- Day One: Exploring IPv6

CHAPTER 1

Configuring IPv6 Neighbor Discovery

IPv6 Neighbor Discovery

SUMMARY

Neighbor discovery is a protocol used for IPv6 traffic that allows different nodes on the same link to advertise their existence to their neighbors, and to learn about the existence of their neighbors.

IN THIS SECTION

IPv6 Neighbor Discovery Overview

IN THIS SECTION

Neighbor discovery is a protocol that allows different nodes on the same link to advertise their existence to their neighbors, and to learn about the existence of their neighbors.

Routers and hosts (nodes) use Neighbor Discovery (ND) messages to determine the link-layer addresses of neighbors that reside on attached links and to overwrite invalid cache entries. Hosts also use ND to find neighboring routers that can forward packets on their behalf.

In addition, nodes use ND to actively track the ability to reach neighbors. When a router (or the path to a router) fails, nodes actively search for alternatives to reach the destination.

This section discusses the following topics:

Improvements Over IPv4 Protocols

IPv6 Neighbor Discovery corresponds to a number of the IPv4 protocols — ARP, ICMP Router Discovery, and ICMP Redirect. However, Neighbor Discovery provides many improvements over the IPv4 set of protocols. These improvements address the following:

- Router discovery—How a host locates routers residing on an attached link.
- Prefix discovery—How a host discovers address prefixes for destinations residing on an attached link. Nodes use prefixes to distinguish between destinations that reside on an attached link and those destinations that it can reach only through a router.
- Parameter discovery—How a node learns various parameters (link parameters or Internet parameters) that it places in outgoing packets.
- Address resolution—How a node uses only a destination IPv6 address to determine a link-layer address for destinations on an attached link.
- Next-hop determination—The algorithm that a node uses for mapping an IPv6 destination address into a neighbor IPv6 address (either the next router hop or the destination itself) to which it plans to send traffic for the destination.
- Neighbor unreachability detection—How a node determines that it can no longer reach a neighbor.
- Duplicate address detection—How a node determines whether an address is already in use by another node.

A router periodically multicasts a router advertisement from each of its multicast interfaces, announcing its availability. Hosts listen for these advertisements for address autoconfiguration and discovery of link-local addresses of the neighboring routers. When a host starts, it multicasts a router solicitation to ask for immediate advertisements.

The router discovery messages do not constitute a routing protocol. They enable hosts to discover the existence of neighboring routers, but are not used to determine which router is best to reach a particular destination.

Neighbor discovery uses the following Internet Control Message Protocol version 6 (ICMPv6) messages: router solicitation, router advertisement, neighbor solicitation, neighbor advertisement, and redirect.

Neighbor discovery for IPv6 replaces the following IPv4 protocols: router discovery (RDISC), Address Resolution Protocol (ARP), and ICMPv4 redirect.

Junos OS Release 9.3 and later supports Secure Neighbor Discovery (SEND). SEND enables you to secure Neighbor Discovery protocol (NDP) messages. It is applicable in environments where physical security on a link is not assured and attacks on NDP messages are a concern. The Junos OS secures NDP messages through cryptographically generated addresses (CGAs).

Router Discovery

Router advertisements can contain a list of prefixes. These prefixes are used for address autoconfiguration, to maintain a database of onlink (on the same data link) prefixes, and for duplication address detection. If a node is onlink, the router forwards packets to that node. If the node is not onlink, the packets are sent to the next router for consideration. For IPv6, each prefix in the prefix list can contain a prefix length, a valid lifetime for the prefix, a preferred lifetime for the prefix, an onlink flag, and an autoconfiguration flag. This information enables address autoconfiguration and the setting of link parameters such as maximum transmission unit (MTU) size and hop limit.

Junos OS Release 22.4R1 and later supports NAT64 IPv6 address prefix router advertisement. The router advertises the configured NAT64 IPv6 address prefix in the router advertisement packets. You can configure up to 3 NAT64 IPv6 address prefix per interface.

You can configure the NAT64 IPv6 address prefix using the command `set protocols router-advertisement interface <interface-name> nat-prefix <prefix>`.

You can configure the router advertisement time using the command `set protocols router-advertisement interface <interface-name> nat-prefix <prefix> lifetime <lifetime>`.

Address Resolution

For IPv6, ICMPv6 neighbor discovery replaces Address Resolution Protocol (ARP) for resolving network addresses to link-level addresses. Neighbor discovery also handles changes in link-layer addresses, inbound load balancing, anycast addresses, and proxy advertisements.

Nodes requesting the link-layer address of a target node multicast a neighbor solicitation message with the target address. The target sends back a neighbor advertisement message containing its link-layer address.

Neighbor solicitation and advertisement messages are used for detecting duplicate unicast addresses on the same link. Autoconfiguration of an IP address depends on whether there is a duplicate address on that link. Duplicate address detection is a requirement for autoconfiguration.

Neighbor solicitation and advertisement messages are also used for neighbor unreachability detection. Neighbor unreachability detection involves detecting the presence of a target node on a given link.

Redirect

Redirect messages are sent to inform a host of a better next-hop router to a particular destination or an onlink neighbor. This is similar to ICMPv4 redirect. Very similar to the ICMPv4 Redirect feature, the ICMPv6 redirect message is used by routers to inform on-link hosts of a better next-hop for a given destination. The intent is to allow the routers to help hosts make the most efficient local routing decisions possible.

SLAAC

In addition to all the other improvements it brings to the networking world, Neighbor Discovery also enables address autoconfiguration, namely Stateless Address Autoconfiguration (SLAAC). IPv6 maintains the capability for stateful address assignment through DHCPv6 (and static assignment), but SLAAC provides a lightweight address configuration method that might be desirable in many circumstances.

SLAAC provides plug-and-play IP connectivity in two phases: Phase 1: Link-local address assignment; and then, in Phase 2: Global address assignment.

- Phase 1—Steps for local connectivity:

    1. Link-Local Address Generation: Any time that a multicast-capable IPv6-enabled interface is turned up, the node generates a link-local address for that interface. This is done by appending an interface identifier to the link-local prefix (FE80::/10). The auto generated link-local address cannot be deleted. However, a new link-local address can also be manually entered, which overwrites the auto generated link-local address.

    2. Duplicate Detection: Before assigning the new link-local address to its interface, the node verifies that the address is unique. This is accomplished by sending a Neighbor Solicitation message destined to the new address. If there is a reply, then the address is a duplicate and the process stops, requiring operator intervention.

    3. Link-Local Address Assignment: If the address is unique, the node assigns it to the interface for which it was generated.

    At this point, the node has IPv6 connectivity to all other nodes on the same link. Phase 2 can only be completed by hosts. The router's interface addresses must be configured by other means.

- Phase 2—Steps for global connectivity:

    1. Router Advertisement: The node sends a Router Solicitation to prompt all on-link routers to send it router advertisements. When the router is enabled to provide stateless autoconfiguration support, the router advertisement contains a subnet prefix for use by neighboring hosts.

    2. Global Address Generation: Once it receives a subnet prefix from a router, the host generates a global address by appending the interface id to the supplied prefix.

    3. Duplicate Address Detection: The host again performsDuplicate Address Detection (DAD), this time for the new global address. 4. Global Address Assignment: Assuming that the address is not a duplicate, the host assigns it to the interface.

    This process ensures full IPv6 global connectivity with no manual host configuration and very little router configuration.

Supported ICMP Router Discovery and IPv6 Neighbor Discovery Standards

Junos OS substantially supports the following RFCs, which define standards for the Internet Control Message Protocol (ICMP for IP version 4 [IPv4]) and neighbor discovery (for IP version 6 [IPv6]).

- RFC 1256, *ICMP Router Discovery Messages*
- RFC 4861, *Neighbor Discovery for IP version 6 (IPv6)*
- RFC 2462, *IPv6 Stateless Address Autoconfiguration*
- RFC 2463, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*
- RFC 4861, *Neighbor Discovery for IP version 6 (IPv6)*
- RFC 4862, *IPv6 Stateless Address Autoconfiguration*
- RFC 8335, *PROBE: A Utility for Probing Interfaces*

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

IN THIS SECTION

This example shows how to configure the router or switch to send IPv6 neighbor discovery messages.

Requirements

In this example, no special configuration beyond device initialization is required.

Overview

IN THIS SECTION

In this example, all of the interfaces in the sample topology are configured with IPv6 addresses. If you plan to extend IPv6 functionality into your LAN, datacenter, or customer networks, you might want to use Stateless Address Auto-Configuration (SLAAC) and that means configuring router advertisements. SLAAC is an IPv6 protocol that provides some similar functionality to DHCP in IPv4. Using SLAAC, network hosts can autoconfigure a globally unique IPv6 address based on the prefix provided by a nearby router in a router advertisement. This removes the need to explicitly configure every interface in a given section of the network. Router advertisement messages are disabled by default, and you must enable them to take advantage of SLAAC.

To configure the router to send router advertisement messages, you must include at least the following statements in the configuration. All other router advertisement configuration statements are optional.

```
protocols {
    router-advertisement {
        interface interface-name {
            prefix prefix;
        }
    }
}
```

To configure neighbor discovery, include the following statements. You configure router advertisement on a per-interface basis.

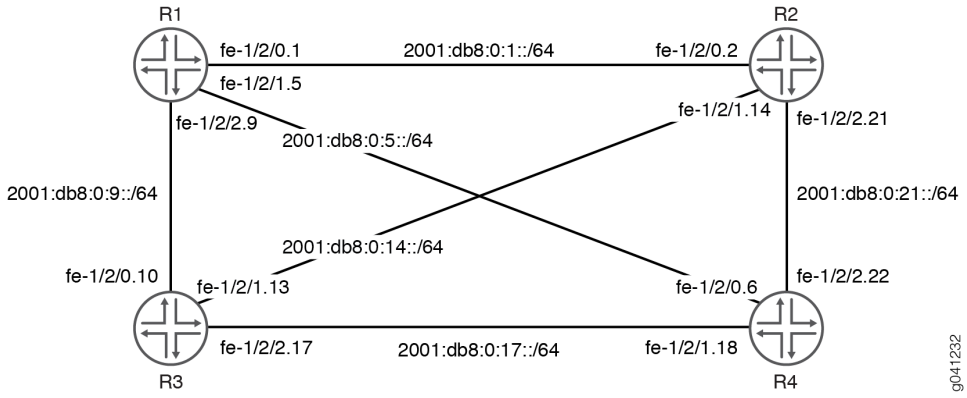
```
protocols {
    router-advertisement {
        interface interface-name {
            current-hop-limit number;
            default-lifetime seconds;
            (link-mtu | no-link-mtu);
            (managed-configuration | no-managed-configuration);
```

```
            max-advertisement-interval seconds;
            min-advertisement-interval seconds;
            (other-stateful-configuration | no-other-stateful-configuration);
            prefix prefix {
                (autonomous | no-autonomous);
                (on-link | no-on-link);
                preferred-lifetime seconds;
                valid-lifetime seconds;
            }
            reachable-time milliseconds;
            retransmit-timer milliseconds;
            solicit-router-advertisement-unicast;
            virtual-router-only;
        }
        traceoptions {
            file filename <files number> <size maximum-file-size> <world-readable | no-world-
readable>;
            flag flag;
        }
    }
}
```

Topology

Figure 1 on page 8 shows a simplified sample topology.

Figure 1: ICMP Router Discover Topology



This example shows how to make sure that all of the IPv6 hosts attached to the subnets in the sample topology can auto-configure a local EUI-64 address.

"CLI Quick Configuration" on page 9 shows the configuration for all of the devices in Figure 1 on page 8. "No Link Title" on page 10 describes the steps on Device R1.

Configuration

IN THIS SECTION

- Procedure | 9

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

Device R1

```
set interfaces fe-1/2/0 unit 1 description to-P2
set interfaces fe-1/2/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
set interfaces fe-1/2/1 unit 5 description to-P4
set interfaces fe-1/2/1 unit 5 family inet6 address 2001:db8:0:5::/64 eui-64
set interfaces fe-1/2/2 unit 9 description to-P3
set interfaces fe-1/2/2 unit 9 family inet6 address 2001:db8:0:9::/64 eui-64
set interfaces lo0 unit 1 family inet6 address 2001:db8::1/128
set protocols router-advertisement interface fe-1/2/0.1 prefix 2001:db8:0:1::/64
set protocols router-advertisement interface fe-1/2/1.5 prefix 2001:db8:0:5::/64
set protocols router-advertisement interface fe-1/2/2.9 prefix 2001:db8:0:9::/64
```

Device R2

```
set interfaces fe-1/2/0 unit 2 description to-P1
set interfaces fe-1/2/0 unit 2 family inet6 address 2001:db8:0:1::/64 eui-64
set interfaces fe-1/2/1 unit 14 description to-P3
set interfaces fe-1/2/1 unit 14 family inet6 address 2001:db8:0:14::/64 eui-64
set interfaces fe-1/2/2 unit 21 description to-P4
set interfaces fe-1/2/2 unit 21 family inet6 address 2001:db8:0:21::/64 eui-64
set interfaces lo0 unit 2 family inet6 address 2001:db8::2/128
```

```
set protocols router-advertisement interface fe-1/2/0.2 prefix 2001:db8:0:1::/64
set protocols router-advertisement interface fe-1/2/1.14 prefix 2001:db8:0:14::/64
set protocols router-advertisement interface fe-1/2/2.21 prefix 2001:db8:0:21::/64
```

Device R3

```
set interfaces fe-1/2/0 unit 10 description to-P1
set interfaces fe-1/2/0 unit 10 family inet6 address 2001:db8:0:9::/64 eui-64
set interfaces fe-1/2/1 unit 13 description to-P2
set interfaces fe-1/2/1 unit 13 family inet6 address 2001:db8:0:14::/64 eui-64
set interfaces fe-1/2/2 unit 17 description to-P4
set interfaces fe-1/2/2 unit 17 family inet6 address 2001:db8:0:17::/64 eui-64
set interfaces lo0 unit 3 family inet6 address 2001:db8::3/128
set protocols router-advertisement interface fe-1/2/0.10 prefix 2001:db8:0:9::/64
set protocols router-advertisement interface fe-1/2/1.13 prefix 2001:db8:0:14::/64
set protocols router-advertisement interface fe-1/2/2.17 prefix 2001:db8:0:17::/64
```

Device R4

```
set interfaces fe-1/2/0 unit 6 description to-P1
set interfaces fe-1/2/0 unit 6 family inet6 address 2001:db8:0:5::/64 eui-64
set interfaces fe-1/2/1 unit 18 description to-P3
set interfaces fe-1/2/1 unit 18 family inet6 address 2001:db8:0:17::/64 eui-64
set interfaces fe-1/2/2 unit 22 description to-P2
set interfaces fe-1/2/2 unit 22 family inet6 address 2001:db8:0:21::/64 eui-64
set interfaces lo0 unit 4 family inet6 address 2001:db8::4/128
set protocols router-advertisement interface fe-1/2/0.6 prefix 2001:db8:0:5::/64
set protocols router-advertisement interface fe-1/2/1.18 prefix 2001:db8:0:17::/64
set protocols router-advertisement interface fe-1/2/2.22 prefix 2001:db8:0:21::/64
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure a IPv6 neighbor discovery:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 description to-P2
user@R1# set fe-1/2/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1# set fe-1/2/1 unit 5 description to-P4
user@R1# set fe-1/2/1 unit 5 family inet6 address 2001:db8:0:5::/64 eui-64
user@R1# set fe-1/2/2 unit 9 description to-P3
user@R1# set fe-1/2/2 unit 9 family inet6 address 2001:db8:0:9::/64 eui-64
user@R1# set lo0 unit 1 family inet6 address 2001:db8::1/128
```

2. Enable neighbor discovery.

```
[edit protocols router-advertisement]
user@R1# set interface fe-1/2/0.1 prefix 2001:db8:0:1::/64
user@R1# set interface fe-1/2/1.5 prefix 2001:db8:0:5::/64
user@R1# set interface fe-1/2/2.9 prefix 2001:db8:0:9::/64
```

Results

From configuration mode, confirm your configuration by entering the `show interfaces` and `show protocols` commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
    unit 1 {
        description to-P2;
        family inet6 {
            address 2001:db8:0:1::/64 {
                eui-64;
            }
        }
    }
}
fe-1/2/1 {
    unit 5 {
        description to-P4;
        family inet6 {
            address 2001:db8:0:5::/64 {
```

```
                eui-64;
            }
        }
    }
}
fe-1/2/2 {
    unit 9 {
        description to-P3;
        family inet6 {
            address 2001:db8:0:9::/64 {
                eui-64;
            }
        }
    }
}
lo0 {
    unit 1 {
        family inet6 {
            address 2001:db8::1/128;
        }
    }
}
```

```
user@R1# show protocols
router-advertisement {
    interface fe-1/2/0.1 {
        prefix 2001:db8:0:1::/64;
    }
    interface fe-1/2/1.5 {
        prefix 2001:db8:0:5::/64;
    }
    interface fe-1/2/2.9 {
        prefix 2001:db8:0:9::/64;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

IN THIS SECTION

To confirm that the configuration is working properly, perform this task:

Checking the Interfaces

Purpose

Verify that the interfaces are up, and view the assigned EUI-64 addresses.

Action

From operational mode, enter the `show interfaces terse` command.

```
user@R1> show interfaces terse
Interface               Admin Link Proto    Local                 Remote
fe-1/2/0
fe-1/2/0.1              up    up   inet6    2001:db8:0:1:2a0:a514:0:14c/64
                                            fe80::2a0:a514:0:14c/64
fe-1/2/1.5              up    up   inet6    2001:db8:0:5:2a0:a514:0:54c/64
                                            fe80::2a0:a514:0:54c/64
fe-1/2/2.9              up    up   inet6    2001:db8:0:9:2a0:a514:0:94c/64
                                            fe80::2a0:a514:0:94c/64
lo0
lo0.1                   up    up   inet6    2001:db8::1
                                            fe80::2a0:a50f:fc56:14c
```

Meaning

The output shows that all interfaces are configured with the IPv6 (inet6) address family. Each IPv6-enabled interface has two IPv6 addresses; one link-local address, and one global address. The global addresses match those shown in Figure 1 on page 8. Junos OS automatically creates a link-local address for any interface that is enabled for IPv6 operation. All link-local addresses begin with the fe80::/64 prefix. The host portion of the address is a full 64 bits long and matches the link-local interface identifier. When an interface address is configured using the `eui-64` statement, its interface identifier matches the interface identifier of the link-local address. This is because link-local addresses are coded according to the EUI-64 specification.

Pinging the Interfaces

Purpose

Verify connectivity between the directly connected interfaces.

Action

1. Determine the remote router's IPv6 interface address.

   On Device R2, run the `show interfaces terse` command for the interface that is directly connected to Device R1, and copy the global address into the capture buffer of your terminal emulator.

```
user@R2> show interfaces fe-1/2/0.2 terse
Interface               Admin Link Proto    Local                 Remote
fe-1/2/0.2              up    up   inet6    2001:db8:0:1:2a0:a514:0:24c/64
                                            fe80::2a0:a514:0:24c/64
```

2. On Device R1, run the `ping` command, using the global address that you copied.

```
user@R1> ping 2001:db8:0:1:2a0:a514:0:24c
PING6(56=40+8+8 bytes) 2001:db8:0:1:2a0:a514:0:14c --> 2001:db8:0:1:2a0:a514:0:24c
16 bytes from 2001:db8:0:1:2a0:a514:0:24c, icmp_seq=0 hlim=64 time=20.412 ms
16 bytes from 2001:db8:0:1:2a0:a514:0:24c, icmp_seq=1 hlim=64 time=18.897 ms
16 bytes from 2001:db8:0:1:2a0:a514:0:24c, icmp_seq=2 hlim=64 time=1.389 ms
```

Meaning

Junos OS uses the same ping command for both IPv4 and IPv6 testing. The lack of any interior gateway protocol (IGP) in the network limits the ping testing to directly-connected neighbors. Repeat the ping test for other directly connected neighbors.

Checking the IPv6 Neighbor Cache

Purpose

Display information about the IPv6 neighbors.

After conducting ping testing, you can find an entries for interface addresses in the IPv6 neighbor cache.

Action

From operational mode, enter the `show ipv6 neighbors` command.

```
user@R1> show ipv6 neighbors
IPv6 Address                 Linklayer Address  State       Exp Rtr Secure Interface
2001:db8:0:1:2a0:a514:0:24c  00:05:85:8f:c8:bd  stale       546 yes no      fe-1/2/0.1
fe80::2a0:a514:0:24c         00:05:85:8f:c8:bd  stale       258 yes no      fe-1/2/0.1
fe80::2a0:a514:0:64c         00:05:85:8f:c8:bd  stale       111 yes no      fe-1/2/1.5
fe80::2a0:a514:0:a4c         00:05:85:8f:c8:bd  stale       327 yes no      fe-1/2/2.9
```

Meaning

In IPv6, the Address Resolution Protocol (ARP) has been replaced by the Neighbor Discovery Protocol (NDP). The IPv4 command `show arp` is replaced by the IPv6 command `show ipv6 neighbors`. The key pieces of information displayed by this command are the IP address, the MAC (Link Layer) address, and the interface.

Verifying IPv6 Router Advertisements

Purpose

Confirm that devices can be added to the network using SLAAC by ensuring that router advertisements are working properly.

Action

From operational mode, enter the `show ipv6 router-advertisement` command.

```
user@R1> show ipv6 router-advertisement
Interface: fe-1/2/0.1
  Advertisements sent: 37, last sent 00:01:41 ago
  Solicits received: 0
  Advertisements received: 38
  Advertisement from fe80::2a0:a514:0:24c, heard 00:05:46 ago
    Managed: 0
    Other configuration: 0
    Reachable time: 0 ms
    Default lifetime: 1800 sec
    Retransmit timer: 0 ms
    Current hop limit: 64
    Prefix: 2001:db8:0:1::/64
      Valid lifetime: 2592000 sec
      Preferred lifetime: 604800 sec

```

Meaning

The output shows that router advertisements are being sent and received on Device R1's interfaces, indicating that both Device R1 and its directly connected neighbors are configured to generate router-advertisements.

Tracing Neighbor Discovery Events

Purpose

Perform additional validation by tracing router advertisements.

Action

1. Configure trace operations.

```
[edit protocols router-advertisement traceoptions]
user@R1# set file ipv6-nd-trace
user@R1# set traceoptions flag all
user@R1# commit
```

2. Run the `show log` command.

```
user@R1> show log ipv6-nd-trace
Mar 29 14:07:16 trace_on: Tracing to "/var/log/P1/ipv6-nd-trace" started

Secure IPv6 Neighbor Discovery

SUMMARY

The Secure Neighbor Discovery (SEND) Protocol for IPv6 traffic prevents an attacker who has access to the broadcast segment from abusing NDP or ARP to trick hosts into sending the attacker traffic destined for someone else, a technique known as ARP poisoning.

IN THIS SECTION

Understanding Secure IPv6 Neighbor Discovery

One of the functions of the IPv6 Neighbor Discovery Protocol (NDP) is to resolve network layer (IP) addresses to link layer (for example, Ethernet) addresses, a function performed in IPv4 by Address Resolution Protocol (ARP). The Secure Neighbor Discovery (SEND) Protocol prevents an attacker who has access to the broadcast segment from abusing NDP or ARP to trick hosts into sending the attacker traffic destined for someone else, a technique known as ARP poisoning.

To protect against ARP poisoning and other attacks against NDP functions, SEND should be deployed where preventing access to the broadcast segment might not be possible.

SEND uses RSA key pairs to produce cryptographically generated addresses, as defined in RFC 3972, *Cryptographically Generated Addresses (CGA)*. This ensures that the claimed source of an NDP message is the owner of the claimed address.

Example: Configuring Secure IPv6 Neighbor Discovery

IN THIS SECTION

This example shows how to configure IPv6 Secure Neighbor Discovery (SEND).

Requirements

This example has the following requirements:

- Junos OS Release 9.3 or later
- IPv6 deployed in your network
- If you have not already done so, you must generate or install an RSA key pair.

  To generate a new RSA key pair, enter the following command:

```
user@host> request security pki generate-key-pair type rsa certificate-id certificate-id-name
size size
```

Overview

IN THIS SECTION

To configure SEND, include the following statements:

```
protocols {
    neighbor-discovery {
        onlink-subnet-only;
        secure {
            security-level {
                (default | secure-messages-only);
            }
            cryptographic-address {
                key-length number;
                key-pair pathname;
            }
            timestamp {
                clock-drift number;
                known-peer-window seconds;
                new-peer-window seconds;
            }
            traceoptions {
                file filename <files number> <match regular-expression> <size size> <world-
readable | no-world-readable>;
                flag flag;
                no-remote-trace;
            }
        }
    }
}
```

Specify **default** to send and receive both secure and unsecured Neighbor Discovery Protocol (NDP) packets. To configure SEND to accept secured NDP messages only and to drop unsecured ones. specify **secure-messages-only**.

All nodes on the segment need to be configured with SEND if the **secure-messages-only** option is used, which is recommended unless only a small subset of devices require increased protection. Failure to configure SEND for all nodes might result in loss of connectivity.

Topology

Configuration

IN THIS SECTION

Procedure

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
set protocols neighbor-discovery secure security-level secure-messages-only
set protocols neighbor-discovery secure cryptographic-address key-length 1024
set protocols neighbor-discovery secure cryptographic-address key-pair /var/etc/rsa_key
set protocols neighbor-discovery secure timestamp
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure a secure IPv6 neighbor discovery:

1. Configure the security level.

```
[edit protocols neighbor-discovery secure]
user@host# set security-level secure-messages-only
```

2. (Optional) Enable the key length.

The default key length is 1024.

```
[edit protocols neighbor-discovery secure]
user@host# set cryptographic-address key-length 1024
```

3. (Optional) Specify the directory path of the public-private key file generated for the cryptographic address.

   The default location of the file is the **/var/etc/rsa_key** directory.

```
[edit protocols neighbor-discovery secure]
user@host# set cryptographic-address key-pair /var/etc/rsa_key
```

4. (Optional) Configure a timestamp to ensure that solicitation and redirect messages are not being replayed.

```
[edit protocols neighbor-discovery secure]
user@host# set timestamp
```

Results

From configuration mode, confirm your configuration by entering the `show protocols` command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show protocols
neighbor-discovery {
    secure {
        security-level {
            secure-messages-only;
        }
        cryptographic-address {
            key-length 1024;
            key-pair /var/etc/rsa_key;
        }
        timestamp;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Verification

IN THIS SECTION

Confirm that the configuration is working properly.

Checking the IPv6 Neighbor Cache

Purpose

Display information about the IPv6 neighbors.

Action

From operational mode, enter the `show ipv6 neighbors` command.

Meaning

In IPv6, the Address Resolution Protocol (ARP) has been replaced by the NDP. The IPv4 command `show arp` is replaced by the IPv6 command `show ipv6 neighbors`. The key pieces of information displayed by this command are the IP address, the MAC (Link Layer) address, and the interface.

Tracing Neighbor Discovery Events

Purpose

Perform additional validation by tracing SEND.

Action

1. Configure trace operations.

```
[edit protocols neighbor-discovery secure]
user@host# set traceoptions file send-log
user@host# set traceoptions flag all
```

2. Run the `show log` command.

```
user@host> show log send-log
Apr 11 06:21:26 proto: outgoing pkt on idx 68 does not have CGA (fe80::2a0:a514:0:14c),
dropping pkt
Apr 11 06:26:44 proto: sendd_msg_handler: recv outgoing 96 bytes on idx 70 with offset 40
Apr 11 06:26:44 dbg: sendd_proto_handler: Modifier (16)
        00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00

Apr 11 06:26:44 cga: snd_is_lcl_cga: BEFORE overriding cc, cc:0, ws->col:0
Apr 11 06:26:44 proto: outgoing pkt on idx 70 does not have CGA (fe80::2a0:a514:0:24c),
dropping pkt
Apr 11 06:26:47 proto: sendd_msg_handler: recv outgoing 96 bytes on idx 68 with offset 40
Apr 11 06:26:47 dbg: sendd_proto_handler: Modifier (16)
        00 00 00 00 00 00 00 00  00 00 00 00 00 00 00 00
```

Meaning

The output shows that because the packet does not have a cryptographically generated address, the packet is dropped.

NDP Proxy and DAD Proxy

SUMMARY

This topic provides details on Neighbor Discovery Protocol (NDP) proxy and Duplicate Address Detection (DAD) proxy functionality for interface restricted and interface unrestricted mode.

IN THIS SECTION

Overview

IN THIS SECTION

The NDP proxy functionality enables packet forwarding among the hosts that are in the same subnet and restricted from communicating directly with each other. NDP proxy is required when you want to enable a host device on different physical segments with same subnet to communicate without an additional gateway and prefix. NDP proxy is like node or a router in the middle of multiple segments with same prefix.

When you configure the device as NDP proxy for addresses, the configured proxy interface (proxy router or node) sends the Neighbor Advertisement (NA) replies to Neighbor Solicitation (NS) on behalf of devices in a different physical segment.

The DAD proxy functionality enables a device to respond to DAD queries for a node that cannot communicate directly with other nodes in the same subnet.

NOTE: NDP or DAD proxy functionality does not work if the NS is for a link local address.

NDP and DAD Proxy (Interface Restricted Mode)

The NDP proxy functionality (interface restricted mode) enables packet forwarding among the hosts that are in the same subnet and restricted to communicate directly with each other. This functionality is primarily used in a scenario where the proxy node needs to apply access control and intercept traffic flowing among the hosts. When you configure NDP proxy on an SRX Series device, the device sends NA and responds to requests from devices seeking MAC addresses of IPv6 prefixes assigned to hosts inside the SRX Series device.

The DAD feature detects the usage of duplicate addresses on a local link by using Neighbor Solicitation (NS) messages. The DAD feature is for IPv6 address and functions similar to gratuitous ARP in IPv4.

NDP and DAD Proxy (Interface Unrestricted Mode)

Starting in Junos OS Release 22.1R1, we support NDP and DAD proxy functionality across multiple proxy configured interfaces (interface unrestricted mode). NDP interface unrestricted proxy works within the existing IPv6 ND functionality and is invoked only if its enabled. Interface unrestricted mode the ND functionality works together across all the configured interfaces for NDP and DAD proxy.

In earlier releases, NDP and DAD proxy functionality was limited and restricted to only the configured interface. Currently, NDP and DAD proxy functionality works across the multiple configured interfaces (interface unrestricted mode).

With NDP and DAD proxy functionality in interface unrestricted mode, the configured interfaces function together to send Neighbor Advertisement (NA) replies to Neighbor Solicitation (NS) on behalf of nodes in a different physical segment which are not directly reachable by the nodes in the originating segment without the overhead of additional prefix assignment.

When you enable NDP proxy in interface unrestricted mode on interfaces using the `set interfaces` *`interface-name`* `unit` *`number`* `family inet6 ndp-proxy interface-unrestricted` command, the proxy interfaces:

- Generates NA for NS requests. Requests are then sent from hosts on behalf of other hosts that are reachable on the subnet through the proxy interfaces.
- Generates NS and sends to all proxy interfaces for the subnet, when the requested address in NS is not available in the neighbor table.

  Looks for forwardable routes for the targeted address in the route table that belongs to the ingress interface of the NS packet. Route lookup provides list of routes pointing to resolve next hops. Proxy uses these next hops to send NS on different ports configured.

  NOTE: When the proxy does the route lookup and the resulting route next hop points to the same interface where the NS has arrived, then proxy drops that NS.

- Allows you to enforce Neighbor Unreachability Detection (NUD) even if the requested target address is available in neighbor cache and is reachable. The force ND feature is useful when the hosts move from one segment to another. To enable the NDP proxy force resolve functionality use the `set protocols neighbor-discovery ndp-proxy proxy-force-resolve` command.
- Forwards packets between hosts that it proxies, allowing communication between the hosts, once the neighbors are resolved.

The DAD feature detects the usage of duplicate addresses on a local link by using Neighbor Solicitation (NS) messages.

When you enable DAD proxy on multiple interfaces using the `set interfaces` *`interface-name`* `unit` *`<number>`* `family inet6 dad-proxy interface-unrestricted` command:

- DAD proxy generates NA reply for the DAD NS requests on behalf of other hosts, if the NS tentative address is reachable through other proxy interface.
- When a DAD NS request arrives and if the tentative address is not available or in stale state in the neighbor cache, the DAD proxy initiates NUD on all other proxy interfaces except the received one.
- If a DAD request is from a host for a tentative address that is already in the middle of a DAD process by another host, then DAD proxy replies with NA for both hosts.

Configuring NDP Proxy

You can enable Neighbor Discovery Protocol (NDP) proxy in interface restricted mode or interface unrestricted mode (across multiple interfaces). You cannot configure both DAD proxy interface restricted mode and interface unrestricted mode simultaneously on an interface.

1. To enable NDP proxy restricted to an interface (interface restricted mode):

```
set interfaces interface-name family inet6 ndp-proxy interface-restricted
```

2. To enable NDP proxy on multiple interfaces (interface unrestricted mode):

```
set interfaces interface-name unit number family inet6 ndp-proxy interface-unrestricted
```

3. To enable or disable NDP proxy behavior of sending NS for already learnt entries that are reachable:

```
set protocols neighbor-discovery ndp-proxy proxy-force-resolve
```

4. To disable NDP proxy for an address that is not present in neighbor cache:

```
set protocols neighbor-discovery ndp-proxy no-proxy-on-resolve
```

5. To get the statistics of events such as NDP proxy requests, NDP proxy conflicts, NDP proxy duplicates, NDP proxy resolve requests and dropped NDP packets:

```
show system statistics icmp6
```

Configuring DAD Proxy

You can enable Duplicate Address Detection (DAD) proxy on a restricted interface (interface restricted mode) or across multiple interfaces (interface unrestricted mode. You cannot configure DAD proxy in interface restricted mode and interface unrestricted modes simultaneously.

To configure DAD proxy on an interface or on multiple interfaces:

1. To enable DAD proxy restricted to an interface (interface restricted mode):

```
set interfaces interface-name family inet6 dad-proxy interface-restricted
```

2. To enable DAD proxy on multiple interfaces (interface unrestricted mode):

```
set interfaces interface-name unit <number> family inet6 dad-proxy interface-unrestricted
```

3. To disable DAD proxy for an address that is not present in a neighbor cache:

```
set protocols neighbor-discovery dad-proxy  no-proxy-on-resolve
```

4. To get the statistics of events such as DAD proxy requests, DAD proxy conflicts, DAD proxy duplicates, DAD proxy resolve requests and dropped DAD packets:

```
show system statistics icmp6
```

Neighbor Discovery Cache Protection

SUMMARY

NDP Cache Protection enables you to protect the routing engine from certain types of denial-of-service (DoS) attacks in IPv6 deployment scenarios.

IN THIS SECTION

Neighbor Discovery Cache Protection Overview

Routing Engines can be susceptible to certain denial-of-service (DoS) attacks in IPv6 deployment scenarios. IPv6 subnets in general tend be very large—for example, a `/64` subnet might have a high number of unassigned addresses. The control plane of the Routing Engine performs the address resolution for unknown addresses. An attacker can quickly overwhelm the control plane of the Routing Engine by generating resolution requests for this unassigned address space, resulting in a cache overflow. The attacker relies on both the number of requests generated and the rate at which requests are queued up. Such scenarios can tie up router resources and prevent the Routing Engine from answering valid neighbor solicitations and maintaining existing neighbor cache entries, effectively resulting in a DoS attack for legitimate users.

The strategies for mitigating such DoS attacks are as follows:

- Filter unused address space.
- Minimize the size of subnets.
- Configure discard routes for subnets.
- Enforce limits to the size and rate of resolution for entries in the neighbor discovery cache.

Neighbor discovery cache impact can be minimized by restricting the number of IPv6 neighbors and new unresolved next-hop addresses that can be added to the cache. You can set limits per interface by using the `nd6-max-cache` and the `nd6-new-hold-limit` configuration statements or system-wide by using the `nd-system-cache-limit` configuration statement.

NOTE:

- For small sized platforms such as ACX, EX22XX, EX3200, EX33XX, and SRX, default is 20,000.
- For medium sized platforms such as EX4200, EX45XX, EX4300, EX62XX, QFX, and MX, default is 75,000.
- For rest of the platforms, default is 100,000.

Configuring Neighbor Discovery Cache Protection

Routing Engines can be susceptible to certain types of denial-of-service (DoS) attacks in IPv6 deployment scenarios. IPv6 subnets in general tend be very large; for example, a `/64` subnet might have a high number of unassigned addresses. The control plane of the Routing Engine performs the address resolution for unknown addresses. An attacker can quickly overwhelm the control plane of the Routing Engine by generating resolution requests for this unassigned address space, resulting in a cache overflow. An attacker relies on both the number of requests generated and the rate at which requests are queued up.

The neighbor discovery process is that part of the control plane that implements the Neighbor Discovery Protocol. It is responsible for performing address resolution and maintaining the entries in the neighbor cache. One way to mitigate the DoS attacks is by enforcing limits to the size of the neighbor discovery cache and the rate of resolution of new next-hop entries, and by prioritizing certain categories of neighbor discovery traffic. You can configure limits to the neighbor discovery cache per interface and systemwide.

Before you begin, ensure that you are running Junos OS Release 15.1 or later.

Local limits apply to individual interfaces and are defined for resolved and unresolved entries in the neighbor discovery queue, while global limits apply systemwide.

To configure neighbor discovery cache protection on an interface:

1. Configure IPv6 family for the interface.

```
[edit interfaces interface-name unit unit number family]
user@host# set inet6
```

2. Configure the maximum size of the neighbor discovery cache for the interface.

```
[edit interfaces interface-name unit unit number family inet6]
user@host# set nd6-max-cache limit
```

3. Configure the maximum number of unresolved entries in the neighbor discovery cache that can be attached to the interface.

```
[edit interfaces interface-name unit unit number family inet6]
user@host# set nd6-new-hold-limit limit
```

To verify the configuration, execute the `show interfaces interface-name` operational command.

To configure neighbor discovery cache protection systemwide:

- Configure the systemwide limit for the neighbor discovery cache.

```
[edit]
user@host# set system nd-system-cache-limit limit
```

To verify the configured system-wide limits, execute the `show system statistics icmp6` operational command.

NOTE:

- For small sized platforms such as ACX, EX22XX, EX3200, EX33XX, and SRX, default is 20,000.
- For medium sized platforms such as EX4200, EX45XX, EX4300, EX62XX, QFX, and MX, default is 75,000.
- For rest of the platforms, default is 100,000.

Example: Configuring Neighbor Discovery Cache Protection to Prevent Denial-of-Service Attacks

IN THIS SECTION

This example shows how to configure a limit to the number of IPv6 neighbor entries that can be added to the neighbor discovery. Enforcing limits to the number of entries in the cache mitigates denial-of-service (DoS) attacks. The neighbor discovery cache feature supports two types of limits:

- Local—Local limits are configured per interface and are defined for resolved and unresolved entries in the neighbor discovery cache.
- Global—Global limits apply systemwide. A global limit is further defined separately for the public interfaces and management interfaces, for example, fxp0. The management interface has a single global limit and no local limit. The global limit enforces a systemwide cap on entries for the neighbor discovery cache, including for the loopback interface for the internal routing instance, as well as management interfaces and the public interfaces.

Requirements

This example requires MX Series routers running Junos OS Release 15.1 or later.

Overview

Routing Engines can be susceptible to certain types of DoS attacks in IPv6 deployment scenarios. IPv6 subnets in general tend be very large—for example, a `/64` subnet might have a high number of unassigned addresses, which can be used to perform DoS attacks. The control plane of the Routing Engine performs the address resolution for unknown addresses. An attacker can quickly overwhelm the control plane of the Routing Engine by generating resolution requests for this unassigned address space and overflow the queue. The attacker relies on both the number of requests generated and the rate at which requests are queued up.

The neighbor discovery process is that part of the control plane that implements the Neighbor Discovery Protocol. It is responsible for performing address resolution and maintaining the neighbor cache. One

way to mitigate DoS attacks is by enforcing limits ot the neighbor discovery queue limits, which can be done by restricting queue size and the rate of resolution, and by prioritizing certain categories of neighbor discovery traffic.

Configuration

IN THIS SECTION

To configure neighbor discovery cache protection, perform these tasks:

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and copy and paste the commands into the CLI at the `[edit]` hierarchy level, and then enter `commit` from configuration mode.

```
set interfaces ge-0/3/0 unit 5 family inet6 nd6-max-cache 100
set interfaces ge-0/3/0 unit 5 family inet6 nd6-new-hold-limit 100
```

You can also configure a systemwide limit to the number of IPv6 neighbor entries in the neighbor discovery cache. This limit also includes the loopback interface, management interfaces, and the public interfaces.

```
set system nd-system-cache-limit 100
```

The limit distribution from the `nd-system-cache-limit` statement for different interface types is performed according to certain fixed percentages. When `nd-system-cache-limit` is defined as *X* and the internal routing interface neighbor discovery cache limit is *Y* (default is 200), then:

- Public maximum cache limit, *Z* = 80% of (*X*- *Y*)
- Management interface maximum cache limit (for example, fxp0), *M* = 20% of (*X*-*Y*)

Configuring Neighbor Discovery Cache Protection

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure neighbor discovery cache protection per interface:

- Configure the `nd6-max-cache` and `nd6-new-hold-limit`.

```
[edit]
user@host# set interfaces ge-0/3/0 unit 5 family inet6 nd6-max-cache 100
user@host# set interfaces ge-0/3/0 unit 5 family inet6 nd6-new-hold-limit 100
```

Results

To confirm neighbor discovery cache protection locally, enter `show interfaces ge-0/3/0` from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces ge-0/3/0
unit 5{
    family inet6 {
        nd6-max-cache 100;
        nd6-new-hold-limit 100;
    }
}
```

Verification

IN THIS SECTION

Confirm that the configuration is working properly.

Verifying Neighbor Discovery Cache Protection Globally

Purpose

Verify that the output reflects the systemwide limit for the neighbor discovery cache.

Action

From operational mode, run the `show system statistics icmp6` command.

```
user@host> show system statistics icmp6

icmp6:
         79 Calls to icmp_error
         0 Errors not generated because old message was icmp error
         0 Errors not generated because rate limitation
         Output histogram:
                 79 unreach
                 30 echo
                 163 multicast listener query
                 6 multicast listener report
                 940 neighbor solicitation
                 694184 neighbor advertisement
         0 Messages with bad code fields
         0 Messages < minimum length
         0 Bad checksums
         0 Messages with bad length
         Input histogram:
                 10 echo reply
                 6 multicast listener report
                 693975 neighbor solicitation
         Histogram of error messages to be generated:
                 0 No route
                 0 Administratively prohibited
                 0 Beyond scope
                 79 Address unreachable
                 0 Port unreachable
                 0 Time exceed transit
                 0 Time exceed reassembly
                 0 Erroneous header field
```

```
                0 Unrecognized next header
                0 Unrecognized option
                0 Unknown
        0 Message responses generated
        0 Messages with too many ND options
        100000 Max System ND nh cache limit
        79840 Max Public ND nh cache limit
        200 Max IRI ND nh cache limit
        19960 Max Management intf ND nh cache limit
        79840 Current Public ND nexthops present
        4 Current IRI ND nexthops present
        0 Current Management ND nexthops present
        909266 Total ND nexthops creation failed as limit reached
        909266 Public ND nexthops creation failed as public limit reached
        0 IRI ND nexthops creation failed as iri limit reached
        0 Management ND nexthops creation failed as mgt limit reached
```

Meaning

The systemwide cap enforced on the neighbor discovery cache entries is **100000**.

Management ND nexthops creation failed as mgt limit reached indicates the drop count for the management interface when the systemwide limit is reached. **Total ND nexthops creation failed as limit reached** indicates failure for management, public, or Internal routing instance interfaces, and **Public ND nexthops creation failed as public limit reached** indicates the drop count for public interfaces when the systemwide limit to the number of entries is reached.

Verifying Neighbor Discovery Cache Protection Locally

Purpose

Verify that the output reflects the configured interface limits.

Action

From operational mode, run the `show interfaces ge-0/3/0` command.

```
user@host> show interfaces ge-0/3/0
Logical interface ge-0/2/0.8 (Index 348) (SNMP ifIndex 690)
    Flags: Up SNMP-Traps 0x4000 VLAN-Tag [ 0x8100.8 ]  Encapsulation: ENET2
    Input packets : 181628
```

```
    Output packets: 79872
    Protocol inet6, MTU: 1500
    Max nh cache: 100000, New hold nh limit: 100000, Curr nh cnt: 79840, Curr new hold cnt: 0,
NH drop cnt: 0
      Flags: Is-Primary
      Addresses, Flags: Is-Preferred Is-Primary
        Destination: 8001:1::/64, Local: 8001:1::1:1
      Addresses, Flags: Is-Preferred
        Destination: fe80::/64, Local: fe80::56e0:3200:8c6:e0a4
    Protocol multiservice, MTU: Unlimited
```

Meaning

The maximum number of total entries and the maximum number of entries for new unresolved next-hop addresses that can be attached to interface ge-0/3/0 is **100000**.

NH drop cnt refers to the number of neighbor discovery requests not serviced because the interface maximum queue size limits have been reached.

Router Advertisement Proxy

SUMMARY

Starting in Junos OS Release 22.1R1, we support Router Advertisement (RA) proxy functionality on SRX Series devices and vSRX 3.0. With this functionality, the device can proxy the RA packets from service provider router to the clients (host).

IN THIS SECTION

Overview

IN THIS SECTION

An IPv6 network deployment usually has one or more upstream routers to delegate IPv6 prefixes through Router Advertisement (RA) to clients. When a client connects to the network, the client starts sending Router Solicitations (RS) IPv6 requests. When clients send, upstream routers either respond with unicast (Layer 2 or Layer 3) RA or with multicast RA. Whenever a new client joins the network, a unicast or a multicast RA is sent to from the router to the client. If it is a multicast packet, then the existing clients also receive the RA, which results in traffic increase. The solution for handling the increased traffic is to enable IPv6 RA proxy to monitor the incoming unsolicited RA and RS packets.

RA proxy functionality conveys all the information that is received from the routers to the clients. The RA proxy information includes the following:

- Router Preference
- Router lifetime
- Reachable time
- Retransmit timer
- ICMPv6 Option (Source link-layer address)
- ICMPv6 Option (MTU)
- ICMPv6 Option (Prefix information)
- ICMPv6 Option (Route Information)
- ICMPv6 Option (DNS Search List)
- ICMPv6 Option (RDNSS option)

NOTE: The RA is processed as well as proxied, unless proxying is disabled. Also, when RA proxy is enabled, the RA packets received on the upstream interface proxied to all the downstream

interfaces. The RA packets received on the downstream interface are not proxied to all the upstream interfaces.

Benefits

- Helps in managemnet of traffic by snooping incoming unsolicited RA and Router Solicitations packets allowing transmission of information from service provider side routers to the clients.
- Loops are prevented using RA blackout timer.
- New proxy bit provides an indication that the RA packet is proxied.

Configure RA Proxy

To enable RA proxy on an interface:

1. Configure the interface as upstream (service provider side interface) for RA proxy:

```
set protocols router-advertisement interface <interface-name> upstream-mode
```

2. Configure the interface as downstream (host side interface) for RA proxy:

```
set protocols router-advertisement interface <interface-name> downstream-mode
```

3. Configure the list of downstream interfaces for RA proxy:

```
set protocols router-advertisement interface <interface-name> downstream <downstream-interface-name>
```

4. Configure preference to select configured or proxied parameters for downstream interface.

```
set protocols router-advertisement interface <interface-name> parameter-preference <preference ((configured | proxied)>
```

5. Configure passive mode option on an interface. If passive mode is configured on the interface, the interface receives and processes RA packets. The interface does not send RAs in (receive-only mode).

The commit fails if the interface has both downstream and passive-mode option configured simultaneously. To enable passive mode (RA receive only mode) on an interface:

```
set protocols router-advertisement interface <interface-name> passive-mode
```

To view the details of configured RA proxy options listed below, use the `show ipv6 router-advertisement`.

- Upstream interfaces
- Downstream interfaces
- Proxy flag
- Proxy blackout timer
- Passive mode details

Troubleshooting

Troubleshooting Network Issues

IN THIS SECTION

Working with Problems on Your Network

IN THIS SECTION

Problem

Description

This checklist provides links to troubleshooting basics, an example network, and includes a summary of the commands you might use to diagnose problems with the router and network.

Solution

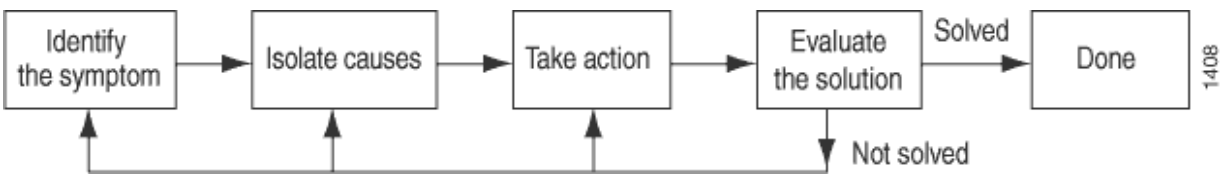
Table 1: Checklist for Working with Problems on Your Network

Tasks	Command or Action
Isolating a Broken Network Connection	
1. *Identifying the Symptoms of a Broken Network Connection*	**ping (*ip-address* | *hostname*) show route (*ip-address* | *hostname*) traceroute (*ip-address* | *hostname*)**
1. *Isolating the Causes of a Network Problem*	`show < configuration | interfaces | protocols | route >`
1. *Taking Appropriate Action for Resolving the Network Problem*	`[edit] delete routing options static route` *`destination-prefix`* **commit and-quit show route *destination-prefix***
1. *Evaluating the Solution to Check Whether the Network Problem Is Resolved*	`show route (ip-address | hostname) ping (ip-address | hostname)` **count 3 traceroute (*ip-address* | *hostname*)**

Isolating a Broken Network Connection

By applying the standard four-step process illustrated in Figure 2 on page 44, you can isolate a failed node in the network. Note that the functionality described in this section is not supported in versions 15.1X49, 15.1X49-D30, or 15.1X49-D40.

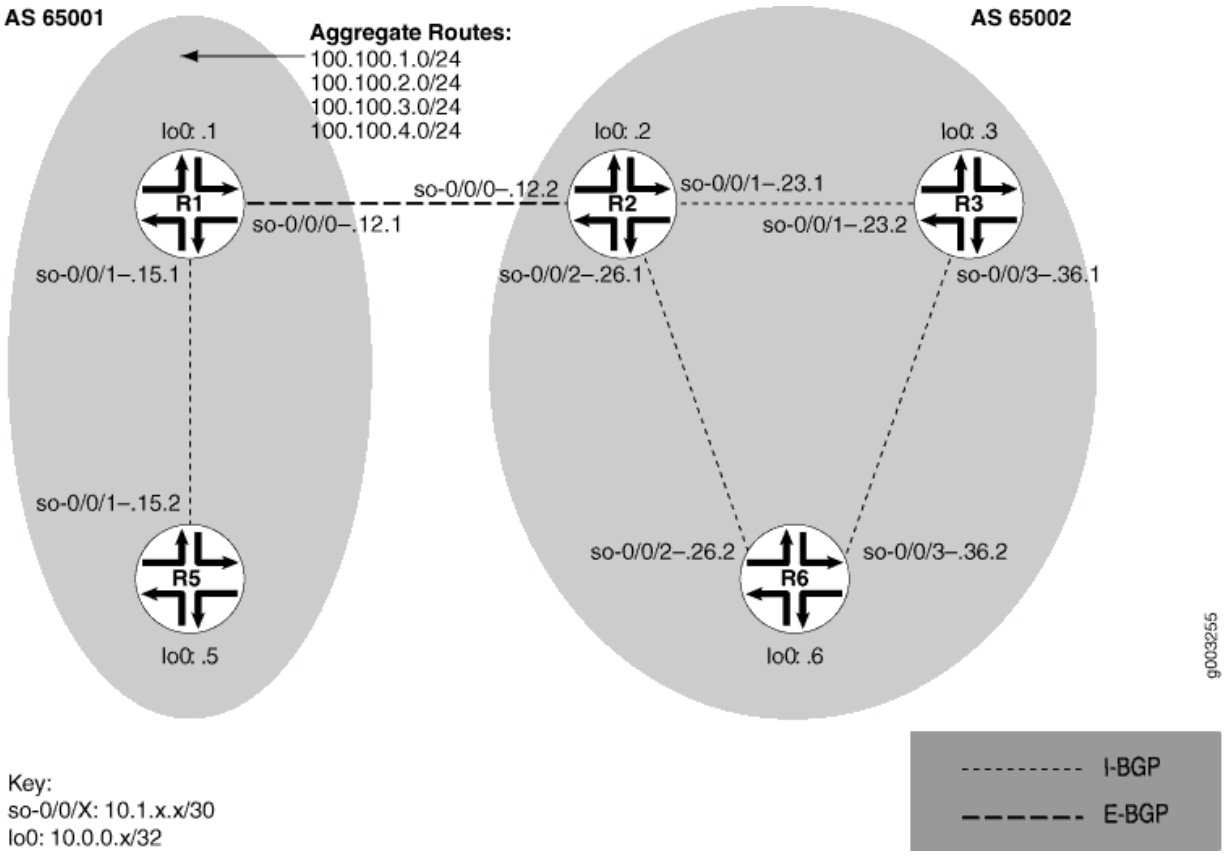
Figure 2: Process for Diagnosing Problems in Your Network



Before you embark on the four-step process, however, it is important that you are prepared for the inevitable problems that occur on all networks. While you might find a solution to a problem by simply trying a variety of actions, you can reach an appropriate solution more quickly if you are systematic in your approach to the maintenance and monitoring of your network. To prepare for problems on your network, understand how the network functions under normal conditions, have records of baseline network activity, and carefully observe the behavior of your network during a problem situation.

Figure 3 on page 45 shows the network topology used in this topic to illustrate the process of diagnosing problems in a network.

Figure 3: Network with a Problem



The network in Figure 3 on page 45 consists of two autonomous systems (ASs). AS 65001 includes two routers, and AS 65002 includes three routers. The border router (`R1`) in AS 65001 announces aggregated prefixes `100.100/24` to the AS 65002 network. The problem in this network is that `R6` does not have access to `R5` because of a loop between `R2` and `R6`.

To isolate a failed connection in your network, follow the steps in these topics:

- *Isolating the Causes of a Network Problem*

- *Taking Appropriate Action for Resolving the Network Problem*
- *Taking Appropriate Action for Resolving the Network Problem*
- *Evaluating the Solution to Check Whether the Network Problem Is Resolved*

Identifying the Symptoms of a Broken Network Connection

IN THIS SECTION

Problem

Description

The symptoms of a problem in your network are usually quite obvious, such as the failure to reach a remote host.

Solution

To identify the symptoms of a problem on your network, start at one end of your network and follow the routes to the other end, entering all or one of the following Junos OS command-line interfaces (CLI) operational mode commands:

```
            user@host> ping (ip-address | host-name)
user@host> show route (ip-address | host-name)
user@host> traceroute (ip-address | host-name)
```

Sample Output

```
user@R6> ping 10.0.0.5
PING 10.0.0.5 (10.0.0.5): 56 data bytes
36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS  Len   ID Flg  off TTL Pro  cks      Src      Dst
```

```
 4  5  00 0054 e2db   0 0000  01  01 a8c6 10.1.26.2  10.0.0.5

36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS  Len   ID Flg  off TTL Pro  cks      Src      Dst
 4  5  00 0054 e2de   0 0000  01  01 a8c3 10.1.26.2  10.0.0.5

36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS  Len   ID Flg  off TTL Pro  cks      Src      Dst
 4  5  00 0054 e2e2   0 0000  01  01 a8bf 10.1.26.2  10.0.0.5

^C
--- 10.0.0.5 ping statistics ---
3 packets transmitted, 0 packets received, 100% packet loss

user@R6> show route 10.0.0.5

inet.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32        *[IS-IS/165] 00:02:39, metric 10
                     > to 10.1.26.1  via so-0/0/2.0

user@R6> traceroute 10.0.0.5
traceroute to 10.0.0.5 (10.0.0.5), 30 hops max, 40 byte packets
 1  10.1.26.1 (10.1.26.1)  0.649 ms  0.521 ms  0.490 ms
 2  10.1.26.2 (10.1.26.2)  0.521 ms  0.537 ms  0.507 ms
 3  10.1.26.1 (10.1.26.1)  0.523 ms  0.536 ms  0.514 ms
 4  10.1.26.2 (10.1.26.2)  0.528 ms  0.551 ms  0.523 ms
 5  10.1.26.1 (10.1.26.1)  0.531 ms  0.550 ms  0.524 ms
```

Meaning

The sample output shows an unsuccessful `ping` command in which the packets are being rejected because the time to live is exceeded. The output for the `show route` command shows the interface (`10.1.26.1`) that you can examine further for possible problems. The `traceroute` command shows the loop between `10.1.26.1` (R2) and `10.1.26.2` (R6), as indicated by the continuous repetition of the two interface addresses.

Isolating the Causes of a Network Problem

IN THIS SECTION

Problem

Description

A particular symptom can be the result of one or more causes. Narrow down the focus of your search to find each individual cause of the unwanted behavior.

Solution

To isolate the cause of a particular problem, enter one or all of the following Junos OS CLI operational mode command:

```
user@host> show < configuration | bgp | interfaces | isis | ospf | route
>
```

Your particular problem may require the use of more than just the commands listed above. See the appropriate command reference for a more exhaustive list of commonly used operational mode commands.

Sample Output

```
user@R6> show interfaces terse
Interface               Admin Link Proto Local                 Remote
so-0/0/0                up    up
so-0/0/0.0              up    up   inet  10.1.56.2/30
                                  iso
so-0/0/2                up    up
so-0/0/2.0              up    up   inet  10.1.26.2/30
                                  iso
so-0/0/3                up    up
```

```
so-0/0/3.0              up    up   inet  10.1.36.2/30
                                   iso
[...Output truncated...]
```

The following sample output is from R2:

```
user@R2> show route 10.0.0.5

inet.0: 22 destinations, 25 routes (22 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32         *[Static/5] 00:16:21
                    > to 10.1.26.2 via so-0/0/2.0
                    [BGP/170] 3d 20:23:35, MED 5, localpref 100
                      AS path: 65001 I
                    > to 10.1.12.1 via so-0/0/0.0
```

Meaning

The sample output shows that all interfaces on R6 are up. The output from R2 shows that a static route [Static/5] configured on R2 points to R6 (10.1.26.2) and is the preferred route to R5 because of its low preference value. However, the route is looping from R2 to R6, as indicated by the missing reference to R5 (10.1.15.2).

Taking Appropriate Action for Resolving the Network Problem

IN THIS SECTION

Problem

Description

The appropriate action depends on the type of problem you have isolated. In this example, a static route configured on `R2` is deleted from the [`routing-options`] hierarchy level. Other appropriate actions might include the following:

Solution

- Check the local router's configuration and edit it if appropriate.
- Troubleshoot the intermediate router.
- Check the remote host configuration and edit it if appropriate.
- Troubleshoot routing protocols.
- Identify additional possible causes.

To resolve the problem in this example, enter the following Junos OS CLI commands:

```
[edit]
                          user@R2# delete routing-options static route destination-
prefix
user@R2# commit and-quit
user@R2# show route destination-prefix
```

Sample Output

```
[edit]
user@R2# delete routing-options static route 10.0.0.5/32

[edit]
user@R2# commit and-quit
commit complete
Exiting configuration mode

user@R2> show route 10.0.0.5

inet.0: 22 destinations, 24 routes (22 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.5/32        *[BGP/170] 3d 20:26:17, MED 5, localpref 100
                      AS path: 65001 I
                    > to 10.1.12.1 via so-0/0/0.0
```

Meaning

The sample output shows the static route deleted from the [routing-options] hierarchy and the new configuration committed. The output for the show route command now shows the BGP route as the preferred route, as indicated by the asterisk (*).

Evaluating the Solution to Check Whether the Network Problem Is Resolved

IN THIS SECTION

Problem

Description

If the problem is solved, you are finished. If the problem remains or a new problem is identified, start the process over again.

You can address possible causes in any order. In relation to the network in *Isolating a Broken Network Connection*, we chose to work from the local router toward the remote router, but you might start at a different point, particularly if you have reason to believe that the problem is related to a known issue, such as a recent change in configuration.

Solution

To evaluate the solution, enter the following Junos OS CLI commands:

```
                                    user@host> show route (ip-address   |host-name)
user@host> ping (ip-address  | host-name)
user@host> traceroute (ip-address  | host-name)
```

Sample Output

```
user@R6> show route 10.0.0.5

inet.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32         *[BGP/170]  00:01:35, MED 5, localpref 100, from 10.0.0.2
                      AS path: 65001 I
                    > to 10.1.26.1 via so-0/0/2.0

user@R6> ping 10.0.0.5
PING 10.0.0.5 (10.0.0.5): 56 data bytes
64 bytes from 10.0.0.5: icmp_seq=0 ttl=253 time=0.866 ms
64 bytes from 10.0.0.5: icmp_seq=1 ttl=253 time=0.837 ms
64 bytes from 10.0.0.5: icmp_seq=2 ttl=253 time=0.796 ms
^C
--- 10.0.0.5 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.796/0.833/0.866/0.029 ms

user@R6> traceroute 10.0.0.5
traceroute to 10.0.0.5 (10.0.0.5), 30 hops max, 40 byte packets
 1  10.1.26.1 (10.1.26.1)  0.629 ms  0.538 ms  0.497 ms
 2  10.1.12.1 (10.1.12.1)  0.534 ms  0.538 ms  0.510 ms
 3  10.0.0.5 (10.0.0.5)  0.776 ms  0.705 ms  0.672 ms
```

Meaning

The sample output shows that there is now a connection between R6 and R5. The show route command shows that the BGP route to R5 is preferred, as indicated by the asterisk (*). The ping command is successful and the traceroute command shows that the path from R6 to R5 is through R2 (10.1.26.1), and then through R1 (10.1.12.1).

Checklist for Tracking Error Conditions

IN THIS SECTION

Problem

Description

Table 2 on page 53 provides links and commands for configuring routing protocol daemon tracing, Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS) protocol, and Open Shortest Path First (OSPF) protocol tracing to diagnose error conditions.

Solution

Table 2: Checklist for Tracking Error Conditions

Tasks	Command or Action
Configure Routing Protocol Process Tracing	
1. *Configure Routing Protocol Process Tracing*	`[edit] edit routing-options traceoptions` *filename* `size` *size* **files** *number* **show co** **log** *filename*
1. *Configure Routing Protocol Tracing for a Specific Routing Protocol*	`[edit] edit protocol` *protocol-name* **trace** *filename* **size** *size* **files** *number* **show com** **log** *filename*
1. *Monitor Trace File Messages Written in Near-Real Time*	**monitor start** *filename*
1. *Stop Trace File Monitoring*	**monitor stop** *filename*

Table 2: Checklist for Tracking Error Conditions *(Continued)*

Tasks	Command or Action
Configure BGP-Specific Options	
1. Display Detailed BGP Protocol Information	[edit] edit protocol bgp traceoptions se detail show commit run show log *filename*
1. Display Sent or Received BGP Packets	[edit] edit protocol bgp traceoptions se (send | receive) show commit run show lo
1. Diagnose BGP Session Establishment Problems	[edit] edit protocol bgp set traceoptior detail show commit run show log *filename*
Configure IS-IS-Specific Options	
1. Displaying Detailed IS-IS Protocol Information	[edit] edit protocol isis traceoptions s detail show commit run show log *filename*
1. Displaying Sent or Received IS-IS Protocol Packets	[edit] edit protocols isis traceoptions (send | receive) show commit run show lo
1. Analyzing IS-IS Link-State PDUs in Detail	[edit] edit protocols isis traceoptions detail show commit run show log *filename*
Configure OSPF-Specific Options	
1. Diagnose OSPF Session Establishment Problems	[edit] edit protocols ospf traceoptions detail show commit run show log *filename*
1. Analyze OSPF Link-State Advertisement Packets in Detail	[edit] edit protocols ospf traceoptions update detail show commit run show log

Configure Routing Protocol Process Tracing

IN THIS SECTION

Action

To configure routing protocol process (rpd) tracing, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options traceoptions
```

2. Configure the file, file size, number, and flags:

```
[edit routing-options traceoptions]
user@host#  set file filename size size file number
[edit routing-options traceoptions]
user@host#  set flag flag
```

   For example:

```
[edit routing-options traceoptions]
user@host# set file daemonlog size 10240 files 10
[edit routing-options traceoptions]
user@host# set flag general
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit routing-options traceoptions]
user@host# show
file daemonlog size 10k files 10;
flag general;
```

4. Commit the configuration:

```
user@host# commit
```

NOTE: Some traceoptions flags generate an extensive amount of information. Tracing can also slow down the operation of routing protocols. Delete the traceoptions configuration if you no longer require it.

1. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
[edit routing-options traceoptions]
user@pro4-a# run show log daemonlog
Sep 17 14:17:31 trace_on: Tracing to "/var/log/daemonlog" started
Sep 17 14:17:31 Tracing flags enabled: general
Sep 17 14:17:31 inet_routerid_notify: Router ID: 10.255.245.44
Sep 17 14:17:31 inet_routerid_notify: No Router ID assigned
Sep 17 14:17:31 Initializing LSI globals
Sep 17 14:17:31 LSI initialization complete
Sep 17 14:17:31 Initializing OSPF instances

Configure Routing Protocol Tracing for a Specific Routing Protocol

IN THIS SECTION

Action

To configure routing protocol tracing for a specific routing protocol, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
                user@host# edit protocol protocol-name traceoptions
```

2. Configure the file, file size, number, and flags:

```
[edit protocols protocol name traceoptions]
                user@host# set file filename size size files
number
[edit protocols protocol name traceoptions]
user@host# set flag flag
```

   For example:

```
[edit protocols ospf traceoptions]
user@host# set file ospflog size 10240 files 10
[edit protocols ospf traceoptions]
user@host# set flag general
```

3. Verify the configuration:

```
user@host# show
```

   For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospflog size 10k files 10;
flag general;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
[edit protocols ospf traceoptions]
user@pro4-a# run show log ospflog
Sep 17 14:23:10 trace_on: Tracing to "/var/log/ospflog" started
Sep 17 14:23:10 rt_flash_update_callback: flash OSPF (inet.0) start

Monitor Trace File Messages Written in Near-Real Time

IN THIS SECTION

Purpose

To monitor messages in near-real time as they are being written to a trace file.

Action

To monitor messages in near-real time as they are being written to a trace file, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> monitor start  filename
```

Sample Output

command-name

```
user@host> monitor start isis
user@host>
*** isis ***
Sep 15 18:32:21 Updating LSP isis5.02-00 in database
Sep 15 18:32:21 Updating L2 LSP isis5.02-00 in TED
Sep 15 18:32:21 Adding a half link from isis5.02 to isis6.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis5.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis6.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis5.00
Sep 15 18:32:21 Scheduling L2 LSP isis5.02-00 sequence 0xd87 on interface fxp2.3
Sep 15 18:32:21 Updating LSP isis5.00-00 in database
Sep 15 18:32:21 Updating L1 LSP isis5.00-00 in TED
Sep 15 18:32:21 Sending L2 LSP isis5.02-00 on interface fxp2.3
Sep 15 18:32:21     sequence 0xd87, checksum 0xc1c8, lifetime 1200
```

Stop Trace File Monitoring

IN THIS SECTION

Action

To stop monitoring a trace file in near-real time, use the following Junos OS CLI operational mode command after you have started monitoring:

```
user@host              monitor stop filename
```

Sample Output

```
user@host> monitor start isis
user@host>
*** isis ***
Sep 15 18:32:21 Updating LSP isis5.02-00 in database
Sep 15 18:32:21 Updating L2 LSP isis5.02-00 in TED
Sep 15 18:32:21 Adding a half link from isis5.02 to isis6.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis5.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis6.00
Sep 15 18:32:21 Adding a half link from isis5.02 to isis5.00
Sep 15 18:32:21 Scheduling L2 LSP isis5.02-00 sequence 0xd87 on interface fxp2.3

CHAPTER

Configuration Statements

autonomous

IN THIS SECTION

Syntax

```
(autonomous | no-autonomous);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name prefix prefix],
[edit protocols router-advertisement interface interface-name prefix prefix]
```

Description

Specify whether prefixes in the router advertisement messages are used for stateless address autoconfiguration:

- **autonomous**—Use prefixes for address autoconfiguration.
- **no-autonomous**—Do not use prefixes for address autoconfiguration.

Default

autonomous

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

cryptographic-address

IN THIS SECTION

Syntax

```
cryptographic-address {
    key-length number;
    key-pair pathname;
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure]
```

Description

Configure parameters for cryptographically generated addresses for Secure Neighbor Discovery.

The Secure Neighbor Discovery (SEND) Protocol uses cryptographically generated addresses (CGAs), as defined in RFC 3972, *Cryptographically Generated Addresses*, to ensure that the sender of a Neighbor Discovery Protocol (NDP) message is the “owner” of the claimed address. Each node must generate a public-private key pair before it can claim an address. The CGA is included in all outgoing neighbor solicitation and neighbor advertisement messages.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing level—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

RELATED DOCUMENTATION

Example: Configuring Secure IPv6 Neighbor Discovery | 20

Understanding Secure IPv6 Neighbor Discovery | 19

current-hop-limit

IN THIS SECTION

Syntax

```
current-hop-limit number;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the default value placed in the hop count field of the IP header for outgoing packets.

Options

number—Hop limit. A value of 0 means the limit is unspecified by this router.

- **Range:** 0 through 255
- **Default:** 64

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

dad-proxy

IN THIS SECTION

Syntax

```
dad-proxy {
 interface-restricted;
 interface-unrestricted;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit name family inet6],
[edit dynamic-profiles name logical-systems name interfaces name unit name family inet6],
[edit interfaces name unit name family inet6]
```

Description

DAD proxy on interface

Options

interface-restricted	Enable DAD interface proxy restricted to interface
interface-unrestricted	Enable DAD interface proxy unrestricted to interface

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1

Option `interface-unrestricted` introduced in Junos OS Release 22.1R1 (on SRX Series and vSRX 3.0 platform).

NOTE: You cannot configure both interface restricted and interface unrestricted modes on the same interface simultaneously.

default-lifetime

IN THIS SECTION

Syntax

```
default-lifetime seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Configure the lifetime associated with a default router.

Options

seconds—Default lifetime. A value of 0 means this router is not the default router.

- **Range:** Maximum advertisement interval value through 9000 seconds
- **Default:** Three times the maximum advertisement interval value

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

max-advertisement-interval (Protocols IPv6 Neighbor Discovery) | 87

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

downstream

IN THIS SECTION

Syntax

```
downstream name;
```

Hierarchy Level

```
[edit logical-systems name protocols router-advertisement interface],
[edit protocols router-advertisement interface]
```

Description

Configure the list of downstream interfaces for RA proxy

Options

name Configure the downstream interface for RA proxy

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.1R1

downstream-mode

IN THIS SECTION

Syntax

```
downstream-mode;
```

Hierarchy Level

```
[edit logical-systems name protocols router-advertisement interface],
[edit protocols router-advertisement interface]
```

Description

Configure the interface as downstream interface for RA proxy

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.1R1

interface (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

Syntax

```
interface interface-name {
    current-hop-limit number;
    default-lifetime seconds;
    (link-mtu | no-link-mtu);
    (managed-configuration | no-managed-configuration);
    max-advertisement-interval seconds;
    min-advertisement-interval seconds;
    (other-stateful-configuration | no-other-stateful-configuration);
```

```
    nat-prefix NAT64 IPv6 address prefix;{
         (lifetime seconds);
    }
    prefix prefix {
        (autonomous | no-autonomous);
        (on-link | no-on-link);
        preferred-lifetime seconds;
        valid-lifetime seconds;
    }
    reachable-time milliseconds;
    retransmit-timer milliseconds;
    solicit-router-advertisement-unicast;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement],
[edit protocols router-advertisement]
```

Description

Configure router advertisement properties on an interface. To configure more than one interface, include the `interface` statement multiple times.

The Junos OS enters the Neighbor Discovery Protocol (NDP) packets into the routing platform cache even if there is no known route to the source.

If you are using Virtual Router Redundancy Protocol (VRRP) for IPv6, you must include the `virtual-router-only` statement on both the primary and backup VRRP on the IPv6 router.

Options

interface-name—Name of an interface. Specify the full interface name, including the physical and logical address components.

nat-prefix—NAT64 IPv6 address prefix. Specify upto 3 NAT64 IPv6 address prefix per interface for router advertisement.

lifetime—Lifetime of the NAT64 IPv6 address prefix in seconds.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

"solicit-router-advertisement-unicast" on page 127 statement added from 15.1 Release onwards.

The *nat-prefix* and *lifetime* options added from Junos OS 22.4R1 Release onwards.

RELATED DOCUMENTATION

- Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery
- Secure IPv6 Neighbor Discovery | 19

key-length

IN THIS SECTION

Syntax

```
key-length number;
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure cryptographic-address]
```

Description

Specify the length of the RSA key used to generate the public-private key pair for the cryptographic address.

Default

1024

Options

number—RSA key length.

- **Range:** 1024 through 2048

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

RELATED DOCUMENTATION

Secure IPv6 Neighbor Discovery | 19

key-pair

IN THIS SECTION

Syntax

```
key-pair pathname;
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure cryptographic-address]
```

Description

Specify the directory path of the public-private key file generated for the cryptographic address.

A cryptographic address is dynamically generated based on a public key and a subnet prefix.

Default

The default location of the file is the **/var/etc/rsa_key** directory.

Options

pathname—Directory path of the public-private key file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

RELATED DOCUMENTATION

Secure IPv6 Neighbor Discovery | 19

link-mtu

IN THIS SECTION

Syntax

```
(link-mtu | no-link-mtu);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Specify whether to include the maximum transmission unit (MTU) option in router advertisement messages:

- **link-mtu**–Includes the MTU option in router advertisements.
- **no-link-mtu**–Does not include the MTU option in router advertisements.

The MTU option included in router advertisement messages ensures that all nodes on a link use the same MTU value in situations where the link MTU is not well known.

Default

Router advertisement messages do not include the MTU option.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS 10.3.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

managed-configuration

IN THIS SECTION

Syntax

```
(managed-configuration | no-managed-configuration);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Specify whether to enable the host to use a stateful autoconfiguration protocol for address autoconfiguration, along with any stateless autoconfiguration already configured:

- **managed-configuration**—Enable host to use stateful autoconfiguration.
- **no-managed-configuration**—Disable host from using stateful autoconfiguration.

You can set two fields in the router advertisement message to enable stateful autoconfiguration on a host: the managed configuration field and the other stateful configuration field. Setting the managed configuration field enables the host to use a stateful autoconfiguration protocol for address autoconfiguration, along with any stateless autoconfiguration already configured. Setting the other stateful configuration field enables autoconfiguration of other nonaddress-related information.

Default

Stateful autoconfiguration is disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

other-stateful-configuration | 108

max-advertisement-interval (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

Syntax

```
max-advertisement-interval seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the maximum interval between each router advertisement message.

The router sends router advertisements on each interface configured to transmit messages. The advertisements include route information and indicate to network hosts that the router is operational.

The router sends these messages periodically, with a time range defined by minimum and maximum values.

Options

seconds—Maximum interval.

- **Range:** 4 through 1800 seconds
- **Default:** 600 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

min-advertisement-interval (Protocols IPv6 Neighbor Discovery) | **89**

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

min-advertisement-interval (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

Syntax

```
min-advertisement-interval seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the minimum interval between each router advertisement message.

The router sends router advertisements on each interface configured to transmit messages. The advertisements include route information and indicate to network hosts that the router is operational.

The router sends these messages periodically, with a time range defined by minimum and maximum values.

Options

seconds—Minimum interval.

- **Range:** 3 seconds through three-quarter times the maximum advertisement interval value
- **Default:** One-third the maximum advertisement interval value

  By default, the maximum advertisement interval is 600 seconds and the minimum advertisement interval is one-third the maximum interval, or 200 seconds.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

max-advertisement-interval (Protocols IPv6 Neighbor Discovery) | 87

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

nd-retransmit-timer

IN THIS SECTION

Syntax

```
nd-retransmit-timer milliseconds;
```

Hierarchy Level

```
[edit system]
```

Description

Set the retransmit timer for neighbor discovery messages. Whenever the state of a neighbor during the Neighbor Discovery (ND) process changes from stale to probe, the value of the retransmit timer controls the interval between the neighbor solicitation messages that are sent out. Also, the retransmit timer controls the time for which the neighbor is in the probe state. A device sends a neighbor solicitation message after the specified number of milliseconds in the nd-retransmit-timer statement, until a reachability confirmation is received. If a solicited neighbor advertisement (NA) message is not received

from the neighbor in response to the soliciation message sent from the device, the neighbor remains in the probe state.

Options

milliseconds—Retransmission frequency.

- **Default:** 0 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

Using NDRA to Provide IPv6 WAN Link Addressing Overview

nd-system-cache-limit

IN THIS SECTION

Syntax

```
nd-system-cache-limit number;
```

Hierarchy Level

```
[edit system]
```

Description

Specify the maximum system cache size for IPv6 next-hop addresses. This limit enforces a systemwide cap on the neighbor discovery cache entries for all interfaces, including the loopback interface for the internal routing instance, management interfaces, and the public interfaces.

Default

100,000

Options

number	Maximum system cache size for IPv6 next-hop addresses.

- **Range:** 200 through 2,000,000

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

nd6-max-cache

IN THIS SECTION

Syntax

```
nd6-max-cache nd6-max-cache;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet6]
```

Description

Specify the maximum number of entries that can be added to the Neighbor Discovery Protocol (NDP) IPv6 neighbor discovery cache for an interface. When this maximum is reached, no new entries are allowed.

Default

- 100,000 for M Series.
- 75,000 for MX Series and QFX Series.
- 20,000 for EX Series.

Options

nd6-max-cache Maximum size of the neighbor discovery next-hop cache for an interface.

- **Range:** 1 through 2,000,000 for MX Series or QFX Series.
- **Range:** 1 through 700,000 for M Series.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

- Configuring Neighbor Discovery Cache Protection | 31
- Example: Configuring Neighbor Discovery Cache Protection to Prevent Denial-of-Service Attacks | 33
- IPv6 Neighbor Discovery Overview | 2
- nd6-new-hold-limit | 96

nd6-new-hold-limit

IN THIS SECTION

Syntax

```
nd6-new-hold-limit nd6-new-hold-limit;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet6]
```

Description

Specify the maximum number of entries for unresolved next-hop addresses that can be added to the Neighbor Discovery Protocol (NDP) IPv6 neighbor discovery cache for an interface.

Default

- 100,000 for M Series.
- 75,000 for MX Series and QFX Series.
- 20,000 for EX Series.

Options

nd6-new-hold-limit	Maximum number of new unresolved next-hop addresses that can be added to the IPv6 neighbor discovery cache.

- **Range:** 1 through 2,000,000

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

ndp

IN THIS SECTION

Syntax

```
ndp name {
 mac mac;
 multicast-mac multicast-mac;
 l2-interface l2-interface;
 publish (mac mac | multicast-mac multicast-mac;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit name family inet6 address],
[edit dynamic-profiles name logical-systems name interfaces name unit name family inet6 address],
[edit interfaces name unit name family inet6 address]
```

Release Information

Description

Configures static Neighbor Discovery Protocol (NDP) entries.

Options

name	Specify the destination IP address.
mac	Specify the MAC address.

multicast-mac	Specify the multicast MAC address.
l2-interface	Specify the Layer 2 interface name for NDP entry.
publish	Use this to reply to NDP requests for this entry.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface

ndp-proxy

IN THIS SECTION

Syntax

```
ndp-proxy {
 interface-restricted;
 interface-unrestricted;
}
```

Hierarchy Level

```
[edit dynamic-profiles name interfaces name unit name family inet6],
[edit dynamic-profiles name logical-systems name interfaces name unit name family inet6],
[edit interfaces name unit name family inet6]
```

Description

Enable NDP proxy on interface

Options

interface-restricted Enable NDP interface proxy restricted to interface

interface-unrestricted Enable NDP interface proxy unrestricted to interface

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1

Option `interface-unrestricted` introduced in Junos OS Release 22.1R1 (on SRX Series and vSRX 3.0 platform).

NOTE: You cannot configure both interface restricted and interface unrestricted modes on the same interface simultaneously.

neighbor-discovery

IN THIS SECTION

Syntax

```
neighbor-discovery
 dad-proxy {
  no-proxy-on-resolve;
 }
 ndp-proxy {
  no-proxy-on-resolve;
  proxy-force-resolve;
 }
 no-dad-on-state-change;
    onlink-subnet-only;
    secure {
        security-level {
            (default | secure-messages-only);
```

```
        }
        cryptographic-address {
            key-length number;
            key-pair pathname;
        }
        timestamp {
            clock-drift number;
            known-peer-window number;
            new-peer-window number;
        }
        traceoptions {
            file filename <files number> <match regular-expression> <size size> <world-
readable | no-world-readable>;
            flag flag;
            no-remote-trace;
        }
    }
}
```

Hierarchy Level

```
[edit protocols]
```

Description

Enable Secure Neighbor Discovery.

Options

dad-proxy Configure DAD proxy behaviour.

- no-proxy-on-resolve—Disable proxy on unresolved address

ndp-proxy Configure NDP proxy behaviour.

- no-proxy-on-resolve—Disable proxy on unresolved address
- proxy-force-resolve—Enable Neighbor Solicitation for already learned address

no-dad-on-state-change Disable DAD on interface state change.

The remaining statements are explained separately. See CLI Explorer.

Default

Disabled

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Option `proxy-force-resolve` introduced onn SRX Series and vSRX 3.0 platforms in Junos OS Release 22.1R1.

RELATED DOCUMENTATION

Secure IPv6 Neighbor Discovery | 19

on-link

IN THIS SECTION

Syntax

```
(on-link | no-on-link);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name prefix prefix],
[edit protocols router-advertisement interface interface-name prefix prefix]
```

Description

Specify whether to enable prefixes to be used for onlink determination:

- **no-on-link**—Disable prefixes from being used for onlink determination.
- **on-link**—Enable prefixes to be used for onlink determination.

Router advertisement messages carry prefixes and information about them. A prefix is onlink when it is assigned to an interface on a specified link. The prefixes specify whether they are onlink or not onlink. A node considers a prefix to be onlink if it is represented by one of the link's prefixes, a neighboring router specifies the address as the target of a redirect message, a neighbor advertisement message is received for the (target) address, or any neighbor discovery message is received from the address. These prefixes are also used for address autoconfiguration. The information about the prefixes specifies the lifetime of the prefixes, whether the prefix is autonomous, and whether the prefix is onlink.

Default

Prefixes are onlink unless explicitly disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

onlink-subnet-only

IN THIS SECTION

Syntax

```
onlink-subnet-only;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols neighbor-discovery],
[edit protocols neighbor-discovery]
```

Description

Enable this option to prevent the device from responding to a neighbor solicitation (NS) from a prefix that is not included as one of the device interface prefixes.

After configuring the `onlink-subnet-only` statement, the Routing Engine needs to be restarted using the `request system reboot both-routing-engines` command. If the attacker's IPv6 destination address is already in the forwarding-table, it is not removed after you configure the `onlink-subnet-only` statement, and

therefore the device continues to respond to ping NSs. Restarting the Routing Engine removes the entry from the forwarding table.

Default

Disabled

Required Privilege Level

admin— To view this statement in the configuration.

admin-control— To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

RELATED DOCUMENTATION

other-stateful-configuration

IN THIS SECTION

Syntax

```
(other-stateful-configuration | no-other-stateful-configuration);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Specify whether to enable autoconfiguration of other nonaddress-related information:

- **no-other-stateful-configuration**—Disable autoconfiguration of other nonaddress-related information.
- **other-stateful-configuration**—Enable autoconfiguration of other nonaddress-related information.

Default

By default, stateful autoconfiguration is disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

parameter-preference

IN THIS SECTION

Syntax

```
parameter-preference(configured | proxied);
```

Hierarchy Level

```
[edit logical-systems name protocols router-advertisement interface],
[edit protocols router-advertisement interface]
```

Description

Preference to select configured or proxied parameters for downstream interface.

Options

configured	Send configured parameters on downstream interface
proxied	Send proxied parameters on downstream interface

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.1R1

passive-mode

IN THIS SECTION

Syntax

```
passive-mode;
```

Hierarchy Level

```
[edit logical-systems name protocols router-advertisement interface],
[edit protocols router-advertisement interface]
```

Description

Configure passive mode on an interface. When you configure this option on the interface, the interface only reieves and processes the RA packets and does not send the RAs (receive-only mode). The commit fails if the interface has both downstream and passive-mode option configured.

Configure RA receive only mode

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 22.1R1.

preference (IPv6 Router Advertisement)

IN THIS SECTION

Syntax

```
preference (high | low | medium);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Specify the router preference that is communicated to IPv6 hosts through router advertisements. The `preference` value in the router advertisements enables IPv6 hosts to select a default router to reach a remote destination.

The `preference` can be configured when there are multiple devices that route to distinct sets of prefixes and where one of the devices would lead to considerably fewer redirects. You can indicate a lower preference for a new device that is not completely configured yet, so that hosts do not adopt this new device as the default device and thus avoid traffic loss.

Options

You can specify different levels of preference depending on your requirements:

high Specify a high preference for a device.

low Specify a low preference for a device.

medium Specify a medium preference for a device. This is the default preference.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

preferred-lifetime

IN THIS SECTION

Syntax

```
preferred-lifetime seconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name prefix prefix],
[edit protocols router-advertisement interface interface-name prefix prefix]
```

Description

Specify how long the prefix generated by stateless autoconfiguration remains preferred.

Options

seconds—Preferred lifetime, in seconds. If you set the preferred lifetime to **0xffffffff**, the lifetime is infinite. The preferred lifetime is never greater than the valid lifetime.

- **Default:** 604,800 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

valid-lifetime | 137

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

Secure IPv6 Neighbor Discovery | 19

prefix (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

Syntax

```
prefix prefix {
    (autonomous | no-autonomous);
    (on-link | no-on-link);
    preferred-lifetime seconds;
    valid-lifetime seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Configure prefix properties in router advertisement messages.

Options

prefix—Prefix name.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

reachable-time

IN THIS SECTION

Syntax

```
reachable-time milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the length of time that a node considers a neighbor reachable until another reachability confirmation is received from that neighbor.

After receiving a reachability confirmation from a neighbor, a node considers that neighbor reachable for a certain amount of time without receiving another confirmation. This mechanism is used for neighbor unreachability detection, a mechanism for finding link failures to a target node.

Options

milliseconds—Reachability time limit.

- **Range:** 0 through 3,600,000 milliseconds

- **Default:** 0 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

retransmit-timer

IN THIS SECTION

Syntax

```
retransmit-timer milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement interface interface-
name],
[edit protocols router-advertisement interface interface-name]
```

Description

Set the retransmission frequency of neighbor solicitation messages. This timer is used to detect when a neighbor has become unreachable and to resolve addresses.

Options

milliseconds—Retransmission frequency.

- **Default:** 0 milliseconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

secure

IN THIS SECTION

Syntax

```
secure {
    security-level {
        (default | secure-messages-only);
    }
    cryptographic-address {
        key-length number;
        key-pair pathname;
    }
    timestamp {
        clock-drift number;
        known-peer-window seconds;
        new-peer-window seconds;
    }
    traceoptions {
        file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery]
```

Description

Configure parameters for Secure Neighbor Discovery.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

RELATED DOCUMENTATION

security-level

IN THIS SECTION

Syntax

```
security-level {
    (default | secure-messages-only);
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure]
```

Description

Configure the type of security mode for Secure Neighbor Discovery.

Options

default—Accept and transmit both secure and unsecured messages.

secure-messages-only—Accept secure messages only. Discard unsecured messages.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

solicit-router-advertisement-unicast

IN THIS SECTION

Syntax

```
solicit-router-advertisement-unicast;
```

Hierarchy Level

```
[edit protocols router-advertisement interface interface-name]
```

Description

Configure devices to send router advertisements as unicast in response to the router solicitation message sent by IPv6 routers.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R1 onwards.

RELATED DOCUMENTATION

https://www.juniper.net/documentation/en_US/junos/information-products/pathway-pages/config-guide-routing/config-guide-routing-neighbor-discovery.html

timestamp

IN THIS SECTION

Syntax

```
timestamp {
    clock-drift value;
```

```
    known-peer-window seconds;
    new-peer-window seconds;
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure]
```

Description

Configure timestamp options, which are used to ensure that solicitation and redirect messages are not being replayed.

Options

clock-drift ***value***—Specify the allowable drift in time between the synchronization of peers. For ***value***, specify a fractional value of 100.

- **Default:** 0.01

known-peer-window ***seconds***—Specify the expected interval in seconds between Secure Neighbor Discovery messages from an established peer. A message from a known peer that arrives after the specified interval is discarded.

- **Default:** 1 second

new-peer-window ***seconds***—Specify the maximum allowable time in seconds between the timestamp of a Secure Neighbor Discovery message from a new peer and when it can be accepted.

- **Default:** 300 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

traceoptions (Protocols IPv6 Neighbor Discovery)

IN THIS SECTION

Syntax

```
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <disable>;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-advertisement],
[edit protocols router-advertisement]
```

Description

For IPv6 neighbor discovery, specify router advertisement protocol-level tracing options.

Trace IPv6 Neighbor Discovery protocol traffic to help debug Neighbor Discovery protocol issues.

Global tracing options are inherited from the configuration set by the `traceoptions` statement at the `[edit routing-options]` hierarchy level. You can override the following global trace options for the IPv6 Neighbor Discovery protocol using the `traceoptions flag` statement included at the `[edit protocols router-advertisement]` hierarchy level:

Default

The default trace options are inherited from the global `traceoptions` statement.

Options

disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place router advertisement tracing output in the file **/var/log/router-advertisement-log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

- **all**—All tracing operations

  > **NOTE**: Use the trace flag **all** with caution as this may cause the CPU to become very busy.

- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations.
- **Default:** If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—IPv6 interface transactions and processing
- **timer**—IPv6 neighbor discovery protocol timer processing

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

traceoptions (Protocols Secure Neighbor Discovery)

IN THIS SECTION

Syntax

```
traceoptions {
    file filename <files number> <match regular-expression> <size size> <world-readable | no-
world-readable>;
    flag flag;
    no-remote-trace;
}
```

Hierarchy Level

```
[edit protocols neighbor-discovery secure]
```

Description

Configure tracing operations for Secure Neighbor Discovery events. To specify more than one tracing operation, include multiple `flag` statements.

Options

file ***filename***—Name of the file to receive the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 10 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements.

Secure Neighbor Discovery Tracing Options

- **configuration**—All configuration events.
- **cryptographic-address**—Cryptographically generated address events.
- **protocol**—All protocol processing events.
- **rsa**—RSA events.

Global Tracing Options

- **all**—All tracing operations.

You can specify one or more of following flag modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

match ***regular-expression***—(Optional) Specify a regular expression to match the output of the trace file you want to log.

no-remote-trace—Disable remote tracing globally or for a specific tracing operation.

no-world-readable—(Optional) Prevent any user from reading this log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1**, and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

- **Syntax: *x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read this log file.

Required Privilege Level

routing and trace—To view this statement in the configuration.

routing-control and trace-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

CHAPTER

Operational Commands

clear ipv6 neighbors

IN THIS SECTION

Syntax

```
clear ipv6 neighbors
<all>
< host hostname>
< interface interface-name>
< logical-system logical-system-name>
< tenant name>
< vpn vpn-name>
```

Description

Clear IPv6 neighbor cache information.

NOTE: On Junos OS Evolved, issuing the `clear ipv6 neighbors` command clears the cache for IPv6 neighbors in a reachable state.

Options

none	Clear all IPv6 neighbor cache information.
all	(Optional) Clear all IPv6 neighbor cache information.
host *hostname*	(Optional) Clear the information for the specified IPv6 neighbors.
interface *interface-name*	(Optional) Clear the information about IPv6 for the specified logical interface.
logical-system *logical-system-name*	(Optional) Clear the IPv6 entries for the specified logical system; only available in the main router context.
tenant *name*	(Optional) Clear the IPv6 entries for the specified tenant system; only available in the main router context.
vpn *vpn-name*	(Optional) Clear entries in the IPv6 table for the specified virtual private network's (VPN) routing table.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ipv6 neighbors

```
user@host> clear ipv6 neighbors
```

Release Information

Command introduced before Junos OS Release 7.4.

clear ipv6 router-advertisement

IN THIS SECTION

Syntax

```
clear ipv6 router-advertisement
<interface interface>
<logical-system (all | logical-system-name)>
```

Description

Clear IPv6 router advertisement counters.

Options

none	Clear IPv6 router advertisement counters for all interfaces.
interface *interface*	(Optional) Clear IPv6 router advertisement counters for the specified interface.
logical-system (all | *logical-system-name*)	(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ipv6 router-advertisement

```
user@host> clear ipv6 router-advertisement
```

Release Information

Command introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

show ipv6 router-advertisement | 180

monitor interface

IN THIS SECTION

Syntax

```
monitor interface
<interface-name | traffic <detail>>
```

Description

Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

NOTE: On Junos OS Evolved, you can use the `monitor interface` command over SSH sessions, but console and Telnet sessions are not supported.

NOTE: This command is not supported on the QFX3000 QFabric switch.

Options

none	Display real-time statistics for all interfaces.
detail	(Optional) With traffic option only, display detailed output.
interface-name	(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.
traffic	(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

Additional Information

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the `show interfaces extensive` command for a particular interface type in the CLI Explorer. To control the output of the `monitor interface` command while it is running, use the keys listed in Table 5 on page 145. The keys are not case-sensitive.

Table 5: Output Control Keys for the monitor interface interface-name Command

Key	Action
c	Clears (returns to zero) the delta counters since `monitor interface` was started. This does not clear the accumulative counter. To clear the accumulative counter, use the `clear interfaces interval` command.
f	Freezes the display, halting the display of updated statistics and delta counters.

Table 5: Output Control Keys for the monitor interface interface-name Command *(Continued)*

Key	Action
i	Displays information about a different interface. The command prompts you for the name of a specific interface.
n	Displays information about the next interface. The `monitor interface` command displays the physical or logical interfaces in the same order as the `show interfaces terse` command.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws the display, resuming the update of the statistics and delta counters.

To control the output of the `monitor interface traffic` command while it is running, use the keys listed in Table 6 on page 146. The keys are not case-sensitive.

Table 6: Output Control Keys for the monitor interface traffic Command

Key	Action
b	Displays the statistics in units of bytes and bits per second (bps).
c	Clears (return to 0) the delta counters in the `Current Delta` column. The statistics counters are not cleared.
d	Displays the `Current Delta` column (instead of the rate column) in bps or packets per second (pps).
p	Displays the statistics in units of packets and packets per second (pps).
q or Esc	Quits the command and returns to the command prompt.
r	Displays the rate column (instead of the `Current Delta` column) in bps and pps.

Required Privilege Level

trace

Output Fields

Table 7 on page 147 describes the output fields for the `monitor interface` command. Output fields are listed in the approximate order in which they appear.

Table 7: monitor interface Output Fields

Field Name	Field Description	Level of Output
`router1`	Hostname of the router.	All levels
`Seconds`	How long the monitor interface command has been running or how long since you last cleared the counters.	All levels
`Time`	Current time (UTC).	All levels
`Delay` *x*/*y*/*z*	Time difference between when the statistics were displayed and the actual clock time. • *x*—Time taken for the last polling (in milliseconds). • *y*—Minimum time taken across all pollings (in milliseconds). • *z*—Maximum time taken across all pollings (in milliseconds).	All levels
`Interface`	Short description of the interface, including its name, status, and encapsulation.	All levels
`Link`	State of the link: `Up`, `Down`, or `Test`.	All levels
`Current delta`	Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.	All levels

Table 7: monitor interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Local Statistics`	(Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels
`Remote Statistics`	(Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. • `Input bytes`—Number of bytes received on the interface. • `Output bytes`—Number of bytes transmitted on the interface. • `Input packets`—Number of packets received on the interface. • `Output packets`—Number of packets transmitted on the interface.	All levels

Table 7: monitor interface Output Fields *(Continued)*

Field Name	Field Description	Level of Output
`Description`	With the `traffic` option, displays the interface description configured at the [`edit interfaces` *`interface-name`*] hierarchy level.	`detail`
Input Errors	Sum of incoming frame aborts and FCS errors.	All levels
Input Drops	Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.	All levels
Input Framing errors	Number of packets received with an invalid frame checksum (FCS).	All levels
Policed discards	Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.	All levels
L3 incompletes	Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the `ignore-l3-incompletes` statement.	All levels
L2 channel errors	Number of times the software did not find a valid logical interface for an incoming frame.	All levels
L2 mismatch timeouts	Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.	All levels

Sample Output

monitor interface (Physical)

```
user@host> monitor interface so-0/0/0
router1                          Seconds: 19                 Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC48
Traffic statistics:                                        Current Delta
  Input packets:                     6045 (0 pps)                  [11]
  Input bytes:                    6290065 (0 bps)                [13882]
  Output packets:                   10376 (0 pps)                  [10]
  Output bytes:                  10365540 (0 bps)                [9418]
Encapsulation statistics:
  Input keepalives:                  1901                          [2]
  Output keepalives:                 1901                          [2]
  NCP state: Opened
  LCP state: Opened
Error statistics:
  Input errors:                         0                          [0]
  Input drops:                          0                          [0]
  Input framing errors:                 0                          [0]
  Policed discards:                     0                          [0]
  L3 incompletes:                       0                          [0]
  L2 channel errors:                    0                          [0]
  L2 mismatch timeouts:                 0                          [0]
  Carrier transitions:                  1                          [0]
  Output errors:                        0                          [0]
  Output drops:                         0                          [0]
  Aged packets:                         0                          [0]

Release Information

Command introduced before Junos OS Release 7.4.

monitor start

IN THIS SECTION

Syntax

```
monitor start filename
```

Description

Start displaying the system log or trace file and additional entries being added to those files.

Options

filename	Specific log or trace file.

Additional Information

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols` *`protocol`*`]` hierarchy levels.

NOTE: To monitor a log file within a logical system, issue the `monitor start` *`logical-system-name/filename`* command.

Required Privilege Level

trace

Output Fields

Table 8 on page 164 describes the output fields for the `monitor start` command. Output fields are listed in the approximate order in which they appear.

Table 8: monitor start Output Fields

Field Name	Field Description
****filename ****	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
Date and time	Timestamp for the log entry.

Sample Output

monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from host.example.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

Release Information

Command introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

monitor list

monitor stop

monitor stop

IN THIS SECTION

Syntax

```
monitor stop filename
```

Description

Stop displaying the system log or trace file.

Options

filename	Specific log or trace file.

Additional Information

Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the `syslog` statement at the `[edit system]` hierarchy level and the `options` statement at the `[edit routing-options]` hierarchy level. The trace files generated by the routing protocol process are those configured with `traceoptions` statements at the `[edit routing-options]`, `[edit interfaces]`, and `[edit protocols` *`protocol`*`]` hierarchy levels.

Required Privilege Level

trace

Output Fields

This command produces no output.

Sample Output

monitor stop

```
user@host> monitor stop
```

<source source-address>
<tos type-of-service>
<ttl value>
<verbose>
<wait seconds>
```

Description

Check host reachability and network connectivity. The `ping` command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options

host	IP address or hostname of the remote system to ping.
bypass-routing	(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.
ce-ip *destination-ip-address* instance *routing-instance-name* source-ip *source-ip-address*	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the connectivity information of customer edge (CE) devices, such as reachability, attachment points, and MAC addresses, from a provider edge (PE) device in a virtual private LAN service (VPLS), hierarchical VPLS (H-VPLS), and Ethernet VPN (EVPN) network. The `ce-ip` option is based on the LSP ping infrastructure,

where the ping utility is extended to use the CE device IP address as the target host and the PE device loopback address as the source for a specific VPLS or EVPN routing instance.

destination-ip-address — IPv4 address of the CE device to ping.

instance *routing-instance-name* — Name of the VPLS or EVPN routing instance. The command output displays the connectivity information of the CE device based on the configured routing instance type.

source-ip *source-ip-address* — Loopback address of the PE device.

count *requests* — (Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

detail — (Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Include in the output the interface on which the ping reply was received.

do-not-fragment — (Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets.

For Junos OS Evolved Release 18.3R1, IPv6 ping does not have do-not-fragment support. The ping command is identified as IPv6 Ping when destination is IPv6 address or inet6 option is used.

For Junos OS IPv6 packets, this option disables fragmentation.

> **NOTE**: In Junos OS Release 11.1 and later, when issuing the ping command for an IPv6 route with the do-not-fragment option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet — (Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6 — (Optional) Ping Packet Forwarding Engine IPv6 routes.

interface *source-interface* — (Optional) Interface to use to send the ping requests.

interval *seconds* — (Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

logical-system *logical-system-name*	(Optional) Name of logical system from which to send the ping requests. Alternatively, enter the `set cli logical-system` *logical-system-name* command and then run the `ping` command. To return to the main router or switch, enter the `clear cli logical-system` command.
tenant *tenant-name*	(Optional) Name of tenant system from which to send the ping requests.
loose-source *value*	(Optional) Intermediate loose source route entry (IPv4). Open a set of values.
mac-address *mac-address*	(Optional) Ping the physical or hardware address of the remote system you are trying to reach.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
pattern *string*	(Optional) Specify a hexadecimal fill pattern to include in the ping packet.
rapid	(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the `count` option.
record-route	(Optional) Record and report the packet's path (IPv4).
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the ping attempt. For Junos OS Evolved, the `routing-instance` option supports only `mgmt_junos`.
size *bytes*	(Optional) Size of ping request packets. The range of values, in bytes, is `0` through `65,468`. The default value is `56`, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.
source *source-address*	(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (`lo.0`).
strict	(Optional) Use the strict source route option (IPv4).
strict-source *value*	(Optional) Intermediate strict source route entry (IPv4). Open a set of values.
tos *type-of-service*	(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is `0` through `255`. If the device configuration includes the `dscp-code-point` *value* statement at the `[edit class-of-service host-outbound-traffic]` hierarchy level, the configured DSCP

	value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the `dscp-code-point` configuration statement instead of the value you specify in this command option.
ttl *value*	(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is `0` through `255`.
verbose	(Optional) Display detailed output.
vpls *instance-name*	(Optional) Ping the instance to which this VPLS belongs.
wait *seconds*	(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is `10` seconds. If this option is used without the count option, a default count of `5` packets is used.

Required Privilege Level

network

Output Fields

When you enter this command, you are provided feedback on the status of your request. An exclamation point (`!`) indicates that an echo reply was received. A period (`.`) indicates that an echo reply was not received within the timeout period. An `x` indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

When pinging a nonexistant route, the display output of `ping` command does not print the number of packets sent or received or the packet loss.

Sample Output

ping ce-ip *destination-ip-address* instance *routing-instance-name* source-ip *source-ip-address* (EVPN)

```
user@host> ping ce-ip 10.0.0.4 instance foo source-ip 127.0.0.1
! -> PE5|foo|evpn|ge-0/0/2.100, 00:11:22:33:44:55:66:77:88:99|12:23:ab:98:34:05

Release Information

Command introduced before Junos OS Release 7.4.

`ce-ip` option introduced in Junos OS Release 17.3 for MX Series routers with MPC and MIC interfaces.

The following options are deprecated for Junos OS Evolved Release 18.3R1: `detail`, `logical-system`, `loose-source`, `mac-address`, `strict`, `strict-source`, and `vpls`.

The command `tenant` option is introduced in Junos OS Release 19.2R1 for SRX Series.

show ipv6 neighbors

IN THIS SECTION

Syntax

```
show ipv6 neighbors
<flags>
```

```
<hostname host-name>
<interface interface-name>
<logical-system logical-system-name>
<reference-count count>
<tenant name>
<vpn vpn-name>
```

Description

Display information about the IPv6 neighbor cache.

NOTE: Starting with Junos OS Release 16.1, `show ipv6 neighbors` command does not display the underlying ifl information if `enhanced-convergence` statement at [`edit irb unit` *unit-number*] hierarchy level and `enhanced-ip` statement at [`edit chassis network-services`] hierarchy level is configured for the destination interface IRB.

Options

none	Display the entries in the IPv6 table.
flags	(Optional) Display the flags set, if any.
hostname *host-name*	(Optional) Display the hostname.
interface *interface-name*	(Optional) Display information about IPv6 for the specified logical interface
logical-system *logical-system-name*	(Optional) Display the IPv6 entries for the specified logical system; only available on the main router context.
reference-count *count*	(Optional) Display the IPv6 next-hop reference count.
tenant *name*	(Optional) Displays the IPv6 entries for the specified tenant system; only available in the main router context.
vpn *vpn-name*	(Optional) Display entries in the IPv6 table for the specified virtual private network's (VPN) routing table.

Required Privilege Level

view

Output Fields

Table 9 on page 178 describes the output fields for the `show ipv6 neighbors` command. Output fields are listed in the approximate order in which they appear.

Table 9: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: **up**, **down**, **incomplete**, **reachable**, **stale**, or **unreachable**.
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: **yes** or **no**.
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: **yes** or **no**.
Interface	Name of the interface.

Sample Output

show ipv6 neighbors

```
user@host> show ipv6 neighbors
IPv6 Address                 Linklayer Address  State       Exp Rtr Secure Interface
2001:db8:0:1:2a0:a514:0:24c  00:05:85:8f:c8:bd  stale       546 yes no      fe-1/2/0.1
fe80::2a0:a514:0:24c         00:05:85:8f:c8:bd  stale       258 yes no      fe-1/2/0.1
fe80::2a0:a514:0:64c         00:05:85:8f:c8:bd  stale       111 yes no      fe-1/2/1.5
fe80::2a0:a514:0:a4c         00:05:85:8f:c8:bd  stale       327 yes no      fe-1/2/2.9
```

show ipv6 neighbors

The command displaying the underlying l2 ifl information when `enhanced-convergence` statement and `enhanced-ip` statement is not configured.

```
IPv6 Address                 Linklayer Address  State       Exp Rtr Secure Interface
23::23:0:0:2                 00:00:23:00:00:02  reachable   0   no  no      irb.0 [xe-2/2/0.0]
```

The command not displaying the underlying l2 ifl information when `enhanced-convergence` statement and `enhanced-ip` statement is configured.

```
IPv6 Address                 Linklayer Address  State       Exp Rtr Secure Interface
23::23:0:0:2                 00:00:23:00:00:02  reachable   0   no  no      irb.0
```

Release Information

Command introduced before Junos OS Release 7.4.

flags, **hostname**, **interface**, **logical-system**, **reference-count**, **tenant**, and **vpn** options added in Junos OS Release 18.3.

RELATED DOCUMENTATION

show ipv6 router-advertisement

IN THIS SECTION

Syntax

```
show ipv6 router-advertisement
<conflicts>
<interface interface>
<logical-system (all | logical-system-name)>
<prefix prefix/prefix length>
```

Description

Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.

The router advertisement module does not function in the backup Routing Engine as the Routing Engine does not send an acknowledgment message after receiving the packets. Starting in Junos OS Release 22.2R1, you can view the router advertisement module information using the `show ipv6 router-advertisement` operational command.

Options

none	Display all IPv6 router advertisement information for all interfaces.
conflicts	(Optional) Display only the IPv6 router advertisement information that is conflicting.
interface *interface*	(Optional) Display IPv6 router advertisement information for the specified interface.
logical-system (all | *logical-system-name*)	(Optional) Perform this operation on all logical systems or on a particular logical system.
prefix *prefix/prefix length*	(Optional) Display IPv6 router advertisement information for the specified prefix.

Additional Information

The display identifies conflicting information by enclosing the value the router is advertising in brackets.

Required Privilege Level

view

Output Fields

Table 10 on page 181 describes the output fields for the `show ipv6 router-advertisement` command. Output fields are listed in the approximate order in which they appear.

Table 10: show ipv6 router-advertisement Output Fields

Field Name	Field Description
`Interface`	Name of the interface.

Table 10: show ipv6 router-advertisement Output Fields *(Continued)*

Field Name	Field Description
`Advertisements sent`	Number of router advertisements sent and the elapsed time since they were sent.
`Solicits received`	Number of solicitation messages received.
`Advertisements received`	Number of router advertisements received.
`Advertisements from`	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
`Managed`	Managed address configuration flag: `0` (stateless) or `1` (stateful).
`Other configuration`	Other stateful configuration flag: `0` (stateless) or `1` (stateful).
`Reachable time`	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
`Default lifetime`	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
`Retransmit timer`	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
`Current hop limit`	Configured current hop limit.
`Prefix`	Name and length of the prefix.
`Valid lifetime`	How long the prefix remains valid for onlink determination.
`Preferred lifetime`	How long the prefix generated by stateless autoconfiguration remains preferred.
`On link`	Onlink flag: `0` (not onlink) or `1` (onlink).

Table 10: show ipv6 router-advertisement Output Fields *(Continued)*

Field Name	Field Description
Autonomous	Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).
Upstream Mode	Configured interface as upstream interface for RA proxy
Downstream Mode	Configured interface as downstream interface for RA proxy.
Downstream	Downstream interface for RA proxy.
Passive Mode	RA receive only mode is enabled.
Proxy Blackout Timer	Proxy blackout timer interval is the time interval for which the interface must not be used as a proxy interface. Proxy functionality is disabled on that interface.
Parameter Preference	Preference to select configured or proxied parameters for downstream interface
error	Displays the details of the error.

Sample Output

show ipv6 router-advertisement (with RA and NAT64 IPv6 address prefix) (cSRX, MX Series, SRX Series, vMX, and vSRX)

```
user@host> show ipv6 router-advertisement
Interface: ge-0/0/0.0

show ipv6 router-advertisement (Backup Routing Engine)

```
user@host> show ipv6 router-advertisement
error: Module not running (routing)
```

Release Information

Command introduced before Junos OS Release 7.4.

Starting in Junos OS Release 22.1, we support RA proxy on SRX Series and vSRX 3.0 . This command output is modified to display the configured upstream interfaces, downstream interfaces, the proxy flag, the proxy blackout timer, and the passive mode information.

RELATED DOCUMENTATION

clear ipv6 router-advertisement | 142

show log

IN THIS SECTION

Syntax

```
show log
<filename / user <username>>
```

Syntax (QFX Series and OCX Series)

```
show log filename
<device-type (device-id | device-alias)>
```

Syntax (TX Matrix Router)

```
show log
<all-lcc | lcc number | scc>
<filename / user <username>>
```

Description

List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options

none	List all log files.

<all-lcc | lcc *number* | scc>

(Routing matrix only)(Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type

(QFabric system only) (Optional) Display log messages for only one of the following device types:

- `director-device`—Display logs for Director devices.
- `infrastructure-device`—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- `interconnect-device`—Display logs for Interconnect devices.
- `node-device`—Display logs for Node devices.

NOTE: If you specify the `device-type` optional parameter, you must also specify either the `device-id` or `device-alias` optional parameter.

(*device-id* | *device-alias*)

If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename

(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

NOTE: The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of **messages**.

user <*username*>

(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

```

Description

Display the route that packets take to a specified network host. Use `traceroute` as a debugging tool to locate points of failure in a network.

Options

host	IP address or name of remote host.
as-number-lookup	(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.
bypass-routing	(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.
ce-ip ***IPv4 or IPv6 address***	(MX Series routers with MPC and MIC interfaces only) (Optional) Check the route to a customer edge (CE) IP address in a virtual private LAN service (VPLS) and Ethernet VPN (EVPN) network.
clns	(Optional) Trace the route belonging to Connectionless Network Service (CLNS).
ethernet ***host***	(Optional) Trace the route to an Ethernet host using unicast MAC address.
extension	(Optional) Trace ICMP extensions
gateway ***address***	(Optional) Address of a router or switch through which the route transits.
inet | inet6	(Optional) Trace the route belonging to IPv4 or IPv6, respectively.
interface ***interface-name***	(Optional) Name of the interface over which to send packets.

logical-system (all | *logical-system-name*)	(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Perform this operation on all logical systems or on a particular logical system.
tenant *tenant-name*	(Optional) Name of a particular tenant system for traceroute attempt.
monitor *host*	(Optional) Display real-time monitoring information for the specified host.
mpls (ldp *FEC address* | rsvp *label-switched-path name*)	(Optional) See `traceroute mpls ldp` and `traceroute mpls rsvp`.
next-hop	The next-hop through which to send packets to a destination.
no-resolve	(Optional) Do not attempt to determine the hostname that corresponds to the IP address.
overlay	(Optional) Traceroute overlay path.
port	(Optional) Base port number to use in traceroute probes.
propagate-ttl	(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the `no-proagate-ttl` configuration statement. **NOTE**: Using `propagate-ttl` with `traceroute` on the CE router does not show hop-by-hop information.
routing-instance *routing-instance-name*	(Optional) Name of the routing instance for the traceroute attempt.
source *source-address*	(Optional) Source address of the outgoing traceroute packets.
tos *value*	(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is `0` through `255`.
ttl *value*	(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is `0` through `128`.
wait *seconds*	(Optional) Maximum time to wait for a response to the traceroute request.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

network

Output Fields

Table 11 on page 198 describes the output fields for the `traceroute` command. Output fields are listed in the approximate order in which they appear.

Table 11: traceroute Output Fields

Field Name	Field Description
`traceroute to`	IP address of the receiver.
`hops max`	Maximum number of hops allowed.
`byte packets`	Size of packets being sent.
`number-of-hops`	Number of hops from the source to the named router or switch.
`router-name`	Name of the router or switch for this hop.
`address`	Address of the router or switch for this hop.
`Round trip time`	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```
user@host> traceroute santacruz
traceroute to host1.example.com (10.156.169.254), 30 hops max, 40 byte packets
 1  blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2  red14  (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms
 3  yellow (10.156.169.254)  7.737 ms  89.905 ms  0.834 ms
```

traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1  10.39.1.1 (10.39.1.1)  0.779 ms  0.728 ms  0.562 ms
 2  10.39.1.6 (10.39.1.6) [AS  32]  0.657 ms  0.611 ms  0.617 ms

```

traceroute (Junos OS Evolved, Through an MPLS LSP)

The Junos OS Evolved `traceroute` command parses MPLS data in the same way as the Linux `traceroute` command: L=label, E=exp_use, S=stack_bottom, and T=TTL. In the example below, `T=1/L=16` indicates the TTL with label 16.

```
user@host> traceroute 192.0.2.50 ttl 255
traceroute to 192.0.2.50 (192.0.2.50), 255 hops max, 60 byte packets

show system statistics icmp6

IN THIS SECTION

Syntax (EX Series Switches)

```
show system statistics icmp6
<all-members>
<local>
<member member-id>
```

Syntax (MX Series Routers, SRX Series)

```
show system statistics icmp6
```

Syntax (TX Matrix Router)

```
show system statistics icmp6
<all-chassis | all-lcc | lcc number / scc>
```

Syntax (TX Matrix Plus Router)

```
show system statistics icmp6
<all-chassis | all-lcc | lcc number | sfc number>
```

Description

Display system-wide Internet Control Message Protocol for IPv6 (ICMPv6) statistics.

Options

none	Display system statistics for ICMPv6.
all-chassis	(Optional) Display system statistics for ICMPv6 for all the routers in the chassis.
all-lcc	(Optional) On a TX Matrix router, display system statistics for ICMPv6 for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for ICMPv6 for all connected T1600 or T4000 LCCs.

all-members (Optional) Display ICMPv6 statistics for all members of the Virtual Chassis configuration.

lcc *number* (Optional) On a TX Matrix router, display system statistics for ICMPv6 for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for ICMPv6 for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local (Optional) Display ICMPv6 statistics for the local Virtual Chassis member.

member *member-id* (Optional) Display ICMPv6 statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

scc (Optional) Display system statistics for ICMPv6 for the TX Matrix router (or switch-card chassis).

sfc *number* (Optional) Display system statistics for ICMPv6 for the TX Matrix Plus router. Replace *number* with 0.

Additional Information

By default, when you issue the `show system statistics icmp6` command on the primary Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the primary Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show ipv6 router-advertisement

IN THIS SECTION

Syntax

```
show ipv6 router-advertisement
<conflicts>
<interface interface>
<logical-system (all | logical-system-name)>
<prefix prefix/prefix length>
```

Description

Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.

The router advertisement module does not function in the backup Routing Engine as the Routing Engine does not send an acknowledgment message after receiving the packets. Starting in Junos OS Release 22.2R1, you can view the router advertisement module information using the `show ipv6 router-advertisement` operational command.

Options

none	Display all IPv6 router advertisement information for all interfaces.
conflicts	(Optional) Display only the IPv6 router advertisement information that is conflicting.
interface *interface*	(Optional) Display IPv6 router advertisement information for the specified interface.
logical-system (all | *logical-system-name*)	(Optional) Perform this operation on all logical systems or on a particular logical system.
prefix *prefix/prefix length*	(Optional) Display IPv6 router advertisement information for the specified prefix.

Additional Information

The display identifies conflicting information by enclosing the value the router is advertising in brackets.

Required Privilege Level

view

Output Fields

Table 12 on page 214 describes the output fields for the `show ipv6 router-advertisement` command. Output fields are listed in the approximate order in which they appear.

Table 12: show ipv6 router-advertisement Output Fields

Field Name	Field Description
`Interface`	Name of the interface.
`Advertisements sent`	Number of router advertisements sent and the elapsed time since they were sent.
`Solicits received`	Number of solicitation messages received.
`Advertisements received`	Number of router advertisements received.
`Advertisements from`	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
`Managed`	Managed address configuration flag: `0` (stateless) or `1` (stateful).
`Other configuration`	Other stateful configuration flag: `0` (stateless) or `1` (stateful).

Table 12: show ipv6 router-advertisement Output Fields *(Continued)*

Field Name	Field Description
`Reachable time`	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
`Default lifetime`	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
`Retransmit timer`	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
`Current hop limit`	Configured current hop limit.
`Prefix`	Name and length of the prefix.
`Valid lifetime`	How long the prefix remains valid for onlink determination.
`Preferred lifetime`	How long the prefix generated by stateless autoconfiguration remains preferred.
`On link`	Onlink flag: `0` (not onlink) or `1` (onlink).
`Autonomous`	Autonomous address configuration flag: `0` (not autonomous) or `1` (autonomous).
`Upstream Mode`	Configured interface as upstream interface for RA proxy
`Downstream Mode`	Configured interface as downstream interface for RA proxy.
`Downstream`	Downstream interface for RA proxy.
`Passive Mode`	RA receive only mode is enabled.
`Proxy Blackout Timer`	Proxy blackout timer interval is the time interval for which the interface must not be used as a proxy interface. Proxy functionality is disabled on that interface.

Table 12: show ipv6 router-advertisement Output Fields *(Continued)*

Field Name	Field Description
Parameter Preference	Preference to select configured or proxied parameters for downstream interface
error	Displays the details of the error.

Sample Output

show ipv6 router-advertisement (with RA and NAT64 IPv6 address prefix) (cSRX, MX Series, SRX Series, vMX, and vSRX)

```
user@host> show ipv6 router-advertisement
Interface: ge-0/0/0.0
  Advertisements sent: 3, last sent 00:00:05 ago
  Solicits sent: 1, last sent 00:00:37 ago
  Solicits received: 0
  Advertisements received: 0
  Solicited router advertisement unicast: Disable
  IPv6 RA Preference: DEFAULT/MEDIUM
  Passive mode: Disable
  Upstream mode: Disable
  Downstream mode: Disable
  Proxy blackout timer: Not Running
  NAT prefix: 6000::/96 Lifetime: 8192 sec
```

show ipv6 router-advertisement

```
user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
```

```
  Solicits received: 0
  Advertisements received: 1
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
    Managed: 0
    Other configuration: 0 [1]
      Reachable time: 0 ms
      Default lifetime: 1800 sec
      Retransmit timer: 0 ms
      Current hop limit: 64
```

show ipv6 router-advertisement (Without RA proxy) (SRX Series and vSRX 3.0)

(Without RA proxy)

```
user@host> show ipv6 router-advertisement
Interface: ge-0/0/1.0
  Advertisements sent: 7, last sent 00:00:11 ago
  Solicits sent: 1, last sent 00:00:41 ago
  Solicits received: 0
  Advertisements received: 0
  Solicited router advertisement unicast: Disable
  IPv6 RA Preference: DEFAULT/MEDIUM
  Passive mode: Enable
  Upstream mode: Disable
  Downstream mode: Disable
  Proxy blackout timer: Not Running
```

(With RA proxy)

```
Interface: ge-0/0/2.0
  Advertisements sent: 2, last sent 00:00:49 ago
  Solicits sent: 1, last sent 00:01:21 ago
  Solicits received: 0
  Advertisements received: 18
  Solicited router advertisement unicast: Disable
  IPv6 RA Preference: DEFAULT/MEDIUM
  Passive mode: Enable
  Upstream mode: Enable
  Downstream mode: Disable
  Proxy parameter preference: Proxied
```

```
  Proxy blackout timer: Not Running
  Downstream: ge-0/0/0.0
  Downstream: ge-0/0/1.0
  Advertisement from fe80::5668:adff:fed8:101b, heard 00:00:00 ago
  Managed: 0
  Other configuration: 1 [0]
  Link MTU: 1500 bytes
  Reachable time: 5555 ms
  Default lifetime: 1799 sec [1800 sec]
  Retransmit timer: 4444 ms
  Current hop limit: 50 [64]
  RDNSS address: abcd:1::1
  Lifetime: 3333 sec
  Prefix: 2002:2:0:2000::/64
  Valid lifetime: 3600 sec
  Preferred lifetime: 2400 sec
  On link: 1
  Autonomous: 1
  Route Information: 2002:2:0:2000::/64
  IPv6 RA Preference: LOW
  Route lifetime: 1111 sec
  DNSSL suffix: juniper.net
  Lifetime: 6666 sec
```

show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
    Other configuration: 0 [1]
```

show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 2001:db8:8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
    Managed: 0
```

```
    Other configuration: 0
    Reachable time: 0 ms
    Default lifetime: 180 sec [1800 sec]
    Retransmit timer: 0 ms
    Current hop limit: 64
    Prefix: 2001:db8:8040:1::/64
      Valid lifetime: 2592000 sec
      Preferred lifetime: 604800 sec
      On link: 1
      Autonomous: 1
```

show ipv6 router-advertisement (Backup Routing Engine)

```
user@host> show ipv6 router-advertisement
error: Module not running (routing)
```

Release Information

Command introduced before Junos OS Release 7.4.

Starting in Junos OS Release 22.1, we support RA proxy on SRX Series and vSRX 3.0 . This command output is modified to display the configured upstream interfaces, downstream interfaces, the proxy flag, the proxy blackout timer, and the passive mode information.
