

ip vrrp timers-learn

Syntax [no] ip vrrp *vrid* timers-learn

Release Information Command introduced in JUNOS Release 10.3.0.

Description Configures the VRRP instance to learn the VRRP advertisement interval from the master VRRP instance. This feature is useful only when you have configured different advertisement intervals for the master VRRP instance and the backup VRRP instance. This feature enables the unified ISSU operation to proceed successfully. The **no** version disables the learning timer for the VRRP instance. If you have configured different advertisement intervals for the VRRP master and VRRP backup instances, the VRRP session breaks, and both instances behave like the master instance, and the router displays an error message.

Options ■ *vrid*—VRID identifier; a number in the range 1–255

Mode Interface Configuration, Subinterface Configuration
