

ethernet oam lfm pdu-lost-threshold

Syntax [no] ethernet oam lfm pdu-lost-threshold *pduLostPackets*

Release Information Command introduced in JUNOS Release 11.1.0.

Description Configures the number of OAM protocol data units (PDUs) that a local OAM client can fail to receive from a remote peer before a link-fault event is triggered. The **no** version removes the configured threshold for PDUs that can be missed from a remote peer before the generation of a link-fault event.

Options ■ *pduLostPackets*—Number of expected OAM packets from the remote peer that the local OAM client can miss before a link-fault event is triggered; a number in the range 3–10; default value is 5
