Enable node protection on the specified static bypass LSP. Node protection ensures that traffic from an LSP traversing a neighboring router can continue to reach its destination even if the neighboring router fails.

### Default

Node protection is disabled.

### Options

`bypass-name` *`name`*—Bypass LSP name.

`next-next-label` *`label`*—Bypass LSP name.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in JUNOS Release 10.1.

## normalization

IN THIS SECTION

- Syntax | 2613
- Hierarchy Level | 2613
- Description | 2613
- Options | 2613
- Required Privilege Level | 2614
- Release Information | 2614

## Syntax

```
normalization {
    failover-normalization;
    no-incremental-normalize;
    normalization-retry-duration seconds;
    normalization-retry-limits number;
    normalize-interval seconds;
}
```

## Hierarchy Level

```
[edit protocols mpls container-label-switched-path lsp-name splitting-merging]
```

## Description

Perform normailzation.

## Options

**failover-normalization**

Enable the ingress router to pro-actively normalize or re-distribute traffic when a link or node failure happens on a member LSP. A member LSP can go down between two scheduled normalization events because of a link-failure or pre-emption.

- **Default:** Disabled

**no-incremental-normalize**

Disables automatic switchover by the ingress router to a new instance of the container LSP until the desired demand is satisfied, although the given number of LSPs can be successfully signaled such that the new aggregate bandwidth value exceeds the old aggregate bandwidth value.

- **Default:** False (disabled)

**normalization-retry-duration** *seconds*

Specifies the duration before which the ingress router performs a normalization reattempt when the previous normalization has not been successful. Normalization is done until a sufficient number of LSPs come up with an aggregate bandwidth that is more than the current aggregate or desired bandwidth.

- **Default:** 30 seconds

**normalization-retry-limits** *number*

Specifies the maximum number of times the ingress router performs normalization reattempts until a sufficient number of LSPs come up successfully with new bandwidth values.

- **Default:** 1

**normalize-interval** *seconds*

Specifies the duration between two normalization events.

- **Range:** 21600 seconds through 6 hours
- **Default:** 21600 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

## optimize-adaptive-teardown

IN THIS SECTION

- Syntax | 2617
- Hierarchy Level | 2617
- Description | 2618
- Options | 2618
- Required Privilege Level | 2618
- Release Information | 2618

### Syntax

```
optimize-adaptive-teardown {
    p2p:
    delay value (3..65535 seconds)
}
```

### Hierarchy Level

```
[edit protocols mpls]
```

### Description

Make use of a new feedback mechanism from TAG library which relies on RPD infrastructure to decide when all the routes using the old LSP instance have fully shifted to the new LSP instance after MBB switchover. When this statement is configured, the `optimize-hold-dead-delay` statement, which delays the teardown of the old LSP instance after MBB switchover, is ignored.

### Options

**p2p** Only point-to-point LSPs configured in the system will be affected.

**delay** Delays the tearing down of old optimized LSP paths based on the configured value.

- **Range:** from 3 through 65535 seconds
- **Default:** 600 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 15.1R1.

## optimize-aggressive

IN THIS SECTION

Syntax | 2619

- Hierarchy Level | 2619
- Description | 2619
- Default | 2619
- Required Privilege Level | 2619
- Release Information | 2619

## Syntax

```
optimize-aggressive;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

If enabled, the LSP reoptimization is based solely on the IGP metric. The reoptimization process ignores the available bandwidth ratio calculations, the least-fill 10 percent congestion improvement rule, and the hop-counts rule. This statement makes reoptimization more aggressive than the default.

## Default

Aggressive optimization is disabled.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# optimize-hold-dead-delay

IN THIS SECTION

- Syntax | 2620
- Hierarchy Level | 2620
- Description | 2620
- Options | 2621
- Required Privilege Level | 2621

## Syntax

```
optimize-hold-dead-delay seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switch-path lsp-name],
[edit protocols mpls],
[edit protocols mpls label-switch-path lsp-name]
```

## Description

Allows you to specify the amount of time to delay the tear down of old paths after the router has switched traffic to new optimized paths. This delay timer starts when the timer specified by the `optimize-switchover-delay` statement has elapsed, which is typically 30 seconds, and at the start of the next retry sequence (in other words, the delay is not an absolute countdown of the seconds configured here).

You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that old paths are not torn down before all routes have been switched over to the new optimized paths.

### Options

*seconds* Configure the time in seconds to wait before tearing down the old paths that were in use prior to the last LSP optimization.

- **Default:** 60 to 90 seconds
- **Range:** 0 through 65,535 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Syntax

```
optimize-switchover-delay seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Delays the switch over of LSPs to newly optimized paths. You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that the new optimized paths have been established before traffic is switched over from the old paths.

## Options

*seconds* Configure the time in seconds to wait before switching LSPs to newly optimized paths.

- **Default:** 1 second
- **Range:** 1 through 900 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

## Description

Enable periodic reoptimization of an LSP that is already set up. If topology changes occur, an existing path might become suboptimal, and a subsequent recomputation might be able to determine a better path. This feature is useful only on LSPs for which constrained-path computation is enabled; that is, for which the `no-cspf` statement is not configured. Also, you only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers).

To avoid extensive resource consumption that might result because of frequent path recomputations, or to avoid destabilizing the network as a result of constantly changing LSPs, we recommend that you either leave the timer value sufficiently large or disable the timer value.

## Default

The optimize timer is disabled.

## Options

*seconds*—Length of the optimize timer, in seconds.

- **Range:** 0 through 65,535 seconds
- **Default:** 0 seconds (the optimize timer is disabled)

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# path (Protocols MPLS)

IN THIS SECTION

- Syntax | 2628
- Hierarchy Level | 2628
- Description | 2628
- Options | 2628
- Required Privilege Level | 2629
- Release Information | 2630

## Syntax

```
path path-name {
    abstract-hop-name (abstract | loose | loose-link | strict);
    (address | hostname) <strict | loose>;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Create a named path and optionally specify the sequence of explicit routers that form the path.

You must include this statement when configuring explicit LSPs.

## Options

`abstract-hop-name`—Name of the predefined abstract hop. The abstract hop can be used in combination with real IP next hops. An abstract hop is traversed by traversing the member nodes. This traversal can be done by either links that satisfy the logical combination of defined constituent attributes, or by any

kind of link. This choice is controlled by the use of abstract hop qualifiers – abstract, loose, loose-link, and strict.

`abstract`—Indicate that the next hop configured in the `path` statement is an abstract hop..

`loose-link`—Indicate that the next hop in the `path` statement is a loose-link abstract hop. This means that the LSP cannot traverse other routers before reaching this router. In other words, the abstract hop of type loose-link is processed only if any of the viable routers is reached in constraint through a link of associated abstract hop membership.

`loose`—Indicate that the next hop in the `path` statement is a loose abstract hop. The path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.

`strict`—Indicate that the next hop in the `path` statement is a strict abstract hop. After the last processed hop in the constraint list, the path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.

*`address`*—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is `loose`. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

*`hostname`*—See *`address`*.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

`loose`—(Optional) Indicate that the next address in the `path` statement is a loose link. This means that the LSP can traverse through other routers before reaching this router.

- **Default:** `strict`

*`path-name`*—Name that identifies the sequence of nodes that form an LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.

`strict`—(Optional) Indicate that the LSP must go to the next address specified in the `path` statement without traversing other nodes. This is the default.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

path destination {
    <address | hostname> <strict | loose>
}
```

## Hierarchy Level

```
[edit protocols mpls]
```

## Description

Configure path protection on your MPLS network.

## Options

***destination*** —Name of a label switched path (LSP). In addition to specifying the name of the configured LSP, you can include some other designation such as **primary-path**.

***address*** —(Optional) IP address of each transit switch (or the IP address of the loopback interface on the switch) in the LSP. If you want to control exactly which switches are selected for the LSP, specify the address or hostname of each transit switch. Specify the addresses in order, starting with the first provider (transit) switch, and continuing sequentially along the path until reaching the egress provider edge switch.

- **Default:** If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

***hostname*** —(Optional) See ***address*** .

- **Default:** If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.

**loose**—(Optional) Indicates that the next address in the `path` statement is a loose link. This means that the LSP can traverse through other switches before reaching this switch.

- **Default: strict**

**strict**—(Optional) Indicates that the LSP must go to the next address specified in the `path` statement without traversing other switches. This is the default.

group-name family inet labeled-unicast],
[edit routing-instances instance-name protocols bgp family inet labeled-unicast],
[edit routing-instances instance-name protocols bgp group group-name family inet labeled-unicast]
```

## Description

Allocate a unique label for each prefix. The `per-prefix-label` statement helps minimize packet loss in most deployments.

Although allocating a label for each prefix is not generally ideal for scaling, it is assumed that a small number of labels are used for BGP labeled-unicast. When labeled BGP is used to set up transport label-switched paths (LSPs), the common case is that each prefix has a unique next hop. Thus, the use of per-prefix labels does not have an adverse scaling impact. On the contrary, the use of per-prefix labels reduces churn in the network when multipath load balancing is enabled for IPv4 labeled-unicast, and a subset of the paths are withdrawn for some reason.

The advantage of per-prefix labeling is that the advertised upstream label is more stable during network changes. That is, if the downstream label changes, the advertised upstream label remains the same under most scenarios. This way, the upstream router is isolated from the downstream network change, and the overall network is more stable. The greater stability of the advertised upstream label helps to reduce traffic loss during many different network change scenarios.

## Default

By default, label allocation is per next-hop router.

[edit routing-options rib],
[edit tenants name routing-instances name routing-options rib]
```

## Description

Create policy-based multipath route using a combination of segment routing traffic-engineered (SR-TE) LDP or RSVP routes and SR-TE IP routes. You can resolve BGP service routes over the mutlipath route, and apply export policies to steer traffic differently for different prefixes. The policy-based multipath feature is supported for both IP and IPv6 protocols.

## Options

**policy** Import policy to create policy-based multipath.

> **NOTE**: This statement is supported only at the `[edit routing-option policy-multipath]` hierarchy level.

Any action commands configured in the policy, such as apply, is evaluated using the active route. For non-active routes, the policy is applied to check if the routes can participate in the multipath route or not. Multipath routes inherit all attributes of the active route. These attributes can be modified using the multipath policy configuration.

The remaining statements are explained separately. See CLI Explorer.

## Required Privilege Level

routing

## Description

Define a routing policy, including subroutine policies.

A *term* is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of `accept` or `reject` is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either `accept` or `reject`) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the `[edit policy-options]` hierarchy level by `policy-statement` *`policy-name`* in alphabetical order, enter the `show policy-options` configuration command.

The statements are explained separately.

## Options

*`actions`*—(Optional) One or more actions to take if the conditions match. The actions are described in Configuring Flow Control Actions.

`family` *`family-name`*—(Optional) Specify an address family protocol. Specify `inet` for IPv4. Specify `inet6` for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify `iso`. For IPv4 multicast VPN traffic, specify `inet-mvpn`. For IPv6 multicast VPN traffic, specify `inet6-mvpn`. For multicast-distribution-tree (MDT) IPv4 traffic, specify `inet-mdt`. For BGP route target VPN traffic, specify `route-target`. For traffic engineering, specify `traffic-engineering`.

> **NOTE**: When `family` is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

`from`—(Optional) Match a route based on its source address.

`as-path-unique-count` *`count`* `(equal | orhigher | orlower)`—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of unique autonomous systems (ASs) in the AS path. Specify the match condition for the unique AS path count.

`aggregate-bandwidth`—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing.

`dynamic-tunnel-attributes` *`dynamic-tunnel-attributes`*—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

*`match-conditions`*—(Optional in `from` statement; required in `to` statement) One or more conditions to use to make a match. The qualifiers are described in Routing Policy Match Conditions.

`multipath-resolve` *`multipath-resolve`*–(Optional) Enable the use of all paths for resolution over the specified prefix.

`limit-bandwidth` *`limit-bandwidth`*—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

- **Range:** 0 through 4,294,967,295 bytes

`no-entropy-label-capability`—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

`priority (high | medium | low)`—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.

`policy` *`subroutine-policy-name`*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”). Policy names cannot take the form `__.*-internal__`, as this form is reserved. For information about how to configure subroutines, see Understanding Policy Subroutines in Routing Policy Match Conditions.

*`policy-name`*—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (“ ”).

`prefix-list` *`prefix-list-name`*—Name of a list of IPv4 or IPv6 prefixes.

`prefix-list-filter` *`prefix-list-name`*—Name of a prefix list to evaluate using qualifiers; *`match-type`* is the type of match, and *`actions`* is the action to take if the prefixes match.

`programmed`—(Optional) Allow policy matches for routes injected by JET APIs.

`protocol` *`protocol-name`*—Name of the protocol used to control traffic engineering database import at the originating point.

Starting in Junos OS Release 19.1R1, you can specify options to match label IS-IS and label OSPF routes using the `l-isis` and `l-ospf` options, respectively. The `isis` options matches all IS-IS routes, excluding

labelled IS-IS routes. The `ospf` option matches all OSPF routes, including OSPFv2, OSPFv3 and labelled OSPF routes.

`resolution-map`—(Optional) Set resolution map modes. A given resolution-map can be shared across multiple policy-statements.

`route-filter` *`destination-prefix match-type <actions>`*—(Optional) List of routes on which to perform an immediate match; *`destination-prefix`* is the IPv4 or IPv6 route prefix to match, *`match-type`* is the type of match (see Configuring Route Lists), and *`actions`* is the action to take if the *`destination-prefix`* matches.

`source-address-filter` *`source-prefix match-type <actions>`*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *`source-prefix`* is the IPv4 or IPv6 route prefix to match, *`match-type`* is the type of match (see Configuring Route Lists), and *`actions`* is the action to take if the *`source-prefix`* matches.

`tag` *`value`*—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

`term` *`term-name`*—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (“ ”). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the `term` statement when defining match conditions and actions.

`to`—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

`then`—(Optional) Actions to take on matching routes. The actions are described in Configuring Flow Control Actions and Configuring Actions That Manipulate Route Characteristics.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5.

Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.

`inet-mdt` option introduced in Junos OS Release 10.0R2.

`route-target` option introduced in Junos OS Release 12.2.

`protocol` and `traffic-engineering` options introduced in Junos OS Release 14.2.

`no-entropy-label-capability` option introduced in Junos OS Release 15.1.

`priority` and `tag` *`value`* options introduced in Junos OS Release 17.1.

`as-path-unique-count` option introduced in Junos OS Release 17.2R1.

`prefix-segment` option introduced in Junos OS Release 17.2R1 for MX Series routers, PTX Series routers, QFX5100 switches, and QFX10000 switches.

`multipath-resolve` and `dynamic-tunnel-attributes` options introduced in Junos OS Release 17.3R1.

`aggregate-bandwidth` and `limit-bandwidth` *`limit-bandwidth`* options introduced in Junos OS Release 17.4R1 for MX Series, PTX Series, and QFX Series.

*l-isis* and *l-ospf* keywords at the `protocol` option is introduced in Junos OS Release 19.1R1.

`resolution-map` statement introduced in Junos OS Release 19.2R1-S1 on MX and PTX Series routers.

`lsp` and `lsp-regex` options introduced in Junos OS Release 19.4R1.

[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name],
[edit protocols mpls static-label-switched-path lsp-name ingress]
```

## Description

Preference for the route.

You can optionally configure multiple LSPs between the same pair of ingress and egress routers. This is useful for balancing the load among the LSPs because all LSPs, by default, have the same preference level. To prefer one LSP over another, set different preference levels for individual LSPs. The LSP with the lowest preference value is used. The default preference for LSPs is lower (more preferred) than all learned routes except direct interface routes.

## Options

*preference*—Preference to assign to the route. A route with a lower preference value is preferred.

- **Range:** 1 through 255
- **Default:** 5 for static MPLS LSPs, 7 for RSVP MPLS LSPs, 9 for LDP MPLS LSPs

## Required Privilege Level

[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

## Description

Configure the setup priority and reservation priority for an LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. Sessions with lower hold priorities are preempted.

## Options

*reservation-priority*—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.

- **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.
- **Default:** 0 (Once the session is set up, no other session can preempt it.)

*setup-priority*—Setup priority.

- **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.
- **Default:** 7 (The session cannot preempt any existing sessions.)

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## protocols evpn encapsulation mpls-inet6

IN THIS SECTION

- Syntax | 2658
- Hierarchy Level | 2659
- Description | 2659
- Required Privilege Level | 2659
- Release Information | 2659

### Syntax

```
protocols evpn encapsulation mpls-inet6
```

### Hierarchy Level

```
[routing-instances <routing-instance-name> protocols evpn encapsulation]
```

### Description

Enables the use of the EVPN-VXLAN and point-to-point (P2P) services over an MPLS-based IPv6 underlay on the PE routers using Segment Routing with Multiprotocol Label Switching (SR-MPLS). The services also operate on the segment routing–traffic engineering (SR-TE) addresses that are responsible for the path calculation between the EVPN PE devices. You can use the EVPN-MPLS commands with the MPLS-based IPv6 underlays.

To enable EVPN-MPLS over IPv6 functionality, include the `protocols evpn encapsulation mpls-inet6` configuration statement at the `[edit routing-instance <routing-instance-name>]` hierarchy level for each EVPN routing instance.

### Required Privilege Level

routing

### Release Information

Statement introduced in Junos OS Release 21.2.

# random

IN THIS SECTION

- Syntax | 2661
- Hierarchy Level | 2661
- Description | 2661
- Default | 2662
- Required Privilege Level | 2662
- Release Information | 2662

## Syntax

```
(random | least-fill | most-fill);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name]
```

## Description

Configure the preferred path when several equal-cost candidate paths to a destination exist, and prefer the path with the highest available bandwidth (with the largest minimum available bandwidth ratio). The available bandwidth ratio of a link is the available bandwidth on a link divided by the maximum reservable bandwidth on the link.

- `least-fill`—Prefer the path with the most available bandwidth (with the largest available bandwidth ratio).

- `most-fill`—Prefer the path with the least available bandwidth (with the minimum available bandwidth ratio). The minimum available bandwidth ratio of a path is the smallest available bandwidth ratio belonging to any of the links in the path.
- `random`—Choose the path at random.

### Default

`random`

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## Syntax

```
(record | no-record);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit logical-systems logical-system-name protocols mpls label-switched-path  (primary |
secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

## Description

Specify whether an LSP should actively record the path by sending the record route object (RRO) of an LSP. The RRO is used to record the path that the LSP traverses. It includes the IP address, router ID, and node ID of the routers in the path. Recording LSP path can be useful for diagnostics and loop detection.

## Default

Recording LSP path is enabled by default when you have node or link protection configured on the device.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

## Syntax

```
remote-interface-switch connection-name {
    interface interface-name.unit-number;
    receive-lsp label-switched-path;
    transmit-lsp label-switched-path;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols connections],
[edit protocols connections (MPLS)]
```

## Description

Configure MPLS LSP tunnel cross-connects. This makes an association between a CCC interface and two LSPs, one for transmitting MPLS packets from the local provider edge switch to the remote provider edge switch and the other for receiving MPLS packets on the local provider edge switch from the remote provider edge switch.

## Options

*connection-name*—Connection name.

**interface** *interface-name.unit-number*—Interface name. Include the logical portion of the name, which corresponds to the logical unit number of the CCC interface.

**receive-lsp** *label-switched-path*—Name of the LSP from the connection's source. This LSP name was specified by the `label-switched-path` statement on the remote provider edge switch in the **protocols mpls** stanza.

**transmit-lsp** *label-switched-path*—Name of the LSP to the connection's destination. This LSP name was specified by the `label-switched-path` statement on the local provider edge switch in the **protocols mpls** stanza.

### Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name]
```

## Description

Specify the amount of time (in seconds) that an LSP must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.

If you have configured BFD on the LSP, the Junos OS waits until the BFD session is restored before starting the revert timer counter.

If you have configured a value of 0 seconds for the `revert-timer` statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.

### Options

*seconds*—Time in seconds.

- **Range:** 0 through 65,535 seconds
- **Default:** 60 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## rsvp-error-hold-time

IN THIS SECTION

- Syntax | 2680
- Hierarchy Level | 2681
- Description | 2681
- Options | 2681
- Required Privilege Level | 2681
- Release Information | 2681

### Syntax

```
rsvp-error-hold-time seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations. The more time you configure, the more time a source node (ingress of an RSVP LSP) can have to learn about the failures of its LSP by monitoring PathErr messages transmitted from downstream nodes.

Information from the PathErr messages is incorporated into subsequent LSP computations, which can improve the accuracy and speed of LSP setup. Some PathErr messages are also used to update traffic engineering database bandwidth information, reducing inconsistencies between the database and the network.

## Options

*seconds*—Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations.

- **Range:** 0 through 240 seconds
- **Default:** 25 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# sampling (Protocols MPLS)

IN THIS SECTION

- Syntax | 2682
- Hierarchy Level | 2682
- Description | 2682
- Options | 2683
- Required Privilege Level | 2683
- Release Information | 2683

## Syntax

```
sampling {
    cut-off-threshold percentile;
    use-average-aggregate;
    use-percentile percentile;
}
```

## Hierarchy Level

```
[edit protocols mpls container-label-switched-path lsp-name splitting-merging]
```

## Description

Configure traffic sampling. By default, sampling mode is set to `Max Aggregate` which means the system will compare each new sample with the previous sample. If the new sample is higher than the old sample, then the newer sample is considered `Sampled Aggregate bandwidth`

### Max Aggregate Example

If normalization happens every 20min (T0, T20, T40..) then if at time T0 the traffic rate is 185Gbps, and subsequently drops to 7.5Gbps at time T3, the max-aggregate sample for the current normalization window T0-T20 will be 185Gbps. When the current normalization window expires at time T20, we use the previous sampled max-aggregate of 185Gbps to calculate the split/merge activities of the next (or

now current) normalization window between T20 – T40. If traffic remains at 7.5Gbps for this second normalization period, then at time T40 the max-aggregate sample of 7.5Gbps would then be used for split/merge activities. Even though traffic volumes dropped at time T3, LSP split/merge activities would not occur until time T40 which might be unexpected. This default behavior can be modified with use-average-aggregate or use-percentile to achieve alternative normalization behavior if desired.

## Options

**cut-off-threshold** *percentile*
Specify the percentile value to be used as a cut-off threshold in removing outlier bandwidth samples. All the aggregate bandwidth samples determined as outliers are used for computing aggregate bandwidth used at the time of normalization.

- **Default:** 0 percentile (the ingress considers all aggregate bandwidth samples for normlaization.)
- **Range:** 0 through 100

**use-average-aggregate**
Specify the ingress router to take average of the aggregate samples for normalization.

This option is mutually exclusive with the `use-percentile` configuration option.

**use-percentile** *percentile*
Specify the ingress router to compute and use the `pth` percentile from all the bandwidth samples, and use that for normalization.

This option is mutually exclusive with the `use-average-aggregate` configuration option.

- **Range:** 0 through 100

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit logical-systems name routing-instances name protocols mpls static-label-switched-path],
[edit protocols mpls static-label-switched-path],
[edit routing-instances name protocols mpls static-label-switched-path]
```

## Description

Static segment for segment routing. A static segment is identified by a unique name. This segment type is assigned a segment identifier (SID) which falls under a default range of 100000 through 1048575. The segment has label operation such as pop-and-forward for adjacency segment and swap-and-forward for prefix or node segment. For both types of label operation, the segment is assigned a next hop that specifies the remote IP address if the outgoing interface is a multi-access interface, or the name of the

outgoing interface if the interface is a point-to-point interface. Static segment configuration is used to statically configure or provision the adjacency SIDs, node SIDs, and prefix SIDs on transit routers.

### Options

| | |
|---|---|
| **pop** | Pop the SID label |
| **swap** | Swap the SID label to this label |
| **description** | Text description of label-switched path |
| **next-hop** | IPv4 address or interface of next-hop router |
| **sid-label** | Segment identifier (SID) label |

The remaining statements are explained separately. See CLI Explorer.

    inherit-label-nexthops;
}
```

## Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing],
[edit protocols source-packet-routing]
```

## Description

Specify an name to identify the segment routing list (used in traffic engineering policy) and the explicit path for source routing label switched path (LSPs) to traverse through traffic engineering segments. The segment list is essentially a stack of segment identifiers.

Starting in Junos OS release 19.1R1 for MX and PTX Series routers, you can enable a translation service to translate next-hop IP addresses into the corresponding segment identifier (SID) labels. The translation service keeps track of the node reached at each hop.

When configured, the `segment-list` of a segment routing traffic engineering (SR-TE) LSP accepts IP addresses for all the hops along the path. These IP addresses can be either the loopback address of a node, or the IP address of a link, as identified by the `node-type`. When `auto-translation` is enabled, next hop IP addresses are automatically translated to corresponding SIDs using the translation service. A retry rate can be set for the retry timer at the *`source-packet-routing`* hierarchy level.

**NOTE**: The segment list enables BGP and static segment routing LSP to steer traffic based on segment routing policies. When a segment list is used by the protocol BGP, the BGP protocol validates these segment identifiers and selects valid segments for traffic engineering.

## Options

**name** Specify a name to identify a SR-TE segment-list.

**NOTE**: The combined length of tunnel-name and LSP name must not exceed 53 characters for per-path telemetry to work.

**<hop-name>** Indicates the next hop in the segment routing traffic engineering policy (SR-TE).

- **ip-address**—Specify the IP address of the hop. For a segment-list to be used by a non-colored segment routing LSP, the first hop must specify an IP address.
- **label**—Specify the SID label of the hop in a segment routing traffic engineering segment list. In static segment routing LSPs, the source routing path uses the segment list only if the second to Nth hop specifies segment identifiers (SID) labels.

  **NOTE**: The range is from 0 to 1,048,576 and is applies to BGP and static segment routing LSPs.

- **label-type**—Use with the option below to indicate that the specified address is the IP address of the node, for example, its loopback address, as opposed to that of a link.

- **node**—Hops that have been specified as `node` are translated to a prefix SID, which can be either a node SID or an anycast SID depending on the type of hop IP address. IP addresses not identified as `node` are consider to be a link.

  **NOTE**: If the first hop is a `node`, for LSP resolution to work correctly, `inherit-label-nexthops` must be enabled at either `source-packet-routing` hierarchy level, or at the relevant `segment-list` hierarchy level.

- **loose | strict**—IP hops specified using router IDs in the sequence can be strict or loose hops. A strict hop must be directly connected to the previous node in the sequence. A loose hop is not necessarily directly connected to the previous node.

  **NOTE**: You can specify only router IDs as loose or strict hop constraints. Labels and other IP addresses are not supported as loose or strict hop constraints in Junos OS Release 19.2R1-S1.

**auto-translate**

This option must be enabled before a given segment list can use IP addresses instead of SIDs for any hop other than the first hop. In addition, all hops in the segment list must have IP addresses. If any hops on the list have both an IP address and a label configured, the label will be retained. Link addresses are only translated into labels if the preceding node advertises an adjacency SID for the address (otherwise translation fails).

**NOTE**: In Junos OS Release 19.1R1, for auto-translate to work for OSPF, RSVP for segment routing must be enabled on all participating interfaces.

- **protected**—(Optional) Enable this option to ensure the adjacency SID is eligible to have a backup path, and that a B-flag is set in adjacency SID advertisements. Note that unless `mandatory` is also selected, the choice succeeds regardless.

  - **mandatory**—(Optional) Enable this option to have translation fail if any *unprotected* links are found in the hop-list.

- **unprotected**—(Optional) Enable this option to ensure that no backup path is calculated for a specific adjacency SID, and that a B-flag is not set in adjacency SID advertisements. Note that unless `mandatory` is also selected, the choice succeeds regardless.

- **mandatory**—(Optional) Enable this option to have translation fail if any *protected* links are found the hop-list.

**compute** (Optional) Enable use of explicit paths specified in segment list for path computation.

**inherit-label-nexthops** Inherit label next hops for first hop in this segment list that have both IP address and label configured in the first hop.

You can configure the `inherit-label-nexthops` statement globally or individually for each segment list.

The `inherit-label-nexthops` statement takes effect only when the segment list first hop has both IP address and SID label present.

If the `inherit-label-nexthops` is not configured at the `[edit protocols source-packet-routing segment-list]` hierarchy, and the first hop in the segment list has both IP address and label specified, the default behavior is to use the IP address.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

select (manual | unconditional);
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary |
secondary) path-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

### Description

Specify the conditions under which the path is selected to carry traffic. The `manual` and `unconditional` options are mutually exclusive.

### Options

`manual`—The path is selected for carrying traffic if it is up and stable for at least the revert timer window (potentially before the revert timer has elapsed). Traffic is sent to other working paths if the current path is down or degraded (receiving errors).

`unconditional`—The path is always selected for carrying traffic, even if it is currently down or degraded (receiving errors).

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## smart-optimize-timer

IN THIS SECTION

Syntax | 2703

- Hierarchy Level | **2703**
- Description | **2703**
- Default | **2704**
- Options | **2704**
- Required Privilege Level | **2704**
- Release Information | **2704**

## Syntax

```
smart-optimize-timer seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.

If you want to disable the smart optimizer, you can set it to zero. The `smart-optimize-timer` value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the `optimize-timer`, which is usually set to a high value. Some ISPs have the `optimize-timer` set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the `smart-optimize-timer` is disabled automatically, and the `optimize-timer` (regular path optimization) goes into effect. This is to protect against a flapping link being used.

### Default

The smart optimization timer is enabled by default.

### Options

*seconds*—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.

- **Range:** 0 through 65,535 seconds
- **Default:** 180 seconds

### Required Privilege Level

# source-routing-path

IN THIS SECTION

- Syntax | 2706
- Hierarchy Level | 2706
- Description | 2707
- Options | 2707
- Required Privilege Level | 2708
- Release Information | 2708

## Syntax

```
source-routing-path name {
    binding-sid binding-sid;
    color color;
    lsp-external-controller;
    metric value;
    no-ingress;
    primary name {
        lsp-external-controller;
        weight weight;
    }
    secondary name {
        weight weight;
    }
    sr-preference sr-preference;
    to to;
}
```

## Hierarchy Level

```
[edit logical-systems name protocols source-packet-routing],
[edit protocols source-packet-routing]
```

## Description

Configure a source-routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing preference for traffic engineering.

Starting with Junos OS Release 18.1R1, compute static noncolored segment routing LSPs for protocol SPRING-TE in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These segment routing LSPs do not have a color associated with them. If an ingress route is not required for a non-colored segment routing LSP then the ingress route installation in inet.3 table can be disabled.

## Options

**name** Specify a name to identify a source routing path.

> **NOTE**: The combined length of tunnel-name and LSP name must not exceed 53 characters for per-path telemetry to work.

**binding-sid** (Optional) Specify the binding label to enable transit functionality for this tunnel. For a non-colored static segment routing LSP, the binding SID label of protocol SPRING-TE have a default preference value of 8 and a metric of 1.

- **Range:** `16` through `1,048,576`

**color** (Colored segment routing LSPs only) Specify a color identifier for the tunnel endpoint. For noncolored segment routing LSPs, you do not have to configure the color parameter.

**lsp-external-controller** Enable external path computing capability for the device. See "lsp-external-controller" on page 3057 for more information.

**metric** Specify metric for routes downloaded for the non-colored static segment routing tunnel.

- **Default:** 1,000,000 through 1,048,575
- **Range:** 1 through 16,777,215 (for BGP)

**no-ingress** Disable ingress route that is not required for the non-colored static segment routing tunnel

**primary** Specify a primary segment list for the configured source routing path.

The non-colored static segment routing LSP can have a maximum of 8 primary paths. incase of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. the paths become weighted ECMP if at least one of the paths have a non-zero weight. In both cases , when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.

**weight** *weight_value*
: Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

**secondary**
: Specify a secondary segment list for the configured non-colored static segment routing LSP.

**sr-preference**
: Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

  - **Range:** `0` through `4,294,967,295`

**to**
: Specify the IP address of the tunnel end-point

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 17.4R1.

The `metric`, `no-ingress`, and `secondary` statements are introduced in Junos OS Release 18.1R1.

`lsp-external-controller` statement introduced in Junos OS Release 20.1R1.

### Syntax

```
source-routing-path-template name {
    bfd-liveness-detection;
    ldp-tunneling;
    metric metric;
    no-ingress;
    primary name {
        compute {
            compute-profile-name;
        }
        lsp-external-controller;
        weight weight;
    }
    secondary name;
    compute {
        compute-profile-name;
    }
```

```
    sr-preference sr-preference;
}
```

## Hierarchy Level

```
[edit protocols source-packet-routing]
```

## Description

Configure a source-routing path template for dynamic creation of segment routing label-switched paths (LSPs).

## Options

**name** Name of the source routing path.

**bfd-liveness-detection** Configure Bidirectional Forwarding Detection (BFD) options for PCE-initiated segment routing LSP template. See "bfd-liveness-detection" on page 2426 for more information.

**ldp-tunneling** Allow LDP to use this LSP for tunneling. This configuration can be applied to PCE-initiated segment routing LSPs only.

**lsp-external-controller** Enable external path computing capability for the device. See "lsp-external-controller" on page 3057 for more information.

**metric** Metric for routes downloaded for this tunnel.

- **Range:** 1 through 16,777,215

**no-ingress** Disable ingress functionality for this tunnel.

**primary *name*** Configure a named identifier for the segment-list that describes the primary segment routing path along which the packet is to be routed. This segment list must have the `dynamic` statement enabled for dynamic creation of segment routing LSPs.

**compute *compute-profile-name*** Enable computation for the specified compute-profile.

**weight *weight*** (Optional) Specify the balance factor for this segment list in SR-TE tunnel.

If the forwarding interfaces have weights assigned by IGP, then hierarchical weighted ECMP is applied. When weight is not specified, only the IGP weights are applied on the forwarding interfaces.

**secondary *name***

Configure a named identifier for the segment-list that describes the secondary segment routing path along which the packet is to be routed. This segment list must have the `dynamic` statement enabled for dynamic creation of segment routing LSPs.

**sr-preference**

Segment routing preference for the segment routing traffic engineered (SPRING-TE) routes. A greater value indicates higher preference.

The preference value of the routes programmed for the segment routing LSP is inherited from the `preference` *value* statement at the `[edit protocols source-packet-routing` hierarchy level. When this value is not configured, the default preference value of 8 is used.

- **Range:** 0 through 4,294,967,295

    splitting-bandwidth bps;
    splitting-merging-threshold percent;
}
```

## Hierarchy Level

```
[edit protocols mpls container-label-switched-path lsp-name]
```

## Description

Perform splitting and merging.

## Options

**maximum-member-lsps** *number*
Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum.

- **Default:** 1

**maximum-signaling-bandwidth** *bandwidth*
Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When `maximum-signaling-bandwidth` is not configured, the value is derived from the `splitting-bandwidth`.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the `splitting-bandwidth`.

- **Default:** 1 bps

**merging-bandwidth** *bandwidth*
Amount of bandwidth in bits per second (bps) that is used for merging during normalization.

- **Default:** 1 bps

**minimum-member-lsps** *number*
Number of LSPd that a container LSP can have as member LSPs at minimum.

- **Default:** 64

**minimum-signaling-bandwidth** *bandwidth*
Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When `minimum-signaling-bandwidth` is not configured, the value is derived from the `merging-bandwidth`.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the `merging-bandwidth`.

- **Default:** 1 bps

**splitting-bandwidth** *bandwidth*
Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

- **Default:** 1 bps

**splitting-merging-threshold** *percent*
Percentage changes in aggregate bandwidth relevant for splitting and merging.

- **Default:** 0%

The remaining statements are explained separately. See CLI Explorer.

spring-te {
    destination-networks name;
    source-routing-path-template name {
        (color [ color ... ] | color-any);
```

```
    }
}
```

## Hierarchy Level

```
[edit routing-options dynamic-tunnels],
```

## Description

Enable next hop-base dynamic tunnel mode.

## Options

**source-routing-path-template *template-name*** Configure template color mapping for segment routing traffic-engineered (SPRING-TE) dynamic LSP parameters.

**color** Specify set of color list to be mapped to corresponding SPRING-TE template.

- When enabled, all templates should have color objects defined.
- All destinations are assumed to be colored as well.
- A color can be mapped to only one template at a given point in time.
- Both the `color` and `color-any` statements can coexist. When the two statements are enabled together, preference is given to a specific color template than color-any.
- A colored and non-colored destination cannot co-exist in the same SR-TE configuration.

**color-any** Enables mapping of any color to corresponding SPRING-TE template. Only one color-any template can be configured for one SR-TE LSP.

# statistics (Protocols MPLS)

IN THIS SECTION

- Syntax | 2726
- Hierarchy Level | 2726
- Description | 2727
- Options | 2727
- Required Privilege Level | 2728
- Release Information | 2728

## Syntax

```
statistics {
    auto-bandwidth (MPLS Statistics);
    file filename <files number> <size size> <world-readable | no-world-readable>;
    interval seconds;
    no-transit-statistics;
    traffic-class-statistics;
    transit-statistics-polling;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Enable MPLS statistics collection and reporting.

## Options

`file` *`filename`*—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file mpls-stat in the /var/log directory.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *file* reaches its maximum size, it is renamed *file*.0, then *file*.1, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.

- **Range:** 2 or more
- **Default:** 2 files

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

`interval` *`seconds`*—Interval at which to periodically collect statistics.

- **Range:** 1 through 65,535
- **Default:** 300 seconds

`no-world-readable`—(Optional) Prevent users from reading the log file.

`size` *`size`*—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named *file* reaches this size, it is renamed *file*.0. When the *file* again reaches its maximum size, *file*.0 is renamed *file*.1 and *file* is renamed *file*.0. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of files with the `files` option.

`world-readable`—(Optional) Enable users to read the log file.

- **Syntax:** Syntax: *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

`traffic-class-statistics`—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

`transit-statistics-polling`—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the `no-transit-statistics` statement at the same time.

The remaining statements are explained separately. See CLI Explorer.

### Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

`traffic-class-statistics` option introduced in Junos OS Release 14.2.

## swap

IN THIS SECTION

- Syntax | 2729
- Hierarchy Level | 2729
- Description | 2729
- Options | 2729
- Required Privilege Level | 2729
- Release Information | 2729

## Syntax

```
swap out-label;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls static-label-switched-path lsp-name
transit incoming-label],
[edit protocols mpls static-label-switched-path lsp-name transit incoming-label]
```

## Description

Remove the label at the top of the label stack and replace it with the specified label. Manually assigned incoming labels can have values from 1,000,000 through 1,048,575. This statement is used to configure static LSPs at transit routers.

## Options

*out-label*—Manually assigned outgoing label value.

- **Range:** 0 through 1,048,575
- **Default:** If you do not define the *out-label* option, the original label value remains unchanged.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# switch-away-lsps

IN THIS SECTION

- Syntax | 2730
- Hierarchy Level | 2730
- Description | 2730
- Required Privilege Level | 2731
- Release Information | 2731

## Syntax

```
switch-away-lsps;
```

## Hierarchy Level

```
[edit logical-systems logical-systems-name protocols mpls interface interface-name],
[edit protocols mpls interface interface-name]
```

## Description

(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. Configure this statement only after you have configured and committed the `always-mark-connection-protection-tlv` statement.

The `always-mark-connection-protection-tlv` statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. When you configure the `switch-away-lsps` statement, traffic is switched to the bypass LSP.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 10.2.

# sync-active-path-bandwidth

IN THIS SECTION

- Syntax | 2733
- Hierarchy Level | 2733
- Description | 2733
- Default | 2734
- Required Privilege Level | 2734
- Release Information | 2734

## Syntax

```
sync-active-path-bandwidth;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mplslabel-switched-path lsp-name],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name auto-
bandwidth],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary |
secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name auto-bandwidth],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

## Description

When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.

When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the `sync-active-path-bandwidth` statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.

For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the `sync-active-path-bandwidth` statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the `sync-active-path-bandwidth` is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.

### Default

When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 13.2.

## te-class-matrix

IN THIS SECTION

Syntax | 2735

- Hierarchy Level | 2735
- Description | 2735
- Default | 2735
- Options | 2736
- Required Privilege Level | 2736
- Release Information | 2736

## Syntax

```
te-class-matrix {
    te number {
        priority priority;
        traffic-class {
            ct number priority priority;
        }
    }
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls diffserv-te],
[edit protocols mpls diffserv-te]
```

## Description

Specify the traffic engineering class matrix for a multiclass LSP or a DiffServ-aware traffic engineering LSP.

## Default

The default traffic engineering class matrix is:

```
te-class-matrix {
    te0 traffic-class ct0 priority 7;
```

```
    te1 traffic-class ct1 priority 7;
    te2 traffic-class ct2 priority 7;
    te3 traffic-class ct3 priority 7;
    te4 traffic-class ct0 priority 0;
    te5 traffic-class ct1 priority 0;
    te6 traffic-class ct2 priority 0;
    te7 traffic-class ct3 priority 0;
}
```

If you define any of the traffic engineering classes, all the default values are dropped.

## Options

`ct`*`number`*—Specify the number of the class type. It can be one of four values: `ct0`, `ct1`, `ct2`, or `ct3`.

`priority` *`priority`*—Specify the priority of the class type. It can be one of eight values from 0 through 7.

`te`*`number`*—Specify the number of the traffic engineering class. It can be one of eight values: `te0`, `te1`, `te2`, `te3`, `te4`, `te5`, `te6`, or `te7`. You must configure the traffic engineering classes in order, starting with `te0`.

`traffic-class`—Specify the traffic class for the traffic engineering class.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

## traceoptions (Protocols MPLS)

IN THIS SECTION

- Syntax | 2739
- Hierarchy Level | 2739
- Description | 2739
- Default | 2739
- Options | 2739
- Required Privilege Level | 2741
- Release Information | 2741

## Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name]
```

## Description

Configure MPLS tracing options at the protocol level or for a label-switched path.

To specify more than one tracing operation, include multiple `flag` statements.

## Default

The default MPLS protocol-level tracing options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

## Options

*`filename`*—Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**. We recommend that you place MPLS tracing output in the file **mpls-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

*flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

**MPLS Tracing Flags**

- `all`—Trace all operations
- `autobw-state`—Automatic bandwidth events.
- `connection`—All circuit cross-connect (CCC) activity
- `connection-detail`—Detailed CCC activity
- `cspf`—CSPF computations
- `cspf-link`—Links visited during CSPF computations
- `cspf-node`—Nodes visited during CSPF computations
- `error`—MPLS error packets
- `graceful-restart`—Trace MPLS graceful restart events
- `lsp-history`—Trace LSP history events
- `lsping`—Trace lsping packets and return codes
- `nsr-synchronization`—Trace NSR synchronization events
- `nsr-synchronization-detail`—Trace NSR synchronization events in detail
- `state`—All LSP state transitions
- `static`—Trace static label-switched path
- `ted-export`—Trace leaking of entries from `lsdist.0` table into the traffic engineering database
- `ted-import`—Trace leaking traffic engineering database entries into the `lsdist.0` table
- `timer`—Timer usage

`no-world-readable`—(Optional) Allow only certain users to read the log file.

`size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB

- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Allow any user to read the log file.

### Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

`ted-export` option introduced in Junos OS Release 14.2.

`ted-import` option introduced in Junos OS Release 14.2.

`lsp-history` option added in Junos OS Release 15.1.

## traffic-class (delay)

IN THIS SECTION

- Syntax | **2742**
- Hierarchy Level | **2742**
- Description | **2742**
- Options | **2743**

Required Privilege Level | 2743
Release Information | 2743

## Syntax

```
traffic-class tc-value {
    average-sample-size sample size;
    padding-size size;
    query-interval milliseconds;
    rtt-delay-threshold rtt threshold value;
    twcd-delay-threshold twcd threshold value;
}
```

## Hierarchy Level

```
[edit protocols mpls oam performance-monitoring querier delay],
[edit protocols mpls label-switched-path lsp-name oam performance-monitoring querier delay],
[edit protocols mpls label-switched-path lsp-name primary path-name oam performance-monitoring
querier delay],
[edit protocols mpls label-switched-path lsp-name secondary path-name oam performance-monitoring
querier delay]
```

## Description

Configure traffic class specific options.

Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the *tc-all|tc-0|tc-1|tc-2|tc-3|tc-4|tc-5|tc-6|tc-7|tc-none* traffic-class values. For each traffic class, you can configure the respective parameters.

To enable traffic-class parameters, configure the `traffic-class-statistics` configuration statement under the `[edit protocol mpls statistic]` hierarchy level.

## Options

**average-sample-size** *sample size* (Optional) Specify the number of samples used for calculating the average of various metrics.

- **Default:** 5
- **Range:** 1 through 30

**padding-size** *size* (Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.

- **Default:** 0
- **Range:** 1 through 1500

**query-interval** *milliseconds* Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

- **Default:** 10 seconds
- **Range:** 1000 through 4294967295 milliseconds

**rtt-delay-threshold** *rtt threshold value* Specify the round-trip delay threshold value.

- **Range:** 1 through 4294967295 microseconds

**twcd-delay-threshold** *twcd threshold value* Specify the two-way channel delay threshold value.

- **Range:** 1 through 4294967295 microseconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 15.1.

## Syntax

```
traffic-class tc-value {
    average-sample-size sample size;
    loss-threshold loss threshold value;
    loss-threshold-window number of samples for loss threshold;
    measurement-quantity bytes|packets;
    query-interval milliseconds;
}
```

## Hierarchy Level

```
[edit protocols mpls oam performance-monitoring querier loss],
[edit protocols mpls label-switched-path lsp-name oam performance-monitoring querier loss],
[edit protocols mpls label-switched-path lsp-name primary path-name oam performance-monitoring
querier loss],
```

```
[edit protocols mpls label-switched-path lsp-name secondary path-name oam performance-monitoring
querier loss]
```

## Description

Configure traffic class specific options.

Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the *tc-all|tc-0|tc-1|tc-2|tc-3|tc-4|tc-5|tc-6|tc-7|tc-none* traffic-class values. For each traffic class, you can configure the respective parameters.

To enable traffic-class parameters, configure the `traffic-class-statistics` configuration statement under the `[edit protocol mpls statistic]` hierarchy level.

## Options

**average-sample-size** *sample size* (Optional) Specify the number of samples used for calculating the average of various metrics.

- **Default:** 5
- **Range:** 1 through 30

**loss-threshold** *loss threshold value* Specify the threshold value that will be used with `loss-threshold-window` to calculate the loss within specified window size.

- **Range:** 1 through 4294967295

**loss-threshold-window** *number of samples for loss threshold* Specify the number of samples used for loss threshold calculation.

- **Range:** 1 through 30

**measurement-quantity** *bytes|packets* (Optional) Specify whether packet or byte loss is being measured at the querier.

- **Default:** packets

**query-interval** *milliseconds* Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

- **Default:** 10 seconds
- **Range:** 1000 through 4294967295 milliseconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# traffic-engineering (Protocols MPLS)

IN THIS SECTION

- Syntax | 2749
- Hierarchy Level | 2749
- Description | 2749
- Default | 2750
- Options | 2750
- Required Privilege Level | 2750
- Release Information | 2750

## Syntax

```
traffic-engineering (bgp | bgp-igp | bgp-igp-both-ribs | mpls-forwarding);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit protocols mpls]
```

## Description

Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.

### Default

bgp

### Options

bgp—On BGP destinations only. Ingress routes are installed in the inet.3 routing table.

bgp-igp—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.

bgp-igp-both-ribs—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.

mpls-forwarding—On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## traffic-engineering

IN THIS SECTION

Syntax | 2751

- Hierarchy Level | 2751
- Description | 2751
- Default | 2751
- Required Privilege Level | 2751
- Release Information | 2752

## Syntax

```
traffic-engineering {
    disable;
}
```

## Hierarchy Level

```
[edit protocols ospf | isis]
```

## Description

Enable the traffic engineering features of the specified routing protocol.

## Default

Traffic engineering is disabled.

Starting in Junos OS release 15.1, traffic engineering is enabled by default whenever the IS-IS protocol is enabled. You can disable it by including the `disable` statement at the `[edit protocols isis traffic-engineering]` hierarchy level. For the EX3300, EX4200, EX4500, EX4550, EX8200 and XRE200, you can disable traffic engineering starting in Junos OS release 15.1R7.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.5.

- Syntax | 2752
- Hierarchy Level | 2753
- Description | 2753
- Options | 2753
- Required Privilege Level | 2753
- Release Information | 2754

### Syntax

```
traffic-engineering {
    unicast;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp family],
[edit logical-systems logical-system-name protocols bgp group group-name family],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address family],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp
family],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp
group group-name family],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp
group group-name neighbor address family],
[edit protocols bgp family],
[edit protocols bgp group group-name family],
[edit protocols bgp group group-name neighbor address family],
[edit routing-instances routing-instance-name protocols bgp family],
[edit routing-instances routing-instance-name protocols bgp group group-name family],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address
family]
```

## Description

Enable traffic engineering address family. This generates a multiprotocol address family indicator (AFI) and a subsequent address family identifier (SAFI) to be negotiated with the BGP peers.

The BGP network layer reachability information (NLRI) information is exchanged between the peers only when the traffic engineering AFI and SAFI are shared between them. If the peers do not agree on the use of the AFI and SAFI, the connection between the peers is terminated.

## Options

**unicast** Include BGP-TE NLRI.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# ultimate-hop-popping

IN THIS SECTION

- Syntax | 2756
- Hierarchy Level | 2756
- Description | 2756
- Default | 2757
- Required Privilege Level | 2757
- Release Information | 2757

## Syntax

```
ultimate-hop-popping;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path label-switched-path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path label-switched-path-name]
```

## Description

Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.

Be aware of the following platform requirements and restrictions:

- UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.

- UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.
- UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.
- UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.
- UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the *no-tunnel-services* statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

## Default

Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.3.

## vrf-table-label

**IN THIS SECTION**

- Syntax | **2759**
- Hierarchy Level | **2759**
- Description | **2760**
- Options | **2760**
- Required Privilege Level | **2760**
- Release Information | **2761**

### Syntax

```
vrf-table-label {
    source-class-usage;
    static;
}
```

### Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

## Description

Map the inner label of a packet to a specific VPN routing and forwarding (VRF) instance. This allows the examination of the encapsulated IP header. The first lookup is done on the VPN label to determine which VRF instance to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts.

When you include the `vrf-table-label` statement in the configuration of a VRF routing instance, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table. Any routes in the VRF routing table are advertised with the LSI logical interface label allocated for the VRF routing table. When packets destined for the VRF routing instance arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table.

All routes in a VRF routing instance configured with this option are advertised with one label allocated per VRF.

**NOTE**:

- The `vrf-table-label` statement is supported on PTX5000 and PTX3000 routers only when third-generation FPCs are installed on the router and `enhanced-ip` command is configured on the chassis.
- Starting in Junos OS Release 17.2, you can configure the `enhanced-ip` command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability. The `vrf-table-label` space is increased to at least 16,000, if the platform can support the scale.

## Options

The remaining statements are explained separately.

- **Range:** 16 through 1,048,575 for static label value.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `source-class-usage` statement added in Junos OS Release 9.3.

Support for the `static` statement added in Junos OS Release 17.2.

## aggregate (Protocols RSVP)

IN THIS SECTION

- Syntax | 2766
- Hierarchy Level | 2766
- Description | 2766
- Default | 2766
- Required Privilege Level | 2766
- Release Information | 2767

## Syntax

```
(aggregate | no-aggregate);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

## Description

Control the use of RSVP aggregate messages on an interface or peer interface, as described below.

**NOTE**: Starting in Junos OS Release 15.2, the `aggregate` statement is deprecated at the `[edit protocols rsvp interface interface-name]` and `[edit logical-systems logical-system-name protocols rsvp interface interface-name]` hierarchy levels, as RSVP message aggregation is enabled by default.

- `aggregate`—Use RSVP aggregate messages.
- `no-aggregate`—Do not use RSVP aggregate messages.

  Aggregate messages can pack multiple RSVP messages into a single transmission, thereby reducing network overhead and enhancing efficiency. The number of supportable sessions and processing overhead are significantly improved when aggregation is enabled.

  Not all routers connected to a subnet need to support aggregation simultaneously. Each RSVP router negotiates its intention to use aggregate messages on a per-neighbor basis. Only when both routers agree are aggregate messages sent.

To have refresh reduction and reliable delivery, you must include the `aggregate` and `reliable` statements.

## Default

Aggregation is enabled.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## authentication-key (Protocols RSVP)

IN THIS SECTION

- Syntax | 2767
- Hierarchy Level | 2767
- Description | 2768
- Options | 2768
- Required Privilege Level | 2768
- Release Information | 2768

### Syntax

```
authentication-key key;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp],
```

```
[edit protocols rsvp interface interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

## Description

Authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface or peer interface. To authenticate node hellos or remote messages between the Point of Local Repair (PLR) to the Merge Point (MP), enable `authentication-key` at the `[edit protocols rsvp]` hierarchy level.

It is recommended to use the `authentication-key` configuration at the `[edit protocols rsvp]` hierarchy level for the RSVP node-neighbor. Because non-RSVP interfaces do not have RSVP authentication key, the `authentication-key` configuration allows the packets to arrive at any interface regardless of RSVP interfaces configuration being enabled or not.

RSVP uses HMAC-MD5 authentication, which is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.

All routers that are connected to the same IP subnet must use the same authentication scheme and password.

## Options

*key*—Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# bandwidth (Protocols RSVP)

IN THIS SECTION

- Syntax | 2769
- Hierarchy Level | 2769
- Description | 2769
- Default | 2770
- Options | 2770
- Required Privilege Level | 2770
- Release Information | 2770

## Syntax

```
bandwidth bps;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass bypass-name],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

## Description

For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.

This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.

## Default

The hardware raw bandwidth is used.

## Options

*bps*—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations `k` (for a thousand), `m` (for a million), or `g` (for a billion [also called a thousand million]).

- **Range:** Any positive integer
- **Default:** 0 (no bandwidth is reserved)

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# bypass (Signaled LSP)

IN THIS SECTION

- Syntax | 2771
- Hierarchy Level | 2771
- Description | 2772
- Options | 2772
- Required Privilege Level | 2772
- Release Information | 2773

## Syntax

```
bypass bypass-name {
    bandwidth bps;
    description text;
    hop-limit number;
    no-cspf;
    path address <strict | loose>;
    priority setup-priority reservation-priority;
    subscription subscription-percentage;
    to address;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit protocols rsvp interface interface-name link-protection]
```

## Description

Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.

If you specify the `bandwidth`, `hop-limit`, and `path` statements for the bypass LSP, these values take precedence over the values configured at the `[edit protocols rsvp interface` *`interface-name`* `link-protection]` hierarchy level. The other attributes (`subscription`, `no-node-protection`, and `optimize-timer`) are inherited from the general constraints.

## Options

***bypass-name*** (Required) Specify a name for the bypass LSP. The name can be up to 64 characters.

**description** Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the `show mpls lsp bypass detail` command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.

**subscription** ***subscription-percentage*** (Optional) Specify the subscription percentage per manual bypass LSP. The subscription percentage configured under a particular manual bypass LSP overrides the subscription percentage configured commonly for all manual bypass LSPs under an interface.

- **Range:** 0 through 65000

**to** ***address*** (Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.

The remaining statements are explained separately. See CLI Explorer.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

`description` option was added in Junos OS Release 10.4.

`subscription` *`subscription-percentage`* option introduced in Junos OS Release 19.2R1 on all platforms.

## bypass (Static LSP)

IN THIS SECTION

- Syntax | 2773
- Hierarchy Level | 2774
- Description | 2774
- Required Privilege Level | 2774
- Release Information | 2774

### Syntax

```
bypass bypass-name {
    bandwidth bps;
    description string;
    next-hop (address | interface-name | address/interface-name);
    push out-label;
    to address;
}
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls static-label-switched-path lsp-name],
[edit protocols mpls static-label-switched-path lsp-name]
```

### Description

Configure specific bandwidth and path constraints for a bypass ingress LSP. It is possible to configure multiple bypass LSPs individually. If you do not, they all share the same path and bandwidth constraints.

The remaining statements are explained separately. See CLI Explorer.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 10.1.

## chained-composite-next-hop

IN THIS SECTION

- Syntax | 2775
- Hierarchy Level | 2775
- Description | 2775
- Default | 2777
- Options | 2777

Required Privilege Level | 2777
Release Information | 2777

## Syntax

```
chained-composite-next-hop {
    ingress;
    transit;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-options forwarding-table]
```

**NOTE**: The `[edit logical-systems]` hierarchy level is not supported on the QFX10000 switches.

## Description

Allows you to configure the chained composite next hops for devices handling ingress or transit traffic in the network.

Chained composite next hops help to facilitate the handling of large volumes of transit traffic in the core of large networks by allowing the router to process much larger volumes of routes. A chained composite next hop allows the router to direct sets of routes sharing the same destination to a common forwarding next hop, rather than having each route also include the destination. In the event that a network destination is changed, rather than having to update all of the routes sharing that destination with the new information, just the shared forwarding next hop is updated with the new information. The chained composite next hops continue to point to this forwarding next hop which now contains the new destination.

On platforms containing only MPCs, such as PTX Series Packet Transport Routers, the MX80 router, the MX2020 router, and the QFX10000 switches, chained composite next hops are enabled by default. On MX Series 5G Universal Routing Platforms containing both DPC and MPC FPCs and on T4000 Core

Routers containing MPC and FPCs, chained composite next hops are disabled by default and need to be explicitly configured.

To explicitly configure chained composite next hops, include the `enhanced-ip` statement at the `[edit chassis network-services]` hierarchy level. However, take the following into consideration when enabling the `enhanced-ip` mode:

- Non-service DPCs do not work with enhanced network services mode options. Only MPCs, MS-DPCs, and MS-MPCs provide support for the `enhanced-ip` configuration.
- If you configure chained composite next hops on MX Series routers with both MPCs, and DPCs or DPCEs, the network services mode must be changed from `enhanced-ip` to `ethernet` for the DPC or DPCE to come online.

  You can verify the FPC status in such cases, using the `show chassis fpc` command output, where the DPCs and DPCEs are marked as `FPC misconfiguration`.

**NOTE**:

- When chained composite next hops are enabled on a device, the BGP connections are reset.
- On MX Series routers with DPCs or DPCEs, only the *l3vpn* option is supported under the *ingress* configuration statement; all other configuration options and functionality are not supported.
- The `transit` statement and the associated functionality is supported only on PTX Packet Transport Routers and QFX10000 switches.
- On MX Series routers, removing the `chained-composite-next-hop` statement from a PE device configuration causes all IBGP sessions to be torn down and triggers the BGP session to flap as well. A similar change on a router configured as a route reflector does not have any effect, however.

  The following is a sample system log message that is generated to record such an event:

  ```
  Nov  6 15:16:21.670 host PE1: rpd[6947]: bgp_peer_mgmt_clear:5995: NOTIFICATION sent to
  10.0.100.2 (External AS 100): code 6 (Cease) subcode 4 (Administratively Reset), Reason:
  Management session cleared BGP neighbor
  ```

- Starting with Junos OS Release 17.2, you cannot configure `chained-composite-next-hop ingress l3vpn extended-space` on a logical system.

The remaining statements are explained separately. See CLI Explorer.

## Default

This statement is disabled by default.

## Options

**ingress** Enable or disable composite chained next hop for ingress traffic.

**transit** (PTX and QFX10000) Enable or disable composite chained next hop for transit traffic. Starting in Junos OS Release 14.1, the `transit l3vpn` statement is enabled by default on PTX Series Packet Transport Routers only.

The remaining statements are explained separately. See CLI Explorer.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.1.

# class-of-service (Protocols RSVP)

IN THIS SECTION

- Syntax | 2778
- Hierarchy Level | 2778
- Description | 2778
- Options | 2779
- Required Privilege Level | 2779
- Release Information | 2779

## Syntax

```
class-of-service cos-value;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

## Description

Class-of-service (CoS) value given to all packets in the bypass LSP. You can specify a single CoS value for all the bypass LSPs traversing an interface. You can also configure CoS values for specific bypass LSPs traversing an interface.

The CoS value might affect the scheduling or queuing algorithm of traffic traveling along an LSP.

### Options

*cos-value*—CoS value. A higher value typically corresponds to a higher level of service.

- **Range:** 0 through 7
- **Default:** If you do not specify a CoS value, the IP precedence bits from the packet's IP header are used as the packet's CoS value.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

# devices

IN THIS SECTION

- Syntax | **2781**
- Hierarchy Level | **2781**
- Description | **2781**
- Default | **2782**
- Options | **2782**
- Required Privilege Level | **2782**
- Release Information | **2782**

## Syntax

```
devices device-names;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Specifies one of the virtual tunnel (VT) interfaces to de-encapsulate the egress traffic for ultimate-hop popping on point-to-multipoint LSPs. If no device is specified, the selection process is performed automatically.

### Default

The device selection process is performed automatically if no device is configured. Junos OS selects one of the available VT interfaces to de-encapsulate the egress traffic.

### Options

*device-names*—Specify which VT interfaces are used to handle the RSVP traffic.

- **Range:** 0 to 8 devices

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 8.1.

## disable (Protocols RSVP)

IN THIS SECTION

- Syntax | 2783
- Hierarchy Level | 2783
- Description | 2783
- Default | 2783
- Required Privilege Level | 2783
- Release Information | 2783

## Syntax

```
disable;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit logical-systems logical-system-name protocols rsvp graceful-restart],
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp],
[edit protocols rsvp graceful-restart],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp peer-interface peer-interface-name]
```

## Description

Explicitly disable RSVP or RSVP graceful restart. Explicitly disable link protection on the specified interface.

## Default

RSVP is enabled on interfaces and peer interfaces configured with the RSVP `interface` statement. RSVP graceful restart is enabled on the router. Link protection is disabled.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 2785

## Syntax

```
dynamic-bidirectional-transport {
    template template;
}
```

## Hierarchy Level

```
[edit protocols rsvp peer-interface peer-interface-name]
```

## Description

Enable the dynamic setup of associated bidirectional packet LSP for transporting non-packet Generalized Multiprotocol Label Switching (GMPLS) label-switched path (LSP).

### Options

**template** ***template*** Name of the template for the dynamic bidirectional packet LSP.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 14.2.

## fast-reroute (Protocols RSVP)

**IN THIS SECTION**

- Syntax | **2785**
- Hierarchy Level | **2786**
- Description | **2786**
- Options | **2786**

### Syntax

```
fast-reroute optimize-timer seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Configure the optimize timer for fast reroute. The optimize timer triggers a periodic optimization process that recomputes the fast reroute detour LSPs to use network resources more efficiently.

## Options

*seconds*—Specify the number of seconds between fast reroute detour LSP optimizations.

- **Range:** 0 through 65,535 seconds
- **Default:** 0 (disabled)

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement added in Junos OS Release 7.5.

Statement introduced in Junos OS Release 14.1.

## graceful-restart (Protocols RSVP)

IN THIS SECTION

- Syntax | 2788
- Hierarchy Level | 2789
- Description | 2789
- Options | 2789
- Required Privilege Level | 2789
- Release Information | 2790

### Syntax

```
graceful-restart {
    disable;
    helper-disable;
    maximum-helper-recovery-time seconds;
    maximum-helper-restart-time seconds;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-options],
[edit protocols rsvp],
[edit routing-options]
```

## Description

Configure graceful restart on the router. You must configure the `graceful-restart` statement at the `[edit routing-options]` hierarchy level to enable graceful restart on the router.

## Options

`disable`—Disable graceful restart on the router or for RSVP.

`helper-disable`—Disable RSVP graceful restart helper mode (this option is only available at the `[edit protocols rsvp]` hierarchy level).

- **Default:** Helper mode is enabled by default.

`maximum-helper-recovery-time` *seconds*—The maximum length of time the router stores the state of neighboring routers when they undergo a graceful restart. The value applies to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.

- **Default:** 180 seconds
- **Range:** 1 through 3600 seconds

`maximum-helper-restart-time` *seconds*—The maximum length of time the router waits between when it discovers that a neighboring router has gone down and when it declares the neighbor down. This value is applied to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.

- **Default:** 20 seconds
- **Range:** 1 through 1800 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

## Description

Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:

- LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.
- Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.
- Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.

## Options

*number*—Maximum number of hops.

- **Range:** 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)
- **Default:** 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)

## Required Privilege Level

## keep-multiplier

IN THIS SECTION

- Syntax | 2798
- Hierarchy Level | 2798
- Description | 2798
- Options | 2798
- Required Privilege Level | 2799
- Release Information | 2799

## Syntax

```
keep-multiplier number;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Specify a value used by RSVP to calculate timer values for network outages, and declare that a reservation or a neighbor is down. It indicates the number of messages that can be lost before a particular state is declared stale and must be deleted. The keep multiplier directly affects the lifetime of an RSVP state.

Starting in Junos OS Release 16.1, for MX Series routers and PTX Series routers, the default RSVP message refresh time, to which this multiplier is applied, has increased from 30 seconds to 20 minutes. The higher message refresh time provides support for RSVP Refresh Reduction Extensions, and improved scaling for MPLS traffic-engineered LSPs, as defined in RFC 2961. The changes are backward compatible so if any nodes in the two-hop neighborhood do not support the higher refresh time, the updated node will automatically fall back to the previous default refresh time to prevent error or tear down messages.

## Options

*number*—Multiplier value.

- **Range:** 1 through 255
- **Default:** 3

> **NOTE**: For MX Series routers and PTX Series routers (running Junos OS release 16.1 or later), this multiplier is applied to a default refresh time of 20 minutes. In earlier Junos OS releases, and for other platforms, the default refresh time remains 30 seconds.

[edit routing-instances instance-name provider-tunnel]
```

## Description

Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the `label-switched-path-template` statement, so you must configure either the default-template using the `default-template` option, or you must specify the name of your preconfigured LSP template.

## Options

`default-template`—Specify that the default LSP template be used for the dynamically generated LSPs.

*`lsp-template-name`*—Specify the name of an LSP to be used as a template for the dynamically generated LSPs.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 8.5.

    subscription percentage;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

## Description

Enable link protection on the specified interface. Using link protection, you can configure a network to reroute traffic quickly around broken links. To fully enable link protection, you also need to configure the `link-protection` statement at the `[edit protocols mpls label-switched-path` *`lsp-name`*`]` hierarchy level. You can configure single or multiple bypasses for protected interface.

## Default

Link protection is disabled.

## Options

`no-node-protection`—Disable node-link protection on the RSVP interface. Link protection remains active. When this option is configured, the router can only initiate a next-hop bypass, not a next-next-hop bypass.

The remaining statements are explained separately. See CLI Explorer.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

- Release Information | 2806

### Syntax

```
max-bypasses number;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

### Description

Specify the maximum number of dynamic bypass LSPs permitted for protecting this interface. When this option is configured, multiple bypasses for link protection are enabled. Call admission control (CAC) is also enabled. The limit on bypasses configured applies only to dynamically generated bypass LSPs. By default, this option is disabled and only one dynamic bypass LSP is enabled for each interface. If you configure `max-bypasses`, you must also configure the "bandwidth" on page 2769 statement.

### Options

*number*—Configure the maximum number of bypass LSPs. If you configure a value of 0, no dynamic bypass LSPs are allowed to be established for the interface. Only static bypass LSPs can be configured.

- **Range:** 0 through 99
- **Default:** 1

## no-local-reversion

IN THIS SECTION

Syntax | 2807

- Hierarchy Level | 2807
- Description | 2807
- Required Privilege Level | 2808
- Release Information | 2808

## Syntax

```
local-reversion;
no-local-reversion;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Disable RSVP local revertive mode as specified in RFC 4090, *Fast Reroute Extensions to RSVP-TE for LSP Tunnels*.

**NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, `no-local-reversion` is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the `local-reversion` statement.

RSVP local revertive mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global revertive mode instead. You might need to disable RSVP local revertive mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local revertive mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resignaled along the restored path is switched back.
- Global revertive mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 10.4.

## node-hello

**IN THIS SECTION**

- Syntax | 2808
- Hierarchy Level | 2809
- Description | 2809
- Required Privilege Level | 2809
- Release Information | 2809

### Syntax

```
(node-hello | no-node-hello);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, node-ID based RSVP hellos are enabled. To disable node-id based hello sessions, use the `no-node-hello` statement. If you have disabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets.

**NOTE**: For Junos OS Release 15.1 or earlier, node-ID based hellos are disabled by default. To enable node-id based hello sessions on routers running Junos OS Release 15.1 or earlier, use the **node-hello** statement.

**NOTE**: If `link-protection` is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. However, if `no-enhanced-frr-bypass` is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# no-adjacency-down-notification (Protocols IS-IS)

IN THIS SECTION

- Syntax | 2810
- Hierarchy Level | 2810
- Description | 2810
- Required Privilege Level | 2811
- Release Information | 2811

## Syntax

```
no-adjacency-down-notification;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis interface interface-name],
[edit protocols isis interface interface-name]
```

## Description

Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signaled label-switched paths (LSPs).

Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.

A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.

If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the `no-adjacency-down-notification` or `no-neighbor-down-notification` statements, you can disable IS-IS adjacency

down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# no-interface-hello

IN THIS SECTION

- Syntax | 2814
- Hierarchy Level | 2814
- Description | 2814
- Required Privilege Level | 2815
- Release Information | 2815

## Syntax

```
no-interface-hello;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Explicitly disable RSVP interface hellos globally on the router.

**NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the `no-interface-hello` command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the "hello-interval" on page 2791 statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a

heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 10.0.

```
path address <strict | loose>;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

## Description

Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.

## Default

No path is configured. CSPF automatically calculates the path the bypass LSP takes.

## Options

*address*—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is `loose`. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

- **Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.

`loose`—(Optional) The next address in the `path` statement is loose. The LSP can traverse other routers before reaching this router.

- **Default:** `strict`

`strict`—(Optional) The LSP must go to the next address specified in the `path` statement without traversing other nodes. This is the default.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# preemption

IN THIS SECTION

- Syntax | 2828
- Hierarchy Level | 2828
- Description | 2828
- Default | 2829
- Options | 2829
- Required Privilege Level | 2829
- Release Information | 2829

## Syntax

```
preemption {
    (aggressive | disabled | normal);
    soft-preemption {
        cleanup-timer seconds;
    }
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Control RSVP session preemption.

### Default

`normal`

### Options

`aggressive`—Preempt RSVP sessions whenever bandwidth is insufficient to handle all sessions. A session is preempted whenever bandwidth is lowered or a new higher-priority session is established.

`disabled`—Do not preempt RSVP sessions.

`normal`—Preempt RSVP sessions to accommodate new higher-priority sessions when bandwidth is insufficient to handle all sessions.

The remaining statements are explained separately. See CLI Explorer.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

## priority (Protocols RSVP)

IN THIS SECTION

- Syntax | 2830
- Hierarchy Level | 2830
- Description | 2830

- Options | 2830
- Required Privilege Level | 2831
- Release Information | 2831

## Syntax

```
priority setup-priority reservation-priority;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass bypass-name],
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name],
```

## Description

Configure the setup priority and reservation priority for a bypass LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. The session with the lower-hold priority is preempted.

## Options

*reservation-priority*—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.

- **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.
- **Default:** 0 (Once the session is set up, no other session can preempt it.)

*setup-priority*—Setup priority.

- **Range:** 0 through 7, where 0 is the highest and 7 is the lowest priority.

- **Default:** 7 (The session cannot preempt any existing sessions.)

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## reliable

IN THIS SECTION

Syntax | 2833

- Hierarchy Level | 2833
- Description | 2833
- Default | 2833
- Required Privilege Level | 2834
- Release Information | 2834

## Syntax

```
(reliable | no-reliable);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

## Description

Enable reliable message delivery on the interface.

To have both refresh reduction and reliable delivery, enable both the `aggregate` and `reliable` statements.

**NOTE**: For Junos OS Release 16.1 running on MX Series or PTX Series routers, setting `no-reliable` on an interface automatically disables the fast reroute (FRR) scalability enhancements, including refresh reduction, for all label-switched paths (LSPs) traversing the interface.

## Default

Starting in Junos OS Release 16.1R1, all refresh reduction extensions are enabled by default.

Prior to Junos OS Release 16.1R1, the `reliable` option is disabled by default.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## rsvp

IN THIS SECTION

- Syntax | 2834
- Hierarchy Level | 2835
- Description | 2835
- Default | 2835
- Required Privilege Level | 2835
- Release Information | 2835

### Syntax

```
rsvp;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols],
[edit protocols]
```

## Description

Enable Resource Reservation Protocol (RSVP) signaling.

You must include the `rsvp` statement in the configuration to enable RSVP on the router.

The primary purpose of RSVP in Junos OS for EX Series switches is to support dynamic signaling within label switched paths (LSPs).

## Default

RSVP is disabled.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# rsvp-te (Routing Options)

IN THIS SECTION

- Syntax | 2836
- Hierarchy Level | 2836
- Description | 2836
- Options | 2836
- Required Privilege Level | 2837
- Release Information | 2837

## Syntax

```
rsvp-te entry-name {
    destination-networks network-prefix;
    label-switched-path-template (Multicast) {
        default-template;
        template-name;
    }
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-options dynamic-tunnels tunnel-name],
[edit routing-options dynamic-tunnels tunnel-name]
```

## Description

Enable RSVP to automatically establish LSPs for any new PE router added to a full mesh of LSPs. To enable this feature, you must configure the `rsvp-te` statement on all of the PE routers in the full mesh.

## Options

*entry-name*—Specify the entry for the RSVP tunnel.

The other options are explained separately.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

## setup-protection

IN THIS SECTION

- Syntax | 2837
- Hierarchy Level | 2838
- Description | 2838
- Required Privilege Level | 2838

### Syntax

```
setup-protection;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

### Description

The facility-backup fast reroute mechanism can provide setup protection for LSPs which are in the process of being signaled. Both point-to-point LSPs and point-to-multipoint LSPs are supported. You should configure the `setup-protection` statement on each of the routers along the LSP path on which you want to enable LSP setup protection. You should also configure IGP traffic engineering on all of the routers on the LSP path.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

RELATED DOCUMENTATION

## soft-preemption (Protocols RSVP)

IN THIS SECTION

- Syntax | 2839
- Hierarchy Level | 2839
- Description | 2839
- Options | 2839
- Required Privilege Level | 2839
- Release Information | 2839

## Syntax

```
soft-preemption {
    cleanup-timer seconds;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp preemption],
[edit protocols rsvp preemption]
```

## Description

Enable soft preemption to attempt to establish a new path for a preempted LSP before tearing it down.

## Options

`cleanup-timer`—A value of 0 disables soft preemption.

- **Range:** 0 through 10800 seconds
- **Default:** 30 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

# subscription

IN THIS SECTION

- Syntax | 2842
- Hierarchy Level | 2842
- Description | 2843
- Options | 2843
- Required Privilege Level | 2843
- Release Information | 2843

## Syntax

```
subscription percentage {
    ct0 percentage;
    ct1 percentage;
    ct2 percentage;
    ct3 percentage;
    piority priority-value percentage;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name link-protection]
```

## Description

Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection). `subscription` is the percentage of the link bandwidth that can be used for the RSVP reservation process.

## Options

`ct`*`number percentage`*—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.

- **Range:** 0 through 65,000
- **Default:** 100 percent

*`percentage`*—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.

- **Range:** 0 through 65,000
- **Default:** 100 percent

`priority` *`priority-value percentage`*—Priority for which subscription percent is being configured.

- **Range:** 0 through 7
- **Default:** 100 percent

*`percentage`*—Subscription percent for the specific priority.

- **Range:** 0 through 65,000
- **Default:** 100 percent

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

`priority` option introduced in Junos OS Release 20.4R1 for MX960, MX2008, MX2010, MX2020, and PTX Series.

## traceoptions (Protocols RSVP)

IN THIS SECTION

- Syntax | 2844
- Hierarchy Level | 2845
- Description | 2845
- Default | 2845
- Options | 2845
- Required Privilege Level | 2847
- Release Information | 2847

### Syntax

```
traceoptions {
    enhanced-frr ;
    file filename  <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Enable RSVP-level trace options.

## Default

The default RSVP-level trace options are those inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

## Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`enhanced-frr` —(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.

*`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place RSVP tracing output in the file **rsvp-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

*`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—All tracing operations
- `error`—All detected error conditions

- `event`—RSVP-related events. New trace messages are added in the file that you create.
- `io-event [detail] [disable]` —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- `io-packets [detail] [disable] [receive] [send]` —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use *detail* to show all objects contained in the message. Use *send* and *receive* to limit tracing to outgoing or incoming packets.
- `lmp`—RSVP-LMP interactions
- `packets`—All RSVP packets
- `path`—All path messages
- `pathtear`—PathTear messages
- `resv`—Resv messages
- `resvtear`—ResvTear messages
- `route`—Routing information
- `state`—Session state transitions, including when RSVP-signaled LSPs come up and go down.

*`flag-modifier`*—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information
- `receive`—Packets being received
- `send`—Packets being transmitted

`no-world-readable`—(Optional) Enable only certain users to read the log file.

`size` *`size`*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches this size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable any user to read the log file.

### Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## tunnel-services (RSVP)

IN THIS SECTION

- Syntax | **2850**
- Hierarchy Level | **2850**
- Description | **2850**

- Default | 2850
- Options | 2850
- Required Privilege Level | 2850
- Release Information | 2851

## Syntax

```
tunnel-services {
    devices device-names;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp],
[edit protocols rsvp]
```

## Description

Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed automatically.

## Default

Ultimate-hop popping is disabled.

## Options

`devices` *`device-names`*—Specify which VT interfaces are used to handle the RSVP traffic.

- **Range:** 0 to 8 devices

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 8.1.

RELATED DOCUMENTATION

Enabling Ultimate-Hop Popping on Point-to-Multipoint LSPs | 1232

## ultimate-hop-popping

IN THIS SECTION

- Syntax | 2851
- Hierarchy Level | 2851
- Description | 2852
- Default | 2852
- Required Privilege Level | 2852
- Release Information | 2852

### Syntax

```
ultimate-hop-popping;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls],
[edit logical-systems logical-system-name protocols mpls label-switched-path label-switched-path-name],
```

```
[edit protocols mpls],
[edit protocols mpls label-switched-path label-switched-path-name]
```

## Description

Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.

Be aware of the following platform requirements and restrictions:

- UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.
- UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.
- UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.
- UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.
- UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the *no-tunnel-services* statement at the `[edit routing-instances routing-instance-name protocols vpls]` hierarchy level.

## Default

Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.3.

RELATED DOCUMENTATION

explicit-null (Protocols MPLS) | 2484

# update-threshold

IN THIS SECTION

- Syntax | 2853
- Hierarchy Level | 2853
- Description | 2853
- Options | 2854
- Required Privilege Level | 2854
- Release Information | 2854

## Syntax

```
update-threshold {
    threshold-percent;
    threshold-value threshold-value;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit protocols rsvp interface interface-name]
```

## Description

Adjust the threshold at which a change in bandwidth triggers an interior gateway protocol (IGP) update.

## Options

*threshold-percent*

Specify the percentage change in reserved bandwidth to trigger IGP update.

- **Default:** 10 percent
- **Range:** 0.001 through 20 percent

**threshold-value** *threshold-value*

Specify the change in reserved bandwidth to trigger IGP update. (is capped at 20% of link bandwidth).

If the threshold-value is configured to greater than 20% of bandwidth on that link, the threshold-value is capped at 20% of bandwidth.

For instance, if bandwidth on an interface is 1Gbps, and the `threshold-value` is configured greater than 200Mbps, the `threshold-value` is capped at 200Mbps. The *threshold-percent* is displayed as 20.000% and the `threshold-value` as 200Mbps.

**NOTE**: The two options, *threshold-percent* and `threshold-value`, are mutually exclusive. You can configure only one option at a given point in time to generate an IGP update for lower bandwidth reservations. As a result, when one option is configured, the other option is calculated and displayed on the CLI.

For instance, on a link of 1Gbps, if the *threshold-percent* is configured to 5%, the `threshold-value` is calculated and displayed as 50Mbps. Similarly, if the `threshold-value` is configured to 50m, then the *threshold-percent* is calculated and displayed as 5%.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

`threshold-value` option introduced in Junos OS Release 19.4R1 on all platforms.

# allow-subnet-mismatch

**IN THIS SECTION**

- Syntax | **2857**
- Hierarchy Level | **2858**
- Description | **2858**
- Default | **2858**
- Required Privilege Level | **2858**
- Release Information | **2858**

## Syntax

```
allow-subnet-mismatch;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp interface interface-name],
[edit protocols ldp interface interface-name]
```

### Description

Ignore the LDP subnet check. For Junos OS Release 8.4 and later releases, an LDP source address subnet check was added for the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address.

### Default

The source address in the LDP link hello packet is matched against the interface address.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.3.

```

## Description

Configure an authentication algorithm type.

**NOTE**: Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha- 256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as hmac-sha-256-128 and hmac-md5-96 on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as hmac-md5-96 on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.

- When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication- algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal` *`proposal-name`*`]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication- algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal` *`proposal-name`*`]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is hmac-md5-96 and not the stronger algorithm of hmac-sha-256-128. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the 3des-cbc algorithm is chosen and not the aes-cfb algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, hmac-sha-256-128 is selected as the authentication method.

- You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.

## Options

*algorithm*—Specify one of the following types of authentication algorithms:

- `aes-128-cmac-96`—Cipher-based message authentication code (AES128, 96 bits).
- `hmac-sha-1-96`—Hash-based message authentication code (SHA1, 96 bits).
- `md5`—Message digest 5.
- **Default:** `hmac-sha-1-96`

> **NOTE**: The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.6.

Statement introduced for BGP in Junos OS Release 8.0.

Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.

Statement introduced for BMP in Junos OS Release 13.3.

# authentication-key (Protocols LDP)

IN THIS SECTION

- Syntax | 2862
- Hierarchy Level | 2862
- Description | 2862
- Required Privilege Level | 2862
- Release Information | 2863

## Syntax

```
authentication-key md5-authentication-key;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp session address],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp
session address],
[edit protocols ldp session address],
[edit routing-instances routing-instance-name protocols ldp session address]
```

## Description

Configure the MD5 authentication signature. The maximum length of the authentication signature is 69 characters.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

## authentication-key-chain (Protocols LDP)

IN THIS SECTION

- Syntax | 2863
- Hierarchy Level | 2863
- Description | 2864
- Options | 2864
- Required Privilege Level | 2864
- Release Information | 2864

### Syntax

```
authentication-key-chain key-chain;
```

### Hierarchy Level

```
[edit logical-systems name protocols ldp session address],
[edit logical-systems name routing-instances instance-name protocols ldp session address],
[edit protocols ldp session address],
[edit routing-instances instance-name protocols ldp session address]
```

## Description

Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update mechanism for LDP, you cannot commit the `0.0.0.0/allow` statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.

**NOTE**: You must also configure an authentication algorithm using the `authentication-algorithm` statement.

## Options

*key-chain*—Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 8.0.

# auto-targeted-session

IN THIS SECTION

- Syntax | 2865
- Hierarchy Level | 2865
- Description | 2865
- Options | 2865
- Required Privilege Level | 2866
- Release Information | 2866

## Syntax

```
auto-targeted-session {
    maximum-sessions seconds;
    teardown-delay seconds;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit protocols ldp]
```

## Description

Configure session parameters for LDP sessions established with the remote LFA node that are automatically targeted using the loopback addresses. Configure parameters of automatically targeted sessions for remote LFA only.

## Options

**maximum-sessions** *seconds* — Specify the maximum number of auto-targeted LDP sessions allowed. Include this statement to optimize the use of router memory.

- **Default:** 100
- **Range:** 1 through 1000

`teardown-delay` *seconds*

Specify the minimum time period for which the auto-targeted session must be alive before tearing down the auto-targeted LDP sessions to the remote LFA node. Include this statement to prevent rapid route-resolution in case of temporary change in IGP topology.

- **Default:** 90 seconds
- **Range:** 1 through 300 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 14.2.

## bfd-liveness-detection (Protocols LDP)

IN THIS SECTION

- Syntax | **2867**
- Hierarchy Level | **2867**
- Description | **2867**
- Options | **2867**
- Required Privilege Level | **2868**
- Release Information | **2868**

## Syntax

```
bfd-liveness-detection {
    detection-time threshold milliseconds;
    ecmp;
    failure-action {
        remove-nexthop;
        remove-route;
    }
    holddown-interval seconds;
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    minimum-transmit-interval milliseconds;
    multiplier detection-time-multiplier;
    no-adaptation;
    transmit-interval {
        minimum-interval milliseconds;
        threshold milliseconds;
    }
    version (0 | 1 | automatic);
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam],
[edit logical-systems logical-system-name protocols ldp oam fec address],
[edit protocols ldp oam],
[edit protocols ldp oam fec address]
```

## Description

Enable Bidirectional Forwarding Detection (BFD) for all MPLS LSPs or for just a specific LSP.

## Options

`minimum-interval`—Minimum transmit and receive interval.

- **Range:** 50 through 255,000 milliseconds
- **Default:** 50

`minimum-receive-interval`—Minimum receive interval.

- **Range:** 50 through 255,000 milliseconds
- **Default:** 50

`minimum-transmit-interval`—Minimum transmit interval.

- **Range:** 50 through 255,000 milliseconds
- **Default:** 50

`multiplier`—Detection time multiplier.

- **Range:** 50 through 255
- **Default:** 3

The other options are explained separately.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 7.6.

Support for the `bfd-liveness-detection` statement at the `[edit protocols ldp oam fec` *address*`]` hierarchy level and the `ecmp` option added in Junos OS Release 9.0.

Support for the `failure-action` statement with the `remove-nexthop` and `remove-route` options and the `holddown-interval` statement added in Junos OS Release 9.4.

# deaggregate

IN THIS SECTION

- Syntax | 2869
- Hierarchy Level | 2869
- Description | 2869
- Default | 2869
- Options | 2870
- Required Privilege Level | 2870
- Release Information | 2870

## Syntax

```
deaggregate | no-deaggregate;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Control forwarding equivalence class (FEC) deaggregation on the router. The use of the `deaggregate` statement in LDP is a standard practice that we recommend for LDP deployments.

## Default

Deaggregation is disabled on the router.

### Options

`deaggregate`—Deaggregate FECs.

`no-deaggregate`—Aggregate FECs.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring FEC Deaggregation | 1391

## disable (Protocols LDP)

IN THIS SECTION

- Syntax | 2871
- Hierarchy Level | 2871
- Description | 2871
- Default | 2871
- Required Privilege Level | 2871
- Release Information | 2871

## Syntax

```
disable;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp graceful-restart],
[edit logical-systems logical-system-name protocols ldp interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp
interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options graceful-restart],
[edit protocols ldp graceful-restart],
[edit protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp interface interface-name],
[edit routing-instances routing-instance-name routing-options graceful-restart]
```

## Description

Explicitly disable LDP on an interface, or explicitly disable LDP graceful restart.

## Default

LDP is enabled on interfaces configured with the LDP `interface` statement. LDP graceful restart is automatically enabled when graceful restart is enabled under the `[edit routing-options]` hierarchy level.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

# dod-request-policy

IN THIS SECTION

- Syntax | 2872
- Hierarchy Level | 2872
- Description | 2872
- Options | 2873
- Required Privilege Level | 2873
- Release Information | 2873

## Syntax

```
dod-request-policy dod-request-policy-name;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit protocols ldp]
```

## Description

Specify the name of the LDP downstream on demand request policy. The `dod-request-policy` statement performs exact match, as a result, LDP sends label request messages only for those FECs matching in the downstream on demand request policy.

### Options

*dod-request-polcy-name* Specify the name of the downstream on demand request policy.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 12.2.

RELATED DOCUMENTATION

Example: Configuring LDP Downstream on Demand | 1471

## downstream-on-demand

IN THIS SECTION

- Syntax | 2873
- Hierarchy Level | 2874
- Description | 2874
- Required Privilege Level | 2874
- Release Information | 2874

### Syntax

```
downstream-on-demand;
```

### Hierarchy Level

```
[edit logical systems logical-system-name protocols ldp session session-address],
[edit protocols ldp session session-address]
```

### Description

Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 12.2.

RELATED DOCUMENTATION

Example: Configuring LDP Downstream on Demand | 1471

## ecmp

IN THIS SECTION

- Syntax | 2875
- Hierarchy Level | 2875
- Description | 2875
- Required Privilege Level | 2875

Release Information | 2875

## Syntax

```
ecmp;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam bfd-liveness-detection],
[edit logical-systems logical-system-name protocols ldp oam fec address bfd-liveness-detection],
[edit protocols ldp oam bfd-liveness-detection],
[edit protocols ldp oam fec address bfd-liveness-detection]
```

## Description

Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the `ecmp` statement, you must also configure the `periodic-traceroute` statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the `periodic-traceroute` statement at the global hierarchy level (`[edit protocols ldp oam]`) while only configuring the `ecmp` statement for a specific FEC (`[edit protocols ldp oam fec address bfd-liveness-detection]`).

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 8.5.

## failure-action (Protocols LDP)

IN THIS SECTION

- Syntax | 2880
- Hierarchy Level | 2880
- Description | 2881
- Options | 2881
- Required Privilege Level | 2881
- Release Information | 2881

### Syntax

```
failure-action {
    remove-nexthop;
    remove-route;
}
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam bfd-livenesss-detection],
[edit logical-systems logical-system-name protocols ldp oam fec address bfd-livenesss-detection],
[edit protocols ldp oam bfd-livenesss-detection],
[edit protocols ldp oam fec address bfd-livenesss-detection]
```

### Description

Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.

### Options

`remove-nexthop`—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.

`remove-route`—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.4.

# graceful-restart (Protocols LDP)

IN THIS SECTION

- Syntax | 2884
- Hierarchy Level | 2884
- Description | 2884
- Required Privilege Level | 2885
- Release Information | 2885

## Syntax

```
graceful-restart {
    disable;
    helper-disable;
    maximum-neighbor-recovery-time value;
    reconnect-time seconds;
    recovery-time value;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Configure LDP graceful restart on the LDP primary protocol instance or for a specific routing instance.

**NOTE**: When you alter the graceful restart configuration at either the `[edit routing-options graceful-restart]` or `[edit protocols ldp graceful-restart]` hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

## hello-interval (Protocols LDP)

IN THIS SECTION

- Syntax | 2886
- Hierarchy Level | 2886
- Description | 2886
- Options | 2886
- Required Privilege Level | 2886
- Release Information | 2886

## Syntax

```
hello-interval seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp interface interface-name],
[edit logical-systems logical-system-name protocols ldp targeted-hello],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp
interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp
targeted-hello],
[edit protocols ldp interface interface-name],
[edit protocols ldp targeted-hello],
[edit routing-instances routing-instance-name protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp targeted-hello]
```

## Description

Control the LDP timer that regulates how often hello messages are sent. You can control the rate both link hello messages and targeted hello messages are sent depending on the hierarchy level at which you configure the `hello-interval` statement.

## Options

*seconds*—Length of time between transmission of hello packets.

- **Range:** 1 through 65,535 seconds
- **Default:** 5 seconds for link hello messages, 15 seconds for targeted hello messages

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for LDP targeted hellos added in Junos OS Release 9.5.

RELATED DOCUMENTATION

# helper-disable (LDP)

IN THIS SECTION

- Syntax | 2887
- Hierarchy Level | 2887
- Description | 2888
- Default | 2888
- Required Privilege Level | 2888
- Release Information | 2888

## Syntax

```
helper-disable;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp graceful-restart],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp
graceful-restart],
[edit protocols ldp graceful-restart],
[edit routing-instances routing-instance-name protocols ldp graceful-restart]
```

### Description

Disable helper mode for LDP graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart LDP.

### Default

Helper mode is enabled by default on all routing protocols (including LDP) that support graceful restart.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## holddown-interval

IN THIS SECTION

- Syntax | 2889
- Hierarchy Level | 2889
- Description | 2889
- Options | 2889
- Required Privilege Level | 2889
- Release Information | 2889

## Syntax

```
holddown-interval holddown-interval;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam bfd-livenesss-detection],
[edit logical-systems logical-system-name protocols ldp oam fec address bfd-livenesss-detection],
[edit protocols ldp oam bfd-livenesss-detection],
[edit protocols ldp oam fec address bfd-livenesss-detection]
```

## Description

Specify how long the BFD session should be up before adding the route or next hop. Specifying a time of 0 seconds causes the route or next hop to be added as soon as the BFD session comes back up.

## Options

*holddown-interval*—Number of seconds the BFD session should remain up before adding the route or next hop.

- **Default:** 0 seconds
- **Range:** 0 through 65,535 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 9.4.

targeted-hello],
[edit protocols ldp interface interface-name],
[edit protocols ldp targeted-hello],
[edit routing-instances routing-instance-name protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp targeted-hello]
```

## Description

Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the `hold-time` statement.

### Options

*seconds*—Hold-time value.

- **Range:** 1 through 65,535 seconds
- **Default:** 15 seconds for link hello messages, 45 seconds for targeted hello messages

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

Support for LDP targeted hellos added in Junos OS Release 9.5.

## Syntax

```
igp-synchronization holddown-interval seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.

## Options

`holddown-interval` *seconds*—Time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational.

- **Default:** 10 seconds

- **Range:** 10 through 60 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.5.

## ingress-policy

IN THIS SECTION

Syntax | 2896

- Hierarchy Level | 2896
- Description | 2896
- Options | 2896
- Required Privilege Level | 2896
- Release Information | 2897

## Syntax

```
ingress-policy [ ingress-policy-names ];
```

## Hierarchy Level

```
[edit logical-system logical-system-name protocols ldp entropy-label],
[edit logical-system logical-system-name protocols ldp oam],
[edit protocols ldp entropy-label],
[edit protocols ldp oam]
```

## Description

Configure an LDP ingress policy for either the entropy label or Operation, Administration, and Management (*OAM*).

For OAM, configure the ingress policy to choose which forwarding equivalence classes (*FEC*s) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under `[edit protocols ldp oam bfd-liveness-detection]` are applied.

## Options

*ingress-policy-names*—Specify the names of the ingress policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.4.

Statement introduced at the `[edit protocols ldp entropy-label]` hierarchy level in Junos OS Release 14.1.

## make-before-break (LDP)

IN THIS SECTION

- Syntax | 2909
- Hierarchy Level | 2909
- Description | 2909
- Options | 2909

Required Privilege Level | 2910
Release Information | 2910

## Syntax

```
make-before-break {
    timeout seconds;
    switchover-delay seconds;
}
```

## Hierarchy Level

```
[edit protocols ldp]
```

## Description

Configures make before break (MBB) for multicast LDP (MLDP) link protection to ensure minimum packet loss when attempting to signal a new label-switched path (LSP) before tearing down the old LSP path.

## Options

**timeout *seconds*** Specify a value to change a make -before-break timeout for point-to-multipoint LSPs. Even if an MBB acknowledgment is not received for a point-to-multipoint LSP before the specified timeout period expires, the label-switching router (LSR) performs an MBB switchover from the old LSR to the new upstream LSR.

- **Range:** 1 through 300 seconds
- **Default:** 30 seconds

**switchover-delay *seconds*** Specify a value to change switchover delay for a point-to-multipoint LSP from the old LSR to the new upstream LSR. If an MBB acknowledgment is received on a point of local repair (PLR) router, the PLR waits for the specified seconds to switch its upstream LSR from the old LSR to the new LSR.

- **Range:** 1 through 300 seconds
- **Default:** 30 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## mldp-inband-signalling (Protocols Multipoint LDP)

IN THIS SECTION

- Syntax | 2913
- Hierarchy Level | 2914
- Description | 2914
- Required Privilege Level | 2914
- Release Information | 2914

### Syntax

```
mldp-inband-signalling {
    policy policy-name;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim],
[edit protocols pim],
```

## Description

Multipoint LDP (mLDP) in-band signalling lets you carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.

On the label-edge router (LER), enable PIM to use mLDP in-band signaling for the upstream neighbors when the LER does not detect a PIM upstream neighbor. On the egress nodes, configure the MPLS LSP root in the PIM configuration, using the `policy` statement.

When used in conjunction with distributed MLD or distributed IGMP, mLDP inband signalling supports interconnecting separate PIM domains via a MPLS-based core. To enable the inter-working, `chassis network-services enhanced-ip` must be enabled and you need to set the `dynamic-profiles profile-name protocols` *`igmp/mld`* `interface` *`interface-name`* to `distributed`. Enabling this command, `mldp-inband-signalling`, has PIM act as a multipoint LDP inband edge router.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 13.2.

Support added in Junos OS Release 18.2R1 for using this command in conjunction with distributed MLD or distributed IGMP.

## Syntax

```
mofrr-asm-starg;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast stream-protection],
[edit logical-systems logical-system-name routing-options multicast stream-protection],
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]
```

## Description

Enable `mofrr-asm-starg` to include any-source multicast (ASM) for (*,G) joins in the Multicast-only fast reroute (MoFRR).

**NOTE**: `mofrr-asm-starg` applies to IP-PIM only. When enabled for group G, *,G will undergo MoFRR as long as there is no S#,G for Group G. In other words, *,G MoFRR will cease and any old states will be torn down when S#,G is created. Note too, that `mofrr-asm-starg` is not supported for mLDP (since mLDP itself does not support *,G).

In a PIM domain with MoFRR enabled, the default for `stream-protection` is S,G routes only.

Context: Multicast-only fast reroute (MoFRR) can be used to reduce traffic loss in a multicast distribution tree in the event of link down. To employ MoFRR, a downstream router is configured with an alternative path back towards the source, over which it receives a backup live stream of the same multicast traffic. That router propagates the same (S,G) join toward both upstream neighbors in order to create duplicate multicast trees. If a failure is detected on the primary tree, the router switches to the backup tree to prevent packet loss.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 14.1.

```

## Description

When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.

In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The `mofrr-disjoint-upstream-only` statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 14.1.

[edit routing-options multicast stream-protection]
```

## Description

MoFRR is supported on both equal-cost multipath (ECMP) paths and non-ECMP paths. Unicast loop-free alternate (LFA) routes need to be enabled to support MoFRR on non-ECMP paths. LFA routes are enabled with the link-protection statement in the interior gateway protocol (IGP) configuration. When you enable link protection on an OSPF or IS-IS interface, Junos OS creates a backup LFA path to the primary next hop for all destination routes that traverse the protected interface.

In the context of load balancing, MoFRR prioritizes the disjoint backup in favor of load balancing the available paths.

For Junos OS releases before 15.1R7, for both ECMP and Non-ECMP scenarios, the default MoFRR behavior was *sticky* , that is, if the Active link went down, the Active Path selection would give preference to Backup Path for the transition. The Active Path would not follow the unicast selected gateway

Starting in Junos OS Release 15.1R7 however, the default behavior for non-EMCP scenarios is to be *non*sticky, that is, the selection of Active Path strictly follows unicast selected gateway. MoFRR no longer chooses a unicast LFA path to become the MoFRR Active path; only a unicast LFA path can be selected to become MoFRR Backup.

## Default

By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## neighbor (Protocols LDP)

IN THIS SECTION

- Syntax | 2921
- Hierarchy Level | 2921
- Description | 2922
- Options | 2922
- Required Privilege Level | 2922
- Release Information | 2922

### Syntax

```
neighbor neighbor-address;
```

### Hierarchy Level

```
[edit protocols ldp],
```

### Description

Configure an LDP targeted neighbor.

LDP sends a targeted hello message to the configured remote neighbor with a targeted request-send-targeted hello message (T) bit set. If the remote neighbor allows receipt of asymmetric hello messages, or if it is configured with the source address as the targeted neighbor, it responds with a targeted hello message. The receipt of a targeted hello message establishes a targeted adjacency with the remote neighbor as described in RFC 5036. Subsequently, a targeted session is established to the remote neighbor.

### Options

| | |
|---|---|
| `neighbor-address` | IP address of the remote LDP neighbor. |

### Required Privilege Level

routing

### Release Information

Statement introduced in Junos OS Release 14.2R1.

[edit logical-systems logical-system-name protocols ldp]
[edit protocols ldp]
```

## Description

Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

## Options

`fec` *`fec-address`*—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

`lsp-ping-interval` *`seconds`*—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the `ping mpls ldp` command.

- **Default:** 60 seconds
- **Range:** 30 through 3,600 seconds

The remaining statements are explained separately. See CLI Explorer.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 7.6.

`lsp-ping-interval` option introduced in Junos OS Release 9.4.

## p2mp (Protocols LDP)

IN THIS SECTION

- Syntax | 2926
- Hierarchy Level | 2927
- Description | 2927
- Options | 2927
- Required Privilege Level | 2927
- Release Information | 2928

### Syntax

```
p2mp {
    no-rsvp-tunneling;
    recursive;
```

```
    root-address root-address;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Enable point-to-multipoint MPLS LSPs in an LDP-signaled LSP.

## Options

**no-rsvp-tunneling** (Optional) Disable LDP point-to-multipoint LSPs from using RSVP-TE LSPs for tunneling, and use LDP paths instead.

> **NOTE**: The `no-rsvp-tunneling` option is introduced in Junos OS Release 16.1R5, 17.3R1, 17.2R2, 16.2R3, and later releases.

Starting in Junos OS Release 12.3R1, Junos OS provides support for Multipoint LDP (M-LDP) for Targeted LDP (T-LDP) sessions with unicast replication, in addition to link sessions. As a result, the default behavior of M-LDP over RSVP tunneling is similar to unicast LDP. However, because T-LDP is chosen over LDP and link sessions to signal point-to-multipoint LSPs, the `no-rsvp-tunelling` option enables LDP natively throughout the network.

**recursive** (Optional) Configure point-to-multipoint recursive parameters, including `route`.

**root-address *root-address*** (Optional) Specify the root address of the point-to-multipoint LSP.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 11.2.

`no-rsvp-tunneling` option added in Junos OS Release 16.1R5.

[edit logical-systems logical-system-name protocols ldp oam],
[edit logical-systems logical-system-name protocols ldp oam fec fec-address],
[edit protocols ldp oam],
[edit protocols ldp oam fec fec-address]
```

## Description

Enable tracing of forwarding equivalence classes (FECs) for LDP LSPs.

## Options

`disable`—(Optional) Disable tracing for a specific FEC. This option is available at the `[edit protocols ldp oam fec` *`fec-address`* `periodic-traceroute]` and `[edit logical-systems` *`logical-system-name`* `protocols ldp oam fec` *`fec-address`* `periodic-traceroute]` hierarchy levels only.

`exp` *`exp-value`*—(Optional) Specify the class of service to use when sending probes.

- **Default:** 7
- **Range:** 0 through 7

`fanout` *`fanout-value`*—(Optional) Specify the maximum number of next hops to search per node.

- **Default:** 16
- **Range:** 1 though 16

`frequency` *`minutes`*—(Optional) Specify the interval between traceroute attempts.

- **Default:** 60 minutes
- **Range:** 15 through 120 minutes

`paths` *`number-of-paths`*—(Optional) Specify the maximum number of paths to search.

- **Default:** 3
- **Range:** 1 through 255

`retries` *`retry-attempts`*—(Optional) Specify the number of attempts to send a probe to a specific node before giving up.

- **Default:** 3
- **Range:** 1 through 9

`source` *`address`*—(Optional) Specify the IPv4 source address to use when sending probes.

`ttl` *`value`*—(Optional) Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.

- **Default:** 64
- **Range:** 1 through 255

`wait` *`seconds`*—(Optional) Specify the wait interval before resending a probe packet.

- **Default:** 10 seconds
- **Range:** 5 though 15 seconds

# policy (Multicast-Only Fast Reroute)

IN THIS SECTION

- Syntax | 2934
- Hierarchy Level | 2934
- Description | 2934
- Required Privilege Level | 2936
- Release Information | 2936

## Syntax

```
policy policy-name;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast stream-protection],
[edit logical-systems logical-system-name routing-options multicast stream-protection],
[edit routing-instances routing-instance-name routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]
```

## Description

When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.

For example:

```
routing-options {
    multicast {
        stream-protection {
            policy mofrr-select;
```

```
        }
    }
}
policy-statement mofrr-select {
    term A {
        from {
            source-address-filter 225.1.1.1/32 exact;
        }
        then {
            accept;
        }
    }
    term B {
        from {
            source-address-filter 226.0.0.0/8 orlonger;
        }
        then {
            accept;
        }
    }
    term C {
        from {
            source-address-filter 227.1.1.0/24 orlonger;
            source-address-filter 227.4.1.0/24 orlonger;
            source-address-filter 227.16.1.0/24 orlonger;
        }
        then {
            accept;
        }
    }
    term D {
        from {
            source-address-filter 227.1.1.1/32 exact;
        }
        then {
            reject; #MoFRR disabled
        }
    }
    term E {
        from {
            route-filter 227.1.1.0/24 orlonger;
        }
        then accept;
```

```
    }
    ...
}
```

## Syntax

```
policy policy-name;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim mldp-inband-signalling],
[edit protocols pim mldp-inband-signalling]
```

## Description

Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.

On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.

The filter policy is configured at the `[edit policy-options]` hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the `p2mp-lsp-root` policy action.

## Options

*policy-name*—Name of a policy configured at the `[edit policy-options]` hierarchy level.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 13.2.

# prefix-segment-range

IN THIS SECTION

- Syntax | 2941
- Hierarchy Level | 2941
- Description | 2941
- Options | 2942
- Required Privilege Level | 2942
- Release Information | 2942

## Syntax

```
prefix-segment-range prefix-segment-range-name {
    attached;
    domain-wide-flooding;
    no-node-segment;
    size size;
    start-index start-index;
    start-prefix start-prefix;
}
```

## Hierarchy Level

```
[edit logical-systems name routing-instances name routing-options source-packet-routing mapping-
server-entry],
[edit logical-systems name routing-options source-packet-routing mapping-server-entry],
[edit routing-instances name routing-options source-packet-routing mapping-server-entry],
[edit routing-options source-packet-routing mapping-server-entry]
```

## Description

Configure the prefix segment range for the LDP mapping server.

## Options

| | |
|---|---|
| *prefix-segment-range-name* | Name of the prefix segment range. |
| **attached** | (Optional) Set the flag in IS-IS mapping server advertisement to indicate that the prefixes and SIDs advertised in the SID or Label Binding TLV are directly connected to their originators. |
| **domain-wide-flooding** | (Optional) Set an S flag in the IS-IS mapping server advertisement to indicate that the SID or Label Binding TLV is flooded across the entire routing domain. |
| **no-node-segment** | (Optional) Clear the node segment flag in the mapping server prefix segment to indicate that the prefix has originated from a single node. |
| **size** *size* | Size of prefix segment range.<br>• **Range:** 1 through 1024 |
| **start-index** *start-index* | Include start index.<br>• **Range:** 0 through 199999 |
| **start-prefix** *start-prefix* | Include start prefix. |

## Required Privilege Level

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 18.2R1.

`attached`, `domain-wide-flooding`, and `no-node-segment` options introduced in Junos OS Release 19.1R1.

reconnect-time seconds;
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp graceful-restart],
[edit protocols ldp graceful-restart],
[edit routing-instances routing-instance-name protocols ldp graceful-restart]
```

## Description

Specify the length of time required to reestablish a Label Distribution Protocol (LDP) session after graceful restart.

## Options

*seconds*—Time required for reconnection.

- **Range:** 30 through 300
- **Default:** 60 seconds

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 9.1.

# session (Protocols LDP)

IN THIS SECTION

- Syntax | 2946
- Hierarchy Level | 2946
- Description | 2946
- Options | 2947
- Required Privilege Level | 2947
- Release Information | 2947

## Syntax

```
session session-address {
    authentication-algorithm (aes-128-cmac-96 | hmac-sha-1-96 | md5);
    authentication-key authentication-key;
    authentication-key-chain authentication-key-chain;
    downstream-on-demand downstream-on-demand;
    (mtu-discovery | no-mtu-discovery);
    transport-address transport-address;
}
```

## Hierarchy Level

```
[edit logical-systems name protocols ldp],
[edit logical-systems name routing-instances name protocols ldp],
[edit protocols ldp],
[edit routing-instances name protocols ldp]
```

## Description

Configure LDP session parameters by specifying the session destination address.

## Options

**session-address** Session destination address.

**authentication-algorithm** Authentication algorithm name.

- Values:
  - `aes-128-cmac-96`—Cipher-based Message Authentication Code (AES128) (96 bits).
  - `hmac-sha-1-96`—Hash-based Message Authentication Code (SHA1) (96 bits).
  - `md5`—Message Digest 5.

**authentication-key** MD5 authentication key.

**authentication-key-chain** Key chain name.

**downstream-on-demand** Configure downstream on demand label distribution mode.

**mtu-discovery** Enable TCP path MTU discovery.

**no-mtu-discovery** Disable TCP path MTU discovery.

**transport-address** *transport-address* IP address used for TCP sessions to the LDP neighbors that have targeted-LDP adjacencies.

You cannot configure this statement for LDP sessions that have discovered adjacencies.

The transport-address configuration can be rejected at the time of validation, if there is no interface with the configured IP address.

## Required Privilege Level

routing

## Release Information

Statement introduced before Junos OS Release 7.4.

`authentication-algorithm` statement introduced in Junos OS Release 7.6.

transport-address option introduced in Junos OS Releasse 19.1R1 for all platforms.

## session-group

IN THIS SECTION

- Syntax | 2948
- Hierarchy Level | 2948
- Description | 2949
- Options | 2949
- Required Privilege Level | 2950
- Release Information | 2950

### Syntax

```
session-group name {
    authentication-algorithm (aes-128-cmac-96 | hmac-sha-1-96 | md5);
    authentication-key authentication-key;
    authentication-key-chain authentication-key-chain;
    downstream-on-demand;
    (mtu-discovery | no-mtu-discovery);
    transport-address transport-address;
}
```

### Hierarchy Level

```
[edit logical-systems name protocols ldp],
[edit logical-systems name routing-instances name protocols ldp],
```

```
[edit protocols ldp],
[edit routing-instances name protocols ldp]
```

## Description

Specify the prefix address of the aggregated group of LDP neighbors for the remote end of the LDP session.

The `session-group` statement is useful when an LDP neighbor is dynamic; for instance, in the case of remote loop free alternate (LFA), a targeted or indirect LDP neighbor is automatically picked from any of the nodes in the network.

The `session-group` statement can also be used for configuring authentication for a prefix group, as LDP authentication for all sessions or authentication at the interface level is not supported.

The remaining statements are explained separately. See CLI Explorer.

## Options

**name** — Session destination address or prefix length.

**authentication-algorithm** — Authentication algorithm name.

- Values:
  - *aes-128-cmac-96*—Cipher-based Message Authentication Code (AES128) (96 bits)
  - *hmac-sha-1-96*—Hash-based Message Authentication Code (SHA1) (96 bits)
  - *md5*—Message Digest 5

**authentication-key** — MD5 authentication key.

**authentication-key-chain** — Authentication key chain name.

**downstream-on-demand** — Configure downstream on demand label distribution mode.

**mtu-discovery | no-mtu-discovery** — Enable and disable TCP path MTU discovery, respectively.

**transport-address *transport-address*** — IP address used for TCP sessions to the LDP neighbors that have targeted-LDP adjacencies, and fall under the same IP subnet.

You cannot configure this statement for LDP sessions that have discovered adjacencies.

The transport-address configuration can be rejected at the time of validation, if there is no interface with the configured IP address.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 16.1.

`transport-address` option introduced in Junos OS Releasse 19.1R1 for all platforms.

RELATED DOCUMENTATION

Configuring Miscellaneous LDP Properties | 1543

## session-protection

IN THIS SECTION

- Syntax | 2951
- Hierarchy Level | 2951
- Description | 2951
- Options | 2951
- Required Privilege Level | 2951

## Syntax

```
session-protection {
    timeout seconds;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Configure when an LDP session is torn down and resignaled after the router stops receiving hello messages from a neighboring router. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished. The LDP session remains up for the duration specified as long as the routers maintain IP network connectivity.

## Options

`timeout` *seconds*—Time in seconds before the LDP session is torn down and resignaled.

- **Range:** 1 through 65,535 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

# traceoptions (Protocols LDP)

IN THIS SECTION

- Syntax | 2957
- Hierarchy Level | 2957
- Description | 2958
- Default | 2958
- Options | 2958
- Required Privilege Level | 2960
- Release Information | 2960

## Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

Specify LDP protocol-level trace options.

## Default

The default LDP protocol-level trace options are inherited from the routing protocols `traceoptions` statement included at the `[edit routing-options]` hierarchy level.

## Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

`file` *`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **ldp-log**. We recommend that you place LDP tracing output in the file **ldp-log**.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

`flag` *`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `address`—Operation of address and address withdrawal messages
- `binding`—Label-binding operations
- `error`—Error conditions
- `event`—Protocol events
- `initialization`—Operation of initialization messages
- `label`—Operation of label request, label map, label withdrawal, and label release messages
- `notification`—Operation of notification messages
- `nsr-synchronization`— Nonstop active routing synchronization events

- p2mp-nsr-synchronization—Point-to-multipoint nonstop active routing synchronization events
- packets—Equivalent to setting address, initialization, label, notification, and periodic flags (see also the filter flag modifier)
- path—Label-switched path operations
- periodic—Operation of hello and keepalive messages
- route—Operation of route messages
- state—Protocol state transitions

*flag-modifier*—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- detail—Provide detailed trace information.
- disable—Disable this trace flag.
- filter—Filter to apply to this flag. The filter flag modifier can be applied only to the route, path, and binding flags. This flag modifier has the following options:
  - match-on—Match on argument specified. The match-on option has the following suboptions:
    - address—Filter based on the source and destination addresses of packets. Available for the packets flag option only.
    - fec—Filter based on the FEC associated with the traced object.
  - policy *policy-name*—Specify the filter policy.
- receive—Packets being received.
- send—Packets being transmitted.

no-world-readable—(Optional) Prevent all users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*.0. When the *trace-file* again reaches this size, *trace-file*.0 is renamed *trace-file*.1 and *trace-file* is renamed *trace-file*.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable any user to read the log file.

### Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

`match-on address` option for the `filter` flag modifier added in Junos OS Release 10.4.

`nsr-synchronization` and `p2mp-nsr-synchronization` operations for `flag` statement introduced in Junos OS Release 13.3.

## traffic-statistics (Protocols LDP)

IN THIS SECTION

- Syntax | 2963
- Hierarchy Level | 2964
- Description | 2964
- Options | 2964
- Required Privilege Level | 2965
- Release Information | 2965

### Syntax

```
traffic-statistics {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    interval seconds;
    no-penultimate-hop;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit routing-instances routing-instance-name protocols ldp]
```

## Description

LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.

## Options

`file` *filename*—Name of the file to receive the output of the LDP statistics operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

`files` *number*—(Optional) Maximum number of LDP statistics files. When a statistics file named *ldp-stat* reaches its maximum size, it is renamed *ldp-stat*`.0`, then *ldp-stat*`.1`, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you also must include the `size` statement to specify the maximum file size.

`interval` *seconds*—(Optional) Specify the interval at which the statistics are polled and written to the file.

- **Default:** 300 seconds (5 minutes)

`no-penultimate-hop`—(Optional) Do not collect traffic statistics on the penultimate hop router.

`no-world-readable`—(Optional) Prevent all users from reading the log file.

`size` *size*—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named *ldp-stat* reaches this size, it is renamed *ldp-stat*`.0`. When *ldp-stat* again reaches this size, *ldp-stat*`.0` is renamed *ldp-stat*`.1` and *ldp-stat* is renamed *ldp-stat*`.0`. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system

- **Default:** 1 MB

If you specify a maximum file size, you also must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable log file access for all users.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

## transport-address

IN THIS SECTION

- Syntax | 2966
- Hierarchy Level | 2966
- Description | 2966
- Default | 2966
- Options | 2966
- Required Privilege Level | 2967
- Release Information | 2967

## Syntax

```
transport-address (address | interface | router-id);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp],
[edit logical-systems logical-system-name protocols ldp interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols ldp],
[edit protocols ldp],
[edit protocols ldp interface interface-name],
[edit routing-instances routing-instance-name protocols ldp interface interface-name]
```

## Description

Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.

## Default

`router-id`

## Options

***address*** Use the specified IP address as the transport address for the LDP session.

**interface** Use the first IP address on the interface as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the `interface` option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the `router-id` option.

**router-id** Use router identifier as the transport address. Unless otherwise configured, the router identifier is the loopback address.

### Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

*address* option introduced in Junos OS Release 19.1R1 for all platforms.

## Description

Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms. See Configuring VLAN TCC Encapsulation for more details. Non-ethernet media types, SONET and ATM interfaces are only supported. It is expected that the user will have the member links of aggregated ethernet with supported hardware for configuring VLAN TCC encapsulation and no commit check is performed externally for the aggregated ethernet (AE) interfaces.

## Options

`atm-ccc-cell-relay`—Use ATM cell-relay encapsulation.

`atm-ccc-vc-mux`—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`atm-cisco-nlpid`—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-mlppp-llc`—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.

`atm-nlpid`—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-ppp-llc`—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.

`atm-ppp-vc-mux`—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

`atm-snap`—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

`atm-tcc-snap`—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

`atm-tcc-vc-mux`—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the `tcc` family only.

`atm-vc-mux`—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`ether-over-atm-llc`—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

`ether-vpls-over-atm-llc`—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

`ether-vpls-over-fr`—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE**: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

`ether-vpls-over-ppp`—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

`ethernet`—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

`ethernet-ccc`—Use Ethernet CCC encapsulation on Ethernet interfaces.

`ethernet-vpls`—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE**: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

`ethernet-vpls-fr`—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the *802.1p* bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

`frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`frame-relay-ether-type`—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

`frame-relay-ether-type-tcc`—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

`frame-relay-ppp`—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the `ppp` family only.

`frame-relay-tcc`—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the `tcc` family only.

`gre-fragmentation`—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet' s size exceeds the tunnel' s maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

`multilink-frame-relay-end-to-end`—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

multilink-ppp—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

ppp-over-ether—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

ppp-over-ether-over-atm-llc—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

vlan-bridge—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE *802.1Q* tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

vlan-ccc—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

vlan-vci-ccc—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.

vlan-tcc—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the tcc family only.

vlan-vpls—Use Ethernet VLAN encapsulation on VPLS circuits.

vxlan—Use VXLAN data plane encapsulation for EVPN.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

```

## Description

For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.

For SRX Series, specify logical link layer encapsulation.

**NOTE**: Not all encapsulation types are supported on the switches. See the switch CLI.

## Default

`ppp`—Use serial PPP encapsulation.

## Physical Interface Options and Logical Interface Options

For physical interfaces:

**NOTE**: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- `atm-ccc-cell-relay`—Use ATM cell-relay encapsulation.
- `atm-pvc`—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- `cisco-hdlc`—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (`cisco-hdlc-ccc`)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the `ccc` family only.
  - TCC version (`cisco-hdlc-tcc`)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- `cisco-hdlc-ccc`—Use Cisco-compatible HDLC framing on CCC circuits.
- `cisco-hdlc-tcc`—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

- `ethernet-bridge`—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

- `ethernet-over-atm`—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

- `ethernet-tcc`—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- `ethernet-vpls`—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

- `ethernet-vpls-fr`—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the *802.1p* bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

- `ethernet-vpls-ppp`—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

- `ether-vpls-over-atm-llc`—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

- `extended-frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the `ccc` family only.

- `extended-frame-relay-ether-type-tcc`—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

- `extended-frame-relay-tcc`—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

- `extended-vlan-bridge`—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE *802.1Q* VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

- `extended-vlan-ccc`—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the `ccc` family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

- `extended-vlan-tcc`—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- `extended-vlan-vpls`—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

  **NOTE**: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- `flexible-ethernet-services`—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

- `flexible-frame-relay`—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to

configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

- `frame-relay`—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

- `frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have `frame-relay-ccc` encapsulation. When you use this encapsulation type, you can configure the `ccc` family only.

- `frame-relay-ether-type`—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

  **NOTE**: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- `frame-relay-ether-type-tcc`—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- `frame-relay-port-ccc`—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the `ccc` family only.

- `frame-relay-tcc`—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

- `generic-services`—Use generic services encapsulation for services with a hierarchical scheduler.

- `multilink-frame-relay-uni-nni`—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

-

- `ppp`—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the

default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

- `ppp-ccc`—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.
- `ppp-tcc`—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the `tcc` family only.
- `vlan-ccc`—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the `ccc` family only.
- `vlan-vci-ccc`—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to `vlan-vci-ccc`.
- `vlan-vpls`—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

  **NOTE**:

  - Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
  - Starting with Junos OS release 13.3, a commit error occurs when you configure `vlan-vpls` encapsulation on a physical interface and configure `family inet` on one of the logical units. Previously, it was possible to commit this invalid configuration.

For logical interfaces:

- `frame-relay`—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- `multilink-frame-relay-uni-nni`—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- `ppp`—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- `ppp-over-ether`—This encapsulation is used for underlying interfaces of pp0 interfaces.

```

## Description

Configure Layer 2 switching cross-connects. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first.

For Layer 2 switching cross-connects to work, you must also configure MPLS.

## Options

*connection-name*—Connection name (up to 128 characters in Junos 12.3 and later).

`interface` *`interface-name.unit-number`*—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration

### Release Information

Statement introduced before Junos OS Release 7.4.

## l2circuit-control-passthrough

IN THIS SECTION

- Syntax | **2986**
- Hierarchy Level | **2987**
- Description | **2987**
- Default | **2987**
- Required Privilege Level | **2987**
- Release Information | **2987**

### Syntax

```
l2circuit-control-passthrough;
```

## Hierarchy Level

```
[edit forwarding-options]
```

## Description

Configure the device to allow LACP, LLDP, OAM LFM, and OAM CFM packets to cross the Layer 2 circuit. If the `l2circuit-control-passthrough` statement is not configured, LACP, LLDP, OAM LFM, and OAM CFM packets are classified as control packets and are not transmitted across the Layer 2 circuit.

**NOTE**: For MX Series routers, the functionality that the `l2circuit-control-passthrough` command provides is performed automatically.

## Default

By default, this statement is not configured.

## Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 19.3R1 for PTX Series routers.

```

## Description

Apply one or more policies to routes being exported from the routing table into BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

## Options

*policy-names*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

```

## Description

Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the `show route receive-protocol bgp` *`neighbor-address`* `hidden` command. The hidden routes can then be retained or dropped from the routing table by configuring the `keep all | none` statement at the `[edit protocols bgp]` or `[edit protocols bgp group` *`group-name`*`]` hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the `keep all` statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the `keep none` statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

## Options

*`policy-names`*—Name of one or more policies.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

- Options | 3008
- Required Privilege Level | 3009
- Release Information | 3009

### Syntax

```
instance-type type;
```

### Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

## Description

Define the type of routing instance.

## Options

**NOTE**: On ACX Series routers, you can configure only the forwarding, virtual router, and VRF routing instances.

*type*—Can be one of the following:

- `evpn`—(MX 3D Series routers, QFX switches and EX9200 switches)—Enable an Ethernet VPN (EVPN) on the routing instance.
  hierarchy level.
- `evpn-vpws`—Enable an Ethernet VPN (EVPN) Virtual Private Wire Service (VPWS) on the routing instance.
- `forwarding`—Provide support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance. Other instances are used for populating RPD learned routes. For this instance type, there is no one-to-one mapping between an interface and a routing instance. All interfaces belong to the default instance inet.0.
- `l2backhaul-vpn`—Provide support for Layer 2 wholesale VLAN packets with no existing corresponding logical interface. When using this instance, the router learns both the outer tag and inner tag of the incoming packets, when the `instance-role` statement is defined as `access`, or the outer VLAN tag only, when the `instance-role` statement is defined as `nni`.
- `l2vpn`—Enable a Layer 2 VPN on the routing instance. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.
- `layer2-control`—(MX Series routers only) Provide support for RSTP or MSTP in customer edge interfaces of a VPLS routing instance. This instance type cannot be used if the customer edge interface is multihomed to two provider edge interfaces. If the customer edge interface is multihomed to two provider edge interfaces, use the default BPDU tunneling.
- `mac-vrf`—(MX Series and vMX routers; QFX5100, QFX10002-60C, QFX5110, QFX5120, QFX5200, QFX10002, QFX10008, and QFX10016 switches; EX9200 Series switches only) Use this routing instance type to configure multiple customer-specific EVPN instances (EVIs) of type `mac-vrf`, each of which can support a different EVPN service type. This configuration results in customer-specific virtual routing and forwarding (VRF) tables with MAC addresses on each Juniper Networks device that serves as a virtual tunnel endpoint (VTEP) in the EVPN-VXLAN network. This type of routing instance is for EVPN unicast routes only.

- `mpls-forwarding`—(MX Series routers only) Allow filtering and translation of route distinguisher (RD) values in IPv4 and IPv6 VPN address families on both routes received and routes sent for selected BGP sessions. In particular, for Inter-AS VPN Option-B networks, this option can prevent the malicious injection of VPN labels from one peer AS boundary router to another.

- `mpls-internet-multicast`—(EX Series, M Series, MX Series, and T Series routers only) Provide support for ingress replication provider tunnels to carry IP multicast data between routers through an MPLS cloud, using MBGP or next-generation MVPN.

- `no-forwarding`—This is the default routing instance. Do not create a corresponding forwarding instance. Use this routing instance type when a separation of routing table information is required. There is no corresponding forwarding table. All routes are installed into the default forwarding table. IS-IS instances are strictly nonforwarding instance types.

- `virtual-router`—Enable a virtual router routing instance. This instance type is similar to a VPN routing and forwarding instance type, but used for non-VPN-related applications. You must configure the `interface` statement for this type of routing instance. You do not need to configure the `route-distinguisher`, `vrf-import`, and `vrf-export` statements.

- `virtual-switch`—(MX Series routers, EX9200 switches, and QFX switches only) Provide support for Layer 2 bridging. Use this routing instance type to isolate a LAN segment with its Spanning Tree Protocol (STP) instance and to separate its VLAN identifier space.

- `vpls`—Enable VPLS on the routing instance. Use this routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.

- `vrf`—VPN routing and forwarding (VRF) instance. Provides support for Layer 3 VPNs, where interface routes for each instance go into the corresponding forwarding table only. Required to create a Layer 3 VPN. Create a VRF table (*`instance-name`*`.inet.0`) that contains the routes originating from and destined for a particular Layer 3 VPN. For this instance type, there is a one-to-one mapping between an interface and a routing instance. Each VRF instance corresponds with a forwarding table. Routes on an interface go into the corresponding forwarding table. You must configure the `interface`, `route-distinguisher`, `vrf-import`, and `vrf-export` statements for this type of routing instance.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

`virtual-switch` and `layer2-control` options introduced in Junos OS Release 8.4.

`mpls-internet-multicast` option introduced in Junos OS Release 11.1 for the EX Series, M Series, MX Series, and T Series.

`evpn` option introduced in Junos OS Release 13.2 for MX 3D Series routers.

`evpn` option introduced in Junos OS Release 17.3 for the QFX Series.

`forwarding` option introduced in Junos OS Release 14.2 for the PTX Series.

`mpls-forwarding` option introduced in Junos OS Release 16.1 for the MX Series.

`evpn-vpws` option introduced in Junos OS Release 17.1 for MX Series routers.

`mac-vrf` option introduced in Junos OS Release 20.4 for MX Series routers, QFX5100, QFX10002-60C, QFX5110, QFX5120, QFX5200, QFX10002, QFX10008, and QFX10016 switches, and EX9200 Series switches.

Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.

`evpn-vpws` option introduced in cRPD Release 20.3R1.

- Syntax | 3013
- Hierarchy Level | 3014
- Description | 3014
- Required Privilege Level | 3014
- Release Information | 3014

### Syntax

```
link-management {
    peer peer-name {
        address ip-address;
        control-channel control-channel-interface;
        lmp-control-channel control-channel-interface {
            remote-address ip-address;
        }
        lmp-protocol {
            hello-dead-interval milliseconds;
            hello-interval milliseconds;
            passive;
            retransmission-interval milliseconds;
            retry-limit number;
        }
```

```
        te-link te-link-name;
    }
    te-link te-link-name {
        disable;
        interface interface-name {
            disable;
            local-address ip-address;
            remote-address ip-address;
            remote-id id-number;
        }
        local-address ip-address;
        remote-address ip-address;
        remote-id id-number;
    }
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>;
        flag flag <flag-modifier> <disable>;
    }
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols],
[edit protocols]
```

## Description

Enable Link Management Protocol (LMP) on the router.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

LMP Configuration Overview

# lmp-control-channel

IN THIS SECTION

- Syntax | 3015
- Hierarchy Level | 3015
- Description | 3015
- Options | 3015
- Required Privilege Level | 3016
- Release Information | 3016

## Syntax

```
lmp-control-channel control-channel-interface {
    remote-address ip-address;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name protocols link-management peer peer-name],
[edit protocols link-management peer peer-name]
```

## Description

Specify the Link Management Protocol (LMP) control channel interface for the peer.

## Options

*control-channel-interface*—Name of the control channel interface.

The remaining statement is described separately in this chapter.

### Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 8.1.

## route-distinguisher

IN THIS SECTION

- Syntax | 3033
- Hierarchy Level | 3034
- Description | 3034
- Options | 3035
- Required Privilege Level | 3035
- Release Information | 3036

### Syntax

```
route-distinguisher (as-number:id | ip-address:id);
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
l2vpn mesh-group mesh-group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
mesh-group mesh-group-name],
[edit protocols evpn interconnect]
[edit routing-instances routing-instance-name],
[edit routing-instances routing-instance-name protocols evpn interconnect]
[edit routing-instances routing-instance-name protocols l2vpn mesh-group mesh-group-name],
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name]
```

## Description

Specify an identifier attached to a route, enabling you to distinguish to which VPN or virtual private LAN service (VPLS) the route belongs. Each routing instance must have a unique route distinguisher (RD) associated with it. The RD is used to place bounds around a VPN so that the same IP address prefixes can be used in different VPNs without having them overlap. If the instance type is `vrf`, the `route-distinguisher` statement is required.

For Layer 2 VPNs and VPLS, if you configure the `l2vpn-use-bgp-rules` statement, you must configure a unique RD for each PE router participating in the routing instance.

For other types of VPNs, we recommend that you use a unique RD for each provider edge (PE) router participating in specific routing instance. Although you can use the same RD on all PE routers for the same VPN routing instance, if you use a unique RD, you can determine the customer edge (CE) router from which a route originated within the VPN.

For Layer 2 VPNs and VPLSs, if you configure mesh groups, the RD in each mesh group must be unique.

**CAUTION**: We strongly recommend that if you change an RD that has already been configured, or change the routing-instance type from `virtual-router` to `vrf`, make the change during a maintenance window, as follows:

1. Deactivate the routing instance.
2. Change the RD.
3. Activate the routing instance.

This is not required if you are configuring the RD for the first time.

## Options

*as-number*:*number*—*as-number* is an assigned AS number, and *number* is any 2-byte or 4-byte value. The AS number can be from 1 through 4,294,967,295. If the AS number is a 2-byte value, the administrative number is a 4-byte value. If the AS number is 4-byte value, the administrative number is a 2-byte value. An RD consisting of a 4-byte AS number and a 2-byte administrative number is defined as a type 2 RD in RFC 4364 *BGP/MPLS IP VPNs*.

> **NOTE**: In Junos OS Release 9.1 and later, the numeric range for AS numbers is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. All releases of Junos OS support 2-byte AS numbers. To configure an RD that includes a 4-byte AS number, append the letter "L" to the end of the AS number. For example, an RD with the 4-byte AS number 7,765,000 and an administrative number of 1,000 is represented as `77765000L:1000`.
>
> In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS dot notation format of two integer values joined by a period: <*16-bit high-order value in decimal*>.<*16-bit low-order value in decimal*>. For example, the 4-byte AS number of 65,546 in the plain-number format is represented as 1.10 in AS dot notation format.

*number*:*id*—Number and identifer expressed in one of these formats: *16-bit number*.*32-bit identifier* or *32-bit number*.*16-bit identifier*.

*ip-address*:*id*—IP address (*ip-address* is a 4-byte value) within your assigned prefix range and a 2-byte value for the *id*. The IP address can be any globally unique unicast address.

- **Range:** 0 through 4,294,967,295 ($2^{32}$ – 1). If the router you are configuring is a BGP peer of a router that does not support 4-byte AS numbers, you need to configure a local AS number. For more information, see *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview*.

> **NOTE**: For Ethernet VPN (EVPN), an RD that includes zero as the *id* value is reserved for the default EVPN routing instance by default. Because the same RD cannot be assigned for two routing instances, using a *ip-address*:*id* RD for another routing instance (default-switch), where the *id* value is zero, throws a commit error.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced before Junos OS Release 7.4.

## traceoptions (Protocols Link Management)

IN THIS SECTION

- Syntax | 3038
- Hierarchy Level | 3038
- Description | 3039
- Options | 3039
- Required Privilege Level | 3040
- Release Information | 3040

### Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
```

### Hierarchy Level

```
[edit logical-systems logical-system-name protocols link-management],
[edit protocols link-management]
```

## Description

Trace options for the LMP protocol.

## Options

`disable`—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

*`filename`*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.

`files` *`number`*—(Optional) Maximum number of trace files. When a trace file named *`trace-file`* reaches its maximum size, it is renamed *`trace-file`*`.0`, then *`trace-file`*`.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000
- **Default:** 2 files

If you specify a maximum number of files, you must also include the `size` statement to specify the maximum file size.

*`flag`*—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- `all`—Trace all available operations
- `hello-packets`—Trace hello packets on any LMP control channel
- `init`—Output from the initialization messages
- `packets`—Trace all packets other than hello packets on any LMP control channel
- `parse`—Operation of the parser
- `process`—Operation of the general configuration
- `route-socket`—Operation of route socket events
- `routing`—Operation of the routing protocols
- `server`—Server processing operations
- `show`—`show` command servicing operations
- `state`—Trace state transitions of the LMP control channels and traffic engineering links

*flag-modifier*—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- `detail`—Provide detailed trace information
- `receive`—Packets being received
- `send`—Packets being transmitted

`no-world-readable`—(Optional) Prevent all users from reading the log file.

`size` *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file*`.0`. When the *trace-file* again reaches this size, *trace-file*`.0` is renamed *trace-file*`.1` and *trace-file* is renamed *trace-file*`.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *x*`k` to specify KB, *x*`m` to specify MB, or *x*`g` to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 1 MB

If you specify a maximum file size, you must also include the `files` statement to specify the maximum number of files.

`world-readable`—(Optional) Enable log file access for all users.

## Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

Support for `hello-packets`, `packets`, and `state` flags added in Junos OS Release 8.1.

# upstream-label

IN THIS SECTION

- Syntax | 3041
- Hierarchy Level | 3041
- Description | 3041
- Options | 3041
- Required Privilege Level | 3041
- Release Information | 3042

## Syntax

```
upstream-label {
    vlan-id vlan-id;
}
```

## Hierarchy Level

```
[edit protocols mpls label-switched-path lsp-name lsp-attributes]
```

## Description

Specify the upstream label for the bidirectional label-switched path (LSP).

## Options

**vlan-id *vlan-id*** VLAN ID to be used for the Generalized MPLS (GMPLS) VLAN LSP at the ingress provider edge (PE) to customer edge (CE) link.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 14.2.

RELATED DOCUMENTATION

## vrf-target

IN THIS SECTION

- Syntax | 3042
- Hierarchy Level | 3043
- Description | 3043
- Options | 3043
- Required Privilege Level | 3044
- Release Information | 3044

### Syntax

```
vrf-target {
    community;
    auto
    import community-name;
    export community-name;
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
l2vpn mesh-group mesh-group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
mesh-group mesh-group-name],
[edit protocols evpn interconnect],
[edit routing-instances routing-instance-name protocols evpn interconnect],
[edit routing-instances routing-instance-name protocols evpn vni-options],
[edit routing-instances routing-instance-name protocols l2vpn mesh-group mesh-group-name],
[edit routing-instances routing-instance-name protocols vpls mesh-group mesh-group-name],
[edit switch-options]
```

## Description

Specify a virtual routing and forwarding (VRF) target community. If you configure the *community* option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. The purpose of the `vrf-target` statement is to simplify the configuration by allowing you to configure most statements at the `[edit routing-instances]` hierarchy level. In effect, this statement configures a single policy for import and a single policy for export to replace the per-VRF policies for every community.

You can still create more complex policies by explicitly configuring VRF import and export policies using the `import` and `export` options.

## Options

*community*—Community name.

*auto*—Automatically derives the route target (RT). The auto-derived route targets have higher precedence over manually configured RT in vrf-target, vrf-export policies, and vrf-import policies.

**NOTE**: Auto-derived route targets are supported only in virtual switch and EVPN routing instances.

`import` *community-name*—Allowed communities accepted from neighbors.

`export` *community-name*—Allowed communities sent to neighbors.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced before Junos OS Release 7.4.

`auto option` added in Junos OS Release 19.1R1 for MX series.

Support at the following hierarchy levels introduced in Junos OS Release 20.3R1 on QFX Series switches: `[edit protocols evpn interconnect]` and `[edit routing-instances` *`routing-instance-name`* `protocols evpn interconnect]`.

## delegation-cleanup-timeout

IN THIS SECTION

- Syntax | **3047**
- Hierarchy Level | **3048**
- Description | **3048**
- Options | **3048**
- Required Privilege Level | **3048**
- Release Information | **3049**

### Syntax

```
delegation-cleanup-timeout seconds;
```

## Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

## Description

Specify the amount of time (in seconds) that a Path Computation Client (PCC) must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful Path Computation Element (PCE) is disconnected.

**NOTE**: In compliance with *draft-ietf-pce-stateful-pce-09*, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the `lsp-cleanup-timer` must be greater than or equal to the `delegation-cleanup-timeout` for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.

## Options

***seconds*** Time (in seconds) that a PCC must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful PCE is disconnected.

A value of 0 indicates immediate delegation cleanup.

- **Range:** 0 through 2,147,483,647 seconds

  Prior to Junos OS Release 18.4R1, the maximum range value is 600 seconds.

- **Default:** 30 seconds

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

### Release Information

Statement introduced in Junos OS Release 12.3.

Support for PTX Series added in Junos OS Release 14.2.

Support for QFX Series switches added in Junos OS Release 16.1R3.

Support for ACX Series added in Junos OS Release 17.1R1.

## delegation-priority

IN THIS SECTION

- Syntax | 3049
- Hierarchy Level | 3049
- Description | 3050
- Options | 3050
- Required Privilege Level | 3050
- Release Information | 3050

### Syntax

```
delegation-priority priority-number;
```

### Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

## Description

Specify the priority number of the active stateful Path Computation Element (PCE). This value is used by the Path Computation Client (PCC) to elect a PCE to delegate LSPs. No two PCEs can have the same delegation-priority value. The PCC elects the PCE with a lower priority as the main active stateful PCE to delegate LSPs.

## Options

*priority-number* — Priority number of the active stateful PCE.

- **Range:** 1 through 65535
- **Default:** 0 (no priority is set)

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.3.

Support for PTX Series added in Junos OS Release 14.2.

Support for QFX Series switches added in Junos OS Release 16.1R3.

Support for ACX Series added in Junos OS Release 17.1R1.

### Syntax

```
lsp-cleanup-timer seconds;
```

### Hierarchy Level

```
[edit protocols pcep pce pce-id]
[edit protocols pcep pce-group group-id]
```

## Description

Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before deleting any non-delegated Path Computation Element (PCE)-initiated LSPs from the failed PCE after a PCEP session terminates.

**NOTE**: In compliance with *draft-ietf-pce-stateful-pce-09*, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the `lsp-cleanup-timer` must be greater than or equal to the `delegation-cleanup-timeout` for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.

## Options

***seconds*** Time (in seconds) that the PCC must wait before deleting any non-delegated PCE-initiated LSPs from the failed PCE after a PCEP session terminates. Non-delegated PCE-initiated LSPs are deleted immediately.

- **Range:** 0 through 2147483647 seconds
- **Default:** 60

## Required Privilege Level

- Release Information | 3070

## Syntax

```
pce-type {
    active stateful;
}
```

## Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

## Description

Configure the path computation element (PCE) type:

- active—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegated control over their LSPs to the PCE.
- stateful—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update the LSP state. A PCC maintains synchronization with the PCE.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.3.

Support for PTX Series added in Junos OS Release 14.2.

Support for QFX Series switches added in Junos OS Release 16.1R3.

Support for ACX Series added in Junos OS Release 17.1R1.

### Release Information

Statement introduced in Junos OS Release 15.1.

## traceoptions (PCE)

**IN THIS SECTION**

Syntax | 3073

- Hierarchy Level | 3073
- Description | 3073
- Options | 3073
- Required Privilege Level | 3074

## Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag (all | pcep);
    no-remote-trace;
}
```

## Hierarchy Level

```
[edit protocols pcep pce pce-id]
```

## Description

Configure the Path Computation Element Protocol (PCEP) tracing options.

## Options

***filename*** Name of the file to receive the output of the tracing operation. All files are placed in the directory **/var/log**.

**files *number*** (Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Range:** 2 through 1000 files
- **Default:** 2 files.

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

*flag* — Area of path computation client process (pccd) to enable debugging output.

- all—Trace all areas of PCD code.
- pcep—Trace Path Computation Element Protocol (PCEP) operations.

*no-remote-trace* — (Optional) Disable remote tracing options.

*no-world-readable* — (Optional) Allow only certain users to read the log file.

**size** *size* — (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.
- **Range:** 10 KB through the maximum file size supported on your system.
- **Default:** 1 MB.

  If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

*world-readable* — (Optional) Allow any user to read the log file.

## Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

# clear mpls lsp

IN THIS SECTION

- Syntax | 3082
- Syntax (EX and QFX Series Switches) | 3082
- Description | 3083
- Options | 3083
- Required Privilege Level | 3083
- Output Fields | 3084
- Sample Output | 3084
- Release Information | 3084

## Syntax

```
clear mpls lsp
<all>
<autobandwidth>
<counters>
<logical-system (all | logical-system-name)>
<name name>
<optimize | optimize-aggressive>
<path regular-expression>
<statistics>
```

## Syntax (EX and QFX Series Switches)

```
clear mpls lsp
<all>
<autobandwidth>
<name name>
<optimize | optimize-aggressive>
<path regular-expression>
<statistics>
```

## Description

Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

**CAUTION**: This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

## Options

| | |
|---|---|
| **all** | Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs. |
| **autobandwidth** | (Optional) Clear LSP autobandwidth counters. |
| **counters** | (Optional) Reset the flap and the MBB counters to zero. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *name*** | (Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*. |
| **optimize \| optimize-aggressive** | (Optional) Run nonpreemptive optimization or aggressive optimization computation now. |
| **path *regular-expression*** | (Optional) Clear the specific LSP path matching the specified regular expression. |
| **statistics** | (Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (`name` and `path` options) on transit routers. |

## Required Privilege Level

clear

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear mpls lsp all

```
user@host> clear mpls lsp all
```

### Release Information

Command introduced before Junos OS Release 7.4.

clear mpls  container-lsp
<autobandwidth>
<history>
<logical-system (all | logical-system-name)>
<member>
<name name>
<optimize | optimize-aggressive>
<statistics>
```

## Description

Release the routes and states associated with MPLS container label-switched paths (LSPs), and start new LSPs.

## Options

| | |
|---|---|
| **none** | Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs. |
| **autobandwidth** | (Optional) Clear LSP autobandwidth counters. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *name*** | (Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*. |
| **optimize \| optimize-aggressive** | (Optional) Run nonpreemptive optimization or aggressive optimization computation now. |
| **statistics** | (Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (`name` and `path` options) on transit routers. |

## Required Privilege Level

# monitor mpls delay rsvp

IN THIS SECTION

- Syntax | 3090
- Description | 3090
- Options | 3090
- Required Privilege Level | 3091
- Output Fields | 3091
- Sample Output | 3093
- Release Information | 3096

## Syntax

```
monitor mpls delay rsvp lsp-name
<detail>
<count count>
<interval seconds>
<padding-size padding-size>
<traffic-class traffic-class>
```

## Description

Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

## Options

| | |
|---|---|
| *lsp-name* | Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed. |
| **detail** | (Optional) Display detailed output of the LSP delay measurement. |

**count** *count*
(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

- **Default:** 10
- **Range:** 1 through 1000000

**interval** *seconds*
(Optional) Specify in seconds the interval between two successive query messages.

- **Range:** 1 through 255 seconds

**padding-size** *padding-size*
(Optional) Specify the length of padding TLV to be included in the query message.

- **Range:** 0 through 1500

**traffic-class** *traffic-class*
(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

- **Range:** 0 though 7

## Required Privilege Level

view

## Output Fields

Table 39 on page 3091 describes the output fields for the `monitor mpls delay rsvp` command. Output fields are listed in the approximate order in which they appear.

**Table 39: monitor mpls delay rsvp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Current two-way channel delay | Sum of packet delays, excluding the processing time of the remote provider edge (PE) router. | All Levels |
| Current round-trip-time | Total time taken for completing round-trip of packet. | All Levels |

**Table 39: monitor mpls delay rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Best two-way channel delay | Best available two-way channel delay count. | All Levels |
| Worst two-way channel delay | Worst available two-way channel delay count. | All Levels |
| Average two-way channel delay | Average of the available two-way channel delay counts. | All Levels |
| Best round-trip-time | Best available round-trip-time count. | All Levels |
| Worst round-trip-time | Worst available round-trip-time count. | All Levels |
| Average round-trip-time | Average of the available round-trip-time counts. | All Levels |
| Average forward delay variation | Average of the variation in forward delay. | All Levels |
| Average reverse delay variation | Average of the variation in reverse delay. | All Levels |
| DM queries sent | Number of queries sent for delay measurement. | All Levels |
| DM responses received | Number of responses received for delay measurement queries. | All Levels |
| DM queries timedout | Number of timed out queries sent for delay measurement. | All Levels |

**Table 39: monitor mpls delay rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| DM responses dropped due to errors | Number of loss measurement responses dropped due to errors. | All Levels |
| Response code | Status of the messages used for delay measurement. Response code can be one of the following:<br>• `Success`—Successful response code.<br>• `Failed`—Failed response code. | `detail` |
| Querier transmit timestamp | Timestamp on the query message when the message is sent out the ingress PE router (querier). This is done in the hardware before packet is sent out of an interface. | `detail` |
| Responder receive timestamp | Timestamp on the response message when the message is received by the egress PE router (responder). This is done in the hardware before packet is received by an interface. | `detail` |
| Responder transmit timestamp | Timestamp on the query message when the message is sent out the egress PE router (responder). This is done in the hardware before packet is sent out of an interface. | `detail` |
| Querier receive timestamp | Timestamp on the response message when the message is received by the ingress PE router (querier). This is done in the hardware before packet is received by an interface. | `detail` |

## Sample Output

### monitor mpls lsp delay rsvp count

```
user@host> monitor mpls lsp delay rsvp LSP-A count 2
```

```
(1)
Current two-way channel delay           : 44 usecs
Current round-trip-time                 : 3243 usecs
(2)
Current two-way channel delay           : 45 usecs
Current round-trip-time                 : 1752 usecs

Best two-way channel delay              : 44 usecs
Worst two-way channel delay             : 45 usecs
Average two-way channel delay           : 45 usecs
Best round-trip-time                    : 1752 usecs
Worst round-trip-time                   : 3243 usecs
Average round-trip-time                 : 2498 usecs
Average forward delay variation         : 1 usecs
Average reverse delay variation         : 1 usecs

DM queries sent                         : 2
DM responses received                   : 2
DM queries timedout                     : 0
DM responses dropped due to errors      : 0

## monitor mpls loss rsvp

IN THIS SECTION

- Syntax | 3097
- Description | 3097
- Options | 3097
- Required Privilege Level | 3098
- Output Fields | 3098
- Sample Output | 3101

Release Information | 3103

## Syntax

```
monitor mpls loss rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<traffic-class traffic-class>
```

## Description

Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

## Options

***lsp-name*** Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.

**detail** (Optional) Display detailed output of the LSP loss measurement.

**bytes** (Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

> **NOTE**: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

**count *count*** (Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.

- **Default:** 10
- **Range:** 1 through 1000000

**interval** *seconds* — (Optional) Specify in seconds the interval between two successive query messages.

- **Range:** 1 through 255 seconds

**traffic-class** *traffic-class* — (Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

- **Range:** 0 though 7

## Output Fields

Table 40 on page 3098 describes the output fields for the `monitor mpls loss rsvp` command. Output fields are listed in the approximate order in which they appear.

**Table 40: monitor mpls loss rsvp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Current forward loss | Difference between the current forward transmit count and the current forward receive count. | All Levels |
| Current forward loss ratio | Total packet loss (current forward loss divided by current forward transmit count). | All Levels |
| Current forward throughput | Current forward transmit count divided by 1000. | All Levels |
| Current reverse loss | Difference between the current reverse transmit count and the current reverse receive count. | All Levels |

**Table 40: monitor mpls loss rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Current reverse loss ratio | Total packet loss (current reverse loss divided by current reverse transmit count). | All Levels |
| Current reverse throughput | Current reverse transmit count divided by 1000. | All Levels |
| Cumulative forward transmit count | Cumulative forward transmit counter value at the time the loss measurement message was originated. | All Levels |
| Cumulative forward loss | Cumulative forward loss counter value at the time the loss measurement message was originated. | All Levels |
| Average forward loss ratio | Average packet loss (current forward loss divided by current forward transmit count). | All Levels |
| Average forward throughput | Average forward transmit count divided by 1000. | All Levels |
| Cumulative reverse transmit count | Cumulative reverse transmit counter value at the time the loss measurement message was originated. | All Levels |
| Cumulative reverse loss | Difference between the cumulative reverse transmit count and the cumulative reverse receive count. | All Levels |
| Average reverse loss ratio | Average packet loss (average reverse loss divided by average reverse transmit count). | All Levels |
| Average reverse throughput | Average reverse transmit count divided by 1000. | All Levels |

**Table 40: monitor mpls loss rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| LM queries sent | Number of queries sent for loss measurement. | All Levels |
| LM responses received | Number of responses received for loss measurement queries. | All Levels |
| LM queries timedout | Number of timed out queries sent for loss measurement. | All Levels |
| LM responses dropped due to errors | Number of loss measurement responses dropped due to errors. | All Levels |
| Response code | Status of the messages used for loss measurement. Response code can be one of the following:<br>• `Success`—Successful response code.<br>• `Failed`—Failed response code. | `detail` |
| Origin timestamp | Time and date the loss measurement message is originated without any specific format (NTP and PTP). | `detail` |
| Forward transmit count | Forward transmit counter value at the time the loss measurement message was originated. | `detail` |
| Forward receive count | Forward receive counter value at the time the loss measurement message was originated. | `detail` |
| Reverse transmit count | Reverse transmit counter value at the time the loss measurement message was originated. | `detail` |
| Reverse receive count | Reverse receive counter value at the time the loss measurement message was originated. | `detail` |

**Table 40: monitor mpls loss rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Current forward transmit count | Difference between the current forward transit count and the previous forward transit count. | detail |
| Current forward receive count | Difference between the current forward receive count and the previous forward receive count. | detail |
| Current reverse transmit count | Difference between the current reverse transit count and the previous reverse transit count. | detail |
| Current reverse receive count | Difference between the current reverse receive count and the previous reverse receive count. | detail |

## Sample Output

### monitor mpls lsp loss rsvp count

# monitor mpls loss-delay rsvp

IN THIS SECTION

- Syntax | 3104
- Description | 3104
- Options | 3105
- Required Privilege Level | 3105
- Output Fields | 3106
- Sample Output | 3106
- Release Information | 3109

## Syntax

```
monitor mpls loss-delay rsvp lsp-name
<detail>
<bytes>
<count count>
<interval seconds>
<padding-size padding-size>
<traffic-class traffic-class>
```

## Description

Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

## Options

| | |
|---|---|
| *lsp-name* | Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed. |
| **detail** | (Optional) Display detailed output of the LSP delay measurement. |
| **bytes** | (Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.<br><br>**NOTE**: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself. |
| **count** *count* | (Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.<br><br>• **Default:** 10<br><br>• **Range:** 1 through 1000000 |
| **interval** *seconds* | (Optional) Specify in seconds the interval between two successive query messages.<br><br>• **Range:** 1 through 255 seconds |
| **padding-size** *padding-size* | (Optional) Specify the length of padding TLV to be included in the query message.<br><br>• **Range:** 0 through 1500 |
| **traffic-class** *traffic-class* | (Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.<br><br>• **Range:** 0 though 7 |

## ping mpls bgp

IN THIS SECTION

- Syntax | 3110
- Description | 3110
- Options | 3110
- Additional Information | 3111
- Required Privilege Level | 3112
- Output Fields | 3112
- Sample Output | 3112
- Release Information | 3112

## Syntax

```
ping mpls bgp fec
<bottom-label-ttl>
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

## Description

Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a `ping mpls bgp` command.

**NOTE**: The `ping mpls bgp` *fec* command only supports single paths.

## Options

**bottom-label-ttl** (Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.

**count** *count* (Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address* (Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail** (Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class* (Optional) Value of the forwarding class for the MPLS ping packets.

| | |
|---|---|
| ***fec*** | Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length. |
| **instance** ***routing-instance-name*** | (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP. |
| **logical-system (all \|** ***logical-system-name*****)** | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| **size** ***bytes*** | (Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum. |
| **source** ***source-address*** | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

### Required Privilege Level

network

### Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (**!**) indicates that an echo reply was received. A period (**.**) indicates that an echo reply was not received within the timeout period. An **x** indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

### Sample Output

#### ping mpls bgp fec count

```
user@host> ping mpls bgp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70% packet loss 4
packets received with error status, not counted as received.
```

### Release Information

Command introduced in Junos OS Release 11.1.

## ping mpls lsp-end-point

**IN THIS SECTION**

- Syntax | **3113**
- Description | **3113**
- Options | **3113**
- Additional Information | **3114**
- Required Privilege Level | **3115**

- Output Fields | **3115**
- Sample Output | **3115**
- Release Information | **3115**

## Syntax

```
ping mpls lsp-end-point prefix-name
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

## Description

Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a `ping mpls` command.

## Options

**count *count*** (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

**destination *address*** (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

**detail** (Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class*** (Optional) Value of the forwarding class for the MPLS ping packets.

| | |
|---|---|
| **instance** *routing-instance-name* | (Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| *prefix-name* | LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address. |
| **size** *bytes* | (Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is `88` bytes. If the endpoint is RSVP-based, the minimum size of the packet is `100` bytes. The maximum size in either case is `65468` bytes. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls lsp-end-point detail

```
user@host> ping mpls lsp-end-point 10.255.245.119 detail
Route to end point address is via LDP FEC
Request for seq 1, to interface 67, label 100032
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 67, label 100032
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 67, label 100032
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 67, label 100032
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 67, label 100032
Reply for seq 5, return code: Egress-ok
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## Release Information

Command introduced before Junos OS Release 7.4.

The size and sweep options were introduced in Junos OS Release 9.6.

The instance option was introduced in Junos OS Release 10.0.

# ping mpls l2circuit

IN THIS SECTION

- Syntax | 3116
- Description | 3116
- Options | 3117
- Additional Information | 3118
- Required Privilege Level | 3118
- Output Fields | 3118
- Sample Output | 3119
- Release Information | 3119

## Syntax

```
ping mpls  l2circuit (interface interface-name | virtual-circuit virtual-circuit-id
neighbor address)
<count count>
<destination address>
<detail>
<exp forwarding-class>
<logical-system (all | logical-system-name)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size bytes>
<source source-address>
<sweep>
<v1>
```

## Description

Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a `ping mpls l2circuit` command.

**NOTE**: This command is not supported on EX4500 and EX4550 switches.

## Options

**count *count***
(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

**destination *address***
(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

**detail**
(Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class***
(Optional) Value of the forwarding class for the MPLS ping packets.

**interface *interface-name***
Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

**logical-system (all | *logical-system-name*)**
(Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode**
(Optional) Reply mode for the ping request. This option has the following suboptions:

- **application-level-control-channel** — Reply using an application level control channel.
- **ip-udp** — Reply using an IPv4 or IPv6 UDP packet.
- **no-reply** — Do not reply to the ping request.

**NOTE**: The `reply-mode` option and its suboptions `application-level-control-channel`, `ip-udp`, and `no-reply` are also available in Junos OS Release 10.2R4 and 10.3R2.

**size *bytes***
(Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes.

| | |
|---|---|
| | If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |
| **v1** | (Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV). |
| **virtual-circuit** *virtual-circuit-id* **neighbor** *address* | Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches. |

## Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period ( `.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

### ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

### ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `reply-mode` option and its suboptions are introduced in Junos OS Release 10.4R1.

# ping mpls l2vpn

- Options | 3121
- Additional Information | 3122
- Required Privilege Level | 3122
- Output Fields | 3122
- Sample Output | 3122
- Release Information | 3123

## Syntax

```
ping mpls l2vpn (instance instance-name   local-site-id local-site-id-number remote-site-id
remote-site-id-number | interface interface-name)
<bottom-label-ttl>
<count count>
<destination address>
<detail>
<exp forwarding-class>
<logical-system (all | logical-system-name)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size bytes>
<source source-address>
<sweep>
```

## Description

Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a `ping mpls l2vpn` command.

## Options

**bottom-label-ttl** (Optional) Display the time-to-live value for the bottom label in the label stack.

**count *count*** (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through 1,000,000. The default value is `5`.

**destination *address*** (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

**detail** (Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class*** (Optional) Value of the forwarding class for the MPLS ping packets.

**instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number*** Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

**interface *interface-name*** Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

**logical-system (all | *logical-system-name*)** (Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode** (Optional) Reply mode for the ping request. This option has the following suboptions:

- **application-level-control-channel** Reply using an application level control channel.
- **ip-udp** Reply using an IPv4 or IPv6 UDP packet.
- **no-reply** Do not reply to the ping request.

The `reply-mode` option and its suboptions `application-level-control-channel`, `ip-udp`, and `no-reply` are also available in Junos OS Release 10.2R4 and 10.3R2.

**size *bytes*** (Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes.

| | |
|---|---|
| | If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l2vpn instance

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l2vpn instance detail

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail
Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l2vpn interface <interface-name> reply-mode

```
user@host> ping mpls l2vpn interface lt-1/2/0.21 reply-mode ip-udp
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `reply-mode` option and its suboptions are introduced in Junos OS Release 10.4R1.

# ping mpls l3vpn

- Output Fields | 3126
- Sample Output | 3126
- Release Information | 3127

## Syntax

```
ping mpls l3vpn prefix prefix-name
<l3vpn-name>
<bottom-label-ttl>
<count count>
<destination address>
<detail>
<exp forwarding-class>
<logical-system (all | logical-system-name)>
<size bytes>
<source source-address>
<sweep>
```

## Description

Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a `ping mpls l3vpn` command.

## Options

| | |
|---|---|
| **bottom-label-ttl** | (Optional) Display the time-to-live value for the bottom label in the label stack. |
| **count** *count* | (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`. |
| **destination** *address* | (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet. |
| **detail** | (Optional) Display detailed information about the echo requests sent and received. |
| **exp** *forwarding-class* | (Optional) Value of the forwarding class for the MPLS ping packets. |
| *l3vpn-name* | (Optional) Layer 3 VPN name. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| **prefix** *prefix-name* | Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch. |
| **size** *bytes* | (Optional) Size of the label-switched path (LSP) ping request packet (`96` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the `ping mpls l3vpn` command does not work.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l3vpn

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l3vpn detail

```

```

### Release Information

Command introduced before Junos OS Release 7.4.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

## request mpls container-lsp

**IN THIS SECTION**

- Syntax | **3127**
- Description | **3127**
- Options | **3128**
- Required Privilege Level | **3128**
- Output Fields | **3128**
- Sample Output | **3128**
- Release Information | **3128**

### Syntax

```
request  mpls container-lsp
<logical-system (all | logical-system-name)>
<name lsp-name>
<adjust-autobandwidth>
<normalization>
```

### Description

Manually trigger a bandwidth allocation adjustment for the container label-switched path (LSP).

## Options

| | |
|---|---|
| **none** | Manually trigger a bandwidth allocation adjustment for all active member LSP paths. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *lsp-name*** | (Optional) Manually trigger a bandwidth allocation adjustment on the specified member LSP only. |
| **adjust-autobandwidth** | (Optional) Request LSP autobandwidth adjustment. |
| **normalization** | (Optional) Request container LSP normalization. |

## Required Privilege Level

clear, maintenance

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request mpls container-lsp

```
user@host> request  mpls container-lsp lsp-name normalize
```

### request mpls container-lsp

```
user@host> request  mpls container-lsp normalize bandwidth bps
```

## Release Information

Command introduced in Junos OS Release 14.2.

Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

RELATED DOCUMENTATION

clear mpls container-lsp | 3084

# request mpls lsp adjust-autobandwidth

IN THIS SECTION

- Syntax | 3129
- Syntax (EX and QFX Series Switches) | 3129
- Description | 3130
- Options | 3130
- Additional Information | 3130
- Required Privilege Level | 3130
- Output Fields | 3130
- Sample Output | 3131
- Release Information | 3131

## Syntax

```
request mpls lsp adjust-autobandwidth
<logical-system (all | logical-system-name)>
<name lsp-name>
```

## Syntax (EX and QFX Series Switches)

```
request mpls lsp adjust-autobandwidth
<name lsp-name>
```

## Description

Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).

Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.

During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as *make-before-break*.

## Options

| | |
|---|---|
| **none** | Manually trigger a bandwidth allocation adjustment for all active LSP paths. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *lsp-name*** | (Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only. |

## Additional Information

For this command to work properly, the following conditions must exist:

- Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the `request mpls lsp adjust-autobandwidth` command.
- The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.

## Required Privilege Level

clear, maintenance

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request mpls lsp adjust-auto-bandwidth

```
user@host> request mpls lsp adjust-auto-bandwidth
```

### Release Information

Statement introduced before Junos OS Release 7.4.

## Output Fields

Table 41 on page 3134 describes the output fields for the `show connections` command. Output fields are listed in the approximate order in which they appear.

**Table 41: show connections Output Fields**

| Field Name | Field Description |
|---|---|
| `CCC and TCC connections [Link Monitoring On I Off]` | Whether link monitoring is enabled: **On** or **Off**. |
| **Legend for Status (St)** | Connection or circuit status. See the output's legend for an explanation of the status field values. |
| **Legend for connection types** | Type of connection:<br>• **if-sw**—Layer 2 switching cross-connect.<br>• **rmt-if**—Remote interface switch. While graceful restart is in progress, **rmt-if** will display a state **(St)** of **Restart**.<br>• **lsp-sw**—LSP stitching cross-connect. While graceful restart is in progress, **lsp-sw** will display a state **(St)** of **Restart**. |
| **Legend for circuit types** | Type of circuits:<br>• **intf**—Interface circuit.<br>• **tlsp**—Transmit LSP circuit.<br>• **rlsp**—Receive LSP circuit. |
| **Connection/Circuit** | Name of the configured CCC connection. |
| **Type** | Type of connection. |
| **St** | State of the connection. |
| **Time last up** | Time that the connection or circuit last transitioned to the **Up** (operational) state. |

**Table 41: show connections Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **# Up trans** | Number of times that the connection or circuit has transitioned to the **Up** (operational) state. |

## Sample Output

### show connections

# show dynamic-tunnels database

IN THIS SECTION

- Syntax | 3136
- Description | 3136
- Options | 3136
- Required Privilege Level | 3137
- Output Fields | 3137
- Sample Output | 3138
- Release Information | 3141

## Syntax

```
show dynamic-tunnels database
<destination>
<logical-system (all | logical-system-name) >
<table routing-table-name>
```

## Description

Display dynamic tunnel database information.

## Options

| | |
|---|---|
| **none** | Display dynamic tunnel database information for all destinations and routing tables. |
| ***destination*** | (Optional) Display database entries for the specified IP address (with optional destination prefix length) only. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **table *routing-table-name*** | (Optional) Display database entries for the specified table only. |

## Output Fields

Table 42 on page 3137 lists the output fields for the `show dynamic-tunnels database` command. Output fields are listed in the approximate order in which they appear.

**Table 42: show dynamic-tunnels database Output Fields**

| Field Name | Field Description |
|---|---|
| `Table` | Name of the routing table (for example, `inet.0`). |
| `Destination-network` | Destination IP address and subnet. |
| `Tunnel to` | Destination IP address and prefix of the tunnel. |
| `State` | State of the tunnel: `Up`, `Up (expires in` *nn*:*nn*:*nn*`seconds)`, or `Dn` (down). |
| `Reference count` | Number of routes across the dynamic tunnel that are currently being resolved. |
| `Next-hop type` | Type of tunnel: GRE or UDP (BGP-Signal).<br>• GRE or UDP (BGP signal)<br>• SRTE—Segment routing traffic-engineered LSP. |
| `Source address` | Source IP address of the tunnel. |
| `Next-hop` | IP address of the destination interface. |
| VPN Label | The label provided by the peer device to identify the VPN through which the packet needs to go. This label is used to identify the VRF for route lookup. |

**Table 42: show dynamic-tunnels database Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Ingress Route | The IGP route along with the corresponding metric that has been selected for forwarding the tunnel-encapsulated packet. |
| `Localized PFE` | Packet Forwarding Engine interface which is the anchor Packet Forwarding Engine for the localized next-hop-based dynamic tunnels.<br><br>When the anchor Packet Forwarding Engine of the tunnel goes down, it is represented by a `#` near the Packet Forwarding Engine name. |
| LSP template name | Name of the segment routing traffic-engineered template configured for dynamic creation of segment routing LSPs. |
| `State` | State of the destination interface: `Up`, `Dn`, or `Dn (no tunnel pic)`. |
| Status | Status of the dynamic segment routing LSP. |

## Sample Output

### show dynamic-tunnels database (Tunnel Is Up)

```
user@host> show dynamic-tunnels database
Table: inet.3

## Output Fields

Table 43 on page 3142 describes the output fields for the `show link-management` command. Output fields are listed in the approximate order in which they appear.

**Table 43: show link-management Output Fields**

| Field Name | Field Description |
|---|---|
| **Peer Name** | Name of the peer. |
| **System identifier** | Internal identifier for the peer. The range of values is **0** through **64,000**. |
| **State** | State of the peer: **Up** or **Down**. |
| **Control address** | Address to which a control channel is established. |
| **CC local ID** | Identifier assigned to the control channel by the local peer. The range of values is **1** through **4,294,967,296**. |
| **CC remote ID** | Identifier assigned to the control channel by the remote peer. The range of values is **1** through **4,294,967,296**. |
| **State** | State of the control channel: **Up** or **Down**. |
| **TxSeqNum** | Sequence number of the hello message being sent to the peer. The range of values is **1** through **4,294,967,295**. |
| **RcvSeqNum** | Sequence number of the last hello message received from the peer. The range of values is **0** through **4,294,967,295.** |
| **Flags** | Code that provides information about the control channel. Currently supports only code value **R**, which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts. |

**Table 43: show link-management Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **TE links** | Traffic-engineered links that are managed by their peer. |
| **TE link name** | Name of the traffic-engineered link. |
| **State** | State of the traffic-engineered link: **Up**, **Down**, or **Init**. |
| **Local identifier** | Identifier of the local side of the link. |
| **Remote identifier** | Identifier of the remote side of the link. |
| **Local address** | Address of the local side of the link. |
| **Remote address** | Address of the remote side of the link. |
| **Encoding** | Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET, Ethernet**, **Packet**, and **PDH**. |
| **Switching** | Type of switching that can be performed on the traffic-engineered link. Supported values are **PSC-1** and **Packet**. |
| **Minimum bandwidth** | Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps). |
| **Maximum bandwidth** | Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps). |
| **Total bandwidth** | Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link. |

**Table 43: show link-management Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Available bandwidth** | Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps). |
| **Name** | Name of the interface. |
| **State** | State of the interface: **Up** or **Down**. |
| **Local ID** | Identifier of the local side of the interface. |
| **Remote ID** | Identifier of the remote side of the interface. |
| **Bandwidth** | Bandwidth, in bps or Mbps, of the member interface. |
| **Used** | Whether the resource is allocated to an LSP: **Yes** or **No**. |
| **LSP-name** | LSP name. |

## Sample Output

### show link-management

## Output Fields

Table 44 on page 3146 describes the output fields for the `show link-management peer` command. Output fields are listed in the approximate order in which they appear.

**Table 44: show link-management peer Output Fields**

| Field Name | Field Description |
|---|---|
| **Peer Name** | Name of the peer. |
| **System identifier** | Internal identifier for the peer. The range of values is **0** through **64,000**. |
| **State** | State of the peer: **Up** or **Down**. |
| **Control address** | Address to which a control channel is established. |

**Table 44: show link-management peer Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Hello interval** | How often the routing device sends Link Management Protocol (LMP) hello packets. |
| **Hello dead interval** | How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up. |
| **CC local ID** | Identifier assigned to the control channel by the local peer. The range of values is **1** through **4,294,967,296**. |
| **CC remote ID** | Identifier assigned to the control channel by the remote peer. The range of values is **1** through **4,294,967,296**. |
| **State** | State of the control channel: **Up** or **Down**. |
| **TxSeqNum** | Sequence number of the hello message being sent to the peer. The range of values is **1** through **4,294,967,295**. |
| **RcvSeqNum** | Sequence number of the last hello message received from the peer. The range of values is **0** through **4,294,967,295.** |
| **Flags** | Code that provides information about the control channel. Currently supports only code value **R**, which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts. |
| **TE links** | Traffic-engineered links that are managed by their peer. |

## Output Fields

Table 45 on page 3150 describes the output fields for the `show link-management routing` command. Output fields are listed in the approximate order in which they appear.

**Table 45: show link-management routing Output Fields**

| Field Name | Field Description |
|---|---|
| **Peer Name** | Name of the peer. |
| **System identifier** | Internal identifier for the peer. The range of values is **0** through **64,000**. |
| **State** | State of the peer: **Up** or **Down**. |
| **Control address** | Address to which a control channel is established. |
| **Control channel** | Interface over which control packets are sent. |
| **State** | State of the control channel. |
| **TE link name** | Traffic-engineered link name. |
| **State** | State of the traffic-engineered link: **Up** or **Down**. |
| **Local identifier** | Identifier of the local side of the link. |
| **Remote identifier** | Identifier of the remote side of the link. |
| **Local address** | Address of the local side of the link. |
| **Remote address** | Address of the remote side of the link. |
| **Encoding** | Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET**, **Ethernet**, and **Packet**. |
| **Minimum bandwidth** | Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link. |

**Table 45: show link-management routing Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Maximum bandwidth** | Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps). |
| **Total bandwidth** | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link. |
| **Available bandwidth** | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated. |
| **Resource** | Forwarding adjacency LSP information. |
| **Type** | Type of resource. The type is always a forwarding adjacency LSP. |
| **State** | State of the LSP: **Up** or **Down**. |
| **System Identifier** | Internal identifier for the peer. The range of values is **0** through **64,000**. |
| **Total bandwidth** | Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process. |
| **Traffic parameters** | • **Encoding**—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include **SDH/SONET**, **Ethernet**, and **Packet**.<br>• **Switching**—Type of switching that can be performed on the traffic-engineered link: **PSC-1** and **Packet**.<br>• **Granularity**—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always **unknown**. |

## Sample Output

### show link-management routing

```
user@host> show link-management routing

## Output Fields

Table 46 on page 3154 describes the output fields for the `show link-management statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 46: show link-management statistics Output Fields**

| Field Name | Field Description |
|---|---|
| **Received packets** | Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |

**Table 46: show link-management statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Received bad packets** | Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |
| **Small packets** | Number of packets that are too small. |
| **Wrong protocol version** | Number of packets specifying the wrong LMP version. |
| **Messages for unknown peer** | Number of packets destined for an unknown peer. |
| **Messages for bad state** | Number of packets indicating a state that does not match the recipient. |
| **Stale acknowledgments** | Number of **configAck** and **LinkSummaryAck** packets received that have a stale message ID. |
| **Stale negative acknowledgments** | Number of **configNack** and **LinkSummaryNack** packets received that have a stale message ID. |
| **Sent packets** | Number of sent packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |
| **Retransmitted packets** | Number of retransmitted packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |

**Table 46: show link-management statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Dropped packets** | Number of packets sent, by message type, that have been dropped by the receiver after the LMP retransmission interval has been exceeded. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |

## Sample Output

### show link-management statistics

```
user@host> show link-management statistics peer pro4-a
Statistics for peer pro4-a
    Received packets
        Config: 1
        Hello: 2572
    Small packets: 0
    Wrong protocol version: 0
    Messages for unknown peer: 0
    Messages for bad state: 0
    Stale acknowledgments: 0
    Stale negative acknowledgments: 0
    Sent packets
        Config: 2
        ConfigAck: 1
        Hello: 2572
    Retransmitted packets
        Config: 1
```

## Syntax

```
show mpls association (iif incoming-interface | oif outgoing-interface)
<logical-system (all | logical-system-name)>
```

## Description

Display the Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) based on the association with an incoming or outgoing LSP interface. The command output displays the list of RSVP-TE LSPs carrying traffic in and out of the same interface.

## Options

| | |
|---|---|
| **iif** *incoming-interface-name* | Display list of RSVP-TE LSPs that share the specified incoming interface to bring in traffic. This option works on transit label-switching routers (LSRs) and egress label edge routers (LERs). |
| **oif** *outgoing-interface-name* | Display list of RSVP-TE LSPs that share the specified outgoing interface to carry out traffic. This option works on ingress LERs and transit LSRs. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## show mpls call-admission-control

IN THIS SECTION

- Syntax | 3168
- Syntax (EX Series Switches) | 3169
- Description | 3169
- Options | 3169
- Additional Information | 3169
- Required Privilege Level | 3169
- Output Fields | 3169
- Sample Output | 3170
- Release Information | 3171

### Syntax

```
show mpls call-admission-control
<instance instance-name>
<logical-system (all | logical-system-name)>
<lsp-name>
```

## Syntax (EX Series Switches)

```
show mpls call-admission-control
<lsp-name>
```

## Description

Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.

## Options

| | |
|---|---|
| **none** | Display CAC information for all LSPs. |
| **instance** *instance-name* | (Optional) Display MPLS LSP CAC information for the specified instance. If *instance-name* is omitted, MPLS LSP CAC information for the master instance is displayed. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| *lsp-name* | (Optional) Display CAC information for the specified LSP only. |

## Additional Information

The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.

## Required Privilege Level

view

## Output Fields

Table 51 on page 3170 describes the output fields for the `show mpls call-admission-control` command. Output fields are listed in the approximate order in which they appear.

**Table 51: show mpls call-admission-control Output Fields**

| Field Name | Field Description |
|---|---|
| **Available bandwidth** | Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at **ct0**) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type. |
| **Layer2 connections** | Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path. |
| **LSP name** | LSP pathname. |
| **Neighbor address** | Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits. |
| **Circuit** | Interface name and circuit information. |
| **Primary** | LSP's primary standby path. |
| **Standby** | LSP's secondary standby path. |
| **VC bandwidth** | Bandwidth constraints associated with a Layer 2 circuit route. |

## Sample Output

### show mpls call-admission-control

## Syntax

```
show mpls container-lsp
<brief | detail | extensive | terse>
<count-active-routes>
<defaults>
<descriptions>
<down | up>
<egress>
<ingress>
<logical-system (all | logical-system-name)>
<name name>
<statistics>
<transit>
<unidirectional>
```

## Description

Display information about configured and active Multiprotocol Label Switching (MPLS) container label-switched paths (LSPs).

## Options

| | |
|---|---|
| **none** | Display standard information about all configured and active member LSPs of the container LSP. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events. |
| **count-active-routes** | (Optional) Show active routes for the container LSP. |
| **defaults** | (Optional) Display the default settings of the container LSP. |
| **descriptions** | (Optional) Display the container LSP descriptions. To view this information, you must configure the description statement at the `[edit protocol mpls container-lsp]` hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages. |
| **down \| up** | (Optional) Display only LSPs that are inactive or active, respectively. |
| **egress** | (Optional) Display the LSPs ending at this device. |
| | **NOTE**: The `egress` option displays all the LSPs including regular LSPs, members of container LSPs, and transit LSPs. This is an expected behavior for all platforms. |
| **ingress** | (Optional) Display the member LSPs originating from this device. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *name*** | (Optional) Display information about the specified LSP or group of LSPs. |
| **statistics** | (Optional) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet. |
| **transit** | (Optional) Display LSPs transiting this routing device. |
| **unidirectional** | (Optional) Display unidirectional LSP information. |

## Required Privilege Level

## Output Fields

Table 52 on page 3174 describes the output fields for the `show mpls container-lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 52: show mpls container-lsp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Ingress LSP` | Information about the member LSPs on the ingress routing device. Each LSP has one line of output. | All levels |
| `Container LSP name` | Name of the container LSP. | All levels |
| `Member LSP count` | Number of member LSPs in the container LSP. | All levels |
| `To` | Destination (egress routing device) of the session. | brief |
| `From` | Source (ingress routing device) of the session. | brief detail |
| `State` | State of the LSP handled by this RSVP session:<br>• `Up`<br>• `Dn` (down)<br>• `Restart` | brief detail |
| `Rt` | Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0). | brief |

**Table 52: show mpls container-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| P | Path. An asterisk (*) underneath this column indicates that the LSP is a primary path. | brief |
| ActivePath | (Ingress LSP) Name of the active path: Primary or Secondary. | detail extensive |
| LSPname | Name of the member LSP. | brief detail |
| Egress LSP | Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output. | All levels |
| Transit LSP | Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. | All levels |
| Min LSPs | Minimum number of member LSPs.<br>Default: 1 | extensive |
| Max LSPs | Number of member LSPs that the container LSP can have at maximum.<br>Default: 64 (due to ECMP limit) | extensive |
| Aggregate bandwidth | Sum of the bandwidths of all member LSPs. | extensive |
| NormalizeTimer | Duration between two normalization events.<br>When not configured, 21600 seconds (6 hours) is set as the default value. | extensive |

**Table 52: show mpls container-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `NormalizeThreshold` | Change in aggregate LSP utilization to trigger splitting or merging expressed in percentage. | extensive |
| `Max Signaling BW` | Maximum bandwidth used to signal LSPs after a normalization event.<br><br>Default value is 0 bps. When not configured, the value is inherited from the splitting bandwidth configuration.<br><br>**NOTE**: Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the maximum signaling bandwidth threshold. | extensive |
| `Min Signaling BW` | Minimum bandwidth used to signal LSPs after a normalization event.<br><br>Default value is 0 bps. When not configured, the value is inherited from the merging bandwidth configuration.<br><br>**NOTE**: Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the minimum signaling bandwidth threshold. | extensive |
| `Splitting BW` | Bandwidth used for LSP splitting and merging.<br><br>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth maximum bandwidth configuration. | extensive |
| `Merging BW` | Bandwidth used for LSP splitting and merging.<br><br>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth minimum bandwidth configuration. | extensive |

**Table 52: show mpls container-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| LSPtype | Type of LSP. | extensive |
| LoadBalance | Loadbalanced bandwidth. | extensive |
| MinBW | Minimum LSP bandwidth in bps related to auto-bandwidth. | extensive |
| AdjustTimer | Total amount of time in seconds allowed before LSP bandwidth adjustment take place.<br>Range: 300 through 315360000 seconds | extensive |
| Max AvgBW util | Current value of the actual maximum average bandwidth utilization in bps. | extensive |
| Overflow limit | Threshold overflow limit. | extensive |
| Underflow limit | Threshold underflow limit. | extensive |
| Priorities | Setup priority and hold priority values.<br>For setup priority, 0 and 7 is the highest and lowest priority, respectively.<br>When not explicitly configured, 7 and 0 are set as the default values for the setup priority and hold priority, respectively. | extensive |
| SmartOptimizeTimer | Time in seconds allowed before path reoptimization. | extensive |
| Computed ERO | Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L). | extensive |

**Table 52: show mpls container-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Received RRO` | Received record route.<br><br>RRO is a series of hops, each with an address followed by a flag. In most cases, the received RRO is the same as the computed ERO. If the received RRO is different from the computed ERO, there is a topology change in the network, and the route is taking a detour.<br><br>The following flags identify the protection capability and status of the downstream node:<br><br>• `0x01`—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.<br><br>• `0x02`—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).<br><br>• `0x03`—Combination of `0x01` and `0x02`.<br><br>• `0x04`—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.<br><br>• `0x08`—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the local protection available bit is set but the node protection bit is cleared.<br><br>• 0x09—Detour is established. Combination of `0x01` and `0x08`.<br><br>• `0x10`—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic | extensive |

**Table 52: show mpls container-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.<br>• `0x20`—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.<br>• `0xb`—Detour is in use. Combination of `0x01`, `0x02`, and `0x08`. | |
| `Created` | Date and time the LSP was created. | extensive |

## Sample Output

### show mpls container-lsp

```

### Syntax

```
show mpls context-identifer
<brief | detail>
<logical-system (all | logical-system-name)>
<primary>;
<protector>;
```

## Description

Display information about configured egress protection context identifiers.

## Options

| | |
|---|---|
| **none** | Display standard information about egress protection. |
| **brief \| detail** | (Optional) Display the specified level of output. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **primary** | (Optional) Perform this operation on the primary node. |
| **protector** | (Optional) Perform this operation on the protector node. |

## Output Fields

Table 53 on page 3183 describes the output fields for the `show mpls egress-protection detail` command. Output fields are listed in the approximate order in which they appear.

**Table 53: show mpls lsp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| ID | Context identifier. | All levels |
| Type | Indicates node type: protector or primary | All levels |
| Metric | MPLS cost value of the context identifier route. This route appears in inet.0 on the protector and primary nodes. On the protector node, the metric is a larger number. | All levels |

**Table 53: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Mode | Indicates "advertise-mode" on page 2402: proxy or alias | `detail` |
| Context table | Name of the MPLS routing table created for egress protection. | All levels |
| Context LSPs | Names of the LSPs that have egress protection configured.<br><br>Loopback interface addresses of the devices from which the LSPs are originated. | `detail` |
| Total | Total number of primary and protector nodes. | All levels |
| Primary | Number of primary nodes. | All levels |
| Protector | Number of protector nodes. | All levels |

## Sample Output

### show mpls context-identifier detail (Protector)

```
user@host> show mpls context-identifier detail
ID: 166.1.3.1
  Type: protector, Metric: 16777215, Mode: alias
  Context table: __166.1.3.1__.mpls.0, Label out: 299968
```

### Sample Output

#### show mpls context-identifier detail (Primary)

```
user@host> show mpls context-identifier detail

ID: 166.1.3.1
  Type: primary, Metric: 1, Mode: alias

Total 1, Primary 1, Protector 0
```

### Release Information

Command introduced in Junos OS Release 11.4R3.

## Syntax

```
show mpls correlation label label-value
<brief | detail | extensive | terse>
<descriptions>
<logical-system (all | logical-system-name)>
```

## Description

Display the correlation information for the Multiprotocol Label Switching (MPLS) label-switched path (LSP) with the owner of the label.

## Options

| | |
|---|---|
| *label-value* | Display information about the specified label. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events. |
| **descriptions** | (Optional) Display the LSP descriptions. To view this information, you must configure the description statement at the `[edit protocol mpls lsp]` hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Output Fields

Table 55 on page 3190 describes the output fields for the `show mpls cspf` command. Output fields are listed in the approximate order in which they appear.

**Table 55: show mpls cspf Output Fields**

| Field Name | Field Description |
|---|---|
| **Queue length** | Number of LSPs queued for automatic path computation. |
| **current** | Current queue length. |
| **maximum** | Maximum queue length (high-water mark). |
| **dequeued** | Number of terminated computation attempts. |
| **Paths** | Counters for label-switched path computations. |
| **total** | Sum of the next four fields. |
| **successful** | Number of path computations that were successfully completed. |

**Table 55: show mpls cspf Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **no route** | Number of path computations that failed because the destination is unreachable. |
| **Sys Error** | Number of path computations that failed because of lack of memory. |
| **CSPFs** | Total number of CSPF computations. A single path might require multiple CSPF computations. |
| **Time** | Time, in seconds, required to perform the label-switched path computation. |
| **Total** | Total amount of time consumed by the CSPF path computation algorithm. |
| **CSPFs** | Total number of CSPF computations. |
| **Avg per CSPF** | Average amount of time required for each CSPF computation. |
| **% of rpd** | Percentage of routing process CPU used in the CSPF computation. |

## Sample Output

### show mpls cspf

```
user@host> show mpls cspf
CSPF statistics
Queue length   current       maximum      dequeued
                     0             0             0
Paths            total    successful      no route     sys error         CSPFs
                     0             0             0             0             0
```

```
Time (secs)      total         CSPFs  avg per CSPF      % of rpd
              0.000000      0.000000      0.000000        0.0000
```

### Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

## show mpls diffserv-te

**IN THIS SECTION**

- Syntax | **3192**

## Output Fields

Table 56 on page 3193 describes the output fields for the `show mpls diffserv-te` command. Output fields are listed in the approximate order in which they appear.

**Table 56: show mpls diffserv-te Output Fields**

| Field Name | Field Description |
|---|---|
| **Bandwidth model** | Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported. |
| **TE class** | DiffServ traffic engineering class. |

**Table 56: show mpls diffserv-te Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Traffic class** | MPLS class type that corresponds to the DiffServ traffic engineering class:<br>• **ct0**—Best effort<br>• **ct1**—Assured forwarding<br>• **ct2**—Expedited forwarding<br>• **ct3**—Network control |
| **Priority** | MPLS preemption priority for this class type, a value from **0** through **7**. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class. |

## Sample Output

### show mpls diffserv-te

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class     Traffic class       Priority
te0          ct0                 3
te1          ct1                 2
```

## Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

# show mpls interface

IN THIS SECTION

- Syntax | 3195
- Description | 3195
- Required Privilege Level | 3195

## Syntax

```
show mpls interface
```

## Description

Display information about MPLS-enabled interfaces. MPLS is enabled on an interface when the interface is configured with both the `set protocols mpls interface` *`interface-name`* and `set interfaces` *`interface-name`* `unit 0 family mpls` commands.

## Required Privilege Level

view

## Output Fields

Table 57 on page 3196 describes the output fields for the `show mpls interface` command. Output fields are listed in the approximate order in which they appear.

**Table 57: show mpls interface Output Fields**

| Field Name | Field Description |
|---|---|
| **Interface** | Name of the interface. |
| **State** | State of the interface: **Up** or **Dn** (down). |
| **Administrative groups** | Administratively assigned colors of the link. |

## Sample Output

### show mpls interface

```
user@switch> show mpls interface

Interface   State        Administrative groups
so-1/0/0.0  Up           Blue Yellow Red
```

## Release Information

Command introduced in Junos OS Release 9.5.

MPLS is enabled on an interface when the interface is configured with both the `set protocol mpls interface` *interface-name* and `set interface` *interface-name* `unit 0 family mpls` statements.

## Required Privilege Level

view

## Output Fields

Table 59 on page 3201 describes the output fields for the `show mpls interface` command. Output fields are listed in the approximate order in which they appear.

**Table 59: show mpls interface Output Fields**

| Field Name | Field Description |
|---|---|
| **Interface** | Name of the interface. |
| **State** | State of the interface: **Up** or **Dn** (down). |
| **Administrative groups** | Administratively assigned colors of the link. |
| **Maximum labels** | Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the `maximum-labels` statement at the `[edit logical-systems` *logical-system-name* `interfaces` *interface-name* `unit` *logical-unit-number* `family mpls]` or the `[edit interfaces` *interface-name* `unit` *logical-unit-number* `family mpls]` hierarchy levels. |

**Table 59: show mpls interface Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Static protection revert time** | Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the `protection-revert-time` statement at the `[edit logical-systems *logical-system-name* protocols mpls interface *interface-name* static]` or the `[edit protocols mpls interface *interface-name* static]` hierarchy levels. |
| **Always mark connection protection tlv** | **Enabled** or **Disabled**: **Enabled** indicates that the `always-mark-connection-protection-tlv` statement is configured at the `[edit logical-systems *logical-system-name* protocols mpls interface *interface-name* static]` or the `[edit protocols mpls interface *interface-name* static]` hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the `switch-away-lsps` statement must be configured. |
| **Switch away lsps** | **Enabled** or **Disabled**: **Enabled** indicates that the `switch-away-lsps` statement is configured at the `[edit logical-systems *logical-system-name* protocols mpls interface *interface-name* static]` or the `[edit protocols mpls interface *interface-name* static]` hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. |

## Sample Output

### show mpls interface

```
user@host> show mpls interface

Interface: ge-0/2/1.57
```

```
State: Up
Administrative group: <none>
Maximum labels: 5
Static protection revert time: 5 seconds
Always mark connection protection tlv: Disabled
Switch away lsps : Disabled
```

### Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

## show mpls label usage

**IN THIS SECTION**

- Syntax | 3203
- Description | 3204
- Options | 3204
- Additional Information | 3204
- Required Privilege Level | 3205
- Output Fields | 3205
- Sample Output | 3205
- Release Information | 3206

### Syntax

```
show mpls label usage
<label label value>
<label-range range-start range-end>
<logical-system  (all | logical-sytem-name)>
```

## Description

Show the available label space resource in RPD and also the applications that use the label space in RPD. There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using this command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

Starting in Junos OS Release 17.2, you can configure the `enhanced-ip` command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.

When you set each member router's network services to `enhanced-ip`, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.

## Options

| | |
|---|---|
| **none** | Display the available labels in each label space and the applications using the labels. |
| **label** *label value* | (Optional) Display the information about which *label value* is used by which protocol, if any. |
| **label-range** *range-start range-end* | (Optional) Display the complete information about the `label-range` specified. WIth the `enhanced-ip` command enabled on the supported device, effective ranges and configured ranges along with details of different label spaces such as LSI, dynamic, block, and static types are displayed. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Additional Information

Once the label space crosses the threshold, a new syslog message is added.

<label-space-name> label space usage crossed threshold limit of 90%.

For instance, LSI label space usage crossed threshold limit of 90%.

## Required Privilege Level

view

## Output Fields

Table 60 on page 3205 describes the output fields for the `show mpls label usage` command. Output fields are listed in the order in which they appear.

**Table 60: show mpls label usage Fields**

| Field Name | Field Description |
|---|---|
| **Label Space** | Indicates the different types of labels currently used in MPLS. |
| **Total** | Indicates the total label space available. |
| **Available** | Indicates the number of freely available labels and also the percentage of the label space available. |
| **Applications** | Indicates the applications that use the MPLS label spaces. |
| **Effective Ranges** | Indicates actual ranges in use, which can be different from configured ranges, if conflicting with label already allocated. |
| **Configured Ranges** | Indicates the currently configured range assigned to different label spaces on the device. |

## Sample Output

### show mpls label usage

```
user@host> show mpls label usage
Label space Total   Available        Applications
LSI         999984  999971 (100.00%) BGP/LDP VPLS with no-tunnel-services, BGP L3VPN with vrf-
table-label
Block       999984  999971 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
```

```
Dynamic     999984  999971 (100.00%) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP, MVPN, EVPN, BGP
Static      48576   48576  (100.00%) Static LSP, Static PW
```

With `enhanced-ip` enabled on the supported device, you get the following additional output.

```
user@host> show mpls label usage
Label space Total   Available        Applications
LSI         996983  996983 (100.00%) BGP/LDP VPLS with no-tunnel-services, BGP L3VPN with vrf-
table-label
Block       996983  996983 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic     996983  996983 (100.00%) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP, MVPN, EVPN, BGP
Static      48576   48576  (100.00%) Static LSP, Static PW
Effective Ranges
Range name  Shared with Start   End
Dynamic     16      999
Dynamic     4001    999999
Static      1000000 1048575
SRGB        1000    2999     OSPF
SRGB        3000    4000     GLOBAL
Configured Ranges
Range name  Shared with Start   End
Dynamic     16      999
Dynamic     4001    999999
Static      1000000 1048575
SRGB        1000    2999     OSPF
SRGB        3000    4000     GLOBAL

user@host> show mpls label usage label 101
Label 101 is used by protocol BGP
user@host> show mpls label usage label 102
Label 102 is used by protocol LDP
user@host> show mpls label usage label 103
Label 103 is not allocated to any protocol
```

## Release Information

Command introduced in Junos OS Release 15.1.

Support for the `label` statement added in Junos OS Release 17.2.

Support for the `label-range` statement added in Junos OS Release 17.2.

# show mpls label usage label-range

<name name>
<p2mp>
<reverse-statistics>
<segment>
<statistics>
<transit>
```

## Syntax (EX Series Switches)

```
show mpls lsp
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<bypass>
<descriptions>
<down | up>
<externally-controlled>
<externally-provisioned>
<lsp-type>
<name name>
<p2mp>
<statistics>
<transit>
```

## Description

Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

## Options

**none**

Display standard information about all configured and active dynamic MPLS LSPs.

**brief | detail | extensive | terse**

(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

In the extensive command output, the duplicate back-to-back messages are recorded as aggregated messages. An additional timestamp is included for these aggregated messages, where if the aggregated messages are five or less, timestamp deltas are recorded for each message, and if the aggregated messages are greater than five, the first and last timestamp is recorded.

For example:

- All timestamps

```
9204 Jun 29 13:23:45.405 54.239.43.110: Explicit Route: bad strict
route [3 times - 13:21:00, 13:22:01, 13:23:10]
```

- Timestamp deltas

```
9204 Jun 29 13:23:45.405 54.239.43.110: Explicit Route: bad strict
route [3 times - 13:21:00, +1:01, +2:10]
```

- First and last timestamp

```
9204 Jun 29 13:23:45.405 54.239.43.110: Explicit Route: bad strict
route [6 times - 13:21:00, 13:23:10]
```

**abstract-computation**

(Optional) Display abstract computation preprocessing for LSPs.

See show mpls lsp abstract-computation for more details.

**autobandwidth**

(Optional) Display automatic bandwidth information. This option is explained separately (see `show mpls lsp autobandwidth`).

**bidirectional | unidirectional**

(Optional) Display bidirectional or unidirectional LSP information, respectively.

**bypass**

(Optional) Display LSPs used for protecting other LSPs.

**count-active-routes** (Optional) Display active routes for LSPs.

**defaults** (Optional) Display the MPLS LSP default settings.

**descriptions** (Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the `[edit protocol mpls lsp]` hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up** (Optional) Display only LSPs that are inactive or active, respectively.

**externally-controlled** (Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

**externally-provisioned** (Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name*** (Optional) Display MPLS LSP information for the specified instance. If *instance-name* is omitted, MPLS LSP information is displayed for the master instance.

**locally-provisioned** (Optional) Display LSPs that have been provisioned locally by the Path Computation Client (PCC).

**logical-system (all | *logical-system-name*)** (Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type*** (Optional) Display information about a particular LSP type:

- `bypass`—Sessions for bypass LSPs.
- `egress`—Sessions that terminate on this routing device.
- `ingress`—Sessions that originate from this routing device.
- `pop-and-forward`—Sessions that originate from RSVP-TE pop-and-forward LSP tunnels.
- `transit`—Sessions that pass through this routing device.

**name *name*** (Optional) Display information about the specified LSP or group of LSPs.

**p2mp** (Optional) Display information about point-to-multipoint LSPs.

**reverse-statistics** (Optional) Display packet statistics for reverse direction of LSPs.

**segment** (Optional) Display segment identifier (SID) labels.

**statistics** (Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

> **NOTE**: If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)
>
> When used with the `bypass` option (`show mpls lsp bypass statistics`), display statistics for the traffic that flows only through the bypass LSP.

**transit** (Optional) Display LSPs transiting this routing device.

## Required Privilege Level

view

## Output Fields

Table 62 on page 3214 describes the output fields for the `show mpls lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 62: show mpls lsp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Ingress LSP` | Information about LSPs on the ingress routing device. Each session has one line of output. | All levels |
| `Egress LSP` | Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output. | All levels |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Transit LSP` | Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. | All levels |
| `P2MP name` | Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format *identifier*:vpls:*router-id*:*routing-instance-name*. The *identifier* is automatically generated by Junos OS. | All levels |
| `P2MP branch count` | Number of destination LSPs the point-to-multipoint LSP is transmitting to. | All levels |
| `P` | An asterisk (`*`) under this heading indicates that the LSP is a primary path. | All levels |
| *address* | (`detail` and `extensive`) Destination (egress routing device) of the LSP. | `detail extensive` |
| `To` | Destination (egress routing device) of the session. | `brief` |
| `From` | Source (ingress routing device) of the session. | `brief detail` |
| `State` | State of the LSP handled by this RSVP session: `Up`, `Dn` (down), or `Restart`. | `brief detail` |
| `Active Route` | Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table (`inet.0`). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (`mpls.0`). | `detail extensive` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Rt` | Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (`inet.0`). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0). | `brief` |
| `P` | Path. An asterisk (`*`) underneath this column indicates that the LSP is a primary path. | `brief` |
| `ActivePath` | (Ingress LSP) Name of the active path: `Primary` or `Secondary`. | `detail extensive` |
| `LSPname` | Name of the LSP. | `brief detail` |
| `Statistics` | Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation). | `extensive` |
| `Aggregate statistics` | Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the `clear mpls lsp statistics` command. | `extensive` |
| `Packets` | Displays the number of packets transmitted over the LSP. | `brief extensive` |
| `Bytes` | Displays the number of bytes transmitted over the LSP. | `brief extensive` |
| `DiffServeInfo` | Type of LSP: multiclass LSP (`multiclass diffServ-TE LSP`) or Differentiated-Services-aware traffic engineering LSP (`diffServ-TE LSP`). | `detail` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| LSPtype | Type of LSP:<br>• Static configured—Static<br>• Dynamic configured—Dynamic<br>• Externally controlled—External path computing entity<br>Also indicates if the LSP is a Penultimate hop popping LSP or an Ultimate hop popping LSP. | detail extensive |
| Bypass | (Bypass LSP) Destination address (egress routing device) for the bypass LSP. | All levels |
| LSPpath | Indicates whether the RSVP session is for the primary or secondary LSP path. LSPpath can be either primary or secondary and can be displayed on the ingress, egress, and transit routing devices. | detail |
| Bidir | (GMPLS) The LSP allows data to travel in both directions between GMPLS devices. | All levels |
| Bidirectional | (GMPLS) The LSP allows data to travel both ways between GMPLS devices. | All levels |
| FastReroute desired | Fast reroute has been requested by the ingress routing device. | detail |
| Link protection desired | Link protection has been requested by the ingress routing device. | detail |
| Node/Link protection desired | Link protection has been requested by the ingress routing device. | detail |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `LSP Control Status` | (Ingress LSP) LSP control mode:<br>• External—By default, all PCE-controlled LSPs are under external control. When an LSP is under external control, the PCC uses the PCE-provided parameters to set up the LSP.<br>• Local—A PCE-controlled LSP can come under local control. When the LSP switches from external control to local control, path computation is done using the CLI-configured parameters and constraint-based routing. Such a switchover happens only when there is a trigger to re-signal the LSP. Until then, the PCC uses the PCE-provided parameters to signal the PCE-controlled LSP, although the LSP remains under local control.<br>A PCE-controlled LSP switches to local control from its default external control mode in cases such as no connectivity to a PCE or when a PCE returns delegation of LSPs back to the PCC. | `extensive` |
| `External Path CSPF status` | (PCE-controlled LSPs) Status of the PCE-controlled LSP with per path attributes:<br>• Local<br>• External | `extensive` |
| `Externally Computed ERO` | (PCE-controlled LSPs) Externally computed explicit route when the route object is not null or empty. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (`S`) or loose (`L`). | `extensive` |
| `EXTCTRL_LSP` | (PCE-controlled LSPs) Display path history including the bandwidth, priority, and metric values received from the external controller. | `extensive` |
| flap counter | Counts the number of times a LSP flaps down or up. | extensive |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| LoadBalance | (Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: Most-fill, Least-fill, or Random. | detail extensive |
| Signal type | Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: DS0, DS3, STS-1, STM-1, or STM-4. | All levels |
| Encoding type | LSP encoding type: Packet, Ethernet, PDH, SDH/SONET, Lambda, or Fiber. | All levels |
| Switching type | Type of switching on the links needed for the LSP: Fiber, Lamda, Packet, TDM, or PSC-1. | All levels |
| GPID | Generalized Payload Identifier (identifier of the payload carried by an LSP): HDLC, Ethernet, IPv4, PPP, or Unknown. | All levels |
| Protection | Configured protection capability desired for the LSP: Extra, Enhanced, none, One plus one, One to one, or Shared. | All levels |
| Upstream label in | (Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP. | All levels |
| Upstream label out | (Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP. | All levels |
| Suggested label received | (Bidirectional LSPs) Label the upstream interface suggests to use in the Resv message that is sent. | All levels |
| Suggested label sent | (Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned. | All levels |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Autobandwidth | (Ingress LSP) The LSP is performing autobandwidth allocation. | detail extensive |
| Mbb counter | Counts the number of times a LSP incurs MBB. | extensive |
| MinBW | (Ingress LSP) Configured minimum value of the LSP, in bps. | detail extensive |
| MaxBW | (Ingress LSP) Configured maximum value of the LSP, in bps. | detail extensive |
| Dynamic MinBW | (Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps. | detail extensive |
| Dynamic MinBW | (Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps. | detail extensive |
| AdjustTimer | (Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds. | detail extensive |
| Adjustment Threshold | (Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization. | detail extensive |
| Time for Next Adjustment | (Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken. | detail extensive |
| Time of Last Adjustment | (Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed. | detail extensive |
| MaxAvgBW util | (Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps. | detail extensive |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Overflow limit` | (Ingress LSP) Configured value of the threshold overflow limit. | `detail extensive` |
| `Overflow sample count` | (Ingress LSP) Current value for the overflow sample count. | `detail extensive` |
| `Bandwidth Adjustment in` *`nnn`* `second(s)` | (Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds. | `detail extensive` |
| `In-place Update Count` | Current value of the in-place LSP bandwidth update counter indicating the number of times an LSP-ID is reused when LSP-ID re-use is enabled for an LSP. | `detail extensive` |
| `Underflow limit` | (Ingress LSP) Configured value of the threshold underflow limit. | `detail extensive` |
| `Underflow sample count` | (Ingress LSP) Current value for the underflow sample count. | `detail extensive` |
| `Underflow Max AvgBW` | (Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow. | `detail extensive` |
| `Active path indicator` | (Ingress LSP) A value of `*` indicates that the path is active. The absence of `*` indicates that the path is not active. In the following example, “long” is the active path.<br><br>`*Primary long`<br>`Standby short` | `detail extensive` |
| `Primary` | (Ingress LSP) Name of the primary path. | `detail extensive` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Secondary` | (Ingress LSP) Name of the secondary path. | `detail extensive` |
| `Standby` | (Ingress LSP) Name of the path in standby mode. | `detail extensive` |
| `State` | (Ingress LSP) State of the path: `Up` or `Dn` (down). | `detail extensive` |
| `COS` | (Ingress LSP) Class-of-service value. | `detail extensive` |
| `Bandwidth per class` | (Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps. | `detail extensive` |
| `Priorities` | (Ingress LSP) Configured value of the setup priority and the hold priority respecitively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority). | `detail extensive` |
| `OptimizeTimer` | (Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds. | `detail extensive` |
| `SmartOptimizeTimer` | (Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds. | `detail extensive` |
| `Reoptimization in xxx seconds` | (Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds. | `detail extensive` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Computed ERO (S [L] denotes strict [loose] hops)` | (Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (`S`) or loose (`L`). | `detail extensive` |
| `CSPF metric` | (Ingress LSP) Constrained Shortest Path First metric for this path. | `detail extensive` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Received RRO` | (Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If `Received RRO` is different from `Computed ERO`, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:<br>• `0x01`—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the `SESSION_ATTRIBUTE` object of the corresponding Path message.<br>• `0x02`—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).<br>• `0x03`—Combination of `0x01` and `0x02`.<br>• `0x04`—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.<br>• `0x08`—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the `Local protection available` bit is set but the `Node protection` bit is cleared.<br>• `0x09`—Detour is established. Combination of `0x01` and `0x08`.<br>• `0x10`—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted. | `detail extensive` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • 0x20—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.<br>• 0xb—Detour is in use. Combination of 0x01, 0x02, and 0x08. | |
| Labels | Labels of pop-and-forward LSP tunnel:<br>• P—Pop labels.<br>• D—Delegation labels. | extensive |
| Index number | (Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed. | extensive |
| Date | (Ingress LSP) Date of the LSP event. | extensive |
| Time | (Ingress LSP) Time of the LSP event. | extensive |
| Event | (Ingress LSP) Description of the LSP event. | extensive |
| Created | (Ingress LSP) Date and time the LSP was created. | extensive |
| Resv style | (Bypass) RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter). | brief detail<br>extensive |
| Labelin | Incoming label for this LSP. | brief detail |
| Labelout | Outgoing label for this LSP. | brief detail |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| LSPname | Name of the LSP. | brief detail |
| Time left | Number of seconds remaining in the lifetime of the reservation. | detail |
| Since | Date and time when the RSVP session was initiated. | detail |
| Tspec | Sender's traffic specification, which describes the sender's traffic parameters. | detail |
| Port number | Protocol ID and sender or receiver port used in this RSVP session. | detail |
| PATH rcvfrom | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor. | detail |
| PATH sentto | Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device. | detail |
| RESV rcvfrom | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the PATH rcvfrom field, indicates that the RSVP negotiation is complete. | detail |
| Record route | Recorded route for the session, taken from the record route object. | detail |
| Pop-and-forward | Attributes of the pop-and-forward LSP tunnel. | extensive |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `ETLD In` | Number of transport labels that the LSP-Hop can potentially receive from its upstream hop. It is recorded as Effective Transport Label Depth (ETLD) at the transit and egress devices. | `extensive` |
| `ETLD Out` | Number of transport labels the LSP-Hop can potentially send to its downstream hop. It is recorded as ETLD at the transit and ingress devices. | `extensive` |
| `Delegation hop` | Specifies if the transit hop is selected as a delegation label:<br>• Yes<br>• No | `extensive` |
| `Soft preempt` | Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used). | `detail` |
| `Soft preemption pending` | Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path. | `detail` |

**Table 62: show mpls lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| MPLS-TE LSP Defaults | Default settings for MPLS traffic engineered LSPs:<br>• LSP Holding Priority—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully.<br>• LSP Setup Priority—Determines whether a new LSP that preempts an existing LSP can be established.<br>• Hop Limit—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress).<br>• Bandwidth—Specifies the bandwidth in bits per second for the LSP.<br>• LSP Retry Timer—Length of time in seconds that the ingress router waits between attempts to establish the primary path. | defaults |

The XML tag name of the bandwidth tag under the auto-bandwidth tag has been updated to maximum-average-bandwidth . You can see the new tag when you issue the show mpls lsp extensive command with the | display xml pipe option. If you have any scripts that use the bandwidth tag, ensure that they are updated to maximum-average-bandwidth.

## Sample Output

### show mpls lsp defaults

```
user@host> show mpls lsp defaults
   MPLS-TE LSP Defaults
      LSP Holding Priority      0
      LSP Setup Priority        7
      Hop Limit                 255
      Bandwidth                 0
      LSP Retry Timer           30 seconds
```

### show mpls lsp descriptions

## Release Information

Command introduced before Junos OS Release 7.4.

`defaults` option added in Junos OS Release 8.5.

`autobandwidth` option added in Junos OS Release 11.4.

`externally-controlled` option added in Junos OS Release 12.3.

`externally-provisioned` option added in Junos OS Release 13.3.

`instance` *`instance-name`* option added in Junos OS Release 15.1.

## show mpls lsp abstract-computation

**IN THIS SECTION**

- Syntax | 3242
- Description | 3242
- Options | 3243
- Required Privilege Level | 3243
- Output Fields | 3243
- Sample Output | 3244
- Release Information | 3245

### Syntax

```
show mpls lsp abstract-computation
<brief | detail | extensive>;
<logical-system (all | logical-system-name)>;
<name lsp-name>;
```

### Description

Display the ingress to egress abstract hop computation used by the constrained shortest path in the preprocessing for LSPs. The command output displays the various computation passes involved per LSP,

and the qualifying exit devices for each pass. It also displays the affinity per pass, and the current start device chosen for the pass.

## Options

| | |
|---|---|
| **brief \| detail \| extensive** | (Optional) Display the desired level of output. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Display the abstract computation for abstract hop constraints on all logical systems or on a particular logical system. |
| ***lsp-name*** | (Optional) Name of the LSP for which the abstract hop computation is displayed. |

## Required Privilege Level

view

## Output Fields

Table 63 on page 3243 describes the output fields for the `show mpls lsp abstract-computation` command. Output fields are listed in the approximate order in which they appear.

**Table 63: show mpls lsp abstract-computation Output Fields**

| Field Name | Field Description |
|---|---|
| `Path computation using abstract hops for LSP` | Name of the LSP for which the abstract hop computation is performed. |
| `Path type` | The type of the path can be primary or secondary. |
| `Path name` | Name of the path. |
| `Credibility` | Credibility value associated with the interior gateway protocol in use. |
| `Total no of CSPF passes` | Number of constrained shortest path passes for the abstract hop. |

**Table 63: show mpls lsp abstract-computation Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| CSPF pass no | Constrained shortest path pass number for the abstract hop computation. |
| Start address of the pass | IP address where the pass starts. |
| Affinity | Name of the abstract hop. |
| Destination | Destination IP address for a node in the pass. |
| State | State of the backtracking:<br>• Valid<br>• Disqualified |

## Sample Output

### show mpls lsp abstract-computation

```
user@R0> show mpls lsp abstract-computation
Path computation using abstract hops for LSP: R0-R31
Path type: Primary, Path name: prim
Credibility: 0, Total no of CSPF passes: 2
CSPF pass no: 0
Start address of the pass: 127.0.0.6
Destination: 127.0.0.1, State: VALID
Destination: 127.0.0.2, State: VALID
Destination: 127.0.0.3, State: VALID
Affinity: ah1
CSPF pass no: 1
Start address of the pass: 127.0.0.1
Destination: 127.0.0.3, State: VALID
Path type: Secondary, Path name: nonstdby
Path type: Standby, Path name: stdby
```

```
Credibility: 0, Total no of CSPF passes: 2
CSPF pass no: 0
Start address of the pass: 127.0.0.6
Destination: 127.0.0.3, State: VALID
Destination: 127.0.0.4, State: VALID
Affinity: ah2
CSPF pass no: 1
Start address of the pass: 127.0.0.4
Destination: 127.0.0.3, State: VALID
```

### Release Information

Command introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

## show mpls lsp autobandwidth

IN THIS SECTION

- Syntax | 3246
- Description | 3246
- Options | 3246
- Required Privilege Level | 3246
- Output Fields | 3246
- Sample Output | 3249
- Release Information | 3249

## Syntax

```
show mpls lsp autobandwidth
<brief | detail | extensive>
<logical-system (all | logical-system-name)>
<name lsp-name>
```

## Description

Display automatic bandwidth information for the LSP(s).

After a Routing Engine switchover, the output of the `show mpls autobandwidth` command might not be up-to-date, as the automatic bandwidth information for the LSP(s) is gathered by the new primary Routing Engine during the first adjustment interval.

## Options

| | |
|---|---|
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **name *lsp-name*** | (Optional) Specify name of the LSP for which the automatic bandwidth information should be displayed. |

## Required Privilege Level

view

## Output Fields

Table 64 on page 3247 describes the output fields for the `show mpls lsp autobandwidth` command. Output fields are listed in the approximate order in which they appear.

**Table 64: show mpls lsp autobandwidth Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `To` | Destination (egress routing device) of the session. | All Levels |
| `From` | Source (ingress routing device) of the session. | All Levels |
| `LSPname` | Name of the LSP. | All Levels |
| `Min BW` | (Ingress LSP) Configured minimum value of the LSP, in bps. | `detail extensive` |
| `Max BW` | (Ingress LSP) Configured maximum value of the LSP, in bps. | `detail extensive` |
| `Max AvgBW util` | (Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.<br>**NOTE**: In calculating this value, the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored. | `detail extensive` |
| `Overflow limit` | (Ingress LSP) Configured value of the threshold overflow limit. | `detail extensive` |
| `Overflow sample count` | (Ingress LSP) Current value for the overflow sample count. | `detail extensive` |
| `Underflow limit` | (Ingress LSP) Configured value of the threshold underflow limit. | `detail extensive` |
| `Underflow sample count` | (Ingress LSP) Current value for the underflow sample count. | `detail extensive` |
| `Adjustment Timer` | (Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds. | `detail extensive` |

**Table 64: show mpls lsp autobandwidth Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Adjustment Threshold` | (Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization. | `detail extensive` |
| `Time for Next Adjustment` | (Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken. | `detail extensive` |
| `Time of Last Adjustment` | (Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed. | `detail extensive` |
| `Last BW` | Previous active bandwidth of the LSP. | `detail extensive` |
| `Last Requested BW` | Bandwidth requested in the previous automatic bandwidth adjustment. | `detail extensive` |
| `Last Signaled BW` | Bandwidth signaled in the previous automatic bandwidth adjustment. | `detail extensive` |
| `Highest Watermark BW` | Maximum bandwidth used by the LSP. | `detail extensive` |
| `Total AutoBw Adjustments` | Total number of attempts to adjust automatic bandwidth including failed and successful adjustments. | `detail extensive` |
| `Successful Adjustments` | Number of successful automatic bandwidth adjustments. | `detail extensive` |
| `Failed Adjustments` | Number of failed automatic bandwidth adjustments. | `detail extensive` |

### Sample Output

#### show mpls lsp autobandwidth

```
user@host> show mpls lsp autobandwidth extensive
To: 10.255.106.133,
From: 10.255.106.135, LSPname: r0-r1
Min BW: 100kbps, Max BW: 0bps, Max AvgBW util: 2.33249Mbps
Overflow limit: 0, Overflow sample count: 0
Underflow limit: 0, Underflow sample count: 0
Adjustment Timer: 300 sec, Adjustment Threshold: 0
Time for Next Adjustment: 23 sec, Time of Last Adjustment: Fri Jun  3 21:05:37
2011
Last BW: 100kbps, Last Requested BW: 2.2169Mbps, Last Signaled BW: 2.2169Mbps,
Highest Watermark BW: 2.33249Mbps
Total AutoBw Adjustments: 1, Successful Adjustments: 1, Failed Adjustments: 0
```

### Release Information

Statement introduced in Junos OS Release 11.4.

Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

`name` *`lsp-name`* option introduced in Junos OS Release 18.1R1 for all platforms.

## Output Fields

Table 65 on page 3251 describes the output fields for the `show mpls path` command. Output fields are listed in the approximate order in which they appear.

**Table 65: show mpls path Output Fields**

| Field Name | Field Description |
|---|---|
| **Path name** | Information about ingress LSPs. Each path has one line of output. |
| **Address** | Addresses of the routing devices that form the LSP. |
| **Strict/loose address** | Whether the address is a configured as a strict or loose address. |

## Sample Output

### show mpls path

```
user@host> show mpls path
Path name        Address          Strict/loose address
p1               123.456.55.6     Strict
                 123.456.1.6      Loose
p2               191.456.1.4      Strict
```

## Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

# show mpls srlg

IN THIS SECTION

- Syntax | 3252
- Description | 3252
- Options | 3252
- Required Privilege Level | 3253
- Output Fields | 3253
- Sample Output | 3253
- Release Information | 3253

## Syntax

```
show mpls srlg
<logical-systems (all | logical-system-name)>
```

## Description

Display Shared Risk Link Group (SRLG) cost and value configuration information.

**NOTE**: If an SRLG is associated with a link that is used by an ingress LSP in the router, then on deleting the SRLG configuration from that router, the SRLG gets removed from the SRLG table only on the next reoptimization of the LSP. Until then, the output of the `run show mpls srlg` command displays `Unknown-XXX` instead of the SRLG name and a non zero srlg-cost for that SRLG.

## Options

| | |
|---|---|
| **logical-system (all \| *logical-system-name*)** | (Optional) View SRLG configuration information for all logical systems or a particular logical system. |

## Required Privilege Level

view

## Output Fields

# show mpls static-lsp

IN THIS SECTION

- Syntax | 3254
- Description | 3254
- Options | 3255
- Required Privilege Level | 3255
- Output Fields | 3256
- Sample Output | 3257
- Release Information | 3258

## Syntax

```
show mpls static-lsp
<brief | detail | extensive | terse>
<bypass>
<descriptions>
<down | up>
<ingress>
<instance instance-name>
<logical-system (all | logical-system-name)>
<lsp-type>
<name name>
<statistics>
<transit>
```

## Description

Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

## Options

| | |
|---|---|
| **none** | Display standard information about all configured and active static MPLS LSPs. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. The **extensive** option displays the same information as the **detail** option, but covers the most recent 50 events. |
| **bypass** | (Optional) Display LSPs used for protecting other static LSPs. |
| **descriptions** | (Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the `[edit protocols mpls static-label-switched-path` *`path-name`* `bypass]`, `[edit protocols mpls static-label-switched-path` *`path-name`* `ingress]`, or `[edit protocols mpls static-label-switched-path` *`path-name`* `transit` *`incoming-label`*`]` hierarchy levels. Only static LSPs with a description are displayed. |
| **down \| up** | (Optional) Display only static LSPs that are inactive or active, respectively. |
| **instance** *instance-name* | (Optional) Display information about all configured and active static MPLS LSPs for the specified routing instance. If *`instance-name`* is omitted, information about all configured and active static MPLS LSPs for the master instance is displayed. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| *lsp-type* | (Optional) Display information about a particular LSP type:<br>• **bypass**—Sessions for bypass LSPs.<br>• **ingress**—Sessions that originate from this routing device.<br>• **transit**—Sessions that pass through this routing device. |
| **name** *name* | (Optional) Display information about the specified static LSP or group of LSPs. |
| **statistics** | (Optional) Display accounting information about static LSPs. |
| **transit** | (Optional) Display static LSPs transiting this routing device. |

## Output Fields

Table 67 on page 3256 describes the output fields for the `show mpls static-lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 67: show mpls static-lsp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Ingress LSPs** | Information about the static LSPs on the ingress routing device. Each session has one line of output. | All levels |
| **Transit LSPs** | Number of static LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. | All levels |
| **Bypass LSPs** | Information about the bypass LSPs configured on the routing device. Each session has one line of output. | All levels |
| **LSPname** | Name of the static LSP. | All levels |
| **To** | Destination (egress routing device) of the session. | All levels |
| **State** | State of the static LSP handled by this RSVP session: **Up**, **Dn** (down), or **Restart**. | All levels |
| **Packets** | Number of packet transiting the static LSP (**statistics** option only). | All levels |
| **Bytes** | Number of bytes transiting the static LSP (**statistics** option only). | All levels |
| **Nexthop** | IP address for the next-hop router for the static LSP. | **detail**, **extensive** |
| **Bypass** | (Bypass LSP) Destination address (egress routing device) for the bypass LSP. | All levels |

**Table 67: show mpls static-lsp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Link protection desired** | Link protection has been requested by the ingress routing device. | **detail**, **extensive** |
| **LabelOperation** | Label operation to perform: **Push**, **Pop**, **Swap**. | **detail**, **extensive** |
| **Outgoing-label** | Outgoing label to use for the MPLS packet in either push or swap label operations. | **detail**, **extensive** |
| **Created** | (Ingress LSP) Date and time the static LSP was created. | **extensive** |
| **Bandwidth** | Bandwidth configured for the static LSP. | **detail**, **extensive** |
| **Resv style** | (Bypass) RSVP reservation style. This field consists of two parts: the number of active reservations and the reservation style, which can be **FF** (fixed filter), **SE** (shared explicit), or **WF** (wildcard filter). | All levels |

## Sample Output

### show mpls static-lsp extensive

```
user@host> show mpls static-lsp extensive
Ingress LSPs:
LSPname: alpha-to-beta, To: 192.168.14.1
  State: Dn
  Nexthop: 192.168.10.1
  LabelOperation: Push, Outgoing-label: 1000001
  Created: Thu Jan 14 16:44:43 2010
  Bandwidth: 0 bps
Total 1, displayed 1, Up 0, Down 1

Transit LSPs:
Total 0, displayed 0, Up 0, Down 0
```

```
Bypass LSPs:
Total 0, displayed 0, Up 0, Down 0
```

### show mpls static-lsp statistics ingress

```
user@host> show mpls static-lsp statistics ingress
Ingress LSPs:
LSPname                      To              State     Packets            Bytes
alpha-to-beta                192.168.14.1    Dn              NA               NA
Total 1, displayed 1, Up 0, Down 1
```

### show mpls static-lsp (when MPLS stitching is used)

The show mpls static-lsp command was extended in Junos release 14.1X53-D25 to accommodate the stitching feature of MPLS. This example shows the LSP state as 'InProgress' because the LSP is waiting for protocol next-hop resolution. For more information, see

```
user@host> show mpls static-lsp
Ingress LSPs:
Total 0, displayed 0, Up 0, Down 0
Transit LSPs: LSPname                              Incoming-label  State
to-165                                                                1000000
InProgress
```

## Release Information

Command introduced in Junos OS Release 10.1.
Command updated in Junos OS Release 14.1X53-D25 to accommodate the stitching feature of MPLS.

# show mpls tunnel manager statistics

IN THIS SECTION

- Syntax | 3259
- Description | 3259
- Options | 3259
- Required Privilege Level | 3260
- Output Fields | 3260
- Sample Output | 3261
- Release Information | 3261

## Syntax

```
show mpls tunnel-manager-statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display a running counter of the number of Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) that have been updated in-place without any change to LSP identifier (ID) through in-place LSP update and without any change to RSVP installed in the inet.3 routing table.

## Options

| | |
|---|---|
| **none** | Display the number of LSPs that have been updated in-place without any change to LSP-ID. |
| **instance** *instance-name* | (Optional) Display the count of the LSPs that have been updated in-place LSPs for the specified instance. If `instance-name` is omitted, LSP statistics for the primary instance are displayed. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

Table 68 on page 3260 describes the output fields for the `show mpls mpls tunnel manager statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 68: show mpls tunnel manager statistics Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `LSP make-before-break` | Indicates signalling a new LSP path before tearing down the old LSP path. Note that the old and the new LSP instances might traverse the same path. | All levels |
| `In-place LSP BW increase` | Indicates LSP bandwidth increase through in-place update of RSVP signaling states corresponding to the LSP. | All levels |
| `In-place LSP BW decrease` | Indicates LSP bandwidth decrease through in-place update of RSVP signaling states corresponding to the LSP. | All levels |
| `In-place LSP update CSPF failure` | Indicates the in-place LSP auto-bandwidth resizing failure at the CSPF path computation stage. | All levels |
| `In-place LSP update signaling error` | Indicates the in-place LSP auto-bandwidth resizing failure when RSVP signaling error is received. | All levels |
| `In-place LSP update signaling timeout` | Indicates the in-place LSP auto-bandwidth resizing failure when RSVP signaling takes too long to complete. | All levels |

### Sample Output

#### show mpls tunnel-manager-statistics

```
user@host> show tunnel manager statistics
MPLS Tunnel Manager Statistics
  LSP make-before-break                   1
  In-place LSP BW increase                1
  In-place LSP BW decrease                1
  In-place LSP update CSPF failure        0
  In-place LSP update signaling error     0
  In-place LSP update signaling timeout   0
```

### Release Information

Command introduced before Junos OS Release 20.4R1.

**Table 69: show performance-monitoring mpls lsp Output Fields**

| Field Name | Display Data | Field Description | Level of Output |
|---|---|---|---|
| Session | Total | Total number of performance monitoring sessions created. | All Levels |
| | Up | Number of performance monitoring sessions that are up and running. | All Levels |
| | Down | Number of performance monitoring sessions that are down. | All Levels |
| LSP name | | Name of the LSP. | All Levels |
| Loss measurement Data | Traffic-class | Traffic class for which loss measurement is performed. | All Levels |
| | Queries sent | Total number of queries sent for loss measurement. | All Levels |
| | Responses received | Total number of responses received for loss measurement queries. | All Levels |
| | Responses dropped due to errors | Total number of loss measurement responses dropped due to errors. | All Levels |
| | Queries timeout | Number of timed out queries sent for loss measurement. | All Levels |

**Table 69: show performance-monitoring mpls lsp Output Fields *(Continued)***

| Field Name | Display Data | | Field Description | Level of Output |
|---|---|---|---|---|
| | Forward loss measurement | Average packet loss | Average packet loss (total loss of packets divided by the total number of samples used since the session is up). | All Levels |
| | | Average packet throughput | Total number of packets sent divided by the time considered for measurement. | All Levels |
| | Reverse loss measurement | Average packet loss | Average packet loss (total loss of packets divided by the total number of samples used since the session is up). | All Levels |
| | | Average packet throughput | Total number of packets sent divided by the time considered for measurement. | All Levels |
| Delay measurement Data | Traffic-class | | Traffic class for which delay measurement is performed. | All Levels |
| | Queries sent | | Total number of queries sent for delay measurement. | All Levels |
| | Responses received | | Total number of responses received for delay measurement queries. | All Levels |
| | Responses dropped due to errors | | Total number of delay measurement responses dropped due to errors. | All Levels |

**Table 69: show performance-monitoring mpls lsp Output Fields *(Continued)***

| Field Name | Display Data | Field Description | Level of Output |
|---|---|---|---|
| | Queries timeout | Number of timed out queries sent for delay measurement. | All Levels |
| | Best 2-way channel delay | Best available two-way channel delay. | All Levels |
| | Worst 2-way channel delay | Worst available two-way channel delay. | All Levels |
| | Best round trip time | Best available round-trip time. | All Levels |
| | Worst round trip time | Worst available round-trip time. | All Levels |
| | Avg absolute fw delay variation | Average of the variation in forward delay. | All Levels |
| | Avg absolute rv delay variation | Average of the variation in reverse delay. | All Levels |
| | Two-way channel delay | Sum of packet delays, excluding the processing time of the remote provider edge (PE) router. | `detail`, `extensive` |
| | Two-way round trip delay | Total time taken for completing round-trip of packet. | `detail`, `extensive` |

## Sample Output

### show performance-monitoring mpls lsp

```
user@host> show performance-monitoring mpls lsp
Session Total: 3 Up: 3 Down: 0

## show route forwarding-table

IN THIS SECTION

- Syntax | 3269
- Description | 3270
- Options | 3270
- Required Privilege Level | 3270
- Output Fields | 3271
- Sample Output | 3275
- Release Information | 3282

### Syntax

```
show route forwarding-table
<detail | extensive | summary>
```

```
<ccc ccc-interface-name>
<destination>
<family family-name>
<label label>
<matching ip_prefix>
<multicast>
<vpn vpn>
```

## Description

Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

## Options

| | |
|---|---|
| **none** | Display the routes in the forwarding table. |
| **detail \| extensive \| summary** | (Optional) Display the specified level of output. |
| **ccc** | (Optional) Display the specified circuit cross-connect interface name for entries to match. |
| ***destination*** | (Optional) Display the destination prefix. |
| **family *family-name*** | (Optional) Display routing table entries for the specified family: **ethernet-switching**, **inet**, **inet6**, **iso**, **mpls**, **vlan classification**. |
| **label *label*** | (Optional) Display route entries for the specified label name. |
| **matching *ip_prefix*** | (Optional) Display route entries for the specified IP prefix. |
| **multicast** | (Optional) Display route entries for multicast routes. |
| **vpn *vpn*** | (Optional) Display route entries for the specified VPN. |

## Required Privilege Level

view

## Output Fields

Table 70 on page 3271 lists the output fields for the `show route forwarding-table` command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 70: show route forwarding-table Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Routing table** | Name of the routing table (for example, **inet**, **inet6**, **mpls**). | All levels |
| **Address family** | Address family (for example, **IP**, **IPv6**, **ISO**, **MPLS**). | All levels |
| **Destination** | Destination of the route. | **detail, extensive** |

**Table 70: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Route Type (Type)** | How the route was placed into the forwarding table. When the **detail** keyword is used, the route type might be abbreviated (as shown in parentheses):<br>• **cloned** (**clon**)—(TCP or multicast only) Cloned route.<br>• **destination** (**dest**)—Remote addresses directly reachable through an interface.<br>• **destination down** (**iddn**)—Destination route for which the interface is unreachable.<br>• **interface cloned** (**ifcl**)—Cloned route for which the interface is unreachable.<br>• **route down** (**ifdn**)—Interface route for which the interface is unreachable.<br>• **ignore** (**ignr**)—Ignore this route.<br>• **interface** (**intf**)—Installed as a result of configuring an interface.<br>• **permanent** (**perm**)—Routes installed by the kernel when the routing table is initialized.<br>• **user**—Routes installed by the routing protocol process or as a result of the configuration. | All levels |
| **Route reference (RtRef)** | Number of routes to reference. | **detail, extensive** |

**Table 70: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Flags** | Route type flags:<br>• **none**—No flags are enabled.<br>• **accounting**—Route has accounting enabled.<br>• **cached**—Cache route.<br>• **incoming-iface *interface-number*** —Check against incoming interface.<br>• **prefix load balance**—Load balancing is enabled for this prefix.<br>• **sent to PFE**—Route has been sent to the Packet Forwarding Engine.<br>• **static**—Static route. | **extensive** |
| **Nexthop** | IP address of the next hop to the destination. | **detail, extensive** |

**Table 70: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Next hop type (Type)** | Next-hop type. When the **detail** keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):<br>• **broadcast (bcst)**—Broadcast.<br>• **deny**—Deny.<br>• **hold**—Next hop is waiting to be resolved into a unicast or multicast type.<br>• **indexed (idxd)**—Indexed next hop.<br>• **indirect (indr)**—Indirect next hop.<br>• **local (locl)**—Local address on an interface.<br>• **routed multicast (mcrt)**—Regular multicast next hop<br>• **multicast (mcst)**—Wire multicast next hop (limited to the LAN).<br>• **multicast discard (mdsc)**—Multicast discard.<br>• **multicast group (mgrp)** —Multicast group member.<br>• **receive (recv)**—Receive.<br>• **reject (rjct)**—Discard. An ICMP unreachable message was sent.<br>• **resolve (rslv)**—Resolving the next hop.<br>• **unicast (ucst)**—Unicast.<br>• **unilist (ulst)**—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. | **detail, extensive** |
| **Index** | Software index of the next hop that is used to route the traffic for a given prefix. | **detail, extensive**<br>none |

**Table 70: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Route interface-index** | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned. | **extensive** |
| **Reference (NhRef)** | Number of routes that refer to this next hop. | none **detail, extensive** |
| **Next-hop interface (Netif)** | Interface used to reach the next hop. | none **detail, extensive** |
| **Alternate forward nh index** | Index number of the alternate next hop interface. Seen with **multicast** option only. | **extensive** |
| **Next-hop L3 Interface** | The next hop layer 3 interface. This option can be expressed as a VLAN name and is only seen with the **multicast** option. | **extensive** |
| **Next-hop L2 Interfaces** | The next hop layer 2 interfaces. Seen with **multicast** option only. | **extensive** |

### Release Information

Command introduced in Junos OS Release 9.5.

RELATED DOCUMENTATION

Example: Configuring MPLS on EX8200 and EX4500 Switches | 54

*Configuring MPLS on EX8200 and EX4500 Provider Switches*

## show route table

IN THIS SECTION

- Syntax | 3283
- Syntax (EX Series Switches, QFX Series Switches) | 3283
- Description | 3283
- Options | 3283
- Required Privilege Level | 3283
- Output Fields | 3283
- Sample Output | 3301
- Release Information | 3306

## Syntax

```
show route table routing-table-name
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches, QFX Series Switches)

```
show route table routing-table-name
<brief | detail | extensive | terse>
```

## Description

Display the route entries in a particular routing table.

## Options

| | |
|---|---|
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |
| ***routing-table-name*** | Display route entries for all routing tables whose names begin with this string (for example, inet.0 and inet6.0 are both displayed when you run the `show route table inet` command). |

## Required Privilege Level

view

## Output Fields

Table 71 on page 3284 describes the output fields for the `show route table` command. Output fields are listed in the approximate order in which they appear.

**Table 71: show route table Output Fields**

| Field Name | Field Description |
|---|---|
| *routing-table-name* | Name of the routing table (for example, inet.0). |
| Restart complete | All protocols have restarted for this routing table.<br>Restart state:<br>• `Pending:`*`protocol-name`*—List of protocols that have not yet completed graceful restart for this routing table.<br>• `Complete`—All protocols have restarted for this routing table.<br>For example, if the output shows-<br>• `LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden)`<br>`Restart Pending: OSPF LDP VPN`<br>This indicates that `OSPF`, `LDP`, and `VPN` protocols did not restart for the `LDP.inet.0` routing table.<br>• `vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)`<br>`Restart Complete`<br>This indicates that all protocols have restarted for the `vpls_1.l2vpn.0` routing table. |
| *number* destinations | Number of destinations for which there are routes in the routing table. |
| *number* routes | Number of routes in the routing table and total number of routes in the following states:<br>• `active` (routes that are active)<br>• `holddown` (routes that are in the pending state before being declared inactive)<br>• `hidden` (routes that are not used because of a routing policy) |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| *route-destination* (entry, announced) | Route destination (for example:10.0.0.1/24). The `entry` value is the number of routes for this destination, and the `announced` value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:<br>• *MPLS-label* (for example, 80001).<br>• *interface-name* (for example, ge-1/0/2).<br>• *neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source* (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).<br>  • *neighbor-address*—Address of the neighbor.<br>  • *control-word-status*—Whether the use of the control word has been negotiated for this virtual circuit: `NoCtrlWord` or `CtrlWord`.<br>  • *encapsulation type*—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.<br>  • `vc-id`—Virtual circuit identifier.<br>  • *source*—Source of the advertisement: `Local` or `Remote`.<br>• *`inclusive multicast Ethernet tag route`*—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384):<br>  • *route distinguisher*—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.<br>  • *Ethernet tag ID*—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.<br>  • *IP address length*—(1 octet) Length of IP address in bits.<br>  • *originating router's IP address*—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| label stacking | (Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.<br>• `S=0 route` indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).<br>• If there is no `S=` information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed). |
| [*protocol*, *preference*] | Protocol from which the route was learned and the preference value for the route.<br>• `+`—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.<br>• `-`—A hyphen indicates the last active route.<br>• `*`—An asterisk indicates that the route is both the active and the last active route. An asterisk before a `to` line indicates the best subpath to the route.<br>In every routing metric except for the BGP `LocalPref` attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the `LocalPref` value in the `Preference2` field. For example, if the `LocalPref` value for Route 1 is 100, the `Preference2` value is -101. If the `LocalPref` value for Route 2 is 155, the `Preference2` value is -156. Route 2 is preferred because it has a higher `LocalPref` value and a lower `Preference2` value. |
| Level | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Route Distinguisher | IP subnet augmented with a 64-bit prefix. |
| PMSI | Provider multicast service interface (MVPN routing table). |
| Next-hop type | Type of next hop. For a description of possible values for this field, see Table 72 on page 3294. |
| Next-hop reference count | Number of references made to the next hop. |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel. |
| Source | IP address of the route source. |
| Next hop | Network layer address of the directly reachable neighboring system. |
| via | Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word `Selected`. This field can also contain the following information:<br>• Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.<br>• Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Label-switched-path *lsp-path-name* | Name of the LSP used to reach the next hop. |
| Label operation | MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). |
| Interface | (Local only) Local interface name. |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop. |
| Indirect next hop | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops. |
| State | State of the route (a route can be in more than one state). See Table 73 on page 3296. |
| Local AS | AS number of the local routing devices. |
| Age | How long the route has been known. |
| AIGP | Accumulated interior gateway protocol (AIGP) BGP attribute. |
| Metric*n* | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value. |
| MED-plus-IGP | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| TTL-Action | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. |
| Task | Name of the protocol that has added the route. |
| Announcement bits | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, *n*-`Resolve inet` indicates that the specified route is used for route resolution for next hops found in the routing table.<br>• *n*—An index used by Juniper Networks customer support only. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| AS path | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:<br>• `I`—IGP.<br>• `E`—EGP.<br>• `Recorded`—The AS path is recorded by the sample process (sampled).<br>• `?`—Incomplete; typically, the AS path was aggregated.<br>When AS path numbers are included in the route, the format is as follows:<br>• `[ ]`—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.<br>• `[ ]`—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.<br>• `{ }`—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.<br>• `( )`—Parentheses enclose a confederation.<br>• `( [ ] )`—Parentheses and brackets enclose a confederation set.<br>**NOTE**: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| validation-state | (BGP-learned routes) Validation status of the route:<br>• `Invalid`—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.<br>• `Unknown`—Indicates that the prefix is not among the prefixes or prefix ranges in the database.<br>• `Unverified`—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.<br>• `Valid`—Indicates that the prefix and autonomous system pair are found in the database. |
| FECs bound to route | Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured. |
| Primary Upstream | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path. |
| RPF Nexthops | When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks. |
| Label | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| weight | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. |
| VC Label | MPLS label assigned to the Layer 2 circuit virtual connection. |
| MTU | Maximum transmission unit (MTU) of the Layer 2 circuit. |
| VLAN ID | VLAN identifier of the Layer 2 circuit. |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP. |
| Communities | Community path attribute for the route. See Table 74 on page 3299 for all possible values for this field. |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS). |
| control flags | Control flags: `none` or `Site Down`. |
| mtu | Maximum transmission unit (MTU) information. |
| Label-Base, range | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device. |
| status vector | Layer 2 VPN and VPLS network layer reachability information (NLRI). |
| Accepted Multipath | Current active path when BGP multipath is configured. |

**Table 71: show route table Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Accepted LongLivedStale | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag. |
| Accepted LongLivedStaleImport | The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.<br><br>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table |
| ImportAccepted LongLivedStaleImport | Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table<br><br>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. |
| Accepted MultipathContrib | Path currently contributing to BGP multipath. |
| Localpref | Local preference value included in the route. |
| Router ID | BGP router ID as advertised by the neighbor in the open message. |
| Primary Routing Table | In a routing table group, the name of the primary routing table in which the route resides. |
| Secondary Tables | In a routing table group, the name of one or more secondary tables in which the route resides. |

Table 72 on page 3294 describes all possible values for the Next-hop Types output field.

**Table 72: Next-hop Types Output Field Values**

| Next-Hop Type | Description |
|---|---|
| Broadcast (bcast) | Broadcast next hop. |
| Deny | Deny next hop. |
| Discard | Discard next hop. |
| Flood | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| Hold | Next hop is waiting to be resolved into a unicast or multicast type. |
| Indexed (idxd) | Indexed next hop. |
| Indirect (indr) | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected. |
| Interface | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network. |
| Local (locl) | Local address on an interface. This next-hop type causes packets with this destination address to be received locally. |
| Multicast (mcst) | Wire multicast next hop (limited to the LAN). |

**Table 72: Next-hop Types Output Field Values *(Continued)***

| Next-Hop Type | Description |
|---|---|
| Multicast discard (mdsc) | Multicast discard. |
| Multicast group (mgrp) | Multicast group member. |
| Receive (recv) | Receive. |
| Reject (rjct) | Discard. An ICMP unreachable message was sent. |
| Resolve (rslv) | Resolving next hop. |
| Routed multicast (mcrt) | Regular multicast next hop. |
| Router | A specific node or set of nodes to which the routing device forwards packets that match the route prefix.<br><br>To qualify as a next-hop type router, the route must meet the following criteria:<br><br>• Must not be a direct or local subnet for the routing device.<br><br>• Must have a next hop that is directly connected to the routing device. |
| Table | Routing table next hop. |
| Unicast (ucst) | Unicast. |
| Unilist (ulst) | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. |

Table 73 on page 3296 describes all possible values for the State output field. A route can be in more than one state (for example, `<Active NoReadvrt Int Ext>`).

**Table 73: State Output Field Values**

| Value | Description |
|---|---|
| Accounting | Route needs accounting. |
| Active | Route is active. |
| Always Compare MED | Path with a lower multiple exit discriminator (MED) is available. |
| AS path | Shorter AS path is available. |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| Clone | Route is a clone. |
| Cluster list length | Length of cluster list sent by the route reflector. |
| Delete | Route has been deleted. |
| Ex | Exterior route. |
| Ext | BGP route received from an external BGP neighbor. |
| FlashAll | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden | Route not used because of routing policy. |
| IfCheck | Route needs forwarding RPF check. |
| IGP metric | Path through next hop with lower IGP metric is available. |

**Table 73: State Output Field Values *(Continued)***

| Value | Description |
|---|---|
| Inactive reason | Flags for this route, which was not selected as best for a particular destination. |
| Initial | Route being added. |
| Int | Interior route. |
| Int Ext | BGP route received from an internal BGP peer or a BGP confederation peer. |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGP path is available. |
| Local Preference | Path with a higher local preference value is available. |
| Martian | Route is a martian (ignored because it is obviously invalid). |
| MartianOK | Route exempt from martian filtering. |
| Next hop address | Path with lower metric next hop is available. |
| No difference | Path from neighbor with lower IP address is available. |
| NoReadvrt | Route not to be advertised. |
| NotBest | Route not chosen because it does not have the lowest MED. |
| Not Best in its group | Incoming BGP AS is not the best of a group (only one AS can be the best). |

**Table 73: State Output Field Values *(Continued)***

| Value | Description |
|---|---|
| NotInstall | Route not to be installed in the forwarding table. |
| Number of gateways | Path with a greater number of next hops is available. |
| Origin | Path with a lower origin code is available. |
| Pending | Route pending because of a hold-down configured on another route. |
| Release | Route scheduled for release. |
| RIB preference | Route from a higher-numbered routing table is available. |
| Route Distinguisher | 64-bit prefix added to IP subnets to make them unique. |
| Route Metric or MED comparison | Route with a lower metric or MED is available. |
| Route Preference | Route with lower preference value is available. |
| Router ID | Path through a neighbor with lower ID is available. |
| Secondary | Route not a primary route. |
| Unusable path | Path is not usable because of one of the following conditions:<br>• The route is damped.<br>• The route is rejected by an import policy.<br>• The route is unresolved. |

**Table 73: State Output Field Values *(Continued)***

| Value | Description |
|---|---|
| Update source | Last tiebreaker is the lowest IP address value. |
| VxlanLocalRT | Route is an EVPN Type 5 route (IP prefix route). |

Table 74 on page 3299 describes the possible values for the Communities output field.

**Table 74: Communities Output Field Values**

| Value | Description |
|---|---|
| *area-number* | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain. |
| bandwidth: *local AS number:link-bandwidth-number* | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| domain-id | Unique configurable number that identifies the OSPF domain. |
| domain-id-vendor | Unique configurable number that further identifies the OSPF domain. |
| *link-bandwidth-number* | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second). |
| *local AS number* | Local AS number: from 1 through 65,535. |
| *options* | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric. |

**Table 74: Communities Output Field Values *(Continued)***

| Value | Description |
|---|---|
| origin | (Used with VPNs) Identifies where the route came from. |
| *ospf-route-type* | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| route-type-vendor | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is *area-number:ospf-route-type:options*. |
| rte-type | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is *area-number:ospf-route-type:options*. |
| target | Defines which VPN the route participates in; target has the format *32-bit IP address:16-bit number*. For example, 10.19.0.0:100. |
| unknown IANA | Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized. |
| unknown OSPF vendor community | Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized. |
| evpn-mcast-flags | Identifies the value in the multicast flags extended community and whether snooping is enabled. A value of 0x1 indicates that the route supports IGMP proxy. |
| evpn-l2-info | Identifies whether Multihomed Proxy MAC and IP Address Route Advertisement is enabled. A value of 0x20 indicates that the proxy bit is set. .<br><br>Use the `show bridge mac-ip-table extensive` statement to determine whether the MAC and IP address route was learned locally or from a PE device. |

## Sample Output

### show route table bgp.l2vpn.0

```
user@host> show route table bgp.l2vpn.0
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
                   *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
                      AS path: I
                    > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am
```

### show route table inet.0

```
user@host> show route table inet.0

```

### Release Information

Command introduced before Junos OS Release 7.4.

Show route table evpn statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.

### RELATED DOCUMENTATION

show route summary

## show ted database

**IN THIS SECTION**

- Syntax | 3307
- Syntax (EX Series Switches) | 3307
- Description | 3307
- Options | 3307
- Required Privilege Level | 3308
- Output Fields | 3308
- Sample Output | 3312
- Release Information | 3318

## Syntax

```
show ted database
<brief | detail | extensive>
<instance instance-name>
<logical-system (all | logical-system-name)>
<system-name>
<topology-id topology bgp-ls-epe>
```

## Syntax (EX Series Switches)

```
show ted database
<brief | detail | extensive>
<system-name>
```

## Description

Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.

## Options

| | |
|---|---|
| **none** | Display standard information about all entries in the traffic engineering database. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display routing instance information for the specified instance. If *instance-name* is omitted, information is displayed for the master instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| ***system-name*** | (Optional) Display traffic engineering database information for a particular system. |
| **topology-id *topology*** | Display the topology information. By default, traffic engineering topology information is displayed. |

## Required Privilege Level

view

## Output Fields

Table 75 on page 3308 describes the output fields for the `show ted database` command. Output fields are listed in the approximate order in which they appear.

**Table 75: show ted database Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| TED database | Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing. | All levels |
| ID | Hostname and address of the node that the link is coming from. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses. | `brief` |
| NodeID | Hostname and address of the node that the link is coming from. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. | `extensive` |
| Type | Type of node. It can be either `Rtr` (router) or `Net` (pseudonode). | All levels |
| Age(s) | How long since the node was last refreshed, in seconds. | All levels |
| LnkIn | Number of nodes pointing toward this node. | All levels |
| LnkOut | Number of nodes to which this node points. | All levels |

**Table 75: show ted database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Protocol | Protocol that reported the node information:<br>• `IS-IS(1)`—IS-IS Level 1.<br>• `IS-IS(2)`—IS-IS Level 2.<br>• `OSPF (area-number)`—OSPF from the specified area. | All levels |
| To | Address on the far end of a link. | `detail extensive` |
| Local | Address of the local interface being used to reach the remote node. | `detail extensive` |
| Remote | Address of the interface on the remote node. | `detail extensive` |
| Local interface index | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. | `detail extensive` |
| Remote interface index | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. | `detail extensive` |
| Metric | Configured traffic engineering metric. | `extensive` |
| IGP metric | Configured interior gateway protocol metric. | `extensive` |
| Static BW | Total interface bandwidth in bps. | `extensive` |
| Reservable bandwidth | Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the `subscription` statement when configuring RSVP. | `extensive` |

**Table 75: show ted database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Flood reflector client, cluster-id *<number>* | Displays flood-reflector related information on the TE links and the cluster ID that the you have connected at the client side. | `extensive` |
| Flood reflector, cluster-id *<number>* | Displays flood-reflector related information on the TE links and the cluster ID that you have connected in the flood reflector. | `extensive` |
| `Available BW [priority]` | (Must include `diffserv-te` statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP. | `extensive` |
| Diffserv-TE BW Model | Bandwidth constraint model used by the LSPs. | `extensive` |
| `Available BW [TE-class]` | (Must include the `diffserv-te` statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each traffic engineering class. | `extensive` |
| `Static BW [CT-class]` | Total interface bandwidth used by an MPLS traffic class, in bps. | `extensive` |

**Table 75: show ted database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Interface Switching Capability Descriptor (*n*) | Information about the interface switching capability descriptor, which is a subtype length value (TLV) of the link TLV. *n* is the index number.<br>• `Switching type`—Type of switching to be performed on a particular link:<br>  • `PSC-1`—Packet switch-capable 1<br>  • `PSC-2`—Packet switch-capable 2<br>  • `PSC-3`—Packet switch-capable 3<br>  • `PSC-4`—Packet switch-capable 4<br>  • `L2SC`—Layer-2-switch-capable<br>  • `TDM`—Time-division-multiplexing-capable<br>  • `LSC`—Lambda switch-capable<br>  • `FSC`—Fiber switch-capable<br>• `Encoding type`—Encoding of the LSP being requested:<br>  • `Packet`<br>  • `Ethernet`<br>  • `ANSI/ETSI PDH`<br>  • `Reserved`<br>  • `SDH /SONET`<br>  • `Digital Wrapper`<br>  • `Lambda (photonic)`<br>  • `Fiber` | `extensive` |

**Table 75: show ted database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • FiberSDH/SONET<br>• Maximum LSP BW [priority] bps—Maximum LSP bandwidth information. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface.<br>• [*n*]—Priority level. The range is from 0 (high) through 7 (low).<br>• *n* Mbps—Amount of the maximum bandwidth.<br>• Minimum LSP BW—Minimum LSP bandwidth in Mbps. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. Minimum LSP BW is displayed only when switching type is PSC-1 or TDM.<br>• Interface MTU—Displayed only when switching type is TDM.<br>• Interface supports standard SONET/SDH—Displayed only when switching type is TDM. | |

## Sample Output

### show ted database brief

```

```

### Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

`topology-id` *topology* option added in Junos OS Release 17.4R1 for MX Series and PTX Series.

Support for ipv6 introduced on Junos OS Release 20.4R1.

`Flood reflector client, cluster-id` *<number>* and `Flood reflector, cluster-id` *<number>* fields are introduced in the output field of the `show ted database extensive` command in Junos OS Release 21.2R1.

## show ted link

**IN THIS SECTION**

- Syntax | 3319
- Syntax (EX Series Switches) | 3319
- Description | 3319

- Options | 3319
- Required Privilege Level | 3320
- Output Fields | 3320
- Sample Output | 3321
- Release Information | 3324

## Syntax

```
show ted link
<brief | detail>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show ted link
<brief | detail>
```

## Description

Display Multiprotocol Label Switching (MPLS) traffic engineering database link information.

## Options

| | |
|---|---|
| **none** | Display standard information about traffic engineering database link information. |
| **brief \| detail** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display routing instance information for the specified instance. If *instance-name* is omitted, information is displayed for the master instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Output Fields

Table 76 on page 3320 describes the output fields for the `show ted link` command. Output fields are listed in the approximate order in which they appear.

**Table 76: show ted link Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| ID | Hostname and address of the node that the link is coming from. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. | `brief` |
| -->ID | Hostname and address of the node that the link is going to. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. | `brief` |
| *hostname* | Hostname and address of the node that the link is coming from. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. | `detail` |
| *hostname* | Hostname and address of the node that the link is going to. An address of `.00` indicates that the node is the routing device itself. An address in the range `0.01` through `0.FF` indicates that the node is a pseudonode. | `detail` |
| Local Path | Number of paths CSPF on the local routing device has placed on the link. | All levels |
| Metric | Configured traffic engineering metric. | `extensive` |

**Table 76: show ted link Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| IGP metric | Configured interior gateway protocol metric. | `detail` |
| Local BW | Amount of bandwidth the local routing device has placed on the link. | All levels |
| Local | Address of the local interface being used to reach the remote node. | `detail extensive` |
| Remote | Address of the interface on the remote node. | `detail extensive` |
| Local interface index | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. | `detail` |
| Remote interface index | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. | `detail` |

## Sample Output

### Release Information

Command introduced before Junos OS Release 7.4.

`instance` *instance-name* option added in Junos OS Release 15.1.

Support for ipv6 introduced on Junos OS Release 20.4R1.

## show ted protocol

**IN THIS SECTION**

- Syntax | 3325
- Syntax (EX Series Switches) | 3325
- Description | 3325
- Options | 3325
- Required Privilege Level | 3325
- Output Fields | 3325
- Sample Output | 3326
- Release Information | 3326

## Syntax

```
show ted protocol
<brief | detail>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show ted protocol
<brief | detail>
```

## Description

Display information about the protocols from which the Multiprotocol Label Switching (MPLS) traffic engineering database learned about its nodes.

## Options

| | |
|---|---|
| **none** | Display standard information about the protocols from which the traffic engineering database learned about its nodes. |
| **brief \| detail** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display routing instance information for the specified instance. If *instance-name* is omitted, information is displayed for the master instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Output Fields

Table 77 on page 3326 describes the output fields for the `show ted protocol` command. Output fields are listed in the approximate order in which they appear.

**Table 77: show ted protocol Output Fields**

| Field Name | Field Description |
|---|---|
| `Protocol name` | Protocol that reported the node information:<br>• `IS-IS(1)`—IS-IS Level 1.<br>• `IS-IS(2)`—IS-IS Level 2.<br>• `OSPF` (*`area-number`*)—OSPF from the specified area. |
| `Credibility` | If the protocols provide conflicting information about a node, the protocol with the highest credibility value is the one that the traffic engineering database uses. |
| `Self node` | Address the protocol uses as the local address. |

## Sample Output

### show ted protocol

```
user@host> show ted protocol
Protocol name        Credibility  Self node
IS-IS(2)             2  (highest) corriedale.00(123.456.1.11)
IS-IS(1)             1            corriedale.00(123.456.1.11)
```

### command-name

```
user@host> show ted protocol topology-id bgp-ls-epe detail
Protocol name        Credibility  Self node
BGP-LS-EPE(0)        342          200.0.0.4
```

## Release Information

Command introduced before Junos OS Release 7.4.

`instance` *`instance-name`* option added in Junos OS Release 15.1.

## traceroute mpls bgp

**IN THIS SECTION**

- Syntax | **3327**
- Description | **3328**
- Options | **3328**
- Required Privilege Level | **3329**
- Output Fields | **3329**
- Sample Output | **3331**
- Release Information | **3331**

### Syntax

```
traceroute mpls bgp fec
<destination destination-address>
<detail>
<exp exp>
<fanout fanout-number>
<logical-system logical system-name>
<no-resolve>
<paths paths-number>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source source-address>
<ttl value>
<wait seconds>
```

## Description

Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use `traceroute mpls bgp` as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

To use the `traceroute mpls bgp` command, make sure you have BGP routes with MPLS labels.

**NOTE**: The `traceroute mpls bgp` *fec* command only supports single paths.

## Options

| | |
|---|---|
| *fec* | Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, use would want to use the IP address of PE2 to trace the BGP path to that router. |
| **destination** *destination-address* | (Optional) Specify the destination address to use when sending probes. |
| **detail** | (Optional) Display detailed output. |
| **exp** *exp* | (Optional) Specify the class of service to use when sending probes.<br>• **Range:** 0 through 7<br>• **Default:** 7 |
| **fanout** *fanout-number* | (Optional) Specify the maximum number of next hops to search per node.<br>• **Range:** 1 through 16<br>• **Default:** 16 |
| **logical-system** *logical-system-name* | (Optional) Specify the name of the logical system for the traceroute attempt. |
| **no-resolve** | (Optional) Specify not to resolve the hostname that corresponds to the IP address. |
| **paths** *paths-number* | (Optional) Specify the number of paths to search.<br>• **Range:** 1 through 255<br>• **Default:** 16 |

| | |
|---|---|
| **pipe-mode** | (Optional) Specify to trace only the outermost FEC. |
| **retries** *retries-number* | (Optional) Specify the number of times to resend probe values.<br>• **Range:** 1 through 9<br>• **Default:** 3 |
| **routing-instance** *routing-instance-name* | (Optional) Specify the name of the routing instance for the trace route attempt. |
| **source** *source-address* | (Optional) Specify the source address of the outgoing traceroute packets. |
| **ttl** *value* | (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.<br>• **Range:** 1 through 125<br>• **Default:** 64 |
| **wait** *seconds* | (Optional) Specify the number of seconds to wait before resending a probe.<br>• **Range:** 5 though 15<br>• **Default:** 10 |

## Output Fields

Table 78 on page 3329 describes the output fields for the `traceroute mpls bgp` *fec* command and the `traceroute mpls bgp` *fec* `detail` command. Output fields are listed in the approximate order in which they appear.

**Table 78: traceroute mpls bgp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Probe options | Probe options specified in the `traceroute mpls bgp` *fec* command. | All levels |

**Table 78: traceroute mpls bgp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| ttl | Time to live value of the labeled packet. | None |
| Label | Outgoing label used for forwarding the packet along the label-switched paths. | None |
| Protocol | Signaling protocol used. For this command, it is BGP. | None |
| Address | Address of the next hop. | None |
| Previous Hop | Address of the previous hop. Previous hop address of the first hop is `null`. | None |
| Probe status | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). | None |
| Hop | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | `detail` |
| Parent | Address of the previous hop. Parent value for the first hop is `null`. | `detail` |
| Return Code | Return code for reporting the result of processing the echo request by the receiver. | `detail` |
| Response time | Time for the echo request to reach the receiver. | `detail` |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is `none`. | `detail` |
| Label Stack | Label stack used to forward the packet. | `detail` |

## Sample Output

### traceroute mpls bgp

```
user@host> traceroute mpls bgp fec
    Probe options: retries 3, exp 7
ttl Label  Protocol Address  Previous Hop  Probe Status Fec-Stack-Sent Fec-Change
1   299824  LDP     81.1.2.2   (null)      Success     LDP, BGP        PUSH-RSVP
2   299825  RSVP    81.2.3.3   81.1.2.2    Success     RSVP, LDP, BGP  (null)
3   299826  RSVP    81.3.4.4   81.2.3.3    Egress      RSVP, LDP, BGP  POP-RSVP
3   299826  LDP     81.3.4.4   81.2.3.3    Success     LDP, BGP        (null)
4   299827  LDP     81.4.5.5   81.3.4.4    Egress      LDP, BGP        POP-LDP
4   299827  BGP     81.4.5.5   81.3.4.4    Egress      BGP             (null)
```

### traceroute mpls bgp detail

```
user@host> traceroute mpls bgp fec detail
  Probe options: retries 3, exp 7
  Hop 2.2.1.81.rev.sfr.net (81.1.2.2) Depth 1
    Probe status: Success
    Parent: (null)
    Return code: Label switched at stack-depth 1
    Sender timestamp: 2013-03-22 05:55:19 PDT 822.99 msec
    Receiver timestamp: 2013-03-22 05:55:19 PDT 856.05 msec
    Response time: 33.06 msec
    MTU: Unknown
    Multipath type: IP bitmask
      Address Range 1: 127.0.0.64 ~ 127.0.0.127
    Label Stack:
      Label 1 Value 299824 Protocol LDP
      Label 2 Value 299276 Protocol BGP
   Fec-Stack-Sent: LDP, BGP
   Fec-Change:
     Operation: PUSH   Protocol RSVP
```

## Release Information

Command introduced in Junos OS Release 14.2.

RELATED DOCUMENTATION

ping mpls bgp | 3109

## transit (Chained Composite Next Hops)

IN THIS SECTION

- Syntax | 3332
- Hierarchy Level | 3333
- Description | 3333
- Default | 3333
- Options | 3333
- Required Privilege Level | 3334
- Release Information | 3334

### Syntax

```
transit {
    (all | no-all);
    (l2vpn | no-l2vpn);
    (l3vpn | no-l3vpn);
    (labeled-bgp | no-labeled-bgp);
    (ldp | no-ldp);
    (ldp-p2mp | no-ldp-p2mp);
    lsp-statistics-from-route;
    (rsvp | no-rsvp);
    (rsvp-p2mp | no-rsvp-p2mp);
    (static | no-static);
}
```

## Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table chained-composite-
next-hop],
[edit routing-options forwarding-table chained-composite-next-hop]
```

**NOTE**: The `[edit logical-systems]` hierarchy level is not supported on the QFX10000 switches.

## Description

Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available only on PTX Packet Transport Routers and QFX10000 switches.

## Default

All of the `transit` statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a **no** option.

Starting in Junos OS Release 14.1, the `transit l3vpn` statement is enabled by default on PTX Series Packet Transport Routers only.

## Options

| | |
|---|---|
| **all \| no-all** | Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The `all \| no-all` statements do not apply to the `lsp-statistics-from-route` statement. |
| **l2vpn \| no-l2vpn** | Enable or disable chained composite next-hops for Layer 2 VPNs. |
| **l3vpn \| no-l3vpn** | Enable or disable chained composite next-hops for Layer 3 VPNs. |
| **labeled-bgp \| no-labeled-bgp** | Enable or disable chained composite next-hops for labeled BGP. |
| **ldp \| no-ldp** | Enable or disable chained composite next-hops for LDP. |
| **ldp-p2mp \| no-ldp-p2mp** | Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs. |

> **NOTE**: The `ldp-p2mp` and `rsvp-p2mp` statements are not supported on MX series routers.
>
> On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `ldp-p2mp` and `rsvp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current primary logical system to fail at the time of a Routing Engine switchover.

**lsp-statistics-from-route** Enable LSP statistics collection from the route.

**rsvp | no-rsvp** Enable or disable chained composite next-hops for RSVP.

**rsvp-p2mp | no-rsvp-p2mp** Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

> **NOTE**: The `ldp-p2mp` and `rsvp-p2mp` statements are not supported on MX series routers.
>
> On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current primary logical system to fail at the time of a Routing Engine switchover.

**static | no-static** Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

## Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## Release Information

Statement introduced in Junos OS Release 12.1.

Sample Output | 3338
Release Information | 3338

## Syntax

```
clear rsvp session
<all>
<connection-destination address>
<connection-source address>
<gracefully>
<logical-system (all | logical-system-name)>
<lsp-id identifier>
<name name>
<optimize-fast-reroute>
<tunnel-id identifier>
```

## Syntax (EX and QFX Series Switches)

```
clear rsvp session
<connection-destination address>
<connection-source address>
<gracefully>
<lsp-id identifier>
<name name>
<optimize-fast-reroute>
<tunnel-id identifier>
```

## Description

Reset and restart Resource Reservation Protocol (RSVP) sessions.

## Options

**all** Clear all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

| | |
|---|---|
| **connection-source** *address* | (Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template. |
| **connection-destination** *address* | (Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template. |
| **gracefully** | (Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **lsp-id** *identifier* | (Optional) LSP identifier (source port) for the RSVP sender template. |
| **name** *name* | (Optional) Reset and restart the specified RSVP session. |
| **optimize-fast-reroute** | (Optional) Begin fast reroute optimization. |
| **tunnel-id** *identifier* | (Optional) Tunnel identifier (destination port) for the RSVP session. |

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear rsvp session all

```
user@host> clear rsvp session all
```

## Release Information

Command introduced before Junos OS Release 7.4.

## monitor label-switched-path

IN THIS SECTION

- Syntax | 3341

- Description | 3341
- Options | 3341
- Additional Information | 3341
- Required Privilege Level | 3342
- Output Fields | 3342
- Sample Output | 3344
- Release Information | 3345

## Syntax

```
monitor label-switched-path lsp-name
<logical-system (logical-system-name)>
```

## Description

Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

## Options

| | |
|---|---|
| **logical-system (** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| *lsp-name* | Name of the LSP. |

## Additional Information

You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the c key. To control the output of the `monitor label-switched-`

`path` command while it is running, use the keys listed in Table 79 on page 3342. The keys are not case-sensitive.

**Table 79: Output Control Keys for the monitor label-switched-path Command**

| Key | Action |
|---|---|
| c | Clears the screen and refreshes the display for this LSP. |
| f | Freezes the display, preventing new information from being displayed. |
| l | Monitors a different LSP. After you type l, you can type the new LSP name. |
| n | Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router. |
| p | Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router. |
| q or Esc | Quits the command and returns to the command prompt. |
| t | Thaws, or restarts, the data display for this LSP. |

## Required Privilege Level

trace

## Output Fields

Table 80 on page 3343 describes the output fields for the `monitor label-switched-path` command. Output fields are listed in the approximate order in which they appear.

**Table 80: monitor label-switched-path Output Fields**

| Field Name | Field Description |
|---|---|
| (1) | Displays the following information:<br>• *hostname*—Name of the router.<br>• Seconds—Time elapsed since this display was started.<br>• Time—Current local time. |
| (2) | Delay—Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load. |
| (3) | Displays the following:<br>• To—Destination address of the LSP.<br>• From—Originating address of the LSP.<br>• State—Current state of the LSP: Up or Down. |
| (4) | Displays the following:<br>• LSPName—Name of the LSP.<br>• Type—Type of LSP: Ingress, Egress, or Transit. |
| (5) | Displays the following:<br>• Label in—Incoming label of the LSP.<br>• Label out—Outgoing label of the LSP. |
| (6) | Port number—Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0. |

**Table 80: monitor label-switched-path Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| (7/8) | `Record route`—All intermediate and egress router addresses for this LSP. |
| (9/10/11) | Displays traffic statistics:<br>• `Output packets`—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.<br>• `Output bytes`—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago. |
| (12) | Displays any errors the router encountered while attempting to retrieve information on the LSP. |
| (13) | Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see Table 79 on page 3342. |

## Sample Output

### monitor label-switched-path

```
user@host> monitor label-switched-path
(1) host                              Seconds: 112              Time: 15:32:22
(2)                                                              Delay: 0/0/0
(3) To 10.10.10.16, From 10.10.10.17, state: Up
(4)   LSPname: k, type: Ingress
(5)   Label in: -, Label out: 126000
(6)   Port number: sender 1, receiver 45583, protocol 0
(7)   Record Route: <self> 192.168.224.196
(8)     192.168.224.202 192.168.224.179
(9)   Traffic statistics:                                        Current delta
(10)    Output packets:                       0                           [0]
(11)    Output bytes:                         0                           [0]
(12)
(13)Next='n', Prev='p', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c',     LSP='l'
```

### Release Information

Command introduced before Junos OS Release 7.4.

Logical system support introduced in Junos OS Release 9.4.

## ping mpls rsvp

**IN THIS SECTION**

- Syntax | 3345
- Description | 3346
- Options | 3346
- Additional Information | 3347
- Required Privilege Level | 3348
- Output Fields | 3348
- Sample Output | 3348
- Release Information | 3352

### Syntax

```
ping mpls rsvp
<lsp-name>
<count count>
<destination address>
<detail>
<dynamic-bypass>
<egress egress-address>
<exp forwarding-class>
<interface interface-name>
<logical-system (all | logical-system-name)>
<manual-bypass>
<multipoint>
<size bytes>
<source source-address>
```

```
<standby standby-path-name>
<sweep>
```

## Description

Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a `ping mpls` command.

## Options

**count *count***
(Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

**destination *address***
(Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

**detail**
(Optional) Display detailed information about the echo requests sent and received.

> **NOTE**: When using the `detail` option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.
>
> In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the `detail` option (even when synchronized using NTP).

**dynamic-bypass**
(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

**egress *egress-address***
(Optional) Only the specified egress router or switch responds to the ping request.

**exp *forwarding-class***
(Optional) Value of the forwarding class for the MPLS ping packets.

**interface**
(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the `manual-bypass` option.

| | |
|---|---|
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| ***lsp-name*** | Ping an RSVP-signaled LSP using an LSP name. |
| **manual-bypass** | (Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the `interface` option. |
| **multipoint** | (Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the `egress` option to ping a specific egress router or switch participating in a point-to-multipoint LSP. |
| **size *bytes*** | (Optional) Size of the LSP ping request packet (`100` through `65468` bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum. |
| **source *source-address*** | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface. |
| **standby *standby-path-name*** | (Optional) Name of the standby path. |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls rsvp (Echo Reply Received)

```
user@host> ping mpls rsvp test1
!!!!!--- lsping statistics ---5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls rsvp (Echo Reply with Error Code)

```
user@host> ping mpls rsvp test2
!!xxx--- lsping statistics ---5 packets transmitted, 2 packets received, 60% packet loss3
packets received with error status, not counted as received.
```

### ping mpls rsvp detail

```
user@host> ping mpls rsvp to-green detail

### Release Information

Command introduced before Junos OS Release 7.4.

The `egress` and `multipoint` options were introduced in Junos OS Release 9.2.

The `size` and `sweep` options were introduced in Junos OS Release 9.6.

The `dynamic-bypass` and `manual-bypass` options were introduced in Junos OS Release 10.2.

## show rsvp interface

**IN THIS SECTION**

- Syntax | **3352**
- Syntax (EX Series Switches) | **3353**
- Description | **3353**
- Options | **3353**
- Required Privilege Level | **3353**
- Output Fields | **3354**
- Sample Output | **3358**
- Release Information | **3362**

### Syntax

```
show rsvp interface
<brief | detail | extensive>
<instance instance-name>
<link-management>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show rsvp interface
<brief | detail | extensive>
<link-management>
```

## Description

Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The `show rsvp interface detail` command displays these event counters under the `Events` section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the `show rsvp statistics` command.

## Options

| | |
|---|---|
| **none** | Display standard information about the status of RSVP-enabled interfaces and packet statistics. |
| **brief \| detail \| extensive \| link-management** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display RSVP status information for the specified instance. If `instance-name` is omitted, RSVP status information is displayed for the master instance. |
| **link-management** | (Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP). |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

## Output Fields

Table 81 on page 3354 lists the output fields for the `show rsvp interface` command. Output fields are listed in the approximate order in which they appear.

**Table 81: show rsvp interface Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `RSVP interface` | Number of interfaces on which RSVP is active. Each interface has one line of output. | All levels |
| `Interface` | Name of the interface. | All levels |
| `Index` | Index of the interface. | `detail` |
| `State` | State of the interface.<br>• `Disabled`—No traffic engineering information is displayed.<br>• `Down`—Interface is not operational.<br>• `Enabled`—Displays traffic engineering information.<br>• `Up`—Interface is operational. | All levels |
| `NoAuthentication` | Interface does not support RSVP authentication. | `detail` |
| `NoAggregate` | Interface does not support refresh reduction. | `detail` |
| `NoReliable` | Interface does not support refresh reduction message ID extension. | `detail` |
| `NoLinkProtection` | Interface does not support link protection. | `detail` |

**Table 81: show rsvp interface Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| HelloInterval | Frequency at which RSVP hellos are sent on this interface (in seconds).<br><br>Prior to Junos OS Release 18.2R2, when the no-interface-hello statement is configured under the [edit protocols rsvp] hierarchy, and there is no interface-specific configuration for the hello interval, the HelloInteval output field displayed the default hello interval time of 9 seconds. Starting in Junos OS Release 18.2R2, with a similar configuration, the HelloInterval output field displays 0 as the hello interval. | detail |
| Address | IP address of the local interface. | detail |
| Active control channel | Next-hop link address to transmit messages. | None specified |
| TElink | Traffic-engineered links that are managed by the peer they are associated with. | None specified |
| Active resv | Number of reservations that are actively reserving bandwidth on the interface. | All levels |
| PreemptionCnt | Number of times an RSVP session was preempted on this interface. | detail |
| Update threshold | Percentage change in reserved bandwidth to trigger an IGP update. | detail |
| Subscription | User-configured subscription factor. | All levels |
| Actual | Available RSVP bandwidth that is recalculated after considering SPRING bandwidth utilization. | extensive |

**Table 81: show rsvp interface Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `bc number` | Bandwidth allocated for the specified bandwidth constraint. | `extensive` |
| `ct number` | Bandwidth allocated for the specified class type. | `extensive` |
| `Static BW` | Total interface bandwidth, in bps. | All levels |
| `Available BW` | Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor). | al levels |
| `Reserved BW` | Currently reserved bandwidth, in bps. | All levels |
| `SoftPreemptionCnt` | Number of times a soft preemption occurred on this interface. This number is not included in the `PreemptionCnt` value. | `detail` |
| `Overbooked BW` | Currently overbooked bandwidth, in bps, by class type (`ct0` through `ct3`). | `detail` |
| `Highwater mark` | Highest bandwidth that has ever been reserved on this interface, in bps. | `brief` |
| `PacketType` | Type of RSVP packet. | `detail` |
| `Total Sent` | Total number of packets sent. | `detail` |
| `Total Received` | Total number of packets received since RSVP was enabled. | `detail` |
| `Last 5 seconds Sent` | Number of packets sent in the last 5 seconds. | `detail` |

**Table 81: show rsvp interface Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Last 5 seconds Received` | Number of packets received in the last 5 seconds. | `detail` |
| `Path` | Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path. | `detail` |
| `PathErr` | Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender. | `detail` |
| `PathTear` | Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path. | `detail` |
| `Resv` | Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path. | `detail` |
| `ResvErr` | Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails. | `detail` |
| `ResvTear` | Statistics about ResvTear messages, which remove reservation states along a path. | `detail` |
| `Hello` | Number of RSVP hello packets that have been sent to and received from the neighbor. | `detail` |
| `Ack` | Acknowledge message for refresh reductions. | `detail` |
| `Srefresh` | Summary refresh messages. | `detail` |
| `EndtoEnd RSVP` | Statistics for the number of end-to-end RSVP messages sent. | `detail` |

**Table 81: show rsvp interface Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Queue | CoS transmit queue number and its associated forwarding class designation. | extensive |
| TxRate | Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue. | extensive |
| Priority | Weight of the queue relative to other configured queues, in percentage. | extensive |
| *queue-priority-value* | Low, High, None, or Exact. None indicates no rate limiting. Exact indicates the queue transmits at the configured rate only. | extensive |
| subscription*priority percentage* | Indicates per-priority subscription percentage. | extensive |

## Sample Output

### show rsvp interface brief

```
user@host> show rsvp interface brief
RSVP interface: 1 active
                  Active Subscr- Static      Available   Reserved    Highwater
Interface   State resv   iption  BW          BW          BW          mark
de0.0     Up         1    23%    10Mbps      989.992kbps 1.31Mbps    1.31Mbps
```

### show rsvp interface detail

Starting in Junos OS Release 15.2, this command also shows conditional PathTear statistics and Node Hellos.

## Release Information

Command introduced before Junos OS Release 7.4.

`instance` option added in Junos OS Release 15.1 for the MX Series.

# show rsvp neighbor

IN THIS SECTION

- Syntax | 3363
- Syntax (EX Series Switches) | 3363
- Description | 3363
- Options | 3364
- Required Privilege Level | 3364
- Output Fields | 3364
- Sample Output | 3370
- Release Information | 3370

## Syntax

```
show rsvp neighbor
<brief | detail | extensive>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show rsvp neighbor
<brief | detail>
```

## Description

Display Resource Reservation Protocol (RSVP) neighbors that were discovered dynamically during the exchange of RSVP packets.

## Options

| | |
|---|---|
| **none** | Display standard information about RSVP neighbors. |
| **brief \| detail** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display the RSVP neighbor information for the specified instance. If `instance-name` is omitted, RSVP neighbor information is displayed for the master instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

Table 82 on page 3364 lists the output fields for the `show rsvp neighbor` command. Output fields are listed in the approximate order in which they appear.

**Table 82: show rsvp neighbor Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `RSVP neighbor` | Number of neighbors that the routing device has learned of. Each neighbor has one line of output. | All levels |
| `via` | Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected. | `detail` |
| `Address` | Address of a learned neighbor. | All levels |

**Table 82: show rsvp neighbor Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Idle` | Length of time the neighbor has been idle, in seconds.<br><br>**NOTE**: Until Junos OS Release 15.1, in the output of the show rsvp neighbor command, the value under the Idle field immediately reflects the changed idle time when a link in the neighboring router is brought down. Starting with Junos OS Release 15.2, a router does not declare a neighbor as idle when a hello adjacency exists and has not timed out. When an interface is brought down, RSVP brings down the neighbor because of the notification it receives from IGP. The reason for considering the IGP-down notification is to support BFD-triggered fast reroute (FRR) and RSVP-TE is not directly a client for BFD notifications. When RSVP brings down the neighbor, the input/output process is not impacted. As a result, the idle time in the output of the show command is not immediately updated. | All levels |
| `Up/Dn` | Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down. | All levels |
| `Up cnt and Down cnt` | Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down. | `detail` |

**Table 82: show rsvp neighbor Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `status` | State of the RSVP neighbor:<br>• `Up`—Routing device can detect RSVP Hello messages from the neighbor.<br>• `Down`—Routing device has received one of the following indications:<br>  • Communication failure from the neighbor.<br>  • Communication from IGP that the neighbor is unavailable.<br>  • Change in the sequence numbers in the RSVP Hello messages sent by the neighbor.<br>• `Restarting`—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled.<br>• `Restarted`—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures.<br>• `Dead`—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down. | `detail` |
| `LastChange` | Time elapsed since the neighbor state changed either from up to down or from down to up. The format is *hh*:*mm*:*ss*. | All levels |
| `Last changed time` | Time elapsed since the neighbor state changed either from up to down or from down to up. | `detail` |
| `HelloInt` | Frequency at which RSVP hellos are sent on this interface (in seconds). | All levels |
| `HelloTx/Rx` | Number of hello packets sent to and received from the neighbor. | All levels |

**Table 82: show rsvp neighbor Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Hello` | Number of RSVP hello packets that have been sent to and received from the neighbor. | `detail` |
| `Message received` | Number of Path and Resv messages that this routing device has received from the neighbor. | `detail` |
| `Remote Instance` | Identification provided by the remote routing device during Hello message exchange. | `detail` |
| `Local Instance` | Identification sent to the remote routing device during Hello message exchange. | `detail` |
| `Refresh reduction` | Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. `Refresh reduction` can have the following values:<br>• `operational`—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961.<br>• `incomplete`—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices.<br>• `not operational`—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions. | `detail` |

**Table 82: show rsvp neighbor Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Remote end` | Neighboring routing device's status with regard to refresh reduction:<br>• `enabled`—Remote routing device has requested refresh reduction during RSVP message exchanges.<br>• `disabled`—Remote routing device does not require refresh reduction. | `detail` |
| `Pop label` | Pop labels of the RSVP-TE pop-and-forward LSP tunnels. | `detail` |
| `Ack-extension` | An RSVP refresh reduction extension:<br>• `enabled`—Both local and remote routing devices support the ack-extension (RFC 2961).<br>• `disabled`—Remote routing device does not support the ack-extension. | `detail` |
| `Link protection` | Status of the MPLS fast reroute mechanism that protects traffic from link failure:<br>• `enabled`—Link protection feature has been turned on, protecting the neighbor with a bypass LSP.<br>• `disabled`—No link protection feature has been enabled for this neighbor. | `detail` |
| `LSP name` | Name of the bypass LSP. | `detail` |

**Table 82: show rsvp neighbor Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Bypass LSP` | Status of the bypass LSP. It can have the following values:<br>• `does not exist`—Bypass LSP is not available.<br>• `connecting`—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment.<br>• `operational`—Bypass LSP is up and running.<br>• `down`—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path. | `detail` |
| `Backup routes` | Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure). | `detail` |
| `Backup LSPs` | Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence). | `detail` |
| `Bypass explicit route` | Explicit route object's (ERO) path that is taken by the bypass LSP. | `detail` |
| `Restart time` | Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds). | `detail` |
| `Recovery time` | Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed. | `detail` |

## Sample Output

### show rsvp neighbor

```
user@host> show rsvp neighbor
RSVP neighbor: 2 learned
Address            Idle Up/Dn LastChange HelloInt HelloTx/Rx
192.168.207.203       0  3/2       13:01        3   366/349
192.168.207.207       0  1/0       22:49        3   448/448
```

### show rsvp neighbor detail

Starting in Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the neighbor. Neighbors with Point of Local Repair (PLR) or Node Protecting Merge Point (NP-MP) also show the Hellos sent /received count.

```
user@host> show rsvp neighbor detail
RSVP neighbor: 2 learned
Address: 192.168.207.203   via: ecstasyl status: Up
   Last changed time: 28:47, Idle: 0 sec, Up cnt: 3, Down cnt: 2
   Message received: 632
   Hello: sent 673, received 656, interval 3 sec
   Remote instance: 0x6432838a, Local instance: 0x74b72e36
   Refresh reduction:  operational
     Remote end: enabled,  Ack-extension: enabled
   Enhanced FRR local protection: enabled
     LSPs (total 76): Phop 0, PPhop 0, Nhop 76, NNhop 0
   Pop Label: 299808(unprotected) 299840(link-protected)
Link protection:  enabled
     LSP name: Bypass_to_192.168.207.203
     Bypass LSP: operational,  Backup routes: 1,  Backup LSPs: 0
     Bypass explicit route: 192.168.207.207 192.168.207.224
  Restart time: 60000 msec, Recovery time: 0 msec
```

## Release Information

Command introduced before Junos OS Release 7.4.

`instance` option added in Junos OS Release 15.1 for the MX Series.

# show rsvp route-session-id

IN THIS SECTION

- Syntax | 3371
- Description | 3371
- Options | 3371
- Required Privilege Level | 3371
- Output Fields | 3372
- Sample Output | 3372
- Release Information | 3373

## Syntax

```
show rsvp route-session-id
```

## Description

Display the session ID and the version information associated with the ingress route added by the Resource Reservation Protocol (RSVP) in the inet.3 table.

Session ID is a pre-populated identifier used for indirect next hops in BGP Prefix Independent Convergence (PIC) enabled router. Session ID is used to identify the session or path.

**NOTE:** `protect core` configuration is not required to display the `route-session-id`.

## Options

**none** Validate and display RSVP route session details.

## Required Privilege Level

view

## Output Fields

Table 83 on page 3372 describes the output fields for the `show rsvp route-session-id` command. Output fields are listed in the approximate order in which they appear.

**Table 83: show rsvp route-session-id Output Fields**

| Field Name | Field Description |
|---|---|
| Ingress Route Destination | Destination (egress routing device) of the session. |
| Ingress Route Preference | RSVP preference value of the ingress session. |
| Ingress Route Metric 1 | Metric 1 associated with the RSVP ingress route. |
| Ingress Route Metric 2 | Metric 2 associated with the RSVP ingress route. |
| Ingress Route Session ID | Session ID associated with the RSVP ingress route. |
| Version | Version number associated with the RSVP ingress route. |

## Sample Output

### show rsvp route-session-id

```
user@host> show rsvp route-session-id

RSVP Ingress Route Session ID Database:
=======================================
   Ingress Route Destination: 1.1.1.5/32
   Ingress Route Preference:  7
```

```
    Ingress Route Metric 1:    20,        Metric 2:  0
    Ingress Route Session ID:  0x146,     Version:   0
```

### Release Information

Command introduced in Junos OS Release 16.1.

## show rsvp pop-and-forward

**IN THIS SECTION**

- Syntax | 3373
- Description | 3373
- Options | 3374
- Required Privilege Level | 3374
- Sample Output | 3374
- Release Information | 3376

### Syntax

```
show rsvp pop-and-forward
<brief | detail | extensive>
<instance routing-instance-name>
<label label>
<logical-system (all | logical-system-name)>
```

### Description

Display RSVP-TE pop-and-forward LSP tunnel information. This information includes the set of in-labels (one-hop pop label or a delegation label), the number of session using each label and the next segment-label (if there is another delegation hop downstream), and whether the in-label is used for unprotected or protected LSPs.

## Options

| | |
|---|---|
| **none** | Display the standard level of information for the RSVP-TE pop-and-forward LSP tunnels. |
| **brief \| detail \| extensive** | (Optional) Display the desired level of output. The brief option is the default level of output.<br><br>The detail option provides more information about the hops in a delegation segment (whether its one-hop or multi-hop).<br><br>The extensive option lists the set of LSPs that are using a given pop or delegation label. |
| **instance** *routing-instance-name* | (Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified routing instance. |
| **label** *label* | (Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified label. |
| **logical-system (all \|** *logical-system-name***)** | (Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for all or the specified logical system. |

## Required Privilege Level

view

## Sample Output

### show rsvp pop-and-forward

```
user@host> show rsvp pop-and-forward
RSVP pop-and-forward: 2 shared labels
Label-in     Hop-count  Next-segment- Protection     Session-
                        label                        count
299840       3          299808        unprotected    100
299872       3          299824        unprotected    50
```

### show rsvp pop-and-forward extensive

```
user@host> show rsvp pop-and-forward extensive
RSVP pop-and-forward: 2 shared labels
299840 (shared-label)
  Next-segment-label: 299808, Hop-count: 3
  Protection: unprotected, Session-count: 2
  Segment-id:
    Hop 1: 70.1.1.2(label=299808)
    Hop 2: 92.1.1.1(label=299808)
    Hop 3: 93.1.1.2
  Segment route:
    Primary: 70.1.1.2, OutIf: ge-0/0/2.0
  Lsp-session list (name, dest-ip, sender-ip, lsp-id):
    pop1, 10.10.10.10, 2.2.2.2, 2
    pop2, 10.10.10.10, 2.2.2.2, 1

299872 (shared-label)
  Next-segment-label: 299824, Hop-count: 3
  Protection: unprotected, Session-count: 4
  Segment-id:
    Hop 1: 70.1.1.2(label=299808)
    Hop 2: 92.1.1.1(label=299808)
    Hop 3: 93.1.1.2
  Segment route:
    Primary: 70.1.1.2, OutIf: ge-0/0/2.0
  Lsp-session list (name, dest-ip, sender-ip, lsp-id):

### Syntax

```
show rsvp session
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<bypass>
<down | up>
<externally-provisioned>
<instance instance-name>
<interface interface-name>
```

```
<logical-system (all | logical-system-name)>
<lsp-type>
<name session-name>
<p2mp>
<session-type>
<statistics>
<te-link te-link>
```

## Syntax (EX and QFX Series Switches)

```
show rsvp session
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<bypass>
<down | up>
<externally-provisioned>
<interface interface-name>
<lsp-type>
<name session-name>
<p2mp>
<session-type>
<statistics>
<te-link te-link>
```

## Description

Display information about RSVP sessions.

## Options

| | |
|---|---|
| **none** | Display standard information about all RSVP sessions. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. |
| **bidirectional \| unidirectional** | (Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively. |
| **bypass** | (Optional) Display RSVP sessions for bypass LSPs. |
| **down \| up** | (Optional) Display only LSPs that are inactive or active, respectively. |

**externally-provisioned** (Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name*** (Optional) Display RSVP sessions for the specified instance. If `instance-name` is omitted, RSVP session information is displayed for the master instance.

**interface *interface-name*** (Optional) Display RSVP sessions for the specified interface only.

RSVP reserves resources only for outgoing LSPs of an interface. Because resources are not reserved for incoming LSPs, the `show rsvp sessions interface` *`interface-name`* command output displays only those RSVP sessions whose next hops correspond to the specified interface.

To identify the number of RSVP sessions formed over the uplink interface on the egress label-switching router (LSR), you can use the following command:

```
user@host> show rsvp session egress extensive | match "PATH rcvfrom:"
| match interface-name | count
```

**logical-system (all | *logical-system-name*)** (Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type*** (Optional) Display information about RSVP sessions with regard to LSPs:

- `bypass`—Sessions used for bypass LSPs.
- `lsp`—Sessions used to set up LSPs.
- `nolsp`—Sessions not used to set up LSPs.

**name *session-name*** (Optional) Display information about the named session.

**p2mp** (Optional) Display point-to-multipoint information.

***session-type*** (Optional) Display information about a particular session type:

- `egress`—Sessions that terminate on this routing device.

To identify the number of RSVP sessions formed over the uplink interface on the egress label-switching router (LSR), you can use the following command:

```
user@host> show rsvp session egress extensive | match "PATH
rcvfrom:" | match interface-name | count
```

- `ingress`—Sessions that originate from this routing device.
- `transit`—Sessions that transit through this routing device.

**statistics** (Optional) Display packet statistics.

**te-link *te-link*** (Optional) Display sessions with reservations on the specified TE link.

## Required Privilege Level

view

## Output Fields

Table 84 on page 3379 describes the output fields for the `show rsvp session` command. Output fields are listed in the approximate order in which they appear.

**Table 84: show rsvp session Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Ingress RSVP` | Information about ingress RSVP sessions. | `detail` |
| `Ingress RSVP` | Information about ingress RSVP sessions. Each session has one line of output. | All levels |
| `Egress RSVP` | Information about egress RSVP sessions. | All levels |
| `Transit RSVP` | Information about the transit RSVP sessions. | All levels |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| P2MP name | (Appears only when the p2mp option is specified). Name of the point-to-multipoint LSP path. | All levels |
| P2MP branch count | (Appears only when the p2mp option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP. | All levels |
| To | Destination (egress routing device) of the session. | All levels |
| From | Source (ingress routing device) of the session. | All levels |
| State | State of the path: Up, Down, or AdminDn. AdminDn indicates that the LSP is being taken down gracefully. | All levels |
| Address | Destination (egress routing device) of the LSP. | detail |
| From | Source (ingress routing device) of the session. | detail |
| LSPstate | State of the LSP that is being handled by this RSVP session. It can be either Up, Dn (down), or AdminDn. AdminDn indicates that the LSP is being taken down gracefully. | brief detail |
| Rt | Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table mpls.0). | brief |
| Active Route | Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (mpls.0). | detail |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `LSPname` | Name of the LSP. | `brief detail` |
| `LSPpath` | Indicates whether the RSVP session is for the primary or secondary LSP path. `LSPpath` can be either `primary` or `secondary` and can be displayed on the ingress, egress, and transit routing devices. `LSPpath` can also indicate when a graceful LSP deletion has been triggered. | `detail` |
| `Bypass` | (Egress routing device) Destination address for the bypass LSP. | `detail` |
| `Bidir` | (When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices. | `detail` |
| `Bidirectional` | (When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices. | `detail` |
| `Upstream label in` | (When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP. | `detail` |
| `Upstream label out` | (When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP. | `detail` |
| `Recovery label received` | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent. | `detail` |
| `Recovery label sent` | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned. | `detail` |
| `Suggested label received` | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent. | `detail` |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Suggested label sent` | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned. | `detail` |
| `Resv style` or `Style` | RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be `FF` (fixed filter), `SE` (shared explicit), or `WF` (wildcard filter). | `brief detail` |
| `Label in` | Incoming label for this LSP. | `brief detail` |
| `Label out` | Outgoing label for this LSP. | `brief detail` |
| `Time left` | Number of seconds remaining in the lifetime of the reservation. | `brief detail` |
| `Since` | Date and time when the RSVP session was initiated. | `detail` |
| `Tspec` | Sender's traffic specification, which describes the sender's traffic parameters. | `detail` |
| `Fspec` | Indicates signaling of LSP bandwidth change with the same lsp-id completion within a stipulated time duration | `detail` |
| `DiffServ info` | Indicates whether the LSP is a multiclass LSP (`multiclass diffServ-TE LSP`) or a Differentiated-Services-aware traffic engineering LSP (`diffServ-TE LSP`). | `detail` |
| `bandwidth` | Bandwidth for each class type (`ct0`, `ct1`, `ct2`, or `ct3`). | `detail` |
| `Port number` | Protocol ID and sender/receiver port used in this RSVP session. | `detail` |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Attrib flags` | `Non-PHP` indicates that ultimate hop popping has been requested by the LSP using this RSVP session | extensive |
| `FastReroute desired` | Fast reroute has been requested by the ingress routing device. | `detail` |
| `Soft preemption desired` | Soft preemption has been requested by the ingress routing device. | `detail` |
| `FastReroute desired` | (Data [not a bypass or backup] LSP when the protection scheme has been requested) Fast reroute (one-to-one backup) has been requested by the ingress routing device. | `detail extensive` |
| `Link protection desired` | (Data [not a bypass or backup] LSP when the protection scheme has been requested) Link protection (many-to-one backup) has been requested by the ingress routing device. | `detail extensive` |
| `Node/Link protection desired` | (Data [not a bypass or backup] LSP when the protection scheme has been requested) Node and link protection (many-to-one backup) has been requested by the ingress routing device. | `detail extensive` |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Type` | LSP type:<br>• `Link protected LSP`—LSP has been protected by link protection at the outgoing interface. The name of the bypass used is also listed here (`extensive`).<br>• `Node/Link protected LSP`—LSP has been protected by node and link protection at the outgoing interface. The name of the bypass used is also listed here (`extensive`).<br>• `Protection down`—LSP is not currently protected.<br>• `Bypass LSP`—LSP that is used to protected one or more user LSPs in case of link failure.<br>• `Backup LSP at Point-of-Local-Repair (PLR)`—LSP that has been temporarily established to protected a user LSP at the ingress of a failed link.<br>• `Backup LSP at Merge Point (MP)`—LSP that has been temporarily established to protected a user LSP at the egress of a failed link. | `detail extensive` |
| `New bypass` | New bypass (the bypass name is also displayed) has been activated to protect the LSP. | `extensive` |
| `Link protection up, using` *`bypass-name`* | Link protection (the bypass name is also displayed) has been activated for the LSP. | `extensive` |
| `Creating backup LSP, link down` | A `link down` event occurred, and traffic is being switched over to the bypass LSP. | `extensive` |
| `Deleting backup LSP, protected LSP restored` | Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted. | `extensive` |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Path mtu` | Displays the value of the path MTU received from the network (through signaling) and the value used for forwarding. This value is only displayed on ingress routing devices with the `allow-fragmentation` statement configured at the `[edit protocols mpls path-mtu]` hierarchy level. If there is a detour LSP, the path MTU for the detour is also displayed. | `detail` |
| Egress protection PLR as protector | RSVP state on the Protector or the point-of-local-repair (PLR) routing device:<br>• `Active`— Egress protection is available at the Protector or the PLR routing device.<br>• `In Use`— Local repair has been completed. | `detail` |
| `PATH rcvfrom` | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. | `detail` |
| `Adspec` | MTU signaled from the ingress routing device to the egress routing device by means of the adspec object. | `detail` |
| `PATH sentto` | Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor (or peer-name in the GMPLS LSP case), and number of packets sent to the downstream routing device. | `detail` |
| `Explct hop <ip-address> expanded` | Displays the specific hop in the EROs that has been expanded by the router. | `extensive` |
| `Explct route` | Explicit route for the session. Normally this value will be the same as that of record route. Differences indicate that path rerouting has occurred, typically during fast reroute. | `detail` |

**Table 84: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Record route` | Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute. | `detail` |

## Sample Output

### show rsvp session

```
user@host> show rsvp session

### show rsvp session extensive transit

Starting in Junos OS Release 16.1, this command also shows node-related details, including whether enhanced local protection is enabled for the LSP and whether the node is a merge point. If the latter is true, both the IP address of the Point of Local Repair (PLR) and the status (LP-MP, NP-MP, or Non-MP) are shown.

```
user@host> show rsvp session extensive transit
  From: 81.1.1.1, LSPstate: Up, ActiveRoute: 0
  LSPname: A-D-1, LSPpath: Primary
  Suggested label received: -, Suggested label sent: -

## Release Information

Command introduced before Junos OS Release 7.4.

`externally-provisioned` option added in Junos OS Release 13.3.

`instance` option added in Junos OS Release 15.1 for the MX Series.

`Explct hop` *`<ip-address>`* `expanded` fields are introduced in the output field of the `show rsvp session` command in Junos OS Release 21.2R1.

### Syntax

```
show rsvp session
<brief | detail | extensive | terse>
<bidirectional | unidirectional>
<down | up>
<interface interface-name>
<lsp-type>
<name session-name>
<session-type>
<statistics>
<te-link te-link>
```

### Description

Display information about Resource Reservation Protocol (RSVP) sessions.

## Options

| | |
|---|---|
| **none** | Display standard information about all RSVP sessions. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. |
| **bidirectional \| unidirectional** | (Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively. |
| **down \| up** | (Optional) Display only LSPs that are inactive or active, respectively. |
| **interface** *interface-name* | (Optional) Display RSVP sessions for the specified interface only. |
| *lsp-type* | (Optional) Display information about RSVP sessions with regard to LSPs:<br>• **bypass**—Sessions used for bypass LSPs.<br>• **lsp**—Sessions used to set up LSPs.<br>• **nolsp**—Sessions not used to set up LSPs. |
| **name** *session-name* | (Optional) Display information about the named session. |
| *session-type* | (Optional) Display information about a particular session type:<br>• **egress**—Sessions that terminate on this switch.<br>• **ingress**—Sessions that originate from this switch.<br>• **transit**—Sessions that transit through this switch. |
| **statistics** | (Optional) Display packet statistics. |
| **te-link** *te-link* | (Optional) Display sessions with reservations on the specified traffic-engineered link name. |

## Output Fields

Table 85 on page 3397 describes the output fields for the `show rsvp session` command. Output fields are listed in the approximate order in which they appear.

**Table 85: show rsvp session Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Ingress RSVP** | Information about ingress RSVP sessions. | **detail** |
| **Ingress RSVP** | Information about ingress RSVP sessions. Each session has one line of output. | All levels |
| **Egress RSVP** | Information about egress RSVP sessions. | All levels |
| **Transit RSVP** | Information about the transit RSVP sessions. | All levels |
| **To** | Destination (egress switch) of the session. | All levels |
| **From** | Source (ingress switch) of the session. | All levels |
| **State** | State of the path: **Up**, **Down**, or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully. | All levels |
| **Address** | Destination (egress switch) of the LSP. | **detail** |
| **LSPstate** | State of the LSP that is being handled by this RSVP session. It can be either **Up**, **Dn** (down), or **AdminDn**. **AdminDn** indicates that the LSP is being taken down gracefully. | **brief, detail** |
| **Rt** | Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the routing table is the primary MPLS table **mpls.0**). | **brief** |

**Table 85: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **ActiveRoute** | Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (**inet.0**). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (**mpls.0**). | **detail** |
| **LSPname** | Name of the LSP. | **brief, detail** |
| **LSPpath** | Indicates whether the RSVP session is for the primary or secondary LSP path. **LSPpath** can be either **primary** or **secondary** and can be displayed on the ingress, egress, and transit switches. **LSPpath** can also indicate when a graceful LSP deletion has been triggered. | **detail** |
| **Recovery label received** | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent. | **detail** |
| **Recovery label sent** | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned. | **detail** |
| **Suggested label received** | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent. | **detail** |
| **Suggested label sent** | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned. | **detail** |
| **Resv style** or **Style** | RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be **FF** (fixed filter), **SE** (shared explicit), or **WF** (wildcard filter). | **brief detail** |
| **Label in** | Incoming label for this LSP. | **brief, detail** |

**Table 85: show rsvp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Label out** | Outgoing label for this LSP. | **brief, detail** |
| **Time left** | Number of seconds remaining in the lifetime of the reservation. | **brief, detail** |
| **Since** | Date and time when the RSVP session was initiated. | **detail** |
| **Tspec** | Sender's traffic specification, which describes the sender's traffic parameters. | **detail** |
| **Port number** | Protocol ID and sender/receiver port used in this RSVP session. | **detail** |
| **Creating backup LSP, link down** | A **link down** event occurred, and traffic is being switched over to the bypass LSP. | **extensive** |
| **Deleting backup LSP, protected LSP restored** | Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted. | **extensive** |
| **PATH rcvfrom** | Address of the previous-hop (upstream) switch or client, interface the neighbor used to reach this switch, and number of packets received from the upstream neighbor. | **detail** |

## Sample Output

### show rsvp session

```
user@switch> show rsvp session
Ingress RSVP: 1 sessions

## Syntax

```
show rsvp statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show rsvp statistics
```

## Description

Display Resource Reservation Protocol (RSVP) packet and error statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of

these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.

## Options

| | |
|---|---|
| **none** | Display RSVP packet and error statistics. |
| **instance** *instance-name* | (Optional) Display RSVP packet and error statistics for the specified instance. If `instance-name` is omitted, RSVP statistics are displayed for the master instance. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Output Fields

Table 86 on page 3403 describes the output fields for the `show rsvp statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 86: show rsvp statistics Output Fields**

| Field Name | Field Description |
|---|---|
| **Packet Type** | Statistics about different RSVP messages. |
| **Total Sent** | Total number of packets sent since RSVP was enabled. |
| **Total Received** | Total number of packets received since RSVP was enabled. |
| **Last 5 seconds Sent** | Total number of packets sent in the last 5 seconds. |
| **Last 5 seconds Received** | Number of packets received in the last 5 seconds. |

**Table 86: show rsvp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Path** | Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path. |
| **PathErr** | Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender. |
| **PathTear** | Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path. |
| **Resv FF** | Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders. |
| **Resv WF** | Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders. |
| **Res SE** | Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders. |
| **ResvErr** | Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails. |
| **ResvTear** | Statistics about ResvTear messages, which remove reservation states along a path. |
| **ResvConf** | Statistics about ResvConfirm messages, which are responses to confirm a reservation request. |
| **Ack** | Acknowledge message for refresh reductions. |
| **SRefresh** | Summary refresh messages. |

**Table 86: show rsvp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Hello** | Number of RSVP hello packets that have been sent to and received from the neighbor. |
| **EndtoEnd RSVP** | Statistics for the number of End-to-end RSVP messages. |
| **Errors** | Statistics about errored RSVP packets. |
| **Rcv pkt bad length** | The packet was not processed because its length is inappropriate. |
| **Rcv pkt unknown type** | The packet is not one of the well-known RSVP types, as defined in RFC 2205, *Resource ReSerVation Protocol (RSVP)*. |
| **Rcv pkt bad version** | The packet is not an RSVP version 1 packet. |
| **Rcv pkt auth fail** | The packet failed authentication checks. |
| **Rcv pkt bad checksum** | The RSVP checksum check failed. |
| **Rcv pkt bad format** | General packet processing failed because the packet was badly formed. |
| **Memory allocation fail** | An internal resource failure occurred. |
| **No path information** | A reservation was received, but no sender is active. |
| **Resv style conflict** | The same session contains inconsistent reservation styles. |

**Table 86: show rsvp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Port conflict** | There were inconsistent port numbers for the same session. |
| **Resv no interface** | An interface for the receive reservation packets cannot be located. |
| **PathErr to client** | Number of PathErr packets delivered to the local client. |
| **ResvErr to client** | Number of ResvErr packets delivered to the local client. |
| **Path timeout** | Number of times the sender timed out because the path was removed. |
| **Resv timeout** | Number of times the receiver timed out because the reservation was removed. |
| **Message out-of-order** | Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number. |
| **Unknown ack msg** | A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1. |
| **Recv nack** | If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again. |
| **Recv duplicated msg-id** | Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts. |
| **No TE-link to recv Hop** | Counter of packets discarded because a TE link was not found. |

**Table 86: show rsvp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Rcv pkt disabled interface** | Number of RSVP packets received on an interface that is not enabled for RSVP. |
| **Transmit buffer full** | Number of times the buffer for assembling an outgoing RSVP message was not large enough. |
| **Transmit failure** | Number of times the RSVP task failed to send out a packet. |
| **Receive failure** | Number of times the RSVP task failed to read an incoming packet. |
| **P2MP RESV discarded by appl** | Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application. |
| **Rate limit** | Number of RSVP packets dropped due to rate limiting. |
| **Err msg loop detected** | Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object. |

## Sample Output

### show rsvp statistics

Starting in Junos OS Release 16.1, this command also shows conditional PathTear statistics and the number of times an LSP state has been retained because of Link Protecting Merge Point (LP-MP) or Node Protecting Merge Point (NP-MP) determination.

```
user@host> show rsvp statistics
   PacketType              Total                 Last 5 seconds

- Release Information | 3416

### Syntax

```
show rsvp version
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switches)

```
show rsvp version
```

## Description

Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.

## Options

| | |
|---|---|
| **none** | Display RSVP protocol settings. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

Table 87 on page 3412 describes the output fields for the `show rsvp version` command. Output fields are listed in the approximate order in which they appear.

**Table 87: show rsvp version Output Fields**

| Field Name | Field Description |
|---|---|
| **Resource ReSerVation Protocol, version** | RSVP software version. |
| **RSVP protocol** | Status of RSVP: **Enabled** or **Disabled**. |
| **R(refresh timer)** | Configured time interval used to generate periodic RSVP messages. |

**Table 87: show rsvp version Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **K(keep multiplier)** | Number of RSVP messages that can be lost before an RSVP state is declared stale. |
| **Preemption** | Currently configured preemption capability: **Aggressive**, **Disabled**, or **Normal**. The default is **Normal**. |
| **Soft-preemption cleanup** | Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol. |
| **Graceful deleting timeout** | Currently configured value for the `graceful-deletion-timeout` statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down. |
| **NSR Mode** | Status of the nonstop active routing feature for RSVP on the restarting device: **Disabled**, **Enabled/Master**, or **Enabled/Standby**. |
| **NSR State** | State of the nonstop active routing feature for RSVP on the restarting device.<br>Possible values are:<br>• **Idle**<br>• **TE-link sync complete**<br>• **Neighbor sync complete**<br>• **Path state sync complete**<br>• **Resv state sync complete**<br>• **Bypass sync complete**<br>• **Init sync complete** |

**Table 87: show rsvp version Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Setup protection** | Status of point-to-point and point-to-multipoint LSP setup protection configuration on the device: **Enabled** or **Disabled**. |
| Route Session-Id count | Total count of session IDs associated with the combination of all the RSVP ingress routes.<br><br>**NOTE**: Starting in Junos OS Release 16.1, the `show rsvp version` command output displays the `Route Session-Id count` output field by default, irrespective of the presence of associated session IDs.<br>When there are no session IDs associated with any RSVP ingress route, the *Route Session-Id count* value is zero (0). |
| **Graceful restart** | Status of the graceful restart feature for RSVP on the restarting routing device: **Enabled** or **Disabled**. |
| **Restart helper mode** | Status of the helper mode feature: **Enabled** or **Disabled**. When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures. |
| **Maximum helper restart time** | Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down. |
| **Maximum helper recovery time** | Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully. |
| **Restart time** | Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states. |

**Table 87: show rsvp version Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Recovery time** | Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed. |
| **P2p transit LSP nexthop mode** | Point-to-point transit LSP next-hop mode on PTX Series devices. The possible values are **Chained** or **Unchained**. |
| **P2mp transit LSP nexthop mode** | Point-to-multipoint transit LSP next-hop mode on PTX Series devices. The possible values are **Chained** or **Unchained**. |

## Sample Output

### show rsvp version

Starting with Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the router.

```
user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
   RSVP protocol:                Enabled
   R(refresh timer):             30 seconds
   K(keep multiplier):           3
   Preemption:                   Normal
   Soft-preemption cleanup:      30 seconds
   Graceful deletion timeout:    30 seconds
   NSR mode:                     Enabled/Master
   NSR state:                    Init sync complete
   Setup protection:             Disabled
   Route Session-Id count:       1
   Graceful restart:             Disabled
   Restart helper mode:          Enabled
   Maximum helper restart time:  20000 msec
   Maximum helper recovery time: 180000 msec
   Restart time:                 0 msec
```

```
    P2p transit LSP nexthop mode: Unchained
    P2mp transit LSP nexthop mode: Unchained
    Enhanced FRR local protection: Enabled
```

### Release Information

Command introduced before Junos OS Release 7.4.

## traceroute mpls rsvp

**IN THIS SECTION**

- Syntax | **3416**
- Description | **3417**
- Options | **3417**
- Required Privilege Level | **3417**
- Output Fields | **3417**
- Sample Output | **3419**
- Release Information | **3421**

### Syntax

```
traceroute mpls <rsvp> lsp-name
<detail>
<egress>
<exp>
<logical-system>
<multipoint>
<no-resolve>
<retries>
<source source-address>
<ttl>
```

## Description

Trace route to a remote host for an MPLS LSP signaled by RSVP. Use `traceroute mpls rsvp` as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)

## Options

| | |
|---|---|
| *lsp-name* | Specify the name of the LSP to be traced. |
| **detail** | (Optional) Display detailed output. |
| **egress** | (Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node. |
| **exp** | (Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7. |
| **logical-system** | (Optional) Specify the name of the logical system for the traceroute attempt. |
| **multipoint** | (Optional) Perform a trace route on a point-to-multipoint LSP. |
| **no-resolve** | (Optional) Specify not to resolve the hostname that corresponds to the IP address. |
| **retries** | (Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3. |
| **source** *source-address* | (Optional) Specify the source address of the outgoing traceroute packets. |
| **ttl** | (Optional) Specify the number of hops to follow before forcing the trace route to quit. |

## Required Privilege Level

network

## Output Fields

Table 88 on page 3418 describes the output fields for the `traceroute mpls rsvp` *lsp-name* and `traceroute mpls rsvp` *lsp-name* `detail` commands. Output fields are listed in the approximate order in which they appear.

**Table 88: traceroute mpls rsvp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Probe options | Probe options specified in the `traceroute mpls rsvp` *`lsp-name`* command. | all levels |
| ttl | Time-to-live value of the labeled packet. | none specified |
| Label | MPLS label used to forward the packets along the LSP. | none specified |
| Protocol | Signaling protocol used. For this command, it is RSVP-TE. | none specified |
| Address | Address of the next hop. | none specified |
| Previous Hop | Address of the previous hop. Previous hop address of the first hop is null. | none specified |
| Probe status | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays `Success` if the trace to a hop is successful or `Egress` if the trace has reached the last router on the path. | none specified |
| Hop | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | `detail` |
| Parent | Address of the previous hop. Parent value for the first hop is null. | `detail` |
| Return Code | Return code for reporting the result of processing the echo request by the receiver. | `detail` |
| Sender timestamp | Displays the timestamp when the MPLS echo request is sent to the next hop. | `detail` |

**Table 88: traceroute mpls rsvp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Receiver timestamp | Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop. | `detail` |
| Response time | Time for the echo request to reach the receiver. | `detail` |
| MTU | Size of the largest packet that includes the label stack forwarded to the next hop. | `detail` |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none. | `detail` |
| Label stack | Label stack used to forward the packet. | `detail` |
| Path | Displays the sub-lsp path number for this traceroute, the interface used, and the destination address. | all levels |

## Sample Output

### traceroute mpls rsvp

       Address Range 1: 127.0.0.64 ~ 127.0.0.127
     Label Stack:
       Label 1 Value 299803 Protocol RSVP-TE
```

### traceroute mpls rsvp multipoint (branch node for sub-LSPs)

The following traceroute output is for a point-to-multipoint LSP where the penultimate node is a branch node for the sub-LSPs.

```
user@host> traceroute mpls rsvp multipoint p2mplsp
  Probe options: retries 3, exp 7

  ttl    Label  Protocol    Address          Previous Hop     Probe Status
```

```
    1   300000  RSVP-TE     81.1.2.2         (null)          Success
    2   299968  RSVP-TE     81.2.3.3         81.1.2.2        Success
    3   299952  RSVP-TE     81.3.4.4         81.2.3.3        Success
    4   299920  RSVP-TE     81.4.6.6         81.3.4.4        Egress

  Path 1 via lt-1/2/0.102 destination 127.0.0.64

  ttl    Label  Protocol    Address          Previous Hop    Probe Status
    4   299920  RSVP-TE     81.4.5.5         81.3.4.4        Egress

  Path 2 via lt-1/2/0.102 destination 127.0.0.64
```

### traceroute mpls rsvp multipoint (single-hop sub-LSPs)

The following traceroute output is for a point-to-multipoint LSP with multiple single-hop sub-LSPs.

```
user@host> traceroute mpls rsvp multipoint p2mplsp
  Probe options: retries 3, exp 7

   ttl    Label  Protocol    Address          Previous Hop    Probe Status
     1        0  RSVP-TE     81.1.2.2         (null)          Egress

   Path 1 via lt-1/2/0.102 destination 127.0.0.64

   ttl    Label  Protocol    Address          Previous Hop    Probe Status
     1        0  RSVP-TE     81.1.8.8         (null)          Egress

   Path 2 via lt-1/2/0.108 destination 127.0.0.64

   ttl    Label  Protocol    Address          Previous Hop    Probe Status
     1        0  RSVP-TE     81.1.9.9         (null)          Egress

   Path 3 via lt-1/2/0.109 destination 127.0.0.64
```

## Release Information

Command introduced in Junos OS Release 9.2.

`egress`, `multipoint`, and `ttl` options added in Junos OS Release 11.2.

# clear ldp neighbor

IN THIS SECTION

- Syntax | 3423
- Description | 3423
- Options | 3423
- Required Privilege Level | 3424
- Output Fields | 3424
- Sample Output | 3424

## Syntax

```
clear ldp neighbor
<instance instance-name>
<logical-system (all | logical-system-name)>
<neighbor>
```

## Description

Tear down Label Distribution Protocol (LDP) neighbor connections.

## Options

| | |
|---|---|
| **none** | Tear down connections with all LDP neighbors for all routing instances. |
| **instance *instance name*** | (Optional) Clear the LDP session for the specified routing instance only. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| ***neighbor*** | (Optional) Clear an LDP session for the specified neighbor (IP address) only. |

### Required Privilege Level

clear

### Output Fields

When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear ldp neighbor

```
user@host> clear ldp neighbor
```

RELATED DOCUMENTATION

- show ldp neighbor | 3468

## clear ldp session

IN THIS SECTION

- Syntax | 3425
- Description | 3425
- Options | 3425
- Required Privilege Level | 3425
- Output Fields | 3425
- Sample Output | 3425
- Release Information | 3426

## Syntax

```
clear ldp session
<all>
<destination>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Clear Label Distribution Protocol (LDP) sessions.

## Options

| | |
|---|---|
| **all** | Clear LDP sessions for all destinations for all routing instances. |
| ***destination*** | (Optional) Clear an LDP session for the specified destination (IP address). |
| **instance *instance-name*** | (Optional) Clear the LDP session for the specified routing instance only. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ldp session

```
user@host> clear ldp session all
```

### Release Information

Command introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

show ldp session | 3496

## clear ldp statistics

IN THIS SECTION

- Syntax | 3426
- Description | 3426
- Options | 3427
- Required Privilege Level | 3427
- Output Fields | 3427
- Sample Output | 3427
- Release Information | 3427

### Syntax

```
clear ldp statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
```

### Description

Set all Label Distribution Protocol (LDP) statistics to zero.

## Options

| | |
|---|---|
| **none** | Set all LDP statistics to zero for all routing instances. |
| **instance** *instance-name* | (Optional) Clear the LDP session for the specified routing instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ldp statistics

```
user@host> clear ldp statistics
```

## Release Information

Command introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

show ldp statistics | 3507

show ldp traffic-statistics | 3513

# ping mpls ldp

IN THIS SECTION

- Syntax | 3428
- Description | 3428
- Options | 3429
- Additional Information | 3430
- Required Privilege Level | 3430
- Output Fields | 3430
- Sample Output | 3431
- Release Information | 3431

## Syntax

```
ping mpls ldp fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

## Description

Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a `ping mpls` command.

## Options

| | |
|---|---|
| **count** *count* | (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`. |
| **destination** *address* | (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet. |
| **detail** | (Optional) Display detailed information about the echo requests sent and received. |
| **exp** *forwarding-class* | (Optional) Value of the forwarding class for the MPLS ping packets. |
| *fec* | Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length. |
| **instance** *routing-instance-name* | (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| **p2mp root-addr** *ip-address* **lsp-id** *identifier* | (Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP. |
| **size** *bytes* | (Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **stitched-protocol** | (Optional) Protocol stitched on intermediate node. |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Additional Information

If the LSP changes, the label and interface information displayed when you issued the `ping` command continues to be used. You must configure MPLS at the `[edit protocols mpls]` hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the `ping mpls ldp` command by specifying a new time in seconds using the `lsp-ping-interval` statement at the `[edit protocols ldp oam]` hierarchy level. For more information, see the MPLS Applications User Guide.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE**: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received, 70% packet loss 4
packets received with error status, not counted as received.
```

### ping mpls ldp p2mp root-addr lsp-id

```
user@host>ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1
Request for seq 1, to interface 71, no label stack.

```

## Release Information

Command introduced before Junos OS Release 7.4.

`size` and `sweep` options introduced in Junos OS Release 9.6.

`instance` option introduced in Junos OS Release 10.0.

`p2mp`, `root-address`, and `lsp-id` options introduced in Junos OS Release 11.2.

# ping mpls segment routing ospf

IN THIS SECTION

- Syntax | 3432
- Description | 3432
- Options | 3433
- Required Privilege Level | 3434
- Output Fields | 3434
- Sample Output | 3434
- Release Information | 3435

## Syntax

```
ping mpls segment routing ospf fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

## Description

Check the operability of MPLS segment routing label-switched path (LSP) connections added by ospf protocol. Type Ctrl+c to interrupt a `ping mpls segment routing ospf` command.

## Options

| | |
|---|---|
| **count** *count* | (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`. |
| **destination** *address* | (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet. |
| **detail** | (Optional) Display detailed information about the echo requests sent and received. |
| **exp** *forwarding-class* | (Optional) Value of the forwarding class for the MPLS ping packets. |
| *fec* | Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length. |
| **instance** *routing-instance-name* | (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on the specified logical system. |
| **p2mp root-addr** *ip-address* **lsp-id** *identifier* | (Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP. |
| **size** *bytes* | (Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **stitched-protocol** | (Optional) Protocol stitched on intermediate node. |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls segment-routing ospf

```
user@host>ping mpls segment-routing ospf 6.6.6.6
!!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

### Release Information

Command introduced in Junos OS Release 19.1R1

## ping mpls segment routing isis

**IN THIS SECTION**

- Syntax | 3435
- Description | 3436
- Options | 3436
- Required Privilege Level | 3437
- Output Fields | 3437
- Sample Output | 3437
- Release Information | 3438

### Syntax

```
ping mpls segment routing isis fec
<count count>
<destination address>
<detail>
<exp forwarding-class>
<instance routing-instance-name>
<logical-system (all | logical-system-name)>
```

```
<p2mp root-addr ip-address lsp-id identifier>
<size bytes>
<source source-address>
<stitched-protocol>
<sweep>
```

## Description

Check the operability of MPLS segment routing label-switched path (LSP) connections added by ISIS protocol. Type Ctrl+c to interrupt a `ping mpls segment routing isis` command.

## Options

**count *count*** (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent. The range of values is `1` through `1,000,000`. The default value is `5`.

**destination *address*** (Optional) Specify an address other than the default (`127.0.0.1/32`) for the ping echo requests. The address can be anything within the `127/8` subnet.

**detail** (Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class*** (Optional) Value of the forwarding class for the MPLS ping packets.

***fec*** Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

**instance *routing-instance-name*** (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

**logical-system (all | *logical-system-name*)** (Optional) Perform this operation on all logical systems or on the specified logical system.

**p2mp root-addr *ip-address* lsp-id *identifier*** (Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

**size *bytes*** (Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is

| | |
|---|---|
| | smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum. |
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **stitched-protocol** | (Optional) Protocol stitched on intermediate node. |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Syntax

```
ping mpls segment-routing spring-te
<egress-ip (active | color |  count | detail | exp | instance | logical-system | secondary |
segment-list | size | skip-fec-validation  | source | sweep | tunnel-source) >
<label-stack ( detail | egress | labels | logical-system | nexthop-address | nexthop-interface )
>
<source-routing-path ( active | color | count | detail | egress-ip | exp | instance | logical-
system | secondary | segment-list | size | skip-fec-validation | source | sweep | tunnel-source>
```

## Description

Check the operability of MPLS segment routing label-switched path (LSP) connections added by segment routing traffic-engineered (SPRING-TE) protocol. Type Ctrl+c to interrupt a `ping mpls segment routing spring-te` command.

## Options

**egress-ip** Specify to ping to or install IP address to use when sending probes.

**active** Specify to use the forwarding path or nexthops from the RIB table.

**color** Specify the color identifier for the tunnel end-point.

- **Range:** 1 through 4294967295

**count *count*** (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent.

- **Range:** 1 through 1000000
- **Default:** 5

**detail** (Optional) Display detailed output.

**exp *exp*** (Optional) Specify the class of service to use when sending probes.

- **Range:** 0 through 7

**instance** *routing-instance-name* — (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

**logical-system** *logical-system-name* — (Optional) Specify the name of the logical system.

**secondary** — Specify to use configured secondary segment list for the given segment routing path.

**segment-list** — Specify the segment list to use when sending probes.

**size** *bytes* — (Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**skip-fec-validation** — Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.

**source** *source-address* — (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).

**sweep** — (Optional) Automatically determine the size of the maximum transmission unit (MTU).

**tunnel-source** — Specify the source protocol used to create tunnel.

**label-stack** — Specify label stack for ping packets. This option works only if you do a minimum configuration of `source-packet-routing` at the `[edit protocols]` hierarchy level.

**detail** — (Optional) Display detailed output.

**egress** — Specify the egress IP address.

**labels** — Specify the labels in label stack.

- **Range:** 16 through 1048575

**logical-system** *logical-system-name* — (Optional) Specify the name of the logical system.

**nexthop-address** *address* — Specify the nexthop IP address for the ping packet.

**nexthop-interface** *interface* — Specify the outgoing interface for the ping packet.

**source-routing-path** — Specify ping source path routing to use when sending probes.

- **active** — Specify to use the forwarding path or nexthops from the RIB table.
- **color** — Specify the color identifier for the tunnel end-point.
  - **Range:** 1 through 4294967295
- **count** *count* — (Optional) Number of ping requests to send. If `count` is not specified, five ping requests are sent.
  - **Range:** 1 through 1000000
  - **Default:** 5
- **detail** — (Optional) Display detailed output.
- **egress-ip**
- **exp** *exp* — (Optional) Specify the class of service to use when sending probes.
  - **Range:** 0 through 7
- **instance** *routing-instance-name* — (Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
- **logical-system** *logical-system-name* — (Optional) Specify the name of the logical system.
- **secondary** — Specify to use configured secondary segment list for the given segment routing path.
- **segment-list** — Specify the segment list to use when sending probes.
- **size** *bytes* — (Optional) Size of the LSP ping request packet (`88` through `65468` bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.
- **skip-fec-validation** — Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.

| | |
|---|---|
| **source** *source-address* | (Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`). |
| **sweep** | (Optional) Automatically determine the size of the maximum transmission unit (MTU). |
| **tunnel-source** | Specify the source protocol used to create tunnel. |

## Additional Information

**NOTE**: With `segment-list` option, valid `tunnel-source` (source protocol used to create tunnel) is only static.

**NOTE**: `segment-list` option is not present when `tunnel-source` is BGP SR-TE since BGP SR-TE does not have named segment list.

**NOTE**: With `source-routing-path` name, valid `tunnel-source` are PCEP and static.

**NOTE**: With `tunnel-source` as PCEP, `secondary` option is not valid as PCEP always sends one primary LSP.

**NOTE**: FEC validation is performed for `ping mpls segment-routing spring-te` by default.

**NOTE**: FEC validation is supported when segment-routing traffic-engineering (SR-TE) tunnel has IGP labels (OSPF and IS-IS) only. For all the other labels (for example, static, LDP, RSVP, etc.), you can use `skip-fec-validation` option.

**NOTE**: For a combination of `egress-ip` and `color` options, valid `tunnel-source` are static and BGP SR-TE.

**NOTE**: `ping mpls segment-routing spring-te` command with `label-stack` option is supported in operational mode only. It is not supported in configuration mode.

**NOTE**: Parallel SID, binding SID, LDP over SR-TE is not supported.

**NOTE**: `ping mpls segment-routing spring-te` command with `label-stack` option adds explicit null label at the bottom of the label stack for interoperability. You can include NIL FEC for label “0” or “router alert label” per OAM standard.

## Required Privilege Level

network

## Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls segment-routing spring-te

```
user@host> ping mpls segment-routing spring-te
Possible completions:
  source-routing-path Source Path routing to use when sending probes
```

```
  egress-ip                 To/Install IP address to use when sending probes
  label-stack               Label stack for traceroute packets
```

### ping mpls segment-routing spring-te (label-stack)

## Release Information

Command introduced in Junos OS Release 20.2R1.

# show ldp database

IN THIS SECTION

- Syntax | 3448
- Description | 3448
- Options | 3448
- Required Privilege Level | 3449
- Output Fields | 3449
- Sample Output | 3453
- Release Information | 3461

## Syntax

```
show ldp database
<brief | detail | extensive>
<inet | l2circuit>
<instance instance-name>
<logical-system (all | logical-system-name)>
<p2mp>
<session session>
<summary>
```

## Description

Display entries in the LDP database.

## Options

| | |
|---|---|
| **none** | Display standard information about all entries in the LDP database for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |

| | |
|---|---|
| **inet \| l2circuit** | (Optional) Display only IPv4 or Layer 2 circuit bindings. |
| **instance** *instance-name* | (Optional) Display routing instance information for the specified instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |
| **p2mp** | (Optional) Display point-to-multipoint binding information. This option is only supported on Junos OS. |
| **session** *session* | (Optional) Display database for the specified session only. *session* is the destination address of the LDP session. |
| **summary** | (Optional)—Display summary output. This option displays the number of labels received and advertised for each LDP session. |

view

## Output Fields

Table 89 on page 3449 describes the output fields for the `show ldp database` command. Output fields are listed in the approximate order in which they appear.

**Table 89: show ldp database Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Input label database` | Label received from the other router. | All levels |
| `Output label database` | Label advertised to the other router. | All levels |
| *session-identifier* | Session identifier, which includes the local and remote label space identifiers. | All levels |
| `Labels received` | Number of labels received from the other router. | All levels |

**Table 89: show ldp database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Labels advertised` | Number of labels advertised to the other router. | All levels. |
| `Label` | Label binding to a route prefix. | All levels |

**Table 89: show ldp database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Prefix` | Route prefix.<br><br>It can be one of the following values:<br><br>• IP prefix.<br><br>• Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.<br><br>• Layer 2 encapsulation type.<br><br>Layer 2 encapsulation types are displayed in the format `L2CKT` *`control word status encapsulation-type vc-number,`* for example, `L2CKT CtflWord FRAME RELAY VC 2`<br><br>• *`control-word-status`*—Displays whether the use of the control word has been negotiated for this virtual circuit:<br><br>  • `NoCtrlWord`<br><br>  • `CtrlWord`<br><br>• *`encapsulation-type`*—Encapsulation type:<br><br>  • `FRAME RELAY`<br><br>  • `ATM AAL5`<br><br>  • `ATM CELL`<br><br>  • `VLAN`<br><br>  • `ETHERNET`<br><br>  • `CISCO_HDLC`<br><br>  • `PPP`<br><br>• `VC number`—Virtual circuit number. It can have any numeric value. | All levels |

**Table 89: show ldp database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • (Stale)—When you display the LDP database for the neighbor of a restarting router, the bindings leaned from the restarting neighbor are displayed as (Stale). Stale bindings are deleted if they are not refreshed within the recovery time. | |
| MTU | MTU of the Layer 2 circuit. MTU is displayed for all encapsulation types except ATM cell encapsulations. | detail |
| VCCV Control Channel types | Virtual Circuit Connection Verification (VCCV) control channel types.<br>• MPLS router alert label<br>• MPLS PW label with TTL=1 | extensive |
| VCCV Control Verification types | The only valid VCCV control verification type is LSP ping. | extensive |
| TDM payload size | Size of the Time Division Multiplex (TDM) payload. | All levels |
| TDM bitrate | Bit rate for the TDM traffic. | All levels |
| Requested VLAN ID | (VLANs) VLAN identifier of the Layer 2 circuit. | detail |
| Cell bundle size | (ATM cell encapsulations) Maximum number of cells that the Layer 2 circuit can receive in a packet. | detail |

**Table 89: show ldp database Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| State | State of the label binding:<br>• Active—Label binding has been installed and distributed appropriately. A label binding is almost always in this state.<br>• New—New label that has not yet been distributed.<br>  • MapRcv—Waiting to receive a label mapping message.<br>  • MapSend—Waiting to send a label mapping message.<br>  • RelRcv—Waiting to receive a label release message.<br>  • RelRsnd—Waiting to receive a label release message before resending label mapping message.<br>  • RelSend—Waiting to send a label release message.<br>  • ReqSend—Waiting to send a label request message.<br>  • W/dSend—Waiting to send a label withdrawal message. | detail |
| Age | Time elapsed since the binding was created. | detail |

## Sample Output

### show ldp database (primary)

```
user@host> show ldp database extensive
Input label database, 10.255.107.232:0--10.255.107.236:0
  Label     Prefix
 299840      10.255.107.232/32

### show ldp database summary

```
user@host> show ldp database summary
Session ID                      Labels received    Labels advertised
10.255.0.1:0--10.255.0.2:0                    4                   4
10.255.0.1:0--10.255.0.3:0                    4                   4
```

### Release Information

Command introduced before Junos OS Release 7.4.

`summary` option introduced in Junos OS Release 14.2.

## show ldp database-label-requests

**IN THIS SECTION**

- Syntax | **3461**
- Description | **3461**
- Options | **3462**
- Required Privilege Level | **3462**
- Output Fields | **3462**
- Sample Output | **3463**
- Release Information | **3463**

### Syntax

```
show ldp database-label-requests
<brief | detail | extensive>
<inet | l2circuit>
<instance instance-name>
<logical-system (all | logical-system-name)>
<p2mp>
<session session>
```

### Description

Display entries in the LDP database label requests.

## Options

| | |
|---|---|
| **none** | Display standard information about all entries in the LDP database for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **inet \| l2circuit** | (Optional) Display only IPv4 or Layer 2 circuit bindings. |
| **instance** *instance-name* | (Optional) Display routing instance information for the specified instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |
| **p2mp** | (Optional) Display point-to-multipoint binding information. This option is only supported on Junos OS. |
| **session** *session* | (Optional) Display database for the specified session only. *session* is the destination address of the LDP session. |

## Required Privilege Level

view

## Output Fields

Table 90 on page 3462 describes the output fields for the `show ldp database-label-requests` command. Output fields are listed in the approximate order in which they appear.

**Table 90: show ldp database-label-requests Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Input label database` | Label received from the other router. | All levels |
| `Output label database` | Label advertised to the other router. | All levels |

**Table 90: show ldp database-label-requests Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Prefix` | Route prefix.<br>It can be one of the following values:<br>• IP prefix. | All levels |
| `State` | State of the label binding:<br>• `Active`—Label binding has been installed and distributed appropriately. A label binding is almost always in this state. | `detail` |

## Sample Output

### show ldp database-label-requests

```
user@host> show ldp database-label-requests
Input label database, 198.51.100.0/24--203.0.113.0/24
  Prefix      State
203.0.113.0/24   Active
192.0.2.0/24   Active

Output label database, 198.51.100.0/24--203.0.113.0/24
  Prefix      State
198.51.100.0/24   Active
```

## Release Information

Statement introduced in Junos OS Release 20.3R1.

# show ldp fec-filters

IN THIS SECTION

- Syntax | 3464
- Description | 3464
- Options | 3464
- Required Privilege Level | 3465
- Output Fields | 3465
- Sample Output | 3465
- Release Information | 3465

## Syntax

```
show ldp fec-filters
<fec>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display information about configured Label Distribution Protocol (LDP) forwarding equivalence class (FEC) filters.

## Options

| | |
|---|---|
| *fec* | (Optional) Display FEC filter information for the specified FEC. |
| **instance** *instance-name* | (Optional) Display FEC filter information for the specified instance. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

Table 91 on page 3465 lists the output fields for the `show ldp fec-filters` command. Output fields are listed in the approximate order in which they appear.

**Table 91: show ldp fec-filters Output Fields**

| Field Name | Field Description |
|---|---|
| **Ingress** | Names of the FEC filters on the ingress routers. |
| **Transit** | Names of the FEC filters on the transit routers. |

## Sample Output

### show ldp fec-filters

```
user@host> show ldp fec-filters 10/8
10.22.1.2/32
     Ingress: f1-10.22.1.2/32 (index: 3)
     Transit: (null) (index: 0)
```

## Release Information

Command introduced before Junos OS Release 7.4.

# show ldp interface

IN THIS SECTION

- Syntax | 3466
- Description | 3466
- Options | 3466
- Required Privilege Level | 3467
- Output Fields | 3467
- Sample Output | 3468
- Release Information | 3468

## Syntax

```
show ldp interface
<brief | detail | extensive>
<interface-name>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display the status of Label Distribution Protocol (LDP)-enabled interfaces.

## Options

| | |
|---|---|
| **none** | Display standard status information about all LDP-enabled interface for all routing instances. |
| ***interface-name*** | (Optional) Display information for the specified interface. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **instance *instance-name*** | (Optional) Display information for the specified routing instance. |

**logical-system (all | *logical-system-name*)** (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS.

## Output Fields

Table 92 on page 3467 describes the output fields for the `show ldp interface` command. Output fields are listed in the approximate order in which they appear.

**Table 92: show ldp interface Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Interface** | Interface name. | All levels |
| **Label space ID** | Label space identifier that the router is advertising on the interface. | All levels |
| **Nbr count** | Number of neighbors on the interface. | All levels |
| **Next hello** | How long until the next hello packet is sent on this interface, in seconds. | All levels |
| **Hello interval** | One-third of the negotiated hold time (in seconds). If the user-configured value for the hello interval is smaller than the computed value, the user-configured value is used. | **detail extensive** |
| **Hold time** | Configured hold time, in seconds. | **detail extensive** |

**Table 92: show ldp interface Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Transport address** | Address to which the neighbor wants the local route to establish the LDP session. | **extensive** |
| **Local hello interval** | Locally configured hello interval. | **extensive** |

### Sample Output

#### show ldp interface extensive

```
user@host> show ldp interface extensive
Interface            Label space ID        Nbr count   Next hello
 fe-0/0/3.0           10.255.245.6:0           2           0
   Hello interval: 1, Hold time: 15, Transport address: 10.255.245.6
   Local hello interval: 2, Index: 69
```

### Release Information

Command introduced before Junos OS Release 7.4.

## show ldp neighbor

IN THIS SECTION

- Syntax | 3469
- Description | 3469
- Options | 3469
- Required Privilege Level | 3469
- Output Fields | 3470

Sample Output | 3471
Release Information | 3471

## Syntax

```
show ldp neighbor
<brief | detail | extensive>
<auto-targeted>
<instance instance-name>
<logical-system (all | logical-system-name)>
<neighbor-address>
```

## Description

Display Label Distribution Protocol (LDP) neighbor information.

## Options

| | |
|---|---|
| **none** | Display standard information about LDP neighbors for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **auto-targeted** | (Optional) Display information about LDP neighbors that are automatically targeted using the loopback addresses. |
| **instance *instance-name*** | (Optional) Display information for the specified routing instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |
| ***neighbor-address*** | (Optional) Display information about the specified LDP neighbor. |

## Required Privilege Level

view

## Output Fields

Table 93 on page 3470 describes the output fields for the `show ldp neighbor` command. Output fields are listed in the approximate order in which they appear.

**Table 93: show ldp neighbor Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| **Address** | IP address of the neighbor. | All levels |
| **Interface** | Interface over which the neighbor was discovered. | All levels |
| **Label space ID** | Label space identifier advertised by the neighbor. | All levels |
| **Hold time** | Remaining hold time before the neighbor expires, in seconds. | All levels |
| **Transport address** | Address to which the neighbor wants the local route to establish the LDP session. | **detail** |
| **Configuration sequence** | Counter that increments whenever the neighbor changes its configuration. | **detail** |
| **Up for** | Length of time the LDP neighbor has been in operation. | **detail extensive** |
| **Reference count** | Reference count for the LDP neighbor. | **extensive** |
| **Hold time** | Displays the neighbor's hold time. The hold time is the proposed hold times for the local and peer routers. | **extensive** |
| **Proposed local/peer** | Hold time value proposed by the local router and the peer router. | **extensive** |

## Sample Output

### show ldp neighbor extensive

```
user@host> show ldp neighbor extensive
Address            Interface          Label space ID         Hold Time
 192.168.37.23      so-1/0/0.0         10.255.245.5:0           44
   Transport address: 10.255.245.5, Configuration sequence: 6
   Up for 00:03:37
   Reference count: 1
   Hold time: 45, Proposed local/peer: 15/45
```

### show ldp neighbor auto-targeted extensive

```
user@host> show ldp neighbor auto-targeted extensive
Address            Interface          Label space ID         Hold time
10.255.107.236     lo0.0              10.255.107.236:0         41
  Transport address: 10.255.107.236, Configuration sequence: 14
  Up for 00:10:53
  Reference count: 2
  Hold time: 45, Proposed local/peer: 45/45
  Hello interval: 15
  Hello flags: targeted
  Neighbor types: Auto-targeted
```

## Release Information

Command introduced before Junos OS Release 7.4.

`neighbor-address` option added in Junos OS Release 8.5.

# show ldp overview

IN THIS SECTION

- Syntax | 3472
- Syntax (EX Series Switch and QFX Series) | 3472
- Description | 3472
- Options | 3472
- Required Privilege Level | 3473
- Output Fields | 3473
- Sample Output | 3478
- Release Information | 3479

## Syntax

```
show ldp overview
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Syntax (EX Series Switch and QFX Series)

```
show ldp overview
<instance instance-name>
```

## Description

Display LDP overview information.

## Options

**none** Display standard overview information about LDP for all routing instances.

**instance *instance-name*** (Optional) Display LDP overview information for the specified routing instance.

**logical-system (all | *logical-system-name*)** (Optional) Display LDP information from systems or a particular logical system on the devices. This option is only supported on Junos OS.

## Required Privilege Level

view

## Output Fields

Table 94 on page 3473 lists the output fields for the `show ldp overview` command. Output fields are listed in the approximate order in which they appear.

**Table 94: show ldp overview Output Fields**

| Field Name | Field description | Level of Output |
|---|---|---|
| `Instance` | LDP routing instance. | All Levels |
| `Router ID` | Router ID of the routing device. | All Levels |
| `Message ID` | Unique identifier of message. | All Levels |
| `Configuration sequence` | Value of configuration sequence. | All Levels |
| `Deaggregate` | Status of control forwarding equivalence class (FEC) deaggregation on the router. By default it is `disabled` on the router. | All Levels |
| `Explicit null` | Advertise label 0 to the egress routing device of an LSP. Explicit null: `enabled` or `disabled`.<br><br>**NOTE**: If you do not include the explicit-null statement in the configuration, label 3 (implicit null) is advertised. | All Levels |

**Table 94: show ldp overview Output Fields *(Continued)***

| Field Name | Field description | Level of Output |
|---|---|---|
| `IPv6 tunneling` | Internet Protocol version 6 tunneling: `enabled` or `disabled`. | All Levels |
| `Strict targeted hellos` | Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. Strict targeted hellos: `enabled` or `disabled`.<br>**NOTE**: LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors. | All Levels |
| `Loopback if added` | Loopback interface is added: `yes` or `no`. | All Levels |
| `Route preference` | Default preference value (also known as an administrative distance) assigned to each route that the routing table receives. LDP preference is: `9` | All Levels |
| `Unicast transit LSP chaining` | Unicast transit LSP chaining: `enabled` or `disabled`. | All Levels |
| `P2MP transit LSP chaining` | P2MP transit LSP chaining: `enabled` or `disabled`. | All Levels |
| `Transit LSP statistics based on route statistics` | Transit LSP statistics based on route statistics: `enabled` or `disabled`. | All Levels |
| Longest match | Longest match for label mapping: `enabled` or `disabled`. | All Levels |
| `Capabilities enabled` | Enabled capabilities: `none` | All Levels |

**Table 94: show ldp overview Output Fields *(Continued)***

| Field Name | Field description | Level of Output |
|---|---|---|
| `Timers` | • `Keepalive interval:` Keepalive interval value.<br>• `Keepalive timeout:` Time interval for which the neighbor LDP node waits before determining session failure.<br>• `Link hello interval:` Specify how often the router sends Link Management Protocol (LMP) hello packets.<br>• `Link hello hold time:` Time interval for which an LDP node waits for a hello message before declaring a neighbor is down.<br>• `Targeted hello interval:` Specify how often LDP sends targeted hello messages.<br>• `Targeted hello hold time:` Time interval for which a sending LSR maintains a record of targeted hello messages from the receiving LSR without receipt of another targeted hello message from that LSR.<br>• `Label withdraw delay:` Time interval for withdrawing labels to reduce router workload during IGP convergence. | All Levels |

**Table 94: show ldp overview Output Fields *(Continued)***

| Field Name | Field description | Level of Output |
|---|---|---|
| `Graceful restart` | Graceful restart attributes.<br>• `Restart`– Graceful restart capability: `enabled` or `disabled`.<br>• `Helper`– Standard graceful restart helper capability: `enabled` or `disabled`.<br>• `Restart in process`– Graceful restart in process.<br>• `Reconnect time`– Period of time that a restarting LSR (label switched router) designates to LDP neighbors to wait until the former reestablishes the session after restarting.<br>• `Max neighbor reconnect time`– Maximum reconnect time.<br>• `Recovery time`– Period of time that an LSR preserves its state across the restart.<br>• `Max neighbor recovery time`– Maximum recovery time designated to LDP neighbors by a restarting LSR. | All Levels |
| `Traffic Engineering` | • `Bgp igp`– BGP and IGP destinations: `enabled` or `disabled`. When enabled, IGPs use MPLS paths for forwarding traffic.<br>• `Both ribs`– BGP and IGP destinations with routes in both RIBs: `enabled` or `disabled`.<br>• `Mpls forwarding`– MPLS routes used for forwarding: `enabled` or `disabled`. | All Levels |

**Table 94: show ldp overview Output Fields *(Continued)***

| Field Name | Field description | Level of Output |
|---|---|---|
| IGP | • Tracking igp metric–Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).<br>• Sync session up delay– Time interval to synchronize LDP session. | All Levels |
| Session protection | • Session protection– Remote neighbor added to LDP configuration which enables protection for all sessions in the corresponding LDP instance: enabled or disabled.<br>• Session protection timeout– Period of time until which the remote neighbor is connected to LSR in the absence of link neighbors. | All Levels |
| Interface addresses advertising | Advertises interface address. | All Levels |
| Label allocation | Label accounting information.<br>• Current number of LDP labels allocated—Number of labels currently in use.<br>• Total number of LDP labels allocated—Cumulative number of labels being allocated.<br>• Total number of LDP labels freed—Cumulative number of labels being freed.<br>• Total number of LDP label allocation failures—Cumulative number of failures for allocating a label.<br>• Current number of labels allocated by all protocols—Number of labels currently being used by routing protocols. | All Levels |

## Sample Output

### show ldp overview

```
user@host> show ldp overview
Instance: master
  Router ID: 192.168.2.1
  Message id: 0
  Configuration sequence: 1
  Deaggregate: disabled
  Explicit null: disabled
  IPv6 tunneling: disabled
  Strict targeted hellos: disabled
  Loopback if added: yes
  Route preference: 9
  Unicast transit LSP chaining: disabled
  P2MP transit LSP chaining: disabled
  Transit LSP statistics based on route statistics: disabled
  Longest Match: enabled
  Capabilities enabled: none
  Timers:
    Keepalive interval: 10, Keepalive timeout: 30
    Link hello interval: 5, Link hello hold time: 15
    Targeted hello interval: 15, Targeted hello hold time: 45
    Label withdraw delay: 60
  Graceful restart:
    Restart: enabled, Helper: enabled, Restart in process: false
    Reconnect time: 60000, Max neighbor reconnect time: 120000
    Recovery time: 160000, Max neighbor recovery time: 240000
  Traffic Engineering:
    Bgp igp: disabled
    Both ribs: disabled
    Mpls forwarding: disabled
  IGP:
    Tracking igp metric: disabled
    Sync session up delay: 10
  Session protection:
    Session protection: disabled
    Session protecton timeout: 0
  Interface addresses advertising:
    192.168.2.1
  Label allocation:
```

```
    Current number of LDP labels allocated: 3
    Total number of LDP labels allocated: 3
    Total number of LDP labels freed: 0
    Total number of LDP label allocation failure: 0
    Current number of labels allocated by all protocols: 3
```

### Release Information

Command introduced in Junos OS Release 11.2.

## show ldp p2mp tunnel

**IN THIS SECTION**

- Syntax | 3479
- Description | 3479
- Options | 3480
- Required Privilege Level | 3480
- Sample Output | 3480
- Release Information | 3480

### Syntax

```
show ldp p2mp tunnel
<brief | detail | extensive>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

### Description

Display LDP point-to-multipoint tunnel table information.

### Options

| | |
|---|---|
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **instance** *instance-name* | (Optional) Display routing instance information for the specified instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Display LDP point-to-multipoint tunnel table information of all logical systems or a particular logical system. |

### Required Privilege Level

View

### Sample Output

#### show ldp p2mp tunnel

```
user@host> show ldp p2mp tunnel extensive

Instance    Tunnel type          Tunnel name
0           Name              10.254.1.1:1:ldp-p2mp:mvpn:vpn-1
    P2MP root-addr 10.255.107.232, lsp-id 16777217
    Self id 805306372
    Reference count 2
```

### Release Information

Command introduced in Junos OS Release 13.3.

## show ldp path

**IN THIS SECTION**

Syntax | 3481

- Description | 3481
- Options | 3481
- Required Privilege Level | 3481
- Output Fields | 3482
- Sample Output | 3482
- Release Information | 3483

## Syntax

```
show ldp path
<brief | detail | extensive>
<destination>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display Label Distribution Protocol (LDP) label-switched paths (LSPs).

## Options

| | |
|---|---|
| **none** | Display standard information about all LDP LSPs for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| ***destination*** | (Optional) Restrict the output to entries that match the specified destination prefix. |
| **instance *instance-name*** | (Optional) Display information for the specified routing instance only. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |

## Required Privilege Level

view

## Output Fields

Table 95 on page 3482 describes the output fields for the `show ldp path` command. Output fields are listed in the approximate order in which they appear.

**Table 95: show ldp path Output Fields**

| Field Name | Field Description |
|---|---|
| **Output Session (label)** | Session ID and labels that this system has sent using LDP. These correspond to MPLS packets received. |
| **Input Session (label)** | Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted. |
| ***route*** | MPLS route. |
| **Attached route** | Route corresponding to the LSP. |
| **Ingress route** | The router acts as the ingress for the LSP. |
| **Reference count** | Reference count for the LDP neighbor. |
| **Transit route** | Names of the forwarding equivalence class (FEC) filters on the transit routers. |
| **Global label** | MPLS label that is used globally. |

## Sample Output

### show ldp path extensive

```
user@host> show ldp path extensive
Output Session (label)          Input Session (label)
10.255.14.220:0(3)              ( )
   Attached route:  10.255.14.221/32
   Reference count: 3, Global label: 3
```

```
10.255.14.220:0(100000)         10.255.14.220:0(3)
   Attached route:  10.255.14.220/32, Ingress route
   Reference count: 2, Transit route, Global label: 100000
10.255.14.220:0(100001)         10.255.14.220:0(100001)
   Attached route:  10.255.14.214/32, Ingress route
   Reference count: 2, Transit route, Global label: 100001
```

### Release Information

Command introduced before Junos OS Release 7.4.

## show ldp rib-groups

**IN THIS SECTION**

- Syntax | 3483
- Description | 3483
- Options | 3484
- Required Privilege Level | 3484
- Output Fields | 3484
- Sample Output | 3484
- Release Information | 3484

### Syntax

```
show ldp rib-groups
<instance instance-name>
<logical-system (all | logical-system-name)>
```

### Description

Displays the rib group names.

## Options

| | |
|---|---|
| **instance** *instance-name* | (Optional) Display routing instance information for the specified instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |

## Required Privilege Level

view

## Output Fields

Table 96 on page 3484 describes the output fields for the `show ldp rib-groups` command. Output fields are listed in the approximate order in which they appear.

**Table 96: show ldp rib-groups Output Fields**

| Field Name | Field Description |
|---|---|
| `Rib group name` | Displays the name of Rib group. |

## Sample Output

### show ldp rib-groups

```
user@host> show ldp rib-groups
Rib group name: LDP
Rib group name: LDP
Rib group name: ldp-install master
Rib group name: ldp-install master
Rib group name: ldp-color master
Rib group name: ldp-color6 master
```

## Release Information

Statement introduced in Junos OS Release 20.3R1.

# show ldp route

IN THIS SECTION

- Syntax | 3485
- Description | 3485
- Options | 3485
- Required Privilege Level | 3486
- Output Fields | 3486
- Sample Output | 3487
- Release Information | 3496

## Syntax

```
show ldp route
<brief | detail | extensive>
<destination>
<fec-and-route>
<fec-only>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).

## Options

| | |
|---|---|
| **none** | Display standard information about all entries in the LDP internal topology table for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |

| | |
|---|---|
| *destination* | (Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length. |
| **fec-and-route** | Display the show routes and the FECs. |
| **fec-only** | Display only LDP FECs. |
| **instance** *instance-name* | (Optional) Display entries for the specified routing instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |

## Output Fields

Table 97 on page 3486 describes the output fields for the `show ldp route` command. Output fields are listed in the approximate order in which they appear.

**Table 97: show ldp route Output Fields**

| Field Name | Field Description |
|---|---|
| `Destination` | Destination prefix. |
| `Next-hop intf/lsp/table` | Interface that is the next hop to the destination prefix. |
| `Next-hop address` | IP address of the next hop. |
| `Session ID` | LDP session ID. |
| `Route flags` | Information about the route. For example, the `Ingress TTL propagate` flag indicates that the time-to-live (TTL) value is being propagated with the route. |

**Table 97: show ldp route Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| `Bound to outgoing label` | The route has been bound to LSPs with the label being distributed for that LSP. |
| `Topology entry` | The topology that the route is bound to. |
| `Ingress route status` | Status of the ingress route. For example, it could be `Active` or `Inactive`. |
| `Last modified` | The length of time since the ingress route status last changed. |
| `Last event(s)` | The last event that occurred. |

## Sample Output

### show ldp route detail

```
user@host> show ldp route 10.255.8.5 detail
Destination         Next-hop intf/lsp               Next-hop address

```

### Release Information

Command introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 20.3R1.

## show ldp session

**IN THIS SECTION**

- Syntax | **3496**
- Description | **3497**
- Options | **3497**
- Required Privilege Level | **3497**
- Output Fields | **3497**
- Sample Output | **3504**
- Release Information | **3506**

### Syntax

```
show ldp session
<brief | detail | extensive>
<auto-targeted>
<destination>
<instance instance-name>
<logical-system (all | logical-system-name)>
```

## Description

Display information about Label Distribution Protocol (LDP) sessions.

## Options

| | |
|---|---|
| **none** | Display standard information about all LDP sessions for all routing instances. |
| **brief \| detail \| extensive** | (Optional) Display the specified level of output. |
| **auto-targeted** | (Optional) Display information about LDP sessions that are automatically targeted using loopback addresses. |
| ***destination*** | (Optional) Restrict LDP session display to the specified address. |
| **instance *instance-name*** | (Optional) Display routing instance information for the specified instance. If *instance-name* is omitted, information is displayed for the master instance. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. This option is only supported on Junos OS. |

## Required Privilege Level

view

## Output Fields

Table 98 on page 3497 describes the output fields for the `show ldp session` command. Output fields are listed in the approximate order in which they appear.

**Table 98: show ldp session Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Address` | Transport address of the session. | any |
| `State` | State of the session: `Nonexistent`, `Connecting`, `Initialized`, `OpenRec`, `OpenSent`, `Operational`, or `Closing`. The states correspond to the state diagram specified in Internet Draft LDP Specification draft-ietf-mpls-rfc3036bis-01.txt. | any |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Connection` | TCP connection state: `Closed`, `Opening`, or `Open`. | any |
| `Hold time` | Time remaining until the session will be closed, in seconds. | any |
| `Session ID` | LDP identifiers of the peers of this session. | detail extensive |
| `Next keepalive` | Time until next keepalive is sent, in seconds. | `detail extensive` |
| `Active` | Whether the local router is playing the active role in the session and during session establishment. | `detail extensive` |
| `Passive` | Whether the local router is playing the passive role in the session and during session establishment. | `detail extensive` |
| `Maximum PDU` | Maximum protocol data unit (*PDU*) size (packet size) for the session. | `detail extensive` |
| `Hold time` | Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the `keepalive-timeout` statement configured at the `[edit protocols ldp]` hierarchy level. | `detail extensive` |
| `Neighbor count` | Number of neighbors that are contributing to the session. | `detail extensive` |
| `Neighbor types` | Category of LDP session: `discovered` or `auto-targeted`. | any |
| `Keepalive interval` | Keepalive interval, in seconds. | `detail extensive` |
| `Connect retry interval` | TCP connection retry interval, in seconds. | `detail extensive` |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Local address | Local transport address. | detail extensive |
| Remote address | Remote transport address. | detail extensive |
| Up for | Time that this session has been up. | detail extensive |
| Last down | Time since the session last went down. | detail extensive |
| Reason | Reason the session went down:<br>• Aborted graceful restart<br>• Authentication key was changed<br>• Bad type length value (TLV)<br>• Bad protocol data unit (PDU) packets<br>• Command-line interface (CLI) command<br>• Connect time expired<br>• Connection error<br>• Connection reset<br>• Error during initialization<br>• Hold time expired<br>• No adjacency or all adjacencies down<br>• Notification received<br>• Received notification from peer<br>• Unexpected End of File (EOF)<br>• Unknown reason | detail extensive |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Number of session flaps` | Number of times the session changes from up to down. | `detail extensive` |
| `Restarting` | LDP is in the process of gracefully restarting. | `detail extensive` |
| `Capabilities advertised` | LDP capabilities advertised to a peer. | `detail extensive` |
| `Capabilities received` | LDP capabilities received from a peer. | `detail extensive` |
| `Protection` | Information about the status of MPLS LDP session protection. | `detail extensive` |
| `restart complete in` *nnn* `msec` | Amount of time (in milliseconds) remaining until graceful restart is declared complete. | `detail extensive` |
| `Authentication type` | Shows the longest match MD5 authentication | `detail extensive` |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Local` | Information about graceful restart for the local end of an LDP session. Graceful restart and helper mode are independent.<br>• `Restart`—Status of the grateful restart feature at the local end of the LDP session: `enabled` or `disabled`.<br>• `Helper mode`—Status of the helper mode feature at the local end of the LDP session: `enabled` or `disabled`. When this feature is enabled, the local end of the LDP session can help the restarting router with its LDP restart procedures.<br>• `Reconnect time`—Amount of time to wait from when a restart is initiated until the router can exchange LDP messages with its neighbors. The default is `60000 msec` and is not configurable. (`Reconnect timeout` refers to "FT Reconnect timeout" in draft-ietf-mpls-ldp-restart-06, *Internet Draft Graceful Restart Mechanism for LDP.)* | `detail extensive` |
| `Remote` | Information about graceful restart at the remote end of an LDP session. Graceful restart and helper mode are independent.<br>• `Restart`—Status of the grateful restart feature at the remote end of the LDP session: `enabled` or `disabled`.<br>• `Helper mode`—Status of the helper mode feature at the remote end of the LDP session: `enabled` or `disabled`. When this feature is enabled, the remote end of the LDP session can help the restarting router with its LDP restart procedures.<br>• `Reconnect time`—Amount of time in milliseconds from when a restart is initiated until the remote router can exchange LDP messages with its neighbors. | `detail extensive` |
| `Local maximum recovery time` | Amount of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). | `detail extensive` |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Next-hop addresses received` | Next-hop addresses received on the session. | `detail extensive` |
| `Queue depth` | Number of messages that are queued for sending to the peers in the group. | `extensive` |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| `Message type` | Type of message being sent:<br>• • `Initialization`—Session initialization negotiation messages sent by an LSR to an LDP peer when the transport connection is established.<br>• `Keeaplive`—Keepalive timer messages sent by an LSR to an LDP peer to keep the session active when there is no information or PDU exchanged between them.<br>• `Notification`—Notification messages (such as state of the LDP session) or error information (such as bad PDU length) sent by an LSR to an LDP peer.<br>• `Address`—Message sent by an LSR to an LDP peer to advertise interface addresses.<br>• `Address withdraw`—Message sent by an LSR to an LDP peer to withdraw a previously advertised interface address.<br>• `Label mapping`—Message sent by an LSR to an LDP peer to advertise label mapping for a forwarding equivalence class (FEC).<br>• `Label request`—Message sent by an LSR to an LDP peer to request a label mapping for an FEC.<br>• `Label withdraw`— Message sent by an LSR to an LDP peer to withdraw a previously advertised FEC-label mapping.<br>• `Label release`—Message sent by an LSR to an LDP peer to notify the peer that a specific FEC-label mapping has been released.<br>• `Label abort`—Message sent by an LSR to an LDP peer to abort a label request message.<br>• `Total`—Messages sent and received during the lifetime of the session. | `extensive` |

**Table 98: show ldp session Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • `Last 5 seconds`—Messages sent and received during the current session. | |

## Sample Output

### show ldp session brief

```
user@host> show ldp session brief
  Address           State        Connection     Hold time
10.255.72.160       Operational  Open             21
10.255.72.164       Operational  Open             20
10.255.72.172       Operational  Open             21
```

### show ldp session detail

```
user@host> show ldp session detail
Address: 192.168.0.3, State: Operational, Connection: Open, Hold time: 27
  Session ID: 192.168.0.2:0--192.168.0.3:0

## Output Fields

Table 99 on page 3508 lists the output fields for the `show ldp statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 99: show ldp statistics Output Fields**

| Field Name | Field Description |
|---|---|
| **Total Sent, Received** | Total number of each message type sent and received. |
| **Last 5 seconds Sent, Received** | Number of each message type sent and received in the last 5 seconds. |

**Table 99: show ldp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Message type** | LDP message types:<br>• **Hello**—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor.<br>• **Initialization**—Messages that indicate an LDP session has started.<br>• **Keepalive**—Messages that ensure that the keepalive timeout is not exceeded.<br>• **Notification**—Advisory information and signal error information.<br>• **Address**—Messages with address information.<br>• **Address withdrawal**—Messages regarding address withdrawal.<br>• **Label mapping**—Messages with label mapping information.<br>• **Label request**—Request for a label mapping from a neighboring router.<br>• **Label withdrawal**—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.<br>• **Label release**—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.<br>• **Label abort**—Messages about label interruptions.<br>• **All UDP**—All hello messages sent by LSRs to the well-known UDP port, 646.<br>• **All TCP**—All LDP session messages. |

**Table 99: show ldp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Event type** | LDP events and errors:<br>• **Sessions opened**—Number of LDP sessions that have been opened.<br>• **Sessions closed**—Number of LDP sessions that have been closed.<br>• **Topology changes**—Number of changes to the known LDP topology.<br>• **No interface**—Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages.<br>• **No session**—Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers.<br>• **No adjacency**—The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender's LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected.<br>• **Unknown version**—The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.<br>• **Malformed PDU**—An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session.<br>An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.<br>An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length).<br>• **Malformed message**—Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them. |

**Table 99: show ldp statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| | An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code.<br><br>An LDP message is considered to be malformed If the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU.<br><br>The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component.<br><br>The LDP message is considered to be malformed if the message is missing one or more mandatory parameters.<br><br>• **Unknown message type**—If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message.<br><br>• **Inappropriate message**—The message is not of the type that the receiver expects to receive.<br><br>• **Malformed TLV**—The TLV lLength is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR.<br><br>• **Bad TLV value**—The TLV Length is too large.<br><br>• **Missing TLV**—The TLV is missing one or more mandatory parameters.<br><br>• **PDU too large**—The PDF is greater than the maximum PDU length. Section "Initialization Message" in RFC 5036 describes how the maximum PDU length for a session is determined. |
| **Total** | Total number of each event or error. |
| **Last 5 seconds** | Number of each event or error in the last 5 seconds. |

## Sample Output

### show ldp statistics

```
user@host> show ldp statistics
Message type                Total                   Last 5 seconds
                        Sent      Received          Sent      Received
Hello                    265           263             2             2
Initialization             2             2             0             0
Keepalive                112           111             1             0
Notification               0             0             0             0
Address                    2             2             0             0
Address withdraw           0             0             0             0
Label mapping              7             6             0             0
Label request              0             0             0             0
Label withdraw             2             0             0             0
Label release              0             2             0             0
Label abort                0             0             0             0
All UDP                  265           263             2             2
All TCP                  123           121             1             0

Event type                              Total       Last 5 seconds

Sessions opened                             2                0
Sessions closed                             0                0
Topology changes                           11                0

No interface                                0                0
No session                                  0                0
No adjacency                                0                0
Unknown version                             0                0
Malformed PDU                               0                0
Malformed message                           0                0
Unknown message type                        0                0
Inappropriate message                       0                0
Malformed TLV                               0                0
Bad TLV value                               0                0
Missing TLV                                 0                0
PDU too large                               0                0
```

### Release Information

Command introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

## show ldp traffic-statistics

IN THIS SECTION

- Syntax | 3513
- Description | 3513
- Options | 3514
- Additional Information | 3514
- Required Privilege Level | 3514
- Output Fields | 3514
- Sample Output | 3516
- Release Information | 3519

### Syntax

```
show ldp traffic-statistics
<instance instance-name>
<logical-system (all | logical-system-name)>
<p2mp>
```

### Description

Display Label Distribution Protocol (LDP) traffic statistics.

**NOTE**: If nonstop active routing features is configured, `show ldp traffic-statistics` command is not supported on backup Routing Engines.

## Options

| | |
|---|---|
| **none** | Display LDP traffic statistics for all routing instances. |
| **instance** *instance-name* | (Optional) Display LDP traffic statistics for the specified routing instance only. |
| **logical-system (all \|** *logical-system-name*) | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| **p2mp** | (Optional) Display only the data traffic statistics for a point-to-multipoint LSP. |

## Additional Information

To collect output from this command on a periodic basis, configure the `traffic-statistics` statement for the LDP protocol. For more information, see the *Junos MPLS Applications Configuration Guide*.

## Output Fields

Table 100 on page 3514 lists the output fields for the `show ldp traffic-statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 100: show ldp traffic-statistics Output Fields**

| Field Name | Field Description |
|---|---|
| `Message type` | LDP message types. |

**Table 100: show ldp traffic-statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| FEC | Forwarding equivalence class (FEC) for which LDP traffic statistics are collected.<br><br>For P2MP LSPs, FEC appears as a combination of root address and the LSP ID (root_addr:lsp_id).<br><br>For multipoint LDP P2MP LSPs, FEC appears as a combination of root address multicast source address, and multicast group address (root_addr:lsp_id/grp,src). |
| Type | Type of traffic originating from a router, either Ingress (originating from this router) or Transit (forwarded through this router). |
| Packets | Number of packets passed by the FEC since its LSP came up. |
| Bytes | Number of bytes of data passed by the FEC since its LSP came up. |
| Shared | Whether a label is shared by prefixes: Yes or No. A Yes value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such. |
| Nexthop | The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.) |

**Table 100: show ldp traffic-statistics Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Label | For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop.<br><br>Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label. |
| Backup route | For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable. |
| Interface | Name of the point-to-multipoint interface for which statistics are displayed. |
| type | Type of LDP traffic on the interface. |

## Sample Output

### show ldp traffic-statistics

```
user@host> show ldp traffic-statistics

## Output Fields

Table 101 on page 3520 describes the output fields for the `show security keychain` command. Output fields are listed in the approximate order in which they appear.

**Table 101: show security keychain Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| keychain | The name of the keychain in operation. | All levels |
| Active-ID Send | Number of routing protocols packets sent with the active key. | All levels |
| Active-ID Receive | Number of routing protocols packets received with the active key. | All levels |
| Next-ID Send | Number of routing protocols packets sent with the next key. | All levels |

**Table 101: show security keychain Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Next-ID Receive | Number of routing protocols packets received with the next key. | All levels |
| Transition | Amount of time until the current key will be replaced with the next key in the keychain. | All levels |
| Tolerance | Configured clock-skew tolerance, in seconds, for accepting keys for a key chain. | All levels |
| Id | Identification number configured for the current key. | `detail` |
| Algorithm | Authentication algorithm configured for the current key. | `detail` |
| State | State of the current key.<br>The value can be:<br>• `receive`<br>• `send`<br>• `send-receive`<br>For the active key, the `State` can be `send-receive`, `send`, or `receive`. For keys that have a future start time, the `State` is `inactive`. Compare the `State` field to the `Mode` field. | `detail` |

**Table 101: show security keychain Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Option | For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.<br><br>The values can be:<br><br>• `basic`—Based on RFC 5304.<br><br>• `isis-enhanced`—Based on RFC 5310.<br><br>The default value is `basic`. When you configure the `isis-enhanced` option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.<br><br>When you configure `basic` (or do not include the `options` statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.<br><br>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key. | `detail` |
| Start-time | Time that the current key became active. | `detail` |

**Table 101: show security keychain Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Mode | Mode of each key (Informational only.)<br>The value can be<br>• receive<br>• send<br>• send-receive<br>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the Mode can be send-receive, send, or receive, regardless of the configured start-time. Compare the Mode field to the State field. | detail |

## Sample Output

### show security keychain brief

```
user@host> show security keychain brief
keychain                Active-ID       Next-ID       Transition  Tolerance
                      Send  Receive   Send  Receive
 hakr                   3     3        1     1        1d 23:58    3600
```

### show security keychain detail

```
user@host> show security keychain detail

                      Send  Receive   Send  Receive
 hakr                   3     3        1     1        1d 23:58    3600
  Id 3, Algorithm hmac-md5, State send-receive, Option basic
  Start-time Wed Aug 11 16:28:00 2010, Mode send-receive
```

```
Id 1, Algorithm hmac-md5, State inactive, Option basic
Start-time Fri Aug 20 11:30:57 2010, Mode send-receive
```

### Release Information

Command introduced in Junos OS Release 11.2.

## traceroute mpls ldp

**IN THIS SECTION**

- Syntax | **3524**
- Description | **3525**
- Options | **3525**
- Required Privilege Level | **3526**
- Output Fields | **3527**
- Sample Output | **3528**
- Release Information | **3529**

### Syntax

```
traceroute mpls <ldp> fec
<destination ip-address>
<detail>
<exp exp>
<fanout fanout-number>
<logical-system logical-system-name>
<no-resolve>
<paths maximum-paths>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source ip-address>
<ttl value>
```

```
<update>
<wait seconds>
```

## Description

Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use `traceroute mpls ldp` as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

## Options

| | |
|---|---|
| *fec* | Specify the IP address and optional prefix of the forwarding equivalence class (FEC). |
| **destination** *ip-address* | (Optional) Specify the destination address to use when sending probes.<br>• **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets. |
| **detail** | (Optional) Display detailed output. |
| **exp** *exp* | (Optional) Specify the class-of-service to use when sending probes.<br>• **Range:** 0 through 7<br>• **Default:** 7 |
| **fanout** *fanout-number* | (Optional) Specify the maximum number of nexthops to search per node.<br>• **Range:** 1 through 16<br>• **Default:** 16 |
| **logical-system** | (Optional) Specify the name of the logical system for the traceroute attempt. |
| **no-resolve** | (Optional) Specify not to resolve the hostname that corresponds to the IP address. |
| **paths** *maximum-paths* | (Optional) Specify the maximum number of paths to search.<br>• **Range:** 1 through 255<br>• **Default:** 16 |
| **pipe-mode** | (Optional) Specify to trace only nodes that understand LDP FEC. |

In an interoperation with other vendor devices or devices running Junos OS Release that do not support tracing of hierarchical LSPs as described in RFC 6424, continuous non-complaint probe status is displayed in the `traceroute mpls ldp` command output. To avoid this LDP loop creation, use the `pipe-mode` option with the `traceroute mpls ldp` *`fec`* command.

> **NOTE**: Even after using the `traceroute mpls ldp` *`fec`* `pipe-mode` command, one or more intermediate transit nodes that do not understand LDP FEC can return non-complaint probe status in the command output.

**retries** *retries-number*

(Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9
- **Default:** 3

**routing-instance** *routing-instance-name*

(Optional) Specify the name of the routing instance for the traceroute attempt.

**source** *source-address*

(Optional) Specify the source address of the outgoing traceroute packets.

**ttl** *value*

(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 125
- **Default:** 64

**update**

(Optional) Update database contents with traceroute results.

**wait** *seconds*

(Optional) Specify the number of seconds to wait before resending a probe.

- **Range:** 5 through 15
- **Default:** 10

## Required Privilege Level

network

## Output Fields

Table 102 on page 3527 describes the output fields for the `traceroute mpls ldp` *fec* command and the `traceroute mpls ldp` *fec* `detail` commands. Output fields are listed in the approximate order in which they appear.

**Table 102: traceroute mpls ldp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Probe options | Probe options specified in the `traceroute mpls ldp` *fec* command. | all levels |
| ttl | Time to live value of the labeled packet. | none specified |
| Label | Outgoing label used for forwarding the packet along the label-switched paths. | none specified |
| Protocol | Signaling protocol used. For this command, it is LDP. | none specified |
| Address | Address of the next hop. | none specified |
| Previous Hop | Address of the previous hop. Previous hop address of the first hop is **null**. | none specified |
| Probe status | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). | none specified |
| Hop | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | **detail** |
| Parent | Address of the previous hop. Parent value for the first hop is **null**. | **detail** |
| Return Code | Return code for reporting the result of processing the echo request by the receiver. | **detail** |

**Table 102: traceroute mpls ldp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Response time | Time for the echo request to reach the receiver. | **detail** |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**. | **detail** |
| Label Stack | Label stack used to forward the packet. | **detail** |

## Sample Output

### traceroute mpls ldp

```
user@router> traceroute mpls ldp 4.4.4.4

  Probe options: ttl 64, retries 3, wait 10, paths 16, exp 7, fanout 16
  ttl    Label  Protocol    Address          Previous Hop     Probe Status
    1   100016  LDP         24.24.24.1       (null)           Success
    2   100000  LDP         20.20.20.2       24.24.24.1       Success
    3        3  LDP         22.22.22.4       20.20.20.2       Egress

```

### Release Information

Command introduced in Junos OS Release 8.4.

## traceroute mpls segment-routing ospf

**IN THIS SECTION**

- Syntax | 3530
- Description | 3530
- Options | 3530
- Required Privilege Level | 3531
- Output Fields | 3532
- Sample Output | 3533
- Release Information | 3534

## Syntax

```
traceroute mpls segment-routing ospf<ldp> fec
<destination ip-address>
<detail>
<exp exp>
<fanout fanout-number>
<logical-system logical-system-name>
<no-resolve>
<paths maximum-paths>
<pipe-mode>
<retries retries-number>
<routing-instance routing-instance-name>
<source ip-address>
<ttl value>
<update>
<wait seconds>
```

## Description

Trace route to a remote host for a segment routing label-switched path added by the ISIS protocol. Use `traceroute mpls segment-routing isisp` as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

## Options

***fec*** Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

**destination *ip-address*** (Optional) Specify the destination address to use when sending probes.

- **Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

**detail** (Optional) Display detailed output.

**exp *exp*** (Optional) Specify the class-of-service to use when sending probes.

- **Range:** 0 through 7

- **Default:** 7

**fanout** *fanout-number* (Optional) Specify the maximum number of nexthops to search per node.

- **Range:** 1 through 16
- **Default:** 16

**logical-system** (Optional) Specify the name of the logical system for the traceroute attempt.

**no-resolve** (Optional) Specify not to resolve the hostname that corresponds to the IP address.

**paths** *maximum-paths* (Optional) Specify the maximum number of paths to search.

- **Range:** 1 through 255
- **Default:** 16

**retries** *retries-number* (Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9
- **Default:** 3

**routing-instance** *routing-instance-name* (Optional) Specify the name of the routing instance for the traceroute attempt.

**source** *source-address* (Optional) Specify the source address of the outgoing traceroute packets.

**ttl** *value* (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 125
- **Default:** 64

**wait** *seconds* (Optional) Specify the number of seconds to wait before resending a probe.

- **Range:** 5 through 15
- **Default:** 10

## Output Fields

Table 104 on page 3537 describes the output fields for the `traceroute mpls segment-routing isis` *fec* command and the `traceroute mpls segment-routing isis` *fec* `detail` commands. Output fields are listed in the approximate order in which they appear.

**Table 104: traceroute mpls ldp Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Probe options | Probe options specified in the `traceroute mpls ldp` *fec* command. | all levels |
| ttl | Time to live value of the labeled packet. | none specified |
| Label | Outgoing label used for forwarding the packet along the label-switched paths. | none specified |
| Protocol | Signaling protocol used. For this command, it is LDP. | none specified |
| Address | Address of the next hop. | none specified |
| Previous Hop | Address of the previous hop. Previous hop address of the first hop is **null**. | none specified |
| Probe status | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). | none specified |
| Hop | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | **detail** |
| Parent | Address of the previous hop. Parent value for the first hop is **null**. | **detail** |

**Table 104: traceroute mpls ldp Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Return Code | Return code for reporting the result of processing the echo request by the receiver. | **detail** |
| Response time | Time for the echo request to reach the receiver. | **detail** |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**. | **detail** |
| Label Stack | Label stack used to forward the packet. | **detail** |

## Sample Output

### traceroute mpls segment-routing isis

```
user@router> traceroute mpls ldp 4.4.4.4

Probe options: ttl 64, retries 3, wait 10, paths 16, exp 7, fanout 16

### Release Information

Command introduced in Junos OS Release 19.1R1.

## traceroute mpls segment-routing spring-te

**IN THIS SECTION**

- Syntax | 3540
- Description | 3540
- Options | 3540

- Additional Information | **3543**
- Required Privilege Level | **3544**
- Output Fields | **3544**
- Sample Output | **3545**
- Release Information | **3550**

## Syntax

```
traceroute mpls segment-routing spring-te
<egress-ip ( active | color |  detail | exp | logical-system | no-resolve | retries |  routing-
instance | secondary | segment-list | skip-fec-validation  | source | ttl | tunnel-source) >
<label-stack ( detail | egress | labels | logical-system | nexthop-address | nexthop-interface |
no-resolve) >
<source-routing-path ( lsp-name | active | color | detail | egress-ip | exp | logical-system |
no-resolve | retries | routing-instance | secondary | segment-list | skip-fec-validation |
source | tunnel-source) >
```

## Description

Trace route to a remote host for a segment routing label-switched path added by segment routing traffic-engineered (SPRING-TE) tunnel. Use `traceroute mpls segment-routing spring-te` as a debugging tool to locate MPLS label-switched path forwarding issues in a network.

## Options

**egress-ip** Specify to trace to or install IP address to use when sending probes.

**active** Specify to use the forwarding path or nexthops from the RIB table.

**color** Specify the color identifier for the tunnel end-point.

- **Range:** 1 through 4294967295

**detail** (Optional) Display detailed output.

**exp *exp*** (Optional) Specify the class of service to use when sending probes.

- **Range:** 0 through 7

**logical-system** *logical-system-name* — (Optional) Specify the name of the logical system for the traceroute attempt.

**no-resolve** — Specify not to attempt to print addresses symbolically.

**retries** *retries-number* — (Optional) Specify the number of times to resend probe values.

- **Range:** 1 through 9

**routing-instance** *routing-instance-name* — (Optional) Specify the name of the routing instance for the trace route attempt.

**secondary** — Specify to use configured secondary segment list for the given segment routing path.

**segment-list** — Specify the segment list to use when sending probes.

**skip-fec-validation** — Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC.

**source** *source-address* — (Optional) Specify the source address of the outgoing traceroute packets.

**ttl** *value* — (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

- **Range:** 1 through 255

**tunnel-source** — Specify the source protocol used to create tunnel.

**label-stack** — Specify the label stack for traceroute packets. This option works only if you do a minimum configuration of `source-packet-routing` at the `[edit protocols]` hierarchy level.

**detail** — (Optional) Display detailed output.

**egress** — Specify the egress IP address.

**labels** — Specify the labels in label stack.

- **Range:** 16 through 1048575

**logical-system** *logical-system-name* — (Optional) Specify the name of the logical system for the traceroute attempt.

| | | |
|---|---|---|
| | **nexthop-address** *address* | Specify the nexthop IP address for the traceroute packet. |
| | **nexthop-interface** *interface* | Specify the outgoing interface for the traceroute packet. |
| | **no-resolve** | Specify not to attempt to print addresses symbolically. |
| **source-routing-path** | Specify the trace source path routing to use when sending probes. | |
| | **lsp-name** | Specify the source path routing name. |
| | **active** | Specify to use the forwarding path or nexthops from the RIB table. |
| | **color** | Specify the color identifier for the tunnel end-point.<br>• **Range:** 1 through 4294967295 |
| | **detail** | (Optional) Display detailed output. |
| | **egress-ip** | Specify to trace to or install IP address to use when sending probes. |
| | **exp** *exp* | (Optional) Specify the class of service to use when sending probes.<br>• **Range:** 0 through 7 |
| | **logical-system** *logical-system-name* | (Optional) Specify the name of the logical system for the traceroute attempt. |
| | **no-resolve** | Specify not to attempt to print addresses symbolically. |
| | **retries** *retries-number* | (Optional) Specify the number of times to resend probe values.<br>• **Range:** 1 through 9 |
| | **secondary** | Specify to use configured secondary segment list for the given segment routing path. |
| | **segment-list** | Specify the segment list to use when sending probes. |
| | **skip-fec-validation** | Specify to skip forwarding equivalence class (FEC) validation or use NIL FEC. |
| | **source** *source-address* | (Optional) Specify the source address of the outgoing traceroute packets. |

| | |
|---|---|
| **ttl** *value* | (Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.<br>• **Range:** 1 through 255 |

## Additional Information

**NOTE**: With `segment-list` option, valid `tunnel-source` (source protocol used to create tunnel) is only static.

**NOTE**: `segment-list` option is not present when `tunnel-source` is BGP-SR-TE since BGP-SR-TE does not have named segment list.

**NOTE**: With `source-routing-path` name, valid `tunnel-source` are PCEP and static.

**NOTE**: With `tunnel-source` as PCEP, `secondary` option is not valid as PCEP always sends one primary LSP.

**NOTE**: FEC validation is performed for `traceroute mpls segment-routing spring-te` by default.

**NOTE**: FEC validation is supported when segment-routing traffic-engineering (SR-TE) tunnel has IGP labels (OSPF and IS-IS) only. For all the other labels (for example, static, ldp, rsvp, etc.), you can use `skip-fec-validation` option.

**NOTE**: For a combination of `egress-ip` and `color` options, valid `tunnel-source` are static and BGP-SR-TE.

**NOTE**: `traceroute mpls segment-routing spring-te` command with `label-stack` option is supported in operational mode only. It is not supported in configuration mode.

**NOTE**: Parallel SID, binding SID, LDP over SR-TE is not supported.

**NOTE**: In case of `traceroute mpls segment-routing spring-te`, the PFE supports only 16 ECMP paths. If there more than 16 ECMP paths to the SR-TE LSP, traceroute is done up to a maximum of 16 hops.

## Required Privilege Level

network

## Output Fields

Table 105 on page 3544 describes the output fields for the `traceroute mpls segment-routing spring-te` command. Output fields are listed in the approximate order in which they appear.

**Table 105: traceroute mpls spring-te Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Probe options | Probe options specified in the `traceroute mpls segment-routing spring-te` command. | all levels |
| ttl | Time to live value of the labeled packet. | none specified |
| Label | Outgoing label used for forwarding the packet along the label-switched paths. | none specified |
| Protocol | Signaling protocol used. For this command, it is LDP. | none specified |

**Table 105: traceroute mpls spring-te Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Address | Address of the next hop. | none specified |
| Previous Hop | Address of the previous hop. Previous hop address of the first hop is **null**. | none specified |
| Probe status | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). | none specified |
| Hop | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | **detail** |
| Parent | Address of the previous hop. Parent value for the first hop is **null**. | **detail** |
| Return Code | Return code for reporting the result of processing the echo request by the receiver. | **detail** |
| Response time | Time for the echo request to reach the receiver. | **detail** |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is **none**. | **detail** |
| Label Stack | Label stack used to forward the packet. | **detail** |

## Sample Output

### traceroute mpls segment-routing spring-te

```
user@host> traceroute mpls segment-routing spring-te
Possible completions:
  source-routing-path Source Path routing to use when sending probes
```

```
  egress-ip                  To/Install IP address to use when sending probes
  label-stack                Label stack for traceroute packets
```

### traceroute mpls segment-routing spring-te (source-routing-path) (No FEC validation)

# CCC and TCC Operational Commands

IN THIS CHAPTER

- show connections | 3551
- show route ccc | 3556
- show route forwarding-table | 3558

## show connections

IN THIS SECTION

- Syntax | 3551
- Syntax (EX Series Switches) | 3552
- Description | 3552
- Options | 3552
- Required Privilege Level | 3553
- Output Fields | 3553
- Sample Output | 3555
- Release Information | 3555

### Syntax

```
show connections
<brief | extensive>
<all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch | remote-
interface-switch>
<down | up | up-down>
```

```
<history>
<labels>
<logical-system (all | logical-system-name)>
<name>
<status>
```

## Syntax (EX Series Switches)

```
show connections
<brief | extensive>
<all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch | remote-
interface-switch>
<down | up | up-down>
<history>
<labels>
<name>
<status>
```

## Description

Display information about the configured circuit cross-connect (CCC) connections.

## Options

| | |
|---|---|
| **none** | Display the standard level of output for all configured CCC connections. |
| **all** | (Optional) Display all connections. |
| **brief \| extensive** | (Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status. |
| **interface-switch** | (Optional) Display interface switch connections only. |
| **lsp-switch** | (Optional) Display LSP switch connections only. |
| **p2mp-receive-switch** | (Optional) Display point-to-multipoint LSP to local interfaces switch connections only. |

| | |
|---|---|
| **p2mp-transmit-switch** | (Optional) Display local interface to point-to-multipoint LSP switch connections only. |
| **remote-interface-switch** | (Optional) Display remote interface switch connections only. |
| **down \| up \| up-down** | (Optional) Display nonoperational, operational, or both kinds of connections. |
| **history** | (Optional) Display information about connection history. |
| **labels** | (Optional) Display labels used for transmit and receive. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |
| ***name*** | (Optional) Display information about the specified connection only. |
| **status** | (Optional) Display information about the connection and interface status. |

## Required Privilege Level

view

## Output Fields

Table 106 on page 3553 describes the output fields for the `show connections` command. Output fields are listed in the approximate order in which they appear.

**Table 106: show connections Output Fields**

| Field Name | Field Description |
|---|---|
| `CCC and TCC connections [Link Monitoring On I Off]` | Whether link monitoring is enabled: **On** or **Off**. |
| **Legend for Status (St)** | Connection or circuit status. See the output's legend for an explanation of the status field values. |

**Table 106: show connections Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| **Legend for connection types** | Type of connection:<br>• **if-sw**—Layer 2 switching cross-connect.<br>• **rmt-if**—Remote interface switch. While graceful restart is in progress, **rmt-if** will display a state **(St)** of **Restart**.<br>• **lsp-sw**—LSP stitching cross-connect. While graceful restart is in progress, **lsp-sw** will display a state **(St)** of **Restart**. |
| **Legend for circuit types** | Type of circuits:<br>• **intf**—Interface circuit.<br>• **tlsp**—Transmit LSP circuit.<br>• **rlsp**—Receive LSP circuit. |
| **Connection/Circuit** | Name of the configured CCC connection. |
| **Type** | Type of connection. |
| **St** | State of the connection. |
| **Time last up** | Time that the connection or circuit last transitioned to the **Up** (operational) state. |
| **# Up trans** | Number of times that the connection or circuit has transitioned to the **Up** (operational) state. |

## Sample Output

### show connections

```
user@switch> show connections
CCC and TCC connections [Link Monitoring On]
  Legend for status (St)             Legend for connection types
  UN -- uninitialized                if-sw:  interface switching
  NP -- not present                  rmt-if: remote interface switching
  WE -- wrong encapsulation          lsp-sw: LSP switching
  DS -- disabled
  Dn -- down                         Legend for circuit types
  -> -- only outbound conn is up     intf -- interface
  <- -- only inbound  conn is up     tlsp -- transmit LSP
  Up -- operational                  rlsp -- receive LSP
  RmtDn -- remote CCC down
  Restart -- restarting

CCC Graceful restart : Restarting

Connection/Circuit               Type    St      Time last up     # Up trans
IFSW-ed                          if-sw   Up      Aug  5 15:39:15           1
  so-1/0/2.0                       intf  Up
  t1-0/1/2.0                       intf  Up
SW-db                            rmt-if  Restart                          0
  so-1/0/3.0                       intf  Up

## Syntax

```
show route ccc ccc
<brief | detail | extensive | terse>
<logical-system (all | logical-system-name)>
```

## Description

Display circuit cross-connect (CCC) entries in the Multiprotocol Link Switching (MPLS) routing table.

## Options

| | |
|---|---|
| *ccc* | Name of an entry with a circuit cross-connect interface. |
| **brief \| detail \| extensive \| terse** | (Optional) Display the specified level of output. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

For information about output fields, see the output field tables for the *show route* command, the *show route detail* command, the *show route extensive* command, or the *show route terse* command.

## Sample Output

### show route ccc extensive

```
user@host> show route ccc fe-0/1/0.600 extensive
mpls.0: 19 destinations, 19 routes (19 active, 0 holddown, 0 hidden)
fe-0/1/2.600 (1 entry, 1 announced)
TSI:
KRT in-kernel fe-0/1/2.600.0      /16 -> {0.0.0.0}
        *CCC    Preference: 7
                Next-hop reference count: 2
                Next hop: via so-0/0/3.0 weight 0x1, selected
                Label operation: Push 101424
                State: <Active Int>
                Local AS:   100

<multicast>
<table routing-instance-name>
<vpn vpn>
```

## Description

Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE**: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the `show pfe route` command.

## Options

| | |
|---|---|
| **none** | Display the routes in the forwarding tables. By default, the `show route forwarding-table` command does not display information about private, or internal, forwarding tables. |
| **detail \| extensive \| summary** | (Optional) Display the specified level of output. |
| **all** | (Optional) Display routing table entries for all forwarding tables, including private, or internal, tables. |
| **bridge-domain (all \| *bridge-domain-name*)** | (MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain. |
| **ccc *interface-name*** | (Optional) Display route entries for the specified circuit cross-connect interface. |
| **destination *destination-prefix*** | (Optional) Destination prefix. |
| **family *family*** | (Optional) Display routing table entries for the specified family: `bridge (ccc \| destination \| detail \| extensive \| interface-name \| label \| learning-vlan-id \| matching \| multicast \| summary \| table \| vlan \| vpn)`, `ethernet-switching`, `evpn`, `fibre-channel`, `fmembers`, `inet`, `inet6`, `iso`, `mcsnoop-inet`, `mcsnoop-inet6`, `mpls`, `satellite-inet`, `satellite-inet6`, `satellite-vpls`, `tnp`, `unix`, `vpls`, or `vlan-classification`. |
| **interface-name *interface-name*** | (Optional) Display routing table entries for the specified interface. |
| **label *name*** | (Optional) Display route entries for the specified label. |
| **lcc *number*** | (TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.<br><br>Replace *number* with the following values depending on the LCC configuration: |

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id* — (MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching* — (Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast** — (Optional) Display routing table entries for multicast routes.

**table** — (Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the `show route instance` command.

**vlan (all |** *vlan-name***)** — (Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn* — (Optional) Display routing table entries for a specified VPN.

view

## Output Fields

Table 107 on page 3562 lists the output fields for the `show route forwarding-table` command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the `detail` keyword is used instead of the `extensive` keyword.

**Table 107: show route forwarding-table Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| Logical system | Name of the logical system. This field is displayed if you specify the `table` *`logical-system-name/routing-instance-name`* option on a device that is configured for and supports logical systems. | All levels |
| Routing table | Name of the routing table (for example, inet, inet6, mpls). | All levels |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Enabled protocols | The features and protocols that have been enabled for a given routing table. This field can contain the following values:<br>• BUM hashing—BUM hashing is enabled.<br>• MAC Stats—Mac Statistics is enabled.<br>• Bridging—Routing instance is a normal layer 2 bridge.<br>• No VLAN—No VLANs are associated with the bridge domain.<br>• All VLANs—The `vlan-id all` statement has been enabled for this bridge domain.<br>• Single VLAN—Single VLAN ID is associated with the bridge domain.<br>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.<br>• Dual VLAN—Dual VLAN tags are associated with the bridge domain<br>• No local switching—No local switching is enabled for this routing instance..<br>• Learning disabled—Layer 2 learning is disabled for this routing instance.<br>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.<br>• VPLS—The VPLS protocol is enabled.<br>• No IRB l2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.<br>• ACKed by all peers—All peers have acknowledged this routing instance. | All levels |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • BUM Pruning—BUM pruning is enabled on the VPLS instance.<br>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.<br>• EVPN—EVPN protocol is enabled for this routing instance.<br>• Def BD OVSDB—Open vSwitch Database (OVSDB) is enabled on the default bridge domain.<br>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.<br>• L2 backhaul—Layer 2 backhaul is enabled.<br>• FRR optimize—Fast reroute optimization<br>• MAC pinning—MAC pinning is enabled for this bridge domain.<br>• MAC Aging Timer—The MAC table aging time is set per routing instance.<br>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.<br>• PBBN—This routing instance is configured as a provider backbone bridged network.<br>• PBN—This routing instance is configured as a provider bridge network.<br>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.<br>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.<br>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain. | |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| | • MPLS control word—Control word is enabled for this MPLS routing instance. | |
| Address family | Address family (for example, `IP`, `IPv6`, `ISO`, `MPLS`, and `VPLS`). | All levels |
| Destination | Destination of the route. | `detail extensive` |
| Route Type (Type) | How the route was placed into the forwarding table. When the `detail` keyword is used, the route type might be abbreviated (as shown in parentheses):<br>• `cloned` (`clon`)—(TCP or multicast only) Cloned route.<br>• `destination` (`dest`)—Remote addresses directly reachable through an interface.<br>• `destination down` (`iddn`)—Destination route for which the interface is unreachable.<br>• `interface cloned` (`ifcl`)—Cloned route for which the interface is unreachable.<br>• `route down` (`ifdn`)—Interface route for which the interface is unreachable.<br>• `ignore` (`ignr`)—Ignore this route.<br>• `interface` (`intf`)—Installed as a result of configuring an interface.<br>• `permanent` (`perm`)—Routes installed by the kernel when the routing table is initialized.<br>• `user`—Routes installed by the routing protocol process or as a result of the configuration. | All levels |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Route Reference (RtRef) | Number of routes to reference. | `detail extensive` |
| Flags | Route type flags:<br>• `none`—No flags are enabled.<br>• `accounting`—Route has accounting enabled.<br>• `cached`—Cache route.<br>• `incoming-iface` *`interface-number`*—Check against incoming interface.<br>• `prefix load balance`—Load balancing is enabled for this prefix.<br>• `rt nh decoupled`—Route has been decoupled from the next hop to the destination.<br>• `sent to PFE`—Route has been sent to the Packet Forwarding Engine.<br>• `static`—Static route. | `extensive` |
| Next hop | IP address of the next hop to the destination.<br>**NOTE**: For static routes that use point-to-point (P2P) outgoing interfaces, the next-hop address is not displayed in the output. | `detail extensive` |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Next hop Type (Type) | Next-hop type. When the `detail` keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):<br>• `broadcast (bcst)`—Broadcast.<br>• `deny`—Deny.<br>• `discard (dscd)` —Discard.<br>• `hold`—Next hop is waiting to be resolved into a unicast or multicast type.<br>• `indexed (idxd)`—Indexed next hop.<br>• `indirect (indr)`—Indirect next hop.<br>• `local (locl)`—Local address on an interface.<br>• `routed multicast (mcrt)`—Regular multicast next hop.<br>• `multicast (mcst)`—Wire multicast next hop (limited to the LAN).<br>• `multicast discard (mdsc)`—Multicast discard.<br>• `multicast group (mgrp)`—Multicast group member.<br>• `receive (recv)`—Receive.<br>• `reject (rjct)`—Discard. An ICMP unreachable message was sent.<br>• `resolve (rslv)`—Resolving the next hop.<br>• `unicast (ucst)`—Unicast.<br>• `unilist (ulst)`—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.<br>• `VxLAN Local`—EVPN Type 5 route in kernel. | `detail extensive` |

**Table 107: show route forwarding-table Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Index | Software index of the next hop that is used to route the traffic for a given prefix. | `detail extensive` none |
| Route interface-index | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned. | `extensive` |
| Reference (NhRef) | Number of routes that refer to this next hop. | `detail extensive` none |
| Next-hop interface (Netif) | Interface used to reach the next hop. | `detail extensive` none |
| Weight | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the `Balance` field description). | `extensive` |
| Balance | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. | `extensive` |
| RPF interface | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when `rpf-check` is configured on the interface. | `extensive` |

## Sample Output

```

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
    unit 0 {
        family inet {
            rpf-check;
            address 192.0.2.2/30;
        }
    }
}
```

## Release Information

Command introduced before Junos OS Release 7.4.

Option `bridge-domain` introduced in Junos OS Release 7.5

Option `learning-vlan-id` introduced in Junos OS Release 8.4

Options `all` and `vlan` introduced in Junos OS Release 9.6.

# PCEP Operational Commands

IN THIS CHAPTER

- clear path-computation-client statistics | 3573
- request path-computation-client active-pce | 3575
- show isis spring sensor info | 3576
- show path-computation-client active-pce | 3579
- show path-computation-client lsp | 3585
- show path-computation-client statistics | 3593
- show path-computation-client status | 3601
- show spring-traffic-engineering | 3604

## clear path-computation-client statistics

IN THIS SECTION

- Syntax | 3574
- Description | 3574
- Options | 3574
- Required Privilege Level | 3574
- Output Fields | 3574
- Sample Output | 3574
- Release Information | 3574

## Syntax

```
clear path-computation-client statistics
<pce-id | all>
```

## Description

Clear Path Computation Element (PCE) statistics.

## Options

***pce-id*** (Optional) Clear statistics of the specified PCE.

**all** (Optional) Clear statistics of all available PCEs configured on the path computation client (PCC).

## Required Privilege Level

clear

## Output Fields

When you enter this command, you are not provided feedback on the status of your request.

## Sample Output

### clear path-computation-client statistics pce-id

```
user@host> clear path-computation-client statistics pce1
```

### clear path-computation-client statistics all

```
user@host> clear path-computation-client statistics all
```

## Release Information

Statement introduced in Junos OS Release 12.3.

RELATED DOCUMENTATION

show path-computation-client statistics | 3593

# request path-computation-client active-pce

IN THIS SECTION

- Syntax | 3575
- Description | 3575
- Options | 3575
- Required Privilege Level | 3575
- Output Fields | 3576
- Release Information | 3576

## Syntax

```
request path-computation-client active-pce pce-id
```

## Description

Request a new active Path Computation Element (PCE).

## Options

| | |
|---|---|
| *pce-id* | Unique user defined ID for this PCE. |
| *retry-delegation* | Retry label-switched path (LSP) delegation |

## Required Privilege Level

request

### Output Fields

This command produces no output. To verify the operation of the command, run the "show path-computation-client active-pce" on page 3579 before and after running the `request path-computation-client active-pce` command.

### Release Information

Command introduced in Junos OS Release 12.3.

RELATED DOCUMENTATION

show path-computation-client active-pce | 3579

## show isis spring sensor info

IN THIS SECTION

- Syntax | 3576
- Description | 3577
- Options | 3577
- Required Privilege Level | 3577
- Output Fields | 3577
- Sample Output | 3577
- Release Information | 3578

### Syntax

```
show isis spring sensor info
logical-system (all |logical-system-name)
```

## Description

Displays a list of sensors associated with the label IS-IS route and next hops for segment routing traffic. The command only displays the information related to the sensors and not the traffic statistics.

## Options

| | |
|---|---|
| **none** | Display the sensor information of an IS-IS SPRING route. |
| **logical-system (all \| *logical-system-name*)** | (Optional) Perform this operation on all logical systems or on a particular logical system. |

## Required Privilege Level

view

## Output Fields

Table 1 describes the output fields for the `show isis spring sensor info` command. Output fields are listed in the approximate order in which they appear.

**Table 108: show isis spring sensor info Output Fields**

| Field | Field Description |
|---|---|
| Sensor-name | Represents the router or interface that the sensor is associated with. |
| Sensor-id | Unique number associated either with route or interface. |

## Sample Output

### show isis spring sensor info

```
user@host> show isis spring sensor info
Per-interface-per-member-link Ingress Sensor:
-------------------------------------------
Sensor-name                       Sensor-id
aggr_ingress_intf_sensor          3221225484
```

```
Per-interface-per-member-link Egress Sensor:
-------------------------------------------
Sensor-name                         Sensor-id
ge-0/0/0.0                          3221225497
ge-0/0/1.0                          3221225498
ge-0/0/2.0                          3221225499

Per-sid Ingress Sensor:
----------------------
Sensor-name                         Sensor-id
16                                  3221225478
17                                  3221225479
18                                  3221225474
19                                  3221225475

# show path-computation-client active-pce

IN THIS SECTION

- Syntax | 3579
- Description | 3579
- Options | 3579
- Required Privilege Level | 3580
- Output Fields | 3580
- Sample Output | 3583
- Release Information | 3585

## Syntax

```
show path-computation-client active-pce
<brief | detail>
```

## Description

Displays information about the current active Path Computation Element (PCE).

## Options

| | |
|---|---|
| **none** | Display brief information about the current active PCE. |
| **brief \| detail** | (Optional) Display the specific level of output. |

## Required Privilege Level

view

## Output Fields

Table 109 on page 3580 describes the output fields for the `show path-computation-client active-pce` command. Output fields are listed in the approximate order in which they appear.

**Table 109: show path-computation-client active-pce Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| IP address | IP address of the current active PCE. | All levels |
| Priority | Active PCE priority. | All levels |
| PCE status | Active PCE state:<br>• PCE_STATE_NEW— Initial PCEP session state.<br>• PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.<br>• PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.<br>• PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.<br>• PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.<br>• PCE_STATE_UP—PCEP session established. | All levels |

**Table 109: show path-computation-client active-pce Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Session type | Active PCE type:<br>• PCE_TYPE_STATELESS—Does not learn LSP state information form PCC.<br>• PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.<br>• PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE. | All levels |
| PCE-primary role | PCE primary role state:<br>• main—Current active PCE.<br>• backup—Backup PCE. | All levels |
| PCRpts | Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s). | All levels |
| PCUpdates | Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters. | All levels |
| Local Keepalive timer | Keepalive timer used by or for the PCC. | All levels |
| Local Dead timer | Dead timer used by or for the PCC. | All levels |
| Remote Keepalive timer | Keepalive timer used by or for the PCE. | All levels |

**Table 109: show path-computation-client active-pce Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Remote Dead timer | Dead timer used by or for the PCE. | All levels |
| PCErr-recv | Information about type, value, and number of PC Error messages received. | All levels |
| Max unknown messages | Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed. | detail |
| Keepalives received | Number of Keepalive messages received by a PCC from a PCE. | detail |
| Keepalives sent | Number of Keepalive messages sent by a PCC to a PCE. | detail |
| Dead timer | Dead timer used by the current active PCE. | detail |
| Elapsed as main current | Time (in seconds) the PCE is in the main primary role state. | detail |
| Elapsed as main total | Time (in seconds) the PCE became main from the last PCCD restart. | detail |
| Unknown msgs/min rate | Number of unknown messages received per minute. | detail |
| Session failures | Number of PCEP session failures with the PCE. | detail |

**Table 109: show path-computation-client active-pce Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Delegation timeout in | Time (in seconds) left for LSP delegation to timeout. | detail |
| Delegation failures | Number of LSP delegation failures. | detail |
| Connection down | Time (in seconds) since the PCEP session is down. | detail |
| PCErr-sent | Information about type, value, and number of PC Error messages sent. | All levels |

## show path-computation-client lsp

IN THIS SECTION

- Syntax | 3585
- Description | 3586
- Options | 3586
- Required Privilege Level | 3586
- Output Fields | 3586
- Sample Output | 3590
- Release Information | 3592

### Syntax

```
show path-computation-client lsp
<extensive (name lsp name)>
<name>
<p2mp>
```

## Description

Display the state of label-switched paths (LSPs) known to the Path Computation Client (PCC).

## Options

**none** Display information about LSPs known to the PCC.

**extensive** (Optional) Display extensive level of output about each known LSP - point-to-point and point-to-multipoint LSPs.

**name** (Optional) Enter regular expression for LSP names to match. You can filter a particular LSP from a large number of LSPs by entering specific name of the LSP.

**p2mp** (Optional) Display information about known point-to-multipoint Path Computation Element (PCE)-initiated LSPs.

## Required Privilege Level

view

## Output Fields

Table 110 on page 3586 describes the output fields for the `show path-computation-client lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 110: show path-computation-client lsp Output Fields**

| Field Name | Field Description |
|---|---|
| LSP Name | Name of the LSP. |
| Status | LSP status:<br>• Primary(Act)—Primary LSP.<br>• Bypass—PCE-initiated bypass LSP. |

**Table 110: show path-computation-client lsp Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| PLSP-Id | PCEP-specific unique identifier for each LSP. The ID is created by the PCC for the lifetime of a PCEP session. |
| LSP-Type | Type of LSP:<br>• External provisioned<br>• Local |
| Controller | Name of the external path computing entity. |
| Path-Setup-Type | Protocol used to set up the LSP:<br>• RSVP-TE<br>• SPRING-TE |
| Template | Name of template used. |
| P2MP name | Name of the point-to-multipoint tree that includes the sub-LSPs of the PCE-initiated LSP. |
| P2MP Branch Name | Name of the branch sub-LSP that makes up the point-to-multipoint tree of the PCE-initiated LSP. |
| PathName | Name of LSP path. |
| From | Ingress IP address of LSP. |
| To | Egress IP address of LSP. |
| State | LSP state: up, down. |

**Table 110: show path-computation-client lsp Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Active Path | Name of active path. |
| Link Protection | LSP Link protection. |
| P2mp tree | Name of the point-to-multipoint tree that includes the sub-LSPs of the PCE-initiated LSP. |
| Path cspf status | CSPF computation done by an external controller or local router. |
| LSP-ID | LSP identifier. |
| RSVP Error | RSVP error ID. |
| Priorities | Setup and hold priorities. |
| Bandwidth | LSP bandwidth. |
| Requested AutoBw | Requested bandwidth to controller for auto-bandwidth. |
| Controller | Name of external controller. |
| Record Route | LSP record route object. |
| From PCE ERO (received) | Explicit Route Object (ERO) received by controller from the routing protocol process. |
| From RPD ERO (reported) | ERO reported from the routing protocol process. |
| Configured ERO on PCC | ERO configured on router. |

**Table 110: show path-computation-client lsp Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Association | Grouping of LSPs.<br><br>Association output details:<br><br>• Association-type—Type of association supported by PCCD. Currently, only `path protection` association is supported.<br><br>**NOTE**: The `path protection` association is displayed as `PROTECTION` in the CLI output.<br><br>• Association ID—Association ID.<br><br>• Association Source—Address of the PCEP speaker that creates the association. For the `path protection` association, association source is always the ingress IP address of the LSP. |
| PCE Traffic Steering | MVPN flow specification capability. |
| FS-ID | Flow specification ID. |
| Route Distinguisher | Route Distinguisher of MVPN instance. |
| Source Prefix | Matching source address of MVPN flow specification. |
| Multicast Group Prefix | Matching group address of MVPN flow specification. |
| State | Flow specification state of specific flow specification ID. |
| Last Rpt/Pcreqest received from RPD at | Time the last PC report or PE request message was received. |
| Last Update sent to PCE at | Time the last update was sent to PCE. |

**Table 110: show path-computation-client lsp Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Last PcUpdate/PcCreate received from PCE at | Time the last PC update message was received from the controller. |
| Last error sent to PCE at | Time the last PC error was sent to the controller. |
| Last 5 reasons to send Report/Pcrequest | • Reconfig<br>• Down<br>• Get_info<br>• Up<br>• Active |

## Sample Output

### show path-computation-client lsp

```
user@host> show path-computation-client lsp

```

## Release Information

Command introduced in Junos OS Release 17.2R1.

`extensive` and `p2mp` options introduced in Junos OS Release 18.3R1 on MX Series routers.

`name` option introduced in Junos OS Release 20.1R1 and Junos OS Evolved Release 20.1R1 on PTX10003-160C and PTX10008 routers.

## Output Fields

Table 111 on page 3594 describes the output fields for the **show path-computation-client statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 111: show path-computation-client statistics Output Fields**

| Field Name | Field Description | Level of Output |
|---|---|---|
| IP address | IP address of the PCE. | All levels |
| Priority | PCE priority. | All levels |
| PCE status | PCE state:<br>• PCE_STATE_NEW— Initial PCEP session state.<br>• PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.<br>• PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.<br>• PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.<br>• PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.<br>• PCE_STATE_UP—PCEP session established. | All levels |

**Table 111: show path-computation-client statistics Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Session type | Active PCE type:<br>• PCE_TYPE_STATELESS—Does not learn LSP state information form PCC.<br>• PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.<br>• PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE. | All levels |
| PCE-primary role | PCE primary role state:<br>• main<br>• primary<br>• backup | All levels |
| PCRpts | Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s). | All levels |
| PCUpdates | Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters. | All levels |
| Local Keepalive timer | Keepalive timer used by or for the PCC. | All levels |
| Local Dead timer | Dead timer used by or for the PCC. | All levels |

**Table 111: show path-computation-client statistics Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Remote Keepalive timer | Keepalive timer used by or for the PCE. | All levels |
| Remote Dead timer | Dead timer used by or for the PCE. | All levels |
| PCErr-recv | Information about type, value, and number of PC Error messages received. | All levels |
| PCErr-sent | Information about type, value, and number of PC Error messages sent. | All levels |
| Max unknown messages | Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed. | detail |
| Keepalives received | Number of Keepalive messages received by a PCC from a PCE. | detail |
| Keepalives sent | Number of Keepalive messages sent by a PCC to a PCE. | detail |
| Elapsed as main current | Time (in seconds) the PCE is in the main primary role state. | detail |
| Elapsed as main total | Time (in seconds) the PCE became main from the last PCCD restart. | detail |
| Unknown msgs/min rate | Number of unknown messages received per minute. | detail |

**Table 111: show path-computation-client statistics Output Fields *(Continued)***

| Field Name | Field Description | Level of Output |
|---|---|---|
| Session failures | Number of PCEP session failures with the PCE. | detail |
| Delegation timeout in | Time (in seconds) left for LSP delegation to timeout. | detail |
| Delegation failures | Number of LSP delegation failures. | detail |
| Connection down | Time (in seconds) since the PCEP session is down. | detail |
| Local IP address | IP address of the PCC. | detail |
| LSP provisioning allowed | LSP provisioning capability. | detail |
| P2MP LSP report allowed | Report capability of point-to-multipoint LSP. | detail |
| P2MP LSP update allowed | Update capability of point-to-multipoint LSP. | detail |
| P2MP LSP init allowed | Initiate capability of point-to-multipoint LSP. | detail |
| PCE Traffic Steering | Traffic steering capability of the PCE. | detail |

### Syntax

```
show path-computation-client status
<extensive>
```

## Description

Display the status of the Path Computation Client (PCC).

## Options

**none** Display the status of the PCC.

**extensive** (Optional) Display extensive information about the PCC including point-to-point and point-to-multipoint PCE-initiated LSPs.

For point-to-multipoint PCE-initiated LSPs, the extensive output displays the point-to-multipoint LSP tree and branches separately for a PCEP session.

## Output Fields

Table 112 on page 3602 describes the output fields for the `show path-computation-client status` command. Output fields are listed in the approximate order in which they appear.

**Table 112: show path-computation-client status Output Fields**

| Field Name | Field Description |
|---|---|
| Session | Name of the PCE with which the PCEP session is established. |
| Type | Type of PCE. |
| Provisioning | Provisioning status of the PCE. |
| Status | PCEP session status. |
| Total number of LSPs | Number of LSPs in total. |

**Table 112: show path-computation-client status Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Static LSPs | Status of point-to-point and point-to-multipoint static LSPs. |
| Externally controlled LSPs | Status of point-to-point and point-to-multipoint LSPs that are controlled by a PCE. |
| Externally provisioned LSPs | Status of point-to-point and point-to-multipoint LSPs that are provisioned by a PCE. |
| Orphaned LSPs | Status of LSPs that are in the orphaned state because of PCEP session failure. |
| Delegated | Status of point-to-point and point-to-multipoint LSPs that are delegated to the PCE by the PCC. |

## Sample Output

### show path-computation-client status

```
user@host> show path-computation-client status extensive
Session              Type                        Provisioning   Status
 pce1               Stateful Active             On             Up

LSP Summary
 Total number of LSPs               : 0
 Static LSPs                        : 0
         P2P                        : 0
                                             : 0/0 (primary/bypass)
         P2MP                       : 0/0 (branches/trees)
 Externally controlled LSPs         : 0
         P2P                        : 0
                                               : 0/0 (primary/bypass)
         P2MP                       : 0/0 (branches/trees)
 Externally provisioned LSPs        : 0/16000 (current/limit)
         P2P                        : 0
```

```
                                                : 0/0 (primary/ bypass)
         P2MP                          : 0/0 (branches/trees)
 Orphaned LSPs                         : 0

pce1 (main)
 Delegated              : 0
        P2P             : 0
                                : 0/0 (primary/bypass)
        P2MP            : 0/0 (branches/trees)

## show spring-traffic-engineering

**IN THIS SECTION**

- Syntax | 3605
- Description | 3605
- Options | 3605
- Required Privilege Level | 3606
- Output Fields | 3606

Sample Output | 3609
Release Information | 3615

## Syntax

```
show spring-traffic-engineering (lsp | overview | sbfd)
<brief | detail>
<color>
<destination>
<logical-system (all | logical-system-name)>
<name lsp-name>
```

## Description

Display ingress details of SPRING traffic engineering.

## Options

**brief | detail** (Optional) Display the specific level of output.

**lsp** Display details of SPRING traffic-engineered LSPs on the ingress router or the Path Computation Client (PCC).

**color** Display only SPRING traffic-engineered LSPs for a specific color. This filtering option is available only for LSP, not available for overview and sbfd.

**destination** Display only SPRING traffic-engineered LSPs to a specific destination. Destination can be IPv4/IPv6 to-address. This filtering option is available only for LSP, not available for overview and sbfd.

**overview** Display overview of SPRING traffic-engineered LSPs on the ingress router, or the PCC.

**sbfd** Display the SPRING traffic-engineered BFD session.

**name *lsp-name*** (Optional) Regular expression for LSP names to match for displaying SPRING traffic-engineering details.

## Required Privilege Level

view

## Output Fields

Table 113 on page 3606 describes the output fields for the `show spring-traffic-engineering` command. Output fields are listed in the approximate order in which they appear.

**Table 113: show spring-traffic-engineering Output Fields**

| Field Name | Field Description |
|---|---|
| To | IP address of the SR-TE LSP destination. |
| State | State of the SR-TE LSP:<br>• Up<br>• Down |
| LSP Name | Name of the SR-TE LSP. |
| S-ERO | Source Explicit Route Object (ERO), or LSP path. |
| Bandwidth | Bandwidth allocated for the SR-TE LSP. |

**Table 113: show spring-traffic-engineering Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| Delegation info | LSP control and routing status:<br>• Control-status:<br>  • Externally controlled—PCE has control of the source-routing path.<br>  This can happen when:<br>  • The `lsp-external-controller pccd` statement is configured either under the source-routing path or under the primary segment list.<br>  • The `request path-computation-client retry-delegation` *`lsp-name`* command is issued for a delegated LSP that was not previously controlled by the PCE.<br>  • Locally controlled—PCC has control of the source-routing path.<br>  This can happen when:<br>  • The PCE has returned the control of the source-routing path.<br>  • Delegation timer with the PCE has expired.<br>• Routing-status: Applicable to delegated source-routing paths only.<br>  • Externally routed—PCE provided the ERO for the source-routing path for a delegated LSP through PCUpdate.<br>  • Locally routed—PCE does not provide ERO for the source-routing path. |
| Route preference | Route preference of the SR-TE LSP. |
| Number of LSPs | Statistics of the total number of SR-TE LSPs and the LSP state. |

**Table 113: show spring-traffic-engineering Output Fields *(Continued)***

| Field Name | Field Description |
|---|---|
| External controllers | Name of the LSP external controller. By default the only supported external controller is `pccd`. |
| BFD name | Name of the BFD session. The name is auto-generated in the `V4-srte_bfd_session-`*id* for IPv6.<br><br>The name is based on the Explicit Route Object (ERO) stack of the LSP path, that is, if multiple LSPs have same path they share the same BFD session name. |
| BFD status | Status of the BFD session: UP, DOWN. |
| Referencing LSPs | Name of referencing LSP. If the LSP does not have a path name, then the referencing LSP is displayed as `unnamed path`. |
| SR-ERO hop count | Number of hops in the segment routing ERO. |
| Hop 1 | Represents the path of the BFD session. If any other LSP is on same path, it has the same BFD session. |
| Total displayed BFD sessions | Total count of all the BFD sessions. |
| Tunnel source | Source of the tunnel configuration; for example, `static configuration`. |
| Ingress telemetry statistics | Ingress telemetry statistics including the sensor name and ID. |
| Transit telemetry statistics | Transit telemetry statistics including the sensor name and ID. |

**Table 113: show spring-traffic-engineering Output Fields *(Continued)***

| | |
|---|---|
| ERO Valid | Indicates whether the received explicit route object (ERO) is valid or not. |

## Sample Output

### show spring-traffic-engineering lsp name

```
user@host> show spring-traffic-engineering lsp name lsp-name
To         State        LSP Name
               10.1.1.7   Up           to-R1
```

### show spring-traffic-engineering lsp detail

```
user@host> show spring-traffic-engineering lsp detail
10.1.1.7
               State: Up
               S-ERO: 24.1.1.1(80001) 10.1.1.3(4509) 11.2.1.2(9875)
               Bandwidth: 100M
               The above line is in IP address(label) format.
```

```

### show spring-traffic-engineering lsp name <name> detail (Static route over SR-TE tunnel)

The following output is generated when `tunnel-tracking` statement is configured at the `[edit protocols source-packet-routing]` hierarchy level.

```
user@host> show spring-traffic-engineering lsp name static-lsp1 detail
Name: static-lsp1
Tunnel-source: Static configuration
To: 7.7.7.7
State: Up
Path: Path1
Path Status: Up
Outgoing interface: NA
Auto-translate status: Disabled Auto-translate result: N/A
Compute Status:Disabled , Compute Result:N/A , Compute-Profile Name:N/A
BFD status: N/A BFD name: N/A
ERO Valid: true
SR-ERO hop count: 2
Hop 1 (Strict):
NAI: None
SID type: 20-bit label, Value: 801003
Hop 2 (Strict):
NAI: None
SID type: 20-bit label, Value: 801007
Path: Path2
Path Status: Up
Outgoing interface: NA
Auto-translate status: Disabled Auto-translate result: N/A
Compute Status:Disabled , Compute Result:N/A , Compute-Profile Name:N/A
```

```
BFD status: N/A BFD name: N/A
ERO Valid: true
SR-ERO hop count: 2
Hop 1 (Strict):
NAI: None
SID type: 20-bit label, Value: 801005
Hop 2 (Strict):
NAI: None
SID type: 20-bit label, Value: 801007

Total displayed LSPs: 1 (Up: 1, Down: 0)
```

**NOTE**: The `Path Status` shows NA when `tunnel-tracking` statement is not configured.

### show spring-traffic-engineering lsp color <value>

```
user@host> show spring-traffic-engineering lsp color 111
To              State     LSPname
6.6.6.6-111<c>  Up        bgp-srte-0.0.0.0-900-6.6.6.6-111
7.7.7.7-111<c>  Up        bgp-srte-0.0.0.0-900-7.7.7.7-111
5.5.5.5-111<c>  Up        bgp-srte-0.0.0.0-900-5.5.5.5-111
```

### show spring-traffic-engineering lsp destination <address>

```
user@host> show spring-traffic-engineering lsp destination 6.6.6.6
To              State     LSPname
6.6.6.6-111<c>  Up        bgp-srte-0.0.0.0-900-6.6.6.6-111
6.6.6.6         Up        pcep-tunnel1
```

## Release Information

Command introduced in Junos OS Release 17.2.

`sbfd` option introduced in Junos OS Release 19.4R1 on all platforms.

`color` and `destination` options introduced in Junos OS 21.2R1.
