximum allowed burst size in bytes) to control the amount of traffic bursting:

```
[edit firewall policer arp_limit]
user@host# set if-exceeding burst-size-limit 1m
```

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur:

burst size = (bandwidth) \* (allowable time for burst traffic)

The range for the burst-size limit is 1 through 150,00 bytes.

3. Specify the policer action discard to discard packets that exceed the rate limits.

```
[edit firewall]
user@host# set policer arp_limit then discard
```

Discard is the only supported policer action.

4. Configure the interfaces.

```
user@host# set interfaces ge-0/0/7 unit 0 family inet policer arp arp_limit
```

## Results

From configuration mode, confirm your configuration by entering the `show firewall` command. If the output does not display the intended configuration, repeat the instructions in this example to correct.

```
[edit]
user@host# show firewall
policer arp_limit {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 1m;
 }
 then discard;
}
[edit]
user@host# show interfaces
ge-0/0/7 {
 unit 0 {
 family inet {
 policer {
 arp arp_limit;
 }
 }
 }
}
```

After you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Verifying the results of arp policer | 1883](#)

To confirm that the configuration is working properly, perform these tasks:

Verifying the results of arp policer

Purpose

Verify the results of the Arp policer.

Action

From the top of the configuration in operational mode, enter the `show policer policer-name` command.

```
user@host> show policer arp_limit-ge-0/0/7.0-inet-arp
Policers:
Name Bytes Packets
arp_limit-ge-0/0/7.0-inet-arp 0 0
```

Meaning

The `show policer policer-name` command displays the names of all firewall filters and policers that are configured on the device.

| [ARP Policer Overview](#) | 1877

Understanding the Benefits of Policers and Token Bucket Algorithms

IN THIS SECTION

- [Scenario 1: Single TCP Connection](#) | 1884

● Scenario 2: Multiple TCP Connections | 1885

This topic describes some scenarios that demonstrate how difficult it is to control traffic that comes into your network without the help of policers and the token bucket algorithm. These scenarios assume that traffic is coming from a TCP-based connection. Depending on the number of TCP connections, policers can have different affects on rate limits.

This topic presents the following scenarios:

- ["Scenario 1: Single TCP Connection" on page 1884](#)
- ["Scenario 2: Multiple TCP Connections" on page 1885](#)

### Scenario 1: Single TCP Connection

[Figure 77 on page 1884](#) shows the traffic loading on an interface with a policer configured. When the traffic rate reaches the configured bandwidth limit (which results in a packet drop), a TCP slow-start mechanism reduces the traffic rate down to half of what it was. When the traffic rate rises again, the same cycle repeats.

**Figure 77: Policer Behavior with a Single TCP Connection**

The problem presented in this scenario is that some bandwidth is available, but it is not being used by the traffic. The unused bandwidth shown in [Figure 77 on page 1884](#) is the result of an overall data

throughput that is lower than the configured bandwidth value. This example is an extreme case because there is only a single TCP connection.

## Scenario 2: Multiple TCP Connections

With multiple TCP connections or some background non-TCP-based traffic, there is less unused bandwidth, as depicted in [Figure 78 on page 1885](#). However, the same issue of unused bandwidth still exists if all the TCP connections experience a drop when the aggregated traffic rate exceeds the configured bandwidth limit.

**Figure 78: Policer Behavior with Background Traffic (Multiple TCP Connections)**

To reduce the problem of unused bandwidth in your network, you can configure a burst size.

- [Comparison of the Two Methods | 1889](#)

### Policer Burst Size Limit Overview

A policer burst-size limit controls the number of bytes of traffic that can pass unrestricted through a policed interface when a burst of traffic pushes the average transmit or receive rate above the configured bandwidth limit. The actual number of bytes of bursty traffic allowed to pass through a policed interface can vary from zero to the configured burst-size limit, depending on the overall traffic load.

By configuring a proper burst size, the effect of a lower shaped rate is alleviated. Use the `burst-size-limit` statement to configure the burst size.

**NOTE:** If you set the burst-size limit too low, too many packets will be subjected to rate limiting. If you set the burst-size limit too high, too few packets will be rate-limited.

Consider these two main factors when determining the burst size to use:

- The allowed duration of a blast of traffic on the line.
- The burst size is large enough to handle the maximum transmission unit (MTU) size of the packets.

The following general guidelines apply to choosing a policer burst-size limit:

- A burst-size limit should not be set lower than 10 times the MTU of the traffic on the interface to be policed.
- The amount of time to allow a burst of traffic at the full line rate of a policed interface should not be lower than 5 ms.
- The minimum and maximum values you can specify for a policer burst-size limit depends on the policer type (two-color or three-color).

**BEST PRACTICE:** The preferred method for choosing a burst-size limit is based on the line rate of the interface on which you apply the policer and the amount of time you want to allow a burst of traffic at the full line rate.

## Effect of Burst-Size Limit

Bursty traffic requires a relatively large burst size so that extra tokens can be allocated into the token bucket for upcoming traffic to use.

### Bursty Traffic Policed Without a Burst-Size Limit

Figure 79 on page 1887 shows an extreme case of bursty traffic where the opportunity to allocate tokens is missed, and the bandwidth goes unused because a large burst size is not configured.

Figure 79: Bursty Traffic Without Configured Burst Size (Excessive Unused Bandwidth)

### Burst-Size Limit Configured to Match Bandwidth Limit and Flow Burstiness

Figure 80 on page 1888 depicts how bandwidth usage changes when a large burst size is configured to handle bursty traffic. The large burst size minimizes the amount of unused bandwidth because tokens

are being allocated in between the bursts of traffic that can be used during traffic peaks. The burst size determines the depth of the token bucket.

**Figure 80: Bursty Traffic with Configured Burst Size (Less Unused Bandwidth)**

### **Burst-Size Limit That Depletes All Accumulated Tokens**

Configuring a large burst size for the unused tokens creates another issue. If the burst size is set to a very large value, the burst of traffic can be transmitted from the interface at line rate until all the accumulated tokens in the token bucket are used up. This means that configuring a large burst size can allow too many packets to avoid rate limiting, which can lead to a traffic rate that exceeds the bandwidth limit for an extended period of time.

If the average rate is considered within 1 second, the rate is still below the configured bandwidth limit. However, the downstream device might not be able to handle bursty traffic, so some packets might be dropped.

### **Two Methods for Calculating Burst-Size Limit**

For policers configured on MX Series, M120, and M320 routers, and EX Series switches, configurable burst-size limit values range from 1 ms through 600 ms of traffic at the policer rate (the configured bandwidth limit).

Because one burst size is not suitable for every traffic pattern, select the best burst size for an interface by performing experimental configurations. For your first test configuration, select the burst-size limit by using one of the calculation methods described in the next two sections.

### Calculation Based on Interface Bandwidth and Allowable Burst Time

If the bandwidth of the policed interface is known, the preferred method for calculating the policer burst-size limit is based on the following values:

- bandwidth—Line rate of the policed interface (in bps units)
- burst-period—Allowable traffic-burst time (5 ms or longer)

To calculate policer bandwidth in bytes:

$$\text{bandwidth} \times \text{burst-period} / 8$$

### Calculation Based on Interface Traffic MTU

If the bandwidth of the policed interface is unknown, calculate the policer burst-size limit based on the following value:

- interface MTU—Maximum transmission unit (in bytes) for the policed interface.

To calculate policer bandwidth in bytes:

$$\text{interface MTU} \times 10$$

### Comparison of the Two Methods

[Figure 81 on page 1890](#) illustrates the relationship between the policer rate (the configured bandwidth limit) and the effective burst-size limit for the two methods of calculating the best policer burst-size

limit. For the method based on interface bandwidth and allowable burst time, the correlation is labeled **5 ms**. For the method based on MTU size, the correlation is labeled **10 MTU**.

**Figure 81: Comparing Burst Size Calculation Methods**

For a policer burst-size limit calculated using the **5 ms** method, the effective burst-size limit is proportional to the configured bandwidth limit. With a very low bandwidth limit, the effective burst-size limit might be so small that the policer rate-limits traffic more aggressively than desired. For example, a traffic “burst” consisting of two MTU-sized packets might be rate-limited. In this scenario, a policer burst-size limit calculated using the **10 MTU** method appears to be a better choice.

### **10 x MTU Method for Selecting Initial Burst Size for Gigabit Ethernet with 100 Kbps Bandwidth**

The following sequence illustrates the use of the 10 x MTU method for selecting an initial burst size for test configurations for a Gigabit Ethernet interface configured with a 100 Kbps bandwidth limit:

1. If you configure a 100 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 1250 bytes, calculated as follows:

$$100 \text{ Kbps} \times 100 \text{ ms} = \frac{100,000 \text{ bps} \times 0.1 \text{ s}}{8 \text{ bits per byte}} = 1250 \text{ bytes}$$

2. In theory, a 10 x MTU burst size would allow up to 15,000 bytes to pass unrestricted. However, the maximum configurable burst-size limit for MX Series, M120, and M320 routers is 600 ms of the bandwidth limit. If you configure the maximum burst-size limit of 600 ms of the bandwidth limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 7500 bytes, calculated as follows:

$$100 \text{ Kbps} \times 600 \text{ ms} = \frac{100,000 \text{ bps} \times 0.6 \text{ s}}{8 \text{ bits per byte}} = 7500 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 600 ms creates a burst duration of 60  $\mu$ s at Gigabit Ethernet line rate, calculated as follows:

$$\frac{7500 \text{ bytes}}{1 \text{ Gbps}} = \frac{60,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.00006 \text{ s} = 60 \mu\text{s}$$

3. If the downstream device is unable to handle the amount of bursty traffic allowed using the initial burst size configuration, reduce the burst-size limit until you achieve acceptable results.

### 5 ms Method for Selecting Initial Burst Size for Gigabit Ethernet Interface with 200 Mbps Bandwidth

The following sequence illustrates the use of the 5 ms method for selecting an initial burst size for test configurations for a Gigabit Ethernet interface configured with a 200 Mbps bandwidth limit. This example calculation shows how a larger burst-size limit can affect the measured bandwidth rate.

1. If you configure a 5 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 125,000 bytes (approximately 83 1500-byte packets), calculated as follows:

$$200 \text{ Mbps} \times 5 \text{ ms} = \frac{200,000,000 \text{ bps} \times 0.005 \text{ s}}{8 \text{ bits per byte}} = 125,000 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 5 ms creates a burst duration of 1 ms at Gigabit Ethernet line rate, calculated as follows:

$$\frac{125,000 \text{ bytes}}{1 \text{ Gbps}} = \frac{1,000,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.001 \text{ s} = 1 \text{ ms}$$

The average bandwidth rate in 1 second becomes 200 Mbps + 1 Mbps = 201 Mbps, which is a minimal increase over the configured bandwidth limit at 200 Mbps.

2. If you configure a 600 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 15 Mbytes (approximately 10,000 1500-byte packets), calculated as follows:

$$200 \text{ Mbps} \times 600 \text{ ms} = \frac{200,000,000 \text{ bps} \times 0.6 \text{ s}}{8 \text{ bits per byte}} = 15,000,000 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 600 ms creates a burst duration of 120 ms at Gigabit Ethernet line rate, calculated as follows:

$$\frac{15,000,000 \text{ bytes}}{1 \text{ Gbps}} = \frac{120,000,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.12 \text{ s} = 120 \text{ ms}$$

The average bandwidth rate in 1 second becomes 200 Mbps + 120 Mbps = 320 Mbps, which is much higher than the configured bandwidth limit at 200 Mbps.

### 200 Mbps Bandwidth Limit, 5 ms Burst Duration

If a 200 Mbps bandwidth limit is configured with a 5 ms burst size, the calculation becomes **200 Mbps x 5 ms = 125 Kbytes**, which is approximately 83 1500-byte packets. If the 200 Mbps bandwidth limit is

configured on a Gigabit Ethernet interface, the burst duration is **125000 bytes / 1 Gbps = 1 ms** at the Gigabit Ethernet line rate.

### 200 Mbps Bandwidth Limit, 600 ms Burst Duration

If a large burst size is configured at 600 ms with the bandwidth limit configured at 200 Mbps, the calculation becomes **200 Mbps x 600 ms = 15 Mbytes**. This creates a burst duration of 120 ms at the Gigabit Ethernet line rate. The average bandwidth rate in 1 second becomes **200 Mbps + 15 Mbytes = 320 Mbps**, which is much higher than the configured bandwidth limit at 200 Mbps. This example shows that a larger burst size can affect the measured bandwidth rate.

### Congestion Management for IP Traffic Flows

Traffic policing, also known as *rate limiting*, is an essential component of network access security that is designed to thwart denial-of-service (DoS) attacks. Traffic policing enables you to control the maximum rate of IP traffic sent or received on an interface and also to partition network traffic into multiple priority levels, also known as *classes of service*. A policer defines a set of traffic rate limits and sets consequences for traffic that does not conform to the configured limits. Packets in a traffic flow that do not conform to traffic limits are either discarded or marked with a different forwarding class or packet loss priority (PLP) level.

With the exception of policers configured to rate-limit aggregate traffic (all protocol families and logical interfaces configured on a physical interface), you can apply a policer to all IP packets in a Layer 2 or Layer 3 traffic flow at a *logical interface*.

With the exception of policers configured to rate-limit based on physical interface media rate, you can apply a policer to specific IP packets in a Layer 3 traffic flow at a logical interface by using a stateless *firewall filter*.

You can apply a policer to inbound or outbound interface traffic. Policers applied to inbound traffic help to conserve resources by dropping traffic that does not need to be routed through a network. Dropping inbound traffic also helps to thwart denial-of-service (DoS) attacks. Policers applied to outbound traffic control the bandwidth used.

**NOTE:** Traffic policers are instantiated on a per-PIC basis. Traffic policing does not work when the traffic for one local policy decision function (L-PDF) subscriber is distributed over multiple Multiservices PICs in an AMS group.

## Traffic Limits

Junos OS policers use a *token bucket algorithm* to enforce a limit on an average transmit or receive rate of traffic at an interface while allowing bursts of traffic up to a maximum value based on the configured bandwidth limit and configured burst size. The token bucket algorithm offers more flexibility than a *leaky bucket algorithm* in that you can allow a specified traffic burst before starting to discard packets or apply a penalty such as packet output-queuing priority or packet-drop priority.

In the token-bucket model, the bucket represents the rate-limiting function of the policer. Tokens are added to the bucket at a fixed rate, but once the specified depth of the bucket is reached, tokens allocated after cannot be stored and used. Each token represents a “credit” for some number of bits, and tokens in the bucket are “cashed in” for the ability to transmit or receive traffic at the interface. When sufficient tokens are present in the bucket, a traffic flow continues unrestricted. Otherwise, packets might be dropped or else re-marked with a lower forwarding class, a higher packet loss priority (PLP) level, or both.

- The rate at which tokens are added to the bucket represents the highest average transmit or receive rate in bits per second allowed for a given service level. You specify this highest average traffic rate as the *bandwidth limit* of the policer. If the traffic arrival rate (or fixed bits-per-second) is so high that at some point insufficient tokens are present in the bucket, then the traffic flow is no longer conforming to the traffic limit. During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the token arrival rate), unused tokens accumulate in the bucket.
- The depth of the bucket in bytes controls the amount of back-to-back bursting allowed. You specify this factor as the *burst-size limit* of the policer. This second limit affects the average transmit or

receive rate by limiting the number of bytes permitted in a transmission burst for a given interval of time. Bursts exceeding the current burst-size limit are dropped until there are sufficient tokens available to permit the burst to proceed.

Figure 82: Network Traffic and Burst Rates

As shown in the figure above, a UPC bar code is a good facsimile of what traffic looks like on the line; an interface is either transmitting (bursting at full rate) or it is not. The black lines represent periods of data transmission and the white space represents periods of silence when the token bucket can replenish.

Depending on the type of policer used, packets in a policed traffic flow that surpasses the defined limits might be implicitly set to a higher PLP level, assigned to a configured forwarding class or set to a configured PLP level (or both), or simply discarded. If packets encounter downstream congestion, packets with a low PLP level are less likely to be discarded than those with a medium-low, medium-high, or high PLP level.

## Traffic Color Marking

Based on the particular set of traffic limits configured, a policer identifies a traffic flow as belonging to one of either two or three categories that are similar to the colors of a traffic light used to control automobile traffic.

- *Single-rate two-color*—A two-color marking policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit in some way, or simply discard them.

A policer is most useful for metering traffic at the port (physical interface) level.

- *Single-rate three-color*—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a

Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and the excess burst size (EBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets arriving are below the CBS (green), exceed the CBS (yellow) but not the EBS, or exceed the EBS (red).

A single-rate three-color policer is most useful when a service is structured according to packet length and not peak arrival rate.

- *Two-rate three-color*—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and peak information rate (PIR), along with their associated burst sizes, the CBS and *peak burst size* (PBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets arriving are below the CIR (green), exceed the CIR (yellow) but not the PIR, or exceed the PIR (red).

A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

Policer actions are implicit or explicit and vary by policer type. The term *Implicit* means that Junos assigns the loss-priority automatically. [Table 109 on page 1896](#) describes the policer actions.

**Table 109: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action                                                                                                                                  |
|-------------------------|--------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

|                         | Red (Nonconforming)            | None                             | Assign low or high loss priority, assign a forwarding class, or discard<br>On some platforms, you can assign medium-low or medium-high loss priority |
| Single-rate three-color | Green (Conforming)             | Assign low loss priority         | None                                                                                                                                                 |
|                         | Yellow (Above the CIR and CBS) | Assign medium-high loss priority | None                                                                                                                                                 |

**Table 109: Policer Actions (Continued)**

| Policer              | Marking                        | Implicit Action                  | Configurable Action |
|----------------------|--------------------------------|----------------------------------|---------------------|
| Two-rate three-color | Red (Above the EBS)            | Assign high loss priority        | Discard             |
|                      | Green (Conforming)             | Assign low loss priority         | None                |
|                      | Yellow (Above the CIR and CBS) | Assign medium-high loss priority | None                |
|                      | Red (Above the PIR and PBS)    | Assign high loss priority        | Discard             |

## Forwarding Classes and PLP Levels

A packet's forwarding class assignment and PLP level are used by the Junos OS class of service (CoS) features. The Junos OS CoS features include a set of mechanisms that you can use to provide differentiated services when best-effort traffic delivery is insufficient. For router (and switch) interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure CoS features to take in a single flow of traffic entering at the edge of your network and provide different levels of service across the network—internal forwarding and scheduling (queuing) for output—based on the forwarding class assignments and PLP levels of the individual packets.

**NOTE:** Forwarding-class or loss-priority assignments performed by a policer or a stateless firewall filter override any such assignments performed on the ingress by the CoS default IP precedence classification at all logical interfaces or by any configured behavior aggregate (BA) classifier that is explicitly mapped to a logical interface.

Based on CoS configurations, packets of a given forwarding class are transmitted through a specific output queue, and each output queue is associated with a transmission service level defined in a *scheduler*.

Based on other CoS configurations, when packets in an output queue encounter congestion, packets with higher loss-priority values are more likely to be dropped by the random early detection (RED) algorithm. Packet loss priority values affect the scheduling of a packet without affecting the packet's relative ordering within the traffic flow.

## Policer Application to Traffic

After you have defined and named a policer, it is stored as a template. You can later use the same policer name to provide the same policer configuration each time you want to use it. This eliminates the need to define the same policer values more than once.

You can apply a policer to a traffic flow in either of two ways:

- You can configure a standard stateless firewall filter that specifies the policer *policer-name* nonterminating action or the three-color-policer (single-rate | two-rate) *policer-name* nonterminating action. When you apply the standard filter to the input or output at a logical interface, the policer is applied to all packets of the filter-specific protocol family that match the conditions specified in the filter configuration.

With this method of applying a policer, you can define specific classes of traffic on an interface and apply traffic rate-limiting to each class.

- You can apply a policer directly to an interface so that traffic rate-limiting applies to all traffic on that interface, regardless of protocol family or any match conditions.

You can configure policers at the queue, logical interface, or Layer 2 (MAC) level. Only a single policer is applied to a packet at the egress queue, and the search for policers occurs in this order:

- Queue level
- Logical interface level
- Layer 2 (MAC) level

## Traffic Policer Types

### IN THIS SECTION

- [Single-Rate Two-Color Policers | 1899](#)
- [Three-Color Policers | 1900](#)
- [Hierarchical Policers | 1901](#)
- [Two-Color and Three-Color Policer Options | 1901](#)

### Single-Rate Two-Color Policers

You can use a single-rate two-color policer, or “policer” when used without qualification, to rate-limit a traffic flow to an average bits-per-second arrival rate (specified by the single specified bandwidth limit) while allowing bursts of traffic for short periods (controlled by the single specified burst-size limit). This type of policer categorizes a traffic flow as either green (conforming) or red (nonconforming). Packets in a green flow are implicitly set to a low loss priority and then transmitted. Packets in a red flow are handled according to actions specified in the policer configuration. Packets in a red flow can be marked—set to a specified forwarding class, set to a specified loss priority, or both—or they can be discarded.

A single-rate two-color policer is most useful for metering traffic at the port (physical interface) level.

### Basic Single-Rate Two-Color Policer

You can apply a basic single-rate two-color policer to Layer 3 traffic in either of two ways: as an interface policer or as a *firewall filter* policer. You can apply the policer as an `<!--<new-term>interface policer</new-term>-->`, meaning that you apply the policer directly to a *logical interface* at the protocol family level. If you want to apply the policer to selected packets only, you can apply the policer as a *firewall filter policer*, meaning that you reference the policer in a stateless firewall filter term and then apply the filter to a logical interface at the protocol family level.

### Bandwidth Policer

A bandwidth policer is simply a single-rate two-color policer that is defined using a bandwidth limit specified as a percentage value rather than as an absolute number of bits per second. When you apply the policer (as an interface policer or as a firewall filter policer) to a logical interface at the protocol family level, the effective bandwidth limit is calculated based on either the physical interface media rate or the logical interface configured shaping rate.

## Logical Bandwidth Policer

A logical bandwidth policer is a bandwidth policer for which the effective bandwidth limit is calculated based on the logical interface configured shaping rate. You can apply the policer as a firewall filter policer only, and the firewall filter must be configured as an interface-specific filter. When you apply an interface-specific filter to multiple logical interfaces on supported routing platforms, any count or policer actions act on the traffic stream entering or exiting each individual interface, regardless of the sum of traffic on the multiple interfaces.

## Three-Color Policers

The Junos OS supports two types of three-color policers: single-rate and two-rate. The main difference between a single-rate and a two-rate policer is that the single-rate policer allows bursts of traffic for short periods, while the two-rate policer allows more sustained bursts of traffic. Single-rate policing is implemented using a single token-bucket model, so that periods of relatively low traffic must occur between traffic bursts to allow the token bucket to refill. Two-rate policing is implemented using a dual token-bucket model, which allows bursts of traffic for longer periods.

### Single-Rate Three-Color Policers

The single-rate three-color type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to a single rate and three traffic categories (green, yellow, and red). A single-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus an *excess* burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that conforms to the bandwidth limit while allowing bursts of traffic as controlled by the excess burst-size limit is categorized as yellow. All other traffic is categorized as red.

A single-rate three-color policer is most useful when a service is structured according to packet length, not peak arrival rate.

### Two-Rate Three-Color Policers

The two-rate three-color type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to two rates and three traffic categories (green, yellow, and red). A two-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus a *peak* bandwidth limit and burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that exceeds the committed traffic limits but remains below the peak traffic limits is categorized as yellow. Traffic that exceeds the peak traffic limits is categorized as red.

A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

## Hierarchical Policers

You can use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or logical interface and apply different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority output queue. This feature is supported on SONET interfaces hosted on M40e, M120, and M320 edge routers with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC, and on T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs.

## Two-Color and Three-Color Policer Options

Both two-color and three-color policers can be configured with the following options:

### Logical Interface (Aggregate) Policers

A logical interface policer—also called an aggregate policer—is a two-color or three-color policer that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer. You apply a logical interface policer directly to a logical interface configuration (and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface).

- You can apply the policer at the interface logical unit level to rate-limit all traffic types, regardless of the protocol family.

When applied in this manner, the logical interface policer will be used by all traffic types (inet, inet6, etc.) and across all layers (layer 2, layer 3) no matter where the policer is attached on the logical interface.

- You can also apply the policer at the logical interface protocol family level, to rate-limit traffic for a specific protocol family.

You can apply a logical interface policer to unicast traffic only. For information about configuring a stateless firewall filter for flooded traffic, see “[Applying Forwarding Table Filters](#)” in the “Traffic Sampling, Forwarding, and Monitoring” section of the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

### Physical Interface Policers

A physical interface policer is a two-color or three-color policer that applies to all logical interfaces and protocol families configured on a physical interface, even if the logical interfaces belong to different routing instances. You apply a physical interface policer to a logical interface at the protocol level through a physical interface filter only, but rate limiting is performed aggregately for all logical interfaces and protocol families configured on the underlying physical interface.

This feature enables you to use a single policer instance to perform aggregate policing for different protocol families and different logical interfaces on the same physical interface.

## Policers Applied to Layer 2 Traffic

In addition to hierarchical policing, you can also apply single-rate two-color policers and three-color policers (both single-rate and two-rate) to Layer 2 input or output traffic. You must configure the two-color or three-color policer as a logical interface policer and reference the policer in the interface configuration at the logical unit level, and not at the protocol level. You cannot apply a two-color or three-color policer to Layer 2 traffic as a stateless firewall filter action.

## Multifield Classification

Like behavior aggregate (BA) classification, which is sometimes referred to as class-of-service (CoS) value traffic classification, multifield classification is a method of classifying incoming traffic by associating each packet with a forwarding class, a packet loss priority level, or both. The CoS scheduling configuration assigns packets to output queues based on forwarding class. The CoS random early detection (RED) process uses the drop probability configuration, output queue fullness percentage, and packet loss priority to drop packets as needed to control congestion at the output stage.

BA classification and multifield classification use different fields of a packet to perform traffic classification. BA classification is based on a *CoS value* in the IP packet header. Multifield classification can be based on *multiple fields* in the IP packet header, including CoS values. Multifield classification is used instead of BA classification when you need to classify packets based on information in the packet other than the CoS values only. Multifield classification is configured using a stateless firewall filter term that matches on any packet header fields and associates matched packets with a forwarding class, a loss priority, or both. The forwarding class or loss priority can be set by a firewall filter action or by a policer referenced as a firewall filter action.

## Order of Policer and Firewall Filter Operations

You can apply both a traffic policer and a stateless *firewall filter* (with or without policing actions) to a single *logical interface* at the same time. In this case, the order of precedence of operations is such that policers applied directly to the logical interface are evaluated before input filters but after output filters.

- If an input firewall filter is configured on the same logical interface as a policer, the policer is executed first.
- If an output firewall filter is configured on the same logical interface as a policer, the firewall filter is executed first.

Figure 83 on page 1903 illustrates the order of policer and firewall filter processing at the same interface.

## Understanding the Frame Length for Policing Packets

Table 110 on page 1904 describes the packet lengths that are considered when you use a traffic policer.

**Table 110: Packet Lengths Considered for Traffic Policers**

| Protocol | Policing Packet Lengths   |
|----------|---------------------------|
| Any      | L3 frame including header |
| IPv4     | L3 frame including header |
| IPv6     | L3 frame including header |
| MPLS     | L3 frame including header |
| VPLS     | MAC                       |
| Bridge   | MAC                       |
| CCC      | MAC                       |

## Supported Standards for Policing

Three-color policers are part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment, which is described and defined in the following RFCs:

- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2475, *An Architecture for Differentiated Service*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 2698, *A Two Rate Three Color Marker*

In a DiffServ environment, the most significant 6 bits of the type-of-service (ToS) octet in the IP header contain a value called the *Differentiated Services code point* (DSCP). Within the DSCP field, the most significant 3 bits are interpreted as the *IP precedence* field, which can be used to select different per-hop forwarding treatments for the packet.

## Hierarchical Policer Configuration Overview

Hierarchically rate-limits Layer 2 ingress traffic for all protocol families. Cannot be applied to egress traffic, Layer 3 traffic, or at a specific protocol level of the interface hierarchy.

Supported on the following interfaces:

- SONET interfaces hosted on M40e, M120, and M320 edge routers with incoming FPCs as SFPC and outgoing FPCs as FFPC.
- SONET interfaces hosted on T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs.
- Ethernet interfaces on Gigabit Ethernet Intelligent Queuing 2 (IQ2) and Ethernet Enhanced IQ2 (IQ2E) PICs.
- MX Series routers with MPC or DPC.

[Table 111 on page 1905](#) describes the hierarchy levels at which you can configure and apply hierarchical policers.

**Table 111: Hierarchical Policer Configuration and Application Summary**

| Policer Configuration | Layer 2 Application | Key Points |

[Hierarchical Policers](#) | 1949

## Packets-Per-Second (pps)-Based Policer Overview

In a modern network environment, both denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks are very common. Over time, these attacks have evolved from brute force types of attacks, where the attacker might try to overrun a connection's available bandwidth with a vast amount of directed traffic to more low-and-slow attacks that use smaller packets, sent at a slower rate to target specific resources in order to deny service.

Traffic policers, both interface-based and filter-based, have been available to mitigate brute force types of DDoS attacks since Junos OS Release 9.6. These policers operate by limiting the traffic rate through a logical interface or by limiting the traffic rate as the ["nonterminating action" on page 857](#) within a firewall filter.

In Junos OS Release 15.1 and earlier releases, there were two parameters available for policers: bandwidth and burst-size. The unit of measure for the bandwidth parameter is bits per second (bps), and the unit of measure for the burst-size parameter is bytes (B). See ["Policer Bandwidth and Burst-Size Limits" on page 1939](#) for details. Policers defined within these parameters are not effective at stopping low-and-slow types of DDoS attacks.

Starting in Junos OS Release 16.1, traffic policers can be defined using packets per second (pps) with the `pps-limit` and `packet-burst` statements. The unit of measure for `pps-limit` is packets per second (pps), and the unit of measure for `packet-burst` is packets. These pps-based policers are more effective at mitigating low-and-slow types of DDoS attacks.

Policers configured with the `if-exceeding-pps` statement are applied in the same manner and in the same locations as bandwidth-based policers. Pps-based policers cannot be applied simultaneously with bandwidth-based policers. Only one policer can be applied at a time except for hierarchical policers, which allow the configuration of two policing actions based on traffic classification.

## Guidelines for Applying Traffic Policers

The following general guidelines pertain to applying traffic policers:

- Only one type of policer can be applied to the input or output of the same physical or logical interface. For example, you are not allowed to apply a policer and a hierarchical policer in the same direction at the same logical interface.
- Chaining of policers—that is, applying policers to both a port and the logical interfaces of that port—is not allowed.
- A maximum of 64 policers is supported per physical or logical interface, provided no behavior aggregate (BA) classification—traffic classification based on CoS values in the packet headers—is applied to the logical interface.
- The policer should be independent of BA classification. Without BA classification, all traffic on an interface is treated either as expedited forwarding (EF) or non-EF, based on the configuration. With BA classification, a physical or logical interface can support up to 64 policers. The interface might be a physical interface or logical interface.
- With BA classification, the miscellaneous traffic (the traffic *not* matching any of the BA classification DSCP/EXP bits) is policed as non-EF traffic. No separate policers are installed for this traffic.
- Policers can be applied to unicast packets only. For information about configuring a filter for flooded traffic, see [Applying Forwarding Table Filters](#).

[Two-Color Policer Configuration Overview | 1993](#)

[Three-Color Policer Configuration Overview | 2077](#)

[Hierarchical Policer Configuration Overview | 1905](#)

## Policer Support for Aggregated Ethernet Interfaces Overview

Aggregated interfaces support single-rate policers, three-color marking policers, two-rate three-color marking policers, hierarchical policers, and percentage-based policers. By default, policer bandwidth and burst-size applied on aggregated bundles is not matched to the user-configured bandwidth and burst-size.

You can configure interface-specific policers applied on an aggregated Ethernet bundle or an aggregated SONET bundle to match the effective bandwidth and burst-size to user-configured values. The shared-bandwidth-policer statement is required to achieve this match behavior.

This capability applies to all interface-specific policers of the following types: single-rate policers, single-rate three-color marking policers, two-rate three-color marking policers, and hierarchical policers.

Percentage-based policers match the bandwidth to the user-configured values by default, and do not require shared-bandwidth-policer configuration. The shared-bandwidth-policer statement causes a split in burst-size for percentage-based policers.

**NOTE:** This feature is supported on the following platforms: T Series routers (excluding T4000 Type 5 FPCs), M120, M10i, M7i (CFEB-E only), M320 (SFPC only), MX240, MX480, and MX960 with DPC, MIC, and MPC interfaces, and EX Series switches.

The following usage scenarios are supported:

- Interface policers used by the following configuration:

```
[edit] interfaces (aeX | asX) unit unit-num family family policer [input | output | arp]
```

- Policers and three-color policers (both single-rate three-color marking and two-rate three-color marking) used inside interface-specific filters; that is, filters that have an interface-specific keyword and are used by the following configuration:

```
[edit] interfaces (aeX | asX) unit unit-num family family filter [input | output]
```

- Common-edge service filters, which are derived from CLI-configured filters and thus inherit interface-specific properties. All policers and three-color policers used by these filters are also affected.

The following usage scenarios are not supported:

- Policers and three-color policers used inside filters that are not interface specific; such a filter is meant to be shared across multiple interfaces.
- Any implicit policers or policers that are part of implicit filters; for example, the default ARP policer applied to an aggregate Ethernet interface. Such a policer is meant to be shared across multiple interfaces.
- Prefix-specific action policers.

To configure this feature, include the shared-bandwidth-policer statement at the following hierarchy levels:

[edit firewall policer *policer-name*], [edit firewall three-color-policer *policer-name*], or [edit firewall hierarchical-policer *policer-name*].

# Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface

## IN THIS SECTION

- [Requirements](#) | [1910](#)
- [Overview](#) | [1910](#)
- [Configuration](#) | [1911](#)
- [Verification](#) | [1917](#)

This example shows how to configure a single-rate two-color policer as a physical interface policer.

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

### IN THIS SECTION

- [Topology](#) | [1911](#)

A *physical interface policer* specifies rate-limiting for aggregate traffic, which encompasses all protocol families and logical interfaces configured on a physical interface, even if the interfaces belong to different routing instances.

You can apply a physical interface policer to Layer 3 input or output traffic only by referencing the policer from a stateless firewall filter that is configured for specific a specific protocol family (not for family any) and configured as a physical interface filter. You configure the filter terms with match

conditions that select the types of packets you want to rate-limit, and you specify the physical interface policer as the action to apply to matched packets.

## Topology

The physical interface policer in this example, `shared-policer-A`, rate-limits to 10,000,000 bps and permits a maximum burst of traffic of 500,000 bytes. You configure the policer to discard packets in nonconforming flows, but you could instead configure the policer to re-mark nonconforming traffic with a forwarding class, a packet loss priority (PLP) level, or both.

To be able to use the policer to rate-limit IPv4 traffic, you reference the policer from an IPv4 physical interface filter. For this example, you configure the filter to pass the policer IPv4 packets that meet either of the following match terms:

- Packets received through TCP and with the IP precedence fields `critical-ecp (0xa0)`, `immediate (0x40)`, or `priority (0x20)`
- Packets received through TCP and with the IP precedence fields `internet-control (0xc0)` or `routine (0x00)`

You could also reference the policer from physical interface filters for other protocol families.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1912](#)
- [Configuring the Logical Interfaces on the Physical Interface | 1912](#)
- [Configuring a Physical Interface Policer | 1913](#)
- [Configuring an IPv4 Physical Interface Filter | 1914](#)
- [Applying the IPv4 Physical interface Filter to Reference the Physical Interface Policers | 1916](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

## CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces so-1/0/0 unit 0 family inet address 192.168.1.1/24
set interfaces so-1/0/0 unit 0 family vpls
set interfaces so-1/0/0 unit 1 family mpls
set firewall policer shared-policer-A physical-interface-policer
set firewall policer shared-policer-A if-exceeding bandwidth-limit 100m burst-size-limit 500k
set firewall policer shared-policer-A then discard
set firewall family inet filter ipv4-filter physical-interface-filter
set firewall family inet filter ipv4-filter term tcp-police-1 from precedence [critical-ecp
immediate priority]
set firewall family inet filter ipv4-filter term tcp-police-1 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-1 then policer shared-policer-A
set firewall family inet filter ipv4-filter term tcp-police-2 from precedence [internet-control
routine]
set firewall family inet filter ipv4-filter term tcp-police-2 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-2 then policer shared-policer-A
set interfaces so-1/0/0 unit 0 family inet filter input ipv4-filter
```

## Configuring the Logical Interfaces on the Physical Interface

### Step-by-Step Procedure

To configure the logical interfaces on the physical interface:

1. Enable configuration of logical interfaces.

```
[edit]
user@host# edit interfaces so-1/0/0
```

2. Configure protocol families on logical unit 0.

```
[edit interfaces so-1/0/0]
user@host# set unit 0 family inet address 192.168.1.1/24
user@host# set unit 0 family vpls
```

### 3. Configure protocol families on logical unit 1.

```
[edit interfaces so-1/0/0]
user@host# set unit 1 family mpls
```

## Results

Confirm the configuration of the firewall filter by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
 unit 0 {
 family inet {
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }
}
```

## Configuring a Physical Interface Policer

### Step-by-Step Procedure

To configure a physical interface policer:

#### 1. Enable configuration of the two-color policer.

```
[edit]
user@host# edit firewall policer shared-policer-A
```

## 2. Configure the type of two-color policer.

```
[edit firewall policer shared-policer-A]
user@host# set physical-interface-policer
```

## 3. Configure the traffic limits and the action for packets in a nonconforming traffic flow.

```
[edit firewall policer shared-policer-A]
user@host# set if-exceeding bandwidth-limit 100m burst-size-limit 500k
user@host# set then discard
```

For a physical interface filter, the actions you can configure for packets in a nonconforming traffic flow are to discard the packets, assign a forwarding class, assign a PLP value, or assign both a forwarding class and a PLP value.

## Results

Confirm the configuration of the policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer shared-policer-A {
 physical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then discard;
}
```

## Configuring an IPv4 Physical Interface Filter

### Step-by-Step Procedure

To configure a physical interface policer as the action for terms in an IPv4 physical interface policer:

1. Configure a standard stateless firewall filter under a specific protocol family.

```
[edit]
user@host# edit firewall family inet filter ipv4-filter
```

You cannot configure a physical interface firewall filter for family any.

2. Configure the filter as a physical interface filter so that you can apply the physical interface policer as an action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set physical-interface-filter
```

3. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields critical-ecp, immediate, or priority and to apply the physical interface policer as a filter action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-1 from precedence [critical-ecp immediate priority]
user@host# set term tcp-police-1 from protocol tcp
user@host# set term tcp-police-1 then policer shared-policer-A
```

4. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields internet-control or routine and to apply the physical interface policer as a filter action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-2 from precedence [internet-control routine]
user@host# set term tcp-police-2 from protocol tcp
user@host# set term tcp-police-2 then policer shared-policer-A
```

## Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
```

```

filter ipv4-filter {
 physical-interface-filter;
 term tcp-police-1 {
 from {
 precedence [critical-ecp immediate priority];
 protocol tcp;
 }
 then policer shared-policer-A;
 }
 term tcp-police-2 {
 from {
 precedence [internet-control routine];
 protocol tcp;
 }
 then policer shared-policer-A;
 }
}

policer shared-policer-A {
 physical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then discard;
}

```

## Applying the IPv4 Physical interface Filter to Reference the Physical Interface Policers

### Step-by-Step Procedure

To apply the physical interface filter so it references the physical interface policers:

1. Enable configuration of IPv4 on the logical interface.

```

[edit]
user@host# edit interfaces so-1/0/0 unit 0 family inet

```

2. Apply the IPv4 physical interface filter in the input direction.

```
[edit interfaces so-1/0/0 unit 0 family inet]
user@host# set filter input ipv4-filter
```

## Results

Confirm the configuration of the firewall filter by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
 unit 0 {
 family inet {
 filter {
 input ipv4-filter;
 }
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to an Interface | 1918](#)
- [Displaying the Number of Packets Processed by the Policer at the Logical Interface | 1918](#)

Confirm that the configuration is working properly.

## Displaying the Firewall Filters Applied to an Interface

### Purpose

Verify that the firewall filter `ipv4-filter` is applied to the IPv4 input traffic at logical interface `so-1/0/0.0`.

### Action

Use the `show interfaces statistics` operational mode command for logical interface `so-1/0/0.0`, and include the `detail` option. In the **Protocol inet** section of the command output, the **Input Filters** field shows that the firewall filter `ipv4-filter` is applied in the input direction.

```
user@host> show interfaces statistics so-1/0/0 detail
Logical interface so-1/0/0.0 (Index 79) (SNMP ifIndex 510) (Generation 149)
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
 Protocol inet, MTU: 4470, Generation: 173, Route table: 0
 Flags: Sendbroadcast-pkt-to-re, Protocol-Down
 Input Filters: ipv4-filter
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 10.39/16, Local: 10.39.1.1, Broadcast: 10.39.255.255, Generation: 163
```

## Displaying the Number of Packets Processed by the Policer at the Logical Interface

### Purpose

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

### Action

Use the `show firewall` operational mode command for the filter you applied to the logical interface.

```
user@host> show firewall filter ipv4-filter
Filter: ipv4-filter
Policers:
Name Packets
```

|                               |       |
|-------------------------------|-------|
| shared-policer-A-tcp-police-1 | 32863 |
| shared-policer-A-tcp-police-2 | 3870  |

The command output displays the name of policer (shared-policer-A), the name of the filter term (police-1) under which the policer action is specified, and the number of packets that matched the filter term. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

## Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers

This topic provides a list of firewall and policier features available on PTX Packet Transport Routers and compares them with firewall and policing features on T Series routers.

### Firewall Filters

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers do not support:
  - Egress Forwarding Table Filters
  - Forwarding Table Filters for MPLS/CCC
  - Family VPLS
- PTX Series Packet Transport Routers do not support nested firewall filters. The `filter` statement at the `[edit firewall family family-name filter filter-name term term-name]` hierarchy level is disabled.

- Because no service PICs are present in PTX Series Packet Transport Routers, service filters are not supported for both IPv4 and IPv6 traffic. The `service-filter` statement at `[edit firewall family (inet | inet6)]` hierarchy level is disabled.
- The PTX Series Packet Transport Routers exclude simple filters. These filters are supported on Gigabit Ethernet intelligent queuing (IQ2) and Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only. The `simple-filter` statement at the `[edit firewall family inet]` hierarchy level is disabled.
- Physical interface filtering is not supported. The `physical-interface-filter` statement at the `[edit firewall family family-name filter filter-name]` hierarchy level is disabled.
- The prefix action feature is not supported on PTX Series Packet Transport Routers. The `prefix-action` statement at `[edit firewall family inet]` hierarchy level is disabled.
- On T Series routers, you can collect a variety of information about traffic passing through the device by setting up one or more accounting profiles that specify some common characteristics of the data. The PTX Series Packet Transport Routers do not support accounting configurations for firewall filters. The `accounting-profile` statement at the `[edit firewall family family-name filter filter-name]` hierarchy level is disabled.
- The reject action is not supported on the loopback (lo0) interface. If you apply a filter to the lo0 interface and the filter includes a reject action, an error message appears.
- PTX Series Packet Transport Routers do not support aggregated ethernet logical interface match conditions. However, child link interface matching is supported.
- PTX Series Packet Transport Routers displays both counts if two different terms in a filter have the same match condition but they have different counts. T Series routers display one count only.
- PTX Series Packet Transport Routers do not have separate policer instances when a filter is bound to multiple interfaces. Use the `interface-specific` configuration statement to create the configuration.
- On PTX Series Packet Transport Routers, when an ingress interface has CCC encapsulation, packets coming in through the ingress CCC interface will not be processed by the egress filters.
- For CCC encapsulation, the PTX Series Packet Transport Routers append an extra 8 bytes for egress Layer 2 filtering. The T Series routers do not. Therefore, egress counters on PTX Series Packet Transport Routers show an extra eight bytes for each packet which impacts policer accuracy.
- On PTX Series Packet Transport Routers, output for the `show pfe statistics traffic` CLI command includes the packets discarded by DMAC and SMAC filtering. On T Series routers, the command output does not include these discarded packets because MAC filters are implemented in the PIC and not in the FPC.

- The last-fragment packet that goes through a PTX firewall cannot be matched by the `is-fragment` matching condition. This feature is supported on T Series routers.

A possible workaround on PTX Series Packet Transport Routers is to configure two separate terms with same the actions: one term contains a match to `is-fragment` and the other term contains a match to `fragment-offset` -except 0.

- On PTX Series Packet Transport Routers, MAC pause frames are generated when packet discards exceed 100 Mbps. This occurs only for frame sizes that are less than 105 bytes.

#### Traffic Policers

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers support ARP policing. T Series routers do not.
- PTX Series Packet Transport Routers do not support LSP policing.
- PTX Series Packet Transport Routers do not support the `hierarchical-policer` configuration statement. .
- PTX Series Packet Transport Routers do not support the `interface-set` configuration statement. This statement groups a number of interfaces into a single, named interface set.
- PTX Series Packet Transport Routers do not support the following policer types for both normal policers and three-color policers:
  - `logical-bandwidth-policer` — Policer uses logical interface bandwidth.
  - `physical-interface-policer` — Policer is a physical interface policer.
  - `shared-bandwidth-policer` — Share policer bandwidth among bundle links.
- When a policer action and forwarding-class, loss-priority actions are configured within the same rule (a *Multifield Classification*), the PTX Series Packet Transport Routers work differently than T Series routers. As shown below, you can configure two rules in the filter to make the PTX filter behave the same as the T Series filter:

PTX Series configuration:

```
rule-1 {
 match: {x, y, z}
 action: {forwarding-class, loss-prio, next}
}
rule-2 {
 match: {x, y, z}
```

```

 action: {policer}
}

```

T Series configuration:

```

rule-1 {
 match: {x, y, z}
 action: {forwarding-class, loss-prio, policer}
}

```

## Hierarchical Policers on ACX Series Routers Overview

On ACX Series routers, two-level ingress hierarchical policing is supported. Single-level policers define a single bandwidth profile that is used by multiple traffic flows with different priorities. Two-level policers enable a single bandwidth profile to be optimally used for multiple traffic flows, based on bandwidth and priority needs of a network. Typically, multiple traffic flows can share a single policer instance. With single-level policers, you cannot administer the method using which the committed information rate (CIR) and the peak information rate (PIR) values specified in the bandwidth profile are shared across different flows. For example, in a certain network deployment, you might want an equal or even distribution of CIR across the individual flows. In such a scenario, you cannot accomplish this requirement using single-level policers and need to configure aggregate or hierarchical policers.

**NOTE:** Hierarchical policers is not applicable on ACX5048 and ACX5096 routers.

Hierarchical policers control the sharing of an aggregate traffic rate across multiple micro-flows, which constitute the aggregate flow or the macro-flow. Micro-flows are defined and matched using firewall filter rules and the action of these rules point to a macro-policer. This macro-policer or aggregate policer determines the amount of aggregate bandwidth that can be used by the micro-flows that are associated with it. You can control the bandwidth to be utilized among the micro-flows in different ways.

**NOTE:** The hierarchical policing mechanism on ACX routers is different from the hierarching policing capability supported on MX Series routers. On MX Series routers, with a hierarchical policer, only one child or subordinate policer can be configured under a parent, top-level policer, whereas on ACX Series routers, you can aggregate and specify multiple child policers under a single parent policer. The hierarchical policing methodology on ACX routers is also called aggregate policing.

Policers are used to enforce bandwidth profiles on the transmitted traffic. A bandwidth profile is configured for each user based on the service level agreement (SLA) and the subscription plan that has been requested by the user from the service or enterprise provider. A bandwidth profile is defined using the following parameters:

- Committed information rate (CIR) denoted in bits per second (bps).
- Committed burst size (CBS) denoted in bytes.
- Excess information rate (EIR) denoted in bps.
- Excess burst size (EBS) denoted in bytes.
- Color mode (CM) can contain only one of two possible values, color-blind or color-aware. In color-aware mode, the local router can assign a higher packet loss priority, but cannot assign a lower packet loss priority. In color-blind mode, the local router ignores the preclassification of packets and can assign a higher or lower packet loss priority.

A policer is then used to enforce the bandwidth profile and perform different actions, depending on whether a certain packet confirms to the attributes in the bandwidth profile or does not satisfy the values in the configured bandwidth profile. Hierarchical policers can be considered to be an alternative technique for hierarchical queuing and shaping. However, a few differences exist between the operations that a hierarchical policer performs when matched against the processes that a hierarchical scheduler performs.

Hierarchical scheduler enables fine-grained bandwidth sharing in terms of percentages of the available bandwidth, whereas hierarchical policing only enables a coarse-grained bandwidth sharing based on the absolute micro-flow values of CIR and EIR. Hierarchical policing enables the packet loss priority (PLP) and also the forwarding class to be modified in certain cases, depending on whether the packet is confirming, exceeding, or violating the particular bandwidth profile. Hierarchical scheduler does not cause any modifications to the PLP or forwarding class values of a packet. Modifications are performed only for violating packets.

ACX routers do not support hierarchical queuing and shaping. Ingress hierarchical policers can work in conjunction with ingress, egress, or both ingress and egress hierarchical queues. For example, a two-

level ingress hierarchical policer combined with a two-level egress queuing framework results in a four-level CoS capability.

## Guidelines for Configuring Hierarchical Policers on ACX Series Routers

Keep the following points in mind when you configure hierarchical or aggregate policers:

- You cannot specify the same policer as both a child policer and a parent policer.
- The child policers of a hierarchical policer use the same resources as normal policers. Therefore, the maximum number of child policers and normal policers in the system for bridge domains and IPv4 services is as follows:
  - Family Bridge
 

A group of 124 entries of policers shared with other family-bridge filters.

A maximum of approximately 62 policers when no other family-bridge filters with the count action for the firewall filter.

Along with 62 policers, you can configure up to 62 family-bridge filters without the count action for the firewall filter.
  - Family inet
 

A group of 250 entries of policers shared with other family-inet filters.

A maximum of about 125 policers when no other family-inet filters with the count action.

Along with 125 policers, you can define up to 62 family-inet filters without the count action.
- The hierarchical policer supports the same policer ranger and burst size behavior as normal policers.
- You must configure the same hierarchical policer mode for all child policers that refer or link with the same parent policer instance.

- You cannot use the same policer template as both a normal policer and a child policer.
- You cannot use the same base policer settings as both a normal policer and an aggregate or hierarchical policer.
- You cannot use the filter-specific statement at the [edit firewall policer *policer-name*] hierarchy level to instantiate an aggregate policer. Instead, the instantiation of the policer is performed by including the aggregate statement at the [edit firewall policer *policer-name*] hierarchy level.
- All the child policers of a certain aggregate policer must contain the same definitions of settings or attributes.
- All the policer instantiation formats are supported for the aggregate policer.
- Ingress two-level hierarchical policing is supported on all ACX routers.
- All the supported match conditions for filters used with normal policers are supported with micro-flow policers.
- You can configure up to 32 hierarchical policer instances. You can configure up to 32 child policers per macro policer instance.
- You can configure hierarchical policers on aggregated Ethernet interfaces.

**NOTE:** Hierarchical policers is not applicable on ACX5048 and ACX5096 routers.

## Hierarchical Policer Modes on ACX Series Routers

### IN THIS SECTION

- [Guarantee Mode | 1926](#)
- [Peak Mode | 1928](#)
- [Hybrid Mode | 1929](#)

The method in which the micro-flow policer determines and manages the share of the aggregate bandwidth for the micro-flow is defined by the hierarchical policer mode. ACX routers support the following three hierarchical policer modes. You can configure the mode or type of the policer for each hierarchical policer instance.

**NOTE:** Hierarchical policer is not applicable on ACX5048 and ACX5096 routers.

### Guarantee Mode

This mode, also called bandwidth-guarantee mode, is used when the micro-flow policer is used to specify that a portion of the aggregate parent policer bandwidth is guaranteed for its micro-flow. When this micro-flow contains no traffic, then amount allocated for this micro-flow out of the aggregate bandwidth is used by the other micro-flows that are transmitting traffic with a size-limit or bandwidth that is higher than their respective guaranteed bandwidth rates.

Consider a sample scenario in which the maximum allowed rate or peak information rate (PIR) for a user is 140 Mbps. A total of four services or applications called expedited forwarding (EF), Gold, Silver and Bronze are defined for the guaranteed bandwidth mode of policer with a CIR of 50 Mbps, 40 Mbps, 30 Mbps, and 20 Mbps respectively. For example, if 140 Mbps of traffic is received for each of the four services, then the permitted traffic rates are 50, 40, 30 and 20 Mbps respectively. If 150 Mbps of Gold traffic is received, only 140 Mbps is permitted for Gold traffic.

All the child policers must be of single-rate, single-bucket, and two-color modes for bandwidth guarantee mode of hierarchical policer. This combination of attributes is also called floor mode. The micro-flow policer value specifies the minimum guaranteed bandwidth (CIR) for the micro-flow. The macro-flow policer value specifies the maximum allowed bandwidth (PIR) for all the flows. The sum or the cumulative value of all CIR values of the configured micro-flows must be less than or equal to the macro-flow PIR. The burst size of macro-flow must be greater than the sum of the aggregate of the

burst size of all the child policers and the largest MTU of the physical interface among all the physical interfaces of the logical interfaces or interface families to which the child policers are attached.

Consider a sample configuration that has two child policers aggregated by a parent PIR in bandwidth-guarantee mode. PIRs for the children policers and the parent policer are configured. When two flows, flow 1 and flow 2, transmit traffic at a rate that exceeds the configured PIR values, then the share of the parent PIR is adjusted to permit traffic for the child policers based on their priorities defined for the flows, while the bandwidth is maintained.

Policers use a token bucket algorithm to enforce a limit on an average transmit or receive rate of traffic at an interface while allowing bursts of traffic up to a maximum value based on the configured bandwidth limit and configured burst size. The token bucket algorithm offers more flexibility than a leaky bucket algorithm in that you can allow a specified traffic burst before starting to discard packets or apply a penalty such as packet output-queuing priority or packet-drop priority. Following are the main components of the token bucket algorithm:

- The bucket represents a rate-limiting function of the policer on the interface input or output traffic.
- Each token in the bucket represents a “credit” for some number of bits, and tokens in the bucket are “cashed in” for the ability to receive or transmit traffic that conforms to a rate limit configured for the policer.
- The token arrival rate is a periodic allocation of tokens into the token bucket that is calculated from the configured bandwidth limit.
- The token bucket depth defines the capacity of the bucket in bytes. Tokens that are allocated after the bucket reaches capacity are not able to be stored and used.

An arriving packet complies with the bandwidth-guarantee mode if tokens are present in the peak burst size (PBS) of either the parent policer or the committed burst size (CBS) of the child policer. If sufficient tokens are not present in the PBS or CBS of either of the parent or child policers respectively, the packet does not conform to the guarantee mode of the hierarchical policer working. In such a case, the child policer rate is guaranteed for the member flows. The following table describes the different scenarios of color-coding for micro-flow and macro-flow policers and the resultant color or priority that is assigned:

| Micro-Color | Macro-Color | Result |
|-------------|-------------|--------|
| Green       | Green       | Green  |
| Green       | Red         | Green  |
| Red         | Green       | Green  |

*(Continued)*

| Micro-Color | Macro-Color | Result |
|-------------|-------------|--------|
| Red         | Red         | Red    |

## Peak Mode

This mode, also called bandwidth-protection mode, is used when the micro-flow policer is used to specify the maximum amount of the aggregate parent policer bandwidth that the micro-flow can use. This mode is used to protect a given micro-flow from starving the other flows. Even when the other micro-flows contain no traffic (the available aggregate bandwidth rate is greater than the rate of the particular micro-flow, the micro-flow cannot use more than the rate configured on its micro-flow policer.

Consider a sample scenario in which the total maximum allowed rate (PIR) for a user is 100 Mbps. A total of four services or applications called expedited forwarding (EF), Gold, Silver and Bronze are defined for the peak or bandwidth-restriction mode of the policer with PIR values of 50 Mbps, 40 Mbps, 30 Mbps, and 20 Mbps respectively. Such a setting is used in topologies in which you want to prevent a certain subscriber or user from utilizing an increased share of the macro-flow or the parent CIR for real-time applications, such as video-on-demand (VoD) or voice over IP (VoIP). For example, if only 100 Mbps of EF packets are received, the permitted bandwidth rate for the traffic is 50 Mbps. When 100 Mbps of traffic is received for each of the four services, then the aggregate allowed traffic is 100 Mbps, in which the rates are as follows for the different services:

- Less than or equal to 50 Mbps for EF traffic
- Less than or equal to 40 Mbps for Gold traffic
- Less than or equal to 30 Mbps for Silver traffic
- Less than or equal to 20 Mbps for Bronze traffic

All the child policers must be of single-rate, single-bucket, and two-color types for bandwidth-protection or peak mode of the hierarchical policer. The micro-flow policer value specifies the maximum allowed bandwidth (PIR) for the micro-flow. The macro-flow policer value specifies the maximum allowed bandwidth (PIR) for all the flows. The sum of the PIR values of the micro-flows must be greater than or equal to the PIR values of the child policers. The macro-flow burst-size must be greater than or equal to that of the micro-flow with the largest burst-size.

Consider a sample configuration that has two child policers aggregated by a parent PIR in bandwidth-guarantee mode. PIRs for the children policers and the parent policer are configured. When two flows, flow 1 and flow 2, transmit traffic at a rate that exceeds the configured PIR values, then the share of the

parent PIR is adjusted to permit traffic for the child policers based on their priorities defined for the flows, while the bandwidth is restricted to maintain the minimum or committed rates of traffic flows.

An arriving packet complies with the bandwidth-guarantee mode if tokens are present in the peak burst size (PBS) of both the child policer and the parent policer. If sufficient tokens are not present in the PBS of both the policers, the packet does not conform to the peak mode of the hierarchical policer working. In such a case, the child policer rate is the maximum allowed rate or PIR for the member flows. The following table describes the different scenarios of color-coding for micro-flow and macro-flow policers and the resultant color or priority that is assigned:

| Micro-Color | Macro-Color | Result |
|-------------|-------------|--------|
| Green       | Green       | Green  |
| Green       | Red         | Red    |
| Red         | Green       | Red    |
| Red         | Red         | Red    |

## Hybrid Mode

This mode, which is a combination of the bandwidth-guarantee and bandwidth-protection modes, enables the capabilities of bandwidth restriction and the per-flow bandwidth moderation to be accomplished simultaneously. Bandwidth-guarantee or bandwidth-restriction mode controls the guaranteed rates for a given micro-flow. However, it does not administer or manage the manner in which the excess aggregate bandwidth can be shared among the micro-flows. A certain micro-flow can potentially use all the excess aggregate bandwidth starving the other micro-flows of any excess bandwidth.

Bandwidth-protection or peak mode controls the amount of bandwidth that a particular micro-flow can consume, thereby protecting other flows from being starved. However, it does not specify any guaranteed rates for the micro-flows. For example, if micro-flow rates for flows f1, f2 and f3 are 50 Mbps, 60 Mbps, 50 Mbps respectively, and the aggregate rate is 70 Mbps, it is possible that f1 and f2 flows might be provided 50 Mbps and 20 Mbps respectively, with no bandwidth allocated for f3.

Hybrid mode implements the benefits of the peak and guaranteed modes to overcome their individual limitations. In hybrid mode, the micro-flow policer specifies two rates, CIR and EIR, for the micro-flow. The CIR specifies the guaranteed portion out of the total macro-flow bandwidth for a micro-flow, and the PIR specifies the maximum portion of the total macro-flow bandwidth for a micro-flow. This

mechanism is analogous to CIR functioning in guarantee mode and EIR functioning in peak mode, thereby combining the advantages of both models. In hybrid mode, both color-aware and color-blind modes are supported for child policers.

Child policers operate in compliance with the RFC 4115 mode of two-rate three color markers. Normal two-rate three color markers on ACX routers operate in compliance with the RFC2698 mode.

Consider a sample configuration in which the maximum allowed rate for a user is 140 Mbps. A total of four services or applications called expedited forwarding (EF), Gold, Silver and Bronze are defined for the hybrid mode of the policer with PIR values of 55Mbps, 60 Mbps, 130 Mbps, and 140 Mbps respectively. The defined CIR values are 50 Mbps, 40 Mbps, 30 Mbps, and 20 Mbps for EF, Gold, Silver, and Bronze services respectively. For example, when 140 Mbps of traffic is received for each of the four services, then the permitted green-colored traffic is 50, 40, 30 and 20 Mbps respectively for the four services. If only 140 Mbps of EF traffic is received, 50 Mbps of EF traffic as green and 5 Mbps of EF traffic as yellow are permitted. In the same scenario, assume the macro-policer rate to be 26 Mbps. Also, assume two child policers in color-aware mode, namely, child policer-1 with a CIR of 10 Mbps and an EIR of 10 Mbps. Child policer-2 has a CIR of 15 Mbps and an EIR of 5 Mbps. When flow-1 is a 100 Mbps stream of yellow traffic, and flow-2 is an 100 Mbps stream of green traffic, the output of this policer hierarchy is as follows:

- Flow-1 has 0 Mbps of green traffic and has less than or equal to 5 Mbps of yellow traffic.
- Flow-2 has 10 Mbps of green traffic and has greater than or equal to 10 Mbps of yellow traffic.
- The sum of yellow traffic is less than or equal to 11 Mbps .

Consider a sample configuration that has two child policers aggregated by a parent PIR in hybrid mode. PIRs for the children policers and the parent policer are configured. When two flows, flow 1 and flow 2, transmit traffic at a rate that exceeds the configured PIR values, then the share of the parent PIR is adjusted to permit traffic for the child policers while the child PIR values are preserved for the two flows.

Hybrid mode of working of the aggregate or hierarchical policer supports two rates (CIR and PIR) and three colors for micro-flows. On ACX routers, for hybrid type of the policer, the micro-policer must be of type modified-trtcm as defined in RFC 4115. Both color-blind and color-aware modes are supported for child policers. Macro policer must be a single rate, single bucket, two color policer with the sum of the CIR values of the micro-flows being less than the PIR value of the macro-flow, and the cumulative value of all the PIR values of the micro-flows being greater than the PIR value of the macro-flow. When micro-flow traffic is less than the CIR value of the micro-flow CIR, the policer causes either the micro-flow CIR to be maintained or PIR to be achieved. When micro-flow traffic is greater than the CIR value of the micro-flow, the micro-flow CIR is guaranteed. Micro-flow excess rates are shared based on the available macro-flow bandwidth with the limitation of the excess information rate distributed for the micro-flows being implemented by the micro-flow PIR. The CBS of the macro-flow must be greater than or equal to the aggregate of the micro-flow CBS. The excess burst size (EBS) of the macro-flow must be greater than or equal to that of the micro-flow with the largest EBS.

An arriving packet complies with the hybrid mode if tokens are present in the committed burst size (CBS) of the child policer. The packet does not comply with hybrid mode if tokens are present in both the EBS of the child policer and the PBS of the parent policer. When a packet does not satisfy the hybrid mode of working of a policer, the CIR of the child policer is guaranteed for the member traffic flows and the PIR value of the child policer is the maximum permitted rate for the member flows. The following table describes the different scenarios of color-coding for micro-flow and macro-flow policers and the resultant color or priority that is assigned:

| Micro-Color | Macro-Color | Result |
|-------------|-------------|--------|
| Green       | Green       | Green  |
| Red         | Green       | Green  |
| Yellow      | Green       | Yellow |
| Yellow      | Red         | Red    |
| Red         | Green       | Red    |
| Red         | Red         | Red    |

## Processing of Hierarchical Policers on ACX Series Routers

Hierarchical policer provisions a controlled sharing of an aggregate among micro-flows. For example, a hierarchical policer is used to share the bandwidth of a certain subscriber or user across different CoS

settings of that user. Assume that the user is configured to connect using a logical interface, and the CoS functionality is configured using DiffServ code point (DSCP) in the traversed packet. The user is assigned an aggregate bandwidth of 140 Mbps. This consolidated bandwidth must be distributed and shared amongst the four supported CoS settings represented by DSCP values of 11, 12, 21, and 22 respectively in the order of 50 Mbps, 40 Mbps, 30 Mbps and 20 Mbps. To obtain this behavior, you must perform the following configurations:

- Configure micro-flows--A micro-flow is characterized by all packets that pass through the same micro policer (or child policer) instance. To enable this configuration, packets must be classified as micro-flows by using filters to match the packets, and the action of the filter to refer to the macro policer. You can group and combine packets matching multiple different filters or terms into a single micro-flow by specifying the same policer instance across the different filters and terms. These settings are identical to the configuration required to associate a single-level policer with a filter.
- Assign child policers to the aggregate policer--This step is additional, from the procedure to create a single-level policer, to configure a hierarchical policer. You must link or associate the child policers to the parent or aggregate policer. You can perform this linking by specifying at each child policer by using the `aggregate-policing aggregate-policer-name` statement at the [edit firewall policer *policer-name*] hierarchy level.

**NOTE:** Hierarchical policer is not applicable on ACX5048 and ACX5096 routers.

- [Instantiation Methods for Child Policers or Normal Policers | 1933](#)
- [Instantiation Methods for Aggregate Policers | 1934](#)

The hierarchical parent policer impacts the packet loss priority (PLP) of the child policer. The PLP-based actions defined in the then statement of the are performed, based on the PLP derived from the combined processing of the child and parent policers. The then statement defined in the parent policer is not effective. This section contains the following topics that describe the methods of instantiation of aggregate or hierarchical policers and child or normal policers.

**NOTE:** Hierarchical policer is not applicable on ACX5048 and ACX5096 routers.

## Instantiation Methods for Child and Aggregate Policers

In the Junos OS, a certain policer configuration or a policer template is used to create multiple instances of the policer in the hardware using the template attributes such as the CIR, PIR, CBS, and PBS values specified in the template. You need not create multiple policer configurations with the same attributes for effective management by using aggregate policers.

## Instantiation Methods for Child Policers or Normal Policers

For a normal policer or a child policer, if you specify a filter-specific attribute for a policer by entering the filter-specific statement at the `[edit firewall policer policer-name]` or `[edit logical-systems logical-system-name firewall policer policer-name]` hierarchy level, when you specify a 'filter-specific' clause, a single policer instance is used by all terms (within the same firewall filter) that reference the policer. For example, if a filter F1 contains terms T1 and T2, they refer to the same policer, say P1. If you configure the policer P1 as a filter-specific type, the same policer instance on the device is referred by both the terms T1 and T2. In this case, F1 is attached to a logical interface named IFL1, which is configured on the physical interface named IFD1.

By default, a policer operates in term-specific mode so that, for a given firewall filter, the Junos OS creates a separate policer instance for every filter term that references the policer. This operation is the default instantiation mode if you do not configure the filter-specific statement. For example, consider a filter F1 that has two terms, T1 and T2. Both these terms refer to the same policer, namely P1. With a term-specific mode of the policer, two policer instances are created on the device, one each for terms T1 and T2.

## Instantiation Methods for Aggregate Policers

The following modes of operations are possible for aggregate policers.

- **Global**—Shares the same parent policer across all the child policer instances in the system.
- **Physical interface-specific**—Shares the same parent policer across all the child policer instances of a certain physical interface. This mode is not supported on ACX routers.
- **Filter-specific**—Shares the same parent policer across all the child policer instances of the same filter. This mode is not supported on ACX routers.
- **Interface-specific**—Shares the same parent policer across all the child policer instances of the same logical interface. This mode is not supported on ACX routers.

You can include the `aggregate global` statement at the `[edit firewall policer policer-template-name]` hierarchy level to define an aggregate policer to be shared or applicable across all of the child policer instances in the router. You can include the `aggregate parent` statement at the `[edit firewall policer policer-template-name]` hierarchy level to define an aggregate policer as the parent policer. The following statement does not take effect for aggregate policers: `set firewall policer policer-template-name filter-specific`.

Consider a sample deployment in which an aggregate policer named P3 is configured. P1 and P2 are child policers. T1, T2, T3, and T4 are terms. F1 and F2 are filters. Logical interfaces, IFL1 and IFL2, are created on the underlying physical interfaces, IFD1 and IFD2 in this configuration. Interface address families are correspondingly created on the interfaces as IFF1 and IFF2.

If you configure an interface-specific filter, term-specific child policer, and the aggregate policer as the global policer, a single instance of P3 is created and associated with the child policers, P1 and P2. Two instances each of P1 and P2 are created, one for T1 within F1 and the other for T2 within F1. The two instances each of P1 and P2 are associated with IFL1 and IFL2, which in turn are bound to IFD1 and IFD2.

If you configure an interface-specific filter, term-specific or filter-specific child policer, and the aggregate policer is physical interface-specific policer, two instances of P3 are created. One instance of P3 contains two child policer instances of P1. P1 contains the filter F1 and term T1 to be applied to IFL1 and IFL2. The other instance of P3 contains two child policer instances of P1. P1 contains F1 and T1 to be applied to another two logical interfaces, IFL3 and IFL4.

If you configure an interface-specific filter, term-specific child policer, and interface-specific aggregate policer, two instances of P3 are created. Each P3 instance contains two P1 instances. One P1 instance contains F1 and T1 for IFF1 to be applied to IFL1. The other P1 instance contains F2 for IFF2 to be applied to IFL1. The other P3 instance contains two P1 instances. Here, one P1 contains F1 and T1 for IFF3 and the other P1 contains F2 and T1 for IFF4 to be applied on IFL2.

If you configure an interface-specific filter, term-specific child policer, and filter-specific aggregate policer, two P3 instances are created. Each P3 contains two P1 instances. One P1 contains P1, T1, F1

IFF1, applied to IFL1. The other P1 contains P1, T2, F1, IFF1, applied to IFL1. The third P1 contains P1, T3, F2, IFF2, applied to IFL1. The last P1 contains P1, T4, F2, IFF2, applied to IFL1.

## Configuring Aggregate Parent and Child Policers on ACX Series Routers

On ACX Series routers, two-level ingress hierarchical policing is supported. Single-level policers define a single bandwidth profile. You must first define the child or subordinate policers and associate or link them with the aggregate parent policer, which is globally applicable for the entire system. You can configure the mode of hierarchical or aggregate policing for the child policers, such as peak mode, guarantee mode, or hybrid mode of policing.

**NOTE:** Hierarchical policer is not applicable on ACX5048 and ACX5096 routers.

**NOTE:** The hierarchical policing mechanism on ACX routers is different from the hierarching policing capability supported on MX Series routers. On MX Series routers, with a hierarchical policer, only one child or subordinate policer can be configured under a parent, top-level policer, whereas on ACX Series routers, you can aggregate and specify multiple child policers under a single parent policer under the [edit firewall] hierarchy level. The hierarchical policing methodology on ACX routers is also called aggregate policing. The hierarchical-policer statement and its substatements at the [edit firewall] hierarchy level that are supported on MX Series routers are not available for ACX Series routers.

To configure child or micro policers for an aggregate parent policer and associate the parent policer with the child policers:

1. Configure one normal policer as a child policer and specify the aggregate policing mode.

```

user@host# set policer mi_pol_1 if-exceeding bandwidth-limit 25m
user@host# set policer mi_pol_1 if-exceeding burst-size-limit 3k
user@host# set policer mi_pol_1 if-exceeding aggregate-policing policer mi_pol_x aggregate-
sharing-mode peak;
user@host# set policer mi_pol_1 then discard

```

2. Configure another normal policer as a child policer and specify the aggregate policing mode. The aggregate-sharing-mode option is a Packet Forwarding Engine statement.

```

user@host# set policer mi_pol_2 if-exceeding bandwidth-limit 30m
user@host# set policer mi_pol_2 if-exceeding burst-size-limit 30k
user@host# set policer mi_pol_2 if-exceeding aggregate-policing policer mi_pol_x aggregate-
sharing-mode peak;
user@host# set policer mi_pol_2 then discard

```

3. Define the aggregate parent policer as the global policer for the system. The aggregate-sharing-mode option is a Packet Forwarding Engine statement.

```

user@host# set policer mi_pol_x if-exceeding bandwidth-limit 55m
user@host# set policer mi_pol_x if-exceeding burst-size-limit 35k
user@host# set policer mi_pol_x aggregate global

```

4. Verify the settings of all policer templates configured by using the show filter policer template command.

```

user@host# show filter policer template

```

| AppType | Template name                      | Bw limit-bits/sec | Burst-bytes | Action Options |
|---------|------------------------------------|-------------------|-------------|----------------|
| -----   | -----                              | -----             | -----       | -----          |
| 0       | mi_pol_1                           | 25000000          | 3000        | DROP           |
|         | Aggregate Child of mi_pol_x mode=2 |                   |             |                |
| 0       | mi_pol_2                           | 30000000          | 30000       | DROP           |
|         | Aggregate Child of mi_pol_x mode=2 |                   |             |                |
| 0       | mi_pol_x                           | 55000000          | 35000       | DROP           |
|         | Aggregate Parent                   |                   |             |                |

5. View the configured policer instances that are linked to the aggregate parent policer by using the `show filter aggregate-policer` command.

```

user@host# show filter aggregate-policer p1
CHILDREN

#1) [UNI1_filtermi_pol_trtcm1-t2] CBS[1000]kB; CIR[10000]kbps; CBS[2000]kB; PIR[30000]kbps;
Agg mode = 3;
#2) [UNI2_filtermi_pol_trtcm2-t2] CBS[1000]kB; CIR[15000]kbps; CBS[2000]kB; PIR[35000]kbps;
Agg mode = 3;

PARENT

[p1] PBS[3000]kB; PIR[38000]kbps;
Sum child CIR[25000]kbps;CBS[2000]kB;
Sum child PIR[65000]kbps;PBS[4000]kB;
Max child CIR[15000]kbps;CBS[1000]kB;
Max child PIR[35000]kbps;PBS[2000]kB;

RESULTS

STATUS = OK

```

The `show filter policer template` and `show filter aggregate-policer` CLI commands need to be run at the PFE level. To go to the PFE level, you need to:

1. Enter the `start shell` CLI command.

```

user@host> start shell

```

2. Establish a vty session by entering the `vtty shell` command followed by the executable name for the component. For example, `vtty feb0`.

```

user@host% vty feb0

```

3. Type the `show filter policer ...` CLI command.

# Configuring Policer Rate Limits and Actions

IN THIS CHAPTER

- Policer Bandwidth and Burst-Size Limits | 1939
- Policer Color-Marking and Actions | 1941
- Single Token Bucket Algorithm | 1944
- Dual Token Bucket Algorithms | 1947

## Policer Bandwidth and Burst-Size Limits

Table 112 on page 1939 lists each of the Junos OS policer types supported. For each policer type, the table summarizes the bandwidth limits and burst-size limits used to rate-limit traffic.

Table 112: Policer Bandwidth Limits and Burst-Size Limits

| Policer Type                                                                                                                                                                                                                                                                                                                                                                                                                                  | Bandwidth Limits                                     | Burst-Size Limits                                  |

## Policer Color-Marking and Actions

Table 113 on page 1941 lists each of the Junos OS policer types supported. For each policer type, the table summarizes the color-marking criteria used to categorize a traffic flow and, for each color, the actions taken on packets in that type of traffic flow.

**Table 113: Implicit and Configurable Policer Actions Based on Color Marking**

| Policer Rate Limits and Color Marking | Implicit Action | Configurable Actions |
|---------------------------------------|-----------------|----------------------|
|---------------------------------------|-----------------|----------------------|

**Single-Rate Two-Color Policer**

- Bandwidth limit
- Burst size

**Table 113: Implicit and Configurable Policer Actions Based on Color Marking (Continued)**

| Policer Rate Limits and Color Marking |                                                 | Implicit Action | Configurable Actions                                                                                                                                                                                                              |

Single Token Bucket Algorithm

IN THIS SECTION

- [Token Bucket Concepts | 1945](#)

- [Single Token Bucket Algorithm | 1945](#)
- [Conformance Measurement for Two-Color Marking | 1946](#)

## Token Bucket Concepts

When you apply traffic policing to the input or output traffic at an interface, the rate limits and actions specified in the policer configuration are used to enforce a limit on the average throughput rate at the interface while also allowing bursts of traffic up to a maximum number of bytes based on the overall traffic load. Junos OS policers measure traffic-flow conformance to a policing rate limit by using a *token bucket algorithm*. An algorithm based on a single token bucket allows burst of traffic for short periods, whereas an algorithm based dual token buckets allows more sustained bursts of traffic.

### Single Token Bucket Algorithm

A single-rate two-color policer limits traffic throughput at an interface based on how the traffic conforms to rate-limit values specified in the policer configuration. Similarly, a hierarchical policer limits traffic throughput at an interface based on how aggregate and premium traffic subflows conform to aggregate and premium rate-limit values specified in the policer configuration. For both two-color policer types, packets in a conforming traffic flow are categorized as *green*, and packets in a non-conforming traffic flow are categorized as *red*.

The single token bucket algorithm measures traffic-flow conformance to a two-color policer rate limit as follows:

- The token arrival rate represents the single *bandwidth limit* configured for the policer. You can specify the bandwidth limit as an absolute number of bits per second by including the `bandwidth-limit bps` statement. Alternatively, for single-rate two-color policers only, you can use the `bandwidth-percent percentage` statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured *logical interface* shaping rate.
- The token bucket depth represents the single *burst size* configured for the policer. You specify the burst size by including the `burst-size-limit bytes` statement.
- If the bucket is filled to capacity, arriving tokens “overflow” the bucket and are lost.

When the bucket contains insufficient tokens for receiving or transmitting the traffic at the interface, packets might be dropped or else re-marked with a lower forwarding class, a higher packet loss priority (PLP) level, or both.

## Conformance Measurement for Two-Color Marking

In two-color-marking policing, a traffic flow whose average arrival or departure rate does not exceed the token arrival rate (bandwidth limit) is considered *conforming traffic*. Packets in a conforming traffic flow (categorized as green traffic) are implicitly marked with a packet loss priority (PLP) level of `low` and then passed through the interface.

For a traffic flow whose average arrival or departure rate exceeds the token arrival rate, conformance to a two-color policer rate limit depends on the tokens in the bucket. If sufficient tokens remain in the bucket, the flow is considered conforming traffic. If the bucket does not contain sufficient tokens, the flow is considered *non-conforming traffic*. Packets in a non-conforming traffic flow (categorized as red traffic) are handled according to policing actions. Depending on the configuration of the two-color policer, packets might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** The number of tokens remaining in the bucket at any given time is a function of the token bucket depth and the overall traffic load.

The token bucket is initially filled to capacity, and so the policer allows an initial traffic burst (back-to-back traffic at average rates that exceed the token arrival rate) up to the size of the token bucket depth.

During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

- [Guaranteed Bandwidth for Three-Color Marking | 1947](#)
- [Nonconformance Measurement for Single-Rate Three-Color Marking | 1947](#)
- [Nonconformance Measurement for Two-Rate Three-Color Marking | 1948](#)

### Token Bucket Concepts

When you apply traffic policing to the input or output traffic at an interface, the rate limits and actions specified in the policer configuration are used to enforce a limit on the average throughput rate at the interface while also allowing bursts of traffic up to a maximum number of bytes based on the overall traffic load. Junos OS policers measure traffic-flow conformance to a policing rate limit by using a *token bucket algorithm*. An algorithm based on a single token bucket allows burst of traffic for short periods, whereas an algorithm based dual token buckets allows more sustained bursts of traffic.

### Guaranteed Bandwidth for Three-Color Marking

A committed information rate (CIR) defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green, and packets in a green flow are implicitly marked with low packet loss priority (PLP) and then passed through the interface. During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the CIR), any unused bandwidth capacity accumulates in the first token bucket, but only up to a configured number of bytes. If any unused bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket.

The committed burst size (CBS) defines the maximum number of bytes for which unused amounts of the guaranteed bandwidth can be accumulated in the first token bucket. A burst of traffic at an average rate that exceeds the CIR is also categorized as green provided that sufficient unused bandwidth capacity is available in the first token bucket.

### Nonconformance Measurement for Single-Rate Three-Color Marking

Single-rate three-color policer configurations specify a second burst size—the excess burst size (EBS)—that defines the maximum number of bytes for which the second token bucket can accumulate unused bandwidth that overflows from the first bucket.

A traffic flow is categorized yellow if its average rate exceeds the CIR and the available bandwidth capacity accumulated in the first bucket if sufficient unused bandwidth capacity is available in the second token bucket. Packets in a yellow flow are implicitly marked with `medium-high` PLP and then passed through the interface.

A traffic flow is categorized red if its average rate exceeds the CIR and the available bandwidth capacity accumulated in the second bucket. Packets in a red flow are implicitly marked with `high` PLP and then either passed through the interface or optionally discarded.

## Nonconformance Measurement for Two-Rate Three-Color Marking

Two-rate three-color policer configurations include a second rate limit—the peak-information-rate (PIR)—that you set to the expected average data rate for traffic arriving at or departing from the interface under peak conditions.

Two-rate three-color policer configurations also include a second burst size—the peak burst size (PBS)—that defines the maximum number of bytes for which the second token bucket can accumulate unused peak bandwidth capacity. During periods of relatively little peak traffic (traffic that arrives at or departs from the interface at average rates that exceed the PIR), any unused peak bandwidth capacity accumulates in the second token bucket, but only up to the maximum number of bytes specified by the PBS.

A traffic flow is categorized yellow if it exceeds the CIR and the available committed bandwidth capacity accumulated in the first token bucket but conforms to the PIR. Packets in a yellow flow are implicitly marked with `medium-high` PLP and then passed through the interface.

A traffic flow is categorized red if it exceeds the PIR and the available peak bandwidth capacity accumulated in the second token bucket. Packets in a red flow are implicitly marked with `high` PLP and then either passed through the interface or optionally discarded.

## Hierarchical Policers

### IN THIS SECTION

- Hierarchical Policer Overview | 1950
- Example: Configuring a Hierarchical Policer | 1951

## Hierarchical Policer Overview

You can use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or *logical interface* and apply different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority.

Hierarchical policing is supported on M40e, M120, and M320 edge routers with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC, and on MX Series, T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs.

You can apply hierarchical policing to a logical interface.

A hierarchical policer configuration defines two policers—one for EF traffic only and another for non-EF traffic—that function in a hierarchical manner:

- **Premium policer**—You configure the premium policer with traffic limits for high-priority EF traffic only: a guaranteed bandwidth and a corresponding burst-size limit. EF traffic is categorized as nonconforming when its average arrival rate exceeds the guaranteed bandwidth and its average packet size exceeds the premium burst-size limit. For a premium policer, the only configurable action for nonconforming traffic is to discard the packets.
- **Aggregate policer**—You configure the aggregate policer with an aggregate bandwidth (to accommodate both high-priority EF traffic up to the guaranteed bandwidth and normal-priority non-EF traffic) and a burst-size limit for non-EF traffic only. Non-EF traffic is categorized as nonconforming when its average arrival rate exceeds the amount of aggregate bandwidth not currently consumed by EF traffic and its average packet size exceeds the burst-size limit defined in the aggregate policer. For an aggregate policer, the configurable actions for nonconforming traffic are to discard the packets, assign a forwarding class, or assign a packet loss priority (PLP) level.

**NOTE:** You must configure the bandwidth limit of the premium policer at or below the bandwidth limit of the aggregate policer. If the two bandwidth limits are equal, then non-EF traffic passes through the interface unrestricted only while no EF traffic arrives at the interface.

EF traffic is guaranteed the bandwidth specified as the premium bandwidth limit, while non-EF traffic is rate-limited to the amount of aggregate bandwidth not currently consumed by the EF traffic. Non-EF traffic is rate-limited to the entire aggregate bandwidth only while no EF traffic is present.

For example, suppose that you configure a hierarchical policer with the following components:

- Premium policer with bandwidth limit set to 2 Mbps, burst-size limit set to 3000 bytes, and nonconforming action set to discard packets.
- Aggregate policer with bandwidth limit set to 10 Mbps, burst-size limit set to 3000 bytes, and nonconforming action set to discard packets.

EF traffic is guaranteed a bandwidth of 2 Mbps. Bursts of EF traffic—EF traffic that arrives at the interface at rates above 2 Mbps—can also pass through the interface provided sufficient tokens are available in the 3000-byte bucket. When no tokens are available for a burst of non-EF traffic, packets are rate-limited using policing actions for the premium policer.

Non-EF traffic is metered to a bandwidth limit that ranges between 8 Mbps and 10 Mbps, depending on the average arrival rate of the EF traffic. Bursts of non-EF traffic—non-EF traffic that arrives at the interface at rates above the current limit for non-EF traffic—also pass through the interface provided sufficient tokens are available in the 3000-byte bucket. When non-EF traffic exceeds the currently allowed bandwidth or when no tokens are available for a burst of non-EF traffic, packets are rate-limited using policing actions for the aggregate policer.

## SEE ALSO

[Hierarchical Policer Configuration Overview | 1905](#)

Example: Configuring a Hierarchical Policer

## Example: Configuring a Hierarchical Policer

### IN THIS SECTION

- [Requirements | 1951](#)
- [Overview | 1952](#)
- [Configuration | 1952](#)
- [Verification | 1958](#)

This example shows how to configure a hierarchical policer and apply the policer to ingress Layer 2 traffic at a logical interface on a supported platform.

## Requirements

Before you begin, be sure that your environment meets the following requirements:

- The interface on which you apply the hierarchical policer is a SONET interface hosted on one of the following routing platforms:
  - M40e, M120, or M320 edge router with incoming FPCs as SFPC and outgoing FPCs as FFPC.
  - MX Series, T320, T640, or T1600 core router with Enhanced Intelligent Queuing (IQE) PICs.

- No other policer is applied to the input of the interface on which you apply the hierarchical policer.
- You are aware that, if you apply the hierarchical policer to logical interface on which an input filter is also applied, the policer is executed first.

## Overview

### IN THIS SECTION

- [Topology | 1952](#)

In this example, you configure a hierarchical policer and apply the policer to ingress Layer 2 traffic at a logical interface.

### *Topology*

You apply the policer to the SONET logical interface `so-1/0/0.0`, which you configure for IPv4 and VPLS traffic. When you apply the hierarchical policer to that logical interface, both IPv4 and VPLS traffic is hierarchically rate-limited.

You also configure the logical interface `so-1/0/0.1` for MPLS traffic. If you choose to apply the hierarchical policer to physical interface `so-1/0/0`, hierarchical policing would apply to IPv4 and VPLS traffic at `so-1/0/0.0` and to MPLS traffic at `so-1/0/0.1`.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1953](#)
- [Defining the Interfaces | 1953](#)
- [Defining the Forwarding Classes | 1954](#)
- [Configuring the Hierarchical Policier | 1955](#)
- [Applying the Hierarchical Policier to Layer 2 Ingress Traffic at a Physical or Logical Interface | 1957](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces so-1/0/0 unit 0 family inet address 192.168.1.1/24
set interfaces so-1/0/0 unit 0 family vpls
set interfaces so-1/0/0 unit 1 family mpls
set class-of-service forwarding-classes class fc0 queue-num 0 priority high policing-priority premium
set class-of-service forwarding-classes class fc1 queue-num 1 priority low policing-priority normal
set class-of-service forwarding-classes class fc2 queue-num 2 priority low policing-priority normal
set class-of-service forwarding-classes class fc3 queue-num 3 priority low policing-priority normal
set firewall hierarchical-policer policer1 aggregate if-exceeding bandwidth-limit 300m burst-size-limit 30k
set firewall hierarchical-policer policer1 aggregate then forwarding-class fc1
set firewall hierarchical-policer policer1 premium if-exceeding bandwidth-limit 100m burst-size-limit 50k
set firewall hierarchical-policer policer1 premium then discard
set interfaces so-1/0/0 unit 0 layer2-policer input-hierarchical-policer policer1
```

### *Defining the Interfaces*

#### **Step-by-Step Procedure**

To define the interfaces:

1. Enable configuration of the physical interface.

```
[edit]
user@host# edit interfaces so-1/0/0
```

## 2. Configure logical unit 0.

```
[edit interfaces so-1/0/0]
user@host# set unit 0 family inet address 192.168.1.1/24
user@host# set unit 0 family vpls
```

If you apply a Layer 2 policer to this logical interface, you must configure at least one protocol family.

## 3. Configure logical unit 1.

```
[edit interfaces so-1/0/0]
user@host# set unit 1 family mpls
```

## Results

Confirm the configuration of the interfaces by entering the `show interfaces` configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
 unit 0 {
 family inet {
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }
}
```

## *Defining the Forwarding Classes*

## Step-by-Step Procedure

To define the forwarding classes referenced as aggregate policer actions:

1. Enable configuration of the forwarding classes.

```
[edit]
user@host# edit class-of-service forwarding-classes
```

2. Define the forwarding classes.

```
[edit class-of-service forwarding-classes]
user@host# set class fc0 queue-num 0 priority high policing-priority premium
user@host# set class fc1 queue-num 1 priority low policing-priority normal
user@host# set class fc2 queue-num 2 priority low policing-priority normal
user@host# set class fc3 queue-num 3 priority low policing-priority normal
```

## Results

Confirm the configuration of the forwarding classes referenced as aggregate policer actions by entering the `show class-of-service` configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
forwarding-classes {
 class fc0 queue-num 0 priority high policing-priority premium;
 class fc1 queue-num 1 priority low policing-priority normal;
 class fc2 queue-num 2 priority low policing-priority normal;
 class fc3 queue-num 3 priority low policing-priority normal;
}
```

## *Configuring the Hierarchical Policer*

### Step-by-Step Procedure

To configure a hierarchical policer:

1. Enable configuration of the hierarchical policer.

```
[edit]
user@host# edit firewall hierarchical-policer policer1
```

## 2. Configure the aggregate policer.

```
[edit firewall hierarchical-policer policer1]
user@host# set aggregate if-exceeding bandwidth-limit 300m burst-size-limit 30k
user@host# set aggregate then forwarding-class fc1
```

For the aggregate policer, the configurable actions for a packet in a nonconforming flow are to discard the packet, change the loss priority, or change the forwarding class.

## 3. Configure the premium policer.

```
[edit firewall hierarchical-policer policer1]
user@host# set premium if-exceeding bandwidth-limit 100m burst-size-limit 50k
user@host# set premium then discard
```

The bandwidth limit for the premium policer must not be greater than that of the aggregate policer.

For the premium policer, the only configurable action for a packet in a nonconforming traffic flow is to discard the packet.

## Results

Confirm the configuration of the hierarchical policer by entering the `show firewall configuration` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
hierarchical-policer policer1 {
 aggregate {
 if-exceeding {
 bandwidth-limit 300m;
 burst-size-limit 30k;
 }
 then {
 forwarding-class fc1;

 burst-size-limit 50k;
 }
 then {
 discard;
 }
}
}

```

### *Applying the Hierarchical Policer to Layer 2 Ingress Traffic at a Physical or Logical Interface*

#### Step-by-Step Procedure

To hierarchically rate-limit Layer 2 ingress traffic for IPv4 and VPLS traffic only on logical interface **so-1/0/0.0**, reference the policer from the logical interface configuration:

1. Enable configuration of the logical interface.

```

[edit]
user@host# edit interfaces so-1/0/0 unit 0

```

When you apply a policer to Layer 2 traffic at a logical interface, you must define at least one protocol family for the logical interface.

2. Apply the policer to the logical interface.

```

[edit]
user@host# set layer2-policer input-hierarchical-policer policer1

```

Alternatively, to hierarchically rate-limit Layer 2 ingress traffic for all protocol families and for *all logical interfaces* configured on physical interface **so-1/0/0**, you could reference the policer from the physical interface configuration.

#### Results

Confirm the configuration of the hierarchical policer by entering the `show interfaces configuration` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces

```

```
so-1/0/0 {
 unit 0 {
 layer2-policer {
 input-hierarchical-policer policer1;
 }
 family inet {
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 1958](#)
- [Displaying Statistics for the Policer | 1959](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

#### Purpose

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

#### Action

Use the `show interfaces operational mode` command for logical interface `so-1/0/0.0`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and

packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer `policer1` as an input or output policer as follows:

- **Input:** `policer1-so-1/0/0.0-inet-i`
- **Output:** `policer1-so-1/0/0.0-inet-o`

In this example, the policer is applied to logical interface traffic in the input direction only.

### *Displaying Statistics for the Policer*

#### **Purpose**

Verify the number of packets evaluated by the policer.

#### **Action**

Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer `policer1`, the input and output policer names are displayed as follows:

- `policer1-so-1/0/0.0-inet-i`
- `policer1-so-1/0/0.0-inet-o`

The **-inet-i** suffix denotes a policer applied to IPv4 input traffic, while the **-inet-o** suffix denotes a policer applied to IPv4 output traffic. In this example, the policer is applied to input traffic only.

#### **RELATED DOCUMENTATION**

[Hierarchical Policer Configuration Overview | 1905](#)

[Guidelines for Applying Traffic Policers | 1907](#)

## Configuring a Policer Overhead

Configuring a policer overhead allows you to control the rate of traffic sent or received on an interface. When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate limit action. Therefore, the policer overhead enables you to control the rate of traffic sent or received on an interface. You can configure the policer overhead to rate-limit queues and Layer 2 and MAC policers. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

This feature is supported on M Series and T Series routers with IQ2 PICs or IQ2E PICs, and on MX Series DPCs.

To configure a policer overhead for controlling the rate of traffic sent or received on an interface:

1. In the [edit chassis] hierarchy level in configuration mode, create the interface on which to add the policer overhead to input or output traffic.

```
[edit chassis]
user@host# edit fpc fpc pic pic
```

For example:

```
[edit chassis]
user@host# edit fpc 0 pic 1
```

2. Configure the policer overhead to control the input or output traffic on the interface. You could use either statement or both the statements for this configuration.

```
[edit chassis fpc fpc pic pic]
user@host# set ingress-policer-overhead bytes;
user@host# set egress-policer-overhead bytes;
```

For example:

```
[edit chassis fpc 0 pic 1]
user@host# set ingress-policer-overhead 10;
user@host# set egress-policer-overhead 20;
```

### 3. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 0 {
 pic 1 {
 ingress-policer-overhead 10;
 egress-policer-overhead 20;
 }
}
```

**NOTE:** When the configuration for the policer overhead bytes on a PIC is changed, the PIC goes offline and then comes back online. In addition, the configuration in the CLI is on a per-PIC basis and, therefore, applies to all the ports on the PIC.

- [Statement Hierarchy for Configuring a Two-Color Policer for Layer 2 Traffic | 1962](#)
- [Statement Hierarchy for Applying a Two-Color Policer to Layer 2 Traffic | 1963](#)

### Guidelines for Configuring Two-Color Policing of Layer 2 Traffic

The following guidelines apply to two-color policing of Layer 2 traffic:

- You can apply a two-color policer to ingress or egress Layer 2 traffic at a *logical interface* hosted on a Gigabit Ethernet interface (ge-) or a 10-Gigabit Ethernet interface (xe-) only.
- A single logical interface supports Layer 2 policing in both directions.
- You can apply a two-color policer to Layer 2 traffic as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic as a stateless *firewall filter* action.
- You can apply a two-color policer to Layer 2 traffic by referencing the policer in the interface configuration at the logical unit level, and not at the protocol level.

For information about configuring three-color policing of Layer 2 traffic, see [Three-Color Policing at Layer 2 Overview](#).

### Statement Hierarchy for Configuring a Two-Color Policer for Layer 2 Traffic

To enable a single-rate two-color policer to rate-limit Layer 2 traffic, include the `logical-interface-policer` statement in the policer configuration.

```
firewall {
 policer policer-name {
 logical-interface-policer;
 if-exceeding {
 (bandwidth-limit bps | bandwidth-percent percentage);
 burst-size-limit bytes;
 }
 then {
 discard;
 }
 }
}
```

```

 forwarding-class class-name;
 loss-priority (high | low | medium-high | medium-low);
 }
}

```

You can include the configuration at the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

### Statement Hierarchy for Applying a Two-Color Policer to Layer 2 Traffic

To apply a logical interface policer to Layer 2 traffic, include the `layer2-policer input-policer policer-name` statement or the `layer2-policer output-policer policer-name` statement to a supported logical interface. Use the `input-policer` or `output-policer` statements to apply a two-color policer at Layer 2.

```

interfaces {
 (ge-fpc/pic/port | xe-fpc/pic/port) {
 unit unit-number {
 layer2-policer {
 input-policer policer-name;
 output-policer policer-name;
 }
 }
 }
}

```

You can include the configuration at the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

## Three-Color Policing at Layer 2 Overview

### IN THIS SECTION

- [Guidelines for Configuring Three-Color Policing of Layer 2 Traffic | 1964](#)
- [Statement Hierarchy for Configuring a Three-Color Policer for Layer 2 Traffic | 1964](#)
- [Statement Hierarchy for Applying a Three-Color Policer to Layer 2 Traffic | 1965](#)

### Guidelines for Configuring Three-Color Policing of Layer 2 Traffic

The following guidelines apply to three-color policing of Layer 2 traffic:

- You can apply a three-color policer to Layer 2 traffic at a *logical interface* hosted on a Gigabit Ethernet interface (ge-) or a 10-Gigabit Ethernet interface (xe-) only.
- A single logical interface supports Layer 2 policing in both directions.
- You can apply a three-color policer to Layer 2 traffic as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic as a stateless *firewall filter* action.
- You can apply a three-color policer to Layer 2 traffic by referencing the policer in the interface configuration at the logical unit level, and not at the protocol level.
- You can apply a color-aware three-color policer to Layer 2 traffic in the egress direction only, but you apply a color-blind three-color policer to Layer 2 traffic in either direction.

For information about configuring two-color policing of Layer 2 traffic, see [Two-Color Policing at Layer 2 Overview](#).

### Statement Hierarchy for Configuring a Three-Color Policer for Layer 2 Traffic

To enable a single-rate or two-rate three-color policer to rate-limit Layer 2 traffic, include the `logical-interface-policer` statement in the three-color-policer configuration.

```
firewall {
 three-color-policer policer-name {
 action {
 loss-priority high then discard;
 }
 logical-interface-policer;
```

```

single-rate {
 (color-aware | color-blind);
 committed-burst-size bytes;
 committed-information-rate bps;
 excess-burst-size bytes;
}
two-rate {
 (color-aware | color-blind);
 committed-burst-size bytes;
 committed-information-rate bps;
 peak-burst-size bytes;
 peak-information-rate bps;
}
}
}

```

You can include the configuration at the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

### Statement Hierarchy for Applying a Three-Color Policer to Layer 2 Traffic

To apply a logical interface policer to Layer 2 traffic, include the `layer2-policer` statement for a supported logical interface at the logical unit level. Use the `input-three-color policer-name` statement or `output-three-color policer-name` statement to specify the direction of the traffic to be policed.

```

interfaces {
 (ge-fpc/pic/port | xe-fpc/pic/port) {
 unit unit-number {
 layer2-policer {
 input-three-color policer-name;
 output-three-color policer-name;
 }
 }
 }
}

```

You can include the configuration at the following hierarchy levels:

- [edit]

- [edit logical-systems *logical-system-name*]

## Example: Configuring a Three-Color Logical Interface (Aggregate) Policer

### IN THIS SECTION

- [Requirements](#) | 1966
- [Overview](#) | 1966
- [Configuration](#) | 1968
- [Verification](#) | 1973

This example shows how to configure a two-rate three-color color-blind policer as a logical interface (aggregate) policer and apply the policer directly to Layer 2 input traffic at a supported logical interface.

### Requirements

Before you begin, make sure that the logical interface to which you apply the three-color logical interface policer is hosted on a Gigabit Ethernet interface (ge-) or a 10-Gigabit Ethernet interface (xe-) on an MX Series router.

### Overview

#### IN THIS SECTION

- [Topology](#) | 1967

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second set of bandwidth and burst-size limits for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the bandwidth and burst-size limits for peak traffic is categorized as yellow.
- Nonconforming traffic that exceeds the bandwidth and burst-size limits for peak traffic is categorized as red.

A logical interface policer defines traffic rate-limiting rules that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer.

**NOTE:** You apply a logical interface policer directly to a logical interface at the logical unit level, and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface at the protocol family level.

### *Topology*

In this example, you configure the two-rate three-color policer `trTCM2-cb` as a color-blind logical interface policer and apply the policer to incoming Layer 2 traffic on logical interface `ge-1/3/1.0`.

**NOTE:** When using a three-color policer to rate-limit Layer 2 traffic, color-aware policing can be applied to egress traffic only.

The policer defines guaranteed traffic rate limits such that traffic that conforms to the bandwidth limit of 40 Mbps with a 100 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as green. As with any policed traffic, the packets in a green flow are implicitly set to a low loss priority and then transmitted.

Nonconforming traffic that falls within the peak traffic limits of a 60 Mbps bandwidth limit and a 200 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as yellow. The packets in a yellow traffic flow are implicitly set to a medium-high loss priority and then transmitted.

Nonconforming traffic that exceeds the peak traffic limits are categorized as red. The packets in a red traffic flow are implicitly set to a high loss priority. In this example, the optional policer action for red traffic (loss-priority high then discard) is configured, so packets in a red traffic flow are discarded instead of transmitted.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 1968](#)
- [Configuring the Logical Interfaces | 1969](#)
- [Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer | 1970](#)
- [Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface | 1972](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
set firewall three-color-policer trTCM2-cb logical-interface-policer
set firewall three-color-policer trTCM2-cb two-rate color-blind
set firewall three-color-policer trTCM2-cb two-rate committed-information-rate 40m
set firewall three-color-policer trTCM2-cb two-rate committed-burst-size 100k
set firewall three-color-policer trTCM2-cb two-rate peak-information-rate 60m
set firewall three-color-policer trTCM2-cb two-rate peak-burst-size 200k
set firewall three-color-policer trTCM2-cb action loss-priority high then discard
set interfaces ge-1/3/1 unit 0 layer2-policer input-three-color trTCM2-cb
```

## *Configuring the Logical Interfaces*

### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Configure single tagging.

```
[edit interfaces ge-1/3/1]
user@host# set vlan-tagging
```

3. Configure logical interface ge-1/3/1.0.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface ge-1/3/1.0.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac 00:00:11:22:33:44
```

### Results

Confirm the configuration of the logical interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
```

```

unit 0 {
 vlan-id 100;
 family inet {
 address 10.10.10.1/30;
 }
}
unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
}
}

```

### *Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer*

#### Step-by-Step Procedure

To configure the two-rate three-color policer as a logical interface policer:

1. Enable configuration of a three-color policer.

```

[edit]
user@host# edit firewall three-color-policer trTCM2-cb

```

2. Specify that the policer is a logical interface (aggregate) policer.

```

[edit firewall three-color-policer trTCM2-cb]
user@host# set logical-interface-policer

```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied, and the policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify that the policer is two-rate and color-blind.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate color-blind
```

A color-aware three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node, and any preexisting color markings are used in determining the appropriate policing action for the packet.

Because you are applying this three-color policer applied to input at Layer 2, you must configure the policer to be color-blind.

4. Specify the policer traffic limits used to classify a green traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

5. Specify the additional policer traffic limits used to classify a yellow or red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

6. (Optional) Specify the configured policer action for packets in a red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set action loss-priority high then discard
```

In color-aware mode, the three-color policer configured action can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

## Results

Confirm the configuration of the three-color policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM2-cb {
 logical-interface-policer;
 action {
 loss-priority high then discard;
 }
 two-rate {
 color-blind;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}
```

### *Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface*

#### Step-by-Step Procedure

To apply the three-color policer to the Layer 2 input at the logical interface:

1. Enable application of Layer 2 logical interface policers.

```
[edit]
user@host# edit interfaces ge-1/3/1 unit 0
```

2. Apply the three-color logical interface policer to a logical interface input.

```
[edit interfaces ge-1/3/1 unit 0]
user@host# set layer2-policerinput-three-color trTCM2-cb
```

## Results

Confirm the configuration of the logical interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 layer2-policer {
 input-three-color trTCM2-cb;
 }
 family inet {
 address 10.10.10.1/30;
 }
 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 1974](#)
- [Displaying Statistics for the Policer | 1974](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

#### **Purpose**

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

#### **Action**

Use the `show interfaces operational mode` command for logical interface `ge-1/3/1.0`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer `trTCM2-cb` as an input or output policer as follows:

- **Input:** `trTCM2-cb-ge-1/3/1.0-log_int-i`
- **Output:** `trTCM2-cb-ge-1/3/1.0-log_int-o`

The `log_int-i` suffix denotes a logical interface policer applied to input traffic, while the `log_int-o` suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to in the input direction only.

### *Displaying Statistics for the Policer*

#### **Purpose**

Verify the number of packets evaluated by the policer.

#### **Action**

Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer `trTCM2-cb`, the input and output policer names are displayed as follows:

- `trTCM2-cb-ge-1/3/1.0-log_int-i`
- `trTCM2-cb-e-1/3/1.0-log_int-o`

The `log_int-i` suffix denotes a logical interface policer applied to input traffic, while the `log_int-o` suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## Layer 2 Traffic Policing at the Pseudowire Overview

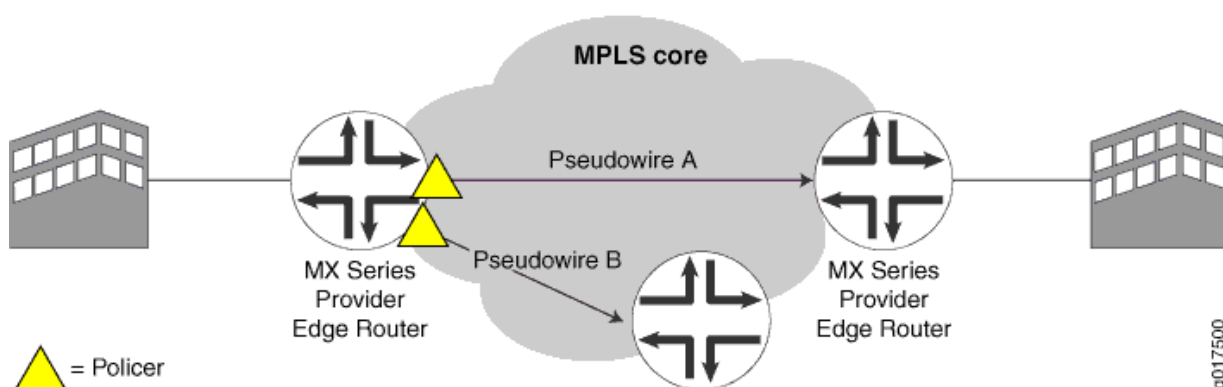

This feature limits traffic that is sent over the core by policing traffic at the Layer 2 pseudowire level. It uses dynamic profiles to attach two- or three-color policers to pseudowire logical interfaces. You apply the dynamic profiles to core-facing egress interfaces so that they can police unicast, multicast, and broadcast traffic that is going over the MPLS core network.

**NOTE:** Pseudowire policer statistics collected by the Routing Engine, kernel, and Packet Forwarding Engine can be displayed on the Routing Engine when you execute the `show interfaces` command.

[Figure 84 on page 1976](#) shows an MX Series 5G Universal Routing Platform configured as a provider edge (PE) router. It communicates with other PE routers over pseudowires. It can aggregate both unicast

and multicast traffic and send it over pseudowires. To limit traffic over the pseudowires, you can set up policers on each pseudowire that faces the MPLS core network.

**Figure 84: Limiting Traffic to the Core Using Layer 2 Policers at the Pseudowire Level**

**NOTE:** This feature is supported only on pseudowire logical interfaces at the egress. It is not supported on tunnel interfaces.

## Configuring a Two-Color Layer 2 Policer for the Pseudowire

For the basic configuration of Layer 2 policers for pseudowires, create a two-color policer.

To configure a two-color policer:

1. Create a two-color policer.

```
[edit firewall]
user@host# edit policer 2color-l2-policer
```

2. Specify that the policer is to be used on a logical interface.

```
[edit firewall policer 2color-l2-policer]
user@host# set logical-interface-policer
```

### 3. Configure the policer.

```
[edit firewall policer 2color-l2-policer]
user@host# edit if-exceeding
[edit firewall policer 2color-l2-policer if-exceeding]
user@host# set bandwidth-limit 30m
user@host# set burst-size-limit 300k
```

### 4. Set the action that the policer takes to loss-priority and specify that the packet loss priority (PLP) is high.

```
[edit firewall policer 2color-l2-policer]
user@host# set then loss-priority high
```

## RELATED DOCUMENTATION

[Attaching Dynamic Profiles to Routing Instances](#) | 1980

## Configuring a Three-Color Layer 2 Policer for the Pseudowire

For the basic configuration of Layer 2 policers for pseudowires, create a three-color policer. This scenario shows a two-rate three-color-marking (trTCM) policer.

To configure a three-color policer:

### 1. Create a three-color policer.

```
[edit firewall]
user@host# edit three-color-policer trTCM-policer
```

2. Specify that the policer is to be used on a logical interface.

```
[edit firewall three-color-policer trTCM-policer]
user@host# set logical-interface-policer
```

3. Set the action for the policer.

```
[edit firewall three-color-policer trTCM-policer]
user@host# set action loss-priority high then discard
```

4. Specify that the policer is a two-rate policer and configure the policer.

```
[edit firewall three-color-policer trTCM-policer]
user@host# edit two-rate
user@host# set color-aware
user@host# set committed-information-rate 10m
user@host# set committed-burst-size 50m
user@host# set committed-burst-size 150k
user@host# set peak-information-rate 50m
user@host# set peak-burst-size 450k
```

## Applying the Policers to Dynamic Profile Interfaces

This configuration shows how to apply policers to a dynamic profile.

Before you can apply policers, you need to have configured your policers as described in:

- ["Configuring a Three-Color Layer 2 Policer for the Pseudowire" on page 1977](#)

- ["Configuring a Two-Color Layer 2 Policer for the Pseudowire" on page 1976](#)

To configure the dynamic profiles:

1. Create a dynamic profile for the three-color policer.

```
[edit dynamic-profiles]
user@host# edit pw-trTCM-policer
```

2. Create a dynamic profile interface that has a dynamic underlying interface unit.

```
[edit dynamic-profiles pw-trTCM-policer]
user@host# edit interfaces $junos-interface-ifd-name unit $junos-underlying-interface-unit
```

3. Specify that VPLS is the protocol family.

```
[edit dynamic-profiles pw-trTCM-policer interfaces "$junos-interface-ifd-name" unit "$junos-underlying-interface-unit"]
user@host# set family vpls
```

4. Assign the three-color policer to the dynamic profile.

```
[edit dynamic-profiles pw-trTCM-policer interfaces "$junos-interface-ifd-name" unit "$junos-underlying-interface-unit"]
user@host# set layer2-policer output-three-color trTCM-policer
```

5. Create a dynamic profile for the two-color policer.

```
[edit dynamic-profiles]
user@host# edit pw-2color-l2-policer
```

6. Create a dynamic profile interface that has a dynamic underlying interface unit.

```
[edit dynamic-profiles pw-2color-l2-policer]
user@host# edit interfaces $junos-interface-ifd-name unit $junos-underlying-interface-unit
```

7. Specify that VPLS is the protocol family.

```
[edit dynamic-profiles pw-2color-l2-policer interfaces "$junos-interface-ifd-name" unit
"$junos-underlying-interface-unit"]
user@host# set family vpls
```

8. Assign the two-color policer to the dynamic profile.

```
[edit dynamic-profiles pw-2color-l2-policer interfaces "$junos-interface-ifd-name" unit
"$junos-underlying-interface-unit"]
user@host# set layer2-policer output-policer 2color-l2-policer
```

[Attaching Dynamic Profiles to Routing Instances | 1980](#)

## Attaching Dynamic Profiles to Routing Instances

To bind the dynamic profile to the pseudowire, attach it to a routing instance. The routing instance can be a VPLS instance type or a virtual switch instance type. You can attach dynamic profiles to the routing instance at the VPLS protocol level, at the mesh-group level, or at the neighbor level.

Because this feature is not supported on tunnel interfaces, for VPLS routing interfaces, you must include the `no-tunnel-services` statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

- To attach the dynamic profile at the VPLS protocol level:

```
[edit routing-instances]
user@host# edit green protocols vpls associate-profile
[edit routing-instances green protocols vpls associate-profile]
user@host# set pw-2color-l2-policer
```

- To attach the dynamic profile at the mesh-group level:

```
[edit routing-instances]
user@host# edit green protocols vpls mesh-group lata-1 associate-profile
[edit routing-instances green protocols vpls mesh-group lata-1 associate-profile]
user@host# set pw-trTCM-policer
```

- To attach the dynamic profile at the neighbor level:

```
[edit routing-instances]
user@host# edit green protocols vpls mesh-group lata-1 neighbor 10.10.1.1 associate-profile
[edit routing-instances green protocols vpls mesh-group lata-1 neighbor 10.10.1.1 associate-profile]
user@host# set pw-2color-l2-policer
```

## Using Variables for Layer 2 Traffic Policing at the Pseudowire Overview

To reduce the number of dynamic profiles needed to police traffic at the core, you can use a variable for the output policer in your dynamic profiles. The variable that you define is called **junos-layer2-output-policer**. The variable is a placeholder that gets filled in when the dynamic profile obtains the value from the routing instance.

To use variables for policers for Layer 2 pseudowires:

1. Create policers.
2. Create a dynamic profile and add a profile variable set to the dynamic profile.
3. In the profile variable set, assign a value to the **junos-layer2-output-policer** variable. This value is the name of one of your policers.

4. In the dynamic profile interface configuration at the [edit dynamic-profiles *profile-name* interfaces "\$junos-interface-ifd-name" unit "\$junos-underlying-interface-unit"] hierarchy, assign **junos-layer2-output-policer** as one of your Layer 2 policers.
5. When you attach the dynamic profile to a routing instance, assign the profile variable set that you configured in the dynamic profile as the **associate-profile** value.
6. Attach the dynamic profile and the profile variable set to the routing instance.

## Configuring a Policer for the Complex Configuration

For the complex configuration of Layer 2 policers for pseudowires, create a two-color policer.

To configure a two-color policer:

1. Create a two-color policer.

```
[edit firewall]
user@host# edit policer 10m-policer
```

2. Specify that the policer is to be used on a logical interface.

```
[edit firewall policer 10m-policer]
user@host# set logical-interface-policer
```

3. Configure the policer.

```
[edit firewall policer 10m-policer]
user@host# edit if-exceeding
[edit firewall policer 10m-policer if-exceeding]
```

```
user@host# set bandwidth-limit 10m
user@host# set burst-size-limit 100k
```

4. Set the action that the policer takes to loss-priority and specify that the packet loss priority (PLP) is high.

```
[edit firewall policer 10m-policer]
user@host# set then loss-priority high
```

## RELATED DOCUMENTATION

[Creating a Dynamic Profile for the Complex Configuration | 1983](#)

[Attaching Dynamic Profiles to Routing Instances for the Complex Configuration | 1984](#)

## Creating a Dynamic Profile for the Complex Configuration

For this configuration, the dynamic profile defines a profile variable set and then assigns the variable to the output policer.

To configure dynamic profiles:

1. Create a dynamic profile.

```
[edit dynamic-profiles]
user@host# edit pw-policer
```

2. Create a profile variable set and define the **junos-layer2-output-policer** variable. In this scenario, set the variable to the **10m-policer**.

```
[edit dynamic-profiles pw-policer]
user@host# edit profile-variable-set pw-policer-var-set
user@host# set junos-layer2-output-policer 10m-policer
```

3. Create a dynamic profile interface that has a dynamic underlying interface unit.

```
[edit dynamic-profiles pw-policer]
user@host# edit interfaces $junos-interface-ifd-name unit $junos-underlying-interface-unit
```

4. Assign the **junos-layer2-output-policer** variable to the two-color output policer.

```
[edit dynamic-profiles pw-policer interfaces "$junos-interface-ifd-name" unit "$junos-underlying-interface-unit"]
user@host# set layer2-policer output-policer $junos-layer2-output-policer
```

5. Specify that VPLS is the protocol family.

```
[edit dynamic-profiles pw-2color-l2-policer interfaces "$junos-interface-ifd-name" unit "$junos-underlying-interface-unit"]
user@host# set family vpls
```

## RELATED DOCUMENTATION

[Attaching Dynamic Profiles to Routing Instances for the Complex Configuration | 1984](#)

## Attaching Dynamic Profiles to Routing Instances for the Complex Configuration

To bind the dynamic profile to the pseudowire, attach it to a routing instance. When your dynamic profile contains variables, you assign one of the profile variable sets that you configured in your dynamic profile when you associate the profile with the routing instance.

The routing instance can be a VPLS instance type or a virtual switch instance type. You can attach the dynamic profile and the profile variable set to the routing instance at the VPLS protocol level, at the mesh-group level, or at the neighbor level.

Because this feature is not supported on tunnel interfaces, for VPLS routing interfaces, you must include the `no-tunnel-services` statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

- To attach the dynamic profile and the profile variable set at the VPLS protocol level:

```
[edit routing-instances]
user@host# edit green protocols vpls associate-profile
[edit routing-instances green protocols vpls associate-profile]
user@host# set profile-variable-set pw-policer
user@host# set profile-variable-set pw-policer-var-set
```

- To attach the dynamic profile and the profile variable set at the mesh-group level:

```
[edit routing-instances]
user@host# edit green protocols vpls mesh-group lata-1 associate-profile
[edit routing-instances green protocols vpls mesh-group lata-1 associate-profile]
user@host# set profile-variable-set pw-policer
user@host# setprofile-variable-set pw-policer-var-set
```

- To attach the dynamic profile and the profile variable set at the neighbor level:

```
[edit routing-instances]
user@host# edit green protocols vpls mesh-group lata-1 neighbor 10.10.1.1 associate-profile
[edit routing-instances green protocols vpls mesh-group lata-1 neighbor 10.10.1.1 associate-profile]
user@host# profile-variable-set pw-policer
user@host# profile-variable-set pw-policer-var-set
```

## Verifying Layer 2 Traffic Policers on VPLS Connections

### IN THIS SECTION

- Purpose | 1986
- Action | 1986
- Meaning | 1986

### Purpose

Display VPLS connections to verify that the dynamic profile is running on the Layer 2 VPN connection.

### Action

```
user@host> show vpls connections
Layer-2 VPN connections:

...
Instance: vpls-10gige
Local site: 10Gige-PE (2)
 connection-site Type St Time last up # Up trans
 1 rmt Up Mar 28 21:27:57 2010 1
 Remote PE: 10.10.1.1, Negotiated control-word: No
 Incoming label: 262145, Outgoing label: 262146
 Local interface: lsi.1048576, Status: Up, Encapsulation: VPLS
 Dynamic profile: pw-policer
 Description: Intf - vpls vpls-10gige local site 2 remote site 1
```

### Meaning

The Dynamic profile field displays the policer that is currently running on the VPLS connection.

Understanding Policers on OVSDB-Managed Interfaces

When you use a Contrail controller to manage VXLANs on a QFX switch (through the Open vSwitch Database—OVSDB—management protocol), the VXLAN interfaces are automatically configured with the flexible-vlan-tagging and encapsulation extended-vlan-bridge statements. Starting with Junos OS Release 14.1X53-D30, you can create family ethernet-switching logical units (subinterfaces) on VXLAN interfaces. This enables you to apply firewall filters with the action three-color-policer to these subinterfaces, which means that you can apply two-rate three-color markers (policers) to OVSDB-managed interfaces. See ["Example: Applying a Policer to OVSDB-Managed Interfaces" on page 1988](#) for information about how to configure policers on VXLAN interfaces managed by a Contrail controller.

**NOTE:** Firewall filters are the only supported configuration items on family ethernet-switching subinterfaces of OVSDB-managed interfaces. Two-rate three-color markers are the only supported policers.

Release History Table

| Release     | Description                                                                                                                             |

## Example: Applying a Policer to OVSDB-Managed Interfaces

### IN THIS SECTION

- [Requirements | 1988](#)
- [Overview | 1988](#)
- [Configuration | 1989](#)

Starting with Junos OS Release 14.1X53-D30, you can create `family ethernet-switching` logical units (subinterfaces) on VXLAN interfaces managed by a Contrail controller. (The controller and switch communicate through the Open vSwitch Database—OVSDB—management protocol). This support enables you to apply firewall filters with the action `three-color-policer` to these subinterfaces, which means that you can apply two-rate three-color markers (policers) to OVSDB-managed interfaces.

Because a Contrail controller can create subinterfaces dynamically, you need to apply firewall filters in such a way that the filters will apply to subinterfaces whenever the controller creates them. You accomplish this by using configuration groups to configure and apply the firewall filters. (You must use configuration groups for this purpose—that is, you cannot apply a firewall filter directly to these subinterfaces.)

**NOTE:** Firewall filters are the only supported configuration items on `family ethernet-switching` subinterfaces of OVSDB-managed interfaces. Two-rate three-color markers are the only supported policers.

### Requirements

This example uses the following hardware and software components:

- A QFX5100 switch
- Junos OS Release 14.1X53-D30 or later

### Overview

This example assumes that interfaces `xe-0/0/0` and `xe-0/0/1` on the switch are VXLAN interfaces managed by a Contrail controller, which means that the controller has applied the `flexible-vlan-tagging` and `encapsulation extended-vlan-bridge` statements to these interfaces. To apply a firewall filter Layer 2

(port) firewall filter with a policer action to any subinterfaces that the controller creates dynamically, you must create and apply the filter as shown in this example.

**NOTE:** As shown in the example, all of the statements must be part of a configuration group when you want to apply a firewall filter (and policer) to an OVSDB-managed subinterface.

## Configuration

### IN THIS SECTION

● [CLI Quick Configuration | 1989](#)

● [Procedure | 1990](#)

To configure a firewall filter with a policer action to be automatically applied to subinterfaces created dynamically by a Contrail controller, perform these tasks:

### CLI Quick Configuration

```
[edit]
set groups vxlan-policer-group interfaces xe-0/0/0 unit <*> family ethernet-switching filter
input vxlan-filter
set groups vxlan-policer-group interfaces xe-0/0/1 unit <*> family ethernet-switching filter
input vxlan-filter
set groups vxlan-policer-group firewall three-color-policer vxlan-policer action loss-priority
high then discard
set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-rate color-blind
set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-rate committed-
burst-size 2m
set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-rate committed-
information-rate 100m
set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-rate peak-burst-
size 4m
set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-rate peak-
information-rate 100m
set groups vxlan-policer-group firewall family ethernet-switching filter vxlan-filter term t1
```

```
then three-color-policer two-rate vxlan-policer
set apply-groups vxlan-policer-group
```

## Procedure

### Step-by-Step Procedure

1. Create configuration group vxlan-policer-group to apply firewall filter vxlan-filter to any subinterface of interface xe-0/0/0. The filter applies to any subinterface because you specify unit <\*>:

```
[edit]
user@switch# set groups vxlan-policer-group interfaces xe-0/0/0 unit <*> family ethernet-
switching filter input vxlan-filter
```

2. Create the same configuration for interface xe-0/0/1:

```
[edit]
user@switch# set groups vxlan-policer-group interfaces xe-0/0/1 unit <*> family ethernet-
switching filter input vxlan-filter
```

3. Configure the policer to discard packets with high loss priority. (Junos OS assigns high loss priority to packets that exceed the peak information rate and the peak burst size.) As with the interface configuration, you must also configure the policer to be part of a configuration group.

```
[edit]
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer
action loss-priority high then discard
```

4. Configure the policer to be color blind, which means that it ignores any preclassification of packets and can assign a higher or lower packet loss priority.

```
[edit]
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-
rate color-blind
```

5. Configure the policer to allow incoming traffic to burst a maximum of 2 megabytes above the committed information rate and still be marked with low packet loss priority (green).

**[edit]**

```
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-
rate committed-burst-size 2m
```

6. Configure the policer to allow guaranteed bandwidth of 100 megabytes under normal line conditions. This is the average rate up threshold under which packets are marked with low packet loss priority (green).

**[edit]**

```
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-
rate committed-information-rate 100m
```

7. Configure the policer to allow incoming packets to burst a maximum of 4 megabytes above the peak information rate and still be marked with medium-high packet loss priority (yellow). Packets that exceed the peak burst size are marked with high packet loss priority (red).

**[edit]**

```
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-
rate peak-burst-size 4m
```

8. Configure the policer to allow a maximum achievable rate of 100 megabytes. Packets that exceed the committed information rate but are below the peak information rate are marked with medium-high packet loss priority (yellow). Packets that exceed the peak information rate are marked with high packet loss priority (red).

**[edit]**

```
user@switch# set groups vxlan-policer-group firewall three-color-policer vxlan-policer two-
rate peak-information-rate 100m
```

9. Configure the firewall filter vxlan-filter to send matching packets (all packets, because there is no from statement) to the policer:

```
[edit]
user@switch# set groups vxlan-policer-group firewall family ethernet-switching filter vxlan-
filter term t1 then three-color-policer two-rate vxlan-policer
```

10. Apply the group to enable its configuration:

```
[edit]
user@switch# set apply-groups vxlan-policer-group
```

**Bandwidth Policer**

*Defines traffic rate limiting that you can apply to Layer 3 protocol-specific traffic at a logical interface, but the bandwidth limit is specified as a percentage value. Bandwidth can be based on physical interface line rate (the default) or the logical interface shaping rate. Can be applied as an interface policer or as a firewall filter policer where the filter is either interface-specific or a physical interface filter.*

Table 114: Two-Color Policer Configuration and Application Overview (*Continued*)

| Policer Configuration                                                                                                                                                                                                                                                                                                                    | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Logical Interface (Aggregate) Policer**

*Defines traffic rate limiting that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer. Can be applied directly to a logical interface configuration only.*

Table 114: Two-Color Policer Configuration and Application Overview (Continued)

| Policer Configuration                                                                                                                                                                                                                                                                                                                        | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                    | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

#### Physical Interface Policer

Defines traffic rate limiting that applies to all logical interfaces and protocol families configured on a physical interface, even if the interfaces belong to different routing instances. Can be applied as a firewall filter policer referenced from a physical interface filter only.

**Table 114: Two-Color Policer Configuration and Application Overview (Continued)**

| Policer Configuration                                                                                                                                                                                                                                                                                                                         | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Single-Rate Two-Color Policer Overview

Single-rate two color policing enforces a configured rate of traffic flow for a particular service level by applying implicit or configured actions to traffic that does not conform to the limits. When you apply a single-rate two-color policer to the input or output traffic at an interface, the policer meters the traffic flow to the rate limit defined by the following components:

- **Bandwidth limit**—The average number of bits per second permitted for packets received or transmitted at the interface. You can specify the bandwidth limit as an absolute number of bits per second or as a percentage value from 1 through 100. If a percentage value is specified, the effective bandwidth limit is calculated as a percentage of either the physical interface media rate or the *logical interface* configured shaping rate.
- **Packets per second (pps) limit** (MX Series with MPC only)—The average number of packets per second permitted for packets received or transmitted at the interface. You specify the pps limit as an absolute number of packets per second.
- **Burst-size limit**—The maximum size permitted for bursts of data.
- **Packet burst limit**—

For a traffic flow that conforms to the configured limits (categorized as green traffic), packets are implicitly marked with a packet loss priority (PLP) level of `low` and are allowed to pass through the interface unrestricted.

For a traffic flow that exceeds the configured limits (categorized as red traffic), packets are handled according to the traffic-policing actions configured for the policer. The action might be to discard the

packet, or the action might be to re-mark the packet with a specified forwarding class, a specified PLP, or both, and then transmit the packet.

To rate-limit Layer 3 traffic, you can apply a two-color policer in the following ways:

- Directly to a logical interface, at a specific protocol level.
- As the action of a standard stateless *firewall filter* that is applied to a logical interface, at a specific protocol level.

To rate-limit Layer 2 traffic, you can apply a two-color policer as a *logical interface policer* only. You cannot apply a two-color policer to Layer 2 traffic through a firewall filter.

- [Verification | 2012](#)

This example shows you how to configure an ingress single-rate two-color policer to filter incoming traffic. The policer enforces the class-of-service (CoS) strategy for in-contract and out-of-contract traffic. You can apply a single-rate two-color policer to incoming packets, outgoing packets, or both. This example applies the policer as an input (ingress) policer. The goal of this topic is to provide you with an introduction to policing by using an example that shows traffic policing in action.

Policers use a concept known as a token bucket to allocate system resources based on the parameters defined for the policer. A thorough explanation of the token bucket concept and its underlying algorithms is beyond the scope of this document. For more information about traffic policing, and CoS in

general, refer to *QOS-Enabled Networks—Tools and Foundations* by Miguel Barreiros and Peter Lundqvist. This book is available at many online booksellers and at [www.juniper.net/books](http://www.juniper.net/books).

## Requirements

To verify this procedure, this example uses a traffic generator. The traffic generator can be hardware-based or it can be software running on a server or host machine.

The functionality in this procedure is widely supported on devices that run Junos OS. The example shown here was tested and verified on MX Series routers running Junos OS Release 10.4.

## Overview

### IN THIS SECTION

- [Topology | 2005](#)

Single-rate two-color policing enforces a configured rate of traffic flow for a particular service level by applying implicit or configured actions to traffic that does not conform to the limits. When you apply a single-rate two-color policer to the input or output traffic at an interface, the policer meters the traffic flow to the rate limit defined by the following components:

- **Bandwidth limit**—The average number of bits per second permitted for packets received or transmitted at the interface. You can specify the bandwidth limit as an absolute number of bits per second or as a percentage value from 1 through 100. If a percentage value is specified, the effective bandwidth limit is calculated as a percentage of either the physical interface media rate or the logical interface configured shaping rate.
- **Burst-size limit**—The maximum size permitted for bursts of data. Burst sizes are measured in bytes. We recommend two formulas for calculating burst size:

Burst size = bandwidth x allowable time for burst traffic / 8

Or

Burst size = interface mtu x 10

For information about configuring the burst size, see "[Determining Proper Burst Size for Traffic Policers](#)" on page 1886.

**NOTE:** There is a finite buffer space for an interface. In general, the estimated total buffer depth for an interface is about 125 ms.

For a traffic flow that conforms to the configured limits (categorized as green traffic), packets are implicitly marked with a packet loss priority (PLP) level of low and are allowed to pass through the interface unrestricted.

For a traffic flow that exceeds the configured limits (categorized as red traffic), packets are handled according to the traffic-policing actions configured for the policer. This example discards packets that burst over the 15 KBps limit.

To rate-limit Layer 3 traffic, you can apply a two-color policer in the following ways:

- Directly to a logical interface, at a specific protocol level.
- As the action of a standard stateless firewall filter that is applied to a logical interface, at a specific protocol level. This is the technique used in this example.

To rate-limit Layer 2 traffic, you can apply a two-color policer as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic through a firewall filter.

**CAUTION:** You can choose either bandwidth-limit or bandwidth percent within the policer, as they are mutually exclusive. You cannot configure a policer to use bandwidth percent for aggregate, tunnel, and software interfaces.

In this example, the host is a traffic generator emulating a webserver. Devices R1 and R2 are owned by a service provider. The webserver is accessed by users on Device Host2. Device Host1 will be sending traffic with a source TCP HTTP port of 80 to the users. A single-rate two-color policer is configured and applied to the interface on Device R1 that connects to Device Host1. The policer enforces the contractual bandwidth availability made between the owner of the webserver and the service provider that owns Device R1 for the web traffic that flows over the link that connects Device Host1 to Device R1.

In accordance with the contractual bandwidth availability made between the owner of the webserver and the service provider that owns Devices R1 and R2, the policer will limit the HTTP port 80 traffic originating from Device Host1 to using 700 Mbps (70 percent) of the available bandwidth with an allowable burst rate of 10 x the MTU size of the gigabit Ethernet interface between the host Device Host1 and Device R1.

**NOTE:** In a real-world scenario you would probably also rate limit traffic for a variety of other ports such as FTP, SFTP, SSH, TELNET, SMTP, IMAP, and POP3 because they are often included as additional services with web hosting services.

**NOTE:** You need to leave some additional bandwidth available that is not rate limited for network control protocols such as routing protocols, DNS, and any other protocols required to keep network connectivity operational. This is why the firewall filter has a final accept condition on it.

### Topology

This example uses the topology in [Figure 85 on page 2005](#).

**Figure 85: Single-Rate Two-Color Policer Scenario**

Figure 86 on page 2006 shows the policing behavior.

Figure 86: Traffic Limiting in a Single-Rate Two-Color Policer Scenario

## Configuration

## Procedure

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

#### Device R1

```
set interfaces ge-2/0/5 description to-Host
set interfaces ge-2/0/5 unit 0 family inet address 172.16.70.2/30
set interfaces ge-2/0/5 unit 0 family inet filter input mf-classifier
set interfaces ge-2/0/8 description to-R2
set interfaces ge-2/0/8 unit 0 family inet address 10.50.0.1/30
```

```

set interfaces lo0 unit 0 description loopback-interface
set interfaces lo0 unit 0 family inet address 192.168.13.1/32
set firewall policer discard if-exceeding bandwidth-limit 700m
set firewall policer discard if-exceeding burst-size-limit 15k
set firewall policer discard then discard
set firewall family inet filter mf-classifier term t1 from protocol tcp
set firewall family inet filter mf-classifier term t1 from port 80
set firewall family inet filter mf-classifier term t1 then policer discard
set firewall family inet filter mf-classifier term t2 then accept
set protocols ospf area 0.0.0.0 interface ge-2/0/5.0 passive
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface ge-2/0/8.0

```

## Device R2

```

set interfaces ge-2/0/8 description to-R1
set interfaces ge-2/0/8 unit 0 family inet address 10.50.0.2/30
set interfaces ge-2/0/7 description to-Host
set interfaces ge-2/0/7 unit 0 family inet address 172.16.80.2/30
set interfaces lo0 unit 0 description loopback-interface
set interfaces lo0 unit 0 family inet address 192.168.14.1/32
set protocols ospf area 0.0.0.0 interface ge-2/0/7.0 passive
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface ge-2/0/8.0

```

## Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [Using the CLI Editor in Configuration Mode](#) in the [Junos OS CLI User Guide](#).

To configure Device R1:

1. Configure the device interfaces.

```

[edit interfaces]
user@R1# set ge-2/0/5 description to-Host
user@R1# set ge-2/0/5 unit 0 family inet address 172.16.70.2/30
user@R1# set ge-2/0/8 description to-R2
user@R1# set ge-2/0/8 unit 0 family inet address 10.50.0.1/30

```

```
user@R1# set lo0 unit 0 description loopback-interface
user@R1# set lo0 unit 0 family inet address 192.168.13.1/32
```

2. Apply the firewall filter to interface ge-2/0/5 as an input filter.

```
[edit interfaces ge-2/0/5 unit 0 family inet]
user@R1# set filter input mf-classifier
```

3. Configure the policer to rate-limit to a bandwidth of 700 Mbps and a burst size of 15000 KBps for HTTP traffic (TCP port 80).

```
[edit firewall policer discard]
user@R1# set if-exceeding bandwidth-limit 700m
user@R1# set if-exceeding burst-size-limit 15k
```

4. Configure the policer to discard packets in the red traffic flow.

```
[edit firewall policer discard]
user@R1# set then discard
```

5. Configure the two conditions of the firewall to accept all TCP traffic to port HTTP (port 80).

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t1 from protocol tcp
user@R1# set term t1 from port 80
```

6. Configure the firewall action to rate-limit HTTP TCP traffic using the policer.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t1 then policer discard
```

7. At the end of the firewall filter, configure a default action that accepts all other traffic.

Otherwise, all traffic that arrives on the interface and is not explicitly accepted by the firewall is discarded.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t2 then accept
```

## 8. Configure OSPF.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface ge-2/0/5.0 passive
user@R1# set area 0.0.0.0 interface lo0.0 passive
user@R1# set area 0.0.0.0 interface ge-2/0/8.0
```

## Step-by-Step Procedure

To configure Device R2:

### 1. Configure the device interfaces.

```
[edit interfaces]
user@R1# set ge-2/0/8 description to-R1
user@R1# set ge-2/0/7 description to-Host
user@R1# set lo0 unit 0 description loopback-interface
user@R1# set ge-2/0/8 unit 0 family inet address 10.50.0.2/30
user@R1# set ge-2/0/7 unit 0 family inet address 172.16.80.2/30
user@R1# set lo0 unit 0 family inet address 192.168.14.1/32
```

### 2. Configure OSPF.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface ge-2/0/7.0 passive
user@R1# set area 0.0.0.0 interface lo0.0 passive
user@R1# set area 0.0.0.0 interface ge-2/0/8.0
```

## Results

From configuration mode, confirm your configuration by entering the `show interfaces`, `show firewall`, and `show protocols ospf` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
ge-2/0/5 {
 description to-Host;
 unit 0 {
 family inet {
 filter {
 input mf-classifier;
 }
 address 172.16.70.2/30;
 }
 }
}
ge-2/0/8 {
 description to-R2;
 unit 0 {
 family inet {
 address 10.50.0.1/30;
 }
 }
}
lo0 {
 unit 0 {

 address 172.16.80.2/30;
 }
 }
}
ge-2/0/8 {
 description to-R1;
```

```
unit 0 {
 family inet {
 address 10.50.0.2/30;
 }
}
lo0 {
 unit 0 {
 description looback-interface;
 family inet {
 address 192.168.14.1/32;
 }
 }
}
```

```
user@R2# show protocols ospf
area 0.0.0.0 {
 interface ge-2/0/7.0 {
 passive;
 }
 interface lo0.0 {
 passive;
 }
 interface ge-2/0/8.0;
}
```

If you are done configuring Device R2, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Clearing the Counters | 2013](#)
- [Sending TCP Traffic into the Network and Monitoring the Discards | 2013](#)

Confirm that the configuration is working properly.

*Clearing the Counters***Purpose**

Confirm that the firewall counters are cleared.

**Action**

On Device R1, run the `clear firewall all` command to reset the firewall counters to 0.

```
user@R1> clear firewall all
```

*Sending TCP Traffic into the Network and Monitoring the Discards***Purpose**

Make sure that the traffic of interest that is sent is rate-limited on the input interface (ge-2/0/5).

**Action**

1. Use a traffic generator to send 10 TCP packets with a source port of 80.

The `-s` flag sets the source port. The `-k` flag causes the source port to remain steady at 80 instead of incrementing. The `-c` flag sets the number of packets to 10. The `-d` flag sets the packet size.

The destination IP address of 172.16.80.1 belongs to Device Host 2 that is connected to Device R2. The user on Device Host 2 has requested a webpage from Device Host 1 (the webserver emulated by the traffic generator on Device Host 1). The packets that being rate-limited are sent from Device Host 1 in response to the request from Device Host 2.

**NOTE:** In this example the policer numbers are reduced to a bandwidth limit of 8 Kbps and a burst size limit of 1500 KBps to ensure that some packets are dropped during this test.

```
[root@host]# hping 172.16.80.1 -c 10 -s 80 -k -d 300
```

```
[User@Host]# hping 172.16.80.1 -c 10 -s 80 -k -d 350
HPING 172.16.80.1 (eth1 172.16.80.1): NO FLAGS are set, 40 headers + 350 data bytes
len=46 ip=172.16.80.1 ttl=62 DF id=0 sport=0 flags=RA seq=0 win=0 rtt=0.5 ms
```

```

.
.
.
--- 172.16.80.1 hping statistic ---
10 packets transmitted, 6 packets received, 40% packet loss
round-trip min/avg/max = 0.5/3000.8/7001.3 ms

```

2. On Device R1, check the firewall counters by using the `show firewall` command.

```

user@R1> show firewall

User@R1# run show firewall

Filter: __default_bpdu_filter__

Filter: mf-classifier
Policers:

```

| Name       | Bytes | Packets |
|------------|-------|---------|
| discard-t1 | 1560  | 4       |

## Meaning

In Steps 1 and 2 the output from both devices shows that 4 packets were discarded. This means that there was at least 8 Kbps of green (in-contract HTTP port 80) traffic and that the 1500 Kbps burst option for red out-of-contract HTTP port 80 traffic was exceeded.

## Example: Configuring Interface and Firewall Filter Policers at the Same Interface

### IN THIS SECTION

- [Requirements | 2015](#)
- [Overview | 2015](#)
- [Configuration | 2016](#)
- [Verification | 2026](#)

This example shows how to configure three single-rate two-color policers and apply the policers to the IPv4 input traffic at the same single-tag virtual LAN (VLAN) logical interface.

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

### IN THIS SECTION

- [Topology | 2016](#)

In this example, you configure three single-rate two-color policers and apply the policers to the IPv4 input traffic at the same single-tag VLAN logical interface. Two policers are applied to the interface through a firewall filter, and one policer is applied directly to the interface.

You configure one policer, named `p-all-1m-5k-discard`, to rate-limit traffic to 1 Mbps with a burst size of 5000 bytes. You apply this policer directly to IPv4 input traffic at the logical interface. When you apply a policer directly to protocol-specific traffic at a logical interface, the policer is said to be applied as an *interface policer*.

You configure the other two policers to allow burst sizes of 500 KB, and you apply these policers to IPv4 input traffic at the logical interface by using an IPv4 standard stateless firewall filter. When you apply a policer to protocol-specific traffic at a logical interface through a firewall filter action, the policer is said to be applied as a *firewall-filter policer*.

- You configure the policer named `p-icmp-500k-500k-discard` to rate-limit traffic to 500 Kbps with a burst size of 500 K bytes by discarding packets that do not conform to these limits. You configure one of the firewall filter terms to apply this policer to Internet Control Message Protocol (ICMP) packets.
- You configure the policer named `p-ftp-10p-500k-discard` to rate-limit traffic to a 10 percent bandwidth with a burst size of 500 KB by discarding packets that do not conform to these limits. You configure another firewall-filter term to apply this policer to File Transfer Protocol (FTP) packets.

A policer that you configure with a bandwidth limit expressed as a percentage value (rather than as an absolute bandwidth value) is called a *bandwidth policer*. Only single-rate two-color policers can be configured with a percentage bandwidth specification. By default, a bandwidth policer rate-limits traffic to the specified percentage of the line rate of the physical interface underlying the target logical interface.

## Topology

You configure the target logical interface as a single-tag VLAN logical interface on a Fast Ethernet interface operating at 100 Mbps. This means that the policer you configure with the 10-percent bandwidth-limit (the policer that you apply to FTP packets) rate-limits the FTP traffic on this interface to 10 Mbps.

**NOTE:** In this example, you do not configure the bandwidth policer as a *logical-bandwidth policer*. Therefore, the percentage is based on the physical media rate rather than on the configured shaping rate of the logical interface.

The firewall filter that you configure to reference two of the policers must be configured as an *interface-specific filter*. Because the policer that is used to rate-limit FTP packets specifies the bandwidth limit as a percentage value, the firewall filter that references this policer must be configured as an interface-specific filter. Thus, if this firewall filter were to be applied to multiple interfaces instead of just the Fast Ethernet interface in this example, unique policers and counters would be created for each interface to which the filter is applied.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2017](#)
- [Configuring the Single-Tag VLAN Logical Interface | 2017](#)
- [Configuring the Three Policers | 2019](#)
- [Configuring the IPv4 Firewall Filter | 2021](#)
- [Applying the Interface Policer and Firewall Filter Policers to the Logical Interface | 2024](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces fe-0/1/1 vlan-tagging
set interfaces fe-0/1/1 unit 0 vlan-id 100
set interfaces fe-0/1/1 unit 0 family inet address 10.20.15.1/24
set interfaces fe-0/1/1 unit 1 vlan-id 101
set interfaces fe-0/1/1 unit 1 family inet address 10.20.240.1/24
set firewall policer p-all-1m-5k-discard if-exceeding bandwidth-limit 1m
set firewall policer p-all-1m-5k-discard if-exceeding burst-size-limit 5k
set firewall policer p-all-1m-5k-discard then discard
set firewall policer p-ftp-10p-500k-discard if-exceeding bandwidth-percent 10
set firewall policer p-ftp-10p-500k-discard if-exceeding burst-size-limit 500k
set firewall policer p-ftp-10p-500k-discard then discard
set firewall policer p-icmp-500k-500k-discard if-exceeding bandwidth-limit 500k
set firewall policer p-icmp-500k-500k-discard if-exceeding burst-size-limit 500k
set firewall policer p-icmp-500k-500k-discard then discard
set firewall family inet filter filter-ipv4-with-limits interface-specific
set firewall family inet filter filter-ipv4-with-limits term t-ftp from protocol tcp
set firewall family inet filter filter-ipv4-with-limits term t-ftp from port ftp
set firewall family inet filter filter-ipv4-with-limits term t-ftp from port ftp-data
set firewall family inet filter filter-ipv4-with-limits term t-ftp then policer p-ftp-10p-500k-discard
set firewall family inet filter filter-ipv4-with-limits term t-icmp from protocol icmp
set firewall family inet filter filter-ipv4-with-limits term t-icmp then policer p-icmp-500k-500k-discard
set firewall family inet filter filter-ipv4-with-limits term catch-all then accept
set interfaces fe-0/1/1 unit 1 family inet filter input filter-ipv4-with-limits
set interfaces fe-0/1/1 unit 1 family inet policer input p-all-1m-5k-discard
```

### *Configuring the Single-Tag VLAN Logical Interface*

#### **Step-by-Step Procedure**

To configure the single-tag VLAN logical interface:

1. Enable configuration of the Fast Ethernet interface.

```
[edit]
user@host# edit interfaces fe-0/1/1
```

2. Enable single-tag VLAN framing.

```
[edit interfaces fe-0/1/1]
user@host# set vlan-tagging
```

3. Bind VLAN IDs to the logical interfaces.

```
[edit interfaces fe-0/1/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 1 vlan-id 101
```

4. Configure IPv4 on the single-tag VLAN logical interfaces.

```
[edit interfaces fe-0/1/1]
user@host# set unit 0 family inet address 10.20.15.1/24
user@host# set unit 1 family inet address 10.20.240.1/24
```

## Results

Confirm the configuration of the VLAN by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
fe-0/1/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 10.20.15.1/24;
 }
 }
}
```

```

unit 1 {
 vlan-id 101;
 family inet {
 address 10.20.240.1/24;
 }
}

```

### *Configuring the Three Policers*

#### **Step-by-Step Procedure**

To configure the three policers:

1. Enable configuration of a two-color policer that discards packets that do not conform to a bandwidth of 1 Mbps and a burst size of 5000 bytes.

**NOTE:** You apply this policer directly to all IPv4 input traffic at the single-tag VLAN logical interface, so the packets will not be filtered before being subjected to rate limiting.

```

[edit]
user@host# edit firewall policer p-all-1m-5k-discard

```

2. Configure the first policer.

```

[edit firewall policer p-all-1m-5k-discard]
user@host# set if-exceeding bandwidth-limit 1m
user@host# set if-exceeding burst-size-limit 5k
user@host# set then discard

```

3. Enable configuration of a two-color policer that discards packets that do not conform to a bandwidth specified as “10 percent” and a burst size of 500,000 bytes.

You apply this policer only to the FTP traffic at the single-tag VLAN logical interface.

You apply this policer as the action of an IPv4 firewall filter term that matches FTP packets from TCP.

```

[edit firewall policer p-all-1m-5k-discard]
user@host# up

```

```
[edit]
user@host# edit firewall policer p-ftp-10p-500k-discard
```

#### 4. Configure policing limits and actions.

```
[edit firewall policer p-ftp-10p-500k-discard]
user@host# set if-exceeding bandwidth-percent 10
user@host# set if-exceeding burst-size-limit 500k
user@host# set then discard
```

Because the bandwidth limit is specified as a percentage, the firewall filter that references this policer must be configured as an interface-specific filter.

**NOTE:** If you wanted this policer to rate-limit to 10 percent of the logical interface configured shaping rate (rather than to 10 percent of the physical interface media rate), you would need to include the `logical-bandwidth-policer` statement at the `[edit firewall policer p-all-1m-5k-discard]` hierarchy level. This type of policer is called a *logical-bandwidth policer*.

#### 5. Enable configuration of the IPv4 firewall filter policer for ICMP packets.

```
[edit firewall policer p-ftp-10p-500k-discard]
user@host# up

[edit]
user@host# edit firewall policer p-icmp-500k-500k-discard
```

#### 6. Configure policing limits and actions.

```
[edit firewall policer p-icmp-500k-500k-discard]
user@host# set if-exceeding bandwidth-limit 500k
user@host# set if-exceeding burst-size-limit 500k
user@host# set then discard
```

## Results

Confirm the configuration of the policers by entering the `show firewall configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer p-all-1m-5k-discard {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 5k;
 }
 then discard;
}
policer p-ftp-10p-500k-discard {
 if-exceeding {
 bandwidth-percent 10;
 burst-size-limit 500k;
 }
 then discard;
}
policer p-icmp-500k-500k-discard {
 if-exceeding {
 bandwidth-limit 500k;
 burst-size-limit 500k;
 }
 then discard;
}
```

### *Configuring the IPv4 Firewall Filter*

## Step-by-Step Procedure

To configure the IPv4 firewall filter:

1. Enable configuration of the IPv4 firewall filter.

```
[edit]
user@host# edit firewall family inet filter filter-ipv4-with-limits
```

## 2. Configure the firewall filter as interface-specific.

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# set interface-specific
```

The firewall filter must be interface-specific because one of the policers referenced is configured with a bandwidth limit expressed as a percentage value.

## 3. Enable configuration of a filter term to rate-limit FTP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# edit term t-ftp

[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# set from protocol tcp
user@host# set from port [ftp ftp-data]
```

FTP messages are sent over TCP port 20 (ftp) and received over TCP port 21 (ftp-data).

## 4. Configure the filter term to match FTP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# set then policer p-ftp-10p-500k-discard
```

## 5. Enable configuration of a filter term to rate-limit ICMP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# up

[edit firewall family inet filter filter-ipv4-with-limits]
user@host# edit term t-icmp
```

## 6. Configure the filter term for ICMP packets

```
[edit firewall family inet filter filter-ipv4-with-limits term t-icmp]
user@host# set from protocol icmp
user@host# set then policer p-icmp-500k-500k-discard
```

## 7. Configure a filter term to accept all other packets without policing.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-icmp]
user@host# up

[edit firewall family inet filter filter-ipv4-with-limits]
user@host# set term catch-all then accept
```

## Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
 filter filter-ipv4-with-limits {
 interface-specific;
 term t-ftp {
 from {
 protocol tcp;
 port [ftp ftp-data];
 }
 then policer p-ftp-10p-500k-discard;
 }
 term t-icmp {
 from {
 protocol icmp;
 }
 then policer p-icmp-500k-500k-discard;
 }
 term catch-all {
 then accept;
 }
 }
}
policer p-all-1m-5k-discard {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 5k;
```

### Step-by-Step Procedure

1. Enable configuration of IPv4 on the logical interface.

2. Apply the firewall filter policers to the interface.

### 3. Apply the interface policer to the interface.

```
[edit interfaces fe-0/1/1 unit 1 family inet]
user@host# set policer input p-all-1m-5k-discard
```

Input packets at fe-0/1/1.0 are evaluated against the interface policer before they are evaluated against the firewall filter policers. For more information, see ["Order of Policer and Firewall Filter Operations" on page 1903](#).

## Results

Confirm the configuration of the interface by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
fe-0/1/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 10.20.15.1/24;
 }
 }
 unit 1 {
 vlan-id 101;
 family inet {
 filter {
 input filter-ipv4-with-limits;
 }
 policer {
 input p-all-1m-5k-discard;
 }
 address 10.20.240.1/24;
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Policers Applied Directly to the Logical Interface | 2026](#)
- [Displaying Statistics for the Policer Applied Directly to the Logical Interface | 2026](#)
- [Displaying the Policers and Firewall Filters Applied to an Interface | 2027](#)
- [Displaying Statistics for the Firewall Filter Policers | 2028](#)

Confirm that the configuration is working properly.

### *Displaying Policers Applied Directly to the Logical Interface*

#### Purpose

Verify that the interface policer is evaluated when packets are received on the logical interface.

#### Action

Use the `show interfaces policers` operational mode command for logical interface fe-0/1/1.1. The command output section for the **Proto** column and **Input Policer** column shows that the policer p-all-1m-5k-discard is evaluated when packets are received on the logical interface.

```
user@host> show interfaces policers fe-0/1/1.1
Interface Admin Link Proto Input Policer Output Policer
fe-0/1/1.1 up up
 inet p-all-1m-5k-discard-fe-0/1/1.1-inet-i
```

In this example, the interface policer is applied to logical interface traffic in the input direction only.

### *Displaying Statistics for the Policer Applied Directly to the Logical Interface*

#### Purpose

Verify the number of packets evaluated by the interface policer.

## Action

Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction.

```
user@host> show policer p-all-1m-5k-discard-fe-0/1/1.1-inet-i
Policers:
Name Bytes Packets
p-all-1m-5k-discard-fe-0/1/1.1-inet-i 200 5
```

### *Displaying the Policers and Firewall Filters Applied to an Interface*

## Purpose

Verify that the firewall filter `filter-ipv4-with-limits` is applied to the IPv4 input traffic at logical interface `fe-0/1/1.1`.

## Action

Use the `show interfaces statistics` operational mode command for logical interface `fe-0/1/1.1`, and include the `detail` option. Under the **Protocol inet** section of the command output section, the **Input Filters** and **Policer** lines display the names of filter and policer applied to the logical interface in the input direction.

```
user@host> show interfaces statistics fe-0/1/1.1 detail
Logical interface fe-0/1/1.1 (Index 83) (SNMP ifIndex 545) (Generation 153)
Flags: SNMP-Traps 0x4000 VLAN-Tag [0x8100.100] Encapsulation: ENET2
Traffic statistics:
 Input bytes : 0
 Output bytes : 46
 Input packets: 0
 Output packets: 1
Local statistics:
 Input bytes : 0
 Output bytes : 46
 Input packets: 0
 Output packets: 1
Transit statistics:
 Input bytes : 0 0 bps
```

```

Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: 1500, Generation: 176, Route table: 0
 Flags: Sendbroadcast-pkt-to-re
 Input Filters: filter-ipv4-with-limits-fe-0/1/1.1-i
 Policier: Input: p-all-1m-5k-discard-fe-0/1/1.1-inet-i
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.20.130/24, Local: 10.20.130.1, Broadcast: 10.20.130.255,
 Generation: 169

```

In this example, the two firewall filter policers are applied to logical interface traffic in the input direction only.

### *Displaying Statistics for the Firewall Filter Policers*

#### **Purpose**

Verify the number of packets evaluated by the firewall filter policers.

#### **Action**

Use the `show firewall operational mode` command for the filter you applied to the logical interface.

```

[edit]
user@host> show firewall filter filter-ipv4-with-limits-fe-0/1/1.1-i

Filter: filter-ipv4-with-limits-fe-0/1/1.1-i
Policers:
Name Bytes Packets
p-ftp-10p-500k-discard-t-ftp-fe-0/1/1.1-i 0 0
p-icmp-500k-500k-discard-t-icmp-fe-0/1/1.1-i 0 0

```

The command output displays the names of the policers (p-ftp-10p-500k-discard and p-icmp-500k-500k-discard), combined with the names of the filter terms (t-ftp and t-icmp, respectively) under which the policer action is specified. The policer-specific output lines display the number of packets that matched the filter term. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

## Bandwidth Policer Overview

### IN THIS SECTION

- [Guidelines for Configuring a Bandwidth Policer | 2030](#)
- [Guidelines for Applying a Bandwidth Policer | 2030](#)

For a single-rate two-color policer only, you can specify the bandwidth limit as a percentage value from 1 through 100 instead of as an absolute number of bits per second. This type of two-color policer, called

a *bandwidth policer*, rate-limits traffic to a bandwidth limit that is calculated as a percentage of either the physical interface media rate or the *logical interface* configured shaping rate.

### Guidelines for Configuring a Bandwidth Policer

The following guidelines apply to configuring a bandwidth policer:

- To specify a percentage bandwidth limit, you include the `bandwidth-percent percentage` statement in place of the `bandwidth-limit bps` statement.
- By default, a bandwidth policer calculates the percentage bandwidth limit based on the physical interface port speed. To configure a bandwidth policer to calculate the percentage bandwidth limit based on the configured logical interface shaping rate instead, include the `logical-bandwidth-policer` statement at the `[edit firewall policer policer-name]` hierarchy level. This type of bandwidth policer is called a *logical bandwidth policer*.

You can configure a logical interface shaping rate by including the `shaping-rate bps` statement at the `[edit class-of-service interfaces interface interface-name unit logical-unit-number]` hierarchy level. A logical interface shaping rate causes the specified amount of bandwidth to be allocated to the logical interface.

**NOTE:** If you configure a logical-bandwidth policer and then apply the policer to a logical interface that is not configured with a shaping rate, then the policer rate-limits traffic on that logical interface to calculate the percentage bandwidth limit based on the physical interface port speed, even if you include the `logical-bandwidth-policer` statement in the bandwidth policer configuration.

- If you reference a bandwidth policer from a stateless *firewall filter* term, you must include the `interface-specific` statement in the firewall filter configuration.

### Guidelines for Applying a Bandwidth Policer

The following guidelines pertain to applying a bandwidth policer to traffic:

- You can use a bandwidth policer to rate-limit protocol-specific traffic (not family any) at the input or output of a logical interface.
- You can apply a bandwidth policer directly to protocol-specific input or output traffic at a logical interface.
- To send only selected packets to a bandwidth policer, you can reference the bandwidth policer from a stateless firewall filter term and then apply the filter to logical interface traffic for a specific protocol family.

- To reference a *logical bandwidth policer* from a firewall filter, you must include the [interface-specific](#) statement in the firewall filter configuration.
- You cannot use a bandwidth policer for forwarding-table filters.
- You cannot apply a bandwidth policer to an aggregate interface, a tunnel interface, or a software interface.

## Example: Configuring a Logical Bandwidth Policer

### IN THIS SECTION

- [Requirements | 2031](#)
- [Overview | 2032](#)
- [Configuration | 2033](#)
- [Verification | 2039](#)

This example shows how to configure a logical bandwidth policer.

### Requirements

Before you begin, make sure that you have two logical units available on a Gigabit Ethernet interface.

## Overview

### IN THIS SECTION

- [Topology | 2032](#)

In this example, you configure a single-rate two-color policer that specifies the bandwidth limit as a percentage value rather than as an absolute number of bits per second. This type of policer is called a *bandwidth policer*. By default, a bandwidth policer enforces a bandwidth limit based on the line rate of the underlying physical interface. As an option, you can configure a bandwidth policer to enforce a bandwidth limit based on the configured shaping rate of the logical interface. To configure this type of bandwidth policer, called a *logical bandwidth policer*, you include the `logical-bandwidth-policer` statement in the policer configuration.

To configure a logical interface shaping rate, include the `shaping-rate bps` statement at the [edit class-of-service interfaces interface *interface-name* unit *logical-unit-number*] hierarchy level. This class-of-service (CoS) configuration statement causes the specified amount of bandwidth to be allocated to the logical interface.

**NOTE:** If you configure a policer bandwidth limit as a percentage but a shaping rate is not configured for the target logical interface, the policer bandwidth limit is calculated as a percentage of the physical interface media rate, even if you enable the logical-bandwidth policing feature.

To apply a logical bandwidth policer to a logical interface, you can apply the policer directly to the logical interface at the protocol family level or (if you only need to rate-limit filtered packets) you can reference the policer from a stateless firewall filter configured to operate in *interface-specific* mode.

### *Topology*

In this example, you configure two logical interfaces on a single Gigabit Ethernet interface and configure a shaping rate on each logical interface. On logical interface `ge-1/3/0.0`, you allocate 4 Mbps of bandwidth. On logical interface `ge-1/3/0.1`, you allocate 2 Mbps of bandwidth.

You also configure a logical bandwidth policer with a bandwidth limit of 50 percent and a maximum burst size of 125,000 bytes, and then you apply the policer to input and output traffic at the logical units configured on `ge-1/3/0.0`. For logical interface `ge-1/3/0.0`, the policer rate-limits to a bandwidth limit of 2 Mbps (50 percent of the 4 Mbps shaping rate configured for the logical interface). For logical interface

ge-1/3/0.1, the policer rate-limits traffic to a bandwidth limit of 1 Mbps (50 percent of the 2 Mbps shaping rate configured for the logical interface).

If no shaping rate is configured for a target logical interface, the policer rate-limits to a bandwidth limit calculated as 50 percent of the physical interface media rate. For example, if you apply a 50 percent bandwidth policer to input or output traffic at a Gigabit Ethernet logical interface without rate shaping, the policer applies a bandwidth limit of 500 Mbps (50 percent of 1000 Mbps).

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2033](#)
- [Configuring the Logical Interfaces | 2034](#)
- [Configuring Traffic Rate-Shaping by Specifying the Amount of Bandwidth to be Allocated to the Logical Interface | 2035](#)
- [Configuring the Logical Bandwidth Policers | 2036](#)
- [Applying the Logical Bandwidth Policers to the Logical Interfaces | 2037](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-1/3/0 per-unit-scheduler
set interfaces ge-1/3/0 vlan-tagging
set interfaces ge-1/3/0 unit 0 vlan-id 100
set interfaces ge-1/3/0 unit 0 family inet address 172.16.1.1/30
set interfaces ge-1/3/0 unit 1 vlan-id 200
set interfaces ge-1/3/0 unit 1 family inet address 172.16.2.1/30
set class-of-service interfaces ge-1/3/0 unit 0 shaping-rate 4m
set class-of-service interfaces ge-1/3/0 unit 1 shaping-rate 2m
set firewall policer LB-policer logical-bandwidth-policer
```

```

set firewall policer LB-policer if-exceeding bandwidth-percent 50
set firewall policer LB-policer if-exceeding burst-size-limit 125k
set firewall policer LB-policer then discard
set interfaces ge-1/3/0 unit 0 family inet policer input LB-policer
set interfaces ge-1/3/0 unit 0 family inet policer output LB-policer
set interfaces ge-1/3/0 unit 1 family inet policer input LB-policer
set interfaces ge-1/3/0 unit 1 family inet policer output LB-policer

```

### *Configuring the Logical Interfaces*

#### **Step-by-Step Procedure**

To configure the logical interfaces:

1. Enable configuration of the physical interface.

```

[edit]
user@host# edit interfaces ge-1/3/0

[edit interfaces ge-1/3/0]
user@host# set per-unit-scheduler
user@host# set vlan-tagging

```

2. Configure the first logical interface.

```

[edit interfaces ge-1/3/0]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 172.16.1.1/30

```

3. Configure the second logical interface.

```

[edit interfaces ge-1/3/0]
user@host# set unit 1 vlan-id 200
user@host# set unit 1 family inet address 172.16.2.1/30

```

## Results

Confirm the configuration of the interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/0 {
 per-unit-scheduler;
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 172.16.1.1/30;
 }
 }
 unit 1 {
 vlan-id 200;
 family inet {
 address 172.16.2.1/30;
 }
 }
}
```

### *Configuring Traffic Rate-Shaping by Specifying the Amount of Bandwidth to be Allocated to the Logical Interface*

#### Step-by-Step Procedure

To configure rate shaping by specifying the bandwidth to be allocated to the logical interface:

1. Enable CoS configuration on the physical interface.

```
[edit]
user@host# edit class-of-service interfaces ge-1/3/0
```

## 2. Configure rate shaping for the logical interfaces.

```
[edit class-of-service interfaces ge-1/3/0]
user@host# set unit 0 shaping-rate 4m
user@host# set unit 1 shaping-rate 2m
```

These statements allocate 4 Mbps of bandwidth to logical unit ge-1/3/0.0 and 2 Mbps of bandwidth to logical unit ge-1/3/0.1.

## Results

Confirm the configuration of the rate shaping by entering the `show class-of-service` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
 ge-1/3/0 {
 unit 0 {
 shaping-rate 4m;
 }
 unit 1 {
 shaping-rate 2m;
 }
 }
}
```

## *Configuring the Logical Bandwidth Policer*

### Step-by-Step Procedure

To configure the logical bandwidth policer:

#### 1. Enable configuration of a single-rate two-color policer.

```
[edit]
user@host# edit firewall policer LB-policer
```

## 2. Configure the policer as a logical-bandwidth policer.

```
[edit firewall policer LB-policer]
user@host# set logical-bandwidth-policer
```

This applies the rate-limiting to logical interfaces.

## 3. Configure the policer traffic limits and actions.

```
[edit firewall policer LB-policer]
user@host# set if-exceeding bandwidth-percent 50
user@host# set if-exceeding burst-size-limit 125k
user@host# set then discard
```

## Results

Confirm the configuration of the policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer LB-policer {
 logical-bandwidth-policer;
 if-exceeding {
 bandwidth-percent 50;
 burst-size-limit 125k;
 }
 then discard;
}
```

### *Applying the Logical Bandwidth Policers to the Logical Interfaces*

## Step-by-Step Procedure

To configure the logical bandwidth policers to the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/0
```

2. Apply the logical bandwidth policer to the first logical interface.

```
[edit interfaces ge-1/3/0]
user@host# set unit 0 family inet policer input LB-policer
user@host# set unit 0 family inet policer output LB-policer
```

3. Apply the policing to the second logical interface.

```
[edit interfaces ge-1/3/0]
user@host# set unit 1 family inet policer input LB-policer
user@host# set unit 1 family inet policer output LB-policer
```

## Results

Confirm the configuration of the interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/0 {
 per-unit-scheduler;
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 policer {
 input LB-policer;
 output LB-policer;
 }
 address 172.16.1.1/30;
 }
 }
 unit 1 {
```

```

 vlan-id 200;
 family inet {
 policer {
 input LB-policer;
 output LB-policer;
 }
 address 172.16.2.1/30;
 }
}

```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 2039](#)
- [Displaying Statistics for the Policer | 2041](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

## Purpose

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

## Action

Use the `show interfaces operational mode` command for logical interfaces `ge-1/3/0.0` and `ge-1/3/0.1`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that lists the policer `LB-policer` as an input or output policer as follows:

- **Input:** `LB-policer-ge-1/3/0.0-inet-i`
- **Output:** `LB-policer-ge-1/3/0.0-inet-o`

In this example, the policer is applied to logical interface traffic in both the input and output directions.

```
user@host> show interfaces ge-1/3/0.0 detail
```

```
Logical interface ge-1/3/0.0 (Index 80) (SNMP ifIndex 154) (Generation 150)
```

```
Flags: SNMP-Traps 0x4000 VLAN-Tag [0x8100.100] Encapsulation: ENET2
```

```

```

```

Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: 1500, Generation: 175, Route table: 0
 Flags: Sendbroadcast-pkt-to-re
 Policer: Input: LB-policer-ge-1/3/0.1-inet-i, Output: LB-policer-ge-1/3/0.1-inet-o
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 172.17.1.0/30, Local: 172.17.1.1, Broadcast: 172.17.1.3, Generation: 167

```

### *Displaying Statistics for the Policer*

#### **Purpose**

Verify the number of packets evaluated by the policer.

#### **Action**

Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer `LB-policer`, the input and output policer names are displayed as follows:

- **LB-policer-ge-1/3/0.0-inet-i**
- **LB-policer-ge-1/3/0.0-inet-o**
- **LB-policer-ge-1/3/0.1-inet-i**
- **LB-policer-ge-1/3/0.1-inet-o**

The **-inet-i** suffix denotes a policer applied to logical interface input traffic, while the **-inet-o** suffix denotes a policer applied to logical interface output traffic. In this example, the policer is applied to both input and output traffic on logical interface `ge-1/3/0.0` and logical interface `ge-1/3/0.1`.

```
user@host> show policer
```

```
Policers:
```

| Name                         | Packets |
|------------------------------|---------|
| __default_arp_policer__      | 0       |
| LB-policer-ge-1/3/0.0-inet-i | 0       |
| LB-policer-ge-1/3/0.0-inet-o | 0       |
| LB-policer-ge-1/3/0.1-inet-i | 0       |
| LB-policer-ge-1/3/0.1-inet-o | 0       |

## Prefix-Specific Counting and Policing Overview

### IN THIS SECTION

- [Separate Counting and Policing for Each IPv4 Address Range | 2043](#)
- [Prefix-Specific Action Configuration | 2043](#)
- [Counter and Policer Set Size and Indexing | 2044](#)

### Separate Counting and Policing for Each IPv4 Address Range

Prefix-specific counting and policing enables you to configure an IPv4 *firewall filter* term that matches on a source or destination address, applies a single-rate two-color policer as the term action, but associates the matched packet with a specific counter and policer instance based on the source or destination in the packet header. You can implicitly create a separate counter or policer instance for a single address or for a group of addresses.

Prefix-specific counting and policing uses a *prefix-specific action* configuration that specifies the name of the policer you want to apply, whether prefix-specific counting is to be enabled, and a source or destination address prefix range.

The prefix range specifies between 1 and 16 sequential set bits of an IPv4 address mask. The length of the prefix range determines the size of the counter and policer *set*, which consists of as few as 2 or as many as 65,536 counter and policer instances. The position of the bits of the prefix range determines the indexing of filter-matched packets into the set of instances.

**NOTE:** A prefix-specific action is specific to a source or destination *prefix range*, but it is not specific to a particular source or destination *address range*, and it is not specific to a particular interface.

To apply a prefix-specific action to the traffic at an interface, you configure a firewall filter term that matches on source or destination addresses, and then you apply the firewall filter to the interface. The flow of filtered traffic is rate-limited using prefix-specific counter and policer instances that are selected per packet based on the source or destination address in the header of the filtered packet.

### Prefix-Specific Action Configuration

To configure a prefix-specific action, you specify the following information:

- Prefix-specific action name—Name that can be referenced as the action of an IPv4 standard firewall filter term that matches packets on source or destination addresses.
- Policer name—Name of a single-rate two-color policer for which you want to implicitly create prefix-specific instances.

**NOTE:** For aggregated Ethernet interfaces, you can configure a prefix-specific action that references a logical interface policer (also called an aggregate policer). You can reference this type of prefix-specific action from an IPv4 standard firewall filter and then apply the filter at the aggregate level of the interface.

- Counting option—Option to include if you want to enable prefix-specific counters.
- Filter-specific option—Option to include if you want a single counter and policer set to be shared across all terms in the firewall filter. A prefix-specific action that operates in this way is said to operate in *filter-specific* mode. If you do not enable this option, the prefix-specific action operates in *term-specific* mode, meaning that a separate counter and policer set is created for each filter term that references the prefix-specific action.
- Source address prefix length—Length of the address prefix, from 0 through 32, to be used with a packet matched on the source address.
- Destination address prefix length—Length of the address prefix, from 0 through 32, to be used with a packet matched on the destination address.
- Subnet prefix length—Length of the subnet prefix, from 0 through 32, to be used with a packet matched on either the source or destination address.

You must configure source and destination address prefix lengths to be from 1 to 16 bits longer than the subnet prefix length. If you configure source or destination address prefix lengths to be more than 16 bits beyond the configured subnet prefix length, an error occurs when you try to commit the configuration.

**Counter and Policer Set Size and Indexing**

The number of prefix-specific actions (counters or policers) implicitly created for a prefix-specific action is determined by the length of the address prefix and the length of the subnet prefix:

1. Size of Counter and Policer Set =  $2^{(source-or-destination-prefix-length - subnet-prefix-length)}$

Table 115 on page 2045 shows examples of counter and policer set size and indexing.

**Table 115: Examples of Counter and Policer Set Size and Indexing**

| Example Prefix Lengths Specified in the Prefix-Specific Action       | Calculation of Counter or Policer Set Size                                                                                                       | Indexing of Instances |                         |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|-------------------------|
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 16 | Size = $2^{(32 - 16)} = 2^{16} = 65,536$ instances<br><br><b>NOTE:</b> This calculation shows the largest counter or policer set size supported. | Instance 0:           | <i>x.x</i> 0.0          |
|                                                                      |                                                                                                                                                  | Instance 1:           | <i>x.x</i> 0.1          |
|                                                                      |                                                                                                                                                  | Instance 65535:       | <i>x.x</i> 255.255      |
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 24 | Size = $2^{(32 - 24)} = 2^8 = 256$ instances                                                                                                     | Instance 0:           | <i>x.x.x</i> 0          |
|                                                                      |                                                                                                                                                  | Instance 1:           | <i>x.x.x</i> 1          |
|                                                                      |                                                                                                                                                  | Instance 255:         | <i>x.x.x</i> 255        |
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 25 | Size = $2^{(32 - 25)} = 2^7 = 128$ instances                                                                                                     | Instance 0:           | <i>x.x.x</i> 0          |
|                                                                      |                                                                                                                                                  | Instance 1:           | <i>x.x.x</i> 1          |
|                                                                      |                                                                                                                                                  | Instance 127:         | <i>x.x.x</i> 127        |
| <i>source-prefix-length</i> = 24<br><i>subnet-prefix-length</i> = 20 | Size = $2^{(24 - 20)} = 2^4 = 16$ instances                                                                                                      | Instance 0:           | <i>x.x</i> 0. <i>x</i>  |
|                                                                      |                                                                                                                                                  | Instance 1:           | <i>x.x</i> 1. <i>x</i>  |
|                                                                      |                                                                                                                                                  | Instance 15:          | <i>x.x</i> 15. <i>x</i> |

[Example: Configuring Prefix-Specific Counting and Policing](#)

# Filter-Specific Counter and Policer Set Overview

By default, a prefix-specific policer set operates in *term-specific* mode so that, for a given *firewall filter*, the Junos OS creates a separate counter and policer set for every filter term that references the prefix-specific action. As an option, you can configure a prefix-specific policer set to operate in *filter-specific* mode so that a single prefix-specific policer set is used by all terms (within the same firewall filter) that reference the policer.

For an IPv4 firewall filter with multiple terms that reference the same prefix-specific policer set, configuring the policer set to operate in filter-specific mode enables you to count and monitor the activity of the policer set at the firewall filter level.

**NOTE:** Term-specific mode and filter-specific mode also apply to policers. See Filter-Specific Policer Overview.

To enable a prefix-specific policer set to operate in filter-specific mode, you can include the [filter-specific](#) statement at the following hierarchy levels:

- [edit firewall family inet prefix-action *prefix-action-name*]
- [edit logical-systems *logical-system-name* firewall family inet prefix-action *prefix-action-name*]

You can reference filter-specific, prefix-specific policer sets from IPv4 (family inet) firewall filters only.

## SEE ALSO

[Two-Color Policer Configuration Overview | 1993](#)

[Prefix-Specific Counting and Policing Overview](#)

[Example: Configuring Prefix-Specific Counting and Policing](#)

[Prefix-Specific Counting and Policing Configuration Scenarios](#)

# Filter-Specific Policer Overview

By default, a policer operates in *term-specific* mode so that, for a given *firewall filter*, the Junos OS creates a separate policer instance for every filter term that references the policer. As an option, you can configure a policer to operate in *filter-specific* mode so that a single policer instance is used by all terms (within the same firewall filter) that reference the policer.

For an IPv4 firewall filter with multiple terms that reference the same policer, configuring the policer to operate in filter-specific mode enables you to count and monitor the activity of the policer at the firewall filter level.

**NOTE:** Term-specific mode and filter-specific mode also apply to prefix-specific policer sets.

To enable a single-rate two-color policer to operate in filter-specific mode, you can include the [filter-specific](#) statement at the following hierarchy levels:

- [edit firewall policer *policer-name*]
- [edit logical-systems *logical-system-name* firewall policer *policer-name*]

You can reference filter-specific policers from IPv4 (family inet) firewall filters only.

## Example: Configuring Prefix-Specific Counting and Policing

### IN THIS SECTION

- [Requirements | 2047](#)
- [Overview | 2047](#)
- [Configuration | 2049](#)
- [Verification | 2055](#)

This example shows how to configure prefix-specific counting and policing.

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

### IN THIS SECTION

- [Topology | 2048](#)

In this example, you configure prefix-specific counting and policing based on the last octet of the source address field in packets matched by an IPv4 firewall filter.

The single-rate two-color policer named `1Mbps-policer` rate-limits traffic to a bandwidth of 1,000,000 bps and a burst-size limit of 63,000 bytes, discarding any packets in a traffic flow that exceeds the traffic limits.

Independent of the IPv4 addresses contained in any packets passed from a firewall filter, the prefix-specific action named `psa-1Mbps-per-source-24-32-256` specifies a set of 256 counters and policers, numbered from 0 through 255. For each packet, the last octet of the source address field is used to index into the associated prefix-specific counter and policer in the set:

- Packets with a source address ending with the octet `0x0000 0000` index the first counter and policer in the set.
- Packets with a source address ending with the octet `0x0000 0001` index the second counter and policer in the set.
- Packets with a source address ending with the octet `0x1111 1111` index the last counter and policer in the set.

The `limit-source-one-24` firewall filter contains a single term that matches all packets from the /24 subnet of source address `10.10.10.0`, passing these packets to the prefix-specific action `psa-1Mbps-per-source-24-32-256`.

### *Topology*

In this example, because the filter term matches the /24 subnet of a single source address, each counting and policing instance in the prefix-specific set is used for only one source address.

- Packets with a source address `10.10.10.0` index the first counter and policer in the set.
- Packets with a source address `10.10.10.1` index the second counter and policer in the set.
- Packets with a source address `10.10.10.255` index the last counter and policer in the set.

This example shows the simplest case of prefix-specific actions, in which the filter term matches on one address with a prefix length that is the same as the prefix length specified in the prefix-specific action for indexing into the set of prefix-specific counters and policers.

For descriptions of other configurations for prefix-specific counting and policing, see [Prefix-Specific Counting and Policing Configuration Scenarios](#).

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2049](#)
- [Configuring a Policer for Prefix-Specific Counting and Policing | 2050](#)
- [Configuring a Prefix-Specific Action Based on the Policer | 2051](#)
- [Configuring an IPv4 Filter That References the Prefix-Specific Action | 2052](#)
- [Applying the Firewall Filter to IPv4 Input Traffic at a Logical Interface | 2054](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set firewall policer 1Mbps-policer if-exceeding bandwidth-limit 1m
set firewall policer 1Mbps-policer if-exceeding burst-size-limit 63k
set firewall policer 1Mbps-policer then discard
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 policer 1Mbps-policer
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 count
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 subnet-prefix-length 24
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 source-prefix-length 32
set firewall family inet filter limit-source-one-24 term one from source-address 10.10.10.0/24
set firewall family inet filter limit-source-one-24 term one then prefix-action psa-1Mbps-per-source-24-32-256
set interfaces so-0/0/2 unit 0 family inet filter input limit-source-one-24
set interfaces so-0/0/2 unit 0 family inet address 10.39.1.1/16
```

## *Configuring a Policer for Prefix-Specific Counting and Policing*

### Step-by-Step Procedure

To configure a policer to be used for prefix-specific counting and policing:

1. Enable configuration of a single-rate two-color policer.

```
[edit]
user@host# edit firewall policer 1Mbps-policer
```

2. Define the traffic limit.

```
[edit firewall policer 1Mbps-policer]
user@host# set if-exceeding bandwidth-limit 1m
user@host# set if-exceeding burst-size-limit 63k
```

Packets in a traffic flow that conforms to this limit are passed with the PLP set to low.

3. Define the actions for nonconforming traffic.

```
[edit firewall policer 1Mbps-policer]
user@host# set then discard
```

Packets in a traffic flow that exceeds this limit are discarded. Other configurable actions for a single-rate two-color policer are to set the forwarding class and to set the PLP level.

### Results

Confirm the configuration of the policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
}
```

```
 then discard;
}
```

### *Configuring a Prefix-Specific Action Based on the Policer*

#### Step-by-Step Procedure

To configure a prefix-specific action that references the policer and specifies a portion of a source address prefix:

1. Enable configuration of a prefix-specific action.

```
[edit]
user@host# edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256
```

Prefix-specific counting and policing can be defined for IPv4 traffic only.

2. Reference the policer for which a prefix-specific set is to be created.

```
[edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256]
user@host# set policer 1Mbps-policer
user@host# set count
```

**NOTE:** For aggregated Ethernet interfaces, you can configure a prefix-specific action that references a logical interface policer (also called an aggregate policer). You can reference this type of prefix-specific action from an IPv4 standard firewall filter and then apply the filter at the aggregate level of the interface.

3. Specify the prefix range on which IPv4 addresses are to be indexed to the counter and policer set.

```
[edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256]
user@host# set source-prefix-length 32
user@host# set subnet-prefix-length 24
```

## Results

Confirm the configuration of the prefix-specific action by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
 then discard;
}
family inet {
 prefix-action psa-1Mbps-per-source-24-32-256 {
 policer 1Mbps-policer;
 subnet-prefix-length 24;
 source-prefix-length 32;
 }
}
```

### *Configuring an IPv4 Filter That References the Prefix-Specific Action*

#### Step-by-Step Procedure

To configure an IPv4 standard firewall filter that references the prefix-specific action:

1. Enable configuration of the IPv4 standard firewall filter.

```
[edit]
user@host# edit firewall family inet filter limit-source-one-24
```

Prefix-specific counting and policing can be defined for IPv4 traffic only.

2. Configure the filter term to match on the packet source address or destination address.

```
[edit firewall family inet filter limit-source-one-24]
user@host# set term one from source-address 10.10.10.0/24
```

### 3. Configure the filter term to reference the prefix-specific action.

```
[edit firewall family inet filter limit-source-one-24]
user@host# set term one then prefix-action psa-1Mbps-per-source-24-32-256
```

You could also use the `next` term action to configure all Hypertext Transfer Protocol (HTTP) traffic to each host to transmit at 500 Kbps and have the total HTTP traffic limited to 1 Mbps.

## Results

Confirm the configuration of the prefix-specific action by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
 then discard;
}
family inet {
 prefix-action psa-1Mbps-per-source-24-32-256 {
 policer 1Mbps-policer;
 subnet-prefix-length 24;
 source-prefix-length 32;
 }
 filter limit-source-one-24 {
 term one {
 from {
 source-address {
 10.10.10.0/24;
 }
 }
 then prefix-action psa-1Mbps-per-source-24-32-256;
 }
 }
}
```

## *Applying the Firewall Filter to IPv4 Input Traffic at a Logical Interface*

### Step-by-Step Procedure

To apply the firewall filter to IPv4 input traffic at a logical interface:

1. Enable configuration of IPv4 on the logical interface.

```
[edit]
user@host# edit interfaces so-0/0/2 unit 0 family inet
```

2. Configure an IP address.

```
[edit interfaces so-0/0/2 unit 0 family inet]
user@host# set address 10.39.1.1/16
```

3. Apply the IPv4 standard stateless firewall filter.

```
[edit interfaces so-0/0/2 unit 0 family inet]
user@host# set filter input limit-source-one-24
```

### Results

Confirm the configuration of the prefix-specific action by entering the `show interfaces` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-0/0/2 {
 unit 0 {
 family inet {
 filter {
 input limit-source-one-24;
 }
 address 10.39.1.1/16;
 }
 }
}
```

```
}
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to an Interface | 2055](#)
- [Displaying Prefix-Specific Actions Statistics for the Firewall Filter | 2056](#)

Confirm that the configuration is working properly.

### *Displaying the Firewall Filters Applied to an Interface*

## Purpose

Verify that the firewall filter `limit-source-one-24` is applied to the IPv4 input traffic at logical interface `so-0/0/2.0`.

## Action

Use the `show interfaces statistics` operational mode command for logical interface `so-0/0/2.0`, and include the `detail` option. In the command output section for **Protocol inet**, the **Input Filters** field displays **limit-source-one-24**, indicating that the filter is applied to IPv4 traffic in the input direction:

```
user@host> show interfaces statistics so-0/0/2.0 detail
Logical interface so-0/0/2.0 (Index 79) (SNMP ifIndex 510) (Generation 149)
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
 Protocol inet, MTU: 4470, Generation: 173, Route table: 0
 Flags: Sendbroadcast-pkt-to-re, Protocol-Down
 Input Filters: limit-source-one-24
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 10.39/16, Local: 10.39.1.1, Broadcast: 10.39.255.255, Generation: 163
```

## Displaying Prefix-Specific Actions Statistics for the Firewall Filter

### Purpose

Verify the number of packets evaluated by the policer.

### Action

Use the `show firewall prefix-action-stats filter filter-name prefix-action name` operational mode command to display statistics about a prefix-specific action configured on a firewall filter.

As an option, you can use the `from set-index to set-index` command option to specify the starting and ending counter or policer to be displayed. A policer set is indexed from 0 through 65535.

The command output displays the specified filter name followed by a listing of the number of bytes and packets processed by each policer in the policer set.

For a term-specific policer, each policer in the set is identified as follows:

```
prefix-specific-action-name-term-name-set-index
```

For a filter-specific policer, each policer is identified in the command output as follows:

```
prefix-specific-action-name-set-index
```

Because the example prefix-specific action `psa-1Mbps-per-source-24-32-256` is referenced by only one term of the example filter `limit-source-one-24`, the example policer `1Mbps-policer` is configured as term-specific. In the `show firewall prefix-action-stats` command output, the policer statistics are displayed as `psa-1Mbps-per-source-24-32-256-one-0`, `psa-1Mbps-per-source-24-32-256-one-1`, and so on through `psa-1Mbps-per-source-24-32-256-one-255`.

```
user@host> show firewall prefix-action-stats filter limit-source-one-24 prefix-action psa-1Mbps-
per-source-24-32-256 from 0 to 9
Filter: limit-source-one-24
Counters:
Name Bytes Packets
psa-1Mbps-per-source-24-32-256-one-0 0 0
psa-1Mbps-per-source-24-32-256-one-1 0 0
psa-1Mbps-per-source-24-32-256-one-2 0 0
psa-1Mbps-per-source-24-32-256-one-3 0 0
psa-1Mbps-per-source-24-32-256-one-4 0 0
```

|                                      |   |   |
|--------------------------------------|---|---|
| psa-1Mbps-per-source-24-32-256-one-5 | 0 | 0 |
| psa-1Mbps-per-source-24-32-256-one-6 | 0 | 0 |
| psa-1Mbps-per-source-24-32-256-one-7 | 0 | 0 |
| psa-1Mbps-per-source-24-32-256-one-8 | 0 | 0 |
| psa-1Mbps-per-source-24-32-256-one-9 | 0 | 0 |

|                                                                                                                                                  |                                                                                                                                                                                       | Instance 127:               | 10.10.10.127 |
|                                                                                                                                                  |                                                                                                                                                                                       | Instances 128 – 255: unused |              |

### Scenario 1: Firewall Filter Term Matches on Multiple Addresses

The complete example, Example: Configuring Prefix-Specific Counting and Policing, shows the simplest case of prefix-specific actions, in which a single-term *firewall filter* matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which a single-term firewall filter matches on two IPv4 source addresses. In addition, the additional condition matches on a source address with a prefix length that is different from the subnet prefix length defined in the prefix-specific action. In this case, the additional condition matches on the /16 subnet of the source address 10.11.0.0.

**NOTE:** Unlike packets that match the source address 10.10.10.0/24, packets that match the source address 10.11.0.0/16 are in a many-to-one correspondence with the instances in the counter and policer set.

The filter-matched packets that are passed to the prefix-specific action index into the counter and policer set in such a way that the counting and policing instances are shared by packets that contain source addresses across the 10.10.10.0/24 and 10.11.0.0/16 subnets as follows:

- The first counter and policer in the set are indexed by packets with source addresses 10.10.10.0 and 10.11.x.0, where *x* ranges from 0 through 255.
- The second counter and policer in the set are indexed by packets with source addresses 10.10.10.1 and 10.11.x.1, where *x* ranges from 0 through 255.
- The 256th (last) counter and policer in the set are indexed by packets with source addresses 10.10.10.255 and 10.11.x.255, where *x* ranges from 0 through 255.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```
[edit]
firewall {
 policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
 then discard;
 }
 family inet {
 prefix-action psa-1Mbps-per-source-24-32-256 {
 policer 1Mbps-policer;
 subnet-prefix-length 24;
 source-prefix-length 32;
 }
 filter limit-source-two-24-16 {
 term one {
 from {
 source-address {
 10.10.10.0/24;
 10.11.0.0/16;
 }
 }
 then prefix-action psa-1Mbps-per-source-24-32-256;
 }
 }
 }
}
```

```

 }
}
interfaces {
 so-0/0/2 {
 unit 0 {
 family inet {
 filter {
 input limit-source-two-24-16;
 }
 address 10.39.1.1/16;
 }
 }
 }
}
}

```

### Scenario 2: Subnet Prefix Is Longer Than the Prefix in the Filter Match Condition

The complete example, Example: Configuring Prefix-Specific Counting and Policing, shows the simplest case of prefix-specific actions, in which the single-term firewall filter matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which the prefix-specific action defines a subnet prefix length that is longer than the prefix of the source address matched by the firewall filter. In this case, the prefix-specific action defines a subnet-prefix value of 25, while the firewall filter matches on a source address in the /24 subnet.

**NOTE:** The firewall filter passes the prefix-specific action packets with source addresses that range from 10.10.10.0 through 10.10.10.255, while the prefix-specific action specifies a set of only 128 counters and policers, numbered from 0 through 127.

The filter-matched packets that are passed to the prefix-specific action index into the counter and policer set in such a way that the counting and policing instances are shared by packets that contain either of two source addresses within the 10.10.10.0/24 subnet:

- The first counter and policer in the set are indexed by packets with source addresses 10.10.10.0 and 10.10.10.128.
- The second counter and policer in the set are indexed by packets with source addresses 10.10.10.1 and 10.10.10.129.
- The 128th (last) counter and policer in the set are indexed by packets with source addresses 10.10.10.127 and 10.10.10.255.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```
[edit]
firewall {
 policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
 then discard;
 }
 family inet {
 prefix-action psa-1Mbps-per-source-25-32-128 {
 policer 1Mbps-policer;
 subnet-prefix-length 25;
 source-prefix-length 32;
 }
 filter limit-source-one-24 {
 term one {
 from {
 source-address {
 10.10.10.0/24;
 }
 }
 then prefix-action psa-1Mbps-per-source-25-32-128;
 }
 }
 }
}
interfaces {
 so-0/0/2 {
 unit 0 {
 family inet {
 filter {
 input limit-source-one-24;
 }
 address 10.39.1.1/16;
 }
 }
 }
}
```

```
 }
}
```

### Scenario 3: SubnetThe 128th counter and policer Prefix Is Shorter Than the Prefix in the Firewall Filter Match Condition

The complete example, Example: Configuring Prefix-Specific Counting and Policing, shows the simplest case of prefix-specific actions, in which the single-term firewall filter matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which the prefix-specific action defines a subnet prefix length that is shorter than the prefix of the source address matched by the firewall filter. In this case, the filter term matches on the /25 subnet of the source address 10.10.10.0.

**NOTE:** The firewall filter passes the prefix-specific action only packets with source addresses that range from 10.10.10.0 through 10.10.10.127, while the prefix-specific action specifies a set of 256 counters and policers, numbered from 0 through 255.

The matched packets that are passed to the prefix-specific action index into the lower half of the counter and policer set only:

- The first counter and policer in the set are indexed by packets with source address 10.10.10.0.
- The second counter and policer in the set are indexed by packets with source address 10.10.10.1 and 10.10.10.129.
- The 128th counter and policer in the set are indexed by packets with source address 10.10.10.127.
- The upper half of the set (instances numbered from 128 through 255) are not indexed by packets passed to the prefix-specific action from this particular firewall filter.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```
[edit]
firewall {
 policer 1Mbps-policer {
 if-exceeding {
 bandwidth-limit 1m;
 burst-size-limit 63k;
 }
 then discard;
 }
}
```

```

}
family inet {
 prefix-action psa-1Mbps-per-source-24-32-256 {
 policer 1Mbps-policer;
 subnet-prefix-length 24;
 source-prefix-length 32;
 }
 filter limit-source-one-25 {
 term one {
 from {
 source-address {
 10.10.10.0/25;
 }
 }
 then prefix-action psa-1Mbps-per-source-24-32-256;
 }
 }
}
}
}
interfaces {
 so-0/0/2 {
 unit 0 {
 family inet {
 filter {
 input limit-source-one-25;
 }
 address 10.39.1.1/16;
 }
 }
 }
}
}

```

## Policer Overhead to Account for Rate Shaping in the Traffic Manager

### IN THIS SECTION

- [Policer Overhead to Account for Rate Shaping Overview | 2065](#)
- [Example: Configuring Policer Overhead to Account for Rate Shaping | 2066](#)

### Policer Overhead to Account for Rate Shaping Overview

If you configure ingress or egress traffic-shaping overhead values for an interface, the traffic manager cannot apply these values to any rate-limiting also applied to the interface. To enable the router to account for the additional Ethernet frame length when policing actions are being determined, you must configure the ingress or egress overhead values for policers separately.

**NOTE:** When a policer overhead value is changed, the PIC or DPC goes offline and then comes back online.

For Gigabit Ethernet Intelligent Queuing 2 (IQ2) and Enhanced IQ2 (IQ2E) PICs or interfaces on Dense Port Concentrators (DPCs) in MX Series routers, you can control the rate of traffic that passes through all interfaces on the PIC or DPC by configuring a *policer overhead*. You can configure a policer ingress overhead and a policer egress overhead, each with values from 0 through 255 bytes. The policer overhead values are added to the length of the final Ethernet frame when determining ingress and egress policer actions.

## Example: Configuring Policer Overhead to Account for Rate Shaping

### IN THIS SECTION

- [Requirements | 2066](#)
- [Overview | 2066](#)
- [Configuration | 2067](#)
- [Verification | 2075](#)

This example shows how to configure overhead values for policers when rate-shaping overhead is configured.

### Requirements

Before you begin, make sure that interface for which you are applying ingress or egress policer overhead is hosted on one of the following:

- Gigabit Ethernet IQ2 PIC
- IQ2E PIC
- DPCs in MX Series routers

### Overview

### IN THIS SECTION

- [Topology | 2067](#)

This example shows how to configure policer overhead values for all physical interfaces on a supported PIC or MPC so that the rate shaping value configured on a logical interface is accounted for in any policing on that logical interface.

## Topology

The router hosts a Gigabit Ethernet IQ2 PIC, installed in PIC location 3 of the Flexible PIC Concentrator (FPC) in slot number 1. The physical interface on port 1 on that PIC is configured to receive traffic on logical interface 0 and send it back out on logical interface 1. Class-of-service scheduling includes 100 Mbps of traffic rate-shaping overhead for the output traffic. A policer egress overhead of 100 bytes is configured on the entire PIC so that, for any policers applied to the output traffic, 100 bytes are added to the final Ethernet frame length when determining ingress and egress policer actions.

**NOTE:** Traffic rate-shaping and corresponding policer overhead are configured separately:

- You configure rate shaping at the [edit class-of-service interfaces *interface-name* unit *unit-number*] hierarchy level.
- You configure policer overhead at the [edit chassis fpc *slot-number* pic *pic-number*] hierarchy level.

When a policer overhead value is changed, the PIC or DPC goes offline and then comes back online.

## Configuration

```

### Configuring the Logical Interfaces

#### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Enable multiple queues for each logical interface (so that you can associate an output scheduler with each logical interface).

```
[edit interfaces ge-1/3/1]
user@host# set per-unit scheduler
user@host# set vlan-tagging
```

**NOTE:** For Gigabit Ethernet IQ2 PICs only, use the `shared-scheduler` statement to enable shared schedulers and shapers on a physical interface.

3. Configure logical interface `ge-1/3/1.0`.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface `ge-1/3/1.1`.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac 00:00:11:22:33:44
```

## Results

Confirm the configuration of the interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 per-unit-scheduler;
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 10.10.10.1/30;
```

```

 }
 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}

```

### *Configuring Traffic Rate-Shaping on the Logical Interface That Carries Output Traffic*

#### Step-by-Step Procedure

To configure traffic rate-shaping on the logical interface that carries output traffic:

1. Enable configuration of class-of-service features.

```

[edit]
user@host# edit class-of-service

```

2. Configure packet scheduling on logical interface ge-1/3/1.0.

- Configure schedulers that specify the percentage of transmission capacity.

```

[edit class-of-service]
user@host# edit schedulers

[edit class-of-service schedulers]
user@host# set be transmit-rate percent 5
user@host# set ef transmit-rate percent 30
user@host# set af transmit-rate percent 30
user@host# set nc transmit-rate percent 35

```

A percentage of zero drops all packets in the queue. When the `rate-limit` option is specified, the transmission rate is limited to the rate-controlled amount. In contrast with the `exact` option, a scheduler with the `rate-limit` option shares unused bandwidth above the rate-controlled amount.

- Configure a scheduler map to associate each scheduler with a forwarding class.

```
[edit class-of-service]
user@host# edit scheduler-maps my-map

[edit class-of-service scheduler-maps my-map]
user@host# set forwarding-class best-effort scheduler be
user@host# set forwarding-class expedited-forwarding scheduler ef
user@host# set forwarding-class network-control scheduler nc
user@host# set forwarding-class assured-forwarding scheduler af
```

- Associate the scheduler map with logical interface ge-1/3/1.0.

```
[edit class-of-service]
user@host# edit interfaces ge-1/3/1 unit 1

[edit class-of-service interfaces ge-1/3/1 unit 1]
user@host# set scheduler-map my-map
```

### 3. Configure 100 Mbps of traffic rate-shaping overhead on logical interface ge-1/3/1.1.

```
[edit class-of-service interfaces ge-1/3/1 unit 1]
user@host# set shaping-rate 100
```

Alternatively, you can configure a shaping rate for a logical interface and oversubscribe the physical interface by including the `shaping-rate` statement at the `[edit class-of-service traffic-control-profiles]` hierarchy level. With this configuration approach, you can independently control the delay-buffer rate.

## Results

Confirm the configuration of the class-of-service features (including the 100 Mbp of shaping of the egress traffic) by entering the `show class-of-service` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
```

```

ge-1/3/1 {
 unit 1 {
 scheduler-map my-map;
 shaping-rate 100m;
 }
}
scheduler-maps {
 my-map {
 forwarding-class best-effort scheduler be;
 forwarding-class expedited-forwarding scheduler ef;
 forwarding-class network-control scheduler nc;
 forwarding-class assured-forwarding scheduler af;
 }
}
schedulers {
 be {
 transmit-rate percent 5;
 }
 ef {
 transmit-rate percent 30;
 }
 af {
 transmit-rate percent 30;
 }
 nc {
 transmit-rate percent 35;
 }
}

```

### *Configuring Policer Overhead on the PIC or DPC That Hosts the Rate-Shaped Logical Interface*

#### **Step-by-Step Procedure**

To configure policer overhead on the PIC or MPC that hosts the rate-shaped logical interface:

1. Enable configuration of the supported PIC or MPC.

```

[edit]
user@host# set chassis fpc 1 pic 3

```

2. Configure 100 bytes of policer overhead on the supported PIC or MPC.

```
[edit chassis fpc 1 pic 3]
user@host# set ingress-policer-overhead 100
user@host# set egress-policer-overhead 100
```

**NOTE:** These values are added to the length of the final Ethernet frame when determining ingress and egress policer actions for all physical interfaces on the PIC or MPC.

You can specify policer overhead with values from 0 through 255 bytes.

## Results

Confirm the configuration of the policer overhead on the physical interface to account for rate-shaping by entering the `show chassis configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show chassis
chassis {
 fpc 1 {
 pic 3 {
 egress-policer-overhead 100;
 ingress-policer-overhead 100;
 }
 }
}
```

### *Applying a Policer to the Logical Interface That Carries Input Traffic*

## Step-by-Step Procedure

To apply a policer to the logical interface that carries input traffic:

1. Configure the logical interface (aggregate) policer.

```
[edit]
user@host# edit firewall policer 500Kbps
```

```
[edit firewall policer 500Kbps]
user@host# set logical-interface-policer
user@host# set if-exceeding bandwidth-limit 500k
user@host# set if-exceeding burst-size-limit 625k
user@host# set then discard
```

2. Apply the policer to Layer 3 input on the IPv4 logical interface.

```
[edit]
user@host# set interfaces ge-1/3/1 unit 0 family inet policer input 500Kbps
```

**NOTE:** The 100 Mbps policer overhead is added to the length of the final Ethernet frame when determining ingress and egress policer actions,

## Results

Confirm the configuration of the policer with rate-shaping overhead by entering the `show firewall` and `show interfaces` configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 500Kbps {
 logical-interface-policer;
 if-exceeding {
 bandwidth-limit 500k;
 burst-size-limit 625k;
 }
 then discard;
}
```

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 per-unit-scheduler;
 vlan-tagging;
 unit 0 {
```

```
vlan-id 100;
layer2-policer {
 input-policer 500Kbps;
}
family inet {
 address 10.10.10.1/30;
}
}
unit 0 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
}
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 2075](#)
- [Displaying Statistics for the Policer | 2076](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

#### Purpose

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

## Action

Use the `show interfaces operational mode` command for logical interface `ge-1/3/1.0`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer `500Kbps` as an input or output policer as follows:

- **Input:** `500Kbps-ge-1/3/1.0-log_int-i`
- **Output:** `500Kbps-ge-1/3/1.0-log_int-o`

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to Input traffic only.

### *Displaying Statistics for the Policer*

## Purpose

Verify the number of packets evaluated by the policer.

## Action

Use the `show policer operational mode` command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer `500Kbps`, the input and output policer names are displayed as follows:

- `500Kbps-ge-1/3/1.0-log_int-i`
- `500Kbps-ge-1/3/1.0-log_int-o`

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## Three-Color Policer Configuration Overview

Table 117 on page 2077 describes the hierarchy levels at which you can configure and apply single-rate tricolor-marking (single-rate TCM) policers and two-rate tricolor-marking (two-rate TCM) policers to Layer 3 traffic. For information about applying three-color policers to Layer 2 traffic, see Three-Color Policing at Layer 2 Overview.

#### Single-Rate Three-Color Physical Interface Policer

Defines traffic rate limiting that applies to all logical interfaces and protocol families configured on a physical interface, even if the interfaces belong to different routing instances. Can be applied as a firewall filter policer only.

Table 117: Three-Color Policer Configuration and Application Overview (*Continued*)

| Policer Configuration                                                                                                                                                                                                                                                                                                                                                                   | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Basic Two-Rate Three-Color Policer**

Defines traffic rate limiting that you can apply to Layer 3 protocol-specific traffic at a logical interface. Can be applied as a firewall filter policer only.

Provides moderate allowances for sustained periods of traffic that exceed the committed bandwidth limit or burst size.

**Table 117: Three-Color Policer Configuration and Application Overview (Continued)**

| Policer Configuration                                                                                                                                                                                                                                                                                                                                                                       | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Overview of Applying Policers

Policies allow you to perform simple traffic policing on specific interfaces or Layer 2 virtual private networks (VPNs) without configuring a firewall filter. To apply policies, include the `policer` statement:

```
policer {
 arp policer-template-name;
 input policer-template-name;
 output policer-template-name;
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

In the family statement, the protocol family can be `ccc`, `inet`, `inet6`, `mpls`, `tcc`, or `vpls`.

In the `arp` statement, list the name of one policer template to be evaluated when Address Resolution Protocol (ARP) packets are received on the interface. By default, an ARP policer is installed that is shared

among all the Ethernet interfaces on which you have configured the `family inet` statement. If you want more stringent or lenient policing of ARP packets, you can configure an interface-specific policer and apply it to the interface. You configure an ARP policer just as you would configure any other policer, at the `[edit firewall policer]` hierarchy level. If you apply this policer to an interface, the default ARP packet policer is overridden. If you delete this policer, the default policer takes effect again.

- You can configure a different policer on each protocol family on an interface, with one input policer and one output policer for each family. When you apply policers, you can configure the family `ccc`, `inet`, `inet6`, `mpls`, `tcc`, or `vpls` only, and one ARP policer for the family `inet` protocol only. Each time a policer is referenced, a separate copy of the policer is installed on the packet forwarding components for that interface.
- If you apply both policers and firewall filters to an interface, input policers are evaluated before input firewall filters, and output policers are evaluated after output firewall filters. In the `input` statement, list the name of one policer template to be evaluated when packets are received on the interface. In the `output` statement, list the name of one policer template to be evaluated when packets are transmitted on the interface.
- For subscribers terminating on MX Series routers over an Aggregated Ethernet (AE) interface that spans multiple FPCs, it is possible for an overall subscriber rate to exceed the configured rate because the limit configured in the policer is applied separately to each interface in the AE bundle. Thus, for example, if you intend to have a policer on a three-member AE interface enforce a bandwidth-limit of *600m*, you would need to configure the `bandwidth-limit` in the policer for *200m* to account for the three interfaces in the AE (that is, 200 Mbps per interface, for a combined total of 600Mbps).
- If you apply the policer to the interface `lo0`, it is applied to packets received or transmitted by the Routing Engine.
- On T Series, M120, and M320 platforms, if the interfaces are on the same FPC, the filters or policers do not act on the sum of traffic entering and exiting the interfaces.

## Applying Aggregate Policers

### IN THIS SECTION

- [Applying Aggregate Policers | 2082](#)

## Applying Aggregate Policers

By default, if you apply a policer to multiple protocol families on the same logical interface, the policer restricts traffic for each protocol family individually. For example, a policer with a 50 Mbps bandwidth

limit applied to both IPv4 and IPv6 traffic would allow the interface to accept 50 Mbps of IPv4 traffic and 50 Mbps of IPv6 traffic. If you apply an aggregate policer, the policer would allow the interface to receive only 50 Mbps of IPv4 and IPv6 traffic combined.

To configure an aggregate policer, include the `logical-interface-policer` statement at the `[edit firewall policer policer-template-name]` hierarchy level:

```
[edit firewall policer policer-template-name]
logical-interface-policer;
```

For the policer to be treated as an aggregate, you must apply it to multiple protocol families on a single logical interface by including the `policer` statement:

```
policer {
 arp policer-template-name;
 input policer-template-name;
 output policer-template-name;
}
```

You can include these statements at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

In the family statement, the protocol family can be `ccc`, `inet`, `inet6`, `mpls`, `tcc`, or `vpls`.

The protocol families on which you do not apply the policer are not affected by the policer. For example, if you configure a single logical interface to accept MPLS, IPv4, and IPv6 traffic and you apply the logical interface policer `policer1` to only the IPv4 and IPv6 protocol families, MPLS traffic is not subject to the constraints of `policer1`.

If you apply `policer1` to a different logical interface, there are two instances of the policer. This means the Junos OS polices traffic on separate logical interfaces separately, not as an aggregate, even if the same logical-interface policer is applied to multiple logical interfaces on the same physical interface port.

### Example: Applying Aggregate Policers

Configure two logical interface policers: `aggregate_police1` and `aggregate_police2`. Apply `aggregate_police1` to IPv4 and IPv6 traffic received on logical interface `fe-0/0/0.0`. Apply `aggregate_police2` to CCC and MPLS traffic received on logical interface `fe-0/0/0.0`. This configuration causes the software to create only one instance of `aggregate_police1` and one instance of `aggregate_police2`.

Apply `aggregate_police1` to IPv4 and IPv6 traffic received on another logical interface `fe-0/0/0.1`. This configuration causes the software to create a new instance of `aggregate_police1`, one that applies to unit 0 and another that applies to unit 1.

```
[edit firewall]
policer aggregate_police1 {
 logical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then {
 discard;
 }
}
policer aggregate_police2 {
 logical-interface-policer;
 if-exceeding {
 bandwidth-limit 10m;
 burst-size-limit 200k;
 }
 then {
 discard;
 }
}
[edit interfaces fe-0/0/0]
unit 0 {
 family inet {
 policer {
 input aggregate_police1;
 }
 }
 family inet6 {
 policer {
 input aggregate_police1;
 }
 }
 family ccc {
 policer {
 input aggregate_police2;
 }
 }
}
```

```

family mpls {
 policer {
 input aggregate_police2;
 }
}
unit 1 {
 family inet {
 policer {
 input aggregate_police1;
 }
 }
 family inet6 {
 policer {
 input aggregate_police1;
 }
 }
}

```

## Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

### IN THIS SECTION

- [Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs | 2085](#)

## Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

M40e, M120, and M320 edge routers and T Series core routers with Enhanced Intelligent Queuing (IQE) PICs support hierarchical policers in the ingress direction and allow you to apply a hierarchical policer for the premium and aggregate (premium plus normal) traffic levels to an interface. Hierarchical policers provide cross-functionality between the configured physical interface and the Packet Forwarding Engine.

Before you begin, there are some general restrictions that apply to hierarchical policers:

- Only one type of policer can be configured for a logical or physical interface. For example, a hierarchical policer and a regular policer in the same direction for the same logical interface is not allowed.

- The chaining of the policers—that is, applying policers to both a port and the logical interfaces of that port—is not allowed.
- There is a limit of 64 policers per interface in case there is no BA classification, providing a single policer per DLCI.
- Only one kind of policer can be applied on a physical or logical interface.
- The policer should be independent of BA classification. Without BA classification, all traffic on an interface will be treated either as EF or non-EF, based on the configuration. With BA classification, an interface can support up to 64 policers. Again, the interface here may be a physical interface or logical interface (for example, DLCI).
- With BA classification, the miscellaneous traffic (the traffic *not* matching with any of the BA classification DSCP/EXP bits) will be policed as non-EF traffic. No separate policers will be installed for this traffic.

## Hierarchical Policer Overview

Hierarchical policing uses two token buckets, one for aggregate (non-EF) traffic and one for premium (EF) traffic. Which traffic is EF and which is non-EF is determined by the class-of-service configuration. Logically, hierarchical policing is achieved by chaining two policers.

**Figure 87: Hierarchical Policer**

In the example in [Figure 87 on page 2086](#), EF traffic is policed by Premium Policer and non EF traffic is policed by Aggregate Policer. What that means is, for EF traffic the out-of-spec action will be the one that is configured for Premium Policer, but the in-spec EF traffic will still consume the tokens from the Aggregate Policer.

But EF traffic will never be submitted to the out-of-spec action of the Aggregate Policer. Also, if the out-of-spec action of the Premium Policer is not set to Discard, those out-of-spec packets will not consume the tokens from the Aggregate Policer. Aggregate Policer only polices the non-EF traffic. As you can see, the Aggregate Policer token bucket can go negative, if all the tokens are consumed by the non-EF traffic and then you get bursts of EF traffic. But that will be for a very short time, and over a period of time it will average out. For example:

- *Premium Policer*: Bandwidth 2 Mbps, OOS Action: Discard
- *Aggregate Policer*: Bandwidth 10 Mbps, OOS Action: Discard

In the above case, EF traffic is guaranteed 2 Mbps and the non-EF traffic will get from 8 Mbps to 10 Mbps, depending on the input rate of the EF traffic.

## Hierarchical Policing Characteristics

Hierarchical token bucket features include:

- Ingress traffic is first classified into EF and non-EF traffic prior to applying a policer:
  - Classification is performed by Q-tree lookup
- Channel number selects a shared token bucket policer:
  - Dual token bucket policer is divided into two single bucket policers:
    - Policer1—EF traffic
    - Policer2—non-EF traffic
- Shared token bucket is used to police the traffic as follows:
  - Policer1 is set to EF rate (for example, 2 Mbps)
  - Policer2 is set to aggregate interface policed rate (for example, 10 Mbps).
  - EF traffic gets applied to Policer1.
    - If traffic is in-spec it is allowed to pass and decrement from both Policer1 and Policer2.
    - If traffic is out-of-spec it can be discarded or marked with a new FC or loss priority. Policer2 will not do anything with out-of-spec EF traffic.
  - Non-EF traffic gets applied only to Policer2.
    - If traffic is in-spec it is allowed to pass through and decremented Policer2.
    - If traffic is out-of-spec it is discarded or marked with a new FC or set with a new drop priority.
- Rate-limit the port speed to a desired rate at Layer 2
- Rate-limit the EF traffic
- Rate-limit the non-EF traffic
- Policing drops counted per color

**Configuring Hierarchical Policers**

To configure a hierarchical policer, apply the `policing-priority` statement to the proper forwarding class and configure a hierarchical policer for the aggregate and premium level. For more information about class of service, see the [Junos OS Class of Service User Guide for Routing Devices](#).

**NOTE:** Hierarchical policers can only be configured on SONET physical interfaces hosted on an IQE PIC. Only aggregate and premium levels are supported.

**CoS Configuration of Forwarding Classes for Hierarchical Policers**

```
[edit class-of-service forwarding-classes]
class fc1 queue-num 0 priority high policing-priority premium;
class fc2 queue-num 1 priority low policing-priority normal;
class fc3 queue-num 2 priority low policing-priority normal;
class fc4 queue-num 3 priority low policing-priority normal;
```

For detailed information on class-of-service configuration and statements, see the [Junos OS Class of Service User Guide for Routing Devices](#).

**Firewall Configuration for Hierarchical Policers**

```
[edit firewall hierarchical-policer foo]
aggregate {
 if-exceeding {
 bandwidth-limit 70m;
 burst-size-limit 1500;
 }
 then {
 discard;
 }
}
premium {
 if-exceeding {
 bandwidth-limit 50m;
 burst-size-limit 1500;
 }
 then {
```

```

 discard;
 }
}

```

You can apply the hierarchical policer as follows:

```

[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-hierarchical-policer foo;

```

You also have the option to apply the policer at the physical port level as follows:

```

[edit interfaces so-0/1/0 layer2-policer]
input-hierarchical-policer foo;

```

## Configuring a Single-Rate Two-Color Policer

You can configure a single-rate two-color policer as follows:

```

[edit firewall policer foo]
 if-exceeding {
 bandwidth-limit 50m;
 burst-size-limit 1500;
 }
 then {
 discard;
 }
}

```

You can apply the policer as follows:

```

[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-policer foo;

```

You also have the option to apply the policer at the physical port level as follows:

```

[edit interfaces so-0/1/0 layer2-policer]
input-policer foo;

```

## Configuring a Single-Rate Color-Blind Policer

This section describes single-rate color blind and color aware policers.

You can configure a single-rate color blind policer as follows:

```
[edit firewall three-color-policer foo]
single-rate {
 color-blind;
 committed-information-rate 50m;
 committed-burst-size 1500;
 excess-burst-size 1500;
}
```

You can apply the single-rate color blind policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You can configure a single-rate color-aware policer as follows:

```
[edit firewall three-color-policer bar]
single-rate {
 color-aware;
 committed-information-rate 50m;
 committed-burst-size 1500;
 excess-burst-size 1500;
}
```

You can apply the single-rate color-aware policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color bar;
```

## Configuring a Two-Rate Tricolor Marker Policer

Ingress policing is implemented using a two-rate tricolor marker (trTCM). This is done with a dual token bucket (DTB) that maintains two rates, committed, and a peak. Egress static policing also uses a token bucket.

The token buckets perform the following ingress policing functions:

- (1K) trTCM - Dual token bucket (red, yellow, and green marking)
- Policing is based on Layer 2 packet size:
  - After +/- byte adjust offset
- Marking is color aware and color blind:
  - Color aware needs to have the color set by q-tree lookup based on:
    - ToS
    - EXP
- Programmable marking actions:
  - Color (red, yellow, green)
  - Drop based on color and congestion profile
- Policer is selected based on the arriving channel number:
  - Channel number LUT produces policer index and queue index
  - Multiple channels can share the same policer (LUT produces same policer index)
- Support ingress policing and trTCM at the following levels:
  - Queue
  - Logical interface (ifl/DLCI)
  - Physical interface (ifd)
  - Physical port (controller ifd)
  - Any combinations of logical interface, physical interface, and port
- Support percentage of interface speed and bits per second

Rate limits may be applied to selected queues on ingress and on predefined queues at egress. The token bucket operates in color aware and color blind modes (specified by RFC 2698).

## Configuring a Color-Blind trTCM

```
[edit firewall three-color-policer foo]
two-rate {
 color-blind;
 committed-information-rate 50m;
 committed-burst-size 1500;
 peak-information-rate 100m;
 peak-burst-size 3k;
}
```

You can apply the three-color two-rate color-blind policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color foo;
```

## Configuring a Color-Aware trTCM

```
[edit firewall three-color-policer bar]
two-rate {
 color-aware;
 committed-information-rate 50m;
 committed-burst-size 1500;
 peak-information-rate 100m;
 peak-burst-size 3k;
}
```

You can apply the three-color two-rate color-aware policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color bar;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color bar;
```

## Three-Color Policer Configuration Guidelines

### IN THIS SECTION

- [Platforms Supported for Three-Color Policers | 2093](#)
- [Color Modes for Three-Color Policers | 2094](#)
- [Naming Conventions for Three-Color Policers | 2095](#)

## Platforms Supported for Three-Color Policers

Three-color policers are supported on the following Juniper Networks routers:

- M120 Multiservice Edge Routers
- M320 Multiservice Edge Routers and T Series Core Routers with Enhanced II Flexible PIC Concentrators (FPCs)
- MX Series 5G Universal Routing Platforms
- T640 Core Routers with Enhanced Scaling FPC4
- T4000 Core Routers with FPC5

On MX Series and M120 routers, you can apply three-color policers to aggregated interfaces.

The discard action for a tricolor marking policer for a *firewall filter* is supported on the M120 routers, M320 routers with Enhanced-III FPCs, M7i and M10i routers with the Enhanced CFEB (CFEB-E), and

MX Series routers with Trio MPCs, so it is not necessary to include the `logical-interface-policer` statement for them.

[Color Modes for Three-Color Policers](#)

[Naming Conventions for Three-Color Policers](#)

## Color Modes for Three-Color Policers

### IN THIS SECTION

● [Color-Blind Mode | 2094](#)

● [Color-Aware Mode | 2094](#)

Three-color policers—both single-rate and two-rate three-color policer schemes—can operate in either of two modes:

### Color-Blind Mode

In *color-blind* mode, the three-color policer assumes that all packets examined have not been previously marked or metered. If you configure a three-color policer to be color-blind instead of color-aware, the policer ignores preexisting color markings that might have been set for a packet by another traffic policer configured at a previous network node.

### Color-Aware Mode

In *color-aware* mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node. At the node where color-aware policing is configured, any preexisting color markings are used in determining the appropriate policing action for the packet.

In color-aware mode, the three-color policer can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

For two-rate, three-color policing, the Junos OS uses two token buckets to manage bandwidth based on the two rates of traffic. For example, two-rate policing might be configured on a node upstream in the network. The two-rate policer has marked a packet as yellow (loss priority medium-low). The color-aware policer takes this yellow marking into account when determining the appropriate policing action. In color-aware policing, the yellow packet would never receive the action associated with either the green packets or red packets. This way, tokens for violating packets are never taken from the metering token buckets at the color-aware policing node.

**NOTE:** For a three-color policer operating in color-aware mode and when the PLP of the input packet is medium-low, the color of the input packet to the policer is mapped to the color yellow. In such a scenario, if the color of the input packet remains unchanged, the policer operates in the following way:

- On a T1600 Enhanced Scaling Type 4 FPC (T1600-FPC4-ES), the PLP of the output packet remains medium-low.
- On a T4000 Type 5 FPC (T4000-FPC5-3D), the PLP of the output packet is marked as medium-high.

Because of this difference, for any applications (such as rewrite and WRED selection on egress interface) that use PLP, the packets are treated differently for the same flow depending on the FPC type (T1600 Enhanced Scaling FPC4 (T1600-FPC4-ES) or T4000 FPC5 (T4000-FPC5-3D)) on which the policer is applied.

Platforms Supported for Three-Color Policers

Naming Conventions for Three-Color Policers

## Naming Conventions for Three-Color Policers

Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly.

We recommend that you name your policer using a convention that identifies the basic components of the policer:

- Three-color policer type—Where srTCM identifies a *single-rate* three-color policer and trTCM identifies a *two-rate* three-color policer.

- Three-color policer color mode—Where *ca* identifies a *color-aware* three-color policer and *cb* identifies a *color-blind three-color policer*.

**NOTE:**  
TCM stands for tricolor marking.

Table 118 on page 2096 describes a recommended naming convention for policers.

**Table 118: Recommended Naming Convention for Policers**

| Three-Color Policer Type             | Naming Convention     | Example Names                                 |

## Basic Single-Rate Three-Color Policers

### IN THIS SECTION

- [Single-Rate Three-Color Policer Overview | 2097](#)
- [Example: Configuring a Single-Rate Three-Color Policer | 2098](#)

### Single-Rate Three-Color Policer Overview

A single-rate three-color policer defines a bandwidth limit and a maximum burst size for guaranteed traffic and a second burst size for peak traffic. A single-rate three-color policer is most useful when a service is structured according to packet length and not peak arrival rate.

Single-rate three-color policing meters a traffic stream based on the following configured traffic criteria:

- Committed information rate (CIR)—Bandwidth limit for guaranteed traffic.
- Committed burst size (CBS)—Maximum packet size permitted for bursts of data that exceed the CIR.
- Excess burst size (EBS)—Maximum packet size permitted for peak traffic.

Single-rate tricolor marking (single-rate TCM) classifies traffic as belonging to one of three color categories and performs congestion-control actions on the packets based on the color marking:

- Green—Traffic that conforms to *either* the bandwidth limit *or* the burst size for guaranteed traffic (CIR or CBS). For a green traffic flow, single-rate marks the packets with an implicit loss priority of `low` and transmits the packets.
- Yellow—Traffic that exceeds *both* the bandwidth limit *and* the burst size for guaranteed traffic (CIR and CBS) but not the burst size for peak traffic (EBS). For a yellow traffic flow, single-rate marks the packets with an implicit loss priority of `medium-high` and transmits the packets.
- Red—Traffic that exceeds the burst size for peak traffic (EBS), single-rate marks packets with an implicit loss priority of `high` and, optionally, discards the packets.

If congestion occurs downstream, the packets with higher loss priority are more likely to be discarded.

**NOTE:** For both single-rate and two-rate three-color policers, the only *configurable* action is to discard packets in a red traffic flow.

The discard action for a tricolor marking policer for a *firewall filter* is supported on the M120 routers, M320 routers with Enhanced-III FPCs, M7i and M10i routers with the Enhanced CFEB (CFEB-E), and MX Series routers with MPCs, so it is not necessary to include the `logical-interface-policer` statement for them.

[Three-Color Policer Configuration Overview | 2077](#)

Example: Configuring a Single-Rate Three-Color Policer

## Example: Configuring a Single-Rate Three-Color Policer

### IN THIS SECTION

- [Requirements | 2098](#)
- [Overview | 2098](#)
- [Configuration | 2099](#)
- [Verification | 2105](#)

This example shows how to configure a single-rate three-color policer.

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

### IN THIS SECTION

- [Topology | 2099](#)

A single-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second burst-size limit for excess traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the burst size for excess traffic is categorized as yellow.
- Nonconforming traffic that exceeds the burst size for excess traffic is categorized as red.

Each category is associated with an action. For green traffic, packets are implicitly set with a loss-priority value of `low` and then transmitted. For yellow traffic, packets are implicitly set with a loss-priority value of `medium-high` and then transmitted. For red traffic, packets are implicitly set with a loss-priority value of `high` and then transmitted. If the policer configuration includes the optional `action` statement (action `loss-priority high then discard`), then packets in a red flow are discarded instead.

You can apply a three-color policer to Layer 3 traffic as a firewall filter policer only. You reference the policer from a stateless firewall filter term, and then you apply the filter to the input or output of a logical interface at the protocol level.

### *Topology*

In this example, you apply a color-aware, single-rate three-color policer to the input IPv4 traffic at logical interface `ge-2/0/5.0`. The IPv4 firewall filter term that references the policer does not apply any packet-filtering. The filter is used only to apply the three-color policer to the interface.

You configure the policer to rate-limit traffic to a bandwidth limit of 40 Mbps and a burst-size limit of 100 KB for green traffic but also allow an excess burst-size limit of 200 KB for yellow traffic. Only nonconforming traffic that exceeds the peak burst-size limit is categorized as red. In this example, you configure the three-color policer action `loss-priority high then discard`, which overrides the implicit marking of red traffic to a high loss priority.

### Configuration

#### IN THIS SECTION

- [CLI Quick Configuration | 2100](#)
- [Configuring a Single-Rate Three-Color Policer | 2100](#)
- [Configuring an IPv4 Stateless Firewall Filter That References the Policer | 2102](#)
- [Applying the Filter to the Logical Interface | 2103](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set firewall three-color-policer srTCM1-ca single-rate color-aware
set firewall three-color-policer srTCM1-ca single-rate committed-information-rate 40m
set firewall three-color-policer srTCM1-ca single-rate committed-burst-size 100k
set firewall three-color-policer srTCM1-ca single-rate excess-burst-size 200k
set firewall three-color-policer srTCM1-ca action loss-priority high then discard
set firewall family inet filter filter-srtcm1ca-all term 1 then three-color-policer single-rate srTCM1-ca
set class-of-service interfaces ge-2/0/5 unit 0 forwarding-class af
set interfaces ge-2/0/5 unit 0 family inet address 10.20.130.1/24
set interfaces ge-2/0/5 unit 0 family inet filter input filter-srtcm1ca-all
```

### *Configuring a Single-Rate Three-Color Policer*

#### **Step-by-Step Procedure**

To configure a single-rate three-color policer:

1. Enable configuration of a three-color policer.

```
[edit]
user@host# edit firewall three-color-policer srTCM1-ca
```

2. Configure the color mode of the single-rate three-color policer.

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate color-aware
```

### 3. Configure the single-rate guaranteed traffic limits.

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate committed-information-rate 40m
user@host# set single-rate committed-burst-size 100k
```

### 4. Configure the single-rate burst-size limit that is used to classify nonconforming traffic.

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate excess-burst-size 200k
```

### 5. (Optional) Configure the action for nonconforming traffic.

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set action loss-priority high then discard
```

For three-color policers, the only configurable action is to discard packets in a red traffic flow. In this example, packets in a red traffic flow have been implicitly marked with a high packet loss priority (PLP) level because the traffic flow exceeded the rate-limiting defined by the single rate-limit (specified by the `committed-information-rate 40m` statement) and the larger burst-size limit (specified by the `excess-burst-size 200k` statement). Because the optional action statement is included, this example takes the more severe action of discarding packets in a red traffic flow.

## Results

Confirm the configuration of the hierarchical policer by entering the `show firewall` configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
three-color-policer srTCM1-ca {
 action {
 loss-priority high then discard;
 }
 single-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 excess-burst-size 200k;
```

```
}
}
```

### *Configuring an IPv4 Stateless Firewall Filter That References the Policier*

#### Step-by-Step Procedure

To configure a standard stateless firewall filter that references the policier:

1. Enable configuration of an IPv4 standard stateless firewall filter.

```
[edit]
user@host# edit firewall family inet filter filter-srtcm1ca-all
```

2. Specify the filter term that references the policier.

```
[edit firewall family inet filter filter-srtcm1ca-all]
user@host# set term 1 then three-color-policer single-rate srTCM1-ca
```

Note that the term does not specify any match conditions. The firewall filter passes all packets to the policier.

#### Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
 filter filter-srtcm1ca-all {
 term 1 {
 then {
 three-color-policer {
 single-rate srTCM1-ca;
 }
 }
 }
 }
}
```

```

}
three-color-policer srTCM1-ca {
 action {
 loss-priority high then discard;
 }
 single-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 excess-burst-size 200k;
 }
}
}

```

### *Applying the Filter to the Logical Interface*

#### Step-by-Step Procedure

To apply the filter to the logical interface:

1. (MX Series routers only) (Optional) Reclassify all incoming packets on the logical interface `ge-2/0/5.0` to assured forwarding, regardless of any preexisting classification.

```

[edit]
user@host# set class-of-service interfaces ge-2/0/5 unit 0 forwarding-class af

```

The classifier name can be a configured classifier or one of the default classifiers.

2. Enable configuration of the logical interface.

```

[edit]
user@host# edit interfaces ge-2/0/5 unit 0 family inet

```

3. Configure an IP address.

```

[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set address 10.20.130.1/24

```

#### 4. Reference the filter as an input filter.

```
[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set filter input filter-srtcm1ca-all
```

### Results

Confirm the configuration of the interface by entering the `show class-of-service` and `show interfaces` configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
 ge-2/0/5 {
 unit 0 {
 forwarding-class af;
 }
 }
}

[edit]
user@host# show interfaces
ge-2/0/5 {
 unit 0 {
 family inet {
 filter {
 input filter-srtcm1ca-all;
 }
 address 10.20.130.1/24;
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to the Logical Interface | 2105](#)

Confirm that the configuration is working properly.

### *Displaying the Firewall Filters Applied to the Logical Interface*

#### Purpose

Verify that the firewall filter is applied to IPv4 input traffic at the logical interface.

#### Action

Use the `show interfaces operational mode` command for the logical interface `ge-2/0/5.0`, and specify `detail` mode. The **Protocol inet** section of the command output displays IPv4 information for the logical interface. Within that section, the **Input Filters** field displays the name of the firewall filter applied to IPv4 input traffic at the logical interface.

```
user@host> show interfaces ge-2/0/5.0 detail

## RELATED DOCUMENTATION

[Three-Color Policar Configuration Overview | 2077](#)

[Three-Color Policar Configuration Guidelines | 2093](#)

## Basic Two-Rate Three-Color Policars

### IN THIS SECTION

- [Two-Rate Three-Color Policar Overview | 2106](#)
- [Example: Configuring a Two-Rate Three-Color Policar | 2108](#)

## Two-Rate Three-Color Policar Overview

A two-rate three-color policar defines two bandwidth limits (one for guaranteed traffic and one for peak traffic) and two burst sizes (one for each of the bandwidth limits). A two-rate three-color policar is most useful when a service is structured according to arrival rates and not necessarily packet length.

Two-rate three-color policing meters a traffic stream based on the following configured traffic criteria:

- Committed information rate (CIR)—Bandwidth limit for guaranteed traffic.
- Committed burst size (CBS)—Maximum packet size permitted for bursts of data that exceed the CIR.
- Peak information rate (PIR)—Bandwidth limit for peak traffic.
- Peak burst size (PBS)—Maximum packet size permitted for bursts of data that exceed the PIR.

Two-rate tricolor marking (two-rate TCM) classifies traffic as belonging to one of three color categories and performs congestion-control actions on the packets based on the color marking:

- Green—Traffic that conforms to the bandwidth limit and burst size for guaranteed traffic (CIR and CBS). For a green traffic flow, two-rate TCM marks the packets with an implicit loss priority of `low` and transmits the packets.
- Yellow—Traffic that exceeds the bandwidth limit or burst size for guaranteed traffic (CIR or CBS) but not the bandwidth limit and burst size for peak traffic (PIR and PBS). For a yellow traffic flow, two-rate TCM marks packets with an implicit loss priority of `medium-high` and transmits the packets.
- Red—Traffic that exceeds the bandwidth limit and burst size for peak traffic (PIR and PBS). For a red traffic flow, two-rate TCM marks packets with an implicit loss priority of `high` and, optionally, discards the packets.

If congestion occurs downstream, the packets with higher loss priority are more likely to be discarded.

**NOTE:** For both single-rate and two-rate three-color policers, the only *configurable* action is to discard packets in a red traffic flow.

For a tricolor marking policer referenced by a *firewall filter* term, the discard policing action is supported on the following routing platforms:

- EX Series switches
- M7i and M10i routers with the Enhanced CFEB (CFEB-E)
- M120 and M320 routers with Enhanced-III FPCs
- MX Series routers with Trio MPCs

To apply a tricolor marking policer on these routing platforms, it is not necessary to include the `logical-interface-policer` statement.

## Example: Configuring a Two-Rate Three-Color Policer

### IN THIS SECTION

- [Requirements | 2108](#)
- [Overview | 2108](#)
- [Configuration | 2109](#)
- [Verification | 2114](#)

This example shows how to configure a two-rate three-color policer.

### Requirements

Support for two-rate three-color policers varies according to the device. It includes SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800 Services Gateway devices running a compatible version of Junos OS.

No special configuration beyond device initialization is required before configuring this example.

### Overview

#### IN THIS SECTION

- [Topology | 2109](#)

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a bandwidth limit and burst-size limit for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed peak traffic limits is categorized as yellow.
- Nonconforming traffic that exceeds peak traffic limits is categorized as red.

Each category is associated with an action. For green traffic, packets are implicitly set with a loss-priority value of `low` and then transmitted. For yellow traffic, packets are implicitly set with a loss-priority value of `medium-high` and then transmitted. For red traffic, packets are implicitly set with a loss-priority value of `high`.

and then transmitted. If the policer configuration includes the optional `action` statement (action `loss-priority high then discard`), then packets in a red flow are discarded instead.

You can apply a three-color policer to Layer 3 traffic as a firewall filter policer only. You reference the policer from a stateless firewall filter term, and then you apply the filter to the input or output of a logical interface at the protocol level.

### *Topology*

In this example, you apply a color-aware, two-rate three-color policer to the input IPv4 traffic at logical interface `fe-0/1/1.0`. The IPv4 firewall filter term that references the policer does not apply any packet-filtering. The filter is used only to apply the three-color policer to the interface.

You configure the policer to rate-limit traffic to a bandwidth limit of 40 Mbps and a burst-size limit of 100 KB for green traffic, and you configure the policer to also allow a peak bandwidth limit of 60 Mbps and a peak burst-size limit of 200 KB for yellow traffic. Only nonconforming traffic that exceeds the peak traffic limits is categorized as red. In this example, you configure the three-color policer action `loss-priority high then discard`, which overrides the implicit marking of red traffic to a high loss priority.

### Configuration

#### IN THIS SECTION

- [CLI Quick Configuration | 2110](#)
- [Configuring a Two-Rate Three-Color Policer | 2110](#)
- [Configuring an IPv4 Stateless Firewall Filter That References the Policer | 2112](#)
- [Applying the Filter to a Logical Interface at the Protocol Family Level | 2113](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [Using the CLI Editor in Configuration Mode](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and then paste the commands into the CLI at the [edit] hierarchy level, and then enter `commit` from configuration mode.

```
set firewall three-color-policer trTCM1-ca two-rate color-aware
set firewall three-color-policer trTCM1-ca two-rate committed-information-rate 40m
set firewall three-color-policer trTCM1-ca two-rate committed-burst-size 100k
set firewall three-color-policer trTCM1-ca two-rate peak-information-rate 60m
set firewall three-color-policer trTCM1-ca two-rate peak-burst-size 200k
set firewall three-color-policer trTCM1-ca action loss-priority high then discard
set firewall family inet filter filter-trtcm1ca-all term 1 then three-color-policer two-rate
trTCM1-ca
set interfaces ge-2/0/5 unit 0 family inet address 10.10.10.1/30
set interfaces ge-2/0/5 unit 0 family inet filter input filter-trtcm1ca-all
set class-of-service interfaces ge-2/0/5 forwarding-class af
```

### *Configuring a Two-Rate Three-Color Policer*

#### **Step-by-Step Procedure**

To configure a two-rate three-color policer:

1. Enable configuration of a three-color policer.

```
[edit]
user@host# set firewall three-color-policer trTCM1-ca
```

2. Configure the color mode of the two-rate three-color policer.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate color-aware
```

### 3. Configure the two-rate guaranteed traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

Traffic that does not exceed both of these limits is categorized as green. Packets in a green flow are implicitly set to `low` loss priority and then transmitted.

### 4. Configure the two-rate peak traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

Nonconforming traffic that does not exceed both of these limits is categorized as yellow. Packets in a yellow flow are implicitly set to `medium-high` loss priority and then transmitted. Nonconforming traffic that exceeds both of these limits is categorized as red. Packets in a red flow are implicitly set to `high` loss priority.

### 5. (Optional) Configure the policer action for red traffic.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set action loss-priority high then discard
```

For three-color policers, the only configurable action is to discard red packets. Red packets are packets that have been assigned `high` loss priority because they exceeded the peak information rate (PIR) and the peak burst size (PBS).

## Results

Confirm the configuration of the policer by entering the `show firewall configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM1-ca {
 action {
 loss-priority high then discard;
```

```

 }
 two-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}

```

### *Configuring an IPv4 Stateless Firewall Filter That References the Policer*

#### Step-by-Step Procedure

To configure an IPv4 stateless firewall filter that references the policer:

1. Enable configuration of an IPv4 standard stateless firewall filter.

```

[edit]
user@host# set firewall family inet filter filter-trtcm1ca-all

```

2. Specify the filter term that references the policer.

```

[edit firewall family inet filter filter-trtcm1ca-all]
user@host# set term 1 then three-color-policer two-rate trTCM1-ca

```

Note that the term does not specify any match conditions. The firewall filter passes all packets to the policer.

#### Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show firewall
family inet {
 filter filter-trtcm1ca-all {
 term 1 {

```

```

 then {
 three-color-policer {
 two-rate trTCM1-ca;
 }
 }
 }
}
three-color-policer trTCM1-ca {
 action {
 loss-priority high then discard;
 }
 two-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}

```

### *Applying the Filter to a Logical Interface at the Protocol Family Level*

#### Step-by-Step Procedure

To apply the filter to the logical interface at the protocol family level:

1. Enable configuration of an IPv4 firewall filter.

```

[edit]
user@host# edit interfaces ge-2/0/5 unit 0 family inet

```

2. Apply the policer to the logical interface at the protocol family level.

```

[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set address 10.10.10.1/30
user@host# set filter input filter-trtcm1ca-all

```

3. (MX Series routers and EX Series switches only) (Optional) For input policers, you can configure a fixed classifier. A fixed classifier reclassifies all incoming packets, regardless of any preexisting classification.

**NOTE:** Platform support depends on the Junos OS release in your implementation.

```
[edit]
user@host# set class-of-service interfaces ge-2/0/5 forwarding-class af
```

The classifier name can be a configured classifier or one of the default classifiers.

## Results

Confirm the configuration of the interface by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-2/0/5 {
 unit 0 {
 family inet {
 address 10.10.10.1/30;
 filter {
 input filter-trtcm1ca-all;
 }
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to the Logical Interface | 2115](#)

Confirm that the configuration is working properly.

### *Displaying the Firewall Filters Applied to the Logical Interface*

#### **Purpose**

Verify that the firewall filter is applied to IPv4 input traffic at the logical interface.

#### **Action**

Use the `show interfaces operational mode` command for the logical interface `ge-2/0/5.0`, and specify `detail` mode. The **Protocol inet** section of the command output displays IPv4 information for the logical interface. Within that section, the **Input Filters** field displays the name of IPv4 firewall filters associated with the logical interface.

```
user@host> show interfaces ge-2/0/5.0 detail
Logical interface ge-2/0/5.0 (Index 105) (SNMP ifIndex 556) (Generation 170)
 Flags: Device-Down SNMP-Traps 0x4004000 Encapsulation: ENET2
 Traffic statistics:
 Input bytes : 0
 Output bytes : 0
 Input packets: 0
 Output packets: 0
 Local statistics:
 Input bytes : 0
 Output bytes : 0
 Input packets: 0
 Output packets: 0

## SEE ALSO

[Two-Rate Three-Color Policer Overview | 2106](#)

## RELATED DOCUMENTATION

[Three-Color Policer Configuration Overview | 2077](#)

[Three-Color Policer Configuration Guidelines | 2093](#)

## Example: Configuring a Two-Rate Three-Color Policer

### IN THIS SECTION

- [Requirements | 2116](#)
- [Overview | 2116](#)
- [Configuration | 2117](#)
- [Verification | 2122](#)

This example shows how to configure a two-rate three-color policer.

### Requirements

Support for two-rate three-color policers varies according to the device. It includes SRX1400, SRX3400, SRX3600, SRX5400, SRX5600, and SRX5800 Services Gateway devices running a compatible version of Junos OS.

No special configuration beyond device initialization is required before configuring this example.

### Overview

#### IN THIS SECTION

- [Topology | 2117](#)

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a bandwidth limit and burst-size limit for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed peak traffic limits is categorized as yellow.
- Nonconforming traffic that exceeds peak traffic limits is categorized as red.

Each category is associated with an action. For green traffic, packets are implicitly set with a loss-priority value of `low` and then transmitted. For yellow traffic, packets are implicitly set with a loss-priority value of `medium-high` and then transmitted. For red traffic, packets are implicitly set with a loss-priority value of `high` and then transmitted. If the policer configuration includes the optional `action` statement (action `loss-priority high then discard`), then packets in a red flow are discarded instead.

You can apply a three-color policer to Layer 3 traffic as a firewall filter policer only. You reference the policer from a stateless firewall filter term, and then you apply the filter to the input or output of a logical interface at the protocol level.

## Topology

In this example, you apply a color-aware, two-rate three-color policer to the input IPv4 traffic at logical interface `fe-0/1/1.0`. The IPv4 firewall filter term that references the policer does not apply any packet-filtering. The filter is used only to apply the three-color policer to the interface.

You configure the policer to rate-limit traffic to a bandwidth limit of 40 Mbps and a burst-size limit of 100 KB for green traffic, and you configure the policer to also allow a peak bandwidth limit of 60 Mbps and a peak burst-size limit of 200 KB for yellow traffic. Only nonconforming traffic that exceeds the peak traffic limits is categorized as red. In this example, you configure the three-color policer action `loss-priority high then discard`, which overrides the implicit marking of red traffic to a high loss priority.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2118](#)
- [Configuring a Two-Rate Three-Color Policer | 2118](#)
- [Configuring an IPv4 Stateless Firewall Filter That References the Policer | 2120](#)
- [Applying the Filter to a Logical Interface at the Protocol Family Level | 2121](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see [Using the CLI Editor in Configuration Mode](#).

To configure this example, perform the following tasks:

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and then paste the commands into the CLI at the [edit] hierarchy level, and then enter `commit` from configuration mode.

```
set firewall three-color-policer trTCM1-ca two-rate color-aware
set firewall three-color-policer trTCM1-ca two-rate committed-information-rate 40m
set firewall three-color-policer trTCM1-ca two-rate committed-burst-size 100k
set firewall three-color-policer trTCM1-ca two-rate peak-information-rate 60m
set firewall three-color-policer trTCM1-ca two-rate peak-burst-size 200k
set firewall three-color-policer trTCM1-ca action loss-priority high then discard
set firewall family inet filter filter-trtcm1ca-all term 1 then three-color-policer two-rate
trTCM1-ca
set interfaces ge-2/0/5 unit 0 family inet address 10.10.10.1/30
set interfaces ge-2/0/5 unit 0 family inet filter input filter-trtcm1ca-all
set class-of-service interfaces ge-2/0/5 forwarding-class af
```

### Configuring a Two-Rate Three-Color Policer

#### Step-by-Step Procedure

To configure a two-rate three-color policer:

1. Enable configuration of a three-color policer.

```
[edit]
user@host# set firewall three-color-policer trTCM1-ca
```

2. Configure the color mode of the two-rate three-color policer.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate color-aware
```

### 3. Configure the two-rate guaranteed traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

Traffic that does not exceed both of these limits is categorized as green. Packets in a green flow are implicitly set to `low` loss priority and then transmitted.

### 4. Configure the two-rate peak traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

Nonconforming traffic that does not exceed both of these limits is categorized as yellow. Packets in a yellow flow are implicitly set to `medium-high` loss priority and then transmitted. Nonconforming traffic that exceeds both of these limits is categorized as red. Packets in a red flow are implicitly set to `high` loss priority.

### 5. (Optional) Configure the policer action for red traffic.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set action loss-priority high then discard
```

For three-color policers, the only configurable action is to discard red packets. Red packets are packets that have been assigned `high` loss priority because they exceeded the peak information rate (PIR) and the peak burst size (PBS).

## Results

Confirm the configuration of the policer by entering the `show firewall configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM1-ca {
 action {
 loss-priority high then discard;
```

```

 }
 two-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}

```

## Configuring an IPv4 Stateless Firewall Filter That References the Policier

### Step-by-Step Procedure

To configure an IPv4 stateless firewall filter that references the policier:

1. Enable configuration of an IPv4 standard stateless firewall filter.

```

[edit]
user@host# set firewall family inet filter filter-trtcm1ca-all

```

2. Specify the filter term that references the policier.

```

[edit firewall family inet filter filter-trtcm1ca-all]
user@host# set term 1 then three-color-policer two-rate trTCM1-ca

```

Note that the term does not specify any match conditions. The firewall filter passes all packets to the policier.

### Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show firewall
family inet {
 filter filter-trtcm1ca-all {
 term 1 {

```

```

 then {
 three-color-policer {
 two-rate trTCM1-ca;
 }
 }
 }
}
three-color-policer trTCM1-ca {
 action {
 loss-priority high then discard;
 }
 two-rate {
 color-aware;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}

```

## Applying the Filter to a Logical Interface at the Protocol Family Level

### Step-by-Step Procedure

To apply the filter to the logical interface at the protocol family level:

1. Enable configuration of an IPv4 firewall filter.

```

[edit]
user@host# edit interfaces ge-2/0/5 unit 0 family inet

```

2. Apply the policer to the logical interface at the protocol family level.

```

[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set address 10.10.10.1/30
user@host# set filter input filter-trtcm1ca-all

```

3. (MX Series routers and EX Series switches only) (Optional) For input policers, you can configure a fixed classifier. A fixed classifier reclassifies all incoming packets, regardless of any preexisting classification.

**NOTE:** Platform support depends on the Junos OS release in your implementation.

```
[edit]
user@host# set class-of-service interfaces ge-2/0/5 forwarding-class af
```

The classifier name can be a configured classifier or one of the default classifiers.

## Results

Confirm the configuration of the interface by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-2/0/5 {
 unit 0 {
 family inet {
 address 10.10.10.1/30;
 filter {
 input filter-trtcm1ca-all;
 }
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to the Logical Interface | 2123](#)

Confirm that the configuration is working properly.

## Displaying the Firewall Filters Applied to the Logical Interface

### Purpose

Verify that the firewall filter is applied to IPv4 input traffic at the logical interface.

### Action

Use the `show interfaces operational mode` command for the logical interface `ge-2/0/5.0`, and specify `detail` mode. The **Protocol inet** section of the command output displays IPv4 information for the logical interface. Within that section, the **Input Filters** field displays the name of IPv4 firewall filters associated with the logical interface.

```
user@host> show interfaces ge-2/0/5.0 detail
Logical interface ge-2/0/5.0 (Index 105) (SNMP ifIndex 556) (Generation 170)
Flags: Device-Down SNMP-Traps 0x4004000 Encapsulation: ENET2

# Configuring Logical and Physical Interface Traffic Policers at Layer 3

## IN THIS CHAPTER

- [Two-Color and Three-Color Logical Interface Policers | 2125](#)
- [Two-Color and Three-Color Physical Interface Policers | 2144](#)

## Two-Color and Three-Color Logical Interface Policers

### IN THIS SECTION

- [Logical Interface \(Aggregate\) Policer Overview | 2125](#)
- [Example: Configuring a Two-Color Logical Interface \(Aggregate\) Policer | 2126](#)
- [Example: Configuring a Three-Color Logical Interface \(Aggregate\) Policer | 2135](#)

### Logical Interface (Aggregate) Policer Overview

A *logical interface policer*—also called an *aggregate policer*—is a two-color or three-color policer that defines traffic rate limiting that you can apply to input or output traffic for multiple protocol families on the same logical interface without creating multiple instances of the policer.

To configure a single-rate two-color *logical interface* policer, include the `logical-interface-policer` statement at one of the following hierarchy levels:

- [edit `firewall policer policer-name`]
- [edit `logical-systems logical-system-name firewall policer policer-name`]

To configure a single-rate or two-rate three-color logical interface policer, include the `logical-interface-policer` statement at one of the following hierarchy levels:

- [edit `firewall three-color-policer name`]
- [edit logical-systems `logical-system-name firewall three-color-policer name`]

**NOTE:** A three-color policer can be applied to Layer 2 traffic as a logical interface policer only. You cannot apply a three-color policer to Layer 2 traffic as a physical interface policer (through a *firewall filter*).

You apply a logical interface policer to Layer 3 traffic directly to the interface configuration at the logical unit level (to rate-limit all traffic types, regardless of the protocol family) or at the protocol family level (to rate-limit traffic of a specific protocol family). It is OK to reference a logical interface policer from a stateless firewall filter term and then apply the filter to a logical interface.

You can apply a logical interface policer to unicast traffic only. For information about configuring a stateless firewall filter for flooded traffic, see “[Applying Forwarding Table Filters](#)” in the “Traffic Sampling, Forwarding, and Monitoring” section of the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

To display a logical interface policer on a particular interface, issue the `show interfaces policers operational mode command`.

[Example: Configuring a Two-Color Logical Interface \(Aggregate\) Policer](#)

[Example: Configuring a Three-Color Logical Interface \(Aggregate\) Policer](#)

[interface-specific \(Firewall Filters\) | 2412](#)

[logical-interface-policer | 2539](#)

## Example: Configuring a Two-Color Logical Interface (Aggregate) Policer

### IN THIS SECTION

- [Requirements | 2127](#)
- [Overview | 2127](#)
- [Configuration | 2128](#)

- [Verification | 2133](#)

This example shows how to configure a single-rate two-color policer as a logical interface policer and apply it to incoming IPv4 traffic on a logical interface.

### Requirements

Before you begin, make sure that the logical interface to which you apply the two-color logical interface policer is hosted on a Gigabit Ethernet interface (ge-) or a 10-Gigabit Ethernet interface (xe-).

### Overview

#### IN THIS SECTION

- [Topology | 2127](#)

In this example, you configure the single-rate two-color policer `policer_IFL` as a logical interface policer and apply it to incoming IPv4 traffic at logical interface `ge-1/3/1.0`.

### *Topology*

If the input IPv4 traffic on the physical interface `ge-1/3/1` exceeds the bandwidth limit equal to 90 percent of the media rate with a 300 KB burst-size limit, then the logical interface policer `policer_IFL` rate-limits the input IPv4 traffic on the logical interface `ge-1/3/1.0`. Configure the policer to mark nonconforming traffic by setting packet loss priority (PLP) levels to high and classifying packets as best-effort.

As the incoming IPv4 traffic rate on the physical interface slows and conforms to the configured limits, Junos OS stops marking the incoming IPv4 packets at the logical interface.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2128](#)
- [Configuring the Logical Interfaces | 2128](#)
- [Configuring the Single-Rate Two-Color Policer as a Logical Interface Policer | 2130](#)
- [Applying the Logical Interface Policer to Input IPv4 Traffic at a Logical Interface | 2132](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

#### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
set firewall policer policer_IFL logical-interface-policer
set firewall policer policer_IFL if-exceeding bandwidth-percent 90
set firewall policer policer_IFL if-exceeding burst-size-limit 300k
set firewall policer policer_IFL then loss-priority high
set firewall policer policer_IFL then forwarding-class best-effort
set interfaces ge-1/3/1 unit 0 family inet policer input policer_IFL
```

#### *Configuring the Logical Interfaces*

### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Configure single tagging.

```
[edit interfaces ge-1/3/1]
user@host# set vlan-tagging
```

3. Configure logical interface ge-1/3/1.0.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface ge-1/3/1.1.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac 00:00:11:22:33:44
```

## Results

Confirm the configuration of the logical interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 10.10.10.1/30;
 }
 }
}
```

```

 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}

```

### *Configuring the Single-Rate Two-Color Policer as a Logical Interface Policer*

#### Step-by-Step Procedure

To configure a single-rate two-color policer as a logical interface policer:

1. Enable configuration of a single-rate two-color policer.

```

[edit]
user@host# edit firewall policer policer_IFL

```

2. Specify that the policer is a logical interface (aggregate) policer.

```

[edit firewall policer policer_IFL]
user@host# set logical-interface-policer

```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied. The policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify the policer traffic limits.

- Specify the bandwidth limit.
  - To specify the bandwidth limit as an absolute rate, from 8,000 bits per second through 50,000,000,000 bits per second, include the `bandwidth-limit bps` statement.
  - To specify the bandwidth limit as a percentage of the physical port speed on the interface, include the `bandwidth-percent percent` statement.

In this example, the CLI commands and output are based on a bandwidth limit specified as a percentage rather than as an absolute rate.

```
[edit firewall policer policer_IFL]
user@host# set if-exceeding bandwidth-percent 90
```

- Specify the burst-size limit, from 1,500 bytes through 100,000,000,000 bytes, which is the maximum packet size to be permitted for bursts of data that exceed the specified bandwidth limit.

```
[edit firewall policer policer_IFL]
user@host# set if-exceeding burst-size-limit 300k
```

#### 4. Specify the policer actions to be taken on traffic that exceeds the configured rate limits.

- To discard the packet, include the discard statement.
- To set the loss-priority value of the packet, include the loss-priority (low | medium-low | medium-high | high) statement.
- To classify the packet to a forwarding class, include the forwarding-class (*forwarding-class* | assured-forwarding | best-effort | expedited-forwarding | network-control) statement.

In this example, the CLI commands and output are based on both setting the packet loss priority level and classifying the packet.

```
[edit firewall policer policer_IFL]
user@host# set then loss-priority high
user@host# set then forwarding-class best-effort
```

## Results

Confirm the configuration of the policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer policer_IFL {
 logical-interface-policer;
 if-exceeding {
```

```

 bandwidth-percent 90;
 burst-size-limit 300k;
 }
 then {
 loss-priority high;
 forwarding-class best-effort;
 }
}

```

### *Applying the Logical Interface Policer to Input IPv4 Traffic at a Logical Interface*

#### Step-by-Step Procedure

To apply the two-color logical interface policer to input IPv4 traffic a logical interface:

1. Enable configuration of the logical interface.

```

[edit]
user@host# edit interfaces ge-1/3/1 unit 0

```

2. Apply the policer to all traffic types or to a specific traffic type on the logical interface.

- To apply the policer to all traffic types, regardless of the protocol family, include the `policer (input | output) policer-name` statement at the `[edit interfaces interface-name unit number]` hierarchy level.
- To apply the policer to traffic of a specific protocol family, include the `policer (input | output) policer-name` statement at the `[edit interfaces interface-name unit unit-number family family-name]` hierarchy level.

To apply the logical interface policer to incoming packets, use the `policer input policer-name` statement.

To apply the logical interface policer to outgoing packets, use the `policer output policer-name` statement.

In this example, the CLI commands and output are based on rate-limiting the IPv4 input traffic at logical interface `ge-1/3/1.0`.

```

[edit interfaces ge-1/3/1 unit 0]
user@host# set family inet policer input policer_IFL

```

## Results

Confirm the configuration of the interface by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 policer input policer_IFL;
 address 10.10.10.1/30;
 }
 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 2134](#)
- [Displaying Statistics for the Policer | 2134](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

#### **Purpose**

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

#### **Action**

Use the `show interfaces operational mode` command for logical interface `ge-1/3/1.0`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface. The **Protocol inet** subsection contains a **Policer** field that would list the policer `policer_IFL` as an input or output logical interface policer as follows:

- **Input:** `policer_IFL-ge-1/3/1.0-log_int-i`
- **Output:** `policer_IFL-ge-1/3/1.0-log_int-o`

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

### *Displaying Statistics for the Policer*

#### **Purpose**

Verify the number of packets evaluated by the policer.

#### **Action**

Use the `show policer operational mode` command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer `policer_IFL`, the input and output policer names are displayed as follows:

- `policer_IFL-ge-1/3/1.0-log_int-i`
- `policer_IFL-ge-1/3/1.0-log_int-o`

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## SEE ALSO

[Two-Color Policer Configuration Overview | 1993](#)

[Logical Interface \(Aggregate\) Policer Overview](#)

## Example: Configuring a Three-Color Logical Interface (Aggregate) Policer

### IN THIS SECTION

- [Requirements | 2135](#)
- [Overview | 2135](#)
- [Configuration | 2136](#)
- [Verification | 2142](#)

This example shows how to configure a two-rate three-color color-blind policer as a logical interface (aggregate) policer and apply the policer directly to Layer 2 input traffic at a supported logical interface.

### Requirements

Before you begin, make sure that the logical interface to which you apply the three-color logical interface policer is hosted on a Gigabit Ethernet interface (ge-) or a 10-Gigabit Ethernet interface (xe-) on an MX Series router.

### Overview

#### IN THIS SECTION

- [Topology | 2136](#)

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second set of bandwidth and burst-size limits for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the bandwidth and burst-size limits for peak traffic is categorized as yellow.

- Nonconforming traffic that exceeds the bandwidth and burst-size limits for peak traffic is categorized as red.

A logical interface policer defines traffic rate-limiting rules that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer.

**NOTE:** You apply a logical interface policer directly to a logical interface at the logical unit level, and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface at the protocol family level.

### *Topology*

In this example, you configure the two-rate three-color policer `trTCM2-cb` as a color-blind logical interface policer and apply the policer to incoming Layer 2 traffic on logical interface `ge-1/3/1.0`.

**NOTE:** When using a three-color policer to rate-limit Layer 2 traffic, color-aware policing can be applied to egress traffic only.

The policer defines guaranteed traffic rate limits such that traffic that conforms to the bandwidth limit of 40 Mbps with a 100 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as green. As with any policed traffic, the packets in a green flow are implicitly set to a low loss priority and then transmitted.

Nonconforming traffic that falls within the peak traffic limits of a 60 Mbps bandwidth limit and a 200 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as yellow. The packets in a yellow traffic flow are implicitly set to a medium-high loss priority and then transmitted.

Nonconforming traffic that exceeds the peak traffic limits are categorized as red. The packets in a red traffic flow are implicitly set to a high loss priority. In this example, the optional policer action for red traffic (loss-priority high then discard) is configured, so packets in a red traffic flow are discarded instead of transmitted.

### Configuration

#### IN THIS SECTION

- [CLI Quick Configuration | 2137](#)
- [Configuring the Logical Interfaces | 2137](#)

- [Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer | 2139](#)
- [Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface | 2141](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
set firewall three-color-policer trTCM2-cb logical-interface-policer
set firewall three-color-policer trTCM2-cb two-rate color-blind
set firewall three-color-policer trTCM2-cb two-rate committed-information-rate 40m
set firewall three-color-policer trTCM2-cb two-rate committed-burst-size 100k
set firewall three-color-policer trTCM2-cb two-rate peak-information-rate 60m
set firewall three-color-policer trTCM2-cb two-rate peak-burst-size 200k
set firewall three-color-policer trTCM2-cb action loss-priority high then discard
set interfaces ge-1/3/1 unit 0 layer2-policer input-three-color trTCM2-cb
```

### *Configuring the Logical Interfaces*

#### **Step-by-Step Procedure**

To configure the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Configure single tagging.

```
[edit interfaces ge-1/3/1]
user@host# set vlan-tagging
```

3. Configure logical interface ge-1/3/1.0.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface ge-1/3/1.0.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac 00:00:11:22:33:44
```

## Results

Confirm the configuration of the logical interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 family inet {
 address 10.10.10.1/30;
 }
 }
}
```

```

 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}

```

### *Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer*

#### Step-by-Step Procedure

To configure the two-rate three-color policer as a logical interface policer:

1. Enable configuration of a three-color policer.

```

[edit]
user@host# edit firewall three-color-policer trTCM2-cb

```

2. Specify that the policer is a logical interface (aggregate) policer.

```

[edit firewall three-color-policer trTCM2-cb]
user@host# set logical-interface-policer

```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied, and the policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify that the policer is two-rate and color-blind.

```

[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate color-blind

```

A color-aware three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node, and any preexisting color markings are used in determining the appropriate policing action for the packet.

Because you are applying this three-color policer applied to input at Layer 2, you must configure the policer to be color-blind.

4. Specify the policer traffic limits used to classify a green traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

5. Specify the additional policer traffic limits used to classify a yellow or red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

6. (Optional) Specify the configured policer action for packets in a red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set action loss-priority high then discard
```

In color-aware mode, the three-color policer configured action can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

## Results

Confirm the configuration of the three-color policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM2-cb {
 logical-interface-policer;
 action {
 loss-priority high then discard;
 }
 two-rate {
```

```

 color-blind;
 committed-information-rate 40m;
 committed-burst-size 100k;
 peak-information-rate 60m;
 peak-burst-size 200k;
 }
}

```

### *Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface*

#### Step-by-Step Procedure

To apply the three-color policer to the Layer 2 input at the logical interface:

1. Enable application of Layer 2 logical interface policers.

```

[edit]
user@host# edit interfaces ge-1/3/1 unit 0

```

2. Apply the three-color logical interface policer to a logical interface input.

```

[edit interfaces ge-1/3/1 unit 0]
user@host# set layer2-policerinput-three-color trTCM2-cb

```

#### Results

Confirm the configuration of the logical interfaces by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces
ge-1/3/1 {
 vlan-tagging;
 unit 0 {
 vlan-id 100;
 layer2-policer {
 input-three-color trTCM2-cb;
 }
 }
}

```

```

 family inet {
 address 10.10.10.1/30;
 }
 }
 unit 1 {
 vlan-id 101;
 family inet {
 address 20.20.20.1/30 {
 arp 20.20.20.2 mac 00:00:11:22:33:44;
 }
 }
 }
}

```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying Traffic Statistics and Policers for the Logical Interface | 2142](#)
- [Displaying Statistics for the Policer | 2143](#)

Confirm that the configuration is working properly.

### *Displaying Traffic Statistics and Policers for the Logical Interface*

## Purpose

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

## Action

Use the `show interfaces operational mode` command for logical interface `ge-1/3/1.0`, and include the `detail` or `extensive` option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer `trTCM2-cb` as an input or output policer as follows:

- Input: trTCM2-cb-ge-1/3/1.0-log\_int-i
- Output: trTCM2-cb-ge-1/3/1.0-log\_int-o

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to in the input direction only.

### *Displaying Statistics for the Policer*

#### **Purpose**

Verify the number of packets evaluated by the policer.

#### **Action**

Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer trTCM2-cb, the input and output policer names are displayed as follows:

- trTCM2-cb-ge-1/3/1.0-log\_int-i
- trTCM2-cb-e-1/3/1.0-log\_int-o

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## Two-Color and Three-Color Physical Interface Policers

### IN THIS SECTION

- [Physical Interface Policer Overview | 2144](#)
- [Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface | 2146](#)

### Physical Interface Policer Overview

A *physical interface policer* is a two-color or three-color policer that defines traffic rate limiting that you can apply to input or output traffic for all the logical interfaces and protocol families configured on a physical interface, even if the logical interfaces belong to different routing instances. This feature is useful when you want to perform aggregate policing for different protocol families and different logical interfaces on the same physical interface.

For example, suppose that a provider edge (PE) router has numerous logical interfaces, each corresponding to a different customer, configured on the same link to a customer edge (CE) device. Now suppose that a customer wants to apply one set of aggregated rate limits for certain types of traffic on a single physical interface. To accomplish this, you could apply a single physical interface policer to the physical interface, which rate-limits all the logical interfaces configured on the interface and all the routing instances to which those interfaces belong.

To configure a single-rate two-color physical interface policer, include the `physical-interface-policer` statement at one of the following hierarchy levels:

- [edit `firewall policer policer-name`]
- [edit logical-system `logical-system-name firewall policer policer-name`]
- [edit routing-instances `routing-instance-name firewall policer policer-name`]
- [edit logical-systems `logical-system-name routing-instances routing-instance-name firewall policer policer-name`]

To configure a single-rate or two-rate three-color physical interface policer, include the `physical-interface-policer` statement at one of the following hierarchy levels:

- [edit `firewall three-color-policer policer-name`]
- [edit logical-system *logical-system-name* `firewall three-color-policer policer-name`]
- [edit routing-instances *routing-instance-name* `firewall three-color-policer policer-name`]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* `firewall three-color-policer policer-name`]

You apply a physical interface policer to Layer 3 traffic by referencing the policer from a stateless *firewall filter* term and then applying the filter to a *logical interface*. You cannot apply a physical interface to Layer 3 traffic directly to the interface configuration.

To reference a single-rate two-color policer from a stateless firewall filter term, use the policer nonterminating action. To reference a single-rate or two-rate three-color policer from a stateless firewall filter term, use the three-color-policer nonterminating action.

The following requirements apply to a stateless firewall filter that references a physical interface policer:

- You must configure the firewall filter for a specific, supported protocol family: ipv4, ipv6, mpls, vpls, or circuit cross-connect (ccc), but not for family any.
- You must configure the firewall filter as a *physical interface filter* by including the physical-interface-filter statement at the [edit firewall family *family-name* filter *filter-name*] hierarchy level.
- A firewall filter that is defined as a physical interface filter can reference a physical interface policer only.
- A firewall filter that is defined on the global (non-logical) system cannot be used in a logical system for interface-specific filter instances. More specifically, you cannot use a template for a **physical-interface-filter** that was created on the global system with a filter attachment that was created on the logical system. Both the template and the attachment must reside on the logical system for filtering to work correctly. This is because, for logical systems, filter instance naming is derived from the physical interface, but the same is not true for interface-specific filter instances.
- A firewall filter that is defined as a physical interface filter cannot reference a policer configured with the interface-specific statement.
- You cannot configure a firewall filter as both a physical interface filter and as a logical interface filter that also includes the interface-specific statement.

## Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface

### IN THIS SECTION

- [Requirements | 2146](#)
- [Overview | 2146](#)
- [Configuration | 2147](#)
- [Verification | 2153](#)

This example shows how to configure a single-rate two-color policer as a physical interface policer.

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

### IN THIS SECTION

- [Topology | 2147](#)

A *physical interface policer* specifies rate-limiting for aggregate traffic, which encompasses all protocol families and logical interfaces configured on a physical interface, even if the interfaces belong to different routing instances.

You can apply a physical interface policer to Layer 3 input or output traffic only by referencing the policer from a stateless firewall filter that is configured for specific a specific protocol family (not for family any) and configured as a physical interface filter. You configure the filter terms with match conditions that select the types of packets you want to rate-limit, and you specify the physical interface policer as the action to apply to matched packets.

## Topology

The physical interface policer in this example, `shared-policer-A`, rate-limits to 10,000,000 bps and permits a maximum burst of traffic of 500,000 bytes. You configure the policer to discard packets in nonconforming flows, but you could instead configure the policer to re-mark nonconforming traffic with a forwarding class, a packet loss priority (PLP) level, or both.

To be able to use the policer to rate-limit IPv4 traffic, you reference the policer from an IPv4 physical interface filter. For this example, you configure the filter to pass the policer IPv4 packets that meet either of the following match terms:

- Packets received through TCP and with the IP precedence fields `critical-ecp (0xa0)`, `immediate (0x40)`, or `priority (0x20)`
- Packets received through TCP and with the IP precedence fields `internet-control (0xc0)` or `routine (0x00)`

You could also reference the policer from physical interface filters for other protocol families.

## Configuration

### IN THIS SECTION

- [CLI Quick Configuration | 2148](#)
- [Configuring the Logical Interfaces on the Physical Interface | 2148](#)
- [Configuring a Physical Interface Policer | 2149](#)
- [Configuring an IPv4 Physical Interface Filter | 2150](#)
- [Applying the IPv4 Physical interface Filter to Reference the Physical Interface Policers | 2152](#)

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see ["Use the CLI Editor in Configuration Mode" on page 1866](#).

To configure this example, perform the following tasks:

### *CLI Quick Configuration*

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces so-1/0/0 unit 0 family inet address 192.168.1.1/24
set interfaces so-1/0/0 unit 0 family vpls
set interfaces so-1/0/0 unit 1 family mpls
set firewall policer shared-policer-A physical-interface-policer
set firewall policer shared-policer-A if-exceeding bandwidth-limit 100m burst-size-limit 500k
set firewall policer shared-policer-A then discard
set firewall family inet filter ipv4-filter physical-interface-filter
set firewall family inet filter ipv4-filter term tcp-police-1 from precedence [critical-ecp
immediate priority]
set firewall family inet filter ipv4-filter term tcp-police-1 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-1 then policer shared-policer-A
set firewall family inet filter ipv4-filter term tcp-police-2 from precedence [internet-control
routine]
set firewall family inet filter ipv4-filter term tcp-police-2 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-2 then policer shared-policer-A
set interfaces so-1/0/0 unit 0 family inet filter input ipv4-filter
```

### *Configuring the Logical Interfaces on the Physical Interface*

#### **Step-by-Step Procedure**

To configure the logical interfaces on the physical interface:

1. Enable configuration of logical interfaces.

```
[edit]
user@host# edit interfaces so-1/0/0
```

2. Configure protocol families on logical unit 0.

```
[edit interfaces so-1/0/0]
user@host# set unit 0 family inet address 192.168.1.1/24
user@host# set unit 0 family vpls
```

### 3. Configure protocol families on logical unit 1.

```
[edit interfaces so-1/0/0]
user@host# set unit 1 family mpls
```

## Results

Confirm the configuration of the firewall filter by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
 unit 0 {
 family inet {
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }

```

### *Configuring a Physical Interface Policer*

## Step-by-Step Procedure

To configure a physical interface policer:

### 1. Enable configuration of the two-color policer.

```
[edit]
user@host# edit firewall policer shared-policer-A
```

## 2. Configure the type of two-color policer.

```
[edit firewall policer shared-policer-A]
user@host# set physical-interface-policer
```

## 3. Configure the traffic limits and the action for packets in a nonconforming traffic flow.

```
[edit firewall policer shared-policer-A]
user@host# set if-exceeding bandwidth-limit 100m burst-size-limit 500k
user@host# set then discard
```

For a physical interface filter, the actions you can configure for packets in a nonconforming traffic flow are to discard the packets, assign a forwarding class, assign a PLP value, or assign both a forwarding class and a PLP value.

## Results

Confirm the configuration of the policer by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer shared-policer-A {
 physical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then discard;
}
```

### *Configuring an IPv4 Physical Interface Filter*

## Step-by-Step Procedure

To configure a physical interface policer as the action for terms in an IPv4 physical interface policer:

1. Configure a standard stateless firewall filter under a specific protocol family.

```
[edit]
user@host# edit firewall family inet filter ipv4-filter
```

You cannot configure a physical interface firewall filter for family any.

2. Configure the filter as a physical interface filter so that you can apply the physical interface policer as an action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set physical-interface-filter
```

3. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields critical-ecp, immediate, or priority and to apply the physical interface policer as a filter action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-1 from precedence [critical-ecp immediate priority]
user@host# set term tcp-police-1 from protocol tcp
user@host# set term tcp-police-1 then policer shared-policer-A
```

4. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields internet-control or routine and to apply the physical interface policer as a filter action.

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-2 from precedence [internet-control routine]
user@host# set term tcp-police-2 from protocol tcp
user@host# set term tcp-police-2 then policer shared-policer-A
```

## Results

Confirm the configuration of the firewall filter by entering the `show firewall` configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
```

```

filter ipv4-filter {
 physical-interface-filter;
 term tcp-police-1 {
 from {
 precedence [critical-ecp immediate priority];
 protocol tcp;
 }
 then policer shared-policer-A;
 }
 term tcp-police-2 {
 from {
 precedence [internet-control routine];
 protocol tcp;
 }
 then policer shared-policer-A;
 }
}

policer shared-policer-A {
 physical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then discard;
}

```

### *Applying the IPv4 Physical interface Filter to Reference the Physical Interface Policers*

#### **Step-by-Step Procedure**

To apply the physical interface filter so it references the physical interface policers:

1. Enable configuration of IPv4 on the logical interface.

```

[edit]
user@host# edit interfaces so-1/0/0 unit 0 family inet

```

2. Apply the IPv4 physical interface filter in the input direction.

```
[edit interfaces so-1/0/0 unit 0 family inet]
user@host# set filter input ipv4-filter
```

## Results

Confirm the configuration of the firewall filter by entering the `show interfaces configuration mode` command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
 unit 0 {
 family inet {
 filter {
 input ipv4-filter;
 }
 address 192.168.1.1/24;
 }
 family vpls;
 }
 unit 1 {
 family mpls;
 }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

## Verification

### IN THIS SECTION

- [Displaying the Firewall Filters Applied to an Interface | 2154](#)
- [Displaying the Number of Packets Processed by the Policer at the Logical Interface | 2154](#)

Confirm that the configuration is working properly.

### *Displaying the Firewall Filters Applied to an Interface*

#### **Purpose**

Verify that the firewall filter `ipv4-filter` is applied to the IPv4 input traffic at logical interface `so-1/0/0.0`.

#### **Action**

Use the `show interfaces statistics` operational mode command for logical interface `so-1/0/0.0`, and include the `detail` option. In the **Protocol inet** section of the command output, the **Input Filters** field shows that the firewall filter `ipv4-filter` is applied in the input direction.

```
user@host> show interfaces statistics so-1/0/0 detail
Logical interface so-1/0/0.0 (Index 79) (SNMP ifIndex 510) (Generation 149)
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
 Protocol inet, MTU: 4470, Generation: 173, Route table: 0
 Flags: Sendbroadcast-pkt-to-re, Protocol-Down
 Input Filters: ipv4-filter
 Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
 Destination: 10.39/16, Local: 10.39.1.1, Broadcast: 10.39.255.255, Generation: 163
```

### *Displaying the Number of Packets Processed by the Policer at the Logical Interface*

#### **Purpose**

Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

#### **Action**

Use the `show firewall` operational mode command for the filter you applied to the logical interface.

```
user@host> show firewall filter ipv4-filter
Filter: ipv4-filter
Policers:
Name Packets
```

|                               |       |
|-------------------------------|-------|
| shared-policer-A-tcp-police-1 | 32863 |
| shared-policer-A-tcp-police-2 | 3870  |

The command output displays the name of policer (shared-policer-A), the name of the filter term (police-1) under which the policer action is specified, and the number of packets that matched the filter term. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

Policing is also an important component of firewall filters. You can achieve policing by including policers in *firewall filter* configurations.

### Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 88 on page 2160](#) illustrates this process.

**NOTE:** A policer restricts traffic at the configured transmission rate per PFE. In QFX10016, QFX10002, QFX10002-60C, and QFX10008 switches, when aggregated ethernet (AE) interface

bundles span multiple PFEs, the overall transmission rate of the policer for the subscriber could exceed the configured transmission rate of the policer (depending on the number of PFEs involved).

As an example:

- Policer with bandwidth-limit 100 mbps configured on an AE interface that has member links xe-1/0/0 (fpc1-pfe0) and xe-1/0/30 (fpc1-pfe1) . Here, the two member links belong to FPC1, but are on different PFEs. When the policer is applied to the AE interface, this will result in a total bandwidth of 200 Mbps as policer is configured for two PFEs.
- Policer with bandwidth-limit 100 mbps configured on an AE interface that has member links xe-1/0/0 (fpc1-pfe0), et-2/0/1 (fpc2-pfe1) and xe-2/0/18:0 (fpc2-pfe2) . Here, one member link belongs to FPC1 and PFE0 on this FPC. The rest two member links belong to FPC2, but different PFEs. When the policer is applied to the AE interface, this will result in a total bandwidth of 300 Mbps as policer is configured for three PFEs.
- Policer with bandwidth-limit 100 mbps configured on an AE interface that has member links xe-1/0/0 and xe-1/0/1 on a single PFE (fpc1-pfe0) . Here, the member links belong to FPC1

and to the same PFE. When the policer is applied to the AE interface, this will result in a total bandwidth of 100 Mbps as policer is configured on a per PFE basis.

Figure 88: Flow of Tricolor Marking Policer Operation

g017049

After you name and configure a policer, you can use it by specifying it as an action in one or more firewall filters.

## Policer Types

A switch supports three types of policers:

- Single-rate two-color marker—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- Single-rate three-color marker—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- Two-rate three-color marker—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 119 on page 2162](#) for information about how metering results are applied for each of these policer types.

## Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 119 on page 2162](#) describes the policer actions.

**Table 119: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action |
|-------------------------|--------------------------------|----------------------------------|---------------------|
| Single-rate two-color   | Green (conforming)             | Assign low loss priority         | None                |
|                         | Red (nonconforming)            | None                             | Discard             |
| Single-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the EBS)            | Assign high loss priority        | Discard             |
| Two-rate three-color    | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the PIR and PBS)    | Assign high loss priority        | Discard             |

**NOTE:** If you specify a policer in an egress *firewall filter*, the only supported action is discard.

## Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

## Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this on some QFX switches, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps. (This behavior does not occur in QFX10000 switches.)

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in ["Planning the Number of Firewall Filters to Create" on page 1704](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Suggested Naming Convention for Policers

We recommend that you use the naming convention *policertypeTCM#-color type* when configuring three-color policers and *policer#* when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention

makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named `srTCM1-ca`. The second two-rate, color-blind three-color configured would be named `trTCM2-cb`. The elements of this naming convention are explained below:

- `sr` (single-rate)
- `tr` (two-rate)
- `TCM` (tricolor marking)
- `1` or `2` (number of marker)
- `ca` (color-aware)
- `cb` (color-blind)

## Policer Counters

On some QFX switches, each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms and provides the total amount. (This does not apply to QFX10000 switches.) If you want to obtain separate packet counts for each term on an affected switch, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

## Policer Algorithms

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

**NOTE:** In an environment of light bursty traffic, QFX5200 might not replicate all multicast packets to two or more downstream interfaces. This occurs only at a line rate burst—if traffic is consistent, the issue does not occur. In addition, the issue occurs only when packet size increases beyond 6k in a one gigabit traffic flow.

## How Many Policers Are Supported?

QFX10000 switches support 8K policers (all policer types). QFX5100 and QFX5200 switches support 1535 ingress policers and 1024 egress policers (assuming one policer per firewall filter term). QFX5110 switches support 6144 ingress policers and 1024 egress policers (assuming one policer per firewall filter term).

QFX3500 and QFX3600 standalone switches and QFabric Node devices support the following numbers of policers (assuming one policer per firewall filter term):

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

## Policers Can Limit Egress Firewall Filters

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.

- Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Traffic Policer Types

### IN THIS SECTION

- [Single-Rate Two-Color Policers | 2167](#)
- [Three-Color Policers | 2167](#)
- [Two-Color and Three-Color Policer Options | 2168](#)

## Single-Rate Two-Color Policers

You can use a single-rate two-color policer, or “policer” when used without qualification, to rate-limit a traffic flow to an average bits-per-second arrival rate (specified by the single specified bandwidth limit) while allowing bursts of traffic for short periods (controlled by the single specified burst-size limit). This type of policer categorizes a traffic flow as either green (conforming) or red (nonconforming). Packets in a green flow are implicitly set to a **low** loss priority and then transmitted. Packets in a red flow are handled according to actions specified in the policer configuration. Packets in a red flow can be marked—set to a specified forwarding class, set to a specified loss priority, or both—or they can be discarded.

A single-rate two-color policer is most useful for metering traffic at the port (physical interface) level.

### Basic Single-Rate Two-Color Policer

You can apply a basic single-rate two-color policer to Layer 3 traffic in either of two ways: as an interface policer or as a firewall filter policer. You can apply the policer as an *interface policer*, meaning that you apply the policer directly to a logical interface at the protocol family level. If you want to apply the policer to selected packets only, you can apply the policer as a *firewall filter policer*, meaning that you reference the policer in a stateless firewall filter term and then apply the filter to a logical interface at the protocol family level.

### Bandwidth Policer

A bandwidth policer is simply a single-rate two-color policer that is defined using a bandwidth limit specified as a percentage value rather than as an absolute number of bits per second. When you apply the policer (as an interface policer or as a firewall filter policer) to a logical interface at the protocol family level, the effective bandwidth limit is calculated based on either the physical interface media rate or the logical interface configured shaping rate.

### Logical Bandwidth Policer

A logical bandwidth policer is a bandwidth policer for which the effective bandwidth limit is calculated based on the logical interface configured shaping rate. You can apply the policer as a firewall filter policer only, and the firewall filter must be configured as an interface-specific filter. When you apply an interface-specific filter to multiple logical interfaces on supported routing platforms, any **count** or **policer** actions act on the traffic stream entering or exiting each individual interface, regardless of the sum of traffic on the multiple interfaces.

## Three-Color Policers

The Junos OS supports two types of three-color policers: single-rate and two-rate. The main difference between a single-rate and a two-rate policer is that the single-rate policer allows bursts of traffic for

short periods, while the two-rate policer allows more sustained bursts of traffic. Single-rate policing is implemented using a single token-bucket model, so that periods of relatively low traffic must occur between traffic bursts to allow the token bucket to refill. Two-rate policing is implemented using a dual token-bucket model, which allows bursts of traffic for longer periods.

### Single-Rate Three-Color Policers

The single-rate three-color type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to a single rate and three traffic categories (green, yellow, and red). A single-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus an *excess* burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that conforms to the bandwidth limit while allowing bursts of traffic as controlled by the excess burst-size limit is categorized as yellow. All other traffic is categorized as red.

A single-rate three-color policer is most useful when a service is structured according to packet length, not peak arrival rate.

### Two-Rate Three-Color Policers

The two-rate three-color type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to two rates and three traffic categories (green, yellow, and red). A two-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus a *peak* bandwidth limit and burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that exceeds the committed traffic limits but remains below the peak traffic limits is categorized as yellow. Traffic that exceeds the peak traffic limits is categorized as red.

A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

### Two-Color and Three-Color Policer Options

Both two-color and three-color policers can be configured with the following options:

#### Logical Interface (Aggregate) Policers

A logical interface policer can be a two-color policer, not a three-color policer. When you apply a logical interface policer to multiple protocol families on the same logical interface, multiple instances of the policer are created, meaning that traffic for each protocol family is policed separately. You apply a logical interface policer directly to a logical interface configuration (and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface).

- You can apply the policer at the interface logical unit level to rate-limit all traffic types, regardless of the protocol family.

When applied in this manner, the logical interface policer will be used by all traffic types (inet, inet6, etc.) and across all layers (layer 2, layer 3) no matter where the policer is attached on the logical interface.

- You can also apply the policer at the logical interface protocol family level, to rate-limit traffic for a specific protocol family.

You can apply a logical interface policer to unicast traffic only. For information about configuring a stateless firewall filter for flooded traffic, see “[Applying Forwarding Table Filters](#)” in the “Traffic Sampling, Forwarding, and Monitoring” section of the [Routing Policies, Firewall Filters, and Traffic Policers User Guide](#).

## Physical Interface Policers

A physical interface policer can be a two-color or three-color policer. When you apply physical interface policer, to different protocol families on the same logical interface, the protocol families share the same policer instance. This means that rate limiting is performed aggregately for the protocol families for which the policer is applied. This feature enables you to use a single policer instance to perform aggregate policing for different protocol families on the same physical interface. If you want a policer instance to be associated with a protocol family, the corresponding physical interface filter needs to be applied to that protocol family. The policer is not automatically applied to all protocol families configured on the physical interface.

In contrast, with logical interface policers there are multiple separate policer instances.

## Policers Applied to Layer 2 Traffic

In addition to hierarchical policing, you can also apply single-rate two-color policers and three-color policers (both single-rate and two-rate) to Layer 2 input or output traffic. You must configure the two-color or three-color policer as a logical interface policer and reference the policer in the interface configuration at the logical unit level, and not at the protocol level. You cannot apply a two-color or three-color policer to Layer 2 traffic as a stateless firewall filter action.

## Multifield Classification

Like behavior aggregate (BA) classification, which is sometimes referred to as class-of-service (CoS) value traffic classification, multifield classification is a method of classifying incoming traffic by associating each packet with a forwarding class, a packet loss priority level, or both. The CoS scheduling configuration assigns packets to output queues based on forwarding class. The CoS random early detection (RED) process uses the drop probability configuration, output queue fullness percentage, and packet loss priority to drop packets as needed to control congestion at the output stage.

BA classification and multifield classification use different fields of a packet to perform traffic classification. BA classification is based on a *CoS value* in the IP packet header. Multifield classification can be based on *multiple fields* in the IP packet header, including CoS values. Multifield classification is used instead of BA classification when you need to classify packets based on information in the packet other than the CoS values only. Multifield classification is configured using a stateless firewall filter term that matches on any packet header fields and associates matched packets with a forwarding class, a loss priority, or both. The forwarding class or loss priority can be set by a firewall filter action or by a policer referenced as a firewall filter action.

## Understanding the Use of Policers in Firewall Filters

### IN THIS SECTION

- [Policers Overview | 2171](#)
- [Policer Types | 2171](#)
- [Policer Actions | 2172](#)
- [Policer Levels | 2173](#)
- [Color Modes | 2173](#)
- [Naming Conventions for Policers | 2174](#)

Policing, or rate limiting, is an important component of firewall filters that lets you control the amount of traffic that enters an interface on Juniper Networks EX Series Ethernet Switches. You can achieve policing by including policers in *firewall filter* configurations.

## Policers Overview

You can use policers to specify rate limits on traffic. A firewall filter configured with a policer permits only traffic within a specified set of rate limits, thereby providing protection from denial-of-service (DoS) attacks. Traffic that exceeds the rate limits specified by the policer is either discarded immediately or is marked as lower priority than traffic that is within the rate limits. The switch discards the lower-priority traffic when there is traffic congestion.

A policer applies two types of rate limits on traffic:

- Bandwidth—The number of bits per second permitted, on average.
- Maximum burst size—The maximum size permitted for bursts of data that exceed the given bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can define specific classes of traffic on an interface and apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then use the policer in a firewall filter configuration.

On all EX Series switches except Juniper Networks EX8200 Ethernet Switches, each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limit specified for the policer. Each EX8200 switch contains three global management counters. You must assign ingress policers to these global management counters to obtain policer statistics. You can assign any number of ingress policers to each global management counter. The policer statistics for each global management counter are the aggregate of the policer statistics for all policers associated with that global management counter.

To get filter-specific packet counts, you must configure a different policer for each firewall filter. Policers give term-specific counts by default.

## Policer Types

Switches support three types of policers:

- Single-rate two-color—A two-color policer (sometimes called simply “policer”) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit or simply discard them. A two-color policer is most useful for metering traffic at the port (physical interface) level.
- Single-rate three-color—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and the excess burst size

(EBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets are arriving at rates that are below the CBS (green), exceed the CBS but not the EBS (yellow), or exceed the EBS (red). A single-rate three-color policer is most useful when a service is structured according to packet size and not according to peak arrival rate.

- **Two-rate three-color**—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and the peak information rate (PIR), along with their associated burst sizes; the CBS, and the peak burst size (PBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on packets are arriving at rates that are below the CIR (green), exceed the CIR but not the PIR (yellow), or exceed the PIR (red). A two-rate three-color policer is most useful when a service is structured according to arrival rates and not to packet size.

## Policer Actions

Policer actions can be implicit or explicit and vary by policer type. The term implicit means that Junos OS assigns a loss-priority value automatically; explicit means that you configure the action. [Table 120 on page 2172](#) lists policer actions.

**Table 120: Policer Actions**

| Policer                 | Marking             | Implicit Action           | Configurable Action                                                     |
|-------------------------|---------------------|---------------------------|-------------------------------------------------------------------------|
| Single-rate two-color   | Green (Conforming)  | Assign low loss priority  | None                                                                    |
|                         | Red (Nonconforming) | None                      | Assign low or high loss priority, assign a forwarding class, or discard |
|                         | Yellow              | Not supported             | Not supported                                                           |
| Single-rate three-color | Green (Conforming)  | Assign low loss priority  | None                                                                    |
|                         | Red (Above the EBS) | Assign high loss priority | Discard                                                                 |

Table 120: Policer Actions (*Continued*)

| Policer              | Marking                                  | Implicit Action                                                            | Configurable Action                                   |
|----------------------|------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------|
|                      | Yellow (Exceeds the CBS but not the EBS) | Assign high loss priority<br><b>NOTE:</b> Not supported on EX8200 switches | None<br><b>NOTE:</b> Not supported on EX8200 switches |
| Two-rate three-color | Green (Conforming)                       | Assign low loss priority                                                   | None                                                  |
|                      | Red (Above the PIR)                      | Assign high loss priority                                                  | Discard                                               |
|                      | Yellow (Exceeds the CIR but not the PIR) | Assign high loss priority<br><b>NOTE:</b> Not supported on EX8200 switches | None<br><b>NOTE:</b> Not supported on EX8200 switches |

**NOTE:** You cannot apply a policer with an action of forwarding-class to an output firewall filter.

**NOTE:** Beginning with Junos OS Release 17.1, on EX4300 switches, you can configure the policer action loss-priority to be low, medium-low, medium-high, or high.

## Policer Levels

You can configure policers at the queue level, *logical interface* level, or Layer 2 (MAC) level. Only a single policer is applied to a packet at the egress queue. The search for policers occurs in this order:

- Queue level
- Logical interface level
- Layer 2 (MAC) level

## Color Modes

Tricolor marking (TCM) policers are not bound by a green-yellow-red coloring convention. Packets are marked with low or high PLP bit configurations based on color. Therefore, both three-color policer types

(single-rate and two-rate) extend the functionality of class-of-service (CoS) traffic policing by providing three levels of drop precedence (loss priority) instead of the two normally available in policers. Both single-rate and two-rate three-color policer types can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer operates without reference to whether the examined packets have been previously marked or metered. In other words, the three-color policer is *blind* to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer operates with reference to any previous marking or metering of the examined packets. In other words, the three-color policer is *aware* of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but can never decrease it. For example, if a color-aware three-color policer meters a packet with a low PLP marking, it can raise the PLP level to high. But it cannot reduce a high PLP level to low.

## Naming Conventions for Policers

We recommend you use the naming convention *rate-TCMnumber-colortype* when configuring three-color policers. TCM stands for tricolor marking. Because policers can be numerous and must be applied correctly to work, observing a simple naming convention makes it easier to apply the policers properly.

For example, if you configure a single-rate, three-color, color-aware policer, name it srTCM1-ca. If you configure a two-rate, three-color, color-blind policer, name it trTCM2-cb.

### Release History Table

| Release | Description                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.1    | Beginning with Junos OS Release 17.1, on EX4300 switches, you can configure the policer action loss-priority to be low, medium-low, medium-high, or high. |

## Understanding Tricolor Marking Architecture

Tricolor marking (TCM) policers provide two functions: metering and marking. A policer meters each packet and passes the packet and the metering result to the marker.

The meter operates in two modes. In the color-blind mode, the meter treats the packet stream as uncolored. Any preset loss priorities are ignored. In the color-aware mode, the meter inspects the packet loss priority (PLP) field, which has been set by an upstream device as high or low; in other words, the PLP field has already been set by a behavior aggregate (BA) or multifield (MF) classifier. The marker changes the PLP of each incoming IP packet according to the results of the meter.

Single-rate TCM is so called because traffic is policed according to one rate—the committed burst rate (CBR)—and two burst sizes: the committed burst size (CBS) and the excess burst size (EBS). The configured information rate (CIR) specifies the average rate at which bits are admitted to the network. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes for packets that are admitted to the network. The EBS is greater than or equal to the CBS, and neither can be 0. As each packet enters the network, its bytes are counted. Packets that do not exceed the CBS are marked low PLP. Packets that exceed the peak information rate (PIR) are marked high PLP.

Two-rate TCM is so called because traffic is policed according to two rates: the CIR and the PIR. The PIR is greater than or equal to the CIR. The CIR specifies the average rate at which bits are admitted to the network, and the PIR specifies the maximum rate at which bits are admitted to the network. As each packet enters the network, its bits are counted. Bits in packets that do not exceed the CIR have their packets marked low PLP. Bits in packets that exceed the PIR have their packets marked high PLP.

### RELATED DOCUMENTATION

[Understanding the Use of Policers in Firewall Filters | 2170](#)

[Configuring Tricolor Marking Policers | 2178](#)

## Configuring Policers to Control Traffic Rates (CLI Procedure)

### IN THIS SECTION

- [Configuring Policers | 2176](#)
- [Specifying Policers in a Firewall Filter Configuration | 2178](#)
- [Applying a Firewall Filter That Is Configured with a Policer | 2178](#)

You can configure policers to rate limit traffic on EX Series switches. After you configure a policer, you can include it in an ingress firewall filter configuration.

When you configure a firewall filter, you can specify a policer action for any term or terms within the filter. All traffic that matches a term that contains a policer action goes through the policer that the term references. Each policer that you configure includes an implicit counter. To get term-specific packet counts, you must configure a separate policer for each filter term that requires policing.

**NOTE:** On all EX Series switches except EX8200 switches, each policer that you configure includes an implicit counter. To ensure term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the ["counter" on page 2342](#) option.

The following policer limits apply on a switch:

- A maximum of 512 policers can be configured for port firewall filters.
- A maximum of 512 policers can be configured for VLAN and Layer 3 firewall filters.

If the number of policers in the firewall filter configuration exceeds these limits, the switch returns the following message when you commit the configuration:

```
Cannot assign policers: Max policer limit reached
```

This topic includes these tasks:

## Configuring Policers

To configure a policer:

1. Specify the name of the policer:

```
[edit firewall]
user@switch# set policer policer-one
```

The policer name can include letters, numbers, and hyphens (-) and can contain up to 64 characters.

2. Specify the filter-specific statement to configure a policer to act as a filter-specific policer; else proceed to step 3:

```
[edit firewall]
user@switch# set policer policer-one filter-specific
```

If you do not specify the filter-specific statement, the policer acts as a term-specific policer by default.

**3. Configure rate limiting for the policer:**

- a. Specify the bandwidth limit in bits per second (bps) to control the traffic rate on an interface:

```
[edit firewall policer policer-one]
user@switch# set if-exceeding bandwidth-limit 300k
```

The range for the bandwidth limit is 1k through 102.3g bps.

- b. Specify the burst-size limit (the maximum allowed burst size in bytes) to control the amount of traffic bursting:

```
[edit firewall policer policer-one]
user@switch# set if-exceeding burst-size-limit 500k
```

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur:

burst size = (bandwidth) \* (allowable time for burst traffic)

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

**4. Specify the policer action **discard** to discard packets that exceed the rate limits:**

```
[edit firewall policer]
user@switch# set policer-one then (Policer Action) discard
```

Discard is the only supported policer action.

**5. On EX8200 switches, you must assign a global management counter to the policer to obtain policer statistics:**

```
[edit firewall policer]
user@switch# set policer-one counter counter-id 0
```

In this sample statement, the global management counter ID is **0**. You can assign any number of policers to the global management counter. The policer statistics displayed for each counter are the collective statistics of all policers assigned to that counter.

## Specifying Policers in a Firewall Filter Configuration

To reference a policer for a single firewall, configure a filter term that includes the policer action:

```
[edit firewall family ethernet-switching]
user@switch# set filter limit-hosts term term-one from source-address 192.0.2.0/28
users@witch# set filter limit-hosts term term-one then policer policer-one
```

## Applying a Firewall Filter That Is Configured with a Policer

A firewall filter that is configured with one or more policer actions, like any other firewall filter, must be applied to a port, VLAN, or Layer 3 interface. For information about applying firewall filters, see the sections on applying firewall filters in "[Configuring Firewall Filters \(CLI Procedure\)](#)" on page 1622.

## Configuring Tricolor Marking Policers

### IN THIS SECTION

- [Configuring a Tricolor Marking Policer | 2179](#)
- [Applying Tricolor Marking Policers to Firewall Filters | 2180](#)

You can rate-limit traffic on EX Series switches by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

This topic describes how to configure single-rate and two-rate tricolor marking (TCM) policers, also known as single-rate and two-rate three-color policers. If you want to configure a single-rate two-color policer (also known just as a "policer"), see ["Configuring Policers to Control Traffic Rates \(CLI Procedure\)" on page 2175](#).

## Configuring a Tricolor Marking Policier

A tricolor marking policer polices traffic on the basis of metering rates, including the configured information rate (CIR), the peak information rate (PIR), their associated burst sizes, and any policing actions configured for the traffic. With tri-color marking, you can configure traffic policing according to two separate modes—color-blind and color-aware. In color-blind mode, the current packet loss priority (PLP) value is ignored. In color-aware mode, the current PLP values are considered by the policer, and the policer can increase those values but cannot decrease them.

To configure a tricolor marking (TCM) policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify the policer as either single-rate or two-rate and as color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set rate mode
```

For example:

```
[edit firewall three-color-policer srTCm-1a]
user@switch# set single-rate color-aware
[edit firewall three-color-policer trTCM2-cb]
user@switch# set two-rate color-blind
```

3. For a single-rate TCM policer, configure the CIR, committed burst size (CBS), and excess burst size (EBS):

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For a two-rate TCM policer, configure the CIR, CBS, PIR, and peak burst size (PBS):

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

## Applying Tricolor Marking Policers to Firewall Filters

To rate-limit traffic by applying a tricolor marking (TCM) policer to a firewall filter:

```
[edit firewall family family filter filter-name term term-name then]
user@switch# set three-color-policer rate stTCM1-ca
```

For example:

```
[edit firewall family inet filter test1 term term1 then]
user@switch# set three-color-policer single-rate policer1
```

You must include either the `single-rate` statement or the `two-rate` statement in the reference to the policer in the firewall filter configuration, and this statement must match the configured TCM policer.

Otherwise, an error message appears in the configuration listing.

For example, if you configure **srTCM1-ca** as a single-rate TCM policer and try to apply it as a two-rate policer, the following message appears:

```
[edit firewall]
user@switch# show three-color-policer srTCM1-ca
single-rate {
 color-aware;
 . . .
```

```

}
user@switch# show filter TESTER
term A {
 then {
 three-color-policer {
 ##
 ## Warning: Referenced two-rate policer does not exist
 ##
 two-rate srTCM;
 }
 }
}
}

```

## Understanding Policers with Link Aggregation Groups

If you apply a policer to a link aggregation group (LAG) on a standalone switch or QFabric node, the policer applies to all the interfaces in the LAG in aggregate. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer (by using a *firewall filter*) to a LAG that has two member interfaces on a single switch or node, the total allowed throughput for both members is 1 Gbps.

If you apply a policer to a LAG that has members on different nodes in a QFabric network Node group or redundant server Node group, the configured rate applies to the interface on each node. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer to a LAG that has one member on server node A and one member on server node B, the allowed throughput for each member is 1 Gbps, for a total allowed throughput of 2 Gbps.

## Understanding Color-Blind Mode for Single-Rate Tricolor Marking

With the color-blind mode of single-rate tricolor marking, all packets are evaluated against the CBS. If a packet exceeds the CBS, it is evaluated against the EBS. In color-blind mode, the policer supports three loss priorities only: low, medium-high, and high.

Packets that exceed the CBS but are below the EBS are marked yellow (medium-high). Packets that exceed the EBS are marked red (high), as shown in [Table 121 on page 2182](#).

**Table 121: Color-Blind Mode TCM Color-to-PLP Mapping**

| Color  | PLP                | Meaning                                                     |
|--------|--------------------|-------------------------------------------------------------|
| Green  | <b>low</b>         | Conforming.                                                 |
| Yellow | <b>medium-high</b> | Packet exceeds the CIR and CBS but does not exceed the EBS. |
| Red    | <b>high</b>        | Packet exceeds the EBS.                                     |

## Understanding Color-Aware Mode for Single-Rate Tricolor Marking

### IN THIS SECTION

- [Summary of PLP Changes | 2183](#)

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase a preassigned PLP but cannot decrease it.

## Summary of PLP Changes

Table 122 on page 2183 shows how a packet's incoming priority can be modified with single-rate marking.

**Table 122: Color-Aware Mode Single-Rate PLP Mapping**

| Incoming PLP       | Packet Metered Against      | Possible Cases                                              | Outgoing PLP       |
|--------------------|-----------------------------|-------------------------------------------------------------|--------------------|
| <b>low</b>         | CIR, CBS, and EBS           | Conforming                                                  | <b>low</b>         |
|                    |                             | Packet exceeds the CIR and CBS but does not exceed the EBS. | <b>medium-high</b> |
|                    |                             | Packet exceeds the EBS.                                     | <b>high</b>        |
| <b>medium-low</b>  | EBS only                    | Packet does not exceed the EBS.                             | <b>medium-low</b>  |
|                    |                             | Packet exceeds the EBS.                                     | <b>high</b>        |
| <b>medium-high</b> | EBS only                    | Packet does not exceed the EBS.                             | <b>medium-high</b> |
|                    |                             | Packet exceeds the EBS.                                     | <b>high</b>        |
| <b>high</b>        | Not metered by the policer. | All cases.                                                  | <b>high</b>        |

The following sections describe single-rate color-aware PLP mapping in more detail.

### Effect on Green Packets (Low PLP)

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the PLP unchanged or increase it to medium-high or high, so these packets are therefore metered against both the CBS and the EBS. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, packets remain marked as low PLP.
- If bursts exceed the CBS but not the EBS, some of the packets are marked as medium-high PLP, and some of the packets remain marked as low PLP.

- If bursts exceed the EBS, some of the packets are marked as high PLP, and some of the packets remain marked as low PLP.

### Effect on Yellow Packets (Medium PLP)

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high, so these packets are therefore metered against the EBS only. For example, if a behavior aggregate or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-high PLP.

### Effect on Red Packets (High PLP)

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CBS or the EBS.

## Understanding Color-Blind Mode for Two-Rate Tricolor Marking

With the color-blind mode of two-rate tricolor marking, all packets are evaluated against the committed information rate (CIR). If a packet exceeds the CIR, it is evaluated against the peak information rate (PIR). Packets that exceed the CIR but are below the PIR are marked yellow (medium-high). Packets that exceed the PIR are marked red (high).

Table 123: Color-Blind Mode TCM Color-to-PLP Mapping

| Color  | PLP                | Meaning                                             |
|--------|--------------------|-----------------------------------------------------|
| Green  | <b>low</b>         | Packet does not exceed the CIR.                     |
| Yellow | <b>medium-high</b> | Packet exceeds the CIR but does not exceed the PIR. |
| Red    | <b>high</b>        | Packet exceeds the PIR.                             |

|                    |                             | Packet exceeds the PIR.                 | <b>high</b>        |
| <b>high</b>        | Not metered by the policer. | All cases.                              | <b>high</b>        |

The following sections describe color-aware two-rate PLP mapping in more detail.

### Effect on Green Packets (Low PLP)

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the packet's PLP unchanged or increase the PLP to medium-high or high. These packets are therefore metered against both the CIR and the PIR. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as low PLP.

- If the rate of traffic flow is greater than the CIR but less than the PIR, some of the packets are marked as medium-high PLP and some of the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as low PLP.

### Effect on Yellow Packets (Medium PLP)

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high. These packets are therefore metered against the PIR only. For example, if a behavior aggregate (BA) or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-high PLP.

### Effect on Red Packets (High PLP)

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CIR or the PIR.

[Overview of Policers | 2157](#)

[Configuring Color-Blind Egress Policers for Medium-Low PLP | 2197](#)

## Example: Using Two-Color Policers and Prefix Lists

If you provide specific amounts of bandwidth to internal or external customers, you can use policing to make sure that customers do not consume more bandwidth than they should receive. For example, you might connect many customers to one 10-Gbps interface and want to ensure that none of them congest the interface by using more bandwidth than they have been allotted.

You could accomplish this by creating a two-color policer similar to the following for each customer:

```
firewall {
 policer Limit-Customer-1 {
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 150m;
 }
 then discard;
 }
}
```

Creating a policer for each customer is clearly not a scalable solution, however. As an alternative, you can create prefix lists that group classes of customers and then create policers for each prefix list. For example, you could create prefix lists such as **Class-A-Customer-Prefixes**, **Class-B-Customer-Prefixes**, and **Class-C-Customer-Prefixes** (at the [edit policy-options] hierarchy level) and create the following corresponding policers:

```
firewall {
 policer Class-A {
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 150m;
 }
 then discard;
 }
 policer Class-B {
 if-exceeding {
 bandwidth-limit 75m;
 burst-size-limit 100m;
 }
 then discard;
 }
 policer Class-C {
 if-exceeding {
```

```

 bandwidth-limit 50m;
 burst-size-limit 75m;
 }
 then discard;
}
}

```

You must create filter terms that specify the prefix lists in their `from` statements and the corresponding policers in their `then` statements similar to the following:

```

firewall
 family inet {
 filter Class-A-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-A-Customer-Prefixes;
 }
 }
 then policer Class-A;
 }
 }
 filter Class-B-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-B-Customer-Prefixes;
 }
 }
 then policer Class-B;
 }
 }
 filter Class-C-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-C-Customer-Prefixes;
 }
 }
 then policer Class-C;
 }
 }
 }
}

```

```
}
}
```

Here are the steps to create this firewall configuration:

1. Create the first policer:

```
[edit firewall]
user@switch# set policer Class-A if-exceeding bandwidth-limit 100m burst-size-limit 150m
user@switch# set policer Class-A then discard
```

2. Create the second policer:

```
[edit firewall]
user@switch# set policer Class-B if-exceeding bandwidth-limit 75m burst-size-limit 100m
user@switch# set policer Class-B then discard
```

3. Create the third policer:

```
[edit firewall]
user@switch# set policer Class-C if-exceeding bandwidth-limit 50m burst-size-limit 75m
user@switch# set policer Class-C then discard
```

4. Create a filter for class A customers:

```
[edit firewall]
user@switch# edit family inet filter Class-A-Customers
```

5. Configure the filter to send packets matching the **Class-A-Customer-Prefixes** prefix list to the **Class-A** policer:

```
[edit firewall family inet filter Class-A-Customers]
user@switch# set term term-1 from source-prefix-list Class-A-Customers
user@switch# set term term-1 then policer Class-A
```

6. Create a filter for class B customers:

```
[edit firewall]
user@switch# edit family inet filter Class-B-Customers
```

7. Configure the filter to send packets matching the **Class-B-Customer-Prefixes** prefix list to the **Class-B** policer:

```
[edit firewall family inet filter Class-B-Customers]
user@switch# set term term-1 from source-prefix-list Class-B-Customers
user@switch# set term term-1 then policer Class-B
```

8. Create a filter for class C customers:

```
[edit firewall]
user@switch# edit family inet filter Class-C-Customers
```

9. Configure the filter to send packets matching the **Class-C-Customer-Prefixes** prefix list to the **Class-C** policer:

```
[edit firewall family inet filter Class-C-Customers]
user@switch# set term term-1 from source-prefix-list Class-C-Customers
user@switch# set term term-1 then policer Class-C
```

10. Apply the filters you created to the appropriate interfaces in the output direction.

**NOTE:** Note that the implicit deny statement in this filter will block traffic from any source that does not match one of the prefix lists. If you want the filter to allow this traffic, you must include an explicit term for this purpose.

## RELATED DOCUMENTATION

[Overview of Policers](#) | 2157

[prefix-list](#) | 2314

## Example: Using Policers to Manage Oversubscription

You might want to use a policer when an interface is oversubscribed and you want to control what will happen if congestion occurs. For example, you might have servers connected to a switch as listed in [Table 125 on page 2192](#).

**Table 125: Servers Connected to Switch**

| Server Type                | Connection           | IP Address |
|----------------------------|----------------------|------------|
| Network application server | 1-gigabit interface  | 10.0.0.1   |
| Authentication server      | 1-gigabit interface  | 10.0.0.2   |
| Database server            | 10-gigabit interface | 10.0.0.3   |

In this example, users access services provided by the network application server, which requests information from the database server as appropriate. When it receives a request from a user, the network application server first contacts the authentication server to verify the user's credentials. When a user is authenticated and the network application server provides the requested service, all the packets sent from the database server to the application server must transit the 1-Gigabit Ethernet interface connected to the application server twice—once on ingress to the application server and again on egress to the user.

The sequence of events for a user session is as follows:

1. A user connects to the application server and requests a service.
2. The application server requests the user's credentials and relays them to the authentication server.
3. If the authentication server verifies the credentials, the application server initiates the requested service.
4. The application server requests the files necessary to meet the user's request from the database server.
5. The database server sends the requested files to the application server.
6. The application server includes the requested files in its response to the user.

Traffic from the database server to the application server might congest the 1-gigabit interface to which that the application server is connected. This congestion might prevent the server from responding to

requests from users and creating new sessions for them. You can use policing to make sure that this does not occur.

To create this firewall configuration, perform the following steps on the database server:

1. Create a policer to drop traffic from the database server to the application server if it exceeds certain limits:

```
[edit firewall]
user@switch# set policer Database-Egress-Policer if-exceeding bandwidth-limit 400 burst-size-limit 500m
user@switch# set policer Database-Egress-Policer then discard
```

2. Create a filter to examine traffic from the database server to the application server:

```
[edit firewall]
user@switch# edit family inet filter Database-Egress-Filter
```

3. Configure the filter to apply the policer to traffic egressing the database server and destined for the application server:

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-1 from destination-address 10.0.0.1
user@switch# set term term-1 then policer Database-Egress-Policer
```

4. If required, configure a term to allow traffic from the database server to other destinations (otherwise the traffic will be dropped by the implicit deny statement):

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-2 then accept
```

Note that omitting a `from` statement causes the term to match all packets, which is the desired behavior.

5. Install the egress filter as an output filter on the database server interface that is connected the application server:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet filter output Database-Egress-Filter
```

Here is how the final configuration would appear:

```
firewall {
 policer Database-Egress-Policer {
 if-exceeding {
 bandwidth-limit 400;
 burst-size-limit 500m;
 }
 then discard;
 }
 family inet {
 filter Database-Egress-Filter {
 term term-1 {
 from {
 destination-address {
 10.0.0.1/24;
 }
 }
 then policer Database-Egress-Policer;
 }
 term term-2 { # If required, include this term so that traffic from the database
server to other destinations is allowed.
 then accept;
 }
 }
 }
}
```

## RELATED DOCUMENTATION

[Overview of Policers](#) | 2157

## Assigning Forwarding Classes and Loss Priority

You can configure firewall filters to assign packet loss priority (PLP) and forwarding classes so that if congestion occurs, the marked packets can be dropped according to the priority you set. The valid match conditions are one or more of the six packet header fields: destination address, source address, IP protocol, source port, destination port, and DSCP. In other words, you can set the forwarding class and

the PLP for each packet entering an interface with a specific destination address, source address, IP protocol, source port, destination port, or DSCP.

**NOTE:** Junos OS assigns forwarding classes and PLP on ingress only. Do not use a filter that assigns forwarding classes or PLP as an egress filter.

When tricolor marking is enabled, a switch supports four PLP designations: **low**, **medium-low**, **medium-high**, and **high**. You can also specify any of the forwarding classes listed in [Table 126 on page 2195](#)

**Table 126: Unicast Forwarding Classes**

| Unicast Forwarding Class | For CoS Traffic Type                                               |
|--------------------------|--------------------------------------------------------------------|
| <b>be</b>                | Best-effort traffic                                                |
| <b>no-loss</b>           | Guaranteed delivery for TCP traffic                                |
| <b>fcoe</b>              | Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic |
| <b>nc</b>                | Network-control traffic                                            |

To assign forwarding classes in firewall filters:

1. Configure the family address type and filter name:

```
[edit]
user@switch# edit firewall family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter as appropriate, including the **forwarding-class** and **loss-priority** action modifiers. For example, each of the following terms in the filter examines various packet header fields and assigns the appropriate forwarding class and packet loss priority:
  - The term **corp-traffic** matches all IPv4 packets with a **10.1.1.0/24** source address and assigns the packets to forwarding class **no-loss** with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term corp-traffic from source-address 10.1.1.0/24;
user@switch# set term corp-traffic then forwarding-class no-loss
user@switch# set term corp-traffic then loss-priority low
```

- The term **data-traffic** matches all IPv4 packets with a **10.1.2.0/24** source address and assigns the packets to forwarding class **be** (best effort) with a loss priority of **medium-high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from source-address 10.1.2.0/24;
user@switch# set term data-traffic then forwarding-class be
user@switch# set term data-traffic then loss-priority medium-high
```

- Because the loss of network-generated packets can jeopardize proper network operation, the delay of these packets is preferable to discarding these packets. The term **network-traffic** assigns the packets with an IP precedence of **net-control** to forwarding class **nc** (network control) with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class nc
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the packets to forwarding class **be** with a loss priority of **high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic then forwarding-class be
user@switch# set term accept-traffic then loss-priority high
```

3. Apply the filter **ingress-filter** to a port, VLAN, or Layer 3 interface. For information about applying the filter, see ["Configuring Firewall Filters" on page 1803](#). (Assigning forwarding classes and PLP is supported only on ingress filters.)

## Configuring Color-Blind Egress Policers for Medium-Low PLP

If you use color-blind mode and want to configure an egress policer that marks packets to have medium-low PLP, you must configure a single-rate two-color policer at the [edit firewall policer *policer-name*] hierarchy level, because color-blind mode does not support medium-low priority. For example:

1. Specify the name of the policer, the bandwidth limit in bits per second (bps) to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit]
user@switch# set firewall policer policer-name if-exceeding bandwidth-limit bytes burst-size-limit bytes
```

2. Specify medium-low loss priority for matching packets:

```
[edit]
user@switch# set firewall policer policer-name then loss-priority medium-low;
```

3. Apply the filter to a port, VLAN, or Layer 3 interface.

## Configuring Two-Color and Three-Color Policers to Control Traffic Rates

### IN THIS SECTION

- [Configuring Two-Color Policers | 2198](#)
- [Configuring Three-Color Policers | 2199](#)

- [Specifying Policers in a Firewall Filter Configuration | 2200](#)
- [Applying a Firewall Filter That Includes a Policer | 2200](#)

You can rate-limit traffic by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

## Configuring Two-Color Policers

To configure a two-color policer:

1. Specify the name of the policer, the bandwidth limit to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit firewall]
user@switch# set policer policer-name <filter-specific> if-exceeding bandwidth-limit bps
burst-size-limit bytes
```

The policer name can contain letters, numbers, and hyphens (-) and can have as many as 64 characters.

The range for the bandwidth limit is 32000 (32k) through 102,300,000,000 (102300m) bps.

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur and divide the result by 8:

**maximum burst size = (interface bandwidth) X (allowable time for burst) / (8 bits/byte)**

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

2. Specify the policer action to discard or assign a loss priority to packets that exceed the rate limits:

```
[edit firewall policer policer-name]
user@switch# set then (discard | loss-priority low | loss-priority high)
```

## Configuring Three-Color Policers

To configure a three-color policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify whether the three-color policer should be single-rate or two-rate and whether it should be color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set (single-rate | two-rate) (color-aware | color-blind)
```

3. For single-rate three-color policers, configure the CIR, CBS, and EBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For two-rate three-color policers, configure the CIR, CBS, PIR, and PBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

## Specifying Policers in a Firewall Filter Configuration

To use a two-color policer, configure a filter term that includes the action **policer**:

```
[edit firewall family family-name]
user@switch# set filter filter-name term name then name
```

For example, the following commands apply a two-color policer to all packets sent from 192.0.2.0/24.

```
[edit firewall family family-name]
user@switch# set filter limit-hosts term term1 from source-address 192.0.2.0/24
user@switch# set filter limit-hosts term term1 then policer policer1
```

To use a three-color policer, configure a filter term that includes the action **three-color-policer**:

```
[edit firewall family name]
user@switch# set filter name term name from match-condition
user@switch# set filter name term name then three-color-policer (single-rate | two-rate) name
```

For example, the following commands apply a single-rate three-color policer to all packets received or sent by interface **ge-0/0/6** (depending on whether the filter is an ingress or egress filter).

```
[edit firewall family name]
user@switch# set filter srTCM term term-one from interface ge-0/0/6
user@switch# set filter srTCM term term-one then three-color-policer single-rate srTCM1-ca
```

You must specify whether the three-color policer is single-rate or two-rate, and this must match the policer itself. Otherwise, the configuration listing includes an error message indicating that the three-color policer you referenced in the filter does not exist.

## Applying a Firewall Filter That Includes a Policer

A firewall filter that includes one or more policer action modifiers must be applied to a port, VLAN, or Layer 3 interface like any other filter. For information about applying firewall filters, see ["Configuring Firewall Filters" on page 1803](#).

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

# Verifying That Two-Color Policers Are Operational

IN THIS SECTION

- [Purpose | 2201](#)
- [Action | 2201](#)
- [Meaning | 2202](#)

## Purpose

Verify that two-color policers in firewall filter configurations are working properly.

## Action

Use the `show firewall policer operational mode` command to verify that the policers are working properly:

```
user@switch> show firewall policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-limit-tcp-icmp
Policers:
Name Packets
icmp-connection-policer 10
tcp-connection-policer 539
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

## Meaning

The `show firewall policer` command displays the names of all firewall filters and policers that are configured. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

## Incomplete Count of Packet Drops

### IN THIS SECTION

- [Problem | 2203](#)
- [Solution | 2204](#)

### Problem

### Description

Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

### Solution

This is expected behavior.

## Counter Reset When Editing Filter

### IN THIS SECTION

- [Problem | 2204](#)
- [Solution | 2204](#)

### Problem

### Description

If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has `term1`, `term2`, and `term3`, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has `term1` and `term2`. Also assume that `term2` has a policer action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit `term1` or `term2` in any way, the counter for the policer referenced by `term2` is reset to 0.

### Solution

This is expected behavior.

## Invalid Statistics for Policer

### IN THIS SECTION

- [Problem | 2205](#)
- [Solution | 2205](#)

### Problem

### Description

If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the `show firewall` command displays incorrect data for the policer.

### Solution

This is expected behavior.

## Policers Can Limit Egress Filters

### IN THIS SECTION

- [Problem | 2205](#)
- [Solution | 2206](#)

### Problem

### Description

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries

for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

## Solution

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

### IN THIS SECTION

● [Problem | 2209](#)

● [Solution | 2210](#)

## Problem

## Description

If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

### Solution

This is expected behavior.

## Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

### IN THIS SECTION

● Problem | [2211](#)

● Solution | [2211](#)

## Problem

### Description

You can configure policers to be filter-specific. This means that Junos OS creates only one policer instance no matter how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

### Solution

To prevent this unexpected behavior, use the information about TCAM slices presented in [Planning the Number of Firewall Filters to Create](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Policers Can Limit Egress Filters

### IN THIS SECTION

- [Problem | 2211](#)
- [Solution | 2212](#)

## Problem

### Description

On some switches, the number of egress policers you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that take up two entries in a 1024-entry TCAM. These are used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you are unable to commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries

for counters get used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

## Solution

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Syntax

```
aigp-adjust (add/divide/multiply/subtract) (user-value | distance-to-protocol-nexthop);
```

## Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then],
[edit policy-options policy-statement policy-name then]
```

## Description

Specify this CLI policy action in an import or export policy to modify the accumulated interior gateway protocol (AIGP) BGP attribute. You can modify the AIGP attribute for one of the following reasons:

- Modify the AIGP metric on the route if it exists on the external BGP sessions between two ASBR routers where there is no interior gateway protocol (IGP)
- Scale up or down while transitioning from one IGP domain, such as OSPF to another IGP domain, such as IS-IS
- Make very minor adjustments on the AIGP from another AS domain or another vendor's routers

**CAUTION:** AIGP is rated very high in the best route decision and comes only after the BGP local preference rule. Therefore, use the AIGP adjustment option with caution as it can have a huge impact on the network.

## Options

|                                               |                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>add   divide  <br/>multiply   subtract</b> | Specify the mathematical operation that needs to be performed on the original AIGP attribute for adjustment.                                                                                                                                                |
| <b>user-value</b>                             | Specify an unsigned 64-bit value in decimal.                                                                                                                                                                                                                |
| <b>distance-to-<br/>protocol-nexthop</b>      | Use the current metric2 value in the routing table as specified in the routing policy. Configure this option in the export policy if you want full control of the advertised AIGP value and do not want BGP to add up the distance to the protocol nexthop. |

[edit logical-systems logical-system-name policy-options policy-statement policy-name term term-name then],
[edit logical-systems logical-system-name policy-options policy-statement policy-name then],
[edit policy-options policy-statement policy-name term term-name then],
[edit policy-options policy-statement policy-name then]
```

## Description

Originate an accumulated interior gateway protocol (AIGP) BGP attribute for a given prefix by export policy, using the `aigp-originate` policy action.

To originate an AIGP attribute, you need configure the policy action on only one node. The AIGP attribute is readadvertised if the neighbors are AIGP enabled with the `aigp` statement in the BGP configuration.

## Default

If you omit the `aigp-originate` policy action, the node still readadvertises the AIGP BGP attribute if AIGP is enabled in the BGP configuration. However, the node does not originate its own AIGP attribute for local prefixes.

As the route is readadvertised by downstream nodes, the cost of the AIGP attribute reflects the IGP distance to the prefix (zero + IGP distance or configured distance + IGP distance).

## Options

*distance*—(Optional) Associate an initial cost when advertising a local prefix with the AIGP BGP attribute.

- **Range:** 0 through 4,294,967,295
- **Default:** The initial cost associated with the AIGP attribute for a local prefix is zero. The *distance* option overrides the default zero value for the initial cost.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- [Description | 2222](#)
- [Options | 2222](#)
- [Required Privilege Level | 2222](#)
- [Release Information | 2222](#)

## Syntax

```
apply-path path;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name policy-options prefix-list name],
[edit policy-options prefix-list name]
```

## Description

Expand a prefix list to include all prefixes pointed to by a defined path. Using the `apply-path` statement eliminates most of the effort required to maintain a group prefix list. You can use this expanded list in defining policies and firewalls.

You can also use the `apply-path` configuration statement with SNMP, as long as the path uses the following configuration: `apply-path "policy-options prefix-list list-name <*>"`. This is the only `apply-path` configuration originally supported for SNMP. As of Junos OS Release 16.1, support for one other SNMP `apply-path` configuration is added: `apply-path "access radius-server <*>"`.

## Options

*path*—String of elements composed of identifiers or configuration keywords that points to a set of prefixes. Use a space to delimit multiple elements. As long as the last path element is not a leaf, that is, terminal, statement, you can include wildcards (enclosed in angle brackets) to match more than one identifier. No elements can be added after a leaf statement, including wildcards.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for `apply-path "access radius-server <*>"` configuration for SNMP added in Junos OS Release 16.1.

Support for the `prefix-list match` condition added in Junos OS Evolved Release 20.2R1 for PTX10003.

### Syntax

```
policer name {
 filter-specific;
 logical-interface-policer;
 physical-interface-policer;
 if-exceeding {
 (bandwidth-limit bits per second | bandwidth-percent percent);
 burst-size-limit bytes;
 }
 then <discard> <forwarding-class forwarding-class> <loss-priority (high | low | medium-high
 | medium-low)> <out-of-profile>;
}
```

### Hierarchy Level

```
[edit firewall]
```

### Description

Apply a policer to an interface. Configure policer rate limits and actions. The traffic to the Routing Engine is controlled by applying the policer on ARP. This prevents network congestion caused by broadcast storms.

A policer applies two types of rate limits on traffic:

- Bandwidth—The number of bits per second permitted, on average
- Maximum burst size—The maximum size permitted for bursts of data that exceed the given bandwidth limit

**Options**

|                                   |                                          |

### Syntax

```
backup-selection {
 destination prefix {
 interface (interface-name| all){
 admin-group {
 exclude [group-name];
 include-all [group-name];
 include-any [group-name];
 preference [group-name];
 }
 bandwidth-greater-equal-primary;
 dest-metric (highest | lowest);
 downstream-paths-only;
 metric-order [root dest];
 node {
```

```

 exclude [node-address];
 preference [node-address];
 }
 protection-type (link | node | node-link);
 root-metric (highest | lowest);
 srlg (loose | strict);
 evaluation-order [admin-group srlg bandwidth protection-type node metric] ;
}
}
}

```

## Hierarchy Level

```

[edit logical-systems logical-system-name routing-options],
[edit logical-systems logical-system-name routing-instances instance-name routing-options],
[edit routing-instances instance-name routing-options],
[edit routing-options]

```

## Description

Define backup selection policies, per prefix per primary next-hop interface, to enforce loop-free alternate (LFA) selection based on admin-group, srlg, bandwidth, protection-type, node, and metric attributes of the backup path.

## Options

|                                      |                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination<br/><i>prefix</i></b> | Define the backup selection policy for a particular destination prefix or for all the prefixes. The value <i>prefix</i> defines the destination prefix name and prefix length. You can specify 0/0 for the IPv4 least-specific prefix or 0::0/0 for the IPv6 least-specific prefix. |
| <b>node</b>                          | Define a list of loop-back IP addresses of the adjacent nodes to either prefer or exclude in the backup path selection. The node can be a local (adjacent router) node, remote node, or any other router in the backup path.                                                        |

**NOTE:** The nodes are identified through the route-id advertised by a node in the LSP.

- exclude** [ *node-address* ] Specify one or more nodes to be excluded. The backup path that has a router from the list is not selected as the loop-free alternative or backup next hop.
- preference** [ *node-address* ] Define an ordered set of one or more nodes to be preferred. The backup path having the leftmost node is selected.

The remaining statements are explained separately. See [CLI Explorer](#).

## community (Policy Options)

### IN THIS SECTION

- [Syntax | 2232](#)
- [Hierarchy Level | 2232](#)
- [Description | 2232](#)
- [Options | 2232](#)
- [Required Privilege Level | 2235](#)
- [Release Information | 2235](#)

### Syntax

```
community name {
 invert-match;
 members [community-ids];
}
```

### Hierarchy Level

```
[edit dynamic policy-options],
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

### Description

Define a community, extended community or large community for use in a routing policy match condition.

### Options

*name*—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").

*invert-match*—Invert the results of the community expression matching. The *community* match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The *invert-match* statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.

*members community-ids*—One or more community members. If you specify more than one member, you must enclose all members in brackets.

The format for *community-ids* is:

```
as-number:community-value
```

Starting in Junos OS Release 15.1, you can apply a wildcard member **segmented-nh.\*:0** to apply the BGP policy to all the S-PMSI A-D routes carrying extended community information.

*as-number* is the AS number and can be a value in the range from 0 through 65,535. *community-value* is the community identifier and can be a number in the range from 0 through 65,535.

You also can specify *community-ids* for communities as one of the following well-known community names, which are defined in RFC 1997, *BGP Communities Attribute*:

- *no-export*—Routes containing this community name are not advertised outside a BGP confederation boundary.
- *no-advertise*—Routes containing this community name are not advertised to other BGP peers.
- *no-export-subconfed*—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

You can explicitly exclude BGP community information with a static route using the *none* option. Include *none* when configuring an individual route in the *route* portion of the *static* statement to override a *community* option specified in the *defaults* portion of the statement.

The format for extended *community-ids* is the following:

```
type:administrator:assigned-number
```

*type* is the type of extended community and can be either a *bandwidth*, *target*, *origin*, *domain-id*, *src-as*, *rt-import*, or a 16-bit number that identifies a specific BGP extended community. The *target* community identifies the destination to which the route is going. The *origin* community identifies where the route originated. The *domain-id* community identifies the OSPF domain from which the route originated. The *src-as* community identifies the autonomous system from which the route originated. The *rt-import* community identifies the route to install in the routing table.

**NOTE:** For `src-as`, you can specify only an AS number and not an IP address. For `rt-import`, you can specify only an IP address and not an AS number.

*administrator* is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

*assigned-number* identifies the local provider.

The format for linking a bandwidth with an AS number is:

bandwidth: *as-number: bandwidth*

*as-number* specifies the AS number and *bandwidth* specifies the bandwidth in bytes per second.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a target or origin extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as `target:334324L:132`.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the target and origin extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal.16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

As defined in RFC 8092, BGP large community uses 12-byte encoding and the format for BGP large *community-ids* is:

```
large: global-administrator: assigned-number: assigned-number
```

`large` indicates BGP large community.

*global-administrator* is the administrator. It is a 4-byte AS number.

*assigned-number* is a 4-byte value used to identify the local provider. BGP large community uses two 4-byte assigned number to identify the local provider.

## Required Privilege Level

## Syntax

```
damping name {
 disable;
 half-life minutes;
 max-suppress minutes;
 reuse number;
 suppress number;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

## Description

Define route flap damping properties to set on BGP routes.

## Options

**disable**—Disable damping on a per-prefix basis. Any damping state that is present in the routing table for a prefix is deleted if damping is disabled.

**half-life *minutes***—Decay half-life. *minutes* is the interval after which the accumulated figure-of-merit value is reduced by half if the route remains stable.

- **Range:** 1 through 45
- **Default:** 15 minutes

**NOTE:** For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.

`max-suppress minutes`—Maximum hold-down time. *minutes* is the maximum time that a route can be suppressed no matter how unstable it has been.

- **Range:** 1 through 720
- **Default:** 60 minutes

**NOTE:** For the max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.

*name*—Name that identifies the set of damping parameters. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

`reuse number`—Reuse threshold. *number* is the figure-of-merit value below which a suppressed route can be used again.

- **Range:** 1 through 20,000
- **Default:** 750 (unitless)

`suppress number`—Cutoff (suppression) threshold. *number* is the figure-of-merit value above which a route is suppressed for use or inclusion in advertisements.

- **Range:** 1 through 20,000
- **Default:** 3000 (unitless)

## Required Privilege Level

`routing`—To view this statement in the configuration.

`routing-control`—To add this statement to the configuration.

## decapsulate (Firewall Filter)

### IN THIS SECTION

- [Syntax | 2240](#)
- [Hierarchy Level | 2241](#)
- [Description | 2241](#)
- [Caveats | 2242](#)
- [Options | 2242](#)
- [Required Privilege Level | 2242](#)
- [Release Information | 2242](#)

## Syntax

```
decapsulate {
 gre {
 apply-groups;
 apply-groups-except;
 forwarding-class;
 interface-group(0 -255)
 no-decrement-ttl;
 routing-instance;
 sample;
 }
 inet-in-udp {
 apply-groups;
 apply-groups-except;
 forwarding-class;
 no-decrement-ttl;
 }
}
```

```

 routing-instance;
 }
 inet6-in-udp {
 apply-groups;
 apply-groups-except;
 forwarding-class;
 no-decrement-ttl;
 routing-instance;
 }
 mpls-in-udp {
 apply-groups;
 apply-groups-except;
 forwarding-class;
 no-decrement-ttl;
 routing-instance;
 }
 gre-in-udp{
 l2tp {
 apply-groups;
 apply-groups-except;
 cookie;
 forwarding-class;
 no-decrement-ttl;
 output-interface;
 sample;
 }
}

```

## Hierarchy Level

[edit **firewall family** *family-name filter filter-name* term *term-name* then],

## Description

Define the termination action for GRE, UDP, and L2TP tunnels.

**NOTE:** inet-in-udp, inet6-in-udp, and mpls-in-udp are supported only on PTX10004, PTX10008, PTX10016 and PTX10001-36MR device models.

## Caveats

The following are the caveats for using the decapsulate firewall filter action.

- For GRE tunnel decapsulate action if "payload type" in GRE header is a value other than IPv4, IPv6, or MPLS, the packet will be dropped.
- For UDP tunnel decapsulation, it is expected that the user will configure term match conditions for UDP destination port correctly to term action for decapsulate of IPv4, IPv6 or MPLS. In case of mismatch traffic can be dropped.
- No decrement TTL attribute is not supported for MPLS payload.
- Output filter cannot match TTL value of outgoing packet for ingress filter decapsulation traffic with no-decrement-ttl configured.

## Options

`gre`—(Optional) Terminate a GRE tunnel for the filter conditions that are matched.

`inet-in-udp`—(Optional) Terminate a UDP tunnel with IPv4 payload.

`inet6-in-udp`—(Optional) Terminate a UDP tunnel with IPv6 payload.

`mpls-in-udp`—(Optional) Terminate a UDP tunnel with MPLS payload.

`l2tp`—(Optional) Terminate an L2TP tunnel for the filter conditions that are matched.

`output-interface interface-name`—(Optional) For L2TP tunnels, enable the packet to be duplicated and sent towards the customer or the network (based on the MAC address in the Ethernet payload),

`cookie l2tpv3-cookie`—(Optional) For L2TP tunnels, specify the L2TP cookie for the duplicated packets. If the tunnel does not contain the receive-cookie configured, packet injection does not happen. In such a case, any received tunnel packet is counted and dropped in the same manner in which packets that arrive with a wrong cookie are counted and dropped.

## Required Privilege Level

`firewall`—To view this statement in the configuration.

`firewall-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.6.

output-interface and cookie options introduced in Junos OS Release 15.1.

decapsulate gre introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers with third generation FPCs and Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers with third-generation FPCs.

no-decrement-ttl attribute for the decapsulate gre filter action introduced in Junos OS Release 15.1F6 and 16.2R1 for PTX5000 routers with third-generation FPCs.

inet-in-udp, inet6-in-udp, and mpls-in-udp introduced in Junos OS Release 22.3R1.

## eracl-ip6-match (packet-forwarding-options)

### IN THIS SECTION

- [Syntax](#) | [2248](#)
- [Hierarchy Level](#) | [2248](#)
- [Description](#) | [2249](#)
- [Options](#) | [2249](#)
- [Required Privilege Level](#) | [2249](#)
- [Release Information](#) | [2249](#)

## Syntax

```
eracl-ip6-match {
 (srcip6-and-destip6 | srcip6-only);
}
```

## Hierarchy Level

```
[edit system packet-forwarding-options]
```

## Description

Use the options of this command to allow source and/or destination IPv6 address match conditions for eRACL inet6 filters.

In Junos, firewall filters are classified as *ingress* or *egress* depending on where in the sequence the packet is evaluated and action taken. Filtering IPv6 traffic on an inet6 egress interface can be useful, for example, for safeguarding a third-party device connected to the Juniper switch.

**NOTE:** After configuring, modifying, or deleting the `erACL-ip6-match` statement, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

## Options

**erACL-ip6-match** Configuring match conditions in a firewall filter for IPv6 source and/or destination IP addresses is only allowed if the `srcip6-and-destip6` or the `srcip6-only` options described below are enabled. The two options cannot both be enabled at the same time. If neither option is configured, the default behavior is to allow match condition to be created for IPv6 destination addresses on egress interfaces only.

- Values:
  - **srcip6-and-destip6**—Choose this option to allow both source and destination IPv6 address match conditions on inet6 interfaces in egress direction. The source and destination port match conditions are also allowed only with this option. Note that when this option is enabled, the scale of eRACLv6 is reduced by half.
  - **srcip6-only**—Choosing this option allows the source IPv6 address match condition in eRACLv6 filters but not a destination address. Both source and destination port match conditions cannot be configured at the same time as this option is enabled (you will get a commit error).

## Required Privilege Level

flow-tap

## Release Information

Statement introduced in Junos OS Release 19.1 (EX4300 and QFX5100 Series switches only).

```

```
[edit routing-instances routing-instance-name protocols bgp group group-name],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

## Description

Apply one or more policies to routes being exported from the routing table into BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

## Options

*policy-names*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

## Description

Apply one or more policies to routes being exported from the routing table into IS-IS.

All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.

For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a *routing policy* for that protocol.

**NOTE:** For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.

## Options

*policy-names*—Name of one or more policies.

- [Options | 2267](#)
- [Required Privilege Level | 2267](#)
- [Release Information | 2267](#)

## Syntax

```
export [policy-name];
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options forwarding-table],
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-instances routing-instance-name routing-options forwarding-table],
[edit routing-options forwarding-table]
```

## Description

Apply one or more policies to routes being exported from the routing table into the forwarding table.

In the `export` statement, list the name of the routing policy to be evaluated when routes are being exported from the routing table into the forwarding table. Only active routes are exported from the routing table.

You can reference the same routing policy one or more times in the same or a different `export` statement.

You can apply export policies to routes being exported from the routing table into the forwarding table for the following features:

- Per-packet load balancing
- Class of service (CoS)

## Options

*policy-name*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

- [Options | 2268](#)
- [Required Privilege Level | 2269](#)
- [Release Information | 2269](#)

### Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices)

```
fib-install-priority <high/medium/>
```

## Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then]
```

## Description

Assign a FIB install priority, as high or low, for matching routes. Non-matching routes are by default classified as unprioritized. When the routes are installed in the forwarding table, the number of forwarding table entries that routes of a particular priority get depends on the memory percentage allotted for the priority. Refer ["fib-prioritization" on page 2269](#) to read more.

Issue the `run show route <prefix> extensive` command as shown in the following example to view the FIB install priority of a particular route.

```
user@host# run show route 10.0.1.1 extensive

inet.0: 33 destinations, 35 routes (33 active, 0 holddown, 0 hidden)
10.0.1.1/32 (1 entry, 1 announced)
TSI:
KRT in-kernel 10.0.1.1/32 -> {10.1.2.1}
 *Static Preference: 5
 FIB Installation Priority: INSTALL PRIORITY MEDIUM
 Next hop type: Router, Next hop index: 11045
 Address: 0x55eaafc82f1c
 Next-hop reference count: 3, key opaque handle: (nil), non-key opaque handle: (nil)
 Next hop: 10.1.2.1 via et-0/0/3.0, selected
 Session Id: 9
 State: <Active Int Ext>
 Local AS:100
 Age: 26
 Validation State: unverified
 Task: RT
 Announcement bits (1): 0-KRT
 AS path: I
 Thread: junos-main
```

## Options

- `high` – Set the FIB install priority as high.

- medium – Set the FIB install priority as medium.

## Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

## Release Information

Command support introduced in Junos OS Evolved Release 22.4R1 for the PTX Series.

## fib-prioritization

## Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices)

```
chassis {
 fib-prioritization {
 high-priority-memory-percent 0...100
 medium-priority-memory-percent 0...100
 }
}
```

## Hierarchy Level

[edit chassis]

## Description

Configure the memory allocation percent to install high and medium priority routes in the Forwarding Information Base (FIB) at device level. Reserve a percentage of memory on chassis for high-priority and medium priority routes, for IPv4, IPv6, and MPLS, BGP, IGP, static, aggregate, generated, and PRPD routes protocol data. The FIB prioritization configuration is a system-wide configuration. The amount of high or medium priority routes supported are different, based on memory available on the FPCs. Please note, that the system must be rebooted every time the FIB prioritization is changed.

```
chassis {
 fib-prioritization {
 high-priority-memory-percent 50
 medium-priority-memory-percent 30
 }
}
```

**NOTE:** Total value of high priority and medium priority percentage must not exceed 100

## Options

fib-prioritization—FIB prefix prioritization to install high and medium priority routes at chassis-level.

- high-priority-memory-percent – Memory allocation for high priority protocol routes. Value range for memory percent is 0 to 100.
- medium-priority-memory-percent – Memory allocation for medium priority protocol routes. Value range for memory percent is 0 to 100.

## Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

## Release Information

Command support introduced in Junos OS Evolved Release 22.4R1 for the PTX Series.

```

## Description

Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the `show route receive-protocol bgp neighbor-address hidden` command. The hidden routes can then be retained or dropped from the routing table by configuring the `keep all | none` statement at the `[edit protocols bgp]` or `[edit protocols bgp group group-name]` hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the `keep all` statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the `keep none` statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

## Options

*policy-names*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

## Syntax

```
import [policy-names];
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols dvmrp],
[edit protocols dvmrp]
```

## Description

Apply one or more policies to routes being imported into the routing table from DVMRP. If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching policy is applied to the route. If no match is found, DVMRP shares with the routing table only those routes that were learned from DVMRP routers.

## Options

*policy-names*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

**NOTE:** Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Statement introduced before Junos OS Release 7.4.

```

## Description

Define the backup selection policy for a specific primary next hop.

## Options

|                                        |                                                                                                                                                                   |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface-name</i></b>           | Name of the primary next-hop interface.                                                                                                                           |
| <b>all</b>                             | All the interfaces.                                                                                                                                               |
| <b>bandwidth-greater-equal-primary</b> | Allow the selection of the backup next hop only if the bandwidth is greater than or equal to the bandwidth of the primary next hop.                               |
| <b>dest-metric (highest lowest)</b>    | Specify the metric from the one-hop neighbor or from the remote router such as an RSVP backup label-switched-path (LSP) tail-end router to the final destination. |
|                                        | <b>highest</b> Select the backup path that has the highest destination metric.                                                                                    |
|                                        | <b>lowest</b> Select the backup path that has the lowest destination metric.                                                                                      |
| <b>downstream-paths-only</b>           | Select the backup path that is a downstream path to the destination.                                                                                              |

**evaluation-order**  
**[ admin-group srlg**  
**bandwidth**  
**protection-type**  
**node metric ]**

Control the order and the criteria of evaluating the backup path. The default order of evaluation is admin-group, srlg, bandwidth, protection-type, node and metric.

**NOTE:** For the explicitly configured evaluation order, only the listed attributes influence the selection of the backup path.

**metric-order [ root**  
**dest ]**

Specify the order of preference of the root and the destination metric during the backup path selection. The preference order can be:

- [root dest] — Backup path selection or preference is first based on the root-metric criteria. If the criteria of all the root-metric is the same, then the selection or preference is based on the dest-metric.
- [dest root] — Backup path selection or preference is first based on the dest-metric criteria. If the criteria of all the dest-metric is the same, then the selection is based on the root-metric.

**NOTE:** Backup path selection or preference is first based on the dest-metric criteria. If the criteria of all the dest-metric is the same, then the selection is based on the root-metric. By default, backup paths with lower destination metric criteria are selected or preferred. If the criteria is the same, then the lowest root metric criteria is preferred or selected.

**root** The metric to a one-hop neighbor or a remote router.

**dest** The metric from a one-hop neighbor or remote router to the final destination.

**protection-type**  
**(link | node | node-**  
**link)**

Specify the required protection type of the backup path.

**NOTE:** If no protection-type is configured, then by default the first best path that matches all the other criteria is executed.

**link** Select the backup path that provides link protection.

**node** Select the backup path that provides node protection.

|                                     |                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>node-link</b>                    | Allow either node or link protection LFA where node-protection LFA is preferred over link-protection LFA.                                                                |
| <b>root-metric (highest lowest)</b> | Specify the metric to the one-hop neighbor or to the remote router such as an RSVP backup label-switched-path (LSP) tail-end router.                                     |
| <b>highest</b>                      | Select the highest root metric.                                                                                                                                          |
| <b>lowest</b>                       | Select the lowest root metric.                                                                                                                                           |
| <b>srlg (loose   strict)</b>        | Define the backup selection to either allow or reject the common shared risk link groups (SRLGs) between the primary link and any link in the backup path.               |
| <b>loose</b>                        | Allow the backup path that has common srlgs between the primary link and any link in the backup path. A backup path with a fewer number of srlg collisions is preferred. |
| <b>strict</b>                       | Reject the backup path that has common srlgs between the primary next-hop link and each link in the backup path.                                                         |

### Syntax

```
ip-options-protocol-queue protocol-name {
 protocol-id protocol-id;
 queue-depth queue-depth;
}
```

### Hierarchy Level

```
[edit forwarding-options]
```

### Description

Configure logical queue-depth in the PFE for ip-options packets for a given protocol such as TCP, UDP, ICMP, and so on, except IGMP. The queue-depth indicates the number of ip-options packets that can be enqueued in the PFE logical queue, beyond which it will start dropping the packets. Currently, IGMP has a default queue-depth of 192 (which is not configurable), and other protocols have a cumulative default queue-depth of 25. The CLI supports configuration for a maximum of 16 protocols. The sum total of queue-depth for all the protocols should not exceed 1024 packets.

## Options

- protocol-id** *protocol-id* Identify the protocol.
- **Range:** 1 through 254
- queue-depth** *queue-depth* Size of the protocol logical options queue for a given protocol.
- **Range:** 1 through 807 packets

## Required Privilege Level

| subtract subtract)
```

## Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then],
[edit policy-options policy-statement policy-name then]
```

## Description

Specify this CLI policy action in an import or export policy to set the metric value to one of the following options as per your network requirement.

## Options

|                                            |                                                                                                                                                                                                                                                            |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>add</b> <i>add</i>                      | Specify a constant that should be added to the metric value. Use this option if you want to increase the metric of a route.                                                                                                                                |
| <b>expression</b>                          | Calculate the metric value based on the route metric and metric2.                                                                                                                                                                                          |
| <b>igp</b> <i>metric_offset</i>            | Configure this option to set the IGP metric for BGP. Specify a metric offset to increase or decrease the calculated IGP metric.                                                                                                                            |
| <b>minimum-igp</b><br><i>metric_offset</i> | Configure this option to set the minimum IGP metric for BGP.                                                                                                                                                                                               |
| <b>aigp</b>                                | Configure this option to set IGP metric to the accumulated interior gateway protocol (AIGP) metric value if an AIGP attribute has been configured. Specify this value in an export policy to redistribute BGP routes to an IGP, such as the OSPF protocol. |
| <b>subtract</b> <i>subtract</i>            | Specify a constant that must be subtracted from the metric value. Use this option if you want to decrease the metric of a route.                                                                                                                           |

## no-walkup

### IN THIS SECTION

- [Syntax | 2300](#)
- [Hierarchy Level | 2300](#)
- [Description | 2301](#)
- [Default | 2301](#)
- [Required Privilege Level | 2301](#)
- [Release Information | 2301](#)

## Syntax

```
no-walkup;
```

## Hierarchy Level

```
[edit logical-system logical-system-name policy-options defaults route-filter],
[edit logical-system logical-system-name policy-options policy-statement policy-statement-name
defaults route-filter]
```

## Description

Override route filter walkup globally or locally for a particular policy statement. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.

## Default

By default, the policy statement performs the type of route filter processing that is enabled at the global level.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 13.3.

## Description

Define a routing policy, including subroutine policies.

A *term* is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of accept or reject is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either accept or reject) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the [edit policy-options] hierarchy level by policy-statement *policy-name* in alphabetical order, enter the show policy-options configuration command.

The statements are explained separately.

## Options

*actions*—(Optional) One or more actions to take if the conditions match. The actions are described in [Configuring Flow Control Actions](#).

*family family-name*—(Optional) Specify an address family protocol. Specify *inet* for IPv4. Specify *inet6* for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify *iso*. For IPv4 multicast VPN traffic, specify *inet-mvpn*. For IPv6 multicast VPN traffic, specify *inet6-mvpn*. For multicast-distribution-tree (MDT) IPv4 traffic, specify *inet-mdt*. For BGP route target VPN traffic, specify *route-target*. For traffic engineering, specify *traffic-engineering*.

**NOTE:** When *family* is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

*from*—(Optional) Match a route based on its source address.

`as-path-neighbors (as-list | as-list-group)`—Compares the AS that originated the route. Evaluates if the right most AS number on the AS path belongs to the `as-list` or `as-list-group` specified in the `as-path-origins` configuration statement. In the case where the route has been aggregated, and the location of the originating AS contains an AS-set, the `as-path-origins` operator evaluates to true if any AS contained in the AS-set belongs to the `as-list` or `as-list-group` specified in the `as-path-origins` configuration statement.

`as-path-origins (as-list | as-list-group)`—Compares the neighbor AS in the AS path. Evaluates if the first AS number on the AS path matches the `as-list` or `as-list-group` specified in the `as-path-neighbors` configuration statement. If the neighboring AS location happens to be an AS-set, the `as-path-neighbors` operator evaluates to true if any AS contained in the AS-set belongs to the `as-list` or `as-list-group` specified in the `as-path-neighbors` configuration statement.

`as-path-transits (as-list | as-list-group)`—Compares any AS in the AS-Path. Evaluates when any AS belongs to the `as-list` or `as-list-group` specified in the `as-path-transit` configuration statement. In the case of AS-set, the `as-path-transit` operator compares all the ASes in the AS-set.

`as-path-calc-length count (equal | orhigher | orlower)`—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of calculated autonomous systems (ASs) in the AS path.

**NOTE:**

- ASs in a sequence count as 1.
- AS sets count as 1.
- BGP confederation segments count as 0.

`as-path-unique-count count (equal | orhigher | orlower)`—(Optional) Specify a number from 0 through 1024 to filter routes based on the total number of unique non-BGP confederation autonomous systems (ASs) in the AS path.

**NOTE:** Duplicate AS numbers are ignored for the count.

`advertise-locator`—(Optional) Enable IS-IS to summarize and advertise locator prefixes.

**Range:** 0-255

`aggregate-bandwidth`—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing.

`dynamic-tunnel-attributes dynamic-tunnel-attributes`—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

*match-conditions*—(Optional in from statement; required in to statement) One or more conditions to use to make a match. The qualifiers are described in [Routing Policy Match Conditions](#).

*multipath-resolve* *multipath-resolve*—(Optional) Enable the use of all paths for resolution over the specified prefix.

*limit-bandwidth* *limit-bandwidth*—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

- **Range:** 0 through 4,294,967,295 bytes

*no-entropy-label-capability*—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

*neighbor*—(Optional) Specify a neighbor for route filtering.

*priority* (high | medium | low)—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.

*policy* *subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form `__.*-internal__`, as this form is reserved. For information about how to configure subroutines, see [Understanding Policy Subroutines in Routing Policy Match Conditions](#).

*policy-name*—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

*prefix-list* *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

*prefix-list-filter* *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match, and *actions* is the action to take if the prefixes match.

*programmed*—(Optional) Allow policy matches for routes injected by JET APIs.

*protocol* *protocol-name*—Name of the protocol used to control traffic engineering database import at the originating point.

Starting in Junos OS Release 19.1R1, you can specify options to match label IS-IS and label OSPF routes using the `l-isis` and `l-ospf` options, respectively. The `isis` options matches all IS-IS routes, excluding labelled IS-IS routes. The `ospf` option matches all OSPF routes, including OSPFv2, OSPFv3 and labelled OSPF routes.

*resolution-map*—(Optional) Set resolution map modes. A given resolution-map can be shared across multiple policy-statements.

`route-filter destination-prefix match-type <actions>`—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see [Configuring Route Lists](#)), and *actions* is the action to take if the *destination-prefix* matches.

`source-address-filter source-prefix match-type <actions>`—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see [Configuring Route Lists](#)), and *actions* is the action to take if the *source-prefix* matches.

`tag value`—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

`term term-name`—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the `term` statement when defining match conditions and actions.

`to`—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

`then`—(Optional) Actions to take on matching routes. The actions are described in [Configuring Flow Control Actions](#) and [Configuring Actions That Manipulate Route Characteristics](#).

`set-down-bit`—(Optional) Configure this option to aggregate leaked locator routes using routing policies.

`validation-database-instance`—(Optional) Name to identify a validation-state with database name.  
`database-name <database-name>`—(Optional) Route Validation Database name to be looked at. state (valid|invalid|unknown)—(Optional) Name to identify a validation-state

## Required Privilege Level

`routing`—To view this statement in the configuration.

`routing-control`—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.

`inet-mdt` option introduced in Junos OS Release 10.0R2.

`route-target` option introduced in Junos OS Release 12.2.

`protocol` and `traffic-engineering` options introduced in Junos OS Release 14.2.

`no-entropy-label-capability` option introduced in Junos OS Release 15.1.

`priority` and `tag value` options introduced in Junos OS Release 17.1.

`as-path-unique-count` option introduced in Junos OS Release 17.2R1.

`prefix-segment` option introduced in Junos OS Release 17.2R1 for MX Series routers, PTX Series routers, QFX5100 switches, and QFX10000 switches.

`multipath-resolve` and `dynamic-tunnel-attributes` options introduced in Junos OS Release 17.3R1.

`aggregate-bandwidth` and `limit-bandwidth limit-bandwidth` options introduced in Junos OS Release 17.4R1 for MX Series, PTX Series, and QFX Series.

`/isis` and `/ospf` keywords at the `protocol` option is introduced in Junos OS Release 19.1R1.

`resolution-map` statement introduced in Junos OS Release 19.2R1-S1 on MX and PTX Series routers.

`lsp` and `lsp-regex` options introduced in Junos OS Release 19.4R1.

`as-path-neighbors`, `as-path-origins`, and `as-path-transits` statements introduced in Junos OS Release 21.3R1.

`advertise-locator` and `set-down-bit` options introduced in Junos OS Release 22.2R1.

[edit logical-systems name policy-options policy-statementpolicy-name term term-name then],
[edit logical-systems name policy-options policy-statementpolicy-name then],
[edit policy-options policy-statementpolicy-name term term-name then],
[edit policy-options policy-statementpolicy-name then]

```

## Description

Sets the priority for route installation. You can choose a relative priority of `high`, `low`, or `medium` to ensure that high priority IGP and LDP routes are updated in the FIB (forwarding table) before medium and low priority routes. Routes are placed in different priority queues according to the priority. Any routes that are not explicitly assigned a priority are treated as medium priority. Within the same priority level, routes will continue to be updated in lexicographic order.

## Options

**high**—Set priority to high.

**low**—Set priority to low.

**medium**—Set priority to medium.

## Required Privilege Level

`routing`—To view this statement in the configuration.

`routing-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 16.1.

}
```

## Hierarchy Level

```
[edit dynamic policy-options],
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

## Description

Define a list of IPv4 or IPv6 address prefixes for use in a routing policy statement or firewall filter statement, or a list of IPv6 addresses or address prefixes for use in an IPv6 RA guard policy.

You can configure up to 85,325 prefixes in each prefix list. To configure more than 85,325 prefixes, configure multiple prefix lists and apply them to multiple firewall filter terms.

## Options

***name***—Name that identifies the list of IPv4 or IPv6 addresses or address prefixes.

***ip-addresses***—These are the IPv4 or IPv6 prefixes specified as prefix/prefix-length. If you omit prefix-length for an IPv4 prefix, the default is /32prefix-length. If you omit prefix-length for an IPv6 prefix, the default is /128.

The remaining statement is explained separately. See [CLI Explorer](#).

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.

Support for the **vpls** protocol family introduced in Junos OS Release 10.2.

Support for IPv6 RA guard policy lists introduced in Junos OS Release 16.1 for EX Series switches.

## route-filter-list (usage)

```
route-filter-list route-filter-list-name;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name policy-statement policy-statement-name term term-name
from],
[edit policy-options policy-statement policy-statement-name term term-name from]
```

## Description

The route filter list is a user-configured list of individual route filters that you create at the [edit policy-options] hierarchy level. Each item in the list consists of a complete route filter statement, made up of a destination prefix, a match type, and an optional action. You can re-use the list in different policies, adding whatever qualifiers you need, rather than having to re-create it for every different case, as shown in the examples below.

```
[edit]
user@router# show policy-options route-filter-list rf-test-list
203.0.113.0/24 address-mask 255.255.255.0;
192.0.2.0/26 orlonger reject;
198.51.100.8/29 exact accept;
```

Once configured, the route-filter-list is used by referencing its *route-filter-list-name* in a policy-statement at the [edit policy-options policy-statement *policy-statement-name* term *term-name* from] hierarchy level. Route filter lists can be used in conjunction with other route-filter statements.

For example:

```
[edit]
user@router# show policy-options policy-statement test-route-filter-list-statement
from {
 route-filter 198.51.100.32/29 exact accept;
 route-filter 192.0.2.1/32 exact;
 route-filter-list rf-test-list;
}
then reject;
```

If one action is associated with the `route-filter-list` entry and another action is associated with the list-level entry, the action associated with the list-level entry takes precedence.

```

policy-options {
 route-filter-list RFL-1 {
 198.1.1.0/24 exact;
 198.2.1.0/24 orlonger;
 }
 route-filter-list RFL-2 {
 198.1.1.0/24 exact reject;
 198.2.1.0/24 orlonger accept;
 }
 policy-statement pol {
 term 1 {
 from {
 route-filter-list RFL-1 longer accept;
 }
 }
 term 2 {
 from {
 route-filter-list RFL-2 longer reject;
 }
 }
 }
}

```

Here is an example on how to specify policy-based control for BGP-LU labels being allocated for a given prefix:

```

[edit]
user@host# show policy-options route-filter-list rfl-1{
198.51.1.1/32 exact {
 label 1000101;
 next-hop 198.52.1.2;
 accept;
 label-allocation-fallback-reject;
}
198.51.1.0/24 prefix-length-range /24-/32 {
 label range 1000000:1000200;
 next-hop 198.53.2.2;
 accept;
}

```

```
}
}
```

```
[edit]
user@host# show policy-options policy-statement p-1{
from {
 route-filter-list rfl-1;
}
then accept;
}
```

```
[edit]
user@host# show protocols bgp group ibgp{
type internal;
local-address 198.0.23.3;
family inet {
 labeled-unicast {
 per-prefix-label;
 }
}
neighbor 198.0.12.1 {
 export p-1;
}
}
```

## Options

When specifying a match prefix, you can specify an exact match with a particular route or a less precise match. You can configure either a common action that applies to the entire list or an action associated with each prefix.

- *list-name*—Name of route-filter-list of routes to match.
- *exact*—Exactly match the prefix length.
- *longer*—Mask is greater than the prefix length.
- *orlonger*—Mask is greater than or equal to the prefix length.
- *prefix-length-range*—Mask falls between two prefix lengths.

- *upto*—Mask falls between two prefix length.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 16.1.

Support on PTX1000, PTX10000, and PTX10003 Packet Transport Routers introduced in Junos OS Release 20.2R1 for the following list-level qualifiers: exact, longer, orlonger, prefix-length-range, and upto.

```

## Hierarchy Level

```
[edit logical-systems logical-system-name policy-options],
[edit logical-systems logical-system-name policy-options policy-statement policy-name term term-name],
[edit policy-options],
[edit policy-options policy-statement policy-name term term-name]
```

## Description

Define a list of route target prefixes for use in a routing policy statement. These prefixes are only useful for filtering routes in the `bgp.rtarget.0` table.

The route target filtering prefix is in the format: *AS number:route target extended community/length*. The first number represents the autonomous system (AS) of the device that sent the advertisement. The second group of numbers represent the route target extended community. The format of the extended community is the same as the extended community type `target::`. For more information about extended communities, see ["Understanding How to Define BGP Communities and Extended Communities "](#) on [page 515](#).

In this route target prefix example `64500:200:101/96`, `64500` is the AS number, `200:101` is the BGP extended community used for the route target, and `96` is the prefix length.

For more information about the route target community, see RFC 4360, *BGP Extended Communities Attribute*.

For more information about the route target filtering prefix format, see RFC 4684, *Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)*.

## Options

*name*—Name that identifies the list of route target filtering prefixes. The name can contain letters, numbers, and hyphens ( - ) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in quotation marks ( " ").

*route-targets*—List of route target filtering prefixes, one route target filter per line in the configuration. When you use the `rtf-prefix-list` statement as a match condition, you do not have the option of configuring the list of route target filtering prefixes. You must first define and configure the route target filtering prefixes with the [policy-options](#) statement.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.2.

## source-address-filter-list (Create List)

```
source-address-filter-list source-address-filter-list-name;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name policy-options],
[edit policy-options]
```

## source-address-filter-list (Use list)

```
source-address-filter-list source-address-filter-list-name;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name policy-statement policy-statement-name term term-name
from],
[edit policy-options policy-statement policy-statement-name term term-name from]
```

## Description

The source address filter list is a user configured list of individual source address filters, typically used to match an incoming route address to unicast source addresses in Multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments, that you create at the [edit policy-options] hierarchy level. Each item in the list consists of a complete source address filter statement, made up of a source-prefix address, a match-type, and an optional action.

For example:

```
[edit]
user@router# show policy-options source-address-filter-list saf-test-list
203.0.113.0/26 exact;
192.0.2.0/24 longer accept;
198.51.100.8/29 exact reject;
```

Once configured, source-address-filter-list is used by referencing its *source-address-filter-list-name* in a policy-statement at the [edit policy-options policy-statement *policy-statement-name* term *term-name* from] hierarchy level. Source address filter lists can be used in conjunction with other source-address-filter statements.

For example:

```
[edit]
user@router# show policy-options policy-statement test-saf-list-statement
from {
source-address-filter 198.51.100.16/29 exact accept;
source-address-filter-list saf-test-list;
}
then reject;
```

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement first introduced in Junos OS Release 16.1 on M Series, MX Series, and T Series.

## standby (Routing Policy Condition)

- [Default | 2333](#)
- [Required Privilege Level | 2333](#)
- [Release Information | 2334](#)

## Syntax

```
walkup;
```

## Hierarchy Level

```
[edit logical-system logical-system-name policy-options defaults route-filter],
[edit logical-system logical-system-name policy-options policy-statement policy-statement-name
defaults route-filter],
[edit policy-options defaults route-filter],
[edit policy-options policy-statement policy-statement-name defaults route-filter]
```

## Description

Enable route filter walkup globally or locally for a particular policy statement. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.

## Default

By default, no route filter walkup is performed and only the longest match route filter in a policy statement term is examined.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

## destination-address

### IN THIS SECTION

- [Syntax | 2343](#)
- [Hierarchy Level | 2344](#)
- [Description | 2344](#)
- [Required Privilege Level | 2344](#)
- [Release Information | 2344](#)

### Syntax

```
destination-address address;
```

## Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name from],
[edit firewall family family-name filter filter-name term term-name from ip-version ip-version]
```

## Description

IP destination address field, which is the address of the destination node for the packet. You cannot specify the destination-address and address match conditions in the same term.

For IPv4, the destination-address field is 32 bits in length. The filter description syntax supports either a mask value that can be noncontiguous, such as 10.0.0.10/255.0.0.255, or prefix notation such as 10.0.0.0/8. Simple filters do not support noncontiguous mask values.

For IPv6, the destination-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in [RFC 2373](#), *IP Version 6 Addressing Architecture*.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 10.1R1.

[edit firewall family family-name filter filter-name],
[edit logical-systems logical-system-name firewall filter filter-name],
[edit logical-systems logical-system-name firewall family family-name filter filter-name]
```

## Description

Limit static service filters or API-client filters to term-based filter format only for inet or inet6 families when enhanced network services mode is configured at the `[edit chassis network-services]` hierarchy level. You cannot attach enhanced mode filters to local loopback, management, or MS-DPC interfaces. These interfaces are processed by the Routing Engine and DPC modules and can accept only compiled firewall filter format. In cases where both filter formats are needed for dynamic service filters, you can use the [enhanced-mode-override](#) statement on the specific filter definition to override the default filter term-based only format of chassis network-service enhanced IP mode. The `enhanced-mode` and the `enhanced-mode-override` statements are mutually exclusive; you can define the filter with either `enhanced-mode` or `enhanced-mode-override`, but not both.

### NOTE:

For MX Series routers with MPCs, you need to initialize Trio-only match filters (that is, a filter that includes at least one match condition or action that is only supported by the Trio chipset) by walking the corresponding SNMP MIB. For example, for any filter that is configured or changed with respect to their Trio only filters, you need to run a command such as the following: `show snmp mib walk (ascii | decimal) object-id`. This forces Junos to learn the filter counters and ensure that the filter statistics are displayed. This guidance applies to all [enhanced-mode](#) firewall filters. It also applies to [Firewall Filter Match Conditions for IPv4 Traffic](#) with flexible match filter terms for offset-range or offset-mask, gre-key, and [Firewall Filter Match Conditions for IPv6 Traffic](#) with any of the following match conditions: `payload-protocol`, `extension headers`, `is_fragment`. It also applies to filters with either of the following [Firewall Filter Terminating Actions](#): `encapsulate` or `decapsulate`, or either of the following [Firewall Filter Nonterminating Actions](#): `policy-map`, and `clear-policy-map`.

When used with one of the chassis enhanced network services modes, firewall filters are generated in term-based format for use with MPC modules. Do not use enhanced mode for firewall filters that are intended for control plane traffic. Control plane filtering is handled by the Routing Engine kernel, which cannot use the term-based format of the enhanced mode filters.

If enhanced network services are not configured for the chassis, the `enhanced-mode` statement is ignored and any enhanced mode firewall filters are generated in both term-based and the default, compiled format. Only term-based (enhanced) firewall filters will be generated, regardless of the setting of the `enhanced-mode` statement at the `[edit chassis network-services]` hierarchy level, if any of the following are true:

- Flexible filter match conditions are configured at the `[edit firewall family family-name filter filter-name term term-name from]` or `[edit firewall filter filter-name term term-name from]` hierarchy levels.
- A tunnel header push or pop action, such as GRE encapsulate or decapsulate is configured at the `[edit firewall family family-name filter filter-name term term-name then]` hierarchy level.
- Payload-protocol match conditions are configured at the `[edit firewall family family-name filter filter-name term term-name from]` or `[edit firewall filter filter-name term term-name from]` hierarchy levels.
- An extension-header match is configured at the `[edit firewall family family-name filter filter-name term term-name from]` or `[edit firewall filter filter-name term term-name from]` hierarchy levels.
- A match condition is configured that only works with MPC cards, such as firewall bridge filters for IPv6 traffic.

For packets sourced from the Routing Engine, the Routing Engine processes Layer 3 packets by applying output filters to the packets and forwards Layer 2 packets to the Packet Forwarding Engine for transmission. By configuring the enhanced mode filter, you explicitly specify that only the term-based filter format is used, which also implies that the Routing Engine cannot use this filter.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 11.4.

## erac1-profile (packet-forwarding-options)

### IN THIS SECTION

- [Syntax | 2350](#)
- [Hierarchy Level | 2350](#)
- [Description | 2351](#)
- [Options | 2351](#)
- [Required Privilege Level | 2351](#)
- [Release Information | 2352](#)

### Syntax

```
erac1-profile {
 erac1-scale;
}
```

### Hierarchy Level

```
[edit system packet-forwarding-options firewall]
[edit system packet-forwarding-options firewall erac1-profile erac1-scale]
```

## Description

Use the option of this command to configure egress firewall filters, also known as eRACLs, in scaled mode. This feature is supported only in the egress direction (routed traffic exiting the device).

In Junos, firewall filters are classified as ingress or egress depending on where in the sequence the packet is evaluated and action taken. Filtering traffic on an egress interface can be useful, for example, for safeguarding a third-party device connected to the Juniper switch.

## Options

**eracl-scale** Use this option to increase the number of egress firewall filters to 2000. When you configure an egress filter in scaled mode, the switch uses ingress TCAM space (IFP) to achieve the higher scale.

**NOTE:** After configuring, modifying, or deleting the `eracl-profile` statement, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

When you enable `eracl-scale` mode, the following restrictions apply:

- You can only apply a filter in the egress direction (traffic exiting the VLAN).
- Only `inet` and `inet6` protocol families are supported.
- Generic Routing Encapsulation (GRE) interfaces are not supported.
- You cannot apply filters with the same match condition to different egress VLANs or Layer 3 interfaces. The only supported actions are `accept`, `discard`, and `count`.
- Match conditions are programmed in the ingress firewall filter TCAM. This means that any counters attached to the filter counts traffic on any incoming VLANs.
- The `eracl-scale` option comes configured in global mode. When enabled, any of your existing egress filters will be automatically reinstalled in scaled mode.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Evolved Release 19.4R2 (QFX5220 switches).

```

```
[edit firewall]
```

## Configure the fields a firewall filter can match on.

*family-name*—Type of addressing protocol:

- `ethernet-switching`—Filter Layer 2 Ethernet packets and Layer 3 (IP) packets (allows some Layer 3 filtering). Not supported on OCX Series switches.
- `egress-to-ingress`—Include this option to increase the number of egress VLAN firewall filter terms from 1024 to 2048.
- `evpn`—Filter Ethernet VPN (EVPN) packets.
- `inet`—Filter Layer 3 IPv4 packets (provides additional Layer 3 filter options).
- `inet6`—Filter Layer 3 IPv6 packets (provides additional Layer 3 filter options).
- `mpls`—Filter multiprotocol label switched packets. Not supported on OCX Series switches.

The remaining statements are explained separately. See [CLI Explorer](#).

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 11.1.

evpn options introduced in Junos OS Release 15.1 for the MX Series.

egress-to-ingress option introduced in Junos OS Release 19.1R1 for the QFX5110.

## fast-lookup-filter

### IN THIS SECTION

- [Syntax | 2360](#)
- [Hierarchy Level | 2360](#)
- [Description | 2360](#)
- [Required Privilege Level | 2361](#)
- [Release Information | 2361](#)

### Syntax

```
fast-lookup-filter;
```

### Hierarchy Level

```
[edit firewall family family-name filter filter-name],
[edit logical-systems logical-system-name firewall family family-name filter filter-name]
```

### Description

The fast-lookup-filter is available for the inet and inet6 protocol families for both static and dynamic profiles. Junos installs firewall filters created under this hierarchy to the accelerated filter block available in the certain MPCs, which provides enhanced performance.

Juniper recommends that you use the `payload-protocol` term rather than the `next-header` term when configuring a firewall filter with match conditions for IPv6 traffic. Although either can be used, `payload-protocol` provides the more reliable match condition because it uses the actual payload protocol to find a match, whereas `next-header` simply takes whatever appears in the first header following the IPv6 header, which may or may not be the actual protocol. In addition, if `next-header` is used with IPv6, the accelerated filter block lookup process is bypassed and the standard filter used instead.

See "[Firewall Filter Match Conditions for IPv6 Traffic](#)" on page 941 for more information about firewall filters and terms.

Fast lookup filters can boost filtering performance by as much as three to four times for filters under 3000 terms. Firewall instances from the same firewall block can also be attached to multiple interfaces.

### Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 13.3R3 for MX 240, MX 480, MX 960, MX 2010, and MX 2020 routers with MPC5E, MPC5EQ, or MPC6E, and later for MPC7E, MPC8E, and MPC9E MPCs.

Support for the next-header firewall match condition was added in Junos OS Release 13.3R6

Support for MPC2E-NG and MPC3E-NG MPCs was added in Junos OS Release 15.1R1.

Release History Table

| Release | Description                                                                                                                            |
|---------|----------------------------------------------------------------------------------------------------------------------------------------|
| 15.1    | Support for MPC2E-NG and MPC3E-NG MPCs was added in Junos OS Release 15.1R1.                                                           |
| 13.3R6  | Support for the next-header firewall match condition was added in Junos OS Release 13.3R6                                              |
| 13.3R3  | Statement introduced in Junos OS Release 13.3R3 for MX 240, MX 480, MX 960, MX 2010, and MX 2020 routers with MPC5E, MPC5EQ, or MPC6E, |

## filter-list-template

### IN THIS SECTION

- [Syntax | 2362](#)
- [Hierarchy Level | 2362](#)
- [Description | 2362](#)
- [Required Privilege Level | 2363](#)
- [Release Information | 2363](#)

### Syntax

```
filter-list-template;
```

### Hierarchy Level

```
[edit firewall family (inet | inet6) filter filter-name],
[edit logical-systems logical-system-name firewall family (inet | inet6) filter filter-name]
```

### Description

(MX5, MX10, MX40, and MX80 routers, and routers that use MX Series MPC line cards only) Configure all interfaces that use the same filter list to use a common template. This feature can be used to save microkernel memory and DMEM memory.

If the same filter list cannot be used on all interfaces, consider merging the filters and using the `from interface firewall filter` term to group the per-interface terms to produce a new common filter list.

**NOTE:** If you configure both `fast-lookup-filter` and interface-specific statements, filter list templates are also used.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 13.3R9.

force-premium;
```

## Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name then],
[edit logical-systems logical-system-name firewall family family-name filter filter-name term term-name then]
```

## Description

Firewall filter option to force premium treatment for traffic (MX Series routers)— By default, a hierarchical policer processes the traffic it receives according to the traffic's forwarding class. Premium, expedited-forwarding traffic has priority for bandwidth over aggregate, best-effort traffic. Now you can include the `force-premium` option at the `[edit firewall filter filter-name term term-name]` hierarchy level to ensure that traffic matching the term is treated as premium traffic by a subsequent hierarchical policer, regardless of its forwarding class. This traffic is given preference over any aggregate traffic received by that policer. Consider a scenario where a firewall filter is applied to an interface that receives both expedited-forwarding voice traffic and best-effort video traffic. Traffic that matches the first term of the filter is passed to a hierarchical policer in the second term. The hierarchical policer also receives best-effort data traffic from another source. The filtered video traffic is treated the same as this data traffic, as aggregate traffic with a lower priority than the premium voice traffic. Consequently, some of the video traffic might be dropped and some of the data traffic passed on.

To avoid that situation, include the `force-premium` option in the firewall filter term that passes traffic to the hierarchical policer. This term forces the video traffic to be marked as premium traffic. The hierarchical policer gives both the voice traffic and the video traffic priority over the aggregate data traffic.

**NOTE:** The `force-premium` filter option is supported only on MPCs.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.3 for family `inet` and `inet6`.

Support for family `vp1s`, `ccc`, and `bridge` added in Junos OS Releases 13.3R8, 13.3R10, 14.1R8, 14.2R7, 15.1R4, 16.1R1, and 17.1R1.

Description

Match packet fields to values specified in a match condition. If the `from` statement is not included in a firewall filter configuration, all packets are considered to match and the actions and action modifiers in the `then` statement are taken.

Options

*match-conditions* —Conditions that define the values or fields that the incoming or outgoing packets must contain for a match. You can specify one or more match conditions. If you specify more than one, they all must match for a match to occur and for the action in the `then` statement to be taken.

Required Privilege Level

- firewall—To view this statement in the configuration.
- firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

## Syntax

```
gtp-header
```

## Hierarchy Level

```
[edit firewall family family-name filter filter-name from]
```

## Description

Include the match conditions for the GTP packet. An example is as below:

```
firewall {
 family inet /inet6 {
 filter gtp_filter {
from {
 protocol udp;
 port 2123;
 gtp-header {
 gtp-teid <TEID value/list/range>;
 ipv4/ipv6 {
 source-address <32bit for v4 and 128 bit for v6>;
 source-prefix-list <prefix-list>;
 destination-address <32bit for v4 and 128 bit for v6>;
 destination-prefix-list <prefix-list>;
 Protocol/next-header <8 bit>;
 Protocol/next-header-except <8 bit>;
 source-port <16 bit>;
 source-port-except <16 bit>;
 destination-port <16 bit>;
 destination-port-except <16 bit>;
 }
 }
}
 then {
 count gtp;
 }
}
```

## Syntax

```
gtp-teid list;
```

## Hierarchy Level

```
[edit firewall family family-name filter filter-name from gtp-header]
```

## Description

Specify the teid value or list of values in the GTP-C packet header. The firewall filter will attempt to match on the provided teid value or list of values.

## Options

`gtp-teid` *list*

- `list` - `gtp-teid` is integer and will take a list of values from 0 to 4294967295. As an example, in the following configuration statement, `gtp-teid` is supplied a list of two values.

```
set firewall family inet filter ft term 1 from gtp-header gtp-teid [100 200]
```

In the following configuration statement, `gtp-teid` is supplied a single value.

```
set firewall family inet filter ft term 1 from gtp-header gtp-teid 105
```

## Required Privilege Level

- `firewall`—To view this statement in the configuration.
- `firewall-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos 22.2R1

## hw-db-profile

Syntax

```
hw-db-profile {
 (balanced | balanced-exem | l2-xl | l3-xl);
 lpm-distribution(1 | 2 | 200 | 3 | 4);
}
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

Use this configuration to configure various database profiles to allocate tables with different sizes in the hardware. PFE restarts automatically once you change the configuration and commit. Profiles under this configuration support the below databases:

- Large Exact Match (LEM)—This table stores Mac table entries, LSR entries, and IPv4 host entries
- Longest Prefix Match (LPM)—This table stores IPv4 and IPv6 route entries

Options

|                         |                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>balanced</b>         | This option balances the database allocation between L2 and L3 data bases.                                                                                                             |
| <b>balanced-exem</b>    | This option allocates more space to the L2 databases such as LEM.                                                                                                                      |
| <b>l2-xl</b>            | This option allocates more space to the L2 databases such as LEM.                                                                                                                      |
| <b>l3-xl</b>            | This option allocates more space to the L3 databases such as LPM and ARP.                                                                                                              |
| <b>lpm-distribution</b> | Choose this option to specify route distribution between public and private(vrf/vpn) routes in LPM. Chose from the available values to select the desired profile. Default value is 1. |

**Default profile**    balanced.

See Table 1 on page 2 to know about the supported scale numbers in each profile:

**Table 129: Profiles and supported scale numbers (IPv4)**

| Profile       | Scale number |           |
|---------------|--------------|-----------|
|               | LEM          | LPM       |
| balanced      | 700,000      | 1,500,000 |
| balanced-exem | 506,000      | 1,480,000 |
| l2-xl         | 1,000,000    | 64,000    |
| l3-xl         | 155,000      | 2,300,000 |

 }
 then {
 discard;
 }
 }
}

```

## Hierarchy Level

```

[edit dynamic-profiles profile-name firewall],
[edit firewall]

```

## Description

Use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or logical interface and apply different policing actions based on whether the packets are classified as *premium* for expedited forwarding (EF) or *aggregate* for a lower priority. The two policers defined within the hierarchical policer are *aggregate* and *premium*.

Hierarchical policers are supported on Enhanced Intelligent Queuing (IQE) PICs and SONET interfaces hosted on the M120 and M320 with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC; on MPCs hosted on MX Series routers; on the T320, T640, and T1600 with Enhanced Intelligent Queuing (IQE) PICs; and on the T4000 with Type 5 FPC and Enhanced Scaling Type 4 FPC.

### NOTE:

- The *if-exceeding-pps* statement is only supported on MX Series routers with MPCs.
- The *if-exceeding* and *if-exceeding-pps* statements are mutually exclusive and, therefore, cannot be applied at the same time.

You can configure the policer in static firewall filters or dynamic firewall filters in a dynamic client profile or a dynamic service profile.

## Options

*hierarchical-policer-name*—Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose the name in quotation marks (" ").

*uid*—When you configure a hierarchical policer at the [edit dynamic-profiles *profile name* firewall] hierarchy level, you must assign a variable UID as the policer name.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.5.

Support at the [edit dynamic-profiles *profile-name* firewall] hierarchy level introduced in Junos OS Release 11.4.

Support for if-exceeding-pps statement on MX Series routers with MPCs introduced in Junos OS Release 15.2.

## Syntax

```
input-chain [filter-name]
```

## Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family filter],
```

## Description

The `input-chain` command works like the **next** filter term to allow multiple levels of filtering on the interface in both the ingress and egress direction. For example, you can implement a combination of

classification and firewall filter rules for evaluation, wherein the first filter performs a generic filter classification and the subsequent filters go on to perform the actual filtering and actions.

To continue on to the next filter, the terminating action in the current filter must be **accept**.

The `input-chain` command is supported on all interfaces except loopback (lo0 and fxp0) and interfaces under logical systems.

## Options

[ *filter-names* ]—Name of each filter in the chain that is to be evaluated when packets are received on the interface. Supports up to 8 ingress and 8 egress filters. Evaluation occurs in the order in which the names appear, from left to right.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- [Hierarchy Level](#) | [2408](#)
- [Description](#) | [2408](#)
- [Required Privilege Level](#) | [2409](#)
- [Release Information](#) | [2409](#)

### Syntax

```
interface-group (0 -255)
```

### Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name then decapsulate gre],
```

### Description

Allows you to explicitly specify and add an interface group to packets after they have undergone GRE decapsulation. In releases prior to Junos OS Release 14.1, the interface group upon decapsulation was always 0 and could not be changed.

In Junos OS Release 14.1 and later, you can assign any arbitrary value in the range of 1 to 255 to the packets' interface-group upon GRE decapsulation. For example, you could use this command to retain the original interface from which the packet was received (if no value is set, the default interface group is 0). You could also use it to ensure that all decapsulated GRE packets are placed in the same group, for example to trigger additional filtering in the forwarding table on the basis of the this data from the inner packet.

The value used in `interface-group` is set after the GRE packet is decapsulate by a filter action in a filter attached to a given ingress interface.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

# loopback-firewall-optimization

## IN THIS SECTION

- [Syntax](#) | [2426](#)
- [Hierarchy Level](#) | [2427](#)
- [Description](#) | [2427](#)
- [Required Privilege Level](#) | [2428](#)
- [Release Information](#) | [2428](#)

## Syntax

```
loopback-firewall-optimization;
```

## Hierarchy Level

```
[edit chassis]
```

## Description

Enable this setting to increase the system limit for the number of loopback filter terms that can be configured. When enabled, you can configure up to 768 loopback filter terms for IPv6, and up to 1152 terms for IPv4. The packet forwarding engine (PFE) will restart upon commit for the new system limits to take effect.

Terms that include a reserved multicast destination such as 224.0.0.x/24, and terms with a time-to-live (TTL) such as 0/1, are not directly supported as match condition in filters used with the loopback address (lo0). Instead, to count packets destined to the reserved multicast address of 224.0.0.6, you would need to create a filter that specifies **protocol OSPF** as the match term. An example showing such a configuration is provided below.

```
[edit interfaces]
lo0 {
 unit 0 {
 family <inet | inet6> {
 filter {
 input f1;
 }
 address 127.0.0.1/32;
 }
 }
}

[edit firewall]
family <inet | inet6> {
 filter f1 {
 term t1 {
 from {
 protocol ospf;
 }
 then {
 count c1;
 accept;
 }
 }
 }
}
```

```
}
}
```

## output-chain

### IN THIS SECTION

- [Syntax | 2430](#)
- [Hierarchy Level | 2430](#)
- [Description | 2430](#)

- Options | 2430
- Required Privilege Level | 2430
- Release Information | 2431

## Syntax

```
output-chain [filter-name]
```

## Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family filter],
```

## Description

The `output-chain` command works like the **next** filter term to allow multiple levels of filtering on the interface in both the ingress and egress direction. For example, you can implement a combination of classification and firewall filter rules for evaluation, wherein the first filter performs a generic filter classification and the subsequent filters go on to perform the actual filtering and actions.

To continue on to the next filter, the terminating action in the current filter must be **accept**.

The `output-chain` command is supported on all interfaces except loopback (lo0 and fxp0) and interfaces under logical systems.

## Options

[ *filter-names* ]—Name of each filter in the chain that is to be evaluated when packets are received on the interface. Supports up to 8 ingress and 8 egress filters. Evaluation occurs in the order in which the names appear, from left to right.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 18.4R1.

Statement introduced in Junos OS Evolved Release 21.4R1 (PTX10001-36MR, PTX10004, PTX10008, and PTX10016).

## per-logical-interface-firewall

### IN THIS SECTION

- [Syntax | 2431](#)
- [Hierarchy Level | 2432](#)
- [Description | 2432](#)
- [Caveats | 2433](#)
- [Required Privilege Level | 2433](#)
- [Release Information | 2433](#)

## Syntax

```
per-logical-interface-firewall
```

## Hierarchy Level

[edit chassis]

## Description

Enables per logical interface firewall filtering in the ingress direction. When enabled, the same set of match conditions and actions that are used for port firewall filters can be used for firewall filters on logical interfaces. The following example depicts the creation of a firewall filter and it being subsequently applied to a logical interface, after the enabling of the `per-logical-interface-firewall` setting.

```
firewall {
 family ethernet-switching {
 filter <filter-name> {
 term <rule-name> {
 from {
 source-mac-address {
 <mac-address>;
 }
 }
 then {
 count <count>;
 policer <policer>;
 }
 }
 }
 }
 policer <policer-name> {
 if-exceeding {
 bandwidth-limit <bandwidth-limit>;
 burst-size-limit <burst-size-limit>;
 }
 then discard;
 }
}
interfaces {
 <interface-name> {
 flexible-vlan-tagging;
 encapsulation flexible-ethernet-services;
 unit <interface-unit-number> {
```

```

 vlan-id <vlan-id>;
 family ethernet-switching {
 filter {
 input <filter-name>;
 }
 }
 }
}

```

## Caveats

- per-logical-interface-firewall is not supported on enterprise style logical interfaces.
- Per logical interface firewall filtering with mix of services provider and enterprise logical interfaces is not supported.
- per-logical-interface-firewall scope is limited to non-VxLAN interfaces.
- With per-logical-interface-firewall, IPv6 address in filters across ifls of an ifd should be exclusive.
- Interface specific knob is not recommended with IPv6 address match.
- IFLs belongs to different vlans cannot have the same filter with IPv6 address match.

## Required Privilege Level

interface

## Release Information

Statement introduced in Junos OS Release 22.2R1 (QFX5110, QFX5120-32C, QFX5120-48T, QFX5120-48Y, QFX5120-48YM, QFX5200, and QFX5210)

## packet-format-match

- [Description | 2434](#)
- [Default | 2434](#)
- [Options | 2435](#)
- [Required Privilege Level | 2435](#)
- [Release Information | 2435](#)

## Syntax

```
packet-format-match {
 (mpls-packet-format-1 | mpls-packet-format-2 | mpls-packet-format-3 | mpls-packet-format-4 |
 mpls-packet-format-5 | mpls-packet-format-6 | mpls-packet-format-7 | mpls-packet-format-8);
}
```

## Hierarchy Level

```
[edit system packet-forwarding-options]
```

## Description

Types of packet formats for MPLS labeled traffic.

**NOTE:** You must restart the PFE every time you configure this command. A PFE reboot forces disruptions to the data plane, a hit that can last several minutes while the component reboots, and is then repopulated with the current routing state.

## Default

The default packet format is `mpls-packet-format-1`.

Options

You can specify a value from 1 through 8.

## promote gre-key

### IN THIS SECTION

- [Syntax | 2436](#)
- [Hierarchy Level | 2436](#)
- [Description | 2436](#)
- [Required Privilege Level | 2436](#)
- [Release Information | 2437](#)

### Syntax

```
promote gre-key;
```

### Hierarchy Level

```
[edit firewall family family-name filter filter-name]
```

### Description

You must configure the `promote gre-key` statement if you want to use `gre-key` as one of the matches in a filter. When you configure `promote gre-key` and use `gre-key` in any of the terms in a filter, the entire filter is compiled in a way that optimizes performance of the filter for `gre-key` matching.

**NOTE:** The `promote gre-key` configuration statement is supported on PTX Series routers only when `network services` is set to `enhanced-mode`. For more information, see [enhanced-mode](#).

### Required Privilege Level

`firewall`—To view this statement in the configuration.

`firewall-control`—To add this statement to the configuration.

### Syntax

```
scale-optimized;
```

### Hierarchy Level

```
[edit firewall family protocol-family-name filter filter-name],
[edit logical systems logical-system-name firewall family protocol-family-name filter filter-name]
```

### Description

Specify to optimize the interface specific firewall filters in the PFE itself.

When an interface specific firewall filter is configured with multiple Interface bind point instances, the PTX help software allocates resources for each interface instance separately, and the resources consumption is directly proportional to the number of bind points. This happens because, RE Junos dfw software creates independent instances for each bind point of an interface specific filter.

For example, if an interface specific firewall filter with 'x' number of prefix matches is bound to 'y' number of interfaces (bind points), the Junos software sends 'x' number of independent firewall instances to the PFE software each with 'y' numbers of prefix matches. This automatically consumes 'x \* y' numbers of prefixes in the Alpha match block of FLT, and this leads to Alpha block prefix scale issue in FLT. When you add the `scale-optimized` flag under the filter hierarchy, the interface specific firewall filters are optimized in the PFE itself.

The `scale-optimized` flag has the following limitations:

- Can only be configured along with `interface-specific` flag.
- Applicable only to IPv6 and IPv4 families.
- Does not support the `next term` action.
- Does not work with filter lists. Filter lists create unique interface-specific filter for each interface they are applied on. Filters lists do not have a template filter, from which they are copied. It does not add any advantage having `scale-optimized` flag.
- Cannot be applied to both input and output directions for an interface.
- The `scale-optimized` flag should be configured along with filter configuration. If you add the `scale-optimized` flag to an existing filter configuration, the filter counters do not increase. To resolve the filter counter issue, create a new filter with the `scale-optimized` flag, replace the filter on the interface and commit it.

## Required Privilege Level

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.

source-address ip-address;
```

### Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name from],
[edit firewall family family-name filter filter-name term term-name from ip-version ip-version]
```

### Description

IP source address field, which is the address of the source node sending the packet. You cannot specify the source-address and address match conditions in the same term.

For IPv4, the source-address field is 32 bits in length. The filter description syntax supports either a mask value that can be noncontiguous, such as 10.0.0.10/255.0.0.255, or prefix notation such as 10.0.0.0/8. Simple filters do not support noncontiguous mask values.

For IPv6, the source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in [RFC 2373](#), *IP Version 6 Addressing Architecture*.

- [Hierarchy Level | 2449](#)
- [Description | 2449](#)
- [Required Privilege Level | 2449](#)
- [Release Information | 2449](#)

## Syntax

```
source-checking;
```

## Hierarchy Level

```
[edit forwarding-options family inet6]
```

## Description

(MX Series 5G Universal Routing Platforms Only) Discard IPv6 packets when the source address type is unspecified, loopback, multicast, or link-local unicast.

RFC 4291, *IP Version 6 Addressing Architecture*, refers to four address types that require special treatment when they are used as source addresses. The four address types are:

- Unspecified--The IPv6 unspecified address is 0:0:0:0:0:0:0:0, which can be notated as ::/128.
- Loopback--The IPv6 loopback address is 0:0:0:0:0:0:0:1, which can be notated as ::1/128.
- Multicast--IPv6 multicast addresses use the prefix FF00::/8.
- Link-Local--IPv6 link-local addresses have the prefix FE80::/10.

The loopback and multicast addresses must never be used as a source address in IPv6 packets. The unspecified and link-local addresses can be used as source addresses but routers must never forward packets that have these addresses as source addresses. Typically, packets that contain unspecified or link-local addresses as source addresses are delivered to the local host. If the destination is not the local host, then the packet must not be forwarded. Configuring this statement filters or discards IPv6 packets of these four address types.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name firewall family family-name service-filter filter-name],
[edit logical-systems logical-system-name firewall family family-name simple-filter filter-name]

```

## Description

Define a firewall filter term.

## Options

*actions*—(Optional) Actions to perform on the packet if conditions match. You can specify one *terminating action* supported for the specified filter type. If you do not specify a terminating action, the packets that match the conditions in the *from* statement are accepted by default. As an option, you can specify one or more *nonterminating actions* supported for the specified filter type.

*filter-name*—(Optional) For *family family-name filter filter-name* only, reference another standard stateless firewall filter from within this term.

*from*—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the *then* statement are taken.

*match-conditions*—One or more conditions to use to make a match on a packet.

*match-conditions-mpls-ipv4-address*—(MPLS-tagged IPv4 traffic only) One or more IP address match conditions to match on the IPv4 packet header. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.

*match-conditions-mpls-ipv4-port*—(MPLS-tagged IPv4 traffic only) One or more UDP or TCP port match conditions to use to match a packet in an MPLS flow. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.

*vlan*—(Optional) Match packets belonging to a particular VXLAN Network Identifier (VNI).

*term-name*—Name that identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (" ").

*then*—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the *from* statement, the packet is accepted.

The Firewall Filter Match Conditions for the different protocols are explained separately:

| <b>action-modifiers</b> | <p>Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.</p> <p>The inline-monitoring-instance action maps the instance for inline monitoring services to the firewall term. You must attach the inline monitoring filter under inet or inet6 family of the logical unit of the interface for applying inline monitoring on the ingress or egress direction. Starting in Junos OS Release 21.1, the inline-monitoring-instance option is also supported by the any, bridge, ccc, mpls, and vpls families.</p> |

## Required Privilege Level

firewall—To view this statement in the configuration.  
 firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.0.

`inline-monitoring-instance` option added in Junos OS Release 19.4R1 on MX Series routers with MPCs excluding MPC10E and MPC11E linecards.

Added additional family support to the `inline-monitoring-instance` option in Junos OS Release 21.1R1.

### Syntax

```
then {
 action;
 action-modifiers;
}
```

### Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name]
```

### Description

Configure a firewall filter action.

### Options

**action**      Actions to accept, discard, or forward packets that match all conditions specified in a filter term.

Starting in Junos OS Release 18.4R1, two new actions – `port-mirror` and `port-mirror-instance` – are added for all match conditions, which enable selective port mirroring of MPLS traffic to a mirrored destination.

The `port-mirror` action enables port mirroring globally on the device, which applies to all Packet Forwarding Engines (PFEs) and associated interfaces.

The `port-mirror-instance` action enables you to customize each instance with different properties for input sampling and port mirroring output destinations, instead of having to use a single system-wide configuration for port mirroring.

**NOTE:**

- You can configure only two port mirroring instances per Flexible PIC Concentrator (FPC) by including the instance `port-mirror-instance-name` statement at the `[edit forwarding-options port-mirror]` hierarchy level. You can then associate individual port mirroring instances with an FPC, PIC, or (Forwarding Engine Board (FEB) depending on the device hardware.
- For both `port-mirror` and `port-mirror-instance` actions, the output interface must be enabled with Layer 2 family and not family MPLS (Layer 3) for the selective port mirroring feature to work.

**action-modifiers**

Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 11.1.

tunnel-end-point tunnel-name {
 gre {
 key authentication key;
 }
 ipv4 {
 destination-address destination-host-address;
 source-address source-host-address;
 }
 ipv6 {
 destination-address destination-host-address;
 source-address source-host-address;
 }
}
```

### Hierarchy Level

[edit [firewall](#)]

## Description

The `tunnel-end-point` command enables line-rate, filter-based, GRE tunneling of IPv4 and IPv6 payloads across IPv4 networks for MX Series routers running Trio-based FPCs (including MX80, MX104 and MX204). Filter-based tunneling encapsulates the original passenger protocol packet in an outer packet header. For example, for filter-based tunneling across IPv4 networks, the header adds 24 bytes or 28 bytes of overhead, including 20 bytes of IPv4 header. Either IPv4 or IPv6 traffic can be the transport protocol. For outgoing packets that match the configured filter term, the original packet are encapsulated inside an IP+GRE header as specified by the tunnel definition. IP lookup is performed on the outer header, and the packets are forwarded accordingly.

The route lookup for GRE encapsulated traffic is supported on the default routing instance only. GRE encapsulation is not supported for logical systems, or for MPLS traffic.

When an subnet range is configured for either the IPv4 or IPv6 option, traffic between hosts in the range is load balanced.

Note that the device must be enabled for [enhanced-mode](#) to support the use of GRE tunnel templates, which allows you to define tunnel attributes.

To use the feature with PTX Series routers, install a PTX Series router as an *encapsulator*, that is, an ingress PE router where you can reference a tunnel template name in an type `inet` or `inet6` ingress firewall filter by configuring the `encapsulate` terminating action.

Configure the tunnel end points as shown here (for IPv4):

- `set firewall tunnel-end-point tunnel-name ipv4 source-address source-host-address`
- `set firewall tunnel-end-point tunnel-name ipv4 destination-address destination-host-address`
- `set firewall tunnel-end-point tunnel-name ipv4 destination-address destination-host-address`

Note that the maximum number of /25 IPv4 or /123 IPv6 subnets allowed for a tunnel-endpoint destination addresses is 64.

An interface-specific encapsulating output filter action is also required. It triggers the Packet Forwarding Engine to use information in the specified tunnel template to encapsulate matching packets and forward the resulting GRE packets. GRE encapsulation is supported only for outgoing IPv4 unicast and IPv6 unicast traffic.

Configure the tunnel end points as shown here (for IPv4):

- `set firewall family inet filter filter-name term term-name then encapsulate gre tunnel-name`

For the GRE decapsulation with PTX Series routers, use a PTX3000 or PTX5000 router with third generation FPCs that is running Junos OS Release 16.1R2 or later and configure the firewall filter at the hierarchy level shown here:

- set firewall family *inet* filter *filter-name* term *term-name* then decapsulate gre

Egress sampling is supported on GRE encapsulated packets, but note that output filter match conditions only work on the contents of ingress packets.

The route lookup for GRE encapsulated traffic is supported on the default routing instance only. GRE encapsulation is supported for ingress IPv4 unicast and IPv6 unicast traffic. It is not supported for logical systems, or for MPLS traffic.

When defining the tunnel end point, or the prefix list, be sure to specify the /32 route. Multiple tunnel end point source-address are not supported.

- A maximum of 1024 tunnel templates is supported. You can configure or change up to 512 tunnel templates at a time
- A maximum of 64 tunnel end point destination addresses are supported in a given tunnel template. When more than one destination IP address exists, the one used for the outer header is based on a hash that is computed on the input packet from the input interface.

## Options

*gre* The encapsulation protocol. You must also specify whether the tunnel is IPv4 or IPv6. An example with IPv4 follows.

```
tunnel-end-point tunnel_name {
 ipv4 {
 source-address 10.255.1.1;
 destination-address 10.255.2.0/25;
 }
 gre;
}
```

- *key number*—An integer value that uniquely identifies a GRE IPv4 tunnel if multiple traffic flows share the same *source-address* and *destination-address* pair. Range: 1 through 0xFFFFFFFF (4,294,967,295 decimal). If a tunnel definition specifies GRE IPv4 tunneling using a key, the system includes the key in the GRE header whenever a Packet Forwarding Engine is instructed to use that tunnel definition to encapsulate a packet.

*gre-in-udp* For MX Series routers; specify if the tunnel is **gre-in-udp**.

- *destination-port number*—An integer value that uniquely identifies the UDP destination port. Range: 1 through 65535.
- *key number*—An integer value that uniquely identifies the **gre-in-udp** tunnel if multiple traffic flows share the same destination-port and source-port. Range: 1 through 0xFFFFFFFF (4,294,967,295 decimal). If you include a key in the tunnel definition to encapsulate packets, the key used is the one in the GRE header.
- *source-port number*—An integer value that uniquely identifies the UDP source port. Range: 1 through 65535.

|                            |                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv4</i>                | The IP network protocol used to transport encapsulated passenger protocol packets; IPv4 transports IPv4 packets encapsulated using filter-based GRE. The default prefix length is 32; the supported range is from 25 to 32. When specified, traffic is load-balanced to the hosts on this subnet.    |
| <i>ipv6</i>                | The IP network protocol used to transport encapsulated passenger protocol packets; IPv6 transports IPv6 packets encapsulated using filter-based GRE. The default prefix length is 128; the supported range is from 121 to 128. When specified, traffic is load-balanced to the hosts on this subnet. |
| <i>source-address</i>      | IP address of the encapsulator (the local ingress PE router). Multiple tunnel end point source-address are not supported.                                                                                                                                                                            |
| <i>destination-address</i> | IP address or address range of the decapsulator (the remote egress PE router). For both IPv4 and IPv6, a maximum of 64 /25 IPv4 or /123 IPv6 subnets can be configured for the end point destination address.                                                                                        |

[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-18],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-37]
```

## Description

Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.

**NOTE:** For integrated routing and bridging (IRB) interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID. You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

The textual description is configured using the `description` statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2 interface name. When you use the interface description rather than the interface name, the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used. To include the IRB interface description instead of the Layer 2 interface description, configure the `use-interface-description` and the `no-vlan-interface-name` statements. If no description is configured for the IRB interface, DHCP relay defaults to using the IRB interface name.

**NOTE:** The `use-interface-description` statement is mutually exclusive with the `use-vlan-id` statement.

If you specify the textual interface description, rather than accepting the default syntax, the identification is for packets returned from the server, and only for instances where that identification would be required by the DHCP relay, such as a stateless pass-through.

**NOTE:** By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

## Options

`logical`—Use the textual description that is configured for the logical interface.

`device`—Use the textual description that is configured for the device interface.

## Required Privilege Level

`interface`—To view this statement in the configuration.

`interface-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.6.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

Support at the `[edit ... relay-agent-remote-id]` and `[edit ... remote-id]` hierarchy levels introduced in Junos OS Release 14.1.

Support at the `[edit vlans vlan-name dhcp-security dhcpv6-options option-18]` and `[edit vlans vlan-name dhcp-security dhcpv6-options option-37]` hierarchy levels introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

```

### Description

For a single-rate two-color policer, configure the bandwidth limit as a number of bits per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with low packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow

might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** This statement specifies the bandwidth limit as an absolute number of bits per second. Alternatively, for single-rate two-color policers only, you can use the *bandwidth-percent percentage* statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

## Options

*bps*—You can specify the number of bits per second either as a decimal number or as a decimal number followed by the abbreviation *k* (1000), *m* (1,000,000), or *g* (1,000,000,000).

Range:

- • (M Series and T Series routers) 8000 through 100,000,000,000
- (Mx Series routers) 8000 through 18,446,744,073,709,551,615

**NOTE:** When you specify a numeric value beyond the supported bandwidth of the PFE, the router caps the bandwidth at the maximum supported bandwidth of the PFE.

- **Default:** None.

```
[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding],
[edit firewall policer policer-name if-exceeding],
[edit logical-systems logical-system-name policer policer-name if-exceeding]
```

## Description

For a single-rate two-color policer, configure the bandwidth limit as a percentage value. Single-rate two-color policing uses the *single token bucket algorithm* to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with low packet loss priority and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** This statement specifies the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate. Alternatively, you can use the `bandwidth-limit bps` statement to specify the bandwidth limit as an absolute number of bits per second.

The function of the bandwidth limit is extended by the burst size (configured using the `burst-size-limit bytes` statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

## Options

*percentage*—Traffic rate as a percentage of either the physical interface media rate or the logical interface configured shaping rate. You can configure a shaping rate on a logical interface by using class-of-service statement.

**NOTE:** The bandwidth percentage policer cannot be used to rate-limit tunnel or software interfaces, or for forwarding table filters. It is only valid for interface-specific filters. When used for matching bandwidth or burst-size on aggregated Ethernet or SONET bundles, bandwidth percentage policers must be used in conjunction with shared-bandwidth-policer.

- **Range:** 0 through 100
- **Default:** None.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

[edit logical-systems logical-system-name policer policer-name if-exceeding]
```

## Description

For a single-rate two-color policer, configure the burst size as a number of bytes. The burst size allows for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Single-rate two-color policing uses the *single token bucket algorithm* to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

The burst size extends the function of the bandwidth limit (configured using either the `bandwidth-limit bps` statement or the `bandwidth-percent percentage` statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

The burst-size limit enforced is based on the burst-size limit you configure. For a rate-limited logical interface, the Packet Forwarding Engine calculates the optimum burst-size-limit values and then applies the value closest to the burst-size-limit value specified in the policer configuration.

On MX Series routers and EX Series switches, the burst-size limit is not as freely configurable as it is on other platforms. Junos OS does not support an unlimited combination of policer bandwidth and burst-size limits on MX Series routers and EX Series switches. For a single-rate two-color policer on an MX Series router and on an EX Series switch, the minimum supported burst-size limit is equivalent to the amount of traffic allowed by the policer bandwidth limit in a time span of 1 millisecond. For example, for a policer configured with a `bandwidth-limit` value of 1 Gbps, the minimum supported value for burst-size-

limit on an MX Series router is 125 KB. If you configure a value that is smaller than the minimum, Junos OS overrides the configuration and applies the actual minimum.

## Options

*bytes*—Burst-size limit in bytes. The minimum recommended value is the maximum transmission unit (MTU) of the IP packets being policed. You can specify the value either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

- **Range:** 1500 through 100,000,000,000
- **Default:** None

## Required Privilege Level

[edit dynamic-profiles profile-name firewall three-color-policer name single-rate],
[edit dynamic-profiles profile-name firewall three-color-policer name two-rate],
[edit firewall three-color-policer policer-name single-rate],
[edit firewall three-color-policer policer-name two-rate]
```

### Description

For a three-color policer, configure the way preclassified packets are metered. In color-aware mode, the local router can assign a higher packet loss priority, but cannot assign a lower packet loss priority.

For example, suppose an upstream router assigned medium-high packet loss priority to a packet because the packet exceeded the committed information rate on the upstream router interface.

- If the local router applies color-aware policing to the packet, the router *cannot* change the packet loss priority to low, even if the packet conforms to the configured committed information rate on the local router interface.

- If the local router applies color-blind policing to the packet, the router *can* change the packet loss priority to low if the packet conforms to the configured committed information rate on the local router interface.

**NOTE:** A color-aware policer cannot be applied to Layer 2 traffic.

## Default

If you omit the `color-aware` statement, the default behavior is color-aware mode.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.4.

```
color-aware;
```

## Hierarchy Level

```
[edit firewall three-color-policer policer-name single-rate],
[edit firewall three-color-policer policer-name two-rate]
```

## Description

Configure the way preclassified packets are metered. In color-aware mode, the switch can assign a higher packet-loss priority, but cannot assign a lower packet loss priority (PLP). For example, suppose an upstream device assigns medium-high PLP to a packet because the packet exceeded its committed information rate (CIR). The switch cannot change the PLP to low even if the packet conforms to the configured CIR of the appropriate interface. On the other hand, if an upstream device assigns low PLP to a packet but the packet exceeds the CIR and committed burst size (CBS) of the switch interface, the switch can increase the PLP to medium-high.

## Default

If you omit the `color-aware` statement, the default behavior is color-aware mode.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

```

## Description

For a three-color policer, configure the way preclassified packets are metered. In color-blind mode, the local router ignores the preclassification of packets and can assign a higher or lower packet loss priority.

For example, suppose an upstream router assigned medium-high packet loss priority to a packet because the packet exceeded the committed information rate on the upstream router interface.

- If the local router applies color-aware policing to the packet, the router *cannot* change the packet loss priority to low, even if the packet conforms to the configured committed information route on the local router interface.

**NOTE:** A color-aware policer cannot be applied to Layer 2 traffic.

- If the local router applies color-blind policing to the packet, the router *can* change the packet loss priority to low if the packet conforms to the configured committed information route on the local router interface.

## Default

If you omit the `color-blind` statement, the default behavior is color-aware mode.

## Required Privilege Level

`firewall`—To view this statement in the configuration.

`firewall-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.4.

Support at the `[edit dynamic-profiles ... single-rate]` and `[edit dynamic-profiles ... two-rate]` hierarchy levels introduced in Junos OS Release 11.4.

```

## Description

For a three-color policer, configure the committed burst size (CBS) as a number of bytes.

**NOTE:** When you include the committed-burst-size statement in the configuration, you must also include the committed-information-rate statement at the same hierarchy level.

In three-color policing, a committed information rate (CIR) defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the CBS. Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the excess-burst-size statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the peak-information-rate and peak-burst-rate statements included in the policer configuration.

Options

*bytes*—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation *k* (1000), *m* (1,000,000), or *g* (1,000,000,000).

- **Range:** 1500 through 100,000,000,000 bytes

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

### Description

For a three-color policer, configure the committed information rate as a number of bits per second. The committed information rate (CIR) is the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions.

**NOTE:** When you include the `committed-information-rate` statement in the configuration, you must also include the `committed-burst-size` statement at the same hierarchy level.

In three-color policing, a CIR defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the committed burst size (CBS). Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the excess-burst-size statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the peak-information-rate and peak-burst-rate statements included in the policer configuration.

## Options

*bps*—Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

Range:

- • 1500 through 100,000,000,000 bps on EX, M, and T Series routers
- 1500 through 18,446,744,073,709,551,615 bps on Mx Series routers

- [Description | 2508](#)
- [Options | 2508](#)
- [Required Privilege Level | 2508](#)
- [Release Information | 2508](#)

### Syntax

```
egress-policer-overhead bytes;
```

### Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number]
```

## Description

Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress *shaping* overhead bytes added to output traffic on the line card.

On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).

**NOTE:** This statement is not supported on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.

## Options

*bytes*—Number of bytes added to a packet exiting an interface.

- **Range:** 0–255 bytes
- **Default:** 0

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 11.1.

## excess-burst-size

### IN THIS SECTION

- [Syntax | 2509](#)
- [Hierarchy Level | 2509](#)
- [Description | 2509](#)
- [Options | 2510](#)
- [Required Privilege Level | 2510](#)
- [Release Information | 2510](#)

### Syntax

```
excess-burst-size bytes;
```

### Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name single-rate],
[edit firewall three-color-policer policer-name single-rate]
```

### Description

For a single-rate three-color policer, configure the excess burst size (EBS) as a number of bytes. The EBS allows for moderate periods of bursting traffic that exceeds both the committed information rate (CIR) and the committed burst size (CBS).

**NOTE:** When you include the excess-burst-size statement in the configuration, you must also include the committed-burst-size and committed-information-rate statements at the same hierarchy level.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policing uses a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red based on the excess-burst-size statement included in the policer configuration.

During periods of traffic that conforms to the CIR, any unused portion of the guaranteed bandwidth capacity accumulates in the first token bucket, up to the maximum number of bytes defined by the CBS. If any accumulated bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket, up to the maximum number of bytes defined by the EBS.

A nonconforming traffic flow is categorized yellow if its size conforms to bandwidth capacity accumulated in the first token bucket. Packets in a yellow flow are marked with medium-high packet loss priority (PLP) and then passed through the interface.

A nonconforming traffic flow is categorized red if its size exceeds the bandwidth capacity accumulated in the second token bucket. Packets in a red traffic flow are marked with high PLP and then either passed through the interface or optionally discarded.

## Options

*bytes*—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation *k* (1000), *m* (1,000,000), or *g* (1,000,000,000).

- **Range:** 1500 through 100,000,000,000 bytes

```

## Description

By default, a policer operates in *term-specific* mode, which means that for a given *firewall filter* the Junos OS creates a separate policer instance for every filter term that references the policer. You can, however, use a common policer instance for all terms within the same firewall filter by setting the *filter-specific* option in the policer. In addition, for IPv4 firewall filters with multiple terms that reference the same policer, filter-specific mode counts and monitors the activity of the policer at the firewall filter level.

**NOTE:** Both filter-specific and term-specific apply to prefix-specific policer sets.

## Required Privilege Level

### Syntax

```
filter-specific;
```

### Hierarchy Level

```
[edit firewall policer policer-name]
```

### Description

Configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. If you use a filter-specific policer in multiple terms, both of the following are true:

- Traffic is policed at the aggregate rate. For example, if you create a policer that has a bandwidth limit of 100 Mbps and use the policer in two terms, the total allowed bandwidth for both terms is 100 Mbps—not 100 Mbps for each term.
- The implicit counter counts all the packets that are matched by any of the terms. For example, if you reference the same filter-specific policer in term1 and term2, and term1 matches 1000 packets and term2 matches 500 packets, the implicit counter shows 1500 matches for the policer.

## Hierarchy Level

```

[edit dynamic-profiles profile-name firewall],
[edit firewall]

```

## Description

Use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or logical interface and apply different policing actions based on whether the packets are classified as `premium` for expedited forwarding (EF) or `aggregate` for a lower priority. The two policers defined within the hierarchical policer are `aggregate` and `premium`.

Hierarchical policers are supported on Enhanced Intelligent Queuing (IQE) PICs and SONET interfaces hosted on the M120 and M320 with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC; on MPCs hosted on MX Series routers; on the T320, T640, and T1600 with Enhanced Intelligent Queuing (IQE) PICs; and on the T4000 with Type 5 FPC and Enhanced Scaling Type 4 FPC.

### NOTE:

- The `if-exceeding-pps` statement is only supported on MX Series routers with MPCs.

- The `if-exceeding` and `if-exceeding-pps` statements are mutually exclusive and, therefore, cannot be applied at the same time.

You can configure the policer in static firewall filters or dynamic firewall filters in a dynamic client profile or a dynamic service profile.

## Options

*hierarchical-policer-name*—Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose the name in quotation marks (" ").

*uid*—When you configure a hierarchical policer at the `[edit dynamic-profiles profile name firewall]` hierarchy level, you must assign a variable UID as the policer name.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## Required Privilege Level

`firewall`—To view this statement in the configuration.

`firewall-control`—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles profile-name firewall]` hierarchy level introduced in Junos OS Release 11.4.

Support for `if-exceeding-pps` statement on MX Series routers with MPCs introduced in Junos OS Release 15.2.

[edit firewall three-color-policer policer-name],
[edit logical-systems logical-system-name firewall policer policer-name],
[edit logical-systems logical-system-name firewall three-color-policer name]
```

## Description

Configure a logical interface policer. For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.

To configure the aggregate policer, configure the firewall policer you want to use as logical-interface-policer. And at the firewall family *family-name* filter *filter-name* hierarchy level where you will reference the policer, make the policer an interface-specific firewall filter action.

The sample configuration shows the relationship.

```
firewall {
 policer Shared_Policer {
 logical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then {
 discard;
 }
 }
}
```

```
 }
}
```

```
family inet {
 filter filter_name{
 interface-specific;
 term term_name {
 then {
 policer Shared_Policer;
 count cinet;
 }
 }
 }
}
```

**NOTE:** Starting in Junos OS Release 12.2R2, on T Series Core Routers only, you can configure an MPLS LSP policer for a specific LSP to be shared across different protocol family types. You must include the logical-interface-policer statement to do so.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support at the [edit firewall three-color-policer *policer-name*] hierarchy level introduced in Junos OS Release 8.2.

Logical systems support introduced in Junos OS Release 9.3.

Support at the [edit dynamic-profiles ... policer *policer-name*] and [edit dynamic-profiles ... three-color-policer *name*] hierarchy levels introduced in Junos OS Release 11.4.

Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.

packet-burst packets;
```

## Hierarchy Level

```
[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding-pps],
[edit firewall policer policer-name if-exceeding-pps],
[edit logical-systems logical-system-name firewall policer policer-name if-exceeding-pps]
```

## Description

For a single-rate two-color policer, configure the packet-burst as a number of packets. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the pps-limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with low packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** This statement specifies the packet burst limit as an absolute number of packets.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

## Options

*packets*—Specify the number of packets either as a decimal number or as a decimal number followed by the abbreviation k (1000), or m (1000000).

- **Range:** 1 through 24414062
- **Default:** None

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 16.1.

## erac1-ip6-match (packet-forwarding-options)

### IN THIS SECTION

- [Syntax | 2553](#)
- [Hierarchy Level | 2553](#)
- [Description | 2554](#)
- [Options | 2554](#)
- [Required Privilege Level | 2554](#)
- [Release Information | 2554](#)

### Syntax

```
erac1-ip6-match {
 (srcip6-and-destip6 | srcip6-only);
}
```

### Hierarchy Level

```
[edit system packet-forwarding-options]
```

## Description

Use the options of this command to allow source and/or destination IPv6 address match conditions for eRACL inet6 filters.

In Junos, firewall filters are classified as *ingress* or *egress* depending on where in the sequence the packet is evaluated and action taken. Filtering IPv6 traffic on an inet6 egress interface can be useful, for example, for safeguarding a third-party device connected to the Juniper switch.

**NOTE:** After configuring, modifying, or deleting the `erac1-ip6-match` statement, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

## Options

**erac1-ip6-match** Configuring match conditions in a firewall filter for IPv6 source and/or destination IP addresses is only allowed if the `srcip6-and-destip6` or the `srcip6-only` options described below are enabled. The two options cannot both be enabled at the same time. If neither option is configured, the default behavior is to allow match condition to be created for IPv6 destination addresses on egress interfaces only.

- Values:
  - **srcip6-and-destip6**—Choose this option to allow both source and destination IPv6 address match conditions on inet6 interfaces in egress direction. The source and destination port match conditions are also allowed only with this option. Note that when this option is enabled, the scale of eRACLv6 is reduced by half.
  - **srcip6-only**—Choosing this option allows the source IPv6 address match condition in eRACLv6 filters but not a destination address. Both source and destination port match conditions cannot be configured at the same time as this option is enabled (you will get a commit error).

## Required Privilege Level

### Syntax

```
peak-burst-size bytes;
```

### Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name two-rate],
[edit firewall three-color-policer policer-name two-rate]
```

### Description

For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS).

**NOTE:** When you include the `peak-burst-size` statement in the configuration, you must also include the `committed-burst-size` and `peak-information-rate` statements at the same hierarchy level.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits.

- A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.
- A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with medium-high packet loss priority (PLP) and then passed through the interface.
- A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with high PLP and then either passed through the interface or optionally discarded.

## Options

*bytes*—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000).

- **Range:** 1500 through 100,000,000,000 bytes

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.4.

Support at the `[edit dynamic-profiles ... two-rate]` hierarchy level introduced in Junos OS Release 11.4.

[edit routing-instances routing-instance-name firewall family family-name filter filter-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name firewall family
family-name filter filter-name]
```

## Description

Configure a physical interface filter. Use this statement to reference a physical interface policer for the specified protocol family.

For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.

To use the aggregate policer, configure the firewall policer you want as `physical-interface-policer`. In addition, at the `firewall family family-name filter filter-name` hierarchy level where you will reference the policer, make the policer a physical-interface-specific firewall filter action. This creates a unique instance of the filter on the physical interface.

The sample configuration shows the settings and relationship between them.

```
firewall {
 policer Shared_Policer {
 physical-interface-policer;
 if-exceeding {
```

```

 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then {
 discard;
 }
}
}

```

```

firewall {
 filter Filter_Name {
 physical-interface-specific;
 term term_name {
 then {
 policer Shared_Policer;
 count cinet;
 }
 }
 }
}

```

```

family inet {
 filter filter_name {
 physical-interface-filter;
 term term_name {
 then {
 policer Shared_Policer;
 count cinet;
 }
 }
 }
}

```

policer policer-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name firewall three-
color-policer policer-name]
```

## Description

Configure an aggregate policer for a physical interface.

A physical interface policer can be a two-color or three-color policer. When you apply physical interface policer, to different protocol families on the same logical interface, the protocol families share the same policer instance. This means that rate limiting is performed in aggregate for the protocol families for which the policer is applied. This feature enables you to use a single policer instance to perform aggregate policing for different protocol families on the same physical interface. If you want a policer instance to be associated with a protocol family, the corresponding physical interface filter needs to be applied to that protocol family. The policer is not automatically applied to all protocol families configured on the physical interface.

In contrast, with logical interface policers there are multiple separate policer instances.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.6.

Support at the [edit dynamic-profiles ... policer *policer-name*] hierarchy level introduced in Junos Release OS 11.4.

Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.

- [Hierarchy Level | 2567](#)
- [Description | 2567](#)
- [Options | 2568](#)
- [Required Privilege Level | 2568](#)
- [Release Information | 2568](#)

### Syntax

```
policer policer-name {
 filter-specific;
 if-exceeding {
 bandwidth-limit bps;
 burst-size-limit bytes;
 }
 then {
 policer-action;
 }
}
```

### Hierarchy Level

```
[edit firewall]
```

### Description

Configure policer rate limits and actions. To activate a policer, you must include the **policer** action modifier in the then statement in a firewall filter term.

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or across filters—the policer’s implicit counter is used to count packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these approaches:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

## Options

*policer-name*—Name that identifies the policer. The name can contain letters, numbers, hyphens (-), and can be up to 64 characters long.

The remaining statements are explained separately. See [CLI Explorer](#).

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 11.1.

[edit logical-systems logical-system-name interfaces interface-name unit unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit unit-number
family family]

```

## Description

Apply a single-rate two-color policer—except for a physical interface policer—to Layer 3 input or output traffic at a logical interface.

- To rate-limit all traffic types, regardless of the protocol family, you can apply a logical interface policer at the logical unit level of a supported interface.
- To rate-limit traffic of a specific protocol family, you can apply a basic two-color policer, a bandwidth policer, or a logical interface policer at the protocol family level of a supported interface.

**NOTE:** You cannot apply a physical interface policer as part of the interface configuration. You can apply a physical interface policer by referencing the policer from a physical interface filter term.

## Options

input *policer-name*—Name of one policer to evaluate packets received on the interface.

output *policer-name*—Name of one policer to evaluate packets transmitted on the interface.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Syntax

```
policer policer-name {
 filter-specific;
 counter {
```

```

 counter-id counter-index;}
 if-exceeding {
 bandwidth-limit bps;
 bandwidth-percent number;
 burst-size-limit bytes;
 }
 logical-bandwidth-policer;
 logical-interface-policer;
 physical-interface-policer;
 shared-bandwidth-policer;
 then {
 policer-action;
 }
}

```

## Hierarchy Level

```

[edit dynamic-profiles profile-name firewall],
[edit firewall],
[edit logical-systems logical-system-name firewall]

```

## Description

Configure policer rate limits and actions. When included at the [edit *firewall*] hierarchy level, the policer statement creates a template, and you do not have to configure a policer individually for every firewall filter or interface. To activate a policer, you must include the *policer-action* modifier in the then statement in a firewall filter term or on an interface.

You can configure the policer in static firewall filters or dynamic firewall filters in a dynamic client profile or a dynamic service profile.

Except for EX8200 switches, each policer that you configure includes an implicit counter. To obtain term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the "counter" on page 2342 option.

## Options

***policer-action***      One or more actions to take:

- `discard`—Discard traffic that exceeds the rate limits.
- `forwarding-class class-name`—Specify the particular forwarding class.
- `loss-priority`—Set the packet loss priority (PLP) to `low`, `medium-low`, `medium-high`, or `high`.

***policer-name*** Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policer names cannot begin with an underscore in the form `__.*`.

**then** Actions to take on matching packets.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## Required Privilege Level

`firewall`—To view this statement in the configuration.

`firewall-control`—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

The `out-of-profile policer` action added in Junos OS Release 8.1.

- [Release Information | 2575](#)

## Syntax

```
policer-drop-probability-low;
```

## Hierarchy Level

```
[edit chassis]
```

## Description

Reduces the possibility that policers configured on the router might drop packets. For some Juniper Networks routers, policers can mark packets as out-of-specification in accordance with TCP. By default, these policers begin to randomly drop packets when the current credit exceeds the credit limit. In the context of TCP, this random drop mechanism helps to smooth the flow of traffic. The `policer-drop-probability-low` statement causes the policers to operate as strict rate limiters and to ignore the standard TCP behavior.

The `policer-drop-probability-low` statement is applicable to the following routing platforms:

- M7i
- M10i
- M120
- M320
- MX Series

## policer-overhead-adjustment

### IN THIS SECTION

- [Syntax | 2576](#)
- [Hierarchy Level | 2576](#)
- [Description | 2577](#)
- [Options | 2577](#)
- [Required Privilege Level | 2577](#)
- [Release Information | 2577](#)

### Syntax

```
interfaces interface-name
 unit unit-number
 policer-overhead <ingress | egress> <adjustment in-bytes>
 policer-overhead <adjustment in-bytes>
```

### Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number]
```

## Description

Add the configured number of bytes to the length of a packet entering the interface or leaving the interface. The policer overhead adjustment at per IFL or direction granularity is in the range of -16 bytes to +16 bytes.

**NOTE:** If you configure the `policer-overhead` adjustment statement without the `ingress` or `egress` option and only with values in the supported range, it is considered for both ingress and egress. For example: set interfaces xe-1/0/1 policer-overhead <value>

## Options

*adjustment-in-bytes*—Policer overhead bytes to be accounted in ingress and egress. Number of bytes used to adjust the length of a packet used for policing purposes entering an interface and leaving an interface.

- **Range:** -16 to +16 bytes

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration

## Release Information

Statement introduced in Junos OS Release 16.1.

- [Hierarchy Level | 2578](#)
- [Description | 2578](#)
- [Options | 2579](#)
- [Required Privilege Level | 2579](#)
- [Release Information | 2579](#)

### Syntax

```
pps-limit pps;
```

### Hierarchy Level

```
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name aggregate if-exceeding],
[edit dynamic-profiles profile-name firewall hierarchical-policer hierarchical-policer-name premium if-exceeding],
[edit firewall hierarchical-policer hierarchical-policer-name aggregate if-exceeding],
[edit firewall hierarchical-policer hierarchical-policer-name premium if-exceeding]
```

### Description

Configure the maximum bandwidth in packets per second (pps) for premium or aggregate traffic in a hierarchical policer.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

## Options

*pps*—Specify the number of packets per second either as a decimal number or as a decimal number followed by the abbreviation *k* (1000), or *m* (1000000).

- **Range:** 2 through 24414062
- **Default:** None

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 16.1.

```
[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding-pps],
[edit firewall policer policer-name if-exceeding-pps],
[edit logical-systems logical-system-name firewallpolicer policer-name if-exceeding-pps]
```

## Description

For a single-rate two-color policer, configure the packets-per-second (pps) limit as a number of packets per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the pps limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with low packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** This statement specifies the pps limit as an absolute number of packets per second. You cannot use the pps limit as a percentage of interface bandwidth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allow more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

## Options

*pps*—Specify the number of packets per second either as a decimal number or as a decimal number followed by the abbreviation *k* (1000), or *m* (1000000).

## Syntax

```
then {
 policer-action;
}
```

## Hierarchy Level

```
[edit firewall policer policer-name]
```

## Description

Configure a policer action.

## Options

*policer-action*—Allowed policer actions are **discard**, **loss-priority high**, and **loss-priority low**. **discard** causes the system to drop traffic that exceeds the rate limits defined by the policer. Use **loss-priority high** to allow the system to forward matching traffic in some cases.

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is **discard**.

## Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 11.1.

## clear interfaces statistics

### IN THIS SECTION

- [Syntax | 2610](#)
- [Description | 2610](#)
- [Options | 2610](#)
- [Required Privilege Level | 2610](#)
- [Output Fields | 2610](#)
- [Sample Output | 2611](#)
- [Release Information | 2611](#)

## Syntax

```
clear interfaces statistics (all | interface-name)
```

## Description

Set interface statistics to zero. If you issue the `clear interfaces statistics interface-name` command and then perform a graceful Routing Engine switchover, the interface statistics are not cleared on the new primary node. Reissue the command to clear the interface statistics again.

Starting in Junos OS Release 17.3R1, this command supports the clearing of Packet Forwarding Engine accounting statistics on logical interfaces configured with accounting options. On these interfaces, the current statistics values are stored as the new current baseline values and then the counters are reset to zero. If the `allow-clear` statement is included in the interface profile, then the cleared statistics values are reported to the accounting options flat file associated with the interface. Reporting is disabled by default; if `allow-clear` is not configured, then the CLI displays cleared statistics counters, but they are not reported to the flat file.

Starting in Junos OS Release 19.1R1, this command supports the clearing of unicast Reverse Path Forwarding (RPF) statistics.

Starting in Junos OS Release 21.3R1, on MX Series Routers, this command supports the clearing of Reverse Path Forwarding (RPF) statistics of the Ethernet interfaces.

## Options

|                              |                                                   |
|------------------------------|---------------------------------------------------|
| <b>all</b>                   | Set statistics on all interfaces to zero.         |
| <b><i>interface-name</i></b> | Set statistics on a particular interface to zero. |

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are provided no feedback on the status of your request.

## Sample Output

### clear interfaces statistics

```
user@host> clear interfaces statistics
```

## Release Information

Command introduced before Junos OS Release 7.4.

### Release History Table

| Release | Description                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.3R1  | Starting in Junos OS Release 17.3R1, this command supports the clearing of Packet Forwarding Engine accounting statistics on logical interfaces configured with accounting options. |

## clear policy statistics

### IN THIS SECTION

- [Syntax | 2611](#)
- [Description | 2612](#)

- [Required Privilege Level | 2612](#)
- [Output Fields | 2612](#)
- [Sample Output | 2612](#)
- [Release Information | 2612](#)

## Syntax

```
clear policy statistics
<policy -name>
```

## Description

Clear policy statistics.

## Options

**none** Clear statistics for all policies.

***policy-name*** (Optional) Clear statistics for the specified policy only.

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**clear policy statistics**

```
user@host> clear policy statistics
```

## Release Information

Command introduced in Junos OS Release 15.1F6.

### Output Fields

[Table 131 on page 2614](#) lists the output fields for the `show accounting profile` command. Output fields are listed in the approximate order in which they appear.

Table 131: show accounting profile Output Fields

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile</b>                 | Name of the accounting profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Sampling interval</b>       | Configured interval, in minutes, for statistic collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Profile Usage Count</b>     | Number of items configured for collecting accounting statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>file information</i></b> | <p>Information about the accounting profile log, including:</p> <ul style="list-style-type: none"> <li>• <b>File</b>—Name of accounting profile log. If no name is explicitly provided, the name of the accounting profile is used. All statistics files are placed in the <b>/var/log</b> directory.</li> <li>• <b>maximum size</b>—Configured size. When the size is exceeded, the log file closes and a new log file opens.</li> <li>• <b>maximum number</b>—Configured maximum number of log files.</li> <li>• <b>bytes written</b>—Number of bytes written to the log file.</li> </ul> |
| <b>Transfer Interval</b>       | Length of time (in minutes) the file remains open, receiving statistics before it is closed, transferred, and rotated. When either the time or the file size is exceeded, the file is closed and a new one opened, whether or not a transfer site is specified.                                                                                                                                                                                                                                                                                                                             |
| <b>Next Scheduled Transfer</b> | Time at which the next transfer occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 131: show accounting profile Output Fields (*Continued*)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Release Information

Command introduced before Junos OS Release 7.4.

## show interfaces destination-class

### IN THIS SECTION

- [Syntax | 2619](#)
- [Description | 2619](#)
- [Options | 2619](#)
- [Additional Information | 2620](#)
- [Required Privilege Level | 2620](#)
- [Output Fields | 2620](#)
- [Sample Output | 2620](#)
- [Release Information | 2622](#)

## Syntax

```
show interfaces destination-class
(all / destination-class-name logical-interface-name)
```

## Description

Display information about interfaces grouped by destination class.

## Options

**all**

Display information about all configured destination classes.

***destination-class-name***

Name of a logical grouping of prefixes that count packets having the destination address matching those prefixes. Whenever a destination class is specified, you must also specify a particular logical interface, not all interfaces.

*logical interface-name*            Name of a logical interface.

Additional Information

For interfaces that carry IPv4, IPv6, or Multiprotocol Label Switching (MPLS) traffic, you can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into sets defined as source classes and destination classes. For more information, see the [Junos OS Network Interfaces Library for Routing Devices](#).

Required Privilege Level

view

Output Fields

[Table 132 on page 2620](#) lists the output fields for the `show interfaces destination-class` command. Output fields are listed in the approximate order in which they appear.

Table 132: show interfaces destination-class Output Fields

| Field Name        | Field Description                                                            |
|-------------------|------------------------------------------------------------------------------|
| Logical interface | Name of the logical interface.                                               |
| Destination class | Name of destination class usage (DCU) counters per class for this interface. |
| Packets           | Packets going to designated user-selected prefixes.                          |
| Bytes             | Bytes going to designated user-selected prefixes.                            |

Release Information

Command introduced before Junos OS Release 7.4.

**all** option introduced in Junos OS Release 8.0.

## show interfaces statistics

### IN THIS SECTION

- [Syntax | 2627](#)
- [Description | 2627](#)
- [Options | 2627](#)
- [Required Privilege Level | 2628](#)
- [Output Fields | 2628](#)
- [Sample Output | 2628](#)
- [Release Information | 2645](#)

### Syntax

```
show interfaces statistics interface-name
<satellite-device [device-alias-name |all]>
<detail>
```

### Description

Display static interface statistics, such as errors.

**NOTE:** When the **show interfaces statistics** command is executed on an interface that is configured on T4000 Type 5 FPC, the *IPv6 transit statistics* field displays:

- Total statistics (sum of transit and local statistics) at the physical interface level
- Transit statistics at the logical interface level

### Options

*interface-name*      Name of an interface.

**satellite-device** (Junos Fusion only) (Optional) Display interface statistics for interfaces on the specified satellite device in the Junos Fusion, or on all satellite devices in the Junos Fusion.  
**[*device-alias-name* | all ]**

**NOTE:** In a Junos Fusion Enterprise, logical interface statistics are not synced across aggregation devices in a dual-aggregation device topology.

**detail** (Optional) Display detailed output.

## Required Privilege Level

view

## Output Fields

Output from both the `show interfaces interface-name detail` and the `show interfaces interface-name extensive` commands include all the information displayed in the output from the `show interfaces statistics` command. For more information, see the particular interface type in which you are interested. For information about destination class and source class statistics, see the “Destination Class Field” section and the “Source Class Field” section under [Common Output Fields Description](#). For information about the input errors and output errors, see [Fast Ethernet and Gigabit Ethernet Counters](#).

## Sample Output

### show interfaces statistics (Fast Ethernet)

```
user@host> show interfaces fe-1/3/1 statistics
Physical interface: fe-1/3/1, Enabled, Physical link is Up
 Interface index: 144, SNMP ifIndex: 1042
 Description: ford fe-1/3/1
 Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
 Source filtering: Disabled, Flow control: Enabled
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 CoS queues : 4 supported, 4 maximum usable queues
 Current address: 00:00:5E:00:53:dc, Hardware address: 00:00:5E:00:53:dc
 Last flapped : 2006-04-18 03:08:59 PDT (00:01:24 ago)
 Statistics last cleared: Never
```

```

Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
Input errors: 0, Output errors: 0
Active alarms : None
Active defects : None
Logical interface fe-1/3/1.0 (Index 69) (SNMP ifIndex 50)
 Flags: SNMP-Traps Encapsulation: ENET2
 Protocol inet, MTU: 1500
 Flags: Is-Primary, DCU, SCU-in

```

| Destination class | Packets<br>(packet-per-second) | Bytes<br>(bits-per-second) |

## Output Fields

Table 134 on page 2647 lists the output fields for the `show policy` command. Output fields are listed in the approximate order in which they appear.

**Table 134: show policy Output Fields**

| Field Name         | Field Description                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>policy-name</i> | Name of the policy listed.                                                                                                       |
| <i>term</i>        | Name of the user-defined policy term. The term name unnamed is used for policy elements that occur outside of user defined terms |
| from               | Match condition for the policy.                                                                                                  |
| then               | Action for the policy.                                                                                                           |

## Sample Output

### show policy

```
user@host> show policy
Configured policies:
__vrf-export-red-internal__
__vrf-import-red-internal__
red-export
rf-test-policy
multicast-scoping
```

### show policy policy-name

```
user@host> show policy vrf-import-red-internal
Policy vrf-import-red-internal:
 from
 203.0.113.0/28 accept
```

```
203.0.113.32/28 accept
then reject
```

## show policy statistics policy-name

```
user@host> show policy statistics iBGP-v4-RR-Import
Policy iBGP-v4-RR-Import:
 [1243328] Term Lab-Infra:
 from [1243328 0] proto BGP
 [28 0] route filter:
 10.11.0.0/8 orlonger
 10.13.0.0/8 orlonger
 then [28 0] accept
 [1243300] Term External:
 from [1243300 1] proto BGP
 [1243296 0] community Ext-Com1 [64496:1515]
 [1243296 0] prefix-list-filter Customer-Routes
 [1243296 0] aspath AS6221
 [1243296 1] route filter:
 172.16.49.0/12 orlonger
 172.16.50.0/12 orlonger
 172.16.51.0/12 orlonger
 172.16.52.0/12 orlonger
 172.16.56.0/12 orlonger
 172.16.60.0/12 orlonger
 then [1243296 2] community + Ext-Com2 [64496:2000] [1243296 0] accept
 [4] Term Final:
 then [4 0] reject
```

## Release Information

Command introduced before Junos OS Release 7.4.

statistics option introduced in Junos OS Release 16.1 for MX Series routers.

### Syntax

```
show policy conditions
 <condition-name>
 <detail>
 <dynamic>
 <logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show policy conditions
 <condition-name>
 <detail>
 <dynamic>
```

### Description

Display all the configured conditions as well as the routing tables with which the configuration manager is interacting. If the `detail` keyword is included, the output also displays dependent routes for each condition.

## Options

## Output Fields

[Table 135 on page 2650](#) lists the output fields for the **show policy conditions** command. Output fields are listed in the approximate order in which they appear.

**Table 135: show policy conditions Output Fields**

| Field Name       | Field Description                                                                                                                 | Level of Output |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Condition        | Name of configured condition.                                                                                                     | All levels      |
| event            | Condition type. If the if-route-exists option is configured, the event type is: Existence of a route in a specific routing table. | All levels      |
| Dependent routes | List of routes dependent on the condition, along with the latest generation number.                                               | detail          |
| Condition tables | List of routing tables associated with the condition, along with the latest generation number and number of dependencies.         | All levels      |

**Table 135: show policy conditions Output Fields (Continued)**

| Field Name                 | Field Description                                                         | Level of Output |
|----------------------------|---------------------------------------------------------------------------|-----------------|
| If-route-exists conditions | List of conditions configured to look for a route in the specified table. | All levels      |

## Sample Output

### show policy conditions detail

```

user@host> show policy conditions detail
Configured conditions:
Condition cond1, event: Existence of a route in a specific routing table
Dependent routes:
 172.16.4.4/32, generation 3
 6.6.6.6/32, generation 3
 10.10.10.10/32, generation 3

Condition cond2, event: Existence of a route in a specific routing table
Dependent routes:
None

Condition tables:
Table inet.0, generation 4, dependencies 3, If-route-exists conditions: cond1 (static) cond2
(static)

```

## Release Information

Command introduced in Junos OS Release 9.0.

## show policy damping

### IN THIS SECTION

- [Syntax | 2652](#)

### Syntax

```
show policy damping
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switch and QFX Series)

```
show policy damping
```

### Description

Display information about BGP route flap damping parameters.

### Options

|             |                                                              |
|-------------|--------------------------------------------------------------|
| <b>none</b> | Display information about BGP route flap damping parameters. |
|-------------|--------------------------------------------------------------|

**logical-system** (all | *logical-system-name*) (Optional) Perform this operation on all logical systems or on a particular logical system.

### Additional Information

In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

### Required Privilege Level

view

### Output Fields

[Table 136 on page 2653](#) describes the output fields for the `show policy damping` command. Output fields are listed in the approximate order in which they appear.

**Table 136: show policy damping Output Fields**

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Halflife              | Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. |
| Reuse merit           | Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.                                                                                                                                                  |
| Suppress/cutoff merit | Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.                                                           |

**Table 136: show policy damping Output Fields (Continued)**

| Field Name            | Field Description                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum suppress time | Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.     |
| Computed values       | <ul style="list-style-type: none"> <li>• Merit ceiling—Maximum merit that a flapping route can collect.</li> <li>• Maximum decay—Maximum decay half-life, in minutes.</li> </ul> |

## Sample Output

### show policy damping

```

user@host> show policy damping
Default damping information:
 Halflife: 15 minutes
 Reuse merit: 750 Suppress/cutoff merit: 3000
 Maximum suppress time: 60 minutes
 Computed values:
 Merit ceiling: 12110
 Maximum decay: 6193
Damping information for "standard-damping":
 Halflife: 10 minutes
 Reuse merit: 4000 Suppress/cutoff merit: 8000
 Maximum suppress time: 30 minutes
 Computed values:
 Merit ceiling: 32120
 Maximum decay: 12453

```

```

## Syntax (EX Series Switches)

```
show route
<all>
<destination-prefix>
<private>
```

## Description

Display the active entries in the routing tables.

## Options

<b>none</b>	Display brief information about all active entries in the routing tables.
<b>all</b>	(Optional) Display information about all routing tables, including private, or internal, routing tables.

<i>destination-prefix</i>	(Optional) Display active entries for the specified address or range of addresses.
<b>logical-system</b> (all   <i>logical-system-name</i> )	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>private</b>	(Optional) Display information only about all private, or internal, routing tables.
<b>programmed detail</b>	(Optional) Display API-programmed routes.
<b>display-client-data</b>	(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.
<b>te-ipv4-prefix-ip</b> <i>te-ipv4-prefix-ip</i>	(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.
<b>te-ipv4-prefix-node-ip</b> <i>te-ipv4-prefix-node-ip</i>	(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the <code>lsdist.0</code> table.
<b>te-ipv4-prefix-node-iso</b> <i>te-ipv4-prefix-node-iso</i>	(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the <code>lsdist.0</code> table.
<b>te-ipv6-prefix-ipv6-addr</b> <i>te-ipv6-prefix-ipv6-addr</i>	(Optional) Filter IPv6 node addresses from the traffic-engineering IPv6 prefix.
<b>te-ipv6-prefix-node-iso</b> <i>te-ipv6-prefix-node-iso</i>	(Optional) Filter IPv6 routes with the specified ISO circuit ID in the traffic-engineering IPv6 prefix.
<b>rib-sharding</b> (main   <i>rib-shard-name</i> )	(Optional) Display the rib shard name.

## Output Fields

[Table 137 on page 2659](#) describes the output fields for the `show route` command. Output fields are listed in the approximate order in which they appear.

Table 137: show route Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number</i> destinations	Number of destinations for which there are routes in the routing table.
<i>number</i> routes	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• active (routes that are active).</li> <li>• holddown (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the add-path or advertise-inactive statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <p>If you have configured uRPF-loose mode, the holddown bit is most likely set because Kernel Routing Table (KRT) is using inactive route to build valid incoming interfaces. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• hidden (routes that are not used because of a routing policy).</li> </ul>

Table 137: show route Output Fields (*Continued*)

Field Name	Field Description
<i>destination-prefix</i>	<p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <i>MPLS-label</i>(for example, 80001).</li> <li>• <i>interface-name</i> (for example, ge-1/0/2).</li> <li>• <i>neighbor-address.control-word-status.encapsulation type.vc-id.source</i> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <i>neighbor-address</i>—Address of the neighbor.</li> <li>• <i>control-word-status</i>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</li> <li>• <i>encapsulation type</i>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <i>vc-id</i>—Virtual circuit identifier.</li> <li>• <i>source</i>—Source of the advertisement: Local or Remote.</li> </ul> </li> </ul>
[ <i>protocol</i> , <i>preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>

Table 137: show route Output Fields (Continued)

Field Name	Field Description
<i>weeks:days</i> <i>hours.minutes.seconds</i>	How long the route been known (for example, 2w4d 13:11:14, or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).
metric	Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
localpref	Local preference value included in the route.
from	Interface from which the route was received.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>

Table 137: show route Output Fields *(Continued)*

Field Name	Field Description
encapsulated	Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-Over IPv6 tunnels are not created and BGP routes are resolved without encapsulation.
Route Labels	Stack of labels carried in the BGP route update.
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• Valid—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
to	<p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is Discard, traffic is dropped.</p>

Table 137: show route Output Fields (Continued)

Field Name	Field Description
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). For VPNs, expect to see multiple push operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul>
Private unicast	(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes not managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.
balance	Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

```

```

## Release Information

Command introduced before Junos OS Release 7.4.

Option private introduced in Junos OS Release 9.5.

Option private introduced in Junos OS Release 9.5 for EX Series switches.

Option display-client-data introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.

Options te-ipv4-prefix-ip, te-ipv4-prefix-node-ip, and te-ipv4-prefix-node-iso introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

rib-sharding option introduced in cRPD Release 20.1R1.

### Syntax

```
show route active-path
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route active-path
<brief | detail | extensive | terse>
```

### Description

Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.

### Options

<b>none</b>	Display all active routes.
-------------	----------------------------

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
<b>logical-system</b> (all   <i>logical-system-name</i> )	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

## Sample Output

### show route active-path

```

user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

<i>show route terse</i>

## show route advertising-protocol

### IN THIS SECTION

- [Syntax | 2677](#)
- [Description | 2677](#)
- [Options | 2677](#)
- [Additional Information | 2678](#)
- [Required Privilege Level | 2678](#)
- [Output Fields | 2678](#)
- [Sample Output | 2682](#)
- [Release Information | 2685](#)

### Syntax

```
show route advertising-protocol protocol neighbor-address
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

### Description

Display the routing information as it has been prepared for advertisement to a particular neighbor of a particular dynamic routing protocol.

### Options

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b><i>neighbor-address</i></b>	Address of the neighboring router to which the route entry is being transmitted.
<b><i>protocol</i></b>	Protocol transmitting the route:

- `bgp`—Border Gateway Protocol
- `dvmrp`—Distance Vector Multicast Routing Protocol
- `msdp`—Multicast Source Discovery Protocol
- `pim`—Protocol Independent Multicast
- `rip`—Routing Information Protocol
- `ripng`—Routing Information Protocol next generation

## Additional Information

Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's `export` routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table `foo` for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, If you do not specify the `table` in the command, the output displays each VRF prefix twice.

## Required Privilege Level

`view`

## Output Fields

[Table 138 on page 2678](#) lists the output fields for the `show route advertising-protocol` command. Output fields are listed in the approximate order in which they appear.

**Table 138: show route advertising-protocol Output Fields**

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, <code>inet.0</code> .	All levels
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.	All levels

Table 138: show route advertising-protocol Output Fields (*Continued*)

Field Name	Field Description	Level of Output
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• active (routes that are active)</li> <li>• holddown (routes that are in the pending state before being declared inactive)</li> <li>• hidden (routes that are not used because of a routing policy)</li> </ul>	All levels
Prefix	Destination prefix.	brief none
<i>destination-prefix</i> (entry , announced)	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
BGP group and type	BGP group name and type (Internal or External).	detail extensive
Route Distinguisher	Unique 64-bit prefix augmenting each IP subnet.	detail extensive
Advertised Label	Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label.	detail extensive
Label-Base, range	First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.	detail extensive

**Table 138: show route advertising-protocol Output Fields (*Continued*)**

Field Name	Field Description	Level of Output
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.	detail extensive
Nexthop	<p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the next-hop advertisement to the peer is Self, and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output.</p>	All levels
MED	Multiple exit discriminator value included in the route.	brief
Lclpref or Localpref	Local preference value included in the route.	All levels
Queued	When BGP route prioritization is enabled and a route is present in a priority queue, this shows which priority queue the route is in.	All levels except brief

Table 138: show route advertising-protocol Output Fields (*Continued*)

Field Name	Field Description	Level of Output
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
Route Labels	Stack of labels carried in the BGP route update.	detail extensive
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	detail extensive
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	detail extensive
Communities	Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command for all possible values for this field.	detail extensive

**Table 138: show route advertising-protocol Output Fields (Continued)**

Field Name	Field Description	Level of Output
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	detail extensive
Attrset AS	Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the Attrset attribute at the originating router.	detail extensive
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	detail extensive
control flags	Control flags: none or Site Down.	detail extensive
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	detail extensive

## Sample Output

### show route advertising-protocol bgp (Layer 3 VPN)

```

user@host> show route advertising-protocol bgp 10.255.14.171

### Syntax

```
show route all
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route all
```

### Description

Display information about all routes in all routing tables, including private, or internal, tables.

### Options

<b>none</b>	Display information about all routes in all routing tables, including private, or internal, tables.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

In Junos OS Release 9.5 and later, only the output fields for the `show route all` command display all routing tables, including private, or hidden, routing tables. The output field table of the [show route](#) command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later.

## Sample Output

### show route all

The following example displays a snippet of output from the `show route` command and then displays the same snippet of output from the `show route all` command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
1 *[MPLS/0] 2d 02:24:39, metric 1

## show route aspath-regex

### IN THIS SECTION

- [Syntax | 2689](#)
- [Syntax \(EX Series Switches\) | 2689](#)
- [Description | 2689](#)
- [Options | 2689](#)
- [Additional Information | 2689](#)
- [Required Privilege Level | 2690](#)
- [Output Fields | 2690](#)
- [Sample Output | 2690](#)
- [Release Information | 2691](#)

## Syntax

```
show route aspath-regex regular-expression
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route aspath-regex regular-expression
```

## Description

Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

## Options

<i>regular-expression</i>	Regular expression that matches an entire AS path.
<b>logical-system</b> (all   <i>logical-system-name</i> )	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Additional Information

You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos Policy Framework Configuration Guide*. The following list summarizes these operators:

- $\{m, n\}$ —At least  $m$  and at most  $n$  repetitions of the AS path term.
- $\{m\}$ —Exactly  $m$  repetitions of the AS path term.
- $\{m, \}$ — $m$  or more repetitions of the AS path term.
- $*$ —Zero or more repetitions of an AS path term.

- $\star$ —One or more repetitions of an AS path term.
- $?$ —Zero or one repetition of an AS path term.
- *aspath\_term* | *aspath\_term*—Match one of the two AS path terms.

When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:

```
show route aspath-regex ".* 234 .*"
```

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field table for the [show route](#) command.

## Sample Output

### show route aspath-regex (Matching a Specific AS Number)

```
user@host> show route aspath-regex 65477
inet.0: 46411 destinations, 46411 routes (46409 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

111.222.1.0/25 *[BGP/170] 00:08:48, localpref 100, from 111.222.2.24

## Syntax

```
show route best destination-prefix
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route best destination-prefix
<brief | detail | extensive | terse>
```

## Description

Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

## Options

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b> .
<b><i>destination-prefix</i></b>	Address or range of addresses.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

## Sample Output

### show route best

```
user@host> show route best 10.255.70.103

## show route community

### IN THIS SECTION

- [Syntax | 2699](#)
- [Syntax \(EX Series Switches\) | 2699](#)
- [Description | 2699](#)
- [Options | 2699](#)

- [Additional Information | 2700](#)
- [Required Privilege Level | 2700](#)
- [Output Fields | 2700](#)
- [Sample Output | 2700](#)
- [Release Information | 2701](#)

## Syntax

```
show route community as-number:community-value
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route community as-number:community-value
<brief | detail | extensive | terse>
```

## Description

Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

## Options

***as-number:community-value*** One or more community identifiers. *as-number* is the AS number, and *community-value* is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

For example:

```
user@host> show route table inet.0 protocol bgp community
"12083:6015" community "12083:65551"
```

or

```
user@host> show route table inet.0 protocol bgp community
[12083:6014 12083:65551]
```

**brief | detail | extensive |  
terse**

(Optional) Display the specified level of output.

**logical-system (all | *logical-  
system-name*)**

(Optional) Perform this operation on all logical systems or on a particular logical system.

## Additional Information

Specifying the `community` option displays all routes matching the community found within the routing table. The `community` option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

## Required Privilege Level

view

### Syntax

```
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switch and QFX Series)

```
show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
```

### Description

Display the BGP routes for which updates might have been reduced because of route flap damping.

### Options

**brief | detail | extensive | terse** (Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

<b>decayed</b>	Display route damping entries that might no longer be valid, but are not suppressed.
<b>history</b>	Display entries that have already been withdrawn, but have been logged.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>suppressed</b>	Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

## Required Privilege Level

view

## Output Fields

Table 139 on page 2705 lists the output fields for the `show route damping` command. Output fields are listed in the approximate order in which they appear.

**Table 139: show route damping Output Fields**

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, <code>inet.0</code> .	All levels
<i>destinations</i>	Number of destinations for which there are routes in the routing table.	All levels
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• active</li> <li>• holddown (routes that are in a pending state before being declared inactive)</li> <li>• hidden (the routes are not used because of a routing policy)</li> </ul>	All levels

Table 139: show route damping Output Fields (*Continued*)

Field Name	Field Description	Level of Output
<i>destination-prefix</i> (entry, announced)	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
[ <i>protocol</i> , <i>preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>	All levels
Next-hop reference count	Number of references made to the next hop.	detail extensive
Source	IP address of the route source.	detail extensive
Next hop	Network layer address of the directly reachable neighboring system.	detail extensive
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected.	detail extensive

**Table 139: show route damping Output Fields (Continued)**

Field Name	Field Description	Level of Output
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	detail extensive
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	detail extensive
State	Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.	detail extensive
Local AS	AS number of the local routing device.	detail extensive
Peer AS	AS number of the peer routing device.	detail extensive
Age	How long the route has been known.	detail extensive
Metric	Metric for the route.	detail extensive
Task	Name of the protocol that has added the route.	detail extensive
Announcement bits	List of protocols that announce this route. <i>n</i> -Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.	detail extensive

Table 139: show route damping Output Fields (Continued)

Field Name	Field Description	Level of Output
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	brief none
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected.	brief none
Communities	Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.	detail extensive

**Table 139: show route damping Output Fields (Continued)**

Field Name	Field Description	Level of Output
Localpref	Local preference value included in the route.	All levels
Router ID	BGP router ID as advertised by the neighbor in the open message.	detail extensive
Merit (last update/now)	Last updated and current figure-of-merit value.	detail extensive
damping-parameters	Name that identifies the damping parameters used, which is defined in the damping statement at the [edit policy-options] hierarchy level.	detail extensive
Last update	Time of most recent change in path attributes.	detail extensive
First update	Time of first change in path attributes, which started the route damping process.	detail extensive
Flaps	Number of times the route has gone up or down or its path attributes have changed.	detail extensive
Suppressed	(suppressed keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it.	All levels
Reusable in	(suppressed keyword only) Time when a suppressed route will again be available.	All levels
Preference will be	(suppressed keyword only) Preference value that will be applied to the route when it is again active.	All levels

### Syntax

```
show route detail
<destination-prefix>
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route detail
<destination-prefix>
```

### Description

Display detailed information about the active entries in the routing tables.

### Options

**none**                      Display all active entries in the routing table on all systems.

<i>destination-prefix</i>	(Optional) Display active entries for the specified address or range of addresses.
<b>logical-system</b> (all   <i>logical-system-name</i> )	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

[Table 140 on page 2713](#) describes the output fields for the `show route detail` command. Output fields are listed in the approximate order in which they appear.

[Table 141 on page 2723](#) describes all possible values for the Next-hop Types output field.

[Table 142 on page 2725](#) describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

[Table 143 on page 2728](#) describes the possible values for the Communities output field.

**Table 140: show route detail Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number</i> destinations	Number of destinations for which there are routes in the routing table.
<i>number</i> routes	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• active (routes that are active)</li> <li>• holddown (routes that are in the pending state before being declared inactive)</li> <li>• hidden (routes that are not used because of a routing policy)</li> </ul>

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <i>MPLS-label</i> (for example, 80001).</li> <li>• <i>interface-name</i> (for example, ge-1/0/2).</li> <li>• <i>neighbor-address:control-word-status:encapsulation type:vc-id:source</i> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</li> <li>• <i>neighbor-address</i>—Address of the neighbor.</li> <li>• <i>control-word-status</i>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</li> <li>• <i>encapsulation type</i>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <i>vc-id</i>—Virtual circuit identifier.</li> <li>• <i>source</i>—Source of the advertisement: Local or Remote.</li> <li>• <i>source</i>—Source of the advertisement: Local or Remote.</li> </ul>
label stacking	<p>( Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
[ <i>protocol,</i> <i>preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value.</p> <p>Preference2 values are signed integers, that is, Preference2 values can be either positive or negative values. However, Junos OS evaluates Preference2 values as unsigned integers that are represented by positive values. Based on the Preference2 values, Junos OS evaluates a preferred route differently in the following scenarios:</p> <ul style="list-style-type: none"> <li>• Both Signed Preference2 values <ul style="list-style-type: none"> <li>• Route A = -101</li> <li>• Route B = -156</li> </ul> <p>Where both the Preference2 values are signed, Junos OS evaluates only the unsigned value of Preference2 and Route A, which has a lower Preference2 value is preferred.</p> </li> <li>• Unsigned Preference2 values <p>Now consider both unsigned Preference2 values:</p> <ul style="list-style-type: none"> <li>• Route A = 4294967096</li> <li>• Route B = 200</li> </ul> <p>Here, Junos OS considers the lesser Preference2 value and Route B with a Preference2 value of 200 is preferred because it is less than 4294967096.</p> </li> <li>• Combination of signed and unsigned Preference2 values</li> </ul>

**Table 140: show route detail Output Fields (Continued)**

Field Name	Field Description
	<p>When Preference2 values of two routes are compared, and for one route the Preference2 is a signed value, and for the other route it is an unsigned value, Junos OS prefers the route with the positive Preference2 value over the negative Preference2 value. For example, consider the following signed and unsigned Preference2 values:</p> <ul style="list-style-type: none"> <li>• Route A = -200</li> <li>• Route B = 200</li> </ul> <p>In this case, Route B with a Preference2 value of 200 is preferred although this value is greater than -200, because Junos OS evaluates only the unsigned value of the Preference2 value.</p>
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see <a href="#">Table 141 on page 2723</a> .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See <a href="#">Table 142 on page 2725</a> .
Local AS	AS number of the local routing device.

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric $n$	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a> .</p>
Task	Name of the protocol that has added the route.
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <math>n</math>-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><math>n</math>—An index used by Juniper Networks customer support only.</li> </ul>

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• Recorded—The AS path is recorded by the sample process (sampled).</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• [ ]—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>

Table 140: show route detail Output Fields (*Continued*)

Field Name	Field Description
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• Valid—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
ORR Generation-ID	Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

**Table 140: show route detail Output Fields (Continued)**

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See <a href="#">Table 143 on page 2728</a> for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.

**Table 140: show route detail Output Fields (Continued)**

Field Name	Field Description
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport DeletePending	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p> <p>The DeletePending flag indicates that a BGP route needs to be processed due to a BGP peer down event.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Statistics ID Group	Indicates the Kernel ID number and Statistics ID number.
Statistics	Indicates the number of packets and data transferred.

**Table 141: Next-hop Types Output Field Values**

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Dynamic List	Dynamic list next hop
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.

**Table 141: Next-hop Types Output Field Values** *(Continued)*

Next-Hop Type	Description
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrt)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul>
Software	Next hop added to the Routing Engine forwarding table for remote IP addresses with prefix /32 for Junos OS Evolved only.
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

**Table 142: State Output Field Values**

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.

Table 142: State Output Field Values *(Continued)*

Value	Description
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.

**Table 142: State Output Field Values (Continued)**

Value	Description
NSR-incapable	Route added by non-NSR supported protocols.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Programmed	Route installed programatically by on-box or off-box applications using API.
ProtectionCand	Indicates paths requesting protection.
ProtectionPath	Indicates the route entry that can be used as a protection path.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.

Table 142: State Output Field Values (*Continued*)

Value	Description
Unusable path	<p>Path is not usable because of one of the following conditions:</p> <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul>
Update source	Last tiebreaker is the lowest IP address value.

Table 143: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
<i>bandwidth: local AS number:link-bandwidth-number</i>	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
<i>domain-id</i>	Unique configurable number that identifies the OSPF domain.
<i>domain-id-vendor</i>	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535.
<i>options</i>	1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.

**Table 143: Communities Output Field Values (Continued)**

Value	Description
origin	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is <i>area-number:ospf-route-type:options</i> .
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is <i>area-number:ospf-route-type:options</i> .
target	Defines which VPN the route participates in; target has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.

## Sample Output

## Release Information

Command introduced before Junos OS Release 7.4.

Comand introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

DeletePending flag added to the command output in Junos OS Release 19.4R1.

## show route exact

### Syntax

```
show route exact destination-prefix
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route exact destination-prefix
<brief | detail | extensive | terse>
```

### Description

Display only the routes that exactly match the specified address or range of addresses.

### Options

**brief | detail | extensive | terse** (Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

<i>destination-prefix</i>	Address or range of addresses.
<b>logical-system</b> (all   <i>logical-system-name</i> )	(Optional) Perform this operation on all logical systems or on a particular logical system.

*show route extensive*

*show route terse*

## show route export

### IN THIS SECTION

- [Syntax | 2749](#)
- [Syntax \(EX Series Switches\) | 2749](#)
- [Description | 2750](#)
- [Options | 2750](#)
- [Required Privilege Level | 2750](#)
- [Output Fields | 2750](#)
- [Sample Output | 2752](#)
- [Release Information | 2752](#)

### Syntax

```
show route export
<brief | detail>
<instance <instance-name> | routing-table-name>
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route export
<brief | detail>
<instance <instance-name> | routing-table-name>
```

Description

Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

Options

- none

(Same as brief.) Display standard information about policy-based export for all instances and routing tables on all systems.
- brief | detail

(Optional) Display the specified level of output.
- instance <instance-name>

(Optional) Display a particular routing instance for which policy-based export is currently enabled.
- logical-system (all | logical-system-name)

(Optional) Perform this operation on all logical systems or on a particular logical system.
- routing-table-name

(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route export inet command).

Required Privilege Level

view

Output Fields

Table 144 on page 2750 lists the output fields for the show route export command. Output fields are listed in the approximate order in which they appear.

Table 144: show route export Output Fields

Field Name	Field Description	Level of Output
Table or <i>table-name</i>	Name of the routing tables that either import or export routes.	All levels

Table 144: show route export Output Fields (*Continued*)

Field Name	Field Description	Level of Output
Routes	Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.	brief none
Export	Whether the table is currently exporting routes to other tables: Y or N (Yes or No).	brief none
Import	Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)	detail
Flags	<p>(instance keyword only) Flags for this feature on this instance:</p> <ul style="list-style-type: none"> <li>• config auto-policy—The policy was deduced from the configured IGP export policies.</li> <li>• cleanup—Configuration information for this instance is no longer valid.</li> <li>• config—The instance was explicitly configured.</li> </ul>	detail
Options	<p>(instance keyword only) Configured option displays the type of routing tables the feature handles:</p> <ul style="list-style-type: none"> <li>• unicast—Indicates <i>instance.inet.0</i>.</li> <li>• multicast—Indicates <i>instance.inet.2</i>.</li> <li>• unicast multicast—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>	detail
Import policy	(instance keyword only) Policy that route export uses to construct the import-export matrix. Not displayed if the instance type is vrf.	detail
Instance	(instance keyword only) Name of the routing instance.	detail
Type	(instance keyword only) Type of routing instance: forwarding, non-forwarding, or vrf.	detail

## Sample Output

### show route export

```
user@host> show route export
```

Table	Export	Routes
inet.0	N	0
black.inet.0	Y	3
red.inet.0	Y	4

### show route export detail

```
user@host> show route export detail
```

inet.0	Routes:	0
black.inet.0	Routes:	3
Import: [ inet.0 ]		
red.inet.0	Routes:	4
Import: [ inet.0 ]		

### show route export instance detail

```
user@host> show route export instance detail
```

```
Instance: master Type: forwarding
 Flags: <config auto-policy> Options: <unicast multicast>
 Import policy: [(ospf-master-from-red || isis-master-from-black)]
Instance: black Type: non-forwarding
Instance: red Type: non-forwarding
```

## Release Information

Command introduced before Junos OS Release 7.4.

Output Fields

Table 145 on page 2754 describes the output fields for the `show route extensive` command. Output fields are listed in the approximate order in which they appear.

Table 145: show route extensive Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number</i> destinations	Number of destinations for which there are routes in the routing table.
<i>number</i> routes	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"><li>• active (routes that are active).</li><li>• holddown (routes that are in the pending state before being declared inactive).</li><li>• hidden (routes that are not used because of a routing policy).</li></ul>

Table 145: show route extensive Output Fields (*Continued*)

Field Name	Field Description
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The entry value is the number of route for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <i>MPLS-label</i> (for example, 80001 ).</li> <li>• <i>interface-name</i> (for example, ge-1/0/2).</li> <li>• <i>neighbor-address:control-word-status:encapsulation type:vc-id:source</i> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</li> <li>• <i>neighbor-address</i>—Address of the neighbor.</li> <li>• <i>control-word-status</i>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</li> <li>• <i>encapsulation type</i>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <i>vc-id</i>—Virtual circuit identifier.</li> <li>• <i>source</i>—Source of the advertisement: Local or Remote.</li> </ul>
TSI	Protocol header information.
label stacking	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• S=0 route indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>

Table 145: show route extensive Output Fields (Continued)

Field Name	Field Description
[ <i>protocol, preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>
Level	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.

Table 145: show route extensive Output Fields (*Continued*)

Field Name	Field Description
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Offset	Whether the metric has been increased or decreased by an offset value.
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.
<i>label-operation</i>	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).

**Table 145: show route extensive Output Fields (Continued)**

Field Name	Field Description
Indirect next hops	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain Indirect next hop: weight follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul>
State	State of the route (a route can be in more than one state).
Session ID	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
Weight	Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.

Table 145: show route extensive Output Fields (*Continued*)

Field Name	Field Description
Inactive reason	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• Active preferred—Currently active route was selected over this route.</li> <li>• Always compare MED—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• AS path—Shorter AS path is available.</li> <li>• Cisco Non-deterministic MED selection—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• Cluster list length—Path with a shorter cluster list length is available.</li> <li>• Forwarding use only—Path is only available for forwarding purposes.</li> <li>• IGP metric—Path through the next hop with a lower IGP metric is available.</li> <li>• IGP metric type—Path with a lower OSPF link-state advertisement type is available.</li> <li>• Interior &gt; Exterior &gt; Exterior via Interior—Direct, static, IGP, or EBGp path is available.</li> <li>• Local preference—Path with a higher local preference value is available.</li> <li>• Next hop address—Path with a lower metric next hop is available.</li> <li>• No difference—Path from a neighbor with a lower IP address is available.</li> <li>• Not Best in its group—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• Number of gateways—Path with a higher number of next hops is available.</li> <li>• Origin—Path with a lower origin code is available.</li> <li>• OSPF version—Path does not support the indicated OSPF version.</li> <li>• RIB preference—Route from a higher-numbered routing table is available.</li> <li>• Route distinguisher—64-bit prefix added to IP subnets to make them unique.</li> <li>• Route metric or MED comparison—Route with a lower metric or MED is available.</li> </ul>

**Table 145: show route extensive Output Fields (Continued)**

Field Name	Field Description
	<ul style="list-style-type: none"> <li>Route preference—Route with a lower preference value is available.</li> <li>Router ID—Path through a neighbor with a lower ID is available.</li> <li>Unusable path—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>Update source—Last tiebreaker is the lowest IP address value.</li> </ul>
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AI GP	Accumulated interior gateway protocol (AI GP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	<p>List of protocols that are consumers of the route. Using the following output as an example, Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <i>n</i>-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>

Table 145: show route extensive Output Fields (*Continued*)

Field Name	Field Description
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• Recorded—The AS path is recorded by the sample process (sampled).</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• Unverified—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• Valid—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>

**Table 145: show route extensive Output Fields (Continued)**

Field Name	Field Description
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.
route status	<p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>Accepted—The specified BGP route is imported by the default BGP policy.</li> <li>Import—The route is imported into a Layer 3 VPN routing instance.</li> <li>Import-Protect—A remote instance egress that is protected.</li> <li>Multipath—A BGP multipath active route.</li> <li>MultipathContrib—The route is not active but contributes to the BGP multipath.</li> <li>Protect—An egress route that is protected.</li> <li>Stale—A route that is marked stale due to graceful restart.</li> </ul>
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

**Table 145: show route extensive Output Fields (Continued)**

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route.
DeletePending	The DeletePending flag indicates that a BGP route needs to be processed due to a BGP peer down event.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).

**Table 145: show route extensive Output Fields (Continued)**

Field Name	Field Description
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.
Forwarding nexthops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.
Statistics ID Group	Indicates the Kernel ID number and Statistics ID number.
Statistics	Indicates the number of packets and data transferred.

## Release Information

Command introduced before Junos OS Release 7.4.

DeletePending flag added to the command output in Junos OS Release 19.4R1.

## show route flow validation

### IN THIS SECTION

- [Syntax | 2779](#)
- [Syntax \(EX Series Switches\) | 2779](#)
- [Description | 2779](#)
- [Options | 2779](#)
- [Required Privilege Level | 2779](#)
- [Output Fields | 2780](#)
- [Sample Output | 2781](#)
- [Release Information | 2781](#)

Syntax

```
show route flow validation
<brief | detail>
<ip-prefix>
<table table-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches)

```
show route flow validation
<brief | detail>
<ip-prefix>
<table table-name>
```

Description

Display flow route information.

Options

<b>none</b>	Display flow route information.
<b>brief   detail</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
<b><i>ip-prefix</i></b>	(Optional) IP address for the flow route.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>table <i>table-name</i></b>	(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route flow validation inet command).

Required Privilege Level

view

## Output Fields

Table 146 on page 2780 lists the output fields for the `show route flow validation` command. Output fields are listed in the approximate order in which they appear.

**Table 146: show route flow validation Output Fields**

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).	All levels
<i>prefix</i>	Route address.	All levels
Active unicast route	Active route in the routing table.	All levels
Dependent flow destinations	Number of flows for which there are routes in the routing table.	All levels
Origin	Source of the route flow.	All levels
Neighbor AS	Autonomous system identifier of the neighbor.	All levels
Flow destination	Number of entries and number of destinations that match the route flow.	All levels
Unicast best match	Destination that is the best match for the route flow.	All levels
Flags	Information about the route flow.	All levels

## Sample Output

### show route flow validation

```

user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 64501
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24

<label name>
<lcc number>
<multicast>
<table routing-instance-name>
<vpn vpn>

```

## Description

Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the `show pfe route` command.

## Options

<b>none</b>	Display the routes in the forwarding tables. By default, the <code>show route forwarding-table</code> command does not display information about private, or internal, forwarding tables.
<b>detail   extensive   summary</b>	(Optional) Display the specified level of output.
<b>all</b>	(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.
<b>bridge-domain (all   <i>bridge-domain-name</i>)</b>	(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.
<b>ccc <i>interface-name</i></b>	(Optional) Display route entries for the specified circuit cross-connect interface.
<b>destination <i>destination-prefix</i></b>	(Optional) Destination prefix.
<b>family <i>family</i></b>	(Optional) Display routing table entries for the specified family: bridge (ccc   destination   detail   extensive   interface-name   label   learning-vlan-id   matching   multicast   summary   table   vlan   vpn), ethernet-switching, evpn, fibre-channel, fmembers, inet, inet6, iso, mcsnoop-inet, mcsnoop-inet6, mpls, satellite-inet, satellite-inet6, satellite-vpls, tnp, unix, vpls, or vlan-classification.
<b>interface-name <i>interface-name</i></b>	(Optional) Display routing table entries for the specified interface.
<b>label <i>name</i></b>	(Optional) Display route entries for the specified label.
<b>lcc <i>number</i></b>	(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

<b>learning-vlan-id</b> <i>learning-vlan-id</i>	(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.
<b>matching</b> <i>matching</i>	(Optional) Display routing table entries matching the specified prefix or prefix length.
<b>multicast</b>	(Optional) Display routing table entries for multicast routes.
<b>table</b>	(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the <code>show route instance</code> command.
<b>vlan</b> (all   <i>vlan-name</i> )	(Optional) Display information for all VLANs or for the specified VLAN.
<b>vpn</b> <i>vpn</i>	(Optional) Display routing table entries for a specified VPN.

### Required Privilege Level

view

### Output Fields

Table 147 on page 2786 lists the output fields for the `show route forwarding-table` command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the `detail` keyword is used instead of the `extensive` keyword.

**Table 147: show route forwarding-table Output Fields**

Field Name	Field Description	Level of Output
Logical system	Name of the logical system. This field is displayed if you specify the table <i>logical-system-name/routing-instance-name</i> option on a device that is configured for and supports logical systems.	All levels
Routing table	Name of the routing table (for example, inet, inet6, mpls).	All levels

Table 147: show route forwarding-table Output Fields (*Continued*)

Field Name	Field Description	Level of Output
Enabled protocols	<p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> <li>• BUM hashing—BUM hashing is enabled.</li> <li>• MAC Stats—Mac Statistics is enabled.</li> <li>• Bridging—Routing instance is a normal layer 2 bridge.</li> <li>• No VLAN—No VLANs are associated with the bridge domain.</li> <li>• All VLANs—The <code>vlan-id all</code> statement has been enabled for this bridge domain.</li> <li>• Single VLAN—Single VLAN ID is associated with the bridge domain.</li> <li>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</li> <li>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</li> <li>• No local switching—No local switching is enabled for this routing instance..</li> <li>• Learning disabled—Layer 2 learning is disabled for this routing instance.</li> <li>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</li> <li>• VPLS—The VPLS protocol is enabled.</li> <li>• No IRB I2-copy—The <code>no-irb-layer-2-copy</code> feature is enabled for this routing instance.</li> <li>• ACKed by all peers—All peers have acknowledged this routing instance.</li> <li>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</li> <li>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</li> <li>• EVPN—EVPN protocol is enabled for this routing instance.</li> </ul>	All levels

Table 147: show route forwarding-table Output Fields (Continued)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> <li>• Def BD OVSDB—Open vSwitch Database (OVSDB) is enabled on the default bridge domain.</li> <li>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</li> <li>• L2 backhaul—Layer 2 backhaul is enabled.</li> <li>• FRR optimize—Fast reroute optimization</li> <li>• MAC pinning—MAC pinning is enabled for this bridge domain.</li> <li>• MAC Aging Timer—The MAC table aging time is set per routing instance.</li> <li>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</li> <li>• PBBN—This routing instance is configured as a provider backbone bridged network.</li> <li>• PBN—This routing instance is configured as a provider bridge network.</li> <li>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</li> <li>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</li> <li>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</li> <li>• MPLS control word—Control word is enabled for this MPLS routing instance.</li> </ul>	
Address family	Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).	All levels
Destination	Destination of the route.	detail extensive

Table 147: show route forwarding-table Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Route Type (Type)	<p>How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> <li>• cloned (clon)—(TCP or multicast only) Cloned route.</li> <li>• destination (dest)—Remote addresses directly reachable through an interface.</li> <li>• destination down (iddn)—Destination route for which the interface is unreachable.</li> <li>• interface cloned (ifcl)—Cloned route for which the interface is unreachable.</li> <li>• route down (ifdn)—Interface route for which the interface is unreachable.</li> <li>• ignore (ignr)—Ignore this route.</li> <li>• interface (intf)—Installed as a result of configuring an interface.</li> <li>• permanent (perm)—Routes installed by the kernel when the routing table is initialized.</li> <li>• user—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul>	All levels
Route Reference (RtRef)	Number of routes to reference.	detail extensive

Table 147: show route forwarding-table Output Fields (*Continued*)

Field Name	Field Description	Level of Output
Flags	<p>Route type flags:</p> <ul style="list-style-type: none"> <li>• none—No flags are enabled.</li> <li>• accounting—Route has accounting enabled.</li> <li>• cached—Cache route.</li> <li>• incoming-iface <i>interface-number</i>—Check against incoming interface.</li> <li>• prefix load balance—Load balancing is enabled for this prefix.</li> <li>• rt nh decoupled—Route has been decoupled from the next hop to the destination.</li> <li>• sent to PFE—Route has been sent to the Packet Forwarding Engine.</li> <li>• static—Static route.</li> </ul>	extensive
Next hop	<p>IP address of the next hop to the destination.</p> <p><b>NOTE:</b> For static routes that use point-to-point (P2P) outgoing interfaces, the next-hop address is not displayed in the output.</p>	detail extensive

Table 147: show route forwarding-table Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Next hop Type (Type)	<p>Next-hop type. When the detail keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• broadcast (bcst)—Broadcast.</li> <li>• deny—Deny.</li> <li>• discard (dscd) —Discard.</li> <li>• hold—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• indexed (idxd)—Indexed next hop.</li> <li>• indirect (indr)—Indirect next hop.</li> <li>• local (locl)—Local address on an interface.</li> <li>• routed multicast (mcrt)—Regular multicast next hop.</li> <li>• multicast (mcst)—Wire multicast next hop (limited to the LAN).</li> <li>• multicast discard (mdsc)—Multicast discard.</li> <li>• multicast group (mgrp)—Multicast group member.</li> <li>• receive (recv)—Receive.</li> <li>• reject (rjct)—Discard. An ICMP unreachable message was sent.</li> <li>• resolve (rslv)—Resolving the next hop.</li> <li>• unicast (ucst)—Unicast.</li> <li>• unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> <li>• VxLAN Local—EVPN Type 5 route in kernel.</li> </ul>	detail extensive
Index	Software index of the next hop that is used to route the traffic for a given prefix.	detail extensive none

**Table 147: show route forwarding-table Output Fields (Continued)**

Field Name	Field Description	Level of Output
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	extensive
Reference (NhRef)	Number of routes that refer to this next hop.	detail extensive none
Next-hop interface (Netif)	Interface used to reach the next hop.	detail extensive none
Weight	Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the Balance field description).	extensive
Balance	Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.	extensive
RPF interface	List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when rpf-check is configured on the interface.	extensive

## Sample Output

## show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 192.0.2.2/30;
 }
 }
}
```

## Release Information

Command introduced before Junos OS Release 7.4.

Option bridge-domain introduced in Junos OS Release 7.5

Option learning-vlan-id introduced in Junos OS Release 8.4

Options all and vlan introduced in Junos OS Release 9.6.

## Syntax

```
show route hidden
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Description

Display only hidden route information. A hidden route is unusable, even if it is the best path.

## Options

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

## Syntax

```
show route inactive-path
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route inactive-path
<brief | detail | extensive | terse>
```

Description

Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.

Options

<b>none</b>	Display all inactive routes.
<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Output Fields

Table 148 on page 2810 lists the output fields for the show route instance command. Output fields are listed in the approximate order in which they appear.

**Table 148: show route instance Output Fields**

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	(operational keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: forwarding, l2vpn, no-forwarding, vpls, virtual-router, or vrf.	All levels
State	State of the routing instance: active or inactive.	brief detail none
Interfaces	Name of interfaces belonging to this routing instance.	brief detail none

**Table 148: show route instance Output Fields (Continued)**

Field Name	Field Description	Level of Output
Restart State	Status of graceful restart for this instance: Pending or Complete.	detail
Path selection timeout	Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is 300.	detail
Tables	Tables (and number of routes) associated with this routing instance.	brief detail none
Route-distinguisher	Unique route distinguisher associated with this routing instance.	detail
Vrf-import	VPN routing and forwarding instance import policy name.	detail
Vrf-export	VPN routing and forwarding instance export policy name.	detail
Vrf-import-target	VPN routing and forwarding instance import target community name.	detail
Vrf-export-target	VPN routing and forwarding instance export target community name.	detail
Vrf-edge-protection-id	Context identifier configured for edge-protection.	detail
Fast-reroute-priority	Fast reroute priority setting for a VPLS routing instance: high, medium, or low. The default is low.	detail
Restart State	Restart state: <ul style="list-style-type: none"> <li>Pending:<i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>Complete—All protocols have restarted for this routing table.</li> </ul>	detail

**Table 148: show route instance Output Fields (Continued)**

Field Name	Field Description	Level of Output
Primary rib	Primary table for this routing instance.	brief none summary
Active/holddown/ hidden	Number of active, hold-down, and hidden routes.	All levels

## Sample Output

## Release Information

Command introduced before Junos OS Release 7.4.

## show route output

### IN THIS SECTION

- [Syntax | 2823](#)
- [Syntax \(EX Series Switches\) | 2823](#)
- [Description | 2823](#)
- [Options | 2823](#)
- [Required Privilege Level | 2823](#)
- [Output Fields | 2824](#)
- [Sample Output | 2824](#)
- [Release Information | 2826](#)

## Syntax

```
show route output (address ip-address | interface interface-name)
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route output (address ip-address | interface interface-name)
<brief | detail | extensive | terse>
```

## Description

Display the entries in the routing table learned through static routes and interior gateway protocols that are to be sent out the interface with either the specified IP address or specified name.

To view routes advertised to a neighbor or received from a neighbor for the BGP protocol, use the `show route advertising-protocol bgp` and `show route receive-protocol bgp` commands instead.

## Options

<b>address <i>ip-address</i></b>	Display entries in the routing table that are to be sent out the interface with the specified IP address.
<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.
<b>interface <i>interface-name</i></b>	Display entries in the routing table that are to be sent out the interface with the specified name.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

## Sample Output

### show route output address

```
user@host> show route output address 172.16.36.1/24

inet.0: 28 destinations, 30 routes (27 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

- [Sample Output | 2829](#)
- [Release Information | 2834](#)

## Syntax

```
show route protocol protocol
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show route protocol protocol
<brief | detail | extensive | terse>
```

## Description

Display the route entries in the routing table that were learned from a particular protocol.

## Options

**brief | detail |  
extensive | terse**

(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**logical-system  
(all | *logical-  
system-name*)**

(Optional) Perform this operation on all logical systems or on a particular logical system.

***protocol***

Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **arp**—Route learned through the Address Resolution Protocol
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route

- `dvmrp`—Distance Vector Multicast Routing Protocol
- `esis`—End System-to-Intermediate System
- `flow`—Locally defined flow-specification route
- `frr`—Precomputed protection route or backup route used when a link goes down
- `isis`—Intermediate System-to-Intermediate System
- `ldp`—Label Distribution Protocol
- `l2circuit`—Layer 2 circuit
- `l2vpn`—Layer 2 virtual private network
- `local`—Local address
- `mpls`—Multiprotocol Label Switching
- `msdp`—Multicast Source Discovery Protocol
- `ospf`—Open Shortest Path First versions 2 and 3
- `ospf2`—Open Shortest Path First versions 2 only
- `ospf3`—Open Shortest Path First version 3 only
- `pim`—Protocol Independent Multicast
- `rip`—Routing Information Protocol
- `ripng`—Routing Information Protocol next generation
- `rsvp`—Resource Reservation Protocol
- `rtarget`—Local route target virtual private network
- `static`—Statically defined route
- `tunnel`—Dynamic tunnel
- `vpn`—Virtual private network

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

Syntax

```
show route receive-protocol protocol neighbor-address
 <brief | detail | extensive | terse>
 <logical-system (all | logical-system-name)
```

Syntax (EX Series Switches)

```
show route receive-protocol protocol neighbor-address
 <brief | detail | extensive | terse>
```

Description

Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

Options

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b><i>protocol neighbor-address</i></b>	Protocol transmitting the route (bgp, dvmrp, msdp, pim, rip, or ripng) and address of the neighboring router from which the route entry was received.

Additional Information

The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

view

## Output Fields

Table 149 on page 2836 describes the output fields for the `show route receive-protocol` command. Output fields are listed in the approximate order in which they appear.

**Table 149: show route receive-protocol Output Fields**

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, inet.0.	All levels
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.	All levels
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• active</li> <li>• holddown (routes that are in pending state before being declared inactive)</li> <li>• hidden (routes that are not used because of a routing policy)</li> </ul>	All levels
Prefix	Destination prefix.	none brief
MED	Multiple exit discriminator value included in the route.	none brief
<i>destination-prefix</i> (entry, announced)	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.	detail extensive

Table 149: show route receive-protocol Output Fields (*Continued*)

Field Name	Field Description	Level of Output
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>	detail extensive
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>	detail extensive
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.	detail extensive
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.	detail extensive
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.	detail extensive
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	All levels
Localpref or Lclpref	Local preference value included in the route.	All levels

Table 149: show route receive-protocol Output Fields (*Continued*)

Field Name	Field Description	Level of Output
AS path	<p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• [ ]—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
Route Labels	Stack of labels carried in the BGP route update.	detail extensive
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	detail extensive

**Table 149: show route receive-protocol Output Fields (Continued)**

Field Name	Field Description	Level of Output
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	detail extensive
Communities	Community path attribute for the route.	detail extensive
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	detail extensive
Attrset AS	Number, local preference, and path of the AS that originated the route. These values are stored in the Attrset attribute at the originating routing device.	detail extensive
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	detail extensive
control flags	Control flags: none or Site Down.	detail extensive
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	detail extensive

## Sample Output

### show route receive-protocol bgp

```
user@host> show route receive-protocol bgp 10.255.245.215
```

```
inet.0: 28 destinations, 33 routes (27 active, 0 holddown, 1 hidden)
```

Prefix	Next hop	MED	Lclpref	AS path
10.22.1.0/24	10.255.245.215	0	100	I
10.22.2.0/24	10.255.245.215	0	100	I

## show route receive-protocol bgp detail (BGP Multicast)

```

user@host> show route receive-protocol bgp 10.4.6.1 detail
bgpmcast.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
* 4:3:0:0:32:10.2.20.20:32:225.1.1.1:10.4.4.4:10.4.0.1/240 (1 entry, 1 announced)

## Syntax

```
show route table routing-table-name
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches, QFX Series Switches)

```
show route table routing-table-name
<brief | detail | extensive | terse>
```

## Description

Display the route entries in a particular routing table.

## Options

<b>brief   detail   extensive   terse</b>	(Optional) Display the specified level of output.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS.
<b><i>routing-table-name</i></b>	Display route entries for all routing tables whose names begin with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route table inet command).

## Required Privilege Level

view

## Output Fields

Table 150 on page 2843 describes the output fields for the `show route table` command. Output fields are listed in the approximate order in which they appear.

**Table 150: show route table Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• Pending:<i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• Complete—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that OSPF, LDP, and VPN protocols did not restart for the LDP.inet.0 routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.12vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for the vpls_1.12vpn.0 routing table.</p>
<i>number</i> destinations	Number of destinations for which there are routes in the routing table.
<i>number</i> routes	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• active (routes that are active)</li> <li>• holddown (routes that are in the pending state before being declared inactive)</li> <li>• hidden (routes that are not used because of a routing policy)</li> </ul>

Table 150: show route table Output Fields (Continued)

Field Name	Field Description
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <i>MPLS-label</i>(for example, 80001).</li> <li>• <i>interface-name</i> (for example, ge-1/0/2).</li> <li>• <i>neighbor-address:control-word-status:encapsulation type:vc-id:source</i> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).</li> <li>• <i>neighbor-address</i>—Address of the neighbor.</li> <li>• <i>control-word-status</i>—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord.</li> <li>• <i>encapsulation type</i>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <i>vc-id</i>—Virtual circuit identifier.</li> <li>• <i>source</i>—Source of the advertisement: Local or Remote.</li> <li>• <i>inclusive multicast Ethernet tag route</i>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <i>route distinguisher</i>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <i>Ethernet tag ID</i>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <i>IP address length</i>—(1 octet) Length of IP address in bits.</li> <li>• <i>originating router's IP address</i>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul>

Table 150: show route table Output Fields *(Continued)*

Field Name	Field Description
label stacking	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>
[ <i>protocol</i> , <i>preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>
Level	<p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).

**Table 150: show route table Output Fields (Continued)**

Field Name	Field Description
Next-hop type	Type of next hop. For a description of possible values for this field, see <a href="#">Table 151 on page 2851</a> .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).

**Table 150: show route table Output Fields (Continued)**

Field Name	Field Description
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See <a href="#">Table 152 on page 2853</a> .
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AI GP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric <i>n</i>	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.

Table 150: show route table Output Fields (Continued)

Field Name	Field Description
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <i>n-Resolve inet</i> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><i>n</i>—An index used by Juniper Networks customer support only.</li> </ul>
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>Recorded—The AS path is recorded by the sample process (sampled).</li> <li>?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>[ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>[ ]—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>{ }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>( )—Parentheses enclose a confederation.</li> <li>( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>

Table 150: show route table Output Fields *(Continued)*

Field Name	Field Description
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• Valid—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.

**Table 150: show route table Output Fields (Continued)**

Field Name	Field Description
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See <a href="#">Table 153 on page 2857</a> for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.

**Table 150: show route table Output Fields (Continued)**

Field Name	Field Description
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 151 on page 2851](#) describes all possible values for the Next-hop Types output field.

**Table 151: Next-hop Types Output Field Values**

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.

**Table 151: Next-hop Types Output Field Values** *(Continued)*

Next-Hop Type	Description
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.

**Table 151: Next-hop Types Output Field Values (Continued)**

Next-Hop Type	Description
Reject (rjct)	Discard. An ICMP unreachable message was sent.
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrt)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul>
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

[Table 152 on page 2853](#) describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

**Table 152: State Output Field Values**

Value	Description
Accounting	Route needs accounting.
Active	Route is active.

**Table 152: State Output Field Values (Continued)**

Value	Description
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.

**Table 152: State Output Field Values** *(Continued)*

Value	Description
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.

**Table 152: State Output Field Values (Continued)**

Value	Description
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul>
Update source	Last tiebreaker is the lowest IP address value.
VxlanLocalRT	Route is an EVPN Type 5 route (IP prefix route).

[Table 153 on page 2857](#) describes the possible values for the Communities output field.

Table 153: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
<i>bandwidth: local AS number:link-bandwidth-number</i>	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
<i>domain-id</i>	Unique configurable number that identifies the OSPF domain.
<i>domain-id-vendor</i>	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535.
<i>options</i>	1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
<i>origin</i>	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.
<i>route-type-vendor</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is <i>area-number:ospf-route-type:options</i> .
<i>rte-type</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is <i>area-number:ospf-route-type:options</i> .

**Table 153: Communities Output Field Values (Continued)**

Value	Description
target	Defines which VPN the route participates in; target has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.
evpn-mcast-flags	Identifies the value in the multicast flags extended community and whether snooping is enabled. A value of 0x1 indicates that the route supports IGMP proxy.
evpn-l2-info	<p>Identifies whether Multihomed Proxy MAC and IP Address Route Advertisement is enabled. A value of 0x20 indicates that the proxy bit is set. .</p> <p>Use the <code>show bridge mac-ip-table extensive</code> statement to determine whether the MAC and IP address route was learned locally or from a PE device.</p>

## Sample Output

### show route table bgp.l2vpn.0

```

user@host> show route table bgp.l2vpn.0
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

- [Release Information | 2876](#)

### Syntax

```
show route terse
<logical-system (all | logical-system-name)>
```

### Syntax (EX Series Switches)

```
show route terse
```

### Description

Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the `show route terse` command displays the local preference attribute and MED instead of the `metric1` and `metric2` values. This is mostly due to historical reasons.

To display the `metric1` and `metric2` value of a BGP route, use the `show route extensive` command.

## Options

<b>none</b>	Display a high-level summary of the routes in the routing table.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.

## Required Privilege Level

view

## Output Fields

[Table 154 on page 2872](#) describes the output fields for the `show route terse` command. Output fields are listed in the approximate order in which they appear.

**Table 154: show route terse Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number</i> destinations	Number of destinations for which there are routes in the routing table.
<i>number</i> routes	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• active (routes that are active)</li> <li>• holddown (routes that are in the pending state before being declared inactive)</li> <li>• hidden (routes that are not used because of a routing policy)</li> </ul>
<i>route key</i>	Key for the state of the route: <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul>

Table 154: show route terse Output Fields *(Continued)*

Field Name	Field Description
A	Active route. An asterisk (*) indicates this is the active route.
V	<p>Validation status of the route:</p> <ul style="list-style-type: none"> <li>• ?—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• I—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• N—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• V—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
Destination	Destination of the route.

Table 154: show route terse Output Fields *(Continued)*

Field Name	Field Description
P	<p>Protocol through which the route was learned:</p> <ul style="list-style-type: none"> <li>• A—Aggregate</li> <li>• B—BGP</li> <li>• C—CCC</li> <li>• D—Direct</li> <li>• G—GMPLS</li> <li>• I—IS-IS</li> <li>• L—L2CKT, L2VPN, LDP, Local</li> <li>• K—Kernel</li> <li>• M—MPLS, MSDP</li> <li>• O—OSPF</li> <li>• P—PIM</li> <li>• R—RIP, RIPng</li> <li>• S—Static</li> <li>• T—Tunnel</li> </ul>
Prf	<p>Preference value of the route. In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>
Metric 1	<p>First metric value in the route. For routes learned from BGP, this is the MED metric.</p>
Metric 2	<p>Second metric value in the route. For routes learned from BGP, this is the IGP metric.</p>

**Table 154: show route terse Output Fields (Continued)**

Field Name	Field Description
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul>

## Sample Output

## Release Information

Command introduced before Junos OS Release 7.4.

## show validation database

### IN THIS SECTION

- [Syntax | 2876](#)
- [Description | 2877](#)
- [Options | 2877](#)
- [Required Privilege Level | 2877](#)
- [Output Fields | 2877](#)
- [Sample Output | 2878](#)
- [Release Information | 2879](#)

## Syntax

```

show validation database
<name database-name>
<brief | detail>
<instance instance-name>
<logical-system logical-system-name>
<mismatch>
<origin-autonomous-system as-number>
<record ip-prefix>
<session ip-address>

```

## Description

Display information about the route validation database when resource public key infrastructure (RPKI) BGP route validation is configured. You can query all route validation records that match a given prefix or origin-autonomous-system. In addition, you can filter the output by a specific RPKI cache session.

## Options

<b>none</b>	Display all route validation database entries.
<b>name database-name</b>	(Optional) Display the records of the specified database in that routing-instance or logical-system. If unspecified, the records of all databases are displayed.
<b>brief   detail</b>	(Optional) Display the specified level of output.
<b>instance <i>instance-name</i></b>	(Optional) Display information about route validation database entries for the specified routing instance. The instance name can be primary for the main instance, or any valid configured instance name or its prefix.
<b>logical-system <i>logical-system-name</i></b>	(Optional) Perform this operation on a particular logical system.
<b>mismatch</b>	(Optional) Filter the output by mismatched origin autonomous systems.
<b>origin-autonomous-system <i>as-number</i></b>	(Optional) Filter the output by mismatched origin autonomous systems. The <code>mismatch</code> qualifier is useful for finding conflicting origin-autonomous-system information between RPKI caches. Mismatches might occur during cache reconfiguration.
<b>record <i>ip-prefix</i></b>	(Optional) Filter the output by route validation records that match a given prefix.
<b>session <i>ip-address</i></b>	(Optional) Filter the output by a specific RPKI cache session.

## Output Fields

[Table 155 on page 2878](#) describes the output fields for the `show validation database` command. Output fields are listed in the approximate order in which they appear.

**Table 155: show validation database Output Fields**

Field Name	Field Description	Level of Output
Prefix	Route validation (RV) record prefix.  RV records are received from the cache server and can also be configured statically at the [edit routing-options validation <a href="#">static</a> ] hierarchy level .	All levels
Origin-AS	Legitimate originator autonomous system (AS).	All levels
Session	IP address of the RPKI cache server.	All levels
State	State of the route validation records. The state can be valid, invalid or unknown.	All levels
Mismatch	Conflicting origin-autonomous-system information between RPKI caches when nonstop active routing (NSR) is configured.	All levels
IPv4 records	Number of IPv4 route validation records.	All levels
IPv6 records	Number of IPv6 route validation records.	All levels

## Sample Output

### show validation database

```

user@host> show validation database
RV database: default
Prefix Origin-AS Session State Mismatch
172.16.1.0/24-32 1 10.0.77.1 valid

## Output Fields

[Table 156 on page 2881](#) describes the output fields for the `show validation group` command. Output fields are listed in the approximate order in which they appear.

**Table 156: show validation group Output Fields**

Field Name	Field Description
Group	Group name.
Maximum sessions	Number of concurrent sessions for each group. The default is 2. The number is configured with the <code>max-sessions</code> statement.
Session	Resource public key infrastructure (RPKI) cache session IP address.
State	State of the connection between the routing device and the cache server. Up means that the connection is established. Connect means that the connection is not established.
Preference	<p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference value is configured with the <code>preference</code> statement at the <code>[edit routing-options validation group group-name session]</code> hierarchy level.</p>

## Sample Output

### show validation group

```
user@host> show validation group
master
 Group: test, Maximum sessions: 3
 Session 10.255.255.11, State: Up, Preference: 100
 Session 10.255.255.12, State: Up, Preference: 100
 Group: test2, Maximum sessions: 2
 Session 10.255.255.13, State: Connect, Preference: 100
```

<logical-system logical-system-name>
```

## Description

Display information about all sessions or a specific session with a resource public key infrastructure (RPKI) cache server.

## Options

<b>none</b>	Display information about all sessions.
<b><i>destination</i></b>	(Optional) Display information about a specific session.
<b>brief   detail</b>	(Optional) Display the specified level of output.
<b>instance <i>instance-name</i></b>	(Optional) Display information about sessions for the specified routing instance. The instance name can be primary for the main instance, or any valid configured instance name or its prefix.
<b>logical-system <i>logical-system-name</i></b>	(Optional) Perform this operation on a particular logical system.

## Required Privilege Level

view

## Output Fields

Table 158 on page 2887 describes the output fields for the `show validation session` command. Output fields are listed in the approximate order in which they appear.

**Table 158: show validation session Output Fields**

Field Name	Field Description	Level of Output
Session	IP address of the RPKI cache server. You configure the session and all of its elements with the <code>session</code> statement.	All levels
State	State of the connection between the routing device and the cache server. Up means that the connection is established. Connect means that the connection is not established.	All levels
Flaps	Number of attempts to establish a session.	None and brief
Uptime	Length of time that the session has remained established.	None and brief
#IPv4/IPv6 records	Number of IPv4 and IPv6 route validation records.	None and brief
Session index	Every session has an index number.	detail
Group	Name of the group to which the session belongs.	detail
Preference	Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.  The default preference is 100. The preference is configurable with the preference statement.	detail

Table 158: show validation session Output Fields *(Continued)*

Field Name	Field Description	Level of Output
Port	TCP port number for the outgoing connection with the cache server. The well-known RPKI port is TCP port 2222. For a given deployment, an RPKI cache server might listen on some other TCP port number. If so, you can configure the alternative port number with the port statement.	detail
Refresh time	Liveliness check interval for an RPKI cache server. Everyrefresh-time (seconds), a serial query protocol data unit (PDU) with the last known serial number is transmitted. The hold-time must be at least 2 x the refresh-time.	detail
Hold time	Length of time in seconds that the session between the routing device and the cache server is considered operational without any activity. After the hold time expires, the session is dropped.  Receiving any PDU from the cache server resets the hold timer. The hold-time is 600 seconds, by default, and must be least 2 x the refresh-time. If the hold time expires, the session is considered to be down. This, in turn, triggers a session restart event. During a session restart, the routing device attempts to start a session with the cache server that has the numerically highest preference.	detail
Record Life time	Amount of time that route validation (RV) records learned from a cache server are valid. RV records expire if the session to the cache server goes down and remains down for the record-lifetime (seconds).	detail
Serial (Full Update)	Number of full serial updates.	detail
Serial (Incremental Update)	Number of incremental serial updates.	detail
Session flaps	Number of attempts to establish a session.	detail

**Table 158: show validation session Output Fields (Continued)**

Field Name	Field Description	Level of Output
Session uptime	Length of time that the session has remained established.	detail
Last PDU received	Time when the most recent PDU was received.	detail
IPv4 prefix count	Number of IPv4 sessions.	detail
IPv6 prefix count	Number of IPv6 sessions.	detail
Authentication key-chain	Configured TCP keychain	detail

## Sample Output

### show validation session brief

```

user@host> show validation session brief
Session State Flaps Uptime #IPv4/IPv6 records
1.3.0.2 up 2 00:01:37 13/0
10.255.255.11 up 3 00:00:01 1/0
10.255.255.12 connect 2 64/68

```

### show validation session detail

```

user@host> show validation session detail
Session 10.0.77.1, State: up
 Group: test, Preference: 100
 Local IPv4 address: 10.0.77.2, Port: 2222
 Refresh time: 300s
 Session flaps: 14, Last Session flap: 5h13m18s ago
 Hold time: 900s
 Record Life time: 3600s
 Serial (Full Update): 0

```

```
Serial (Incremental Update): 0
Authentication key-chain: new_auth_key
 Session flaps 2
 Session uptime: 00:48:35
 Last PDU received: 00:03:35
 IPv4 prefix count: 71234
 IPv6 prefix count: 345
```

## Release Information

Command introduced in Junos OS Release 12.2.

## Output Fields

[Table 159 on page 2891](#) describes the output fields for the `show validation statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 159: show validation statistics Output Fields**

Field Name	Field Description
Total RV records	Group name.
Total Replication RV records	Number of concurrent sessions for each group. The default is 2. The number is configured with the <code>max-sessions</code> statement.

Table 159: show validation statistics Output Fields (*Continued*)

Field Name	Field Description
Static records	Number of static records.
Prefix entries	Resource public key infrastructure (RPKI) cache session IP address.
Origin-AS entries	State of the connection between the routing device and the cache server. Up means that the connection is up. Connect means that the connection is not up.
Memory utilization	<p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference value is configured with the preference statement at the [edit routing-options validation group group-name <a href="#">session</a>] hierarchy level.</p>
Policy origin-validation requests	Number of queries for validation state of a given instance and prefix.
Valid	Number of valid prefixes reported by the validation query.
Invalid	Number of invalid prefixes reported by the validation query.
Unknown	Number of unknown prefixes reported by the validation query. This means that the prefix is not found in the database.
BGP import policy reevaluation notifications	A change, addition, or deletion of a route validation record triggers a BGP import reevaluation for all exact matching and more specific prefixes.
inet.0	Number of IPv4 route validation records that have been added, deleted, or changed.

**Table 159: show validation statistics Output Fields (Continued)**

Field Name	Field Description
inet6.0	Number of IPv6 route validation records that have been added, deleted, or changed.

## Sample Output

### show validation statistics

```
user@host> show validation statistics
```

```

Total RV records: 32000
Total Replication RV records: 32000
 Prefix entries: 8000
 Origin-AS entries: 8000
Memory utilization: 8550016 bytes
RV database: default
 RV records in Database: 32000
 Origin-AS entries in Database: 8000
 Database origin-validation re-evaluation statistics: 54000
 Attempts resulting Valid: 6000
 Attempts resulting Invalid: 12000
 Attempts resulting Unknown: 36000
 BGP import policy reevaluation notifications: 0
 inet.0, 0
 inet6.0, 0
 Policy origin-validation re-evaluation statistics: 54000
 Attempts resulting Valid: 6000
 Attempts resulting Invalid: 12000
 Attempts resulting Unknown: 36000
 BGP import policy reevaluation notifications: 0

```

## test policy

### IN THIS SECTION

- [Syntax | 2894](#)
- [Description | 2894](#)
- [Options | 2895](#)
- [Additional Information | 2895](#)
- [Required Privilege Level | 2895](#)
- [Output Fields | 2895](#)
- [Sample Output | 2895](#)
- [Release Information | 2896](#)

## Syntax

```
test policy policy-name prefix
```

## Description

Test a policy configuration to determine which prefixes match routes in the routing table.

**NOTE:** If you are using the `test policy` command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the `set cli logical-system R2` command.

## Options

<i>policy-name</i>	Name of a policy.
<i>prefix</i>	Destination prefix to match.

## Additional Information

All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the `from` clause in the specified policy. All prefixes accepted by the policy are displayed. The `test policy` command evaluates a policy differently from the BGP import process. When testing a policy that contains an `interface match` condition in the `from` clause, the `test policy` command uses the match condition. In contrast, BGP does not use the `interface match` condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.

When testing a policy, you can see the length of time (in microseconds) required to evaluate the policy and the number of times it has been executed by running the `show policy policy-name statistics` command.

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field tables for the `show route` command, the `show route detail` command, the `show route extensive` command, or the `show route terse` command.

## Sample Output

### test policy

```
user@host> test policy test-statics 172.16.0.1/8
inet.0: 44 destinations, 44 routes (44 active, 0 holddown, 0 hidden)
Prefixes passing policy:

172.16.3.0/8 *[BGP/170] 16:22:46, localpref 100, from 10.255.255.41
 AS Path: 50888 I
 > to 10.11.4.32 via en0.2, label-switched-path l2

## Syntax

```
clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | logical-system logical-system-name)
```

## Syntax (EX Series Switches)

```
clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | policer counter (all | counter-id counter-index))
```

## Syntax (QFX Series)

```
clear firewall (all | counter counter-name | filter filter-name
```

## Description

Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The `clear firewall` command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.

**NOTE:** The `clear firewall` command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the `prefix-action` action on matched packets, wait at least 5 seconds before you enter the `show firewall prefix-action-stats` command. A 5-second pause between issuing the `clear firewall` and `show firewall prefix-action-stats` commands avoids a possible timeout of the `show firewall prefix-action-stats` command.

## Options

<b>all</b>	Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.
<b>counter <i>counter-name</i></b>	Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.
<b>filter <i>filter-name</i></b>	Clear the packet and byte counts for the specified firewall filter.
<b>log (all   <i>logical-system-name</i>)</b>	Clear log entries for IPv4 firewall filters that have then log as an action. Use log all to clear all log entries or log <i>logical-system-name</i> to clear log entries for the specified logical system.
<b>logical-system <i>logical-system-name</i></b>	Clear the packet and byte counts for the specified logical system.
<b>policer counter (all   counter-id <i>counter-index</i>)</b>	(EX8200 switches only) Clear all policer counters using the policer counter all command, or clear a specific policer counter using the policer counter counter-id <i>counter-index</i> command. The value of <i>counter-index</i> can be 0, 1, or 2.

## Required Privilege Level

clear

## Sample Output

**clear firewall all**

```
user@host> clear firewall all
```

**clear firewall (counter counter-name)**

```
user@host> clear firewall counter port-filter-counter
```

**clear firewall (filter filter-name)**

```

## Syntax

```
show firewall
<application (CFM | eswd | RMPS)>>
<counter counter-name>
<detail>
<filter filter-name>
<filter regex regular-expression>
```

```
<logical-system (all | logical-system-name)>
<terse>
```

## Syntax (EX Series Switches)

```
show firewall
<application (CFM | eswd | RMPS)>>
<counter counter-name>
<detail>
<filter filter-name>
<filter regex regular-expression>
<log <(detail | interface interface-name)>>
<policer counters <(detail | counter-id counter-index <detail>)>>
<terse>
```

## Description

Display enhanced statistics and counters for all configured firewall filters.

If you query for options on the `show firewall filter` command, on Junos OS systems, you will see this output, which includes the configured Flowspec filters:

```
show firewall filter ?
Possible completions:
 <filtername> Filter name
 __flowspec_default_inet__ # Flowspec filter name
 application Owner application
 counter Counter name
 logical-system Name of logical system, or 'all'
 regex Show filter using regular expression
 version Show filter version installed
```

However, on Junos OS Evolved systems, the Flowspec filters names are not shown here. To view Flowspec filters, use the `show firewall application routing` command.

## Options

<b>none</b>	(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.
<b>application (CFM   eswd   RMPS)</b>	<p>(Optional) Show firewall elements owned by the selected software component:</p> <ul style="list-style-type: none"> <li>• Connectivity Fault Management (CFM)</li> <li>• Ethernet switching daemon (eswd)—Shows only on devices that support it.</li> <li>• Resource Management and Packet Steering (RMPS)</li> </ul>
<b>counter <i>counter-name</i></b>	(Optional) Name of a filter counter.
<b>detail</b>	(EX Series switches and MX Series routers only) (Optional) Display firewall filter statistics and enhanced policer statistics and counters.
<b>filter <i>filter-name</i></b>	(Optional) Name of a configured filter.
<b>filter regex <i>regular-expression</i></b>	(Optional) Regular expression that matches the names of a subset of filters.
<b>logical-system (all   <i>logical-system-name</i>)</b>	(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>log</b>	(Optional) Display log entries for firewall filters.
<b>log &lt;(detail   interface <i>interface-name</i>)&gt;</b>	(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.
<b>policer counters &lt;(detail   counter-id <i>counter-index</i> &lt;detail&gt;)&gt;</b>	(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.
<b>terse</b>	(Optional) Display firewall filter names only.

## Output Fields

Table 163 on page 2914 lists the output fields for the `show firewall` command. Output fields are listed in the approximate order in which they appear.

**Table 163: show firewall Output Fields**

Field Name	Field Description
Filter	<p>Name of a filter that has been configured with the filter statement at the [edit firewall] hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> <li>When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <code>-i</code> for an input filter or <code>-o</code> for an output filter.</li> <li>When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <code>-in</code> for an input filter or <code>-out</code> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (<code>__</code>) characters and the name of the logical system (for example, <code>__ls1/filter1</code>).</li> <li>When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (<code>:</code>).</li> </ul> <p><b>NOTE:</b> For bridge family filter, the ip-protocol match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p>

Table 163: show firewall Output Fields (*Continued*)

Field Name	Field Description
Counters	<p>Display filter counter information:</p> <ul style="list-style-type: none"> <li>• Name—Name of a filter counter that has been configured with the counter firewall filter action.</li> <li>• Bytes—Number of bytes that match the filter term under which the counter action is specified.</li> <li>• Packets—Number of packets that matched the filter term under which the counter action is specified.</li> </ul> <p><b>NOTE:</b> On M and T Series routers, firewall filters cannot count ip-options packets on a per option type and per interface basis. A limited work around is to use the show pfe statistics ip options command to see ip-options statistics on a per Packet Forwarding Engine (PFE) basis. See <a href="#">show pfe statistics ip</a> for sample output.</p>
Policers	<p>Display policer information:</p> <ul style="list-style-type: none"> <li>• Name—Name of policer.</li> <li>• Bytes—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer.</li> </ul> <p>For other combinations of policer type, device, and line card type, this field is blank.</p> <ul style="list-style-type: none"> <li>• Packets—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>
Policer Counter Index	(EX8200 switch only) Global management counter ID. The counter ID value ( <i>counter-index</i> ) can be 0, 1, or 2.
Green	(EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).

**Table 163: show firewall Output Fields (Continued)**

Field Name	Field Description
Yellow	(EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.
Discard	(EX8200 switch only) Number of discarded packets.
Bytes	(EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.
Packets	(EX8200 switch only) Number of green, yellow, red, or discarded packets.
Filter name	(EX8200 switch only) Name of the filter with a term associated to a policer.
Term name	(EX8200 switch only) Name of the term associated with a policer.
Policer name	(EX8200 switch only) Name of the policer that is associated with a global management counter.
P1-t1	<ul style="list-style-type: none"> <li>• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter.</li> <li>• Offered packet statistics for traffic subjected to policing.</li> <li>• Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</li> </ul>

## Sample Output

### show firewall filter (MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
```

```

Counters:

## Release Information

Command introduced before Junos OS Release 7.4.

Option `logical-system` introduced in Junos OS Release 9.3.

Option `terse` introduced in Junos OS Release 9.4.

Option `policer counters` introduced in Junos OS Release 12.2 for EX Series switches.

Option `detail` introduced in Junos OS Release 12.3 for EX Series switches.

Option `detail` introduced in Junos OS Release 14.1 for MX Series routers.

Option `regex regular-expression` introduced in Junos OS Release 14.2.

Option `lsp` introduced in Junos OS Evolved Release 18.3R1.

### Syntax

```
show firewall
<application (CFM | eswd | RMPS)>>
<counter counter-name>
<filter filter-name>
<log <detail | interface interface-name>>
<terse>
```

### Description

Display statistics about configured firewall filters.

### Options

**application (CFM |  
eswd | RMPS)**

(Optional) Show firewall elements owned by the selected software component:

- Connectivity Fault Management (CFM)
- Ethernet switching daemon (eswd)—Shows only on devices that support it.
- Resource Management and Packet Steering (RMPS)

- counter** *counter-name* (Optional) Display statistics about a particular firewall filter counter.
- filter** *filter-name* (Optional) Display statistics about a particular firewall filter.
- log** (Optional) Display log entries for all firewall filter activity.
- terse** (Optional) Display firewall filter names only.

- [Release Information](#) | 2930

## Syntax

```
show firewall filter version <filter-name>
```

## Description

Display the version number of the installed firewall filter in the Routing Engine.

### Options

`none`—(Optional) Display the version number of all installed firewall filters.

*filter-name*—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.

### Additional Information

The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1.

Release Information

Command introduced before Junos OS Release 7.4.

extensive option introduced in Junos OS Release 16.1.

logical-system option introduced in Junos OS Release 9.3.

show firewall prefix-action-stats

IN THIS SECTION

- [Syntax \(filter-specific mode\) | 2935](#)
- [Syntax \(term-specific mode\) | 2935](#)
- [Description | 2935](#)
- [Options | 2935](#)
- [Required Privilege Level | 2935](#)
- [Output Fields | 2936](#)
- [Sample Output | 2936](#)
- [Release Information | 2937](#)

## Syntax (filter-specific mode)

```
show firewall prefix-action-stats filter filter-name prefix-action prefix-action-name
<from number to number>
<logical-system (logical-system-name | all)>
```

## Syntax (term-specific mode)

```
show firewall prefix-action-stats filter filter-name prefix-action prefix-action-name-term-name
<from number to number>
<logical-system (logical-system-name | all)>
```

## Description

Display prefix action statistics about configured firewall filters.

If you clear statistics for firewall filters that are applied to MPCs and that also use the prefix-action action on matched packets, wait at least 5 seconds before you enter the `show firewall prefix-action-stats` command. A 5-second pause between issuing the `clear firewall` and `show firewall prefix-action-stats` commands avoids a possible timeout of the `show firewall prefix-action-stats` command.

By default, policers operate in *term-specific* mode.

See ["Filter-Specific Policer Overview" on page 2046](#) for information about how to configure policers in *filter-specific* mode.

## Options

<b>filter</b> <i>filter-name</i>	Name of a filter.
<b>prefix-action</b> <i>prefix-action-name</i>	Name of a prefix action.
<b>from</b> <i>number</i> <b>to</b> <i>number</i>	(Optional) Starting and ending counter or policer.
<b>logical-system</b> ( <i>logical-system-name</i>   all)	(Optional) Perform this operation on all logical systems or on a particular system.

# Output Fields

Table 167 on page 2936 lists the output fields for the `show firewall prefix-action-stats` command. Output fields are listed in the approximate order in which they appear.

**Table 167: show firewall prefix-action-stats Output Fields**

Field Name	Field Description
Filter	<p>Filter name.</p> <p>Filters configured for logical systems include the name of the filter prefixed with the two underscore characters (__) and the name of the logical system (for example, __ls1/filter1).</p>

# Sample Output

The following sample output assumes that the policer *act1* is in term mode and that there is a term named *term1* configured in the firewall filter *test*.

## show firewall prefix-action-stats

```

user@host> show firewall prefix-action-stats filter test prefix-action act1-term1 from 0 to 9
Filter: test
Counters:
Name Bytes Packets
act1-0 0 0
act1-1 0 0
act1-2 0 0
act1-3 0 0
act1-4 0 0
act1-5 0 0
act1-6 0 0
act1-7 0 0
act1-8 0 0
act1-9 0 0
Policers:
Name Bytes Packets
act1-0 0 0
act1-1 0 0
act1-2 0 0

```

act1-3	0	0
act1-4	0	0
act1-5	0	0
act1-6	0	0
act1-7	0	0
act1-8	0	0
act1-9	0	0

### Release Information

Command introduced before Junos OS Release 7.4.

logical-system option introduced in Junos OS Release 9.3.

- [Required Privilege Level | 2944](#)
- [Output Fields | 2944](#)
- [Sample Output | 2945](#)
- [Release Information | 2947](#)

## Syntax

```
show policer
<detail>
<policer-name>
```

## Description

Display the number of policed packets for a given policer or an aggregate policer. An aggregate policer is an aggregate of different policers on the same logical interface.

Options

**detail** (Optional) Display additional statistics and counters. Requires the *enhanced-policer* statement to be enabled at the **[edit chassis]** hierarchy level.

**NOTE:** show policer detail is not available for the following counters: three color policers, hierarchical policers, prefix-specific actions, LSP policers and other nexthop policers, and fast-update-filters on devices running MPC1 or MPC2 line cards.

*policer-name* (Optional) Display the number of policed packets for the specified policer.

**<null>** Displays the number of policed packets for all configured policers.

Required Privilege Level

view

Output Fields

Table 170 on page 2945 lists the output fields for the show policer command. Output fields are listed in the approximate order in which they appear.

**Table 170: show policer Output Fields**

Field Name	Field Description
Name	<p>Name of the policer. Policer detail also includes the following statistics:</p> <p><b>OOS</b> Packet statistics for packets that are marked out-of-specification by the policer. Changes to all packets that have out-of-specification actions, such as discard, color marking, or forwarding-class, are included in this counter.</p> <p><b>Offered</b> Packet statistics for traffic subjected to policing.</p> <p><b>Transmitted</b> Packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the within-specification statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</p>
Bytes	<ul style="list-style-type: none"> <li>(For two-color policers on MX Series routers, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers)—Total number of bytes policed by the specified policer.</li> </ul> <p>For other combinations of policer type, device, and line card type, this field is blank.</p> <ul style="list-style-type: none"> <li>(T Series and M10i)—Not applicable. The Bytes information is not displayed.</li> </ul>
Packets	Total number of packets policed by the specified policer.

## Sample Output

### show policer (Junos OS Evolved)

In Junos OS Evolved, the output of this command doesn't display the default Address Resolution Protocol (ARP) policer because it isn't needed. Distributed denial of service (DDoS) protection replaces the functionality of the default ARP policer.

```
user@host> show policer
```

```
Policers:
```

Name	Bytes	Packets
__default_arp_mgmt0__	0	0

__default_arp_mgmt1__	0	0
__default_icmpv4_mgmt__	0	0
__default_icmpv6_mgmt__	0	0
__default_mcast_mgmt0__	0	0
__default_mcast_mgmt1__	0	0

### show policer (MX Series)
