

strip-domain

Syntax strip-domain { enable | disable }
no strip-domain

Release Information Command introduced before JUNOS Release 7.1.0.

Description Strips the domain name from the username before sending an access-request message to the RADIUS server. The domain name is the text after the last @ character. For example, xyz.com is the domain name of the following: fred@abc.com@xyz.com. To stop stripping the domain name, use the **disable** keyword. The **no** version resets the default, **disable**.

- Options**
- enable—Specifies the feature
 - disable—Disables the feature; this is the default setting
