When a new link comes up, the switch logs out enough sessions so that when the sessions log in again, they are placed on the new link and the link loads are balanced. The switch uses an algorithm to log out sessions in the least disruptive manner by first logging out FDISCs whose FLOGI is not on the same link, then the least-loaded FLOGIs (loaded in terms of related FDISC logins).

Similarly, when you rebalance an existing link load, the switch logs out only enough sessions so that when the sessions log in again, they balance the load on the existing links. In this case (rebalance without a new link up), the switch takes into account the dependencies between FLOGIs and FDISCs when selecting sessions to log out.

The simple load-balancing algorithm uses the sum of the FLOGI and FDISC sessions to determine the session load on each link for both initial load balancing and load rebalancing.

### ***ENode-Based Load Balancing***

ENode-based load balancing can result in a less balanced load across the NP\_Port links because the VN\_Port FDISC sessions are assigned to the same link as the parent ENode FLOGI session, regardless of how many FDISC sessions are associated with the ENode. However, ENode-based load balancing has the advantage of keeping all of the sessions associated with a particular ENode on one link, which provides better control and predictability.

When you use the ENode-based load-balancing algorithm, the gateway assigns the ENode to an NP\_Port link when the ENode sends its FLOGI message to the gateway. The gateway places the ENode session on the least-loaded link at that time. The VN\_Port FDISC sessions associated with an ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. Essentially, the ENode sessions are load-balanced, but the VN\_Port sessions are not.

ENode-based load balancing ensures that each ENode and its associated VN\_Port sessions are assigned to the same NP\_Port link. ENode-based load balancing provides more control and predictability and ensures that if the link carrying an ENode goes down, all of the ENodes associated VN\_Port sessions also go down.

The disadvantage of ENode-based load balancing is that if one ENode has a large number of sessions and the other ENodes do not, the link that carries the ENode with the large number of sessions might have a much larger load than the other NP\_Port links in the gateway proxy fabric.

For example, if a gateway fabric has two NP\_Ports connected to the FC fabric, and two ENodes log in to the fabric, one ENode session is placed on each link. If two VN\_Port sessions are initiated on one of the ENodes, those sessions are placed on the same link as the parent ENode. If 1000 VN\_Port sessions are initiated on the other ENode, all of the 1000 VN\_Port sessions are placed on the same link as that ENode. In this case, one link has 3 sessions (1 ENode FLOGI session and 2 VN\_Port FDISC sessions) and the other link has 1001 sessions (1 ENode FLOGI session and 1000 VN\_Port FDISC sessions).

When a new link comes up or when you rebalance an existing load, the switch logs out all sessions (FLOGIs and FDISCs) in the fabric. As the sessions log in again, the switch assigns them to NP\_Ports in a balanced manner, with all FDISCs assigned to the same link as the parent FLOGI. A new link coming up or a rebalance disrupts all of the existing sessions.

The ENode-based load-balancing algorithm uses the sum of the FLOGI and FDISC sessions to determine the session load on each link for both initial load balancing and load rebalancing.

### ***FLOGI-Based Load Balancing***

FLOGI-based load balancing is similar to ENode-based load balancing in most ways:

- It can result in a less balanced load across the NP\_Port links because the VN\_Port FDISC sessions are assigned to the same link as the parent ENode FLOGI session, regardless of how many FDISC sessions are associated with the ENode.
- When an ENode logs in with a FLOGI, the gateway places the session on the least-loaded link, and the FDISC logins associated with the FLOGI are placed on the same link, regardless of link load.
- Provides control and predictability because each ENode and its associated VN\_Port (FDISC) sessions are assigned to the same link, so if the link an ENode is on goes down, all of its associated sessions also go down.
- If one ENode has a large number of sessions and the other ENodes do not, the link that carries the ENode with the large number of sessions might have a much larger load than the other NP\_Port links in the gateway proxy fabric.

FLOGI-based load balancing differs from ENode-based load balancing in two important ways:

1. The switch uses the sum of the FLOGI sessions on a link to determine the link load. The switch does not use FDISC sessions when calculating the number of sessions on a link. (ENode-based load balancing uses the sum of the FLOGI and FDISC sessions to calculate the number of sessions on a link.)
2. When a new link comes up or when you rebalance an existing load, the switch logs out enough FLOGI (and FDISC) sessions so that when the FLOGI sessions log in again, the load is balanced. The switch balances the load based only on the number of FLOGI sessions, not the sum of FLOGI and FDISC sessions. However, the FDISC sessions associated with a FLOGI follow the FLOGI to the new link if the FLOGI session is part of the rebalancing.

The FLOGI-based load-balancing algorithm uses only the FLOGI sessions to determine the session load on each link for both initial load balancing and load rebalancing.

#### ***Load-Balancing Algorithm Comparison***

[Table 304 on page 4435](#) compares the three load-balancing algorithms and summarizes their differences, advantages, and disadvantages.

**Table 304: Load-Balancing Algorithm Comparison**

| Load-Balancing Algorithm   | Session Assignment                                                            | Session Disruption on Rebalance                                                                                           | Session Count Method            | Advantages                                                                                                                                                                                               | Disadvantages                                                                               |
|----------------------------|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Simple (default algorithm) | FDISC sessions can be placed on different links than the parent FLOGI session | Minimum number of selected sessions logged out (FDISC sessions can be logged out independent of the parent FLOGI session) | Sum of FLOGI and FDISC sessions | <ul style="list-style-type: none"> <li>• Most equal session distribution across links</li> <li>• Minimum number of sessions logged out when rebalancing</li> <li>• Least disruptive algorithm</li> </ul> | <ul style="list-style-type: none"> <li>• Less session control and predictability</li> </ul> |

Table 304: Load-Balancing Algorithm Comparison (*continued*)

| Load-Balancing Algorithm | Session Assignment                                                            | Session Disruption on Rebalance                                                                                        | Session Count Method                                                   | Advantages                                                                                                                                                                                                                | Disadvantages                                                                                                                                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENode-based              | FDISC sessions are always placed on the same link as the parent FLOGI session | All sessions are logged out                                                                                            | Sum of FLOGI and FDISC sessions                                        | <ul style="list-style-type: none"> <li>Better session control and predictability (on link down, all sessions associated with an ENode go down)</li> </ul>                                                                 | <ul style="list-style-type: none"> <li>Most disruptive algorithm; all sessions logged out on rebalance</li> <li>Might result in less balanced link load because FDISCs are placed on the same link as parent FLOGI</li> </ul> |
| FLOGI-based              | FDISC sessions are always placed on the same link as the parent FLOGI session | Minimum number of selected sessions logged out (but FDISC sessions logged out when parent FLOGI session is logged out) | FLOGI sessions only (FDISC sessions not included in the session count) | <ul style="list-style-type: none"> <li>Better session control and predictability (on link down, all sessions associated with an ENode go down)</li> <li>Minimum number of sessions logged out when rebalancing</li> </ul> | <ul style="list-style-type: none"> <li>Might result in less balanced link load because FDISCs are placed on the same link as parent FLOGI</li> </ul>                                                                          |

### Load-Rebalancing Methods

The load-rebalancing method determines the way the system redistributes sessions to balance the load on the NP\_Ports that belong to a local FC fabric on an FCoE-FC gateway.

You can rebalance the existing load on existing NP\_Port links using either of two methods:

- Automated load rebalancing—When a load rebalancing trigger occurs, the switch automatically rebalances the link loads by redistributing the sessions across the active NP\_Port links. There are three possible load rebalancing triggers:

- When you enable automated load rebalancing, the switch checks the load balance on the existing NP\_Port links. If the links are already balanced, the switch does not rebalance the link load. If the links are not balanced, the switch rebalances the link loads using the configured load-balancing algorithm.

Enabling automated load rebalancing causes sessions to be logged out in accordance with the configured load-balancing algorithm if the link load is unbalanced. If the link load is already balanced when you enable automated load rebalancing, the links are not rebalanced. (Disabling automated load rebalancing is not disruptive because the link load is already balanced.)

- When a new NP\_Port link comes up on a local FCoE-FC gateway fabric, the switch rebalances the link load using the configured load-balancing algorithm if automated load balancing is enabled.
- When the port speed is changed (unless the port speed change does not change the actual port speed, for example, changing the port speed from auto to 8 Gbps).

Use automated load rebalancing if you want link loads to be rebalanced automatically when a load-balancing trigger occurs, instead of at times of your choosing. Keep in mind that load rebalancing is a disruptive event (sessions are logged out).

- On-demand load rebalancing—You choose when to rebalance the NP\_Port links by explicitly requesting a load rebalance using an operational command. The system rebalances the link load only when you issue the rebalancing command.

Use on-demand load rebalancing if you only want to rebalance the link load once or if you want to rebalance the link loads at controlled times instead of automatically.

You can also request a load rebalancing *dry run*. A dry run simulates rebalancing and lists the sessions that might be affected if you choose to perform an actual load-rebalancing operation. The link loads are not rebalanced when you request a dry run.

### NP\_Port Interface FIP Session Limit Effect on Load Balancing

The maximum number of FIP login sessions configured for each NP\_Port interface affects load balancing. When an interface reaches its maximum number of FIP login sessions, that interface is removed from the list of interfaces used for load balancing. The other interfaces in the gateway fabric continue to accept ENode login sessions until they reach their configured maximum session limit. Only interfaces that have not reached their maximum session limit are included in the load-balancing calculations.

**NOTE:** If all NP\_Port interfaces in a gateway fabric reach their FIP login session limits, the fabric sends subsequent multicast discovery advertisements (MDAs) with the availability bit set to 0 (zero) to prevent additional ENode login attempts. While the maximum number of sessions is running on the gateway fabric, ENodes cannot use that fabric to log in to the FC switch. When the number of sessions falls below the maximum, the gateway sets the availability bit in MDAs to 1 so that ENodes can log in to the fabric again.

### Load-Balancing Triggers and Timing

Several events trigger load balancing. Some of the events trigger load balancing only when automated load balancing is enabled. Other events trigger load rebalancing whether or not automated rebalancing is enabled.

This section describes the load-balancing triggers, what happens when the trigger action occurs, and how the switch determines if and when to balance the link load:

- [Load-Balancing Triggers on page 4437](#)
- [Load-Balancing Timer on page 4438](#)

#### **Load-Balancing Triggers**

[Table 305 on page 4438](#) describes the four different events can trigger load balancing or load rebalancing. In every case, link load rebalancing uses the configured load-balancing algorithm to determine the placement of sessions on links.

Table 305: Load-Balancing Triggers and Actions

| Trigger Event                                          | Action                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| New link comes up                                      | <p>Triggers a load-rebalancing operation regardless of whether or not automated load rebalancing is enabled. (The new link has no sessions, so the sessions on other links must be redistributed to balance the load.)</p> <p>The link load is not rebalanced if there are no sessions on the existing links or if there are so few sessions on the existing links that they cannot be redistributed.</p>                                       |
| On-demand load rebalancing request issued from CLI     | <p>The switch checks the NP_Port link load. If the load is not balanced across the links, the switch rebalances the link load. If the load is already balanced, nothing happens.</p> <p><b>NOTE:</b> Requesting a dry run displays sessions that might be disrupted if you rebalance the link load, but does not rebalance the link load.</p>                                                                                                   |
| Automated load balancing configured for the first time | <p>The switch checks the NP_Port link load. If the load is not balanced across the links, the switch rebalances the link load. If the load is already balanced, nothing happens.</p>                                                                                                                                                                                                                                                            |
| NP_Port speed change                                   | <p>If automated rebalancing is enabled, changing the port speed brings the port up and down (flaps the port) and causes the switch to rebalance the link loads. If the port speed change does not change the actual port speed (for example, changing the port speed from <i>auto</i> to 8 Gbps), the link loads are not rebalanced.</p> <p>If automated rebalancing is not enabled, port speed changes do not cause link load rebalancing.</p> |

**NOTE:** When an NP\_Port link goes down, it does not trigger load rebalancing. The loads on the remaining active links are already balanced, and as the sessions logged out from the down link log in again, they are they assigned to links in a balanced manner determined by the configured load-balancing algorithm.

### Load-Balancing Timer

When you trigger load balancing from the CLI, the load-balancing action occurs immediately after you execute the command. However, when a load-balancing trigger occurs that is not a CLI command, the switch does not balance the link loads immediately. Instead, the switch follows an intelligent timer process:

1. The switch checks the current load balance on the NP\_Port links in the local gateway FC fabric. If the load is already balanced, the switch does nothing, and there is no session disruption.
2. If the check shows that the link load is not balanced, the switch starts a 10-second timer. If no other load-balancing triggers occur during the 10-second interval, the switch rebalances the load.

If another load-balancing trigger occurs during the 10-second interval, the timer resets to 10 seconds. The 10-second timer prevents the switch from performing multiple disruptive load-rebalancing actions in a short period of time.

**NOTE:** The switch processes new sessions that log in after the timer starts in the normal manner. The new sessions are considered in the load-balancing evaluation and operation.

3. At a maximum of 30 seconds after the first load-balancing trigger occurs, the switch checks the link load balance again. If the links are already balanced, the switch cancels the load-rebalancing operation. If the links are not balanced, the switch rebalances the link loads.

**NOTE:** If the trigger event that started the load-rebalancing timer is no longer valid when the timer elapses, the switch cancels the rebalancing operation. For example, if a new NP\_Port link comes up and triggers the timer, then goes down before the timer expires, the original link up event is no longer valid, and the switch cancels the rebalancing operation (unless another valid rebalancing trigger occurs in that time frame).

When a link load rebalancing operation is in progress, the switch defers any load-rebalancing triggers that occur until the load-rebalancing operation is complete. The new rebalancing operation begins after the current rebalancing operation finishes if a check shows that rebalancing is required.

If you explicitly request load rebalancing from the CLI using the **request fibre-channel proxy load-rebalance** operational command, the switch rejects the command and displays an error message stating that rebalancing is already in progress.

### Load Rebalancing Behavior When a Link Goes Down

If an NP\_Port link goes down, the ENode and VN\_Port sessions on that link are logged out. The ENodes and VN\_Port sessions log in again and are assigned to NP\_Port links based on the link load and the load-balancing algorithm. If a link goes down, the switch does not rebalance the remaining load on the remaining links to avoid disrupting the existing ENode and VN\_Port sessions. (Also, it is not necessary to rebalance the links in that manner because after a link goes down, the sessions on the remaining links are already balanced. As the logged out sessions log back in, the switch places them on the remaining active links in a balanced manner, according to the configured load-balancing algorithm.)

**NOTE:** When you use the simple load-balancing algorithm, an ENode and its associated VN\_Port sessions might be on different links. In that case, if the NP\_Port with the ENode goes down, only the VN\_Ports on the same link are logged out. VN\_Ports on other links remain up and running.

## Interface Load Calculation Algorithm

A weighted round-robin (WRR) algorithm determines the interface load based on:

- The current number of sessions on the interface

**NOTE:** The configured load-balancing algorithm determines how the switch counts the number of sessions. For simple and ENode-based load balancing, the number of sessions is the sum of the FLOGI and FDISC sessions on each link. For FLOGI-based load balancing, the number of sessions is the sum of the FLOGI sessions on each link.

- The interface weight, which is the speed of the Fibre Channel link (2 Gbps, 4 Gbps, or 8 Gbps)

The interface load algorithm is:

$$(\text{number-of-sessions} * \text{max-weight}) / \text{weight}$$

where *max-weight* is an internal constant.

If the load on the FC interfaces is equal, the session is assigned to the interface with the highest link speed (the greatest weight).

For example, if the three FC interfaces have the characteristics shown in [Table 306 on page 4440](#), the loads of the interfaces are not equal:

**Table 306: FC Interface Session-Based Load-Balancing Characteristics for Unequal Loads**

| Interface | Number of Sessions | Weight (Speed) |
|-----------|--------------------|----------------|
| fc-0/0/0  | 4                  | 4 Gbps         |
| fc-0/0/1  | 1                  | 2 Gbps         |
| fc-0/0/2  | 8                  | 8 Gbps         |

In this example, interfaces fc-0/0/0 and fc-0/0/2 have a greater load than fc-0/0/1. For simple load balancing, the gateway assigns the next new FLOGI or FDISC to fc-0/0/1 because it is the least-loaded interface. For both ENode-based and FLOGI-based load balancing, the gateway assigns the next new FLOGI to fc-0/0/1 because it is the least-loaded interface. Then all VN\_Port FDISCs from that ENode follow the ENode FLOGI and are also assigned to fc-0/0/1 regardless of the link load.

For another example, if the three FC interfaces have the characteristics shown in [Table 307 on page 4441](#), the loads of the interfaces are equal:

**Table 307: FC Interface Session-Based Load-Balancing Characteristics for Equal Loads**

| Interface | Number of Sessions | Weight (Speed) |
|-----------|--------------------|----------------|
| fc-0/0/0  | 4                  | 4 Gbps         |
| fc-0/0/1  | 2                  | 2 Gbps         |
| fc-0/0/2  | 8                  | 8 Gbps         |

In this case, all interfaces have the same relative load. For simple load balancing, the gateway assigns the next new FLOGI or FDISC to fc-0/0/2 because although the loads of the three interfaces are equal, fc-0/0/2 has the greatest weight. For both ENode-based and FLOGI-based load balancing, the gateway assigns the next new FLOGI to fc-0/0/2, and all VN\_Port FDISCs from that ENode follow the ENode FLOGI and are also assigned to fc-0/0/2 regardless of the link load.

After the gateway establishes a session between an ENode or a VN\_Port and an FC switch on an NP\_Port, the session remains on that NP\_Port until the ENode or VN\_Port performs a LOGO.

If the physical FC interface link goes down, the FLOGI and FDISC sessions on the down link are logged out. The ENodes and VN\_Ports log in again to start new sessions on other NP\_Ports in the local gateway FC fabric in accordance with the configured load-balancing algorithm (assuming there is more than one NP\_Port connected to the FC fabric).

### Load-Balancing Scenarios

The configured load-balancing algorithm, the sequence in which ENodes log in to the FC network, the current session count (number of sessions per interface) and the interface speed determine the way the session load is balanced across the native FC interfaces (NP\_Ports) in a gateway FC fabric. Whether you are balancing the link load for the first time or rebalancing an existing link load, the way the load is distributed across the active links is the same.

**NOTE:** The way the switch counts the number of sessions on a port depends on the load-balancing algorithm. For simple and ENode-based load balancing, the sum of the FLOGI and FDISC sessions equals the session count. For FLOGI-based load balancing, only the FLOGI sessions are counted in the total session count.

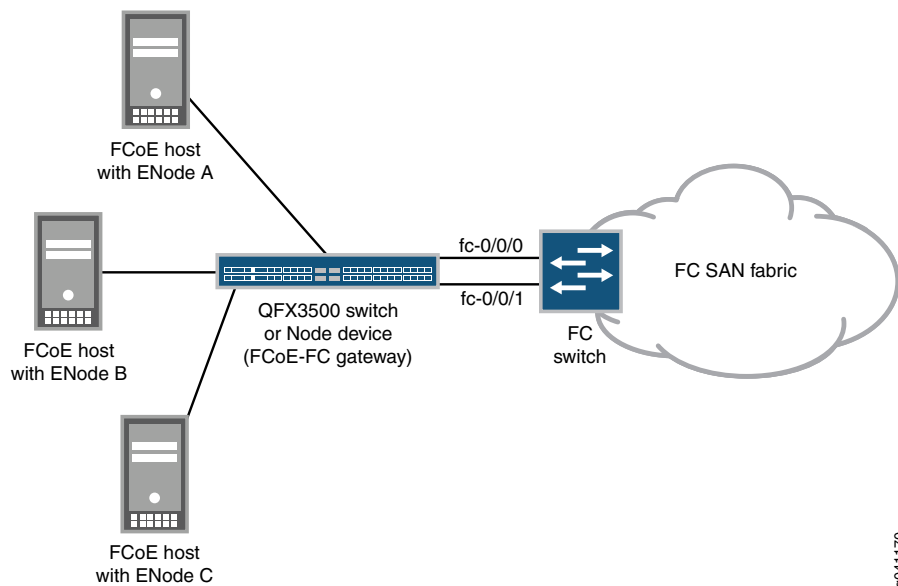

The following scenarios demonstrate how sessions are assigned to links for each load-balancing algorithm:

- [Simple Load-Balancing Algorithm Scenario on page 4442](#)
- [ENode-Based Load-Balancing Algorithm Scenarios on page 4443](#)
- [FLOGI-Based Load-Balancing Algorithm Scenarios on page 4444](#)

All of the scenarios use the topology shown in [Figure 167 on page 4442](#).

**Figure 167: Sample Load-Balancing Topology**

#### **Simple Load-Balancing Algorithm Scenario**

Simple load balancing results in the most equal load distribution among the NP\_Ports connected to an FC SAN fabric because VN\_Port FDISC sessions do not need to “follow” the parent ENode FLOGI session on the same link between the gateway and the FC fabric. When a new FLOGI or FDISC session is initiated, it is assigned to the least-loaded link.

The simple load-balancing algorithm example uses the topology shown in [Figure 167 on page 4442](#) and has the following characteristics:

- QFX Series configured as an FCoE-FC gateway
- Two gateway NP\_Ports, **fc-0/0/0** and **fc-0/0/1**, connected to an FC SAN fabric switch at a speed of 8 Gbps
- Three ENodes, ENode\_A, ENode\_B, and ENode\_C connected to the gateway
- NP\_Ports **fc-0/0/0** and **fc-0/0/1**, and ENode\_A, ENode\_B, and ENode\_C, belong to the same local FC fabric on the gateway

When the NP\_Ports initialize, they send FLOGI messages to the FC switch and log in to the FC SAN fabric. The gateway then advertises the fabric to the ENodes on the Ethernet side of the network. At this point, the load on both of the NP\_Ports is equal. Now the ENodes and VN\_Ports start to log in to the fabric:

1. ENode\_A sends a FLOGI to log in to the fabric. Because the loads on the two NP\_Ports are equal, the session for ENode\_A is randomly placed on one of the links. In this example, the ENode\_A FLOGI session is placed on port **fc-0/0/0**.
2. ENode\_B logs in. Because the load is less on port **fc-0/0/1**, the ENode\_B FLOGI session is placed on port **fc-0/0/1**.

3. ENode\_C logs in. Because the link loads are equal, the ENode\_C login session is randomly placed on one of the links. In this example, the ENode\_C login session is placed on port **fc-0/0/0**.
4. A VN\_Port on ENode\_A sends an FDISC to log in to the fabric. Because port **fc-0/0/1** currently is the least-loaded link, the VN\_Port session is placed on port **fc-0/0/1**, even though its parent ENode session is on port **fc-0/0/0**.
5. As each new VN\_Port session comes up, it is placed on the least-loaded link, regardless of the link on which its parent ENode session is placed.

### ***ENode-Based Load-Balancing Algorithm Scenarios***

ENode-based load balancing ensures that VN\_Port FDISC sessions are placed on the same link as their parent ENode FLOGI sessions, regardless of the link load. ENode-based load balancing can result in a less-balanced load among the NP\_Port links, but it provides the control and predictability of keeping ENodes and their VN\_Port sessions on the same link.

The examples in this section use the topology shown in [Figure 167 on page 4442](#).

- QFX Series configured as an FCoE-FC gateway
- Two gateway NP\_Ports, **fc-0/0/0** and **fc-0/0/1**, connected to an FC SAN fabric switch at a speed of 8 Gbps
- Three ENodes connected to the gateway:
  - ENode\_A, which has 2 VN\_Port FDISC sessions
  - ENode\_B, which has 20 VN\_Port FDISC sessions
  - ENode\_C, which has 100 VN\_Port FDISC sessions
- NP\_Ports **fc-0/0/0** and **fc-0/0/1**, and ENode\_A, ENode\_B, and ENode\_C, belong to the same local FC fabric on the gateway

When the NP\_Ports initialize, they send FLOGI messages to the FC switch and log in to the FC SAN fabric. The gateway then advertises the fabric to the ENodes on the Ethernet side of the network. At this point, the load on both of the NP\_Ports is equal. Now the ENodes and VN\_Ports start to log in to the fabric. As the following two scenarios show, how these sessions are placed on the links depends on the sequence in which they log in to the fabric.

#### **Scenario 1:**

1. ENode\_A sends a FLOGI to log in to the fabric. Because the loads on the two NP\_Ports are equal, the session for ENode\_A is randomly placed on one of the links. In this example, the ENode\_A FLOGI session is placed on port **fc-0/0/0**.
2. ENode\_B logs in. Because the load is less on port **fc-0/0/1**, the ENode\_B FLOGI session is placed on port **fc-0/0/1**.
3. The two VN\_Ports on ENode\_A log in to the fabric. Their sessions are placed on port **fc-0/0/0**, following ENode\_A on the link. Now port **fc-0/0/0** has a greater load (one FLOGI session plus two FDISC sessions) than port **fc-0/0/1** (one FLOGI session).

4. The 20 VN\_Ports on ENode\_B log in to the fabric. Their sessions are placed on port **fc-0/0/1**, following ENode\_B on the link. Now port **fc-0/0/0** has a lesser load (one FLOGI, two FDISC) than port **fc-0/0/1**.
5. ENode\_C logs in. Because the load is less on port **fc-0/0/0**, the ENode\_C FLOGI session is placed on port **fc-0/0/0**.
6. The 100 VN\_Ports on ENode\_C log in to the fabric. Their sessions follow the ENode\_C session onto port **fc-0/0/0**.
7. If more VN\_Ports come up, their FDISC sessions are placed on the same link as the corresponding parent ENode session.

#### Scenario 2:

1. ENode\_A sends a FLOGI to log in to the fabric. Because the loads on the two NP\_Ports are equal, the session for ENode\_A is randomly placed on one of the links. In this example, the ENode\_A FLOGI session is placed on port **fc-0/0/0**.
2. ENode\_B logs in. Because the load is less on port **fc-0/0/1**, the ENode\_B FLOGI session is placed on port **fc-0/0/1**.
3. The two VN\_Ports on ENode\_A log in to the fabric. Their sessions are placed on port **fc-0/0/0**, following ENode\_A on the link. Now port **fc-0/0/0** has a greater load (one FLOGI session plus two FDISC sessions) than port **fc-0/0/1** (one FLOGI session).
4. In this step, the login sequence in Scenario 2 differs from the login sequence in Scenario 1, resulting in a different placement of sessions on the links, and therefore a different load on the links. ENode\_C logs in before the ENode\_B VN\_Ports log in, which changes the session count on the links compared to the first scenario. Because the load in this scenario is less on port **fc-0/0/1**, the ENode\_C FLOGI session is placed on port **fc-0/0/1** (instead of port **fc-0/0/0** as in the first scenario).
5. The 20 VN\_Ports on ENode\_B log in to the fabric. Their sessions are placed on port **fc-0/0/1**, following ENode\_B on the link. Now port **fc-0/0/0** carries one FLOGI and two FDISC sessions, and port **fc-0/0/1** carries two FLOGI and 20 FDISC sessions.
6. The 100 VN\_Ports on ENode\_C log in to the fabric. Their sessions follow the ENode\_C session onto port **fc-0/0/1**. Now port **fc-0/0/1** carries 2 FLOGI and 120 FDISC sessions, whereas port **fc-0/0/0** carries one FLOGI and two FDISC sessions.
7. If more VN\_Ports come up, their FDISC sessions are placed on the same link as the corresponding parent ENode session.

Because of the sequence of ENode logins in Scenario 2, port **fc-0/0/1** carries a greater load than port **fc-0/0/0**. If the simple load-balancing algorithm had been used, the FLOGI and FDISC sessions would be allocated to the two links evenly. However, because the FDISC sessions are placed on the same link as their parent FLOGI sessions, this example demonstrates how using the ENode-based load-balancing algorithm can lead to scenarios in which the link loads are not equal.

#### *FLOGI-Based Load-Balancing Algorithm Scenarios*

FLOGI-based load balancing is similar in many ways to ENode-based load balancing. An important difference that affects how the switch places sessions on links is that for

FLOGI-based load balancing, only the FLOGI sessions are counted when the link load is calculated. FDISC sessions are not counted to determine the link load. Because ENode-based load balancing uses the sum of the FLOGI and FDISC sessions to determine the link load, an interface with exactly the same combination of FLOGI and FDISC sessions can have a different session count depending on the algorithm used. A different session count can change the interface to which the switch assigns the next session.

As with ENode-based load balancing, FLOGI-based load balancing ensures that VN\_Port FDISC sessions are placed on the same link as their parent ENode FLOGI sessions, regardless of the link load. FLOGI-based load balancing can result in a less-balanced load among the NP\_Port links, but it provides the control and predictability of keeping ENodes and their VN\_Port sessions on the same link.

The examples in this section use the topology shown in [Figure 167 on page 4442](#).

- QFX Series configured as an FCoE-FC gateway
- Two gateway NP\_Ports, **fc-0/0/0** and **fc-0/0/1**, connected to an FC SAN fabric switch at a speed of 8 Gbps
- Three ENodes connected to the gateway:
  - ENode\_A, which has 2 VN\_Port FDISC sessions
  - ENode\_B, which has 20 VN\_Port FDISC sessions
  - ENode\_C, which has 100 VN\_Port FDISC sessions
- NP\_Ports **fc-0/0/0** and **fc-0/0/1**, and ENode\_A, ENode\_B, and ENode\_C, belong to the same local FC fabric on the gateway

When the NP\_Ports initialize, they send FLOGI messages to the FC switch and log in to the FC SAN fabric. The gateway then advertises the fabric to the ENodes on the Ethernet side of the network. At this point, the load on both of the NP\_Ports is equal. Now the ENodes and VN\_Ports start to log in to the fabric.

Because FLOGI-based load balancing does not count FDISC sessions when calculating the link load, how the sessions are placed on the link depends only on the number of FLOGI sessions per interface, not on the number of FLOGI sessions plus FDISC sessions. This means that an ENode with a FLOGI session and many FDISC sessions is counted as having the same load as an ENode with a FLOGI session and no FDISC sessions.

#### Scenario 1:

1. ENode\_A sends a FLOGI to log in to the fabric. Because the loads on the two NP\_Ports are equal, the session for ENode\_A is randomly placed on one of the links. In this example, the ENode\_A FLOGI session is placed on port **fc-0/0/0**.
2. ENode\_B logs in. Because the load is less on port **fc-0/0/1**, the ENode\_B FLOGI session is placed on port **fc-0/0/1**.
3. The two VN\_Ports on ENode\_A log in to the fabric. Their sessions are placed on port **fc-0/0/0**, following ENode\_A on the link. However, unlike simple load balancing or ENode-based load balancing, the session count of the two ports is still equal (one session each) because the FDISC sessions are not used in the session count.

4. The 20 VN\_Ports on ENode\_B log in to the fabric. Their sessions are placed on port **fc-0/0/1**, following ENode\_B on the link. Again, unlike simple load balancing or ENode-based load balancing, the session count of the two ports is still equal (one session each) because the FDISC sessions are not used in the session count.
5. ENode\_C logs in. Because the link loads are counted as equal, the ENode\_C login session is randomly placed on one of the links. In this example, the ENode\_C login session is placed on port **fc-0/0/0**.
6. The 100 VN\_Ports on ENode\_C log in to the fabric. Their sessions follow the ENode\_C session onto port **fc-0/0/0**.
7. If more VN\_Ports come up, their FDISC sessions are placed on the same link as the corresponding parent ENode session.

If a fourth ENode, ENode\_D, sends a FLOGI to log in to the fabric, it is placed on port **fc-0/0/1** because port **fc-0/0/0** has a session count of two (two FLOGIs from ENode\_A and ENode\_C, FDISCs not counted) and port **fc-0/0/1** has a session count of one (one FLOGI from ENode\_B, FDISCs not counted), so port **fc-0/0/1** is the least-loaded port.

With FLOGI-based load balancing, it is possible for ENodes with many FDISC sessions to be placed on the same link, whereas ENodes with few FDISC sessions are placed on different links because only FLOGIs are used in the session count.

### Load Balancing on the FCoE Interfaces (Ethernet Links)

You can achieve load balancing on the 10-Gigabit Ethernet interfaces that belong to an FCoE VLAN by configuring them in one or more link aggregation groups (LAGs). In addition to load balancing, LAGs offer the advantages of protecting against port failover, increasing available link bandwidth, and preventing spanning-tree algorithms from blocking physical links and wasting bandwidth.

## Understanding OxID Hash Control for FCoE Traffic Load Balancing

The originator exchange identifier (OxID) field is one of several fields that the switch can use in its hash function computation for FCoE traffic load balancing over multiple outgoing links in an Ethernet link aggregation group (LAG). The originator of an exchange between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) uses the OxID field as an identifier for that exchange. The originator also uses the OxID field to track the progress of the series of sequences that comprise the exchange.

When FCoE traffic traverses a LAG, it can take multiple different links between the source and destination endpoints. The idea is to distribute the FCoE traffic across the LAG links, thus balancing the link load. The switch creates a hash value from some of the packet header fields, and uses the hash value to assign each packet to one of the LAG links. The switch always uses five packet header fields to compute the hash value:

- Source ID (SID)
- Destination ID (DID)
- Fabric ID (FID)
- Source Port ID (SPID)
- Source Module ID (SMID)

In addition, the OxID field is included by default in the FCoE load-balancing hash computation. However, if you do not want to use the OxID field in the FCoE load-balancing hash computation, you can remove it from the computation by using the **set forwarding-options hash-key family fcoe oxid disable** command.

Including the OxID field in the load-balancing hash computation allows different exchanges between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) to take different paths across the network, thus improving the aggregate network throughput.

However, if the paths between different sets of FC endpoints have common links, congestion on one set of FC endpoints can affect the other set of endpoints. Such congestion can happen if the FCoE traffic on the two sets of endpoints uses the same priority (IEEE 802.1p code point). It is common for networks to use priority 3 (IEEE 802.1p code point 011) for FCoE traffic. However, on the QFX3500 switch, you can assign different IEEE priorities to different lossless FCoE flows as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 4896](#) to further separate the traffic flows.

## Understanding VN\_Port to VF\_Port FIP Snooping on an FCoE Transit Switch

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping is a security mechanism that is designed to prevent unauthorized access and data transmission to a Fibre Channel (FC) network. It works by filtering traffic to permit only servers that have logged in to an FC network to access that network.

You explicitly enable VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (FC-BB-5) on FCoE VLANs when the QFX Series is an FCoE transit switch connecting FCoE devices on the Ethernet network to FC switches or gateways at the FC storage area network (SAN) edge. The transit switch applies FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VF\_Port FIP snooping. An FCoE transit switch is a data center bridging (DCB) switch with FIP snooping capability.

Through the FIP process, FCoE devices that have a converged network adapter (CNA) present an FCoE Node (ENode) that can log in to the FC network. The login process establishes a dedicated virtual link between a virtual N\_Port (VN\_Port) on the ENode and a virtual F\_Port (VF\_Port) on the FC switch to emulate a point-to-point connection. The emulated connection is called a virtual link.

Virtual links pass transparently through the switch. The ENode VN\_Port and the FC switch VF\_Port do not detect the transit switch, and virtual links appear to be direct point-to-point links.

The QFabric system applies VN2VF\_Port FIP snooping firewall filters at the directly attached edge ports associated with the FCoE VLANs on which you enable VN2VF\_Port FIP snooping. FIP snooping provides security for virtual links by creating firewall filters based on information gathered (snooped) about FC devices during FIP transactions.

The QFX3500 switch also supports VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping (FC-BB-6) to allow FCoE initiators and targets to communicate directly through the switch without going through an FCoE forwarder (FCF) or an FC switch, as described in [“Understanding VN\\_Port to VN\\_Port FIP Snooping on an FCoE Transit Switch” on page 4454](#).

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping (FC-BB-5) or VN2VN\_Port FIP snooping (FC-BB-6), but not both. The same QFX3500 switch can have multiple FCoE VLANs configured, some for VN2VF\_Port FIP snooping traffic and others for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port snooping VLANs, VN2VF\_Port FIP snooping traffic is dropped.

When you enable VN2VF\_Port FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN2VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN2VN\_Port virtual links.

## FC Network Security

In traditional FC networks, the FC switch is usually a trusted entity, and server ENodes connect directly to its VF\_Ports. After an ENode gains access to the network through the fabric login (FLOGI) process, the FC switch enforces zoning configurations, ensures that the ENode uses valid addresses, monitors the connection, and performs other security functions to prevent unauthorized access.

However, FCoE exposes FC frames to Ethernet networks, which do not have the same level of security as native FC networks. VN2VF\_Port FIP snooping firewall filters emulate the native FC network security functions by preventing unauthorized access to the FC switch through the transit switch and by ensuring the security of the virtual link between each ENode and the FC switch, as shown in [Figure 168 on page 4449](#). VN2VF\_Port FIP snooping also prevents man-in-the-middle attacks.

**Figure 168: FCoE Transit Switch Performs VN2VF\_Port FIP Snooping**

The transit switch performs VN2VF\_Port FIP snooping at the ports connected to the FCoE devices. At the SAN edge, the FC switch must be able to convert the FCoE traffic to native FC traffic.

## VN2VF\_Port FIP Snooping Functions

When VN2VF\_Port FIP snooping is enabled, the QFX3500 transit switch sets and applies filters to block all FCoE traffic by default. The transit switch monitors FIP logins, solicitations, and advertisements that pass through it and gathers information about the

ENode address and the address of the port on the FC switch. The transit switch uses the information to construct firewall filters that permit access only to logged-in ENodes. All other traffic on the VLAN is denied.

For example, when an ENode on an FCoE VLAN performs a successful login to an FC switch port, the transit switch snoops the FIP information and constructs a firewall filter that provides access for the ENode to that port on the FC switch.

The firewall filters enable FCoE frames to pass through the transit switch only on a virtual link established between an FCoE device ENode VN\_Port and the FC switch VF\_Port to which it has logged in. The firewall filters ensure that ENodes can only connect to the FC switches they have successfully logged in to and that only valid FCoE traffic along valid paths is transmitted. VN2VF\_Port FIP snooping maintains the filters by tracking FCoE sessions (ENode to FCF sessions).

---

### FIP Snooping Firewall Filters

The effect of the firewall filters is to protect the FCoE ports. VN2VF\_Port FIP snooping performs the following actions and checks to ensure that FCoE traffic is valid:

- Denies ENodes that use the FC switch media access control (MAC) address as the source address.
- Enables ENodes to transmit FIP and FCoE frames to the FC switch address.
- Ensures that the FCoE source address the FC switch assigns or accepts is only used for FCoE traffic.
- Ensures that FCoE frames are only addressed to the accepting FC switch.

---

### Session Scalability

The system supports up to 2500 total FIP snooping sessions on an interface, a gateway FC fabric, a QFX3500 switch, a QFabric Node device, or a QFabric Node group. For example, you can:

- Place all 2500 sessions on one gateway FC fabric interface.
- Split the 2500 sessions among the interfaces on one gateway FC fabric.
- Split the 2500 sessions among the interfaces on multiple gateway FC fabrics on a switch.
- Split the 2500 sessions among the interfaces on multiple gateway FC fabrics on multiple Node devices in a QFabric Node group.

Regardless of how you allocate the sessions among interfaces and local FC fabrics on a QFX3500 switch or on a QFabric system Node device or Node group, the combined FIP session limit is a maximum of 2500 sessions.

---

### VN2VF\_Port FIP Snooping Implementation

You enable VN2VF\_Port FIP snooping on a per-VLAN basis on VLANs that carry FCoE traffic. The switch snoops FIP frames at the ports associated with FCoE VLANs enabled

for VN2VF\_Port FIP snooping. The switch then installs the resulting firewall filters on the ports to ensure that all VN2VF\_Port FIP snooping occurs on the switch network edge.

VN2VF\_Port FIP snooping FCoE VLANs must meet the following criteria:

- An FCoE VLAN should be dedicated to FCoE traffic only.
- An FCoE VLAN cannot support both VN2VF\_Port FIP snooping and VN2VN\_Port FIP snooping simultaneously. You must configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic.

**NOTE:** Changing an FCoE VLAN from VN2VF\_Port FIP snooping mode to VN2VN\_Port snooping mode terminates the existing virtual links on the VLAN. The transit switch removes the existing FIP snooping filters, creates the new FIP snooping filters, and applies them to the FIP snooping ports. If you downgrade the software to Junos OS Release 12.1 or earlier, VLANs configured for VN2VN\_Port FIP snooping revert to VN2VF\_Port FIP snooping VLANs.

- All access ports associated with an FCoE VLAN (ports connected to a converged network adapter [CNA] in an FCoE device) should be configured in **tagged-access** port mode. Access ports associated with an FCoE VLAN should not be configured as access ports or trunk ports.
- All ports connected to an FC switch (or FCoE forwarder) must be configured in **trunk** port mode. Ports connected to an FC switch must be configured as trusted ports.
- FIP traffic uses the native VLAN (FIP VLAN discovery and notification frames are exchanged as untagged packets).
- All FCoE VLAN traffic must be tagged and cannot belong to the native VLAN.
- FCoE VLAN traffic cannot be untagged or priority-tagged.

When you enable VN2VF\_Port FIP snooping, the switch inspects FIP frames.

The VN2VF\_Port FIP snooping implementation includes these considerations:

- [ENode-Facing Interfaces on page 4451](#)
- [Network-Facing Interfaces on page 4452](#)
- [FC-MAP on page 4452](#)

### ***ENode-Facing Interfaces***

We recommend that you enable VN2VF\_Port FIP snooping on all FCoE VLANs that connect VN\_Ports to VF\_Ports to ensure secure connections between server ENodes and FC switches (or enable VN2VN\_Port FIP snooping on FCoE VLANs that connect VN\_Ports to other VN\_Ports). The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) should be configured in **tagged-access** port mode. After VN2VF\_Port FIP snooping is enabled on an FCoE VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login with an FC switch.

The **tagged-access** port mode was not available in Junos OS Release 11.3 and prior releases. In Release 11.3 and earlier, **trunk** port mode was used for Ethernet interfaces that connected to FCoE access devices. Because **tagged-access** mode is now available, using **trunk** mode for interfaces connected to FCoE CNAs is not recommended.

If an existing configuration uses **trunk** mode for ports connected to FCoE CNAs, you can change the port mode to **tagged-access** without disrupting traffic. Although we recommend changing the port mode of these ports from **trunk** to **tagged-access** as a best practice, it is not mandatory. New configurations should use **tagged-access** mode for interfaces that connect to FCoE devices.

**NOTE:** Do not configure ENode-facing interfaces as FCoE trusted interfaces when VN2VF\_Port FIP snooping is enabled on those interfaces. If you enable VN2VF\_Port FIP snooping on an FCoE VLAN and you configure ENode-facing interfaces that are members of the FIP snooping VLAN as **fcoe-trusted**, then FCoE devices might not be able to log in to the FC network.

**NOTE:** Changing ports from untrusted to trusted removes any existing VN2VF\_Port FIP snooping filters from the ports and terminates the existing sessions. Changing the fabric ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate VN2VF\_Port FIP snooping filters.

---

### **Network-Facing Interfaces**

When the switch acts as an FCoE transit switch, you must configure any interface that is connected to a switch as an FCoE trusted interface in **trunk** port mode and as a 10-Gigabit Ethernet interface.

Switch-facing Ethernet interfaces have the following requirements and behaviors:

- You must explicitly configure switch-facing trunk ports on an FCoE transit switch as FCoE trusted interfaces.
- After you configure an FC switch-facing trunk port as a trusted interface, the FCoE transit switch always processes FC switch frames because they come from a source on a trusted interface.
- All ports in an FCoE VLAN must be configured as tagged access or trunk ports.

### **FC-MAP**

When the switch acts as an FCoE transit switch and you enable VN2VF\_Port FIP snooping on an FCoE VLAN, you can optionally specify a 24-bit FCoE mapped address prefix (FC-MAP) value. On a given VLAN, the transit switch learns only those FC switches that have a matching FC-MAP value. If the transit switch FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, the transit switch does not discover the FC switch

on that VLAN, and the ENodes on that VLAN cannot access the FC switch. An FCoE VLAN can have one and only one FC-MAP value.

The FC-MAP value is a MAC address prefix unique to an FC switch in the FC SAN fabric that the FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN). The FC switch combines the FC-MAP value with a unique 24-bit FCID value for the ENode VN\_Port during the login process. This creates a 48-bit identifier that is unique to the fabric. The FC switch assigns this 48-bit value to the ENode VN\_Port as its MAC address and unique identifier for the session. Each VN\_Port session the ENode establishes with the FC switch receives a unique FCID from the FC switch, so an FCoE device can host multiple virtual links (one for each VN\_Port) to an FC switch, each with a 48-bit MAC address that is unique to the fabric.

The VN2VF\_Port FIP snooping filter compares the configured FC-MAP value with the FC-MAP value in the header of frames coming from the ENode VN\_Port. If the values do not match, the transit switch denies access.

**NOTE:** Changing the FC-MAP value causes all logins to be dropped and forces ENodes to log in again.

**NOTE:** Do not configure static MAC addresses with the FC-MAP value as a prefix (the first 24 bits of the MAC address). If you configure a static MAC address that uses the FC-MAP value as a prefix, the system deletes the static MAC address automatically after you enable FIP snooping. The static MAC address configuration is not restored even if you disable FIP snooping later. (The system considers a static MAC address with the FC-MAP value as the prefix to be a misconfiguration.) Do not use a MAC address with the FC-MAP value as the prefix for any traffic other than the FIP snooping traffic when the QFX Series is acting as a transit switch.

### T11 VN2VF\_Port FIP Snooping Specification

For more details about VN2VF\_Port FIP snooping, see <http://www.t11.org/ftp/t11/pub/fc/bb-5/08-264v3.pdf> for the Technical Committee T11 organization document *Increasing FCoE Robustness using FIP Snooping*.

## Understanding VN\_Port to VN\_Port FIP Snooping on an FCoE Transit Switch

VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping (FC-BB-6) on an FCoE transit switch is conceptually similar to VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (FC-BB-5) on an FCoE transit switch. VN2VN\_Port FIP snooping provides security in the form of filters. The filters help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network.

You enable VN2VN\_Port FIP snooping on the FCoE VLAN that transports the VN2VN traffic. The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

A key benefit of VN2VN\_Port FIP snooping is that it enables FCoE initiators and targets to communicate directly through the switch without going through an FCoE forwarder (FCF) or an FC switch. The transit switch does not differentiate between initiators and targets because the transit switch sees both VN\_Ports as FIP virtual link end points. Direct VN2VN\_Port communication requires secure access (FIP snooping filters) because ENodes are not trusted entities.

---

### VN2VN\_Port FIP Snooping and FIP Snooping Virtual Links

FIP snooping under the T11 FC-BB-5 specification requires that an FC switch or an FCF must be in the path between two VN\_Ports when they communicate. Introduced in the T11 FC-BB-6 specification (see <http://www.t11.org/ftp/t11/pub/fc/bb-6/10-019v3.pdf>), VN2VN\_Port FIP snooping allows the FCoE transit switch to connect two VN\_Ports to each other directly, without going through an FC switch or an FCF, provided that the ENodes have logged in to the FC network.

In VN2VF\_Port FIP snooping, when an ENode logs in to the FC network, the FCoE transit switch snoops the FIP communication between the ENode and the FC switch. In VN2VN\_Port FIP snooping mode, the transit switch creates filters on the switch access

ports to control VN\_Port access to other VN\_Ports on the Ethernet network. This allows the switch to establish a dedicated virtual link that emulates a point-to-point connection between two VN\_Ports, through the switch.

Virtual links pass transparently through the transit switch. The VN\_Ports do not detect the transit switch, and virtual links appear to be direct point-to-point links.

You explicitly enable VN2VN\_Port FIP snooping on FCoE VLANs when the QFX3500 switch is an FCoE transit switch connecting FCoE devices on the Ethernet network to each other and to FC switches or gateways at the FC storage area network (SAN) edge. An FCoE transit switch is a data center bridging (DCB) switch with FIP snooping capability.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port traffic is dropped.

When you enable FIP snooping, the system snoops VN2VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port FIP packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN\_Port FIP snooping. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

### VN2VN\_Port Communication Modes

The transit switch supports two VN2VN\_Port communication modes:

- Point-to-point mode
- Multipoint mode

In point-to-point mode, two ENodes are connected to the network and form a single VN\_Port to VN\_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.

In multipoint mode, multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN\_Ports. This is analogous to loop mode in traditional FC networks.

The VN2VN\_Port communication mode is not configured; it is determined by the number of ENodes connected to the network.

### Network Security

In traditional FC networks, the FC switch is usually a trusted entity and the server ENodes are untrusted entities. The ENodes connect directly to the FC switch VF\_Ports. After an

ENode gains access to the network through the fabric login (FLOGI) process, the FC switch enforces zoning configurations, ensures that the ENode uses valid addresses, monitors the connection, and performs other security functions to prevent unauthorized access.

However, FCoE exposes FC frames to Ethernet networks, which do not have the same level of security as native FC networks. VN2VN\_Port FIP snooping filters emulate the native FC network security functions by preventing unauthorized access and by ensuring the security of the virtual link between ENode VN\_Ports. The transit switch performs VN2VN\_Port FIP snooping at the ports connected to the FCoE VN\_Port devices.

---

### VN2VN\_Port FIP Snooping Functions

When you enable VN2VN\_Port FIP snooping, the QFX3500 transit switch sets and applies filters to block all FCoE traffic on the VLAN by default. The transit switch monitors FIP logins, solicitations, and advertisements that pass through it and gathers information about the ENode address. The transit switch uses the information to construct filters that permit access only to logged-in ENodes. All other traffic on the VLAN is denied.

The filters enable FCoE frames to pass through the transit switch only on a virtual link established between two VN\_Ports. The filters ensure that ENodes can only connect to other ENodes if they have successfully logged in to each other, and that only valid FCoE traffic along valid paths is transmitted. VN2VN\_Port FIP snooping maintains the filters by tracking VN\_Port to VN\_Port sessions.

---

### Scalability

Because ENodes are untrusted and the system needs to apply filters to untrusted FIP snooping interfaces, the total number of combined VN2VN\_Port FIP snooping sessions per switch is 376 sessions (ENode to ENode sessions) on untrusted interfaces. On interfaces that are configured as trusted interfaces, no FIP snooping filters are applied.

**NOTE:** The total number of sessions the system can support is the combined number of VN2VF\_Port sessions and VN2VN\_Port sessions. If VN2VF\_Port sessions are active, the total number of available VN2VN\_Port sessions is reduced.

---

---

### VN2VN\_Port FIP Snooping Implementation

You enable VN2VN\_Port FIP snooping on a per-VLAN basis on VLANs that carry FCoE traffic. The switch snoops FIP frames at the ports associated with FCoE VLANs enabled for VN2VN\_Port FIP snooping. The switch then installs the resulting filters on the ENode-facing ports to ensure that all FIP snooping occurs on the switch network edge.

VN2VN\_Port FIP snooping FCoE VLANs must meet the following criteria:

- An FCoE VLAN should be dedicated to FCoE traffic only.
- An FCoE VLAN cannot support both VN2VF\_Port FIP snooping (FC-BB-5) and VN2VN\_Port FIP snooping (FC-BB-6) simultaneously. You must configure separate FCoE VLANs for FIP snooping traffic and for VN2VN\_Port FIP snooping traffic.

**NOTE:** Changing an FCoE VLAN from VN2VF\_Port FIP snooping mode to VN2VN\_Port FIP snooping mode terminates the existing virtual links on the VLAN. The transit switch removes the existing FIP snooping filters, creates the new FIP snooping filters, and applies them to the FIP snooping ports. If you downgrade the software to Junos OS Release 12.1 or earlier, VLANs configured for VN2VN\_Port FIP snooping revert to VN2VF\_Port FIP snooping VLANs.

- As a best practice, all access ports associated with an FCoE VLAN (ports connected to a converged network adapter [CNA] in an FCoE device) should be configured in **tagged-access** port mode, but access and trunk port modes are also supported.
- Access ports should be configured as untrusted ports.
- All ports connected to another transit switch must be configured in **trunk** port mode.
- FIP traffic uses the native VLAN.
- You can enable VN2VN\_Port FIP snooping on a native VLAN.

### ENode-Facing Interfaces

We recommend that you either enable VN2VN\_Port FIP snooping on all FCoE VLANs to ensure secure connections between VN\_Ports, or enable VN2VF\_Port FIP snooping on FCoE VLANs that connect ENodes to an FC switch. The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) should be configured in **tagged-access** port mode, unless your CNA does not support tagged VN2VN traffic. After you enable VN2VN\_Port FIP snooping on an FCoE VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login (FIP FLOGI) with another ENode.

The **tagged-access** port mode was not available in Junos OS Release 11.3 and prior releases. In Release 11.3 and earlier, **trunk** port mode was used for Ethernet interfaces that connected to FCoE access devices. Because **tagged-access** mode is now available, using **trunk** mode for interfaces connected to FCoE CNAs is not recommended.

If an existing configuration uses **trunk** mode for ports connected to FCoE CNAs, you can change the port mode to **tagged-access** without disrupting traffic. Although we recommend changing the port mode of these ports from **trunk** to **tagged-access** as a best practice, it is not mandatory. New configurations should use **tagged-access** mode for interfaces that connect to FCoE devices.

**NOTE:** Do not configure ENode-facing interfaces as FCoE trusted interfaces when VN2VN\_Port FIP snooping is enabled on those interfaces. If you enable VN2VN\_Port FIP snooping on an FCoE VLAN and you configure ENode-facing interfaces that are members of the VN2VN\_Port FIP snooping VLAN as FCoE trusted, then FCoE devices might not be able to log in to each other.

**NOTE:** Changing ports from untrusted to trusted removes any existing VN2VN\_Port FIP snooping filters from the ports and terminates the existing sessions. Changing the ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate VN2VN\_Port FIP snooping filters.

---

### Network-Facing Interfaces (Connecting to Another Transit Switch)

---

Configure any interface that is connected to another transit switch (not to an ENode) as an FCoE trusted interface, in **trunk** port mode, and as a 10-Gigabit Ethernet interface.

Network-facing Ethernet interfaces have the following requirements and behaviors:

- You must explicitly configure network-facing trunk ports on an FCoE transit switch as FCoE trusted interfaces.
- After you configure a network-facing trunk port as a trusted interface, the FCoE transit switch always processes frames from the connected switch because they come from a source on a trusted interface.
- As a best practice, configure ports in an FCoE VLAN as tagged access ports, but access and trunk port modes are also supported to accommodate whatever types of VN2VN traffic your CNA supports.

---

### Beacon Period (VN2VN\_Port FIP Snooping Link Maintenance)

---

The transit switch needs to maintain the virtual links between VN\_Ports, and needs to know when sessions begin and end, and when to install and remove the FIP snooping filters. FIP snooping uses a FIP keepalive advertisement to accomplish this task. VN2VN\_Port FIP snooping does not exchange FIP keepalive timer information. Instead, you configure a *beacon period*, which performs the same function as a keepalive timer.

The beacon period is the time interval between messages which verify that the connection is still valid and that the device at the other end of the virtual link is still reachable. You set the beacon period value for each FCoE VLAN that you configure to do VN2VN\_Port FIP snooping.

**NOTE:** Explicitly set the beacon period when you configure VN2VN\_Port FIP snooping. VN\_Ports do not automatically send beacons.

ENodes transmit periodic multicast N\_Port\_ID beacons to the ALL-VN2VN-ENode-MACs address. The transmission period varies by a random delay of between 0 ms and 100 ms to avoid synchronized bursts of multicast traffic on the network.

If the transit switch does not receive a beacon message from an ENode within 2.5 times the configured beacon period, the transit switch considers the virtual link to be down and terminates the virtual link to that ENode.

## Understanding MC-LAGs on an FCoE Transit Switch

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX3500 switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fibre Channel over Ethernet (FCoE) traffic. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX3500 switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because MC-LAGs do not carry forwarding class and IEEE 802.1p priority information.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as passthrough transit switch ports.

QFX3500 Node devices support MC-LAGs. QFabric Node devices do not support MC-LAGs.

This topic describes:

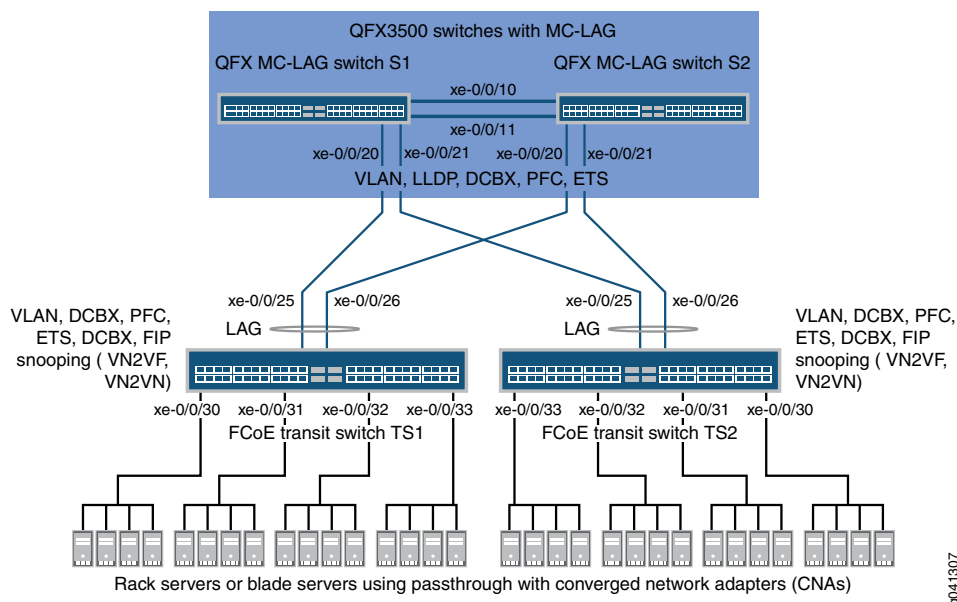

- [Supported Topology on page 4459](#)
- [FIP Snooping and FCoE Trusted Ports on page 4461](#)
- [CoS and Data Center Bridging \(DCB\) on page 4462](#)

### Supported Topology

QFX3500 switches that are not directly connected to FCoE hosts and that act as passthrough transit switches support MC-LAGs for FCoE traffic in an *inverted-U* network topology, as shown in [Figure 169 on page 4460](#):

Figure 169: Supported Topology for an MC-LAG on an FCoE Transit Switch

The following rules and guidelines apply to MC-LAGs when used for FCoE traffic. The rules and guidelines help ensure the proper handling and lossless transport characteristics required for FCoE traffic:

- The two QFX3500 switches that form the MC-LAG (Switches S1 and S2) cannot use ports that are part of an FCoE-FC gateway fabric. The MC-LAG switch ports must be passthrough transit switch ports (used as part of an intermediate transit switch that is not directly connected to FCoE hosts).
- MC-LAG Switches S1 and S2 cannot be not directly connected to the FCoE hosts.
- The two QFX3500 switches that serve as access devices for FCoE hosts (FCoE Transit Switches TS1 and TS2) use standard LAGs to connect to MC-LAG Switches S1 and S2. FCoE Transit Switches TS1 and TS2 can be standalone QFX3500 switches or they can be Node devices in a QFabric.
- Transit Switches TS1 and TS2 must use transit switch ports for the FCoE hosts and for the standard LAGs to MC-LAG Switches S1 and S2.
- Enable FIP snooping on the FCoE VLAN on Transit Switches TS1 and TS2. You can configure either VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping or VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping, depending on whether the FCoE hosts need to access targets in the FC SAN (VN2VF\_Port FIP snooping) or targets in the Ethernet network (VN2VN\_Port FIP snooping).

FIP snooping should be performed at the access edge and is not supported on MC-LAG switches. Do not enable FIP snooping on MC-LAG Switches S1 and S2. (Do not enable FIP snooping on the MC-LAG ports that connect Switches S1 and S2 to Switches TS1 and TS2 or on the LAG ports that connect Switch S1 to S2.)

- The class of service (CoS) configuration must be consistent on the MC-LAG switches. Because the MC-LAG carries no forwarding class or priority information, each MC-LAG

switch needs to have the same CoS configuration to support lossless transport. (On each MC-LAG switch, the name, egress queue, and CoS provisioning of each forwarding class must be the same, and the PFC configuration must be the same.)

### ***Transit Switches (Server Access)***

The role of FCoE Transit Switches TS1 and TS2 is to connect FCoE hosts in a multi-homed fashion to the MC-LAG switches. In essence, Transit Switches TS1 and TS2 act as access switches for the FCoE hosts. (FCoE hosts are directly connected to Transit switches TS1 and TS2.)

The transit switch configuration depends on whether you want to do VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, and whether the QFX3500 transit switches also have ports configured as part of an FCoE-FC gateway virtual fabric. Ports that the QFX3500 switch uses in an FCoE-FC gateway virtual fabric cannot be included in the transit switch LAG connection to the MC-LAG switches. (Ports cannot belong to both a transit switch and an FCoE-FC gateway; you must use different ports for each mode of operation.)

### ***MC-LAG Switches (FCoE Aggregation)***

The role of MC-LAG Switches S1 and S2 is to provide redundant, load-balanced connections between FCoE transit switches. In essence, MC-LAG Switches S1 and S2 act as aggregation switches. FCoE hosts are not directly connected to the MC-LAG switches.

The MC-LAG switch configuration is the same regardless of which type of FIP snooping that FCoE Transit Switches TS1 and TS2 perform.

### **FIP Snooping and FCoE Trusted Ports**

To maintain secure access, enable VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping at the transit switch access ports connected directly to the FCoE hosts. FIP snooping should be performed at the access edge of the network to prevent unauthorized access. For example, in [Figure 169 on page 4460](#), you enable FIP snooping on the FCoE VLANs on Transit Switches TS1 and TS2 that include the access ports connected to the FCoE hosts.

Do not enable FIP snooping on the switches used to create the MC-LAG. For example, in [Figure 169 on page 4460](#), you would not enable FIP snooping on the FCoE VLANs on Switches S1 and S2.

Configure links between switches as FCoE trusted ports to reduce FIP snooping overhead and ensure that the system performs FIP snooping only at the access edge. In the sample topology, configure the Transit Switch TS1 and TS2 LAG ports connected to the MC-LAG switches as FCoE trusted ports, configure the Switch S1 and S2 MC-LAG ports connected to Switches TS1 and TS2 as FCoE trusted ports, and configure the ports in the LAG that connects Switches S1 to S2 as FCoE trusted ports.

## CoS and Data Center Bridging (DCB)

---

The MC-LAG links do not carry forwarding class or priority information. The following CoS properties must have the same configuration on each MC-LAG switch or on each MC-LAG interface to support lossless transport:

- FCoE forwarding class name—For example, the forwarding class for FCoE traffic could use the default **fcoe** forwarding class on both MC-LAG switches.
- FCoE output queue—For example, the **fcoe** forwarding class could be mapped to queue 3 on both MC-LAG switches (queue 3 is the default mapping for the **fcoe** forwarding class).
- Classifier—The forwarding class for FCoE traffic must be mapped to the same IEEE 802.1p code point on each member interface of the MC-LAG on both MC-LAG switches. For example, the FCoE forwarding class **fcoe** could be mapped to IEEE 802.1p code point 011 (code point 011 is the default mapping for the **fcoe** forwarding class).
- Priority-based flow control (PFC)—PFC must be enabled on the FCoE code point on each MC-LAG switch and applied to each MC-LAG interface using a congestion notification profile.

You must also configure enhanced transmission selection (ETS) on the MC-LAG interfaces to provide sufficient scheduling resources (bandwidth, priority) for lossless transport. The ETS configuration can be different on each MC-LAG switch, as long as enough resources are scheduled to support lossless transport for the expected FCoE traffic.

LLDP and DCBX must be enabled on each MC-LAG member interface (LLDP and DCBX are enabled by default on all interfaces).

**NOTE:** As with all other FCoE configurations, FCoE traffic requires a dedicated VLAN that carries only FCoE traffic, and IGMP snooping must be disabled on the FCoE VLAN.

---

## Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

This topic describes:

- [DCBX Basics on page 4463](#)
- [DCBX Modes and Support on page 4464](#)
- [DCBX Attribute Types on page 4467](#)
- [DCBX Application Protocol TLV Exchange on page 4468](#)
- [DCBX and PFC on page 4469](#)
- [DCBX and ETS on page 4469](#)

---

### DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

---

### DCBX Modes and Support

---

This section describes DCBX support on the QFX Series:

- [DCBX Modes \(Versions\) on page 4464](#)
- [Autonegotiation on page 4466](#)
- [CNA Support for DCBX Modes on page 4467](#)
- [Interface Support for DCBX on page 4467](#)

#### **DCBX Modes (Versions)**

The QFX Series supports the two most common DCBX modes:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

**NOTE:** The QFX Series does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The QFX Series drops LLDP frames that contain pre-CEE DCBX TLVs.

[Table 308 on page 4465](#) summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

Table 308: Summary of Differences Between IEEE DCBX and DCBX Version 1.01

| Characteristic                                                                   | IEEE DCBX                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | DCBX Version 1.01                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OUI                                                                              | 0x0080c2                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 0x001b21                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Frame Format                                                                     | Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs                                                                                                                                                                                                                                                                       | Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The “willing” bit determines whether or not an interface can change its configuration to match the connected peer.                                                                                                                                                                                                                                                                                                         |
| Symmetric/asymmetric configuration with peer                                     | Asymmetric or symmetric                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Symmetric only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Differences in the <b>show dcbx interface interface-name</b> operational command | <ul style="list-style-type: none"> <li>• Synchronization information is not shown because symmetric configuration is not required.</li> <li>• Operational state information is not shown because the operational states do not have to be symmetric.</li> <li>• TLV type is shown because unique TLVs are sent for each DCBX attribute.</li> <li>• ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.</li> </ul> | <ul style="list-style-type: none"> <li>• Synchronization information is shown because symmetric configuration is required.</li> <li>• Operational state information is shown because the operational states do have to be symmetric.</li> <li>• TLV type is not shown because one TLV is used for all attribute information.</li> <li>• Recommendation TLV is not sent (DCBX Version 1.01 uses the “willing” bit to determine whether or not an interface uses the peer interface configuration).</li> </ul> |

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—<http://www.ieee802.org/1/files/public/docs2008/az-wadelaar-dcbx-capability-exchange-discovery-protocol-T108-v101.pdf>
- For IEEE DCBX—<http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf>

**NOTE:** As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.

- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

**NOTE:** On interfaces that use the IEEE DCBX mode, the `show dcbx neighbors interface interface-name` operational command does not include application, PFC, or ETS operational state in the output.

### ***Autonegotiation***

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on QFX3500 switches and QFabric systems:

- QFX3500 switch—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

**NOTE:** If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

### **CNA Support for DCBX Modes**

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on QFX Series interfaces depends on the DCBX features that the CNAs in your network support.

### **Interface Support for DCBX**

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

### **DCBX Attribute Types**

DCBX has three attribute types:

- **Informational**—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- **Asymmetric**—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- **Symmetric**—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- [Asymmetric Attributes on page 4467](#)
- [Symmetric Attributes on page 4468](#)

### **Asymmetric Attributes**

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- **Configuration TLV**—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing,” the configuration on the interface cannot be overridden by the peer interface configuration.
- **Recommendation TLV**—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface

sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

### ***Symmetric Attributes***

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

### **DCBX Application Protocol TLV Exchange**

---

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

- [Application Protocol TLV Exchange on page 4468](#)
- [FCoE Application Protocol TLV Exchange on page 4468](#)
- [Disabling Application Protocol TLV Exchange on page 4469](#)

### ***Application Protocol TLV Exchange***

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

### ***FCoE Application Protocol TLV Exchange***

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

**NOTE:** If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

---

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

**NOTE:** If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as “FCoE down,” and FCoE is disabled on that interface.

### ***Disabling Application Protocol TLV Exchange***

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

## **DCBX and PFC**

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

## **DCBX and ETS**

This section describes:

- [Default DCBX ETS Advertisement on page 4470](#)
- [ETS Advertisement and Peer Configuration on page 4470](#)
- [ETS Recommendation TLV on page 4470](#)

### ***Default DCBX ETS Advertisement***

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

### ***ETS Advertisement and Peer Configuration***

DCBX does not control the switch's ETS (hierarchical scheduling) operational state. If the connected peer is configured as "willing," DCBX pushes the switch's ETS configuration to the switch's peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer, but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

### ***ETS Recommendation TLV***

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **recommendation-tlv no-auto-negotiation** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

**NOTE:** You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

## Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

---

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see [“Applications” on page 4472](#)) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see [“Application Maps” on page 4473](#)) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

- [Applications on page 4472](#)
- [Application Maps on page 4473](#)
- [Classifying and Prioritizing Application Traffic on page 4474](#)
- [Enabling Interfaces to Exchange Application Protocol Information on page 4475](#)
- [Disabling DCBX Application Protocol Exchange on page 4475](#)

---

### Applications

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

**NOTE:** If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see <http://standards.ieee.org/develop/regauth/ethertype/eth.txt> on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at <http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml> on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

### Application Maps

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

---

### Classifying and Prioritizing Application Traffic

---

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

### Enabling Interfaces to Exchange Application Protocol Information

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

**NOTE:** You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.

### Disabling DCBX Application Protocol Exchange

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

## Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows so that frames are not dropped during periods of congestion. Flow control stops and resumes the transmission of network traffic between two nodes on a full-duplex Ethernet physical link. Controlling the flow prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

The QFX Series supports two methods of flow control:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Both Ethernet PAUSE and PFC are link-level flow control mechanisms.

Ethernet PAUSE pauses transmission of all traffic on a link.

PFC decouples the pause function from the physical link and enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

**NOTE:** Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause head-of-line blocking and spread congestion through the network.

---

If you attempt to configure both Ethernet PAUSE and PFC on a link, the switch returns a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

## Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends a PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives a PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

In this scenario, if Node B sends a PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

*Symmetric flow control* means an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

*Asymmetric flow control* allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) The QFX Series supports both symmetric and asymmetric flow control.

- [Symmetric Flow Control on page 4477](#)
- [Asymmetric Flow Control on page 4478](#)

### *Symmetric Flow Control*

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send PAUSE messages and respond to them (flow control

is enabled), or the interface cannot send PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to PAUSE messages.)

### ***Asymmetric Flow Control***

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric PAUSE. [Table 309 on page 4478](#) describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

**Table 309: Asymmetric Ethernet PAUSE Flow Control Configuration**

| Receive (Rx) Buffer | Transmit (Tx) Buffer | Configured Flow Control State                                                                                                                                                                                |
|---------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On                  | Off                  | Interface generates and sends Ethernet PAUSE messages. Interface does not respond to PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).         |
| Off                 | On                   | Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send PAUSE messages. (The interface does not request that the connected peer stop sending traffic.) |
| On                  | On                   | Same functionality as symmetric Ethernet PAUSE. Interface generates and sends PAUSE messages and responds to received PAUSE messages.                                                                        |
| Off                 | Off                  | Ethernet PAUSE flow control is disabled.                                                                                                                                                                     |

The configured flow control is the PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, the QFX Series supports autonegotiation of Ethernet PAUSE with the connected peer. (The QFX Series does not support autonegotiation on 10-Gigabit Ethernet interfaces.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the PAUSE and ASM\_DIR bits, as described in [Table 310 on page 4479](#):

Table 310: Flow Control State Advertised to the Connected Peer (Autonegotiation)

| Rx Buffer State | Tx Buffer State | PAUSE Bit | ASM_DIR Bit | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-----------------|-----------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Off             | Off             | 0         | 0           | The interface advertises no PAUSE capability. This is equivalent to disabling flow control on an interface.                                                                                                                                                                                                                                                                                                                                                            |
| On              | On              | 1         | 0           | The interface advertises symmetric flow control (both the transmission of PAUSE messages and the ability to receive and respond to PAUSE messages).                                                                                                                                                                                                                                                                                                                    |
| On              | Off             | 0         | 1           | The interface advertises asymmetric flow control (the transmission of PAUSE messages, but not the ability to receive and respond to PAUSE messages).                                                                                                                                                                                                                                                                                                                   |
| Off             | On              | 1         | 1           | The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send PAUSE requests to the peer, the interface supports both symmetric and asymmetric PAUSE configuration on the peer because the peer is not affected if the peer does not receive PAUSE requests. (If the interface responds to the peer's PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.) |

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in [Table 311 on page 4480](#). The first four columns show the PAUSE configuration on the local QFX Series and on the connected peer (also known as the link partner). The last two columns show the PAUSE resolution that results from the local and peer configurations on each interface. This illustrates how the PAUSE configuration of each interface affects the PAUSE behavior on the other interface.

**NOTE:** In the Resolution columns of the table, disabling PAUSE transmit means that the interface receive buffers do not generate and send PAUSE messages to the peer. Disabling PAUSE receive means that the interface transmit buffers do not respond to PAUSE messages received from the peer.

Table 311: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces

| Local Interface (QFX Series) |             | Peer Interface |             | Local Resolution                                | Peer Resolution                                 |
|------------------------------|-------------|----------------|-------------|-------------------------------------------------|-------------------------------------------------|
| PAUSE Bit                    | ASM_DIR Bit | PAUSE Bit      | ASM_DIR Bit |                                                 |                                                 |
| 0                            | 0           | Don't care     | Don't care  | Disable PAUSE transmit and receive              | Disable PAUSE transmit and receive              |

**NOTE:** For your convenience, [Table 311 on page 4480](#) replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

## PFC

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the switch receive buffer fills to a threshold, the switch sends a pause frame to the sender to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

All of the other priorities on the link continue to send frames. Only the frames sent with the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Head-of-line blocking
- A paused priority that caused upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic.
- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames.

When it receives a PFC frame, the QFX Series pauses traffic on egress queues based on the priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in [Table 312 on page 4481](#):

**Table 312: Default PFC Priority to Queue and Forwarding Class Mapping**

| IEEE 802.1p Priority (Code Point) | Queue | Forwarding Class |
|-----------------------------------|-------|------------------|
| 0 (000)                           | 0     | best-effort      |
| 1 (001)                           | 1     | best-effort      |
| 2 (010)                           | 2     | best-effort      |
| 3 (011)                           | 3     | fcoe             |
| 4 (100)                           | 4     | no-loss          |
| 5 (101)                           | 5     | best-effort      |
| 6 (110)                           | 6     | network-control  |
| 7 (111)                           | 7     | network-control  |

For example, when the QFX Series receives a PFC pause frame that pauses priority 3, queue 3 is paused. If you do not want to use the default configuration, you can configure customized mapping of priorities to different queues and forwarding classes.

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the `fcoe` forwarding class as a lossless forwarding class that is mapped to queue 3, and default classifiers map incoming priority 3 traffic to the `fcoe` forwarding class. However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires. If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 802.1p priority as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 4896](#) and [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#).

You enable PFC on a priority on an ingress interface by configuring an input CNP and then associating the CNP with an interface. The CNP enables PFC on a specified IEEE 802.1 code point. When you associate the CNP with an interface, ingress traffic mapped to that priority uses PFC to pause transmission whenever the queue buffer fills to the pause threshold.

Although unicast traffic and multdestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multdestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multdestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

**NOTE:** You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs.

---

### Lossless Transport Support

---

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priority (code point) of lossless forwarding classes.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, `fcoe` and `no-loss`. If you explicitly configure lossless forwarding classes, you must include the `no-loss` packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit configuration, you must configure CNPs to enable PFC on the priority of the lossless traffic.

**NOTE:** Junos OS Release 12.2 introduced changes to the way the QFX Series handles lossless forwarding classes (the `fcoe` and `no-loss` forwarding classes).

In Junos OS Release 12.1, both explicitly configuring the `fcoe` and `no-loss` forwarding classes and using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the `fcoe` or the `no-loss` forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the `fcoe` or the `no-loss` forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the explicit `fcoe` and `no-loss` forwarding class configuration before you upgrade to Junos OS Release 12.2.

See “[Overview of CoS Changes Introduced in Junos OS Release 12.2](#)” on [page 4820](#) for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the `fcoe` and `no-loss` forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new `no-loss` packet drop attribute or the forwarding class is lossy.

## Understanding Fibre Channel Terminology

To understand the Fibre Channel (FC) and Fibre Channel over Ethernet (FCoE) capabilities of the QFX Series, you should become familiar with the terms defined in [Table 313 on page 4484](#).

Table 313: Fibre Channel Terms

| Term                            | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| addressing mode                 | <p>Format for the locally unique MAC address the FC switch assigns to FCoE devices for FCoE transactions after FIP establishes a connection between an FCoE device and the FC switch. The two addressing modes are <i>fabric-provided MAC address (FPMA)</i> and <i>server-provided MAC address (SPMA)</i>. The QFX Series supports only FPMA.</p> <p>During FLOGI or FDISC, the ENode advertises the addressing modes it supports. If the FC switch supports an addressing mode that the ENode uses, the virtual link can be established, and the devices can communicate.</p> <p>See also <i>fabric-provided MAC address (FPMA)</i> and <i>server-provided MAC address (SPMA)</i>.</p>      |
| ALL-ENode-MACs                  | <p>Well-known multicast MAC address to which all FCoE ENodes listen. FCFs send multicast <i>FIP discovery advertisement</i> messages and <i>FIP keepalive</i> messages to the ALL-ENode-MACs address so that ENodes can discover and maintain connections to FCFs. The hexadecimal format of the address is <b>01:10:18:01:00:01</b>.</p> <p>See also <i>well-known address (WKA)</i>.</p>                                                                                                                                                                                                                                                                                                    |
| ALL-FCF-MACs                    | <p>Well-known multicast MAC address to which all FCFs listen. ENodes send multicast <i>FIP discovery solicitation</i> messages to the ALL-FCF-MACs address to find out which FCFs can accept a login. The hexadecimal format of the address is <b>01:10:18:01:00:02</b>.</p> <p>See also <i>well-known address (WKA)</i>.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| congestion notification         | See <i>quantized congestion notification (QCN)</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| converged network adapter (CNA) | <p>Physical adapter that combines the functions of a Fibre Channel <i>host bus adapter (HBA)</i> to process FCoE frames and a <i>lossless Ethernet network interface card (NIC)</i> to process non-FCoE Ethernet frames. CNAs have one or more Ethernet ports. CNAs encapsulate Fibre Channel frames in Ethernet for FCoE transport and de-encapsulate Fibre Channel frames from FCoE to native Fibre Channel.</p> <p>See also <i>host bus adapter (HBA)</i>.</p>                                                                                                                                                                                                                             |
| data center bridging (DCB)      | <p>Set of IEEE specifications that enhance Ethernet to allow it to support converged Ethernet (LAN) and Fibre Channel (SAN) traffic on one Ethernet network. DCB features include <i>priority-based flow control (PFC)</i>, <i>enhanced transmission selection (ETS)</i>, <i>Data Center Bridging Capability Exchange protocol (DCBX)</i>, <i>quantized congestion notification (QCN)</i>, and full-duplex 10-Gigabit Ethernet ports.</p> <p>See also <i>priority-based flow control (PFC)</i>, <i>Ethernet PAUSE</i>, <i>enhanced transmission selection (ETS)</i>, <i>Data Center Bridging Capability Exchange protocol (DCBX)</i>, and <i>quantized congestion notification (QCN)</i>.</p> |
| expansion port (E_Port)         | An expansion port in an FC switch/FCF that connects the FC switch/FCF to the E_Port of another FC switch/FCF to form an <i>Interswitch Link (ISL)</i> in a common FC fabric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 313: Fibre Channel Terms (*continued*)

| Term                                                     | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Center Bridging Capability Exchange protocol (DCBX) | Discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network. It is an extension of the Link Layer Data Protocol (LLDP, described in IEEE 802.1AB)<br><br>See also <i>data center bridging (DCB)</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| enhanced transmission selection (ETS)                    | Mechanism that provides finer granularity of bandwidth management within a link.<br><br>See also <i>data center bridging (DCB)</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| ENode MAC                                                | <i>Lossless Ethernet MAC</i> paired with an <i>FCoE controller</i> in an ENode.<br><br>See also <i>FCoE node (ENode)</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ENode MAC address                                        | Globally unique address assigned to the CNA by the manufacturer and used to identify the node for FIP transactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Ethernet PAUSE                                           | As defined in IEEE 802.3X, a flow control mechanism that temporarily stops the transmission of Ethernet frames on a link for a specified period. A receiving element sends an Ethernet PAUSE frame when a sender transmits data faster than the receiver can accept it. Ethernet PAUSE affects the entire link, not just an individual flow. An Ethernet PAUSE frame temporarily stops all traffic transmission on the link and allows the receiver's input buffer to empty sufficiently to restart traffic on the link. Ethernet PAUSE messages are sent to the previous hop and do not automatically propagate to the source of the congestion.<br><br>See also <i>priority-based flow control (PFC)</i> .                                                                                                                                                                                                                                                                                                                                           |
| fabric                                                   | Interconnection of network nodes using one or more network switches that function as a network single logical entity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| fabric discovery (FDISC)                                 | Subsequent logins from the same ENode for different users, applications, or virtual machines after an ENode performs an initial FLOGI to log in to a switch.<br><br>FC and FIP FDISC messages serve the same function in FC and FCoE networks, respectively. N_Ports send FC FDISC messages to the FC switch and VN_Ports send FIP FDISC messages to the FCF.<br><br>After an N_Port acquires its initial N_Port ID through the FC FLOGI process, it can acquire additional N_Port IDs by sending an FC FDISC with a new worldwide port name and a source ID of 0x000000. The new port name and blank source ID tell the FC switch to assign a new N_Port ID to the N_Port. The different N_Port IDs allow multiple virtual machines or users on the N_Port to have separate, secure virtual links on the same physical N_Port. These additional ports are also referred to as VN_Ports.<br><br>FIP FDISC works the same way, except the VN_Port logs in using a FIP FLOGI message.<br><br>See also <i>fabric login (FLOGI)</i> and <i>N_Port ID</i> . |

| Term                               | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fabric login (FLOGI)               | <p>Creation of a logical connection to the FC switch and establishment of a node's operating environment.</p> <p>For FC devices, an N_Port logs in to the FC network by sending an FC FLOGI message to the F_Port of an FC switch.</p> <p>For FCoE devices, a VN_Port logs in to the FC network by sending a FIP FLOGI message to the VF_Port of an FC switch.</p>                                                                                                                                                                                                                                                                                                                 |
| fabric port (F_Port)               | <p>FC port on an FC switch or an FCF that connects point-to-point to an FC node port (N_Port) on an FC host (server or storage device). An F_Port provides access to fabric services for FC devices.</p> <p>F_Ports are intermediate ports in a connection between FC device end-point N_Ports. For example, a connection between an FC host server and an FC storage device through an FC switch looks like this: FC server N_Port to FC switch ingress F_Port to FC switch egress F_Port to FC storage device N_Port.</p> <p>See also <i>node port (N_Port)</i>.</p>                                                                                                             |
| fabric-provided MAC address (FPMA) | <p>MAC address that an FCF assigns to a single ENode MAC through the FLOGI or FDISC process that is unique to the local fabric. The FPMA uniquely identifies a single VN_Port at that ENode MAC in FCoE transactions with the FCF.</p> <p>Because an ENode can have more than one ENode MAC, an FCF can assign multiple FPMAs to an ENode, one FPMA per ENode MAC.</p> <p>An FPMA is a 48-bit value that consists of two 24-bit values, the N_Port ID and the FC-MAP value. The N_Port ID uniquely identifies the VN_Port and the FC-MAP value identifies the FCF.</p> <p>See also <i>FCoE node (ENode)</i>, <i>N_Port ID</i>, and <i>FCoE mapped address prefix (FC-MAP)</i>.</p> |
| FCF-MAC                            | Lossless Ethernet MAC paired with an FCoE controller in an FCF. The FCF-MAC enables the FCF to handle FCoE traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| FCoE controller                    | <p>Instantiates and terminates VN_Port and VF_Port instances on an ENode. An ENode can have more than one FCoE controller. Each FCoE controller is paired with a lossless Ethernet MAC on the ENode.</p> <p>See also <i>lossless Ethernet MAC</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FC forwarder (FCF)                 | Alternative term and acronym to refer to an FC switch that has all physical Fibre Channel ports and the necessary set of services as defined in the T11 Organization <i>Fibre Channel Switched Fabric (FC-SW)</i> standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FCoE forwarder (FCF)               | Defined by the <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification available at <a href="http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf">http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf</a> as a device that has the necessary set of services as defined in FC-SW and the FCoE capabilities to act as an FCoE-based FC switch.                                                                                                                                                                                                                                                                                                                           |

Table 313: Fibre Channel Terms (*continued*)

| Term                                | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FCoE Initialization Protocol (FIP)  | <p>Layer 2 protocol for endpoint discovery, fabric login, and fabric association. FIP enables FCoE devices and FC switches to discover one another. Through FIP, FCoE nodes can log in to an FC switch, access the SAN FC fabric, and communicate with target FC devices. FIP messages also maintain the connection between the FCoE initiator and the FCF.</p> <p>FIP has its own EtherType (0x8914) to distinguish its traffic from payload-carrying FCoE traffic and other Ethernet traffic.</p>                             |
| FCoE link endpoint (LEP)            | Virtual FC interface mapped onto a physical Ethernet interface to handle FC frame encapsulation and de-encapsulation and transmission and reception of FC frames encapsulated in Ethernet through a single virtual link.                                                                                                                                                                                                                                                                                                        |
| FCoE mapped address prefix (FC-MAP) | <p>24-bit value that identifies the FC switch and is half of the 48-bit FPMA MAC address. The FC-MAP value can be configured on the FC switch and has a default value of 0EFC00h. The FC-MAP value was originally called the Fibre Channel Organizationally Unique Identifier (FC-OUI).</p> <p>See also <i>fabric-provided MAC address (FPMA)</i>.</p>                                                                                                                                                                          |
| FCoE node (ENode)                   | <p>Fibre Channel node that has one or more lossless Ethernet MACs, each paired with an <i>FCoE Controller</i> in order to transmit FCoE frames. An ENode combines FCoE termination functions and the FC stack on a CNA. ENodes present virtual FC interfaces to FC switches or FCFs in the form of VN_Ports, which can establish FCoE virtual links with FC switch/FCF VF_Ports. ENodes perform FCoE related functions in a <i>converged network adapter (CNA)</i>.</p> <p>See also <i>converged network adapter (CNA)</i>.</p> |
| FCoE-FC gateway                     | A form of N_Port virtualizer in which the node-facing ports are FCoE ports and the FC switch-facing ports are FC ports.                                                                                                                                                                                                                                                                                                                                                                                                         |
| FCoE-FCoE gateway                   | A form of N_Port virtualizer in which the node-facing ports are FCoE ports and the FC switch-facing ports are FCoE ports.                                                                                                                                                                                                                                                                                                                                                                                                       |
| FC-FC gateway                       | A form of N_Port virtualizer in which the node-facing ports are FC ports and the FC switch-facing ports are FC ports.                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 313: Fibre Channel Terms (*continued*)

| Term                                                      | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FCoE transit switch (also known as a FIP snooping bridge) | <p>Switch with a minimum set of features designed to support FCoE Layer 2 forwarding and FCoE security. The switch can also have optional additional features.</p> <p>Minimum feature support is:</p> <ul style="list-style-type: none"> <li>• Priority-based flow control (PFC)</li> <li>• Enhanced transmission selection (ETS)</li> <li>• Data Center Bridging Capability Exchange Protocol (DCBX), including the FCoE application TLV</li> <li>• FIP snooping (minimum support is FIP automated filter programming at the ENode edge)</li> </ul> <p>Additional FIP snooping capabilities can include learning the virtual FC connection paths (VN2VF, VN2VN, or VE2VE) and monitoring the FIP keepalive mechanisms. Other optional capabilities can also enhance FCoE within the standards. FIP snooping is typically configurable on a per-VLAN basis.</p> <p>A transit switch has an FC stack even though it is not an FC switch or an FCF.</p> |
| FCoE VLAN                                                 | VLAN dedicated to carrying only FCoE traffic. FCoE traffic must travel in a VLAN. Only FCoE interfaces should be members of an FCoE VLAN. Ethernet traffic that is not FCoE traffic must travel in a different VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Fibre Channel                                             | High-speed network technology used for storage area networks (SANs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Fibre Channel fabric                                      | <p>Network of Fibre Channel devices that allows communication among devices, device name lookup, security, and redundancy.</p> <p>Also a local fabric on a QFX3500 switch with FCoE interfaces connected to FCoE devices on the Ethernet network and native FC interfaces connected to an FC switch in a SAN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Fibre Channel ID (FCID)                                   | <p>24-bit value the FC switch assigns to the N_Port or VN_Port as a unique identifier within the local FC network. The FCID consists of an 8-bit domain value, an 8-bit area value, and an 8-bit port value. The FCID is sometimes called an N_Port ID.</p> <p>See also <i>N_Port ID</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Fibre Channel over Ethernet (FCoE)                        | <p>Standard for transporting FC frames over Ethernet networks. FCoE encapsulates Fibre Channel frames in Ethernet so that the same high-speed Ethernet physical infrastructure can transport both data and storage traffic while preserving the lossless CoS that FC requires. FCoE has its own EtherType (0x8906) to differentiate it from other Ethernet traffic.</p> <p>FCoE runs on a DCB network. FCoE servers connect to a switch that supports both FCoE and native FC protocols. This allows FCoE servers on the Ethernet network to access FC storage devices in the SAN fabric on one converged network.</p> <p>See also <i>data center bridging (DCB)</i>.</p>                                                                                                                                                                                                                                                                             |

Table 313: Fibre Channel Terms (*continued*)

| Term                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fibre Channel services      | Functions required for establishing FC network connectivity among devices and for managing devices on the FC network, such as login servers, domain managers, name servers, and zone servers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| FC stack                    | <p>FC or FCoE protocol capability implemented on a device to support the FC or FCoE functionality. Having an FC stack does not imply consuming a domain ID.</p> <p>Each FC or FCoE enabled server or storage device has an FC stack. Similarly, an FC or FCoE switch, an FCF, an FCoE-FC gateway, and an FCoE transit switch have FC stacks.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| Fibre Channel switch        | Network switch that implements the Fibre Channel protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| FIP discovery advertisement | <p>Multicast or unicast message that the FC switch (or FCF) transmits to ENodes to advertise the switch's presence on the network so that ENodes can discover the switch and request to log in to the FC fabric.</p> <p>The FC switch periodically sends multicast FIP discovery advertisements to the ALL-ENode-MACs address, a well-known address to which all ENodes listen. The multicast messages advertise the FC switch to all ENodes on the VLAN and serve as keepalive messages to maintain connectivity between the FC switch and ENodes.</p> <p>When an ENode sends a FIP discovery solicitation message to the FC switch, the FC switch responds with a unicast FIP discovery advertisement to that ENode.</p> |
| FIP discovery solicitation  | <p>Multicast or unicast message that an ENode transmits to FC switches (or FCFs) to find compatible switches in the network.</p> <p>When an ENode initializes, it sends a multicast FIP discovery solicitation to the ALL-FCF-MACs address, a well-known address to which all FC switches and FCFs listen. Compatible switches reply with a unicast FIP discovery advertisement.</p> <p>The ENode compiles a list of compatible switches, selects a switch, and logs in to that switch.</p>                                                                                                                                                                                                                                |
| FIP keepalive               | Periodic multicast FIP discovery advertisement sent from the FC switch or FCF to all ENodes to maintain connectivity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 313: Fibre Channel Terms (*continued*)

| Term                   | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIP snooping           | <p>For VN_Port to VF_Port (VN2VF) paths (Technical Committee T11 BB-FC-5 specification), FIP snooping is a security feature enabled for FCoE VLANs on an Ethernet switch that connects ENodes to FC switches or FCFs. FIP snooping inspects data in FIP frames and uses that data to create firewall filters. The filters permit only traffic from sources that perform a successful FLOGI to the FC switch. All other traffic on the VLAN is denied. FIP snooping filters are installed on the ports in the FCoE VLAN.</p> <p>For VN_Port to VN_Port (VN2VN) paths (Technical Committee T11 BB-FC-6 specification), the FIP snooping security feature filters access between VN_Ports in a similar manner to VN2VF_Port FIP snooping.</p> <p>FIP snooping can also apply similarly to VE_Port to VE_Port (VE2VE) paths.</p> <p>FIP snooping can also snoop to provide additional visibility of FCoE Layer 2 operation.</p> <p>See also <i>FCoE node (ENode)</i>.</p> |
| FIP snooping bridge    | See <i>FCoE transit switch</i> and <i>FIP snooping</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| host bus adapter (HBA) | Physical mechanism that connects a host system to other FC network and storage devices. HBAs have a unique worldwide node name (WWNN) for the HBA node, which all of the ports on the HBA share, and each port on an HBA has a unique worldwide port name (WWPN).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| initiator              | System component that originates an I/O command over an I/O bus or network. An FCoE server sending a request to an FC storage device is an example of an initiator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| iSCSI transit switch   | <p>Layer 2 Ethernet switch with a minimum set of best-practice Ethernet features to support iSCSI, along with optional enhancements. Minimum feature support is:</p> <ul style="list-style-type: none"> <li>• IEEE 802.3X asymmetric and symmetric flow control on ports not running in DCB mode</li> <li>• Priority-based flow control (PFC)</li> <li>• Enhanced transmission selection (ETS)</li> <li>• Data Center Bridging Capability Exchange Protocol (DCBX), including the iSCSI application TLV</li> </ul> <p>Other capabilities such as Internet storage name service (iSNS) are optional.</p>                                                                                                                                                                                                                                                                                                                                                               |
| interswitch link (ISL) | Link between the <i>E_Ports</i> of two FC switches in a common FC fabric. When two FCoE-based FC switches are connected together, there is a virtual ISL through Layer 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| logout (LOGO)          | <p>For FC devices, an N_Port logs out from the FC network by sending an FC LOGO message to the F_Port of an FC switch. The switch can also send a LOGO message to an N_Port to terminate its connection.</p> <p>For FCoE devices, a VN_Port logs out from the FC network by sending a FIP LOGO message to the VF_Port of an FC switch. The switch can also send a LOGO message to a VN_Port to terminate its connection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 313: Fibre Channel Terms (*continued*)

| Term                            | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lossless Ethernet MAC           | <p>Full-duplex Ethernet MAC that implements Ethernet extensions to avoid Ethernet frame loss due to congestion and supports at least 2.5-KB jumbo frames. Each lossless Ethernet MAC combines with an FCoE Controller to perform FCoE termination functions on an ENode.</p> <p>See also <i>priority-based flow control (PFC)</i>, <i>quantized congestion notification (QCN)</i>, <i>FCoE controller</i>, and <i>FCoE node (ENode)</i>.</p>                                                                                                                                                                                                                                                                                                                 |
| lossless Ethernet network       | Ethernet network composed of only full-duplex links and lossless Ethernet MACs and with CoS and flow control to prevent dropping of frames.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| lossless transport              | In DCB networks, the ability to switch FCoE frames over an Ethernet network without dropping any frames. Lossless transport uses mechanisms such as priority-based flow control and quantized congestion notification to control traffic flows and avoid congestion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| N_Port ID                       | See <i>Fibre Channel ID (FCID)</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| N_Port ID virtualizer           | <p>Presents itself as an FC or FCoE switch to external devices, but connects to an actual FC or FCoE switch in the other direction to provide the FC-SW services.</p> <p>An N_Port ID virtualizer logs in to the actual FC or FCoE switch in the same way as a normal node device and uses the NPIV mechanism to proxy incoming FLOGIs to FDISCs on the actual FC or FCoE switch.</p> <p>An N_Port ID virtualizer has an FC stack even though it is not an FC switch or an FCF.</p> <p>The acronym <i>NPV</i> is commonly used for N_Port ID virtualizer even though the acronym is not defined in the standards.</p>                                                                                                                                        |
| N_Port ID Virtualization (NPIV) | <p>NPIV enables a physical N_Port to acquire multiple N_Port IDs. Each N_Port ID maps to a different application (such as a virtual machine) or to a different user. This allows you to associate one F_Port with many N_Port IDs and create multiple discrete, secure virtual links over one physical point-to-point connection.</p> <p>NPIV increases resource and bandwidth utilization and allows the implementation of access control, zoning, and port security on a per-application or per-user basis.</p> <p>After an N_Port performs a FLOGI and receives its first N_Port ID, it can request more N_Port IDs by sending FDISC messages.</p> <p>See also <i>fabric login (FLOGI)</i>, <i>fabric discovery (FDISC)</i>, and <i>virtual link</i>.</p> |

Table 313: Fibre Channel Terms (*continued*)

| Term                              | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node port (N_Port)                | <p>N_Ports can be in two modes:</p> <ul style="list-style-type: none"> <li>Fabric N_Port—Node port that is an FC host or storage device end port in a point-to-point link between the device and the F_Port of an FC switch. The point-to-point link can be virtual or physical.</li> <li>Point-to-point N_Port—Node port that connects to another N_Port. The QFX3500 switch does not support this configuration.</li> </ul> <p>N_Ports handle creation, detection, and flow of messages to and from the connected devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| node worldwide name (NWWN)        | WWN that is unique worldwide and is assigned to an FC node. An NWWN is valid for multiple ports that are on that node (this identifies the ports as network interfaces of a particular node).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| port mode                         | <p>Role that the port plays in the FC fabric (endpoint device, FC switch connection to endpoint devices, interswitch link).</p> <p>See also <i>node port (N_Port)</i>, <i>virtual node port (VN_Port)</i>, <i>proxy node port (NP_Port)</i>, <i>fabric port (F_Port)</i>, and <i>virtual fabric port (VF_Port)</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| port worldwide name (PWWN)        | WWN that is unique worldwide and is assigned to an FC port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| priority-based flow control (PFC) | <p>Link-level flow control mechanism defined by IEEE 802.1Qbb that allows independent flow control for each class of service (as defined in the 3-bit CoS field of the Ethernet header by IEEE 802.1Q tags) to ensure that no frame loss from congestion occurs in DCB networks.</p> <p>PFC is an enhancement of the Ethernet PAUSE mechanism, but PFC controls classes of flows, whereas Ethernet PAUSE indiscriminately pauses all of the traffic on a link. With PFC, a receiving device can signal a transmitting device to pause transmission based on traffic class.</p> <p>PFC provides application-specific bandwidth reservations so you can ensure that time-critical protocols and applications such as FCoE receive the priority necessary to prevent frame loss. PFC allows the same physical link to carry FCoE traffic and provide lossless service while also carrying loss-tolerant Ethernet traffic.</p> <p>See also <i>Ethernet PAUSE</i>.</p> |
| proxy gateway mode                | Connects FCoE initiators to FC switches in a converged Ethernet and Fibre Channel network and acts as an intermediary for these devices. The FCoE-FC gateway represents and acts for the FCoE initiators in transactions from the FCoE initiators destined for an FC switch, including converting FIP and FCoE frames to FC frames. The gateway represents and acts for an FC switch in transactions from the FC switch destined for an FCoE initiator, including converting FC frames to FIP frames and encapsulating FC frames in Ethernet.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| proxy node port (NP_Port)         | N_Port on the QFX Series that performs proxy functions when it is configured as an FCoE-FC gateway. The NP_Port acts as a proxy for the FCoE device VN_Ports in transactions with the FC switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 313: Fibre Channel Terms (*continued*)

| Term                                    | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| quantized congestion notification (QCN) | Mechanism defined by IEEE 802.1Qau that manages network congestion within a Layer 2 domain. When a queue reaches a configured threshold, QCN throttles traffic at the source of the congestion by transmitting messages that propagate back to the source and temporarily stop the source from transmitting. When the queue crosses the threshold that indicates the congestion has dissipated, QCN sends a message to allow the source to resume transmitting frames. |
| session                                 | Fabric login (FLOGI) or fabric discovery (FDISC) login to the FC SAN fabric. Session does not refer to end-to-end server-to-storage sessions.                                                                                                                                                                                                                                                                                                                          |
| server-provided MAC address (SPMA)      | <p>MAC address that an ENode assigns to one of its ENode MACs and is not assigned to any other ENode MAC in the same FCoE VLAN. An SPMA can be associated with more than one VN_Port at that ENode MAC.</p> <p>The QFX Series does not support SPMA.</p> <p>See also <i>ENode MAC</i> and <i>fabric-provided MAC address (FPMA)</i>.</p>                                                                                                                               |
| storage area network (SAN)              | Network whose primary purpose is the transfer of data between computer systems and storage devices. This term is most commonly used in the context of any network that supports block storage, usually iSCSI, FC, and FCoE networks.                                                                                                                                                                                                                                   |
| target                                  | System component that receives an I/O command. An FC storage device that receives a request from a server is an example of a target.                                                                                                                                                                                                                                                                                                                                   |
| VE_Port                                 | Virtual ports created to form a connection (an <i>interswitch link</i> ) between two FCoE-based FC switches as part of a common FC fabric.                                                                                                                                                                                                                                                                                                                             |
| VE2VE (VE_Port to VE_Port)              | The <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification capability of FCFs to connect to each other as a single FCoE FC SAN.                                                                                                                                                                                                                                                                                                                            |
| VN2VF (VN_Port to VF_Port)              | The <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification capability of an ENode to connect to an FCF or to an FCoE-enabled FC SAN.                                                                                                                                                                                                                                                                                                                       |
| VN2VN (VN_Port to VN_Port)              | The <i>Fibre Channel Backbone - 6 (FC-BB-6)</i> specification capability of an ENode to connect directly over Layer 2 to another ENode without the need of any FC-related services. This capability is most often used in small-scale FCoE SANs.                                                                                                                                                                                                                       |
| virtual fabric port (VF_Port)           | <p>Data-forwarding component that emulates an F_Port. A VF_Port is dynamically instantiated on successful completion of a FIP FLOGI exchange and connects to one or more VN_Ports. The term <i>virtual</i> indicates the use of a non-FC link such as an FCoE link.</p> <p>See also <i>fabric port (F_Port)</i>.</p>                                                                                                                                                   |
| virtual link                            | <p>Logical link connecting two FCoE Link End Points (LEPs) over a lossless Ethernet network, for example, the link between a VF_Port and a VN_Port. The MAC addresses of the two LEPs identifies a virtual link.</p> <p>See also <i>FCoE link end point (LEP)</i> and <i>lossless Ethernet network</i>.</p>                                                                                                                                                            |

Table 313: Fibre Channel Terms (*continued*)

| Term                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| virtual node port (VN_Port) | <p>Data-forwarding component that emulates an N_Port. With FCoE, a VN_Port is dynamically instantiated on successful completion of a FIP FLOGI exchange and connects to one or more VF_Ports. The term <i>virtual</i> indicates the use of a non-FC link such as an FCoE link.</p> <p>VN_Port is also used for the virtual N_Ports created in both FC and FCoE when additional NPIV-based logins occur over a previously created N_Port-to-VN_Port or N_Port-to-VF_Port connection.</p> <p>See also <i>node port (N_Port)</i>.</p> |
| well-known address (WKA)    | <p>Address identifier used to access a service provided by an FC fabric. The service can be distributed in many elements throughout a fabric, or it can be centralized in one element. A WKA is always accessible, regardless of zoning. An example of a WKA is the <i>ALL-FCF-MACs</i> address to which all FCFs listen.</p>                                                                                                                                                                                                      |
| worldwide name (WWN)        | <p>64-bit identifier that is similar to a MAC address except that it is not used for forwarding. It uniquely identifies an FC device. The WWN is derived from the IEEE organizationally unique identifier (OUI) and vendor-supplied information. A WWN is unique worldwide.</p>                                                                                                                                                                                                                                                    |
| worldwide node name (WWNN)  | <p>See <i>node worldwide name (NWWN)</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| worldwide port name (WWPN)  | <p>See <i>port worldwide name (PWWN)</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric

To transmit Fibre Channel (FC) traffic between FCoE devices and a storage area network (SAN) FC switch, you configure a local FC fabric on the gateway. The gateway FC fabric includes FCoE and native FC interfaces, and a VLAN to carry FCoE traffic from FCoE-capable devices. The gateway FC fabric creates the path between the FCoE devices and the SAN.

This example describes how to configure the interfaces, VLAN, and FC fabric to connect FCoE devices to the FC switch and route traffic between the VLAN and FC interfaces:

## Requirements

---

This example uses the following hardware and software components:

- A configured and provisioned Juniper Networks QFX3500 Switch to act as an FCoE-FC gateway
- FCoE-capable devices in an Ethernet network equipped with converged network adapters (CNAs)
- An FC switch to transmit and receive native FC traffic
- FC storage devices in the SAN
- Junos OS Release 11.1 or later for the QFX Series

## Overview

---

No interfaces are configured for FC network connectivity by default. You need to configure the FC fabric and its interfaces explicitly. Each FC fabric consists of a combination of at least one FCoE VLAN interface between the FCoE-FC gateway and the FCoE devices, and one or more native FC interfaces between the FCoE-FC gateway and the FC switch.

An FCoE VLAN interface connects the FCoE-FC gateway to FCoE devices. FCoE traffic between the devices and the FCoE-FC gateway requires a dedicated VLAN used only for FCoE traffic. You cannot mix standard Ethernet traffic and FCoE traffic on the FCoE VLAN.

**NOTE:** IGMP snooping is not supported on FCoE VLANs. Disable IGMP snooping on FCoE VLANs.

Disable storm control on all Ethernet interfaces that belong to the FCoE VLAN to prevent FCoE traffic from being dropped. Configuring storm control on an Ethernet interface and including that interface in an FCoE-FC gateway may have undesirable effects, including FCoE packet loss. After disabling storm control on all interfaces, enable storm control on any interfaces that are not part of an FCoE-FC gateway on which you want to use storm control.

When FCoE frames enter the FCoE-FC gateway, the gateway:

1. Strips the Ethernet encapsulation from the FCoE frames.
2. Sends the resulting native FC frames to the FC switch through the gateway's native FC interfaces.

Each FC interface and FCoE VLAN interface can belong to only one FC fabric. Different FC fabrics must use different native FC interfaces and different FCoE VLAN interfaces. Multiple FC fabrics on the FCoE-FC gateway can connect to the same FC switch, but they must use different FC interfaces and different FCoE VLAN interfaces.

The Ethernet interfaces that belong to the FCoE VLAN should be configured in tagged-access port mode and must include the native VLAN because FIP VLAN discovery and notification frames are exchanged as untagged packets. These Ethernet interfaces

require a maximum transmission unit (MTU) size of at least 2180 bytes to accommodate the FC payload and FCoE encapsulation. (Sometimes the MTU is rounded up to 2500 bytes. If larger frames are expected on the interface, set the MTU size accordingly.)

This example shows a simple configuration to illustrate the basic steps for creating:

- The FCoE-device-facing VLAN and its 10-Gigabit Ethernet interfaces
- The VLAN interface
- The FC-switch-facing native FC interfaces
- One FC fabric on the FCoE-FC gateway

Configuring these elements results in traffic being routed between the VLAN and FC interfaces, thus connecting the FCoE devices to the FC switch through the FCoE-FC gateway.

A VLAN called **blue** transports FCoE traffic between FCoE devices and the FCoE-FC gateway using an FCoE VLAN interface called **vlan.100**. The FCoE-FC gateway's **vlan.100** interface presents an F\_Port interface to the FCoE devices on the VLAN. For each FCoE device ENode that logs in to the FCoE-FC gateway, the gateway instantiates a virtual F\_Port (VF\_Port) interface. This creates a virtual link between the ENode VN\_Port and the FCoE-FC gateway. The FCoE-FC gateway's native FC interfaces transport FC traffic between the gateway and the FC switch.

Configuring both the FCoE VLAN interface and the native FC interfaces as part of a gateway fabric associates them in the switch and makes the connection between the FCoE servers and the FC switch.

### Topology

The topology for this example consists of one QFX3500 switch with FC-capable ports to connect to the FC switch and with Ethernet ports in tagged-access mode to connect to the FCoE devices. [Table 314 on page 4497](#) and [Figure 170 on page 4498](#) show the configuration components of this example.

**Table 314: Components of the Fibre Channel Interface Configuration Topology**

| Property                  | Settings                                                                     |
|---------------------------|------------------------------------------------------------------------------|
| Switch hardware           | QFX3500 switch in gateway mode                                               |

| Fibre Channel fabric <b>fcproxy1</b> | <p>Fabric type: <b>proxy</b></p> <p>Fabric ID: <b>1</b></p> <p>FC interfaces: <b>fc-0/0/0</b>, <b>fc-0/0/1</b>, <b>fc-0/0/2</b>, <b>fc-0/0/3</b>, <b>fc-0/0/4</b>, <b>fc-0/0/5</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Figure 170: Fibre Channel Interface Configuration Topology

g040587

This configuration example creates a VLAN for FCoE traffic and routes its traffic to an FCoE VLAN interface that is part of the FC fabric. It also creates the FC interfaces needed to connect to the FC switch.

To set up FC interfaces and FCoE VLAN interfaces:

- Configure a VLAN to use as a dedicated FCoE VLAN:
  - Configure the interfaces the FCoE VLAN uses as Ethernet switching interfaces in tagged-access port mode.
  - Disable storm control on the interfaces.
  - Configure the interfaces the FCoE VLAN uses with the native VLAN.
  - Configure the FCoE VLAN to use the desired Ethernet interfaces.
  - Disable IGMP snooping on the FCoE VLAN. (IGMP snooping is enabled by default on all VLANs, but is not supported on FCoE VLANs).
- Configure the FCoE VLAN interface.
- Define the interface for the FCoE VLAN (associate the VLAN with the FCoE VLAN interface).
- Configure the physical FC interfaces (either one or two 6-port blocks) that connect to the FC switch.
- Configure the logical FC interfaces that connect to the FC switch.
- Configure the FCoE-FC gateway fabric:
  - Configure the fabric ID.
  - Configure the fabric as a proxy fabric.
  - Add the FCoE VLAN interface and the native FC interfaces to the fabric.

To keep the example simple, the configuration steps show six Ethernet interfaces in the FCoE VLAN and six native FC interfaces in the FC fabric. Use the same configuration procedure to add more interfaces to the FCoE VLAN or to the FC fabric.

### Configuration

#### CLI Quick Configuration

To quickly configure FCoE and native FC interfaces on an FCoE-FC gateway and route traffic between the FCoE VLAN and FC interfaces, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans blue vlan-id 100
set vlans native vlan-id 1
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/7 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/8 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode tagged-access vlan members blue
```

```

set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access vlan members
blue
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode tagged-access vlan members
blue
set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/7 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/8 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/9 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/11 unit 0 family ethernet-switching native-vlan-id 1
set interfaces xe-0/0/6 mtu 2180
set interfaces xe-0/0/7 mtu 2180
set interfaces xe-0/0/8 mtu 2180
set interfaces xe-0/0/9 mtu 2180
set interfaces xe-0/0/10 mtu 2180
set interfaces xe-0/0/11 mtu 2180
delete ethernet-switching-options storm-control interface all
set vlans blue interface xe-0/0/6.0
set vlans blue interface xe-0/0/7.0
set vlans blue interface xe-0/0/8.0
set vlans blue interface xe-0/0/9.0
set vlans blue interface xe-0/0/10.0
set vlans blue interface xe-0/0/11.0
set protocols igmp-snooping vlan blue disable
set interfaces vlan unit 100 family fibre-channel port-mode f-port
set vlans blue l3-interface vlan.100
set chassis fpc 0 pic 0 fibre-channel port-range 0 5
set interfaces fc-0/0/0 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/1 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/2 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/3 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/4 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/5 unit 0 family fibre-channel port-mode np-port
set interfaces fc-0/0/0 fibrechannel-options speed 4g
set interfaces fc-0/0/1 fibrechannel-options speed 4g
set interfaces fc-0/0/2 fibrechannel-options speed 4g
set interfaces fc-0/0/3 fibrechannel-options speed 4g
set interfaces fc-0/0/4 fibrechannel-options speed 4g
set interfaces fc-0/0/5 fibrechannel-options speed 4g
set fc-fabrics fcproxy1 fabric-id 1
set fc-fabrics fcproxy1 fabric-type proxy
set fc-fabrics fcproxy1 interface vlan.100
set fc-fabrics fcproxy1 interface fc-0/0/0.0
set fc-fabrics fcproxy1 interface fc-0/0/1.0
set fc-fabrics fcproxy1 interface fc-0/0/2.0
set fc-fabrics fcproxy1 interface fc-0/0/3.0
set fc-fabrics fcproxy1 interface fc-0/0/4.0
set fc-fabrics fcproxy1 interface fc-0/0/5.0

```

#### Step-by-Step Procedure

Configure FCoE and FC interfaces in an FCoE-FC gateway FC fabric and set up traffic routing between the FCoE VLAN and FC interfaces:

1. Configure the VLAN for FCoE traffic:  

```
[edit vlans]
user@switch# set blue vlan-id 100
```
2. Configure the native VLAN:  

```
[edit vlans]
user@switch# set native vlan-id 1
```

3. Configure the Ethernet interfaces for the FCoE VLAN in tagged-access mode and as members of the FCoE VLAN (VLAN blue):

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
user@switch# set xe-0/0/7 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
user@switch# set xe-0/0/8 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
user@switch# set xe-0/0/9 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
user@switch# set xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
user@switch# set xe-0/0/11 unit 0 family ethernet-switching port-mode tagged-access
vlan members blue
```

4. Configure the native VLAN on the Ethernet interfaces in the FCoE VLAN:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/7 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/8 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/9 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
user@switch# set xe-0/0/11 unit 0 family ethernet-switching native-vlan-id 1
```

5. Set the MTU to 2180 for each Ethernet interface:

```
[edit interfaces]
user@switch# set xe-0/0/6 mtu 2180
user@switch# set xe-0/0/7 mtu 2180
user@switch# set xe-0/0/8 mtu 2180
user@switch# set xe-0/0/9 mtu 2180
user@switch# set xe-0/0/10 mtu 2180
user@switch# set xe-0/0/11 mtu 2180
```

6. Disable storm control on all interfaces (afterward, be sure to enable storm control on any interfaces on which you want to use storm control):

```
delete ethernet-switching-options storm-control interface all
```

7. Assign the Ethernet interfaces to the FCoE VLAN:

```
[edit vlans blue interface]
user@switch# set xe-0/0/6.0
user@switch# set xe-0/0/7.0
user@switch# set xe-0/0/8.0
user@switch# set xe-0/0/9.0
user@switch# set xe-0/0/10.0
user@switch# set xe-0/0/11.0
```

8. Disable IGMP snooping on the FCoE VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan blue disable
```

9. Configure the FCoE VLAN interface and port mode for the FCoE traffic:

```
[edit interfaces]
user@switch# set vlan unit 100 family fibre-channel port-mode f-port
```

10. Define the FCoE VLAN interface as the interface for the FCoE VLAN:

```
[edit vlans]
user@switch# set blue l3-interface vlan.100
```

11. Configure the physical FC interfaces the fabric uses to connect to the FC switch:

```
[edit chassis fpc 0 pic 0]
user@switch# set fibre-channel port-range 0 5
```

**NOTE:** When you configure ports as FC ports, the port designation changes from xe-n/n/n.n format to fc-n/n/n.n format to indicate that the interface is an FC interface. FC interfaces do not support 10-Gbps interface speed but instead conform to FC interface speeds of 2 Gbps, 4 Gbps, or 8 Gbps.

12. Configure the native FC interfaces and port mode:

```
[edit interfaces]
user@switch# set fc-0/0/0 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/1 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/2 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/3 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/4 unit 0 family fibre-channel port-mode np-port
user@switch# set fc-0/0/5 unit 0 family fibre-channel port-mode np-port
```

13. Configure the native FC interface port speed:

```
[edit interfaces]
user@switch# set fc-0/0/0 fibrechannel-options speed 4g
user@switch# set fc-0/0/1 fibrechannel-options speed 4g
user@switch# set fc-0/0/2 fibrechannel-options speed 4g
user@switch# set fc-0/0/3 fibrechannel-options speed 4g
user@switch# set fc-0/0/4 fibrechannel-options speed 4g
user@switch# set fc-0/0/5 fibrechannel-options speed 4g
```

14. Configure the FC fabric name and unique ID:

```
[edit fc-fabrics]
user@switch# set fcproxy1 fabric-id 1
```

15. Define the FC fabric as an FCoE-FC gateway:

```
[edit fc-fabrics]
user@switch# set fcproxy1 fabric-type proxy
```

16. Assign the FCoE VLAN interface to the fabric:

```
[edit fc-fabrics]
user@switch# set fcproxy1 interface vlan.100
```

17. Assign the native FC interfaces to the fabric:

```
[edit fc-fabrics]
user@switch# set fcproxy1 interface fc-0/0/0.0
user@switch# set fcproxy1 interface fc-0/0/1.0
user@switch# set fcproxy1 interface fc-0/0/2.0
user@switch# set fcproxy1 interface fc-0/0/3.0
user@switch# set fcproxy1 interface fc-0/0/4.0
user@switch# set fcproxy1 interface fc-0/0/5.0
```

**Results** Display the results of the configuration:

```
user@switch> show configuration

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command and then copy the hierarchy and paste it into the switch terminal window.

## Verification

To verify that the native FC interfaces and FCoE VLAN interface have been created, added to the FC fabric, and are operating properly, perform these tasks:

- [Verifying That the Native FC Interfaces and the FCoE VLAN Interface Have Been Created on page 4506](#)
- [Verifying That the FCoE VLAN Includes the Correct Ethernet Interfaces on page 4507](#)
- [Verifying That the FC Fabric Includes the Correct Interfaces on page 4507](#)
- [Verifying Native FC Interface Operation on page 4508](#)
- [Verifying That IGMP Snooping Has Been Disabled on the FCoE VLAN on page 4508](#)

### *Verifying That the Native FC Interfaces and the FCoE VLAN Interface Have Been Created*

**Purpose** Verify that the six native FC interfaces and the FCoE VLAN interface have been created on the switch and are configured in the correct mode.

**Action** List all of the FC interfaces configured on the switch using the `show fibre-channel interfaces` command:

```
user@switch> show fibre-channel interfaces
```

| Interface  | Idx | Type | Native    |      | Config Mode | Oper Mode | State |
|------------|-----|------|-----------|------|-------------|-----------|-------|
|            |     |      | Fabric-id | NPIV |             |           |       |
| fc-0/0/0.0 | 70  | FC   | 1         | YES  | NP          | NP        | up    |
| fc-0/0/1.0 | 71  | FC   | 1         | YES  | NP          | NP        | up    |
| fc-0/0/2.0 | 72  | FC   | 1         | YES  | NP          | NP        | up    |
| fc-0/0/3.0 | 73  | FC   | 1         | YES  | NP          | NP        | up    |
| fc-0/0/4.0 | 74  | FC   | 1         | YES  | NP          | NP        | up    |
| fc-0/0/5.0 | 75  | FC   | 1         | YES  | NP          | NP        | up    |
| vlan.100   | 67  | FCOE | 1         | YES  | F           | F         | up    |

**Meaning** The `show fibre-channel interfaces` command lists all native FC interfaces and FCoE VLAN interfaces configured on the switch. The command output shows that the FC interfaces `fc-0/0/0.0`, `fc-0/0/1.0`, `fc-0/0/2.0`, `fc-0/0/3.0`, `fc-0/0/4.0`, and `fc-0/0/5.0` have been created and that those six interfaces:

- Are native Fibre Channel interfaces (type FC).
- Belong to the FC fabric with a configured fabric ID of 1.
- Are capable of N\_Port ID virtualization (NPIV).

- Have a configured mode and an operational mode of proxy N\_Port (**NP**), which means that they should be connected to an FCF or an FC switch, not to an FCoE device, and that they carry native FC traffic.
- Show an operational state of **up**.

The command output also shows that the FCoE VLAN interface **vlan.100** has been created and that interface:

- Is an FCoE VLAN interface (type **FCOE**).
- Belongs to the FC fabric with a configured fabric ID of 1.
- Is capable of N\_Port ID virtualization (NPIV).
- Has a configured mode and an operational mode of F\_Port (**F**), which means that its interfaces connect to FCoE devices and carry FCoE traffic.
- Shows an operational state of **up**.

#### *Verifying That the FCoE VLAN Includes the Correct Ethernet Interfaces*

**Purpose** Verify that the FCoE VLAN **blue** has been created with the correct VLAN tag (**100**) and with the correct Ethernet interfaces.

**Action** List all of the interfaces configured on the switch in VLAN **blue** using the **show vlans** command:

```
user@switch> show vlans blue
Name      Tag      Interfaces
blue      100
          xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0, xe-0/0/10.0
          xe-0/0/11.0
```

**Meaning** The **show vlans blue** command lists the interfaces that are members of the FCoE VLAN **blue**. The command output shows that the **blue** VLAN has a tag ID of 100 and includes the interfaces **xe-0/0/6.0**, **xe-0/0/7.0**, **xe-0/0/8.0**, **xe-0/0/9.0**, **xe-0/0/10.0**, and **xe-0/0/11.0**.

#### *Verifying That the FC Fabric Includes the Correct Interfaces*

**Purpose** Verify that the FC fabric configuration is configured on the switch with the correct native FC and FCoE VLAN interfaces.

**Action** List all of the interfaces configured on FC fabrics on the switch using the **show fibre-channel fabric** command:

```
user@switch> show fibre-channel fabric
Name      Fabric-id  Type      Interfaces
fcproxy1  1          PROXY
          fc-0/0/0.0
          fc-0/0/1.0
          fc-0/0/2.0
          fc-0/0/3.0
          fc-0/0/4.0
```

```
fc-0/0/5.0
vlan.100
```

**Meaning** The **show fibre-channel fabric** command lists the interfaces that are members of each FC fabric. The command output shows that the only fabric configured on the switch is named **fcproxy1**, has a fabric-id of 1, and is a **proxy** fabric in an FCoE-FC gateway. The command output also shows that the native FC interfaces **fc-0/0/0.0**, **fc-0/0/1.0**, **fc-0/0/2.0**, **fc-0/0/3.0**, **fc-0/0/4.0**, and **fc-0/0/5.0**, and the FCoE VLAN interface **vlan.100** belong to **fcproxy1**.

#### *Verifying Native FC Interface Operation*

**Purpose** Verify that the native FC interfaces are online and display the number of FC sessions on each interface.

**Action** List all of the native FC NP\_Port interface states and sessions by FC fabric using the **show fibre-channel proxy np-port** command:

```
user@switch> show fibre-channel proxy np-port
Fabric: fcproxy1, Fabric-id: 1
```

| NP-Port    | State  | Sessions | LB state | LB weight |
|------------|--------|----------|----------|-----------|
| fc-0/0/0.0 | online | 3        | ON       | 4         |
| fc-0/0/1.0 | online | 3        | ON       | 4         |
| fc-0/0/2.0 | online | 2        | ON       | 4         |
| fc-0/0/3.0 | online | 2        | ON       | 4         |
| fc-0/0/4.0 | online | 2        | ON       | 4         |
| fc-0/0/5.0 | online | 2        | ON       | 4         |

**Meaning** The **show fibre-channel proxy np-port** command lists the interfaces that are configured as native FC proxy N\_Port interfaces. The command output shows:

- The fabric name is **fcproxy1** and its fabric ID is 1.
- The interfaces are **online**.
- The number of FC sessions (virtual links) running on each interface.
- The load-balancing (LB) state is **ON** for all of the interfaces.
- The LB weight reflects the port speed of each interface, which is 4 Gbps.

#### *Verifying That IGMP Snooping Has Been Disabled on the FCoE VLAN*

**Purpose** Verify that IGMP snooping is disabled on the FCoE VLAN.

**Action** List the IGMP snooping protocol information for the FCoE VLAN using the **show configuration protocols igmp-snooping vlan blue** command:

```
user@switch> show configuration protocols igmp-snooping vlan blue
disable;
```

**Meaning** The **show configuration protocols igmp-snooping vlan blue** command lists the IGMP snooping configuration for the FCoE VLAN. The command output shows that IGMP snooping is disabled on the FCoE VLAN.

**Example: Configuring CoS PFC for FCoE Traffic**

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

This example describes how to configure PFC for FCoE traffic:

- [Requirements on page 4510](#)
- [Overview on page 4510](#)
- [Configuration on page 4511](#)
- [Verification on page 4515](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).
- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

### Topology

[Table 315 on page 4510](#) shows the configuration components for this example.

**Table 315: Components of the PFC for FCoE Traffic Configuration Topology**

| Component | Settings       |
|-----------|----------------|
| Hardware  | QFX3500 switch |

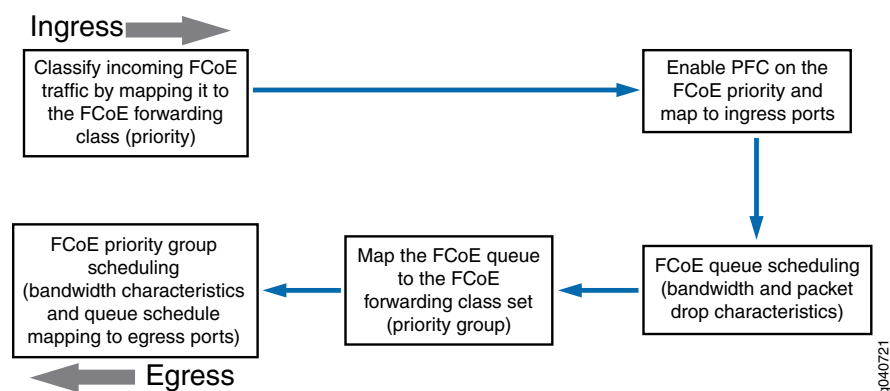

Table 315: Components of the PFC for FCoE Traffic Configuration Topology (*continued*)

Figure 171 on page 4511 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 171: PFC for FCoE Traffic Configuration Components Block Diagram

### Configuration

#### CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network

configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

#### Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority
low code-points 011
```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point 011:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```

3. Apply the PFC configuration to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
```

4. Assign the classifier to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
```

5. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

6. Map the FCoE forwarding class to the FCoE scheduler:
 

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```
7. Configure the forwarding class set for the FCoE traffic:
 

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
8. Define the traffic control profile for the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:
 

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

### Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 fcoe-classifier {
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
  }
}
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 30000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
```

```
    }
  }
}
interfaces {
  xe-0/0/31 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {

        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
  xe-0/0/34 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-classifier;
      }
    }
  }
}
```

```

    }
  }
  scheduler-maps {
    fcoe-map {
      forwarding-class fcoe scheduler fcoe-sched;
    }
  }
  schedulers {
    fcoe-sched {
      transmit-rate 3000000000;
      shaping-rate percent 100;
      priority low;
    }
  }
}

```

**TIP:** To quickly configure the interfaces, issue the load merge terminal command and then copy the hierarchy and paste it into the switch terminal window.

## Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- [Verifying That Priority-Based Flow Control Has Been Enabled on page 4515](#)
- [Verifying the Ingress Interface PFC Configuration on page 4516](#)

### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE queue to enable lossless transport.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: fcoe-cnp, Index: 51697
```

```
Cable Length: 100 m
```

| Priority | PFC      | MRU  |
|----------|----------|------|
| 000      | Disabled |      |
| 001      | Disabled |      |
| 010      | Disabled |      |
| 011      | Enabled  | 2500 |
| 100      | Disabled |      |
| 101      | Disabled |      |
| 110      | Disabled |      |
| 111      | Disabled |      |

```
Type: Output
```

| Priority | Flow-Control-Queues |
|----------|---------------------|
| 000      | 0                   |
| 001      | 1                   |
| 010      | 2                   |

|     |   |
|-----|---|
| 011 | 3 |
| 100 | 4 |
| 101 | 5 |
| 110 | 6 |
| 111 | 7 |

**Meaning** The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point 011 for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### *Verifying the Ingress Interface PFC Configuration*

**Purpose** Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

**Action** List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
```

```
    }
}
```

**Meaning** The **show configuration class-of-service interfaces** commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

### Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX3500 switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX3500 switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

**NOTE:** This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX3500 switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX3500 switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see [“Example: Configuring Multichassis Link Aggregation” on page 1958](#). However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX3500 Node devices support MC-LAGs. QFabric system Node devices do not support MC-LAGs.

This topic describes:

- [Requirements on page 4518](#)
- [Overview on page 4518](#)

- [Configuration on page 4523](#)
- [Verification on page 4531](#)

---

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode, and connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

---

## Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).
- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

This example does not show how to configure the MC-LAG itself. This example does include a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

### **Topology**

QFX3500 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in [Figure 172 on page 4519](#):

Figure 172: Supported Topology for an MC-LAG on an FCoE Transit Switch

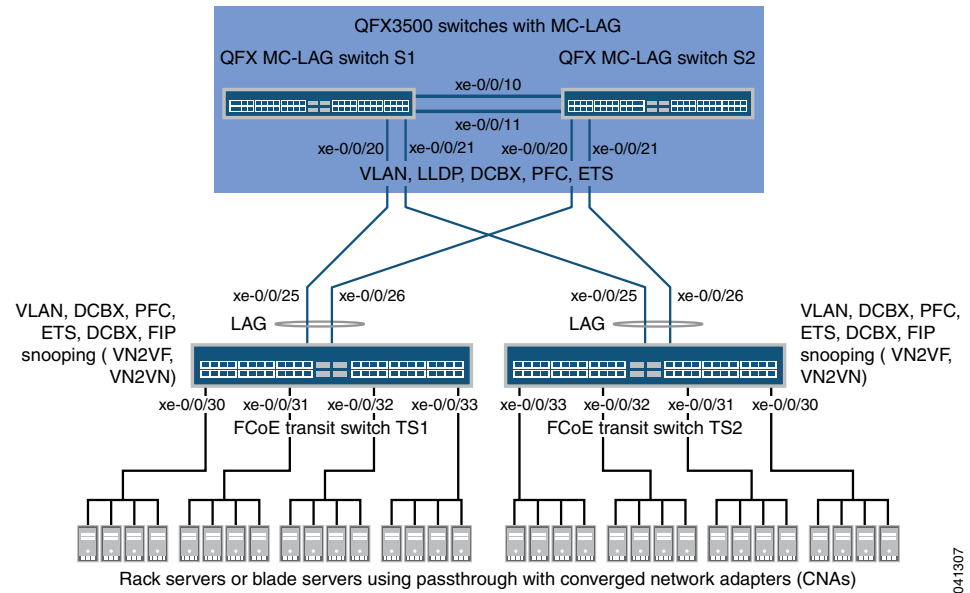

Table 316 on page 4519 shows the configuration components for this example.

Table 316: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

| Component                                                                  | Settings                                                                                                                |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Hardware                                                                   | Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access) |
| Forwarding class (all switches)                                            | Default <b>fc</b> forwarding class.                                                                                     |
| Classifier (forwarding class mapping of incoming traffic to IEEE priority) | Default IEEE 802.1p trusted classifier on all FCoE interfaces.                                                          |

Table 316: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology (*continued*)

| Component                                                | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| FIP snooping                                       | <p>Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping.</p> <p>This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration.</p> |

**NOTE:** This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is **queue 3**.

**NOTE:** In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (011) to the FCoE forwarding class. You can configure the BA classifier if you wish, but you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required

to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ([“Example: Configuring Multichassis Link Aggregation” on page 1958](#) describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ([“Configuring Link Aggregation” on page 2033](#) describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

### Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- [Configuring MC-LAG Switches S1 and S2 on page 4525](#)
- [Configuring FCoE Transit Switches TS1 and TS2 on page 4526](#)
- [Results on page 4528](#)

#### CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the [edit] hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g

**Configuring MC-LAG Switches S1 and S2**

**Step-by-Step Procedure** To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:
 

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```
2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):
 

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```
3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:
 

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
```
6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:
 

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
7. Apply the PFC configuration to the LAG and MC-LAG interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```
8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):
 

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
9. Disable IGMP snooping on the FCoE VLAN:
 

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

### *Configuring FCoE Transit Switches TS1 and TS2*

#### **Step-by-Step Procedure**

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

- ```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
  5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```
  6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point 011:
 

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
  7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile
fcoe-cnp
```
  8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):
 

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
  9. Disable IGMP snooping on the FCoE VLAN:
 

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```
  10. Add the member interfaces to the LAG:
 

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```
  11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

12. On the FCoE access interfaces (xe-0/0/30, xe-0/0/31, xe-0/0/32, xe-0/0/33), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN\_Port FIP snooping; the example is equally valid if you use VN2VF\_Port FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan
examine-fip examine-vn2v2 beacon-period 90000
```

## Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 30000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
```

```

}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  ae0 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  ae1 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}

```

**NOTE:** The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see [“Example: Configuring Multichassis Link Aggregation” on page 1958](#).

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  xe-0/0/30 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/31 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/32 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  xe-0/0/33 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
}
```

```

}
ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}
}

```

**NOTE:** The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

## Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- [Verifying That the Output Queue Schedulers Have Been Created on page 4532](#)
- [Verifying That the Priority Group Output Scheduler \(Traffic Control Profile\) Has Been Created on page 4532](#)
- [Verifying That the Forwarding Class Set \(Priority Group\) Has Been Created on page 4533](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 4533](#)
- [Verifying That the Interface Class of Service Configuration Has Been Created on page 4534](#)
- [Verifying That the Interfaces Are Correctly Configured on page 4536](#)
- [Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 4538](#)
- [Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2 on page 4539](#)
- [Verifying That IGMP Snooping Is Disabled on the FCoE VLAN on page 4539](#)

***Verifying That the Output Queue Schedulers Have Been Created***

**Purpose** Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

**Action** List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023
```

```
Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified
Shaping rate: 100 percent,
drop-profile-map-set-type: mark
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any       1      <default-drop-profile>
  Medium high   any       1      <default-drop-profile>
  High          any       1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

***Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created***

**Purpose** Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

**Action** List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
Shaping rate: 100 percent
```

```
Scheduler map: fcoe-map
Guaranteed rate: 3000000000
```

**Meaning** The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

#### *Verifying That the Forwarding Class Set (Priority Group) Has Been Created*

**Purpose** Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class      Index
  fcoe                  1
```

**Meaning** The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

#### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

**Action** List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Enabled   2500
  100      Disabled
  101      Disabled
```

110	Disabled
111	Disabled
Type: Output	
Priority	Flow-Control-Queues
000	
	0
001	
	1
010	
	2
011	
	3
100	
	4
101	
	5
110	
	6
111	
	7

**Meaning** The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### ***Verifying That the Interface Class of Service Configuration Has Been Created***

**Purpose** Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

**Action** List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}

ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
```

```
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
```

**Meaning** The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

**NOTE:** Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

### ***Verifying That the Interfaces Are Correctly Configured***

**Purpose** Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

**Action** List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
```

```

        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```

user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/32 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {

```

```
        port-mode tagged-access;
        vlan {
            members fcoe_vlan;
        }
    }
}

ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

**Meaning** The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe\_vlan**)

***Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces***

**Purpose** Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

**Action** List the port security configuration on FCoE transit switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
```

```
    examine-fip;
}
```

**Meaning** The `show configuration ethernet-switching-options secure-access-port` command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe\_vlan**). On Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

#### *Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2*

**Purpose** Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

**Action** List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,    Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
...
```

**NOTE:** The output has been truncated to show only the relevant information.

**Meaning** The `show fip snooping brief` command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe\_vlan**
- The FIP snooping mode is VN2VN\_Port FIP snooping (**VN2VN Snooping**)

#### *Verifying That IGMP Snooping Is Disabled on the FCoE VLAN*

**Purpose** Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

**Action** List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

**Meaning** The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe\_vlan**).

## Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

---

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The QFX Series handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the QFX Series exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).

- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

- [Requirements on page 4541](#)
- [Overview on page 4541](#)
- [Configuration on page 4545](#)
- [Verification on page 4546](#)

### Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

### Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

**NOTE:** DCBX also advertises PFC and enhanced transmission selection (ETS) information. See [“Configuring DCBX Autonegotiation” on page 4601](#) for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.
- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. [Table 317 on page 4542](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. [Table 318 on page 4542](#) shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

**Table 317: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)**

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

**Table 318: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)**

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low

**Table 318: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier) (continued)**

Code Point	Forwarding Class	Loss Priority
110	best-effort	low
111	best-effort	low

### Topology

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

**NOTE:** You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 319 on page 4543 shows the configuration components for this example.

**Table 319: Components of DCBX Application Protocol Exchange Configuration Topology**

Component	Settings
Hardware	QFX Series device
LLDP	Enabled by default on Ethernet interfaces
DCBX	Enabled by default on Ethernet interfaces
iSCSI application (Layer 4)	Application name— <b>iscsi</b> protocol— <b>TCP</b> destination-port— <b>3260</b> code-points— <b>111</b>
PTP application (Layer 2)	Application name— <b>ptp</b> ether-type— <b>0x88F7</b> code-points— <b>001, 101</b>

Table 319: Components of DCBX Application Protocol Exchange Configuration Topology (*continued*)

Component	Settings

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

## Configuration

**CLI Quick Configuration** To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ntp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ntp-app-map application PTP code-points [001 101]
set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ntp-app-map
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe
loss-priority high code-points 011
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class
network-control loss-priority high code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ntp-cl2 import default forwarding-class
network-control loss-priority low code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ntp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ntp-cl2
```

### Configuring DCBX Application Protocol TLV Exchange

**Step-by-Step Procedure** To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.  
  

```
[edit applications]
user@switch# set application iSCSI protocol tcp destination-port 3260
user@switch# set application FCoE ether-type 0x8906
user@switch# set application PTP ether-type 0x88F7
```
2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.  
  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
```
3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.  
  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-ntp-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-ntp-app-map application PTP code-points [001 101]
```

4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
```

5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority
high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control
loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

---

## Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- [Verifying the Application Configuration on page 4546](#)
- [Verifying the Application Map Configuration on page 4547](#)
- [Verifying DCBX Application Protocol Exchange Interface Configuration on page 4547](#)
- [Verifying the PFC Configuration on page 4548](#)
- [Verifying the Classifier Configuration on page 4549](#)

### *Verifying the Application Configuration*

**Purpose** Verify that DCBX applications have been configured.

**Action** List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
```

```

application iSCSI {
    protocol tcp;
    destination-port 3260;
}

application fcoe {
    ether-type 0x8906;
}

application ptp {
    ether-type 0x88F7;
}

```

**Meaning** The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

#### *Verifying the Application Map Configuration*

**Purpose** Verify that the application maps have been configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```

user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iSCSI code-points 111;
    application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
    application iSCSI code-points 111;
    application PTP code-points [001 101];
}

```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

#### *Verifying DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps have been applied to the correct interfaces.

**Action** List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
    application-map dcbx-iscsi-ptp-app-map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

#### *Verifying the PFC Configuration*

**Purpose** Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

**Action** Display the PFC configuration to verify that PFC is enabled on the FCoE code point (011) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

**Meaning** The `show class-of-service congestion-notification-profile` configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile `fcoe-cnp` has been configured and has enabled PFC on the IEEE 802.1p code point `011` (the default FCoE code point).

The `show class-of-service interfaces` configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile `fcoe-cnp`, which enables PFC on the FCoE code point, is applied to interface `xe-0/0/10`.

### *Verifying the Classifier Configuration*

**Purpose** Verify that the classifiers have been configured and applied to the correct interfaces.

**Action** Display the classifier configuration by using the configuration mode command `show class-of-service`:

```
user@switch# show class-of-service
classifiers {
  ieee-802.1 fcoe-iscsi-cl1 {
    import default;
    forwarding-class network-control {
      loss-priority high code-points 111;
    }
    forwarding-class fcoe {
      loss-priority high code-points 011;
    }
  }
  ieee-802.1 iscsi-ptp-cl2 {
    import default;
    forwarding-class network-control {
      loss-priority low code-points 111;
    }
    forwarding-class best-effort {
      loss-priority low code-points [ 001 101 ];
    }
  }
}
interfaces {
  xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-iscsi-cl1;
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      classifiers {
        ieee-802.1 iscsi-ptp-cl2;
      }
    }
  }
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

**Meaning** The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

## Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are directly connected to the same FCoE transit switch.

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VN\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are directly connected to the same FCoE transit switch, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port (FIP snooping) traffic is dropped.

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF\_Port FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are directly connected to the same transit switch:

- [Requirements on page 4552](#)
- [Overview on page 4552](#)
- [Configuration on page 4553](#)
- [Verification on page 4554](#)

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch used as a transit switch
- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

### Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

### Topology

[Table 320 on page 4552](#) shows the configuration components for this example.

**Table 320: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)**

Component	Settings
Hardware	QFX3500 switch (FCoE transit switch TS1)  Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)
Interfaces and port modes	<ul style="list-style-type: none"> <li>• Interface <b>xe-0/0/20</b>, port mode <b>tagged-access</b>, connects directly to the FCoE host with ENode1.</li> <li>• Interface <b>xe-0/0/21</b>, port mode <b>tagged-access</b>, connects directly to the FCoE host with ENode2.</li> </ul>
Interface VLAN membership	Both interfaces use VLAN <b>vlan200</b> .
VN2VN_Port FIP snooping VLAN	VLAN name— <b>vlan200</b> VLAN ID—200
FIP snooping mode and beacon period	Set <b>examine-vn2vn</b> (VN2VN_Port FIP snooping) Beacon period—90000 ms

Figure 173 on page 4553 shows the network topology for this example.

**Figure 173: VN2VN\_Port FIP Snooping (FCoE Hosts Connected to Same Transit Switch) Topology**

### Configuration

#### CLI Quick Configuration

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to the same transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

#### *Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)*

#### Step-by-Step Procedure

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host ENodes:  

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode tagged-access
```
2. Configure the interface VLAN membership so that the interfaces connected to the ENodes are members of the dedicated VN2VN\_Port VLAN (vlan200):  

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```
3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:  

```
user@switch# set vlans vlan200 vlan-id 200
```
4. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:  

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
```

## Verification

---

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping is Enabled on the FCoE VLAN on page 4554](#)
- [Verifying the Interface Port Mode on page 4555](#)

### *Verifying That VN2VN\_Port FIP Snooping is Enabled on the FCoE VLAN*

**Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and the correct interfaces (**xe-0/0/20** and **xe-0/0/21**) are members of the VLAN.

**Action** List the FIP snooping information using the operational mode command **show fip snooping detail**.

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/20
    Active VN_Ports : 1
  VN_Port Information
    VN-Port MAC: 0e:fc:00:01:0a:01
    Active Sessions : 1
  Session Information
    Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/21
    Active VN_Ports : 1
  VN_Port Information
    VN-Port MAC: 0e:fc:00:01:0b:01
    Active Sessions : 1
  Session Information
    Vlink far-end VN-Port-MAC: 0e:fc:00:01:0a:01
```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces for the ENodes are **xe-0/0/20** and **xe-0/0/21**.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

**Verifying the Interface Port Mode**

**Purpose** Verify that the interface port modes are **tagged-access**.

**Action** List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command.

Use the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail** to list the Ethernet switching interface information. The output is truncated to show only the relevant portions:

```
user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.

user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Tagged-Access
.
.
.
```

**Meaning** The **show ethernet-switching interfaces detail** command lists the port mode as **tagged-access** for both interfaces.

### Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other.

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VF\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a

VN\_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN2VF\_Port traffic is dropped.

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF\_Port FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are directly connected to different transit switches, and the transit switches are directly connected to each other:

- [Requirements on page 4556](#)
- [Overview on page 4557](#)
- [Configuration on page 4558](#)
- [Verification on page 4560](#)

---

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches used as transit switches

- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

### Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

### Topology

Table 321 on page 4557 shows the configuration components for this example.

**Table 321: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to Different FCoE Transit Switches)**

Component	Settings
Hardware	Two QFX3500 switches (FCoE transit switch TS1 and FCoE transit switch TS2)  Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)
Interfaces and port modes	<ul style="list-style-type: none"> <li>• Interface <b>xe-0/0/20</b>, port mode <b>tagged-access</b>, connects directly from transit switch TS1 to the FCoE host with ENode1.</li> <li>• Interface <b>xe-0/0/21</b>, port mode <b>trunk</b>, connects directly from transit switch TS1 to transit switch TS2.</li> <li>• Interface <b>xe-0/0/31</b>, port mode <b>trunk</b>, connects directly from transit switch TS2 to transit switch TS1.</li> <li>• Interface <b>xe-0/0/30</b>, port mode <b>tagged-access</b>, connects directly from transit switch TS2 to the FCoE host with ENode2.</li> </ul>
Interface VLAN membership	The interfaces on both transit switches use VLAN <b>vlan200</b> .
VN2VN_Port FIP snooping VLAN	VLAN name (both transit switches)— <b>vlan200</b> VLAN ID—200
FIP snooping mode and beacon period	Set <b>examine-vn2vn</b> (VN2VN_Port FIP snooping) Beacon period—90000 ms

Figure 174 on page 4558 shows the network topology for this example.

**Figure 174: VN2VN\_Port FIP Snooping (FCoE Hosts Connected to Different Transit Switches) Topology**

### Configuration

To configure VN2VN\_Port FIP snooping for VN\_Ports that are directly connected to different transit switches (and the transit switches are directly connected to each other), perform these tasks:

- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS1 on page 4559](#)
- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS2 on page 4559](#)

#### CLI Quick Configuration

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS1**

- Step-by-Step Procedure** To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:
1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode1 (xe-0/0/20) and to FCoE transit switch TS2 (xe-0/0/21):
 

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
```
  2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (vlan200):
 

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```
  3. Configure the network-facing port (xe-0/0/21) as an FCoE trusted port:
 

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
```
  4. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:
 

```
user@switch# set vlans vlan200 vlan-id 200
```
  5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:
 

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS2**

- Step-by-Step Procedure** To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:
1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode2 (xe-0/0/30) and to FCoE transit switch TS1 (xe-0/0/31):
 

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
```
  2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (vlan200):
 

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
```
  3. Configure the network-facing port (xe-0/0/31) as an FCoE trusted port:
 

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
```
  4. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:
 

```
user@switch# set vlans vlan200 vlan-id 200
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip  
examine-vn2v2 beacon-period 90000
```

---

### Verification

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly on both switches, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping is Enabled on the FCoE VLAN \(Transit Switches TS1 and TS2\) on page 4560](#)
- [Verifying the Interface Port Mode on page 4562](#)

***Verifying That VN2VN\_Port FIP Snooping is Enabled on the FCoE VLAN (Transit Switches TS1 and TS2)***

**Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and that the correct interfaces (**xe-0/0/20** and **xe-0/0/21** on TS1, and **xe-0/0/30** and **xe-0/0/31** on TS2) are members of the VLAN.

**Action** List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail

```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)

- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, and **xe-0/0/30** and **xe-0/0/31** on transit switch TS2. Because the transit switches are transparent passthrough switches, the network-facing trunk ports “see” the FCoE host ENodes at the far end of the VN2VN\_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

### ***Verifying the Interface Port Mode***

**Purpose** Verify that the interface port modes are **tagged-access** for ENode-facing ports and **trunk** for network-facing ports on each transit switch.

**Action** List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command.

Use the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail** to list the Ethernet switching interface information on FCoE transit switch TS1. The output is truncated to show only the relevant portions:

```
user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.
```

```
user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on FCoE transit switch TS2 using the operational mode commands **show ethernet-switching interfaces xe-0/0/30.0 detail** and **show ethernet-switching interfaces xe-0/0/31.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/30.0 detail
Interface: xe-0/0/30.0, Index: 56, State: up, Port mode: Tagged-Access
.
.
.
```

```
user@switch> show ethernet-switching interfaces xe-0/0/31.0 detail
Interface: xe-0/0/31.0, Index: 59, State: up, Port mode: Trunk
.
.
.
```

### Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are indirectly connected through an aggregation layer FCoE transit switch. Each FCoE host ENode is directly connected to an FCoE transit switch, but the FCoE transit switches are not directly connected to each other. The FCoE transit switches are both connected to a third FCoE transit switch that acts as an aggregation layer switch.

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VN\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are indirectly connected, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port traffic is dropped.

- ENode-facing ports must be set in **tagged-access** port mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** port mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are indirectly connected across an aggregation layer FCoE transit switch:

- [Requirements on page 4564](#)
- [Overview on page 4564](#)
- [Configuration on page 4565](#)
- [Verification on page 4568](#)

### Requirements

This example uses the following hardware and software components:

- Three Juniper Networks QFX3500 Switches used as transit switches
- Junos OS Release 12.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

### Overview

This example shows you how to:

- Set the correct interface port modes on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

### Topology

[Table 322 on page 4564](#) shows the configuration components for this example.

**Table 322: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Indirectly Connected Across an Aggregation Layer FCoE Transit Switch)**

Component	Settings
Hardware	<p>Three QFX3500 switches, two of which are FCoE transit switches that are directly attached to the FCoE hosts (transit switches TS1 and TS2) and one of which is an aggregation layer FCoE transit switch (TS3)</p> <p>Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)</p>

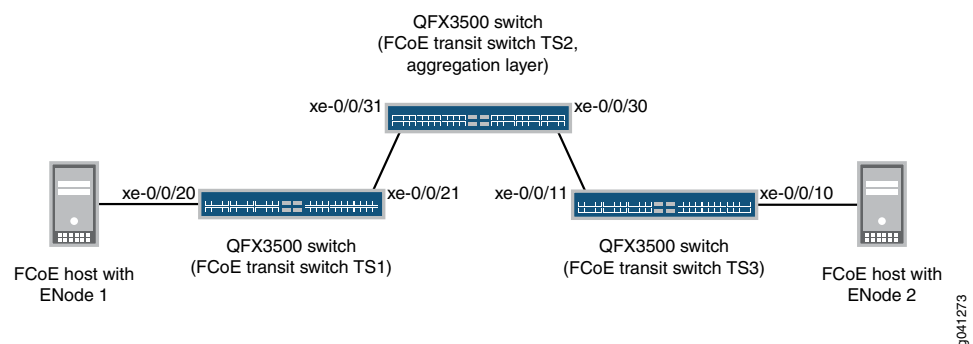

**Table 322: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Indirectly Connected Across an Aggregation Layer FCoE Transit Switch) (*continued*)**

### Configuration

To configure VN2VN\_Port FIP snooping for VN\_Ports that are indirectly connected across an aggregation layer FCoE transit switch, perform these tasks:

- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS1 on page 4567](#)
- [Configuring VN2VN\\_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2 on page 4567](#)
- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS3 on page 4568](#)

**CLI Quick  
Configuration**

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/30 fcoe-trusted
set ethernet-switching-options secure-access-port interface xe-0/0/31 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS3:

```
set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set ethernet-switching-options secure-access-port interface xe-0/0/11 fcoe-trusted
set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2
beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS1**

- Step-by-Step Procedure** To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:
1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode1 (**xe-0/0/20**) and to aggregation layer FCoE transit switch TS2 (**xe-0/0/21**):
 

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/21 unit 0 family ethernet-switching port-mode trunk
```
  2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):
 

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```
  3. Configure the network-facing port (**xe-0/0/21**) as an FCoE trusted port:
 

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/21 fcoe-trusted
```
  4. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:
 

```
user@switch# set vlans vlan200 vlan-id 200
```
  5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:
 

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip examine-vn2v2 beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2**

- Step-by-Step Procedure** To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing ports as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:
1. Configure the port modes of the interfaces that connect directly to FCoE transit switches TS1 (**xe-0/0/31**) and TS3 (**xe-0/0/30**). Both interfaces are network-facing and must be configured as trunk interfaces:
 

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode trunk
```
  2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):
 

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
```
  3. Configure the network-facing ports (**xe-0/0/30** and **xe-0/0/31**) as FCoE trusted ports:
 

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/30 fcoe-trusted
```

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/31
fcoe-trusted
```

4. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip
examine-vn2v2 beacon-period 90000
```

### *Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS3*

#### **Step-by-Step Procedure**

To configure interface port modes, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the port modes of the interfaces that connect directly to the FCoE host with ENode2 (xe-0/0/10) and to aggregation layer FCoE transit switch TS2 (xe-0/0/11):

```
user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching port-mode
tagged-access
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (vlan200):

```
user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members
vlan200
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the network-facing port (xe-0/0/11) as an FCoE trusted port:

```
user@switch# set ethernet-switching-options secure-access-port interface xe-0/0/11
fcoe-trusted
```

4. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set ethernet-switching-options secure-access-port vlan vlan200 examine-fip
examine-vn2v2 beacon-period 90000
```

---

### **Verification**

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly on all three switches, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping Is Enabled on the FCoE VLAN \(All Three Transit Switches\)](#) on page 4568
- [Verifying the Interface Port Mode](#) on page 4571

#### ***Verifying That VN2VN\_Port FIP Snooping Is Enabled on the FCoE VLAN (All Three Transit Switches)***

**Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (vlan200), the beacon period is set to 90000 milliseconds, and that the correct interfaces (xe-0/0/20

and **xe-0/0/21** on TS1, **xe-0/0/30** and **xe-0/0/31** aggregation layer TS2, and **xe-0/0/10** and **xe-0/0/11** on TS3) are members of the VLAN.

**Action** List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
Beacon_Period: 90000

Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01

```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, **xe-0/0/30** and **xe-0/0/31** on aggregation layer transit switch TS2, and **xe-0/0/10** and **xe-0/0/11** on transit switch TS3. Because the transit switches are transparent passthrough switches, the network-facing trunk ports “see” the FCoE host ENodes at the far end of the VN2VN\_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

#### *Verifying the Interface Port Mode*

**Purpose** Verify that the interface port modes are **tagged-access** for ENode-facing ports and **trunk** for network-facing ports on each transit switch.

**Action** List the Ethernet switching interfaces to confirm the port mode using the **show ethernet-switching interfaces detail** operational command for each interface. The output is truncated to show only the relevant portions.

List the Ethernet switching interface information on FCoE transit switch TS1 using the operational mode commands **show ethernet-switching interfaces xe-0/0/20.0 detail** and **show ethernet-switching interfaces xe-0/0/21.0 detail**:

```

user@switch> show ethernet-switching interfaces xe-0/0/20.0 detail
Interface: xe-0/0/20.0, Index: 75, State: up, Port mode: Tagged-Access
.
.
.
user@switch> show ethernet-switching interfaces xe-0/0/21.0 detail

```

```
Interface: xe-0/0/21.0, Index: 83, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on aggregation layer FCoE transit switch TS2 using the operational mode commands **show ethernet-switching interfaces xe-0/0/30.0 detail** and **show ethernet-switching interfaces xe-0/0/31.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/30.0 detail
Interface: xe-0/0/30.0, Index: 71, State: up, Port mode: Trunk
.
.
.
```

```
user@switch> show ethernet-switching interfaces xe-0/0/31.0 detail
Interface: xe-0/0/31.0, Index: 73, State: up, Port mode: Trunk
.
.
.
```

List the Ethernet switching interface information on FCoE transit switch TS3 using the operational mode commands **show ethernet-switching interfaces xe-0/0/10.0 detail** and **show ethernet-switching interfaces xe-0/0/11.0 detail**:

```
user@switch> show ethernet-switching interfaces xe-0/0/10.0 detail
Interface: xe-0/0/10.0, Index: 56, State: up, Port mode: Tagged-Access
.
.
.

## Example: Configuring Automated Fibre Channel Interface Load Rebalancing

Automated Fibre Channel (FC) interface (NP\_Port) load rebalancing configures the switch to rebalance the session loads on the native FC interfaces automatically on a load-rebalancing trigger event. (Alternatively, you can rebalance the link load on the FC interfaces on demand so that you control when the link load is rebalanced.) Rebalancing the FC link load is a disruptive action that causes some or all of the current sessions to log out, then log in again to be placed on the active FC links in a balanced manner.

This example shows you how to configure and verify automated FC link load rebalancing on an FCoE-FC gateway local FC fabric.

- [Requirements on page 4573](#)
- [Overview on page 4573](#)
- [Configuration on page 4574](#)
- [Verification on page 4575](#)

---

## Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

---

## Overview

When a load rebalancing trigger occurs, the switch automatically rebalances the link loads by redistributing the sessions across the active NP\_Port links.

There are three possible load-rebalancing triggers:

1. When you enable automated load rebalancing, the switch checks the load balance on the existing NP\_Port links. If the links are already balanced, the switch does not rebalance the link load. If the links are not balanced, the switch rebalances the link loads using the configured load-balancing algorithm.
2. When a new NP\_Port link comes up on a local FCoE-FC gateway fabric, the switch rebalances the link load using the configured load-balancing algorithm if automated load balancing is enabled.
3. When the port speed is changed (unless the port speed change does not change the actual port speed, for example, changing the port speed from auto to 8 Gbps).

Automated load rebalancing logs out sessions in accordance with the configured load-balancing algorithm. Disabling automated load rebalancing is not disruptive because the link load is already balanced.

Use automated load rebalancing if you want link loads to be rebalanced automatically instead of at times of your choosing. Keep in mind that load rebalancing is a disruptive event (sessions are logged out).

## Topology

This example configures automated load rebalancing on a local FC fabric on an FCoE-FC gateway. This example does not show you how to configure the load-balancing algorithm or any other load-balancing characteristics. The load-balancing configuration for this example is:

- FC fabric name—`fc_fabric_100`
- FC fabric ID—100

- FC fabric type—Proxy
- FC fabric interfaces—fc-0/0/0, fc-0/0/1, fc-0/0/42, fc-0/0/43, vlan.100, vlan.20
- Load-balancing algorithm—Simple
- No fabric WWN verify—Configured
- Traceoptions—Configured to log in file fc\_fabric\_100\_proxy.log

---

## Configuration

To configure automated load balancing on a local FC fabric, perform this task:

- [\[xref target has no title\]](#)
- [Results on page 4574](#)

### CLI Quick Configuration

To quickly configure automated load balancing, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit]
set fc-fabrics fc_fabric_100 proxy auto-load-rebalance
```

### Step-by-Step Procedure

- Configure automated load balancing on FC fabric fc\_fabric\_100:  
user@switch# set fc-fabrics fc\_fabric\_100 proxy auto-load-rebalance

## Results

Display the results of the configuration:

```
user@switch> show configuration fc-fabrics
fc_fabric_100 {
    fabric-id 100;
    fabric-type proxy;
    interface {
        fc-0/0/0.0;
        fc-0/0/1.0;
        vlan.100;
        vlan.20;
        fc-0/0/42.0;
        fc-0/0/43.0;
    }
    proxy {
        traceoptions {
            file fc_fabric_100_proxy.log size 20m;
            flag all;
        }
        load-balance-algorithm simple;
        auto-load-rebalance;
        no-fabric-wwn-verify;
    }
}
```

## Verification

### *Verifying That Automated Load Rebalancing Is Enabled*

**Purpose** Verify that automated load rebalancing is configured on local FC fabric **fc\_fabric\_100**.

**Action** Verify the results of the automated load-rebalancing configuration using the operational mode command **show fibre-channel proxy fabric-state fabric fc\_fabric\_100**:

```
user@switch> show fibre-channel proxy fabric-state fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
Proxy load balance algorithm: Simple, Fabric WWN verification: No
Auto load rebalance enabled : Yes
Last rebalance start-time   : Never
Last rebalance end-time     : Never
Last rebalance trigger      : None
Last rebalance trigger-time  : Mon Sep 10 21:42:30 2012 usec: 814602
Last rebalance trigger-result: None
```

**Meaning** The **show fibre-channel proxy fabric-state fabric fc\_fabric\_100** operational command displays information about the specified local FC fabric. The output shows that the **Auto load rebalance enabled** field value is **Yes**, which indicates that automated load rebalancing is enabled on fabric **fc\_fabric\_100**.

## Configuring an FCoE-FC Gateway Fibre Channel Fabric

Fibre Channel (FC) fabric configuration consists of creating a unique name and identifier for each FC fabric you want to create and configuring it as an FCoE-FC gateway.

You can create a maximum of 12 FC fabrics on a QFX3500 switch. After you create a fabric, you can create and assign interfaces to the fabric, configure FIP parameters for the fabric, and set proxy traceoptions.

To configure an FC fabric using the CLI, specify a unique name and identification number for the fabric:

1. Configure the fabric name and fabric ID:

```
[edit]
user@switch# set fc-fabrics fabric-name fabric-id fabric-id
```

**NOTE:** Changing the fabric name or the fabric ID causes all logins to drop and forces the ENodes to log in again.

For example, to configure an FC fabric with the name **fab\_ulous** and the fabric ID 10 (the range of **fabric-id** values is 1 through 4095):

```
[edit]
user@switch# set fc-fabrics fab_ulous fabric-id 10
```

2. Configure the fabric as a gateway fabric:

```
[edit fc-fabrics fabric-name]
user@switch# set fabric-type proxy
```

For example, to configure the FC fabric with the name **fab\_ulous** as a gateway fabric:

```
[edit fc-fabrics fab_ulous]
user@switch# set fabric-type proxy
```

## Disabling the Fabric WWN Verification Check

When a QFX Series NP\_Port sends a fabric login (FLOGI) request to a Fibre Channel (FC) switch, the FLOGI accept (FLOGI-ACC) reply from the FC switch contains the SAN fabric worldwide name (WWN). The QFX Series uses the SAN fabric WWN in the multicast discovery advertisement (MDA) that the QFX Series sends to the ENodes in the FCoE network.

However, some FC switches substitute their own WWN (often the FC switch's virtual WWN) for the SAN fabric WWN in the FLOGI-ACC message. In this case, different NP\_Ports that log in to the same FC fabric might receive different fabric WWNs in the FLOGI-ACC messages if the NP\_Ports are connected to different FC switches in the SAN fabric.

If the QFX Series receives different fabric WWNs on NP\_Ports that are connected to the same SAN fabric, the QFX Series uses the first fabric WWN it receives in the MDA it sends to the ENodes. The QFX Series isolates the NP\_Ports that receive a different fabric WWN from other FC switches in that SAN fabric. No ENode sessions are assigned to the isolated NP\_Ports. FC traffic is assigned only to NP\_Ports that receive a fabric WWN in the FLOGI-ACC message that matches the fabric WWN received by the first NP\_Port to log in to the FC fabric. (If an NP\_Port receives a fabric WWN that does not match the fabric WWN received by the first NP\_Port to log in to the FC fabric, it does not carry traffic to the SAN fabric.)

To prevent ENodes from being isolated due to a mismatched fabric WWN, you can disable the gateway fabric WWN verification check. Disabling the fabric WWN verification check enables all NP\_Ports connected to a SAN fabric are used to carry traffic between the gateway and the FC switch, regardless of the fabric WWN the NP\_Port receives in the FLOGI-ACC message.

**NOTE:** Disabling or enabling the fabric WWN verification check logs out all FCoE sessions.

To disable the fabric WWN verification check:

- `[edit fc-fabrics fabric-name proxy]`  
`user@switch# set no-fabric-wwn-verify`

## Configuring a Physical Fibre Channel Interface

When you configure the switch as an FCoE-FC gateway, you must configure either 6 or 12 of the physical interfaces as native FC interfaces. Native FC interfaces connect to the storage area network (SAN) FC switch.

You can configure ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces. You cannot individually configure a single port as a native FC interface. Within these port blocks, you cannot mix FC interfaces with Ethernet interfaces. All of the ports in a block must be either native FC interfaces or Ethernet interfaces.

You can configure:

- Six native FC interfaces by configuring either ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, or ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- Twelve native FC interfaces by configuring ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.
- No native FC interfaces by leaving ports xe-0/0/0 through xe-0/0/5 and ports xe-0/0/42 through xe-0/0/47 in their default state as Ethernet interfaces.
- To configure physical FC interfaces using the CLI, specify the physical port block you want to configure on the switch as native FC interfaces:

```
[edit chassis]
user@switch# set fpc fpc pic pic fibre-channel port-range port-range-low port-range-high
```

For example, to configure six native FC interfaces, you can configure ports 0 through 5 as physical FC interfaces:

```
[edit chassis]
user@switch# set fpc 0 pic 0 fibre-channel port-range 0 5
```

To configure 12 native FC interfaces requires two separate statements:

```
[edit chassis]
user@switch# set fpc 0 pic 0 fibre-channel port-range 0 5
user@switch# set fpc 0 pic 0 fibre-channel port-range 42 47
```

- [Understanding Interfaces on an FCoE-FC Gateway on page 4420](#)

## Configuring a Fibre Channel Interface

When a QFX3500 acts as an FCoE-FC gateway, native Fibre Channel (FC) traffic flows between the switch and the storage area network (SAN) FC switch. When you configure a port as an FC interface, it transports only FC traffic. It does not transport Ethernet traffic.

You can configure ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces.

Each of these blocks of ports must be configured either as all Ethernet ports or as all native FC ports. Within each block of ports, you cannot mix FC and Ethernet interfaces. This means that you can configure 0, 6, or 12 ports as native FC ports. “[Configuring a Physical Fibre Channel Interface](#)” on page 4578 describes how to configure the port blocks as physical FC interfaces.

**NOTE:** Do not configure ports that you want to use for native FC traffic as part of an Ethernet VLAN or as Ethernet ports.

Configure a port as an FC interface when the port connects to the F\_Port of an FC switch.

FC interface configuration includes:

- Explicitly specifying one or more ports as an FC family interface in NP\_Port mode (mandatory).
- Configuring the FC interface options port speed and buffer-to-buffer credit state change number (BB\_SC\_N) (optional).
- Configuring the interface as a loopback interface (optional).

The buffer-to-buffer state change number feature prevents the loss of buffer-to-buffer credits between the two interfaces on either end of an FC link. The state change number determines the number of frames and receiver ready (R\_RDY) primitives the interfaces exchange between the state change send (BB\_SCs) and the state change receive (BB\_SCr) primitives used to track these transactions.

Enabling BB\_SC\_N by configuring BB\_SC\_N on both of the FC link interfaces:

- Requests that  $2^{BB\_SC\_N}$  number of frames be sent between two consecutive BB\_SCs primitives, and
- Requests that  $2^{BB\_SC\_N}$  number of R\_RDY primitives be sent between two consecutive BB\_SCr primitives.

When the number of R\_RDY primitives received equals  $2^{BB\_SC\_N}$ , the R\_RDY counter resets to zero. When the number of frames received equals  $2^{BB\_SC\_N}$ , the frame counter resets

to zero. The interfaces calculate the number of buffer-to-buffer credits lost based on counter discrepancies and take corrective action to recover the lost credits.

If you enable BB\_SC\_N, the recommended BB\_SC\_N setting is eight. Setting the BB\_SC\_N number to zero (0) disables the feature. If either of the two connected FC interfaces is configured with zero as the BB\_SC\_N value, then both interfaces disable the feature. If the two connected FC interfaces have different nonzero BB\_SC\_N numbers configured, both interfaces use the higher number.

For the port to transport FC traffic, you must also set the physical port as an FC port using the **port-range** command.

To configure an FC interface using the CLI:

1. Specify the interface as family FC and set the port mode to NP\_Port (setting the port mode to NP\_Port is a mandatory configuration):

```
[edit]
user@switch# set interfaces interface-name unit unit family fibre-channel port-mode np-port
```

For example, to configure the interface **fc-0/0/3** as an FC interface and set the port mode to **np-port**:

```
[edit]
user@switch# set interfaces fc-0/0/3 unit 0 family fibre-channel port-mode np-port
```

2. Configure the FC interface speed option:

```
[edit]
user@switch: set interfaces interface-name fibrechannel-options speed (auto-negotiation | 2g | 4g | 8g)
```

For example, to set the FC interface speed option to **8g** for the interface **fc-0/0/3**:

```
[edit]
user@switch: set interfaces fc-0/0/3 fibrechannel-options speed 8g
```

The default port mode is **auto-negotiation**, which sets the port speed to match the speed of the attached FC F\_Port interface (2 Gbps, 4 Gbps, or 8 Gbps).

3. Configure the optional buffer-to-buffer credit state change number:

```
[edit]
user@switch: set interfaces interface-name fibrechannel-options bb-sc-n 0..15
```

For example, to set the FC interface buffer-to-buffer credit state change number to **8** for the interface **fc-0/0/3**:

```
[edit]
user@switch: set interfaces fc-0/0/3 fibrechannel-options bb-sc-n 8
```

After you configure one or more FC interfaces, assign them and an FCoE VLAN to an FC fabric.

## Configuring an FCoE VLAN Interface

When you configure the switch as an FCoE-FC gateway, a Layer 3 FCoE VLAN interface transmits and receives Fibre Channel over Ethernet (FCoE) traffic between the gateway and FCoE-capable servers on the Ethernet network. Configuring a Layer 3 FCoE VLAN interface on the switch creates virtual fabric port (VF\_Port) interfaces facing the FCoE server virtual node ports (VN\_Ports).

The FCoE VLAN interface is the interface for the dedicated VLAN the FCoE servers use for FCoE traffic. Each FC fabric requires at least one dedicated FCoE VLAN and at least one Layer 3 FCoE VLAN interface to transport FCoE traffic. On QFabric systems, the FCoE VLAN interface, the FCoE VLAN, and the interfaces that are members of the FCoE VLAN must be on the same Node device.

---

**NOTE:** FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

---

Before you configure an FCoE VLAN interface, create the FCoE VLAN and assign 10-Gigabit Ethernet interfaces configured in tagged-access port mode to the VLAN. These 10-Gigabit Ethernet interfaces are the physical interfaces that transport the FCoE traffic to and from the FCoE devices in the Ethernet network.

Each Ethernet interface that connects to FCoE devices must also include the native VLAN to transport FIP traffic, because FIP VLAN discovery and notification frames are exchanged as untagged packets. The FCoE VLAN must carry only FCoE traffic. A VLAN cannot transport a mix of FCoE and standard Ethernet traffic.

FCoE VLAN interface configuration includes:

- Configuring a VLAN to use as a dedicated FCoE VLAN.
- Configuring a native VLAN for FIP traffic.
- Configuring member interfaces for the FCoE VLAN.
- Configuring the FCoE VLAN as a Fibre Channel (family) VLAN and setting the port mode value to **f-port**. Explicitly configuring the FCoE VLAN interface in F\_Port mode is mandatory. The switch interface with which the FCoE server VN\_Ports communicate must present a VF\_Port to the servers.
- Configuring the FCoE VLAN interface as the Layer 3 interface for FCoE traffic.

To configure an FCoE VLAN interface:

1. Configure a dedicated FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id
```

For example, to configure a VLAN named **fcoe\_vlan** with a VLAN ID of **100** as the FCoE VLAN:

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

2. Configure a native VLAN for FIP traffic:

```
[edit vlans]
user@switch# set native vlan-id vlan-id
```

For example, to configure the native VLAN with a VLAN ID of 1:

```
[edit vlans]
user@switch# set native vlan-id 1
```

3. Configure member interfaces for the FCoE VLAN (use **ethernet-switching** as the family and **tagged-access** as the port mode):

```
[edit interfaces]
user@switch# set interface-name unit unit family family port-mode mode vlan members
vlan-name
```

For example, to configure the interface **xe-0/0/10** as a member of the FCoE VLAN **fcoe\_vlan**:

```
[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access vlan
members fcoe_vlan
```

4. Assign member interfaces to the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit unit family family native-vlan-id vlan-id
```

For example, to configure the interface **xe-0/0/10** as a member of the native VLAN with the native VLAN ID 1:

```
[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
```

5. Assign the Ethernet interfaces to the FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name interface interface-name
```

For example, to assign the interface **xe-0/0/10.0** to the FCoE VLAN named **fcoe\_vlan**:

```
[edit vlans]
user@switch# set fcoe_vlan interface xe-0/0/10.0
```

6. Define an interface as an FCoE VLAN interface in F\_Port mode (to present a VF\_Port to the FCoE servers):

```
[edit interfaces]
user@switch# set vlan unit unit family fibre-channel port-mode f-port
```

For example, to configure VLAN unit **100** as an FCoE VLAN interface and set the port mode to **f-port**:

```
[edit interfaces]
user@switch# set vlan unit 100 family fibre-channel port-mode f-port
```

7. Define the Layer 3 FCoE VLAN interface:

```
[edit vlans]
user@switch# set vlan-name l3-interface vlan-interface-name
```

For example, to configure VLAN interface unit **100** (the FCoE VLAN interface defined earlier in this example) as the Layer 3 FCoE VLAN interface for FCoE VLAN **fcoe\_vlan**:

```
[edit vlans]
user@switch# set fcoe_vlan l3-interface vlan.100
```

#### Related Documentation

## Assigning Interfaces to a Fibre Channel Fabric

When you configure the switch as an FCoE-FC gateway, you assign one or more (up to 12) native Fibre Channel (FC) interfaces and at least one FCoE VLAN interface to each FC fabric. FC interfaces transport native FC traffic between the proxy gateway and the storage area network (SAN) FC switch. FCoE VLAN interfaces transport FCoE traffic between FCoE-capable servers and the gateway.

Each FC fabric needs both types of interfaces to transport traffic between FCoE servers on the Ethernet network and FC storage devices in the core FC network behind the FC switch. FCoE traffic between the FCoE servers and the gateway must travel in a dedicated FCoE VLAN. Native FC traffic passes between the gateway and the FC switch on the native FC interfaces.

You must configure the FC interfaces and the FCoE VLAN interfaces that you assign to a particular fabric on the same Juniper Networks QFX3500 Switch. Traffic between an FCoE device and the FC switch must ingress and egress the same gateway.

To assign core-facing native FC interfaces and a server-facing FCoE VLAN interface to an FC fabric, configure a fabric and then specify the interfaces:

1. Assign the native FC interfaces to the FC fabric:

```
[edit fc-fabrics fabric-name]
user@switch: set interface interface-name
user@switch: set interface interface-name
user@switch: set interface interface-name
...
```

2. Assign an FCoE VLAN interface to the FC fabric:

```
[edit fc-fabrics fabric-name]
user@switch: set interface vlan-name
```

For example, to assign the native FC interfaces **fc-0/0/0.0**, **fc-0/0/1.0**, and **fc-0/0/2.0** and the FCoE VLAN interface **vlan.100** to an FC fabric named **san\_tana**:

```
user@switch: set fc-fabrics san_tana interface fc-0/0/0.0
user@switch: set fc-fabrics san_tana interface fc-0/0/1.0
user@switch: set fc-fabrics san_tana interface fc-0/0/2.0
user@switch: set fc-fabrics san_tana interface vlan.100
```

## Deleting a Fibre Channel Interface

Before you delete a Fibre Channel (FC) interface, you must first delete the interface from the FC fabric configuration. This prevents configuration errors that would result if you deleted an FC interface from the **[edit interfaces]** hierarchy level but did not delete the interface from the FC fabric.

When you configure the switch as an FCoE-FC gateway, FC interfaces transmit and receive native FC traffic between the gateway and the FC switch. You can configure ports **xe-0/0/0** through **xe-0/0/5** as **fc-0/0/0** through **fc-0/0/5** and ports **xe-0/0/42** through **xe-0/0/47** as **fc-0/0/42** through **fc-0/0/47** to create one or two blocks of six native FC interfaces.

To delete an FC interface using the CLI:

1. Delete the FC interface from the FC fabric to which it belongs:

```
[edit]
user@switch# delete fc-fabrics fabric-name interface interface-name
```

For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

```
[edit]
user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
```

2. Delete the FC interface from the switch **[edit interfaces]** hierarchy:

```
[edit]
user@switch: delete interfaces interface-name
```

For example, to delete the interface **fc-0/0/3.0** from the switch:

```
[edit]
user@switch: delete interfaces fc-0/0/3.0
```

The FC interface has been deleted from the FC fabric and from the switch.

## Disabling Storm Control on FCoE Interfaces on an FCoE-FC Gateway

Storm control is enabled by default on all interfaces. However, when an interface on a QFX3500 switch or a QFX3500 Node device in a QFabric system is configured as part of an FCoE-FC gateway VLAN, storm control can force an interface to drop FCoE packets when traffic passes a certain threshold. When a QFX3500 switch or a QFX3500 Node device is acting as an FCoE-FC gateway, disable storm control on the QFX3500 switch or QFX3500 Node device. If desired, enable storm control on Ethernet interfaces that do not belong to the FCoE-FC gateway VLAN.

You can disable storm control in either of two ways:

- Disable storm control on all interfaces, then enable storm control on the interfaces you want to use storm control. (From the default configuration, you cannot disable storm control on individual interfaces because the default configuration enables storm control on **all** interfaces, not on individual interfaces.)

For example, if you want interfaces xe-0/0/20, xe-0/0/21, and xe-0/0/22 to use storm control, disable storm control on all interfaces, then enable storm control on those three interfaces:

1. Disable storm control on all interfaces:

```
user@switch# delete ethernet-switching-options storm-control interface all
```

2. Enable storm control on interfaces xe-0/0/20, xe-0/0/21, and xe-0/0/22:

```
user@switch# set ethernet-switching-options storm-control interface xe-0/0/20
user@switch# set ethernet-switching-options storm-control interface xe-0/0/21
user@switch# set ethernet-switching-options storm-control interface xe-0/0/22
```

- Disable storm control for all unknown unicast traffic on all interfaces by including the following statement in your configuration:

```
user@switch# set ethernet-switching-options storm-control interface all no-unknown-unicast
```

## Defining the Proxy Load-Balancing Algorithm

When the QFX Series is configured as an FCoE-FC gateway, it balances the FCoE session load assigned to each NP\_Port link between the gateway and the FC switch in the FC SAN to avoid overloading or underutilizing each link. The QFX Series supports three types of load-balancing mechanisms:

- Simple load balancing—Load balancing is based on the weighted utilization (session load) of the NP\_Ports connected to an FC fabric. The session load is the sum of the

FLOGI and FDISC sessions on each link. Each new ENode fabric login (FLOGI) or VN\_Port fabric discovery (FDISC) session is assigned to the least-loaded link, so an FDISC session initiated by the VN\_Port on an ENode might not be assigned to the same link as the parent ENode's FLOGI session. Simple load balancing is the default algorithm. Simple load balancing is the default load-balancing algorithm. Rebalancing the link load disrupts only selected sessions to minimize the impact (the switch uses an algorithm to log out only the sessions that need to be moved to other links to balance the load when those sessions log in again).

- **ENode-based load balancing**—Load balancing is based on the weighted utilization (session load) of the NP\_Ports connected to an FC fabric. The session load is the sum of the FLOGI and FDISC sessions on each link. However, when an ENode logs in to the fabric, the switch places all subsequent VN\_Port FDISC sessions associated with that ENode on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. The switch calculates the link load based on the combined total of FLOGIs and FDISCs on each NP\_Port link. Rebalancing the link load disrupts all sessions (all sessions log out and then log in again).
- **FLOGI-based load balancing**—Load balancing is based on the weighted utilization (session load) of the NP\_Ports connected to an FC fabric. The session load is the sum of the FLOGI sessions on each link. FDISC sessions are not counted. When an ENode logs in to the fabric, the switch places all subsequent VN\_Port FDISC sessions associated with that ENode on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. Rebalancing the link load disrupts only selected sessions to minimize the impact (the switch uses an algorithm to log out only the sessions that need to be moved to other links to balance the load when those sessions log in again).

To define the proxy load-balancing algorithm for a proxy fabric on the FCoE-FC gateway, set the algorithm as **enode-based**, **simple**, or **flogi-based**:

- [edit fc-fabrics *fabric-name* proxy]  
user@switch# **set load-balance-algorithm (enode-based | simple | flogi-based)**

For example, to configure a gateway fabric named **san\_fab1** to use **enode-based** load balancing:

```
user@switch# set fc-fabrics san_fab1 proxy load-balance-algorithm enode-based
```

#### Related Documentation

- [Example: Configuring Automated Fibre Channel Interface Load Rebalancing on page 4572](#)
- [Simulating On-Demand Fibre Channel Link Load Rebalancing \(Dry Run Test\) on page 4588](#)

## Simulating On-Demand Fibre Channel Link Load Rebalancing (Dry Run Test)

On-demand Fibre Channel (FC) link load rebalancing is a disruptive action that causes sessions to log out of the network, then log back in to be placed on FC links (NP\_Ports) in a balanced manner. The number of sessions logged out to rebalance the links depends on the load-balancing algorithm used (simple, ENode-based, or FLOGI-based) and whether or not the load is already balanced. (If the link load is already balanced, the switch does not rebalance the loads when you request on-demand load rebalancing.)

You can use the **dry-run** option to list the sessions that might be affected (logged out to be redistributed among the active FC interface links) by on-demand load rebalancing *before* you actually rebalance the link load. (Because new sessions might log in between the time you perform a dry run and the time you request on-demand load rebalancing, the affected sessions may change. Therefore, the sooner that you perform an on-demand load rebalance after you perform a dry run, the more accurate the dry run results are likely to be.)

To request a link load rebalancing dry run:

```
user@switch> request fibre-channel proxy load-rebalance dry-run fabric fabric-name
```

For example, to request a dry run on an FC fabric named *fc\_fabric\_100* to display a list of sessions that might be disrupted if you request an actual link load rebalance:

```
user@switch> request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
F-Port      FCID      Port-WWN      NP-Port
vlan.100    0x8a013a  02:01:00:64:00:00:2a  fc-0/0/1.0
vlan.100    0x8a013c  02:01:00:64:00:00:2b  fc-0/0/1.0
vlan.100    0x8a0146  02:01:00:64:00:00:2e  fc-0/0/1.0
vlan.100    0x8a014c  02:01:00:64:00:00:2f  fc-0/0/1.0
```

## Enabling and Disabling CoS OxID Hash Control

The originator exchange identifier (OxID) field is one of several fields that the switch can use in its hash function computation for FCoE traffic load balancing over multiple outgoing links. You can configure whether or not the switch uses the OxID in the hash computation.

Including the OxID field in the load-balancing hash computation allows different exchanges between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) to take different paths across the network, thus improving the aggregate network throughput.

However, if the paths between different sets of FC endpoints have common links, congestion on one set of FC endpoints can affect the other set of endpoints. Such congestion can happen if the FCoE traffic on the two sets of endpoints uses the same priority (IEEE 802.1p code point). It is common for networks to use priority 3 (IEEE 802.1p code point 011) for FCoE traffic. However, on the QFX3500, you can assign different IEEE priorities to different lossless FCoE flows as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 4896](#) to further separate the traffic flows.

OxID hash control is enabled by default.

- To enable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid enable
```

- To disable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid disable
```

## Configuring FIP on an FCoE-FC Gateway

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) establishes and maintains Fibre Channel (FC) virtual links between pairs of FCoE devices. A virtual link emulates the physical point-to-point link that FC requires between two FC devices.

FIP is enabled by default and uses the default FIP settings on all FCoE interfaces that are part of the gateway FC fabric. You can use the default FIP parameter values, or you can configure FIP parameters globally or on a per-interface basis. Configuring FIP on an individual interface overrides the global FIP configuration.

You can configure the following parameters globally for the fabric and per interface:

- FIP keepalive message transmission interval—This interval is the time period between sending FIP keepalive messages.

- **Priority**—If an FCoE node (ENode) connects to more than one switch, the priority value determines the switch to which the ENode connects. The switch with the lowest priority number has the highest priority.

You can only configure the following parameters globally on an FC fabric:

- **FC-MAP**—The 24-bit FCoE mapped address prefix that identifies the attached FC switch in the SAN fabric. The FC-MAP value is used in the fabric provided MAC address (FPMA) created for each ENode that logs in. This value must be the same for the FC switch and the QFX Series.

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

- **FCoE trusted**—You can globally configure all of the Ethernet ports in a specified FC fabric to be FCoE trusted. You might want to configure interfaces as FCoE trusted if the interfaces are connected to a transit switch that is performing FIP snooping. For interfaces that are directly connected to FCoE hosts, FIP snooping should be enabled, and you should not configure the fabric as FCoE trusted.

**NOTE:** Do not configure interfaces with FIP snooping enabled as FCoE trusted.

Configuring interfaces as FCoE trusted reduces system overhead by eliminating the need for filters. The total number of sessions the system can support is 2500 sessions. Sessions are defined as the combined number of VN\_Port to VF\_Port sessions and VN\_Port to VN\_Port sessions. (Although VN2VF and VN2VN sessions run in different FCoE VLANs, the session limit is a system limit, not a per-VLAN limit.)

**NOTE:** A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions. There is no limit to the number of end-to-end storage sessions.

**NOTE:** Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate FIP snooping filters.

- **Maximum number of FCoE sessions per ENode**—You can globally configure the maximum number of FCoE sessions (FLOGI plus FDISC) permitted from an ENode. The maximum number of sessions per ENode is 2000 sessions. The total number of sessions (VN2VF\_Port sessions and VN2VN\_Port sessions combined) cannot exceed the gateway fabric's maximum limit of 2500 sessions.

To configure FIP options globally using the CLI:

1. Specify the fabric on which you want to configure FIP:

```
[edit]
user@switch# set fc-fabrics fabric-name protocols fip
```

2. Configure the FIP keepalive message transmission interval in milliseconds to specify the amount of time between periodic FIP discovery advertisements for the fabric interfaces (the default is 8000 ms; the range is 250 through 90000 ms):

```
[edit fc-fabrics fabric-name protocols fip]
user@switch# set fka-adv-period milliseconds
```

3. Configure the priority value the switch advertises to ENodes in the range from 0 through 255; the default value is 128:

```
[edit fc-fabrics fabric-name protocols fip]
user@switch# set priority priority
```

4. Configure the FC-MAP value to match the FC-MAP value of the attached FC switch in the FC SAN fabric; the range of possible values is 0EFC00 through 0EFCFF, and the default value is 0EFC00:

```
[edit fc-fabrics fabric-name protocols fip]
user@switch# set fc-map fc-map
```

5. Configure the interfaces in the FC fabric as FCoE trusted (in this example, we assume that the interfaces have not been enabled for FIP snooping):

```
[edit fc-fabrics fabric-name protocols fip]
user@switch# set fcoe-trusted
```

6. Configure the maximum number of FCoE sessions for each ENode in the fabric:

```
[edit fc-fabrics fabric-name protocols fip]
user@switch# set max-sessions-per-enode
```

For example, to configure all FCoE interfaces associated with an FC fabric called **movieco\_san** with a FIP keepalive interval value of **25000** milliseconds, a priority of **70**, an FC-MAP value of **0EFC01**, as FCoE trusted, and with a maximum number of FCoE sessions per ENode of 200 sessions:

```
[edit fc-fabrics movieco_san protocols fip]
user@switch# set fka-adv-period 25000
user@switch# set priority 70
user@switch# set fc-map 0EFC01
user@switch# set fcoe-trusted
user@switch# set max-sessions-per-enode 200
```

To override the global FC fabric FIP configuration for a specific FCoE interface using the CLI:

1. Specify the fabric and interface on which you want to configure FIP:

```
[edit fc-fabrics fabric-name protocols fip interface interface-name]
```

2. Configure the FIP keepalive message transmission interval and priority:

```
[edit fc-fabrics fabric-name protocols fip interface interface-name]
user@switch# set fka-adv-period milliseconds
user@switch# set priority priority
```

## Setting the Maximum Number of FIP Login Sessions per ENode

When the switch acts as an FCoE-FC gateway, FCoE node (ENode) devices in the Ethernet network use the gateway to connect to the Fibre Channel (FC) storage area network (SAN). You can limit the maximum number of FIP login sessions permitted on each ENode. Limiting the number of login sessions can prevent login session rejections caused when the connected FC switch port configuration limits the number of FIP login sessions.

The maximum number of FIP sessions per ENode is 2000 sessions (FLOGI plus FDISC sessions). The limit you set applies to every ENode in the specified gateway fabric. Each ENode in the fabric can have up to the maximum number of sessions, but the total number of active sessions cannot exceed the session limits you apply to the fabric or the Node device.

There are also configurable FIP login session limits that you can apply to the gateway FC fabric, to the QFX3500 switch or QFabric system Node device, and to the interfaces in each FC fabric.

- To set a maximum number of FIP login sessions per ENode using the CLI:

```
[edit fc-fabrics fc-fabric-name protocols fip]  
user@switch# set max-sessions-per-enode max-login-sessions
```

For example, to configure the ENodes on an FC fabric named **sanfab1** with a maximum FIP login session limit of **250** sessions:

```
[edit fc-fabrics sanfab1]  
user@switch# set protocols fip max-sessions-per-enode 250
```

- Related Documentation**

## Setting the Maximum Number of FIP Login Sessions per FC Interface

When the switch acts as an FCoE-FC gateway, NP\_Ports are the native FC interfaces the gateway uses to connect to the FC switch. You can limit the maximum number of FIP login sessions permitted on an NP\_Port interface. Limiting the number of login sessions on an interface can prevent login session rejections caused when the connected FC switch port configuration limits the number of FIP login sessions.

**TIP:** A good practice is to configure a maximum number of login sessions on each NP\_Port that is less than or equal to the maximum number of login sessions permitted on the connected FC switch port.

The maximum number of FIP sessions is 2500 sessions. (This is the combined total of all VN2VF\_Port and VN2VN\_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the gateway FC fabric, to the QFX3500 switch or QFabric system Node device, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections, the sum of the maximum FIP login sessions on all of the NP\_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.

- To set a maximum number of FIP login sessions on an NP\_Port using the CLI:

```
[edit fc-fabrics fc-fabric-name interface interface-name]
user@switch# set max-login-sessions max-login-sessions
```

For example, to configure NP\_Port interface **fc-0/0/5** with a maximum FIP login session limit of **500** sessions on an FC fabric named **sanfab1**:

```
[edit fc-fabrics sanfab1]
user@switch# set interface fc-0/0/5 max-login-sessions 500
```

### Related Documentation

## Setting the Maximum Number of FIP Login Sessions per FC Fabric

When the QFX Series acts as an FCoE-FC gateway, you configure at least one local FC fabric on the gateway. A gateway FC fabric creates associations that connect FCoE devices on an Ethernet network to an FC switch on a Fibre Channel network. Each FC fabric on a gateway includes native FC interfaces (NP\_Ports) that connect the gateway to the FC switch. When FCoE devices want to log in to the FC switch, the gateway sends the FIP login requests to the FC switch on the NP\_Port links.

You can limit the maximum number of FIP login sessions permitted on a gateway FC fabric. If a QFX3500 switch or QFabric system Node device has more than one FC fabric, limiting the number of login sessions on an FC fabric can prevent one FC fabric from using all of the login sessions available on the device.

The maximum number of FIP sessions is 2500 sessions. (This is the combined total of all VN2VF\_Port and VN2VN\_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the FC fabric NP\_Port interfaces, to the QFX3500 switch or QFabric system Node device, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections:

- The sum of the maximum FIP login sessions on all of the NP\_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.
- The sum of the maximum FIP login sessions on all of the FC fabrics on a device should not exceed the maximum number of sessions per device.
- To set a maximum number of FIP login sessions on an FC fabric using the CLI:

```
[edit fc-fabrics fc-fabric-name]  
user@switch# set max-login-sessions max-login-sessions
```

For example, to configure an FC fabric named **sanfab1** with a maximum FIP login session limit of **2000** sessions:

```
[edit fc-fabrics sanfab1]  
user@switch# set fc-fabrics sanfab1 max-login-sessions 2000
```

### Related Documentation

- [Setting the Maximum Number of FIP Login Sessions per FC Interface on page 4593](#)
- [Setting the Maximum Number of FIP Login Sessions per Node Device on page 4595](#)
- [Understanding Interfaces on an FCoE-FC Gateway on page 4420](#)

## Setting the Maximum Number of FIP Login Sessions per Node Device

When a QFX3500 switch or QFabric system Node device acts as an FCoE-FC gateway, it connects FCoE devices on an Ethernet network to an FC switch in a Fibre Channel network. You can limit the maximum number of FIP login sessions for the FCoE devices on each Node device.

For QFX3500 switches, the maximum limit means that the sum of the FIP login sessions on all of the local FC fabrics on that QFX3500 switch cannot exceed the device maximum.

For the QFabric system, the limit applies to each Node device in the QFabric system. For example, if you configure a maximum FIP login session value of 2000 sessions, each Node device in the QFabric system can have a total of up to 2000 FIP login sessions running on its FC fabrics.

The maximum number of FIP sessions a device can support is 2500 sessions. (This is the combined total of all VN2VF\_Port and VN2VN\_Port sessions on the system.)

There are also configurable FIP login session limits that you can apply to the FC fabrics on the devices, to the NP\_Port interfaces in each FC fabric, and to the ENodes in each FC fabric. To prevent unexpected FIP login rejections:

- The sum of the maximum FIP login sessions for all of the FC fabrics on a device should not exceed the maximum number of sessions per device.
- The sum of the maximum FIP login sessions on all of the NP\_Port interfaces that belong to an FC fabric should not exceed the maximum number of sessions the FC fabric supports or the device supports.
- To set a maximum number of FIP login sessions for Node devices using the CLI:

[edit **fc-options**]

```
user@switch# set max-login-sessions-per-node max-login-sessions-per-node
```

For example, to configure a maximum FIP login limit of **2000** sessions on a QFX3500 switch or on all Node devices in a QFabric system:

[edit **fc-options**]

```
user@switch# set max-login-sessions-per-node 2000
```

## Configuring VN2VF\_Port FIP Snooping on an FCoE Transit Switch

VN\_Port to VF\_Port (VN2VF\_Port) Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping uses information gathered during FIP discovery and login to create firewall filters that provide security against unauthorized access to the FC switch or FCoE forwarder (FCF) through the EX4500 or QFX Series when the switch is acting as an FCoE transit switch. The firewall filters allow only FCoE devices that succeed at logging in to the FC fabric to access the FCF through the transit switch. VN2VF\_Port FIP snooping provides security for the point-to-point virtual links that connect host FCoE Nodes (ENodes) and FCFs in the FCoE VLAN by denying access to any device that does not successfully log in to the FCF.

VN2VF\_Port FIP snooping is disabled by default. You enable VN2VF\_Port FIP snooping on a per-VLAN basis for VLANs that carry FCoE traffic. Ensure that a VLAN that carries FCoE traffic carries only FCoE traffic, because enabling VN2VF\_Port FIP snooping denies access for all other Ethernet traffic.

**NOTE:** All of the transit switch ports are untrusted by default. If an ENode on an FCoE device logs in to an FCF before you enable VN2VF\_Port FIP snooping on the VLAN and you then enable VN2VF\_Port FIP snooping, the transit switch denies traffic from the ENode because the transit switch has not snooped (learned) the ENode state. The following process automatically logs the ENode back in to the FCF to reestablish the connection:

1. VN2VF\_Port FIP snooping is enabled on an FCoE VLAN on the switch.
2. The switch denies existing connections between servers and the FCF on the FCoE VLAN by filtering the FCoE traffic and FIP traffic, so no keepalive messages from the ENodes reach the FCF.
3. The FCF port timer for each ENode and for each VN\_Port on each ENode expires.
4. The FCF sends each ENode whose port timer has expired a Clear Virtual Links (CVL) message.
5. The CVL message causes the ENode to log in again.

Because the FCF is a trusted source, you configure interfaces that connect to the FCF as trusted interfaces. VN2VF\_Port FIP snooping continues to run on trusted interfaces so that the switch learns the FCF state.

**NOTE:** Do not configure ENode-facing interfaces both with FIP snooping enabled and as trusted interfaces. FCoE VLANs with interfaces that are directly connected to FCoE hosts should be configured with FIP snooping enabled and the interfaces should not be trusted interfaces. Ethernet interfaces that are connected to an FCF should be configured as trusted interfaces and should not have FIP snooping enabled. Interfaces that are connected to a transit switch that is performing FIP snooping can be configured as trusted interfaces if the FCoE VLAN is not enabled for FIP snooping.

Optionally, you can specify an FC-MAP value for each FCoE VLAN. On a given FCoE VLAN, the switch learns only FCFs that have a matching FC-MAP value. The default FC-MAP value is 0EFC00h for all FC devices. (Enter hexadecimal values for FC-MAP preceded by the hexadecimal indicator “0x”—for example, 0x0EFC00.) If you change the FC-MAP value of an FCF, change the FC-MAP value for the FCoE VLAN it belongs to on the switch and on the servers you want to communicate with the FCF. An FCoE VLAN can have one and only one FC-MAP value.

To enable VN2VF\_Port FIP snooping:

- To enable VN2VF\_Port FIP snooping on a single VLAN and specify the optional FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name examine-fip fc-map fc-map-value
```

For example, to enable VN2VF\_Port FIP snooping on a VLAN named **san1\_vlan** and change the FC-MAP value to **0x0EFC03**:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan san1_vlan examine-fip fc-map 0x0EFC03
```

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces ENodes to log in again.

- To enable VN2VF\_Port FIP snooping on all VLANs and use the default FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all examine-fip
```

- To configure an interface as a trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name fcoe-trusted
```

For example, to configure interface **xe-0/0/30** as a trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/30 fcoe-trusted
```

## Disabling VN2VF\_Port FIP Snooping on an FCoE-FC Gateway Switch Interface

When the switch acts as an FCoE-FC gateway, the FCoE-network-facing Ethernet interfaces in the FCoE VLAN are automatically enabled for VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping. You can disable VN2VF\_Port FIP snooping on an individual Ethernet interface or you can disable VN2VF\_Port FIP snooping globally for all Ethernet interfaces in a gateway Fibre Channel (FC) fabric.

Disable VN2VF\_Port FIP snooping on an Ethernet interface by configuring it as an FCoE trusted interface. Disable VN2VF\_Port FIP snooping on all Ethernet interfaces in an FC fabric by configuring the FC fabric as FCoE trusted.

Do not disable VN2VF\_Port FIP snooping on an interface unless you are certain that the interface is connected to a trusted device. Do not disable VN2VF\_Port FIP snooping on an FC fabric unless all of the FCoE-network-facing interfaces in the fabric are either connected to a transit switch that is performing VN2VF\_Port FIP snooping on the FCoE devices as they log in to the FC network or all of the interfaces are connected to trusted devices.

VN2VF\_Port FIP snooping installs firewall filters that block FIP and FCoE frames from sources that have not logged in to the switch and prevents unauthorized access to the network. Disabling VN2VF\_Port FIP snooping disables these firewall filters and permits access to all FIP and FCoE frames transported on that interface.

- To disable VN2VF\_Port FIP snooping on an FCoE-device-facing Ethernet interface in an FCoE VLAN, configure that interface as a trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name fcoe-trusted
```

For example, to configure interface *xe-0/0/7* as a trusted FC interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/7 fcoe-trusted
```

- To disable VN2VF\_Port FIP snooping on all FCoE-device-facing interfaces in a gateway FC fabric, configure that fabric as a trusted fabric:

```
[edit]
user@switch# set fc-fabrics fabric-name protocols fip fcoe-trusted
```

For example, to configure an FC fabric named *santastic* as an FCoE trusted fabric:

```
[edit]
user@switch# set fc-fabrics santastic protocols fip fcoe-trusted
```

## Enabling VN2VN\_Port FIP Snooping and Configuring the Beacon Period on an FCoE Transit Switch

VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VF\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

VN2VN\_Port FIP snooping is disabled by default. You enable VN2VN\_Port FIP snooping on a per-VLAN basis on VLANs that carry VN2VN\_Port FCoE traffic. Ensure that the VLAN carries only FCoE traffic between VN\_Ports, because enabling VN2VN\_Port FIP snooping denies access for all other traffic, including VN2VF\_Port FIP snooping traffic.

All ENodes that you want to communicate using VN2VN\_Port FIP snooping must use an FCoE VLAN dedicated to VN2VN\_Port traffic. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN2VF\_Port traffic is dropped.

The *beacon period* is conceptually similar to the FIP keepalive period (timer) for VN2VF\_Port FIP snooping virtual link maintenance. The beacon period performs virtual link maintenance for VN2VN\_Port FIP snooping. It is the time interval between messages that verify the connection is still valid and the device at the other end of the virtual link is still reachable. You set the beacon period value for each FCoE VLAN that you configure to do VN2VN\_Port FIP snooping.

**NOTE:** In addition to enabling VN2VN\_Port FIP snooping and configuring the beacon period, you must also configure a dedicated FCoE VLAN for the VN2VN\_Port traffic, and set the FCoE transit switch ports in the proper port mode and trusted or untrusted state (interfaces are untrusted by default). See the VN2VN\_Port FIP snooping configuration example topics for complete configurations of several common network topologies.

To enable VN2VN\_Port FIP snooping and set the beacon period on an FCoE VLAN that is dedicated to VN2VN\_Port traffic:

- [edit ethernet-switching-options secure-access-port]  
user@switch# **set vlan *vlan-name* examine-fip examine-vn2vn beacon-period *milliseconds***

For example, to enable VN2VN\_Port FIP snooping on a VLAN named **vlan200** and set the beacon period to **90000** milliseconds:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan200 examine-fip examine-vn2vn beacon-period 90000
```

## Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. QFX Systems support three DCBX modes:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric Node devices come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

**NOTE:** QFX Systems do not support pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00. If a QFX Series interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

```
[edit protocols dcbx]
user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |
dcbx-version-1.01)
```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

## Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default

forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

**NOTE:** If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as “FCoE down” and disables FCoE on the interface.

When DCBX marks an interface as “FCoE down,” the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as “FCoE down.”

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

```
[edit]
user@switch# set protocols dcbx interface interface-name priority-flow-control
no-auto-negotiation
```

2. Turn off autonegotiation for applications.

```
[edit]
user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
```

3. Turn off autonegotiation for ETS.

```
[edit]
user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
no-auto-negotiation
```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# set enhanced-transmission-selection recommendation-tlv no-auto-negotiate

## Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

**NOTE:** Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# **set enhanced-transmission-selection recommendation-tlv no-auto-negotiate**

## Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps

and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

```
[edit applications]
user@switch# set application application-name ether-type ether-type
```

For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

```
user@switch# set applications application ptp ether-type 0x88F7
```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

```
[edit]
user@switch# set applications application application-name protocol (tcp | udp)
destination-port port-value
```

For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

```
user@switch# set applications application iscsi protocol tcp destination-port 3260
```

## Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

```
[edit policy-options]
user@switch# set application-maps application-map-name application application-name
code-points [ aliases ] [ bit-patterns ]
```

For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

```
user@switch# set policy-options application-maps ptp-app-map application ptp code points
[ 001 101 ]
```

## Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange

After you define applications and map them to IEEE 802.1p code points in an application map, apply the application map to the interfaces on which you want DCBX to exchange the application protocol information with connected peers. (See *Related Documentation* for how to define applications and configure application maps to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

- To apply an application map to a DCBX interface, specify the DCBX interface and the application map name:

```
[edit protocols]
```

```
user@switch# set dcbx interface interface-name application-map application-map-name
```

For example, to apply an application map named **ptp-app-map** on interface **xe-0/0/11**:

```
user@switch# set protocols dcbx interface xe-0/0/11 application-map ptp-app-map
```

<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Define applications that DCBX advertises.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 4604</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li><li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 4472</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li></ul>

## applications (DCBX)

<b>Syntax</b>	<code>applications {     no-auto-negotiation; }</code>
<b>Hierarchy Level</b>	[edit <code>protocols dcbx interface interface-name</code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 12.1 for the EX Series
<b>Description</b>	Configure Data Center Bridging Capability Exchange protocol (DCBX) applications on an interface.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 4694</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li> </ul>

## auto-load-rebalance

<b>Syntax</b>	<code>auto-load-rebalance;</code>
<b>Hierarchy Level</b>	[edit <code>fc-fabrics fabric-name proxy</code> ]
<b>Release Information</b>	Command introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure the system to rebalance NP_Port link loads automatically on an FCoE-FC gateway proxy fabric if the link loads become unbalanced. Load rebalancing is a disruptive action that forces some or all sessions (depending on the configured load-balancing algorithm) to log out and then log in again. When sessions log in again, they are placed on NP_Port interfaces so that the link loads are balanced.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining the Proxy Load-Balancing Algorithm on page 4586</a></li> <li>• <a href="#">Example: Configuring Automated Fibre Channel Interface Load Rebalancing on page 4572</a></li> <li>• <a href="#">Simulating On-Demand Fibre Channel Link Load Rebalancing (Dry Run Test) on page 4588</a></li> <li>• <a href="#">Understanding Load Balancing in an FCoE-FC Gateway Proxy Fabric on page 4431</a></li> <li>• <a href="#">Monitoring Fibre Channel Interface Load Balancing on page 4665</a></li> </ul>

## bb-sc-n

---

<b>Syntax</b>	<code>bb-sc-n <i>bb-sc-n</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">fibrechannel-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the buffer-to-buffer credit state change number to prevent the permanent loss of Fibre Channel credits over time (buffer-to-buffer credit recovery).
<b>Options</b>	<p><i>bb-sc-n</i>—Number of buffer-to-buffer state change credits.</p> <p><b>Range:</b> 0 through 15</p> <p><b>Default:</b> 0 (disabled)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel interfaces on page 4751</a></li><li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li><li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li><li>• <a href="#">Configuring a Physical Fibre Channel Interface on page 4578</a></li><li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li></ul>

## beacon-period

<b>Syntax</b>	<code>beacon-period <i>milliseconds</i></code>
<b>Hierarchy Level</b>	[edit ethernet-switching options secure-access-port vlan (all   <i>vlan-name</i> ) <a href="#">examine-fip</a> <a href="#">examine-vn2vn</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Set the interval between periodic beacons. Beacons perform virtual link maintenance for VN_Ports in a way that is similar to FIP keepalive advertisements.</p> <p>The ENode sends periodic beacons every 90 seconds on behalf of the VN_Port. Each received beacon resets the session timer for the virtual link connection to the other VN_Port. If the FCF does not receive a beacon before the beacon timer expires, the VN_Port is considered as “down” and the virtual link is terminated. The beacon timer expires in 2.5 times the configured beacon timer value.</p>
<b>Options</b>	<p><i>milliseconds</i>—Time in milliseconds between beacons.</p> <p><b>Range:</b> 250 through 90000 milliseconds</p> <p><b>Default:</b> 8000 milliseconds</p>
<b>Required Privilege Level</b>	<p>storage—To view this statement in the configuration.</p> <p>storage-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch) on page 4551</a></li> <li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches) on page 4555</a></li> <li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch) on page 4563</a></li> </ul>

## code-points (Application Maps)

---

<b>Syntax</b>	<code>code-points [ <i>aliases</i> ] [ <i>bit-patterns</i> ];</code>
<b>Hierarchy Level</b>	[edit policy-options <b>application-maps</b> <i>application-map-name</i> <b>application</b> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Define one or more code-point aliases or bit sets for an application.
<b>Options</b>	<i>aliases</i> —Name of the alias or aliases.  <i>bit-patterns</i> —Value of the code-point bits, in decimal form.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Application Map for DCBX Application Protocol TLV Exchange on page 4606</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li><li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 4472</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li></ul>

## dcbx

<b>Syntax</b>	<pre> dcbx {   disable;   interface (<i>interface-name</i>   all) {     disable;     application-map <i>application-map-name</i>;     applications {       no-auto-negotiation;     }     enhanced-transmission-selection {       no-auto-negotiation;       recommendation-tlv {         no-auto-negotiation;       }     }     mode (auto-negotiate   ieee-dcbx   dcbx-version-1.01);     priority-flow-control {       no-auto-negotiation;     }   } } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">protocols</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 11.3 for EX Series switches.</p> <p><b>mode</b> and <b>recommendation-tlv</b> statements introduced in Junos OS Release 12.2 for the QFX Series.</p>
<b>Description</b>	Configure DCBX properties.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 4694</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li> <li>• Understanding DCB Features and Requirements on EX Series Switches</li> <li>• Disabling DCBX to Disable PFC Autonegotiation on EX Series Switches (CLI Procedure)</li> </ul>

## description (Fibre Channel Fabrics)

---

<b>Syntax</b>	<code>description <i>description</i></code>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fabric-name</i> ]
<b>Description</b>	Text string that describes the Fibre Channel fabric. The text string has no effect on the operation of the fabric.
<b>Options</b>	<b><i>description</i></b> —Text that describes the fabric. Text can include letters, numbers, and hyphens (-) and can be up to 255 characters in length. If the text includes spaces, enclose the entire text string in quotation marks.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fabric on page 4718</a></li></ul>

## destination-port (Applications)

<b>Syntax</b>	<code>destination-port <i>port-value</i>;</code>
<b>Hierarchy Level</b>	[edit applications <b>application</b> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) destination port number, which combines with <b>protocol</b> to identify an application type. The Internet Assigned Numbers Authority (IANA) assigns port numbers. See the IANA <i>Service Name and Transport Protocol Port Number Registry</i> at <a href="http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml">http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml</a> for a list of assigned port numbers.
<div>  <p><b>NOTE:</b> To create an application for iSCSI, use the protocol <b>tcp</b> with the destination port number <b>3260</b>.</p> </div>	
<b>Options</b>	<i>port-value</i> —Identifier for the port.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 4604</a></li> <li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li> <li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 4472</a></li> <li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li> </ul>

## disable (DCBX)

---

<b>Syntax</b>	disable
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx</a> ]  [edit <a href="#">protocols dcbx interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Disable Data Center Bridging Capability Exchange protocol (DCBX) on one or more 10-Gigabit Ethernet interfaces.
<b>Default</b>	DCBX is enabled by default on all 10-Gigabit or higher Ethernet interfaces.  DCBX is enabled by default on all 10-Gigabit Ethernet interfaces on EX4500 CEE-enabled switches.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li><li>• <a href="#">Disabling DCBX to Disable PFC Autonegotiation on EX Series Switches (CLI Procedure)</a></li><li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li><li>• <a href="#">Understanding DCB Features and Requirements on EX Series Switches</a></li></ul>

## enhanced-transmission-selection

<b>Syntax</b>	<pre> enhanced-transmission-selection {   no-auto-negotiation;   recommendation-tlv {     no-auto-negotiation;   } } </pre>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Disable advertising the enhanced transmission selection (ETS) state of the interface to the peer. To disable ETS on the interface, do not enable ETS on the interface in the class-of-service (CoS) configuration.</p> <p>Disabling ETS autonegotiation stops the QFX Series from advertising the ETS Configuration TLV and the ETS Recommendation TLV.</p>
<b>Options</b>	<b>no-auto-negotiate</b> —Disable automatic negotiation of priority-based flow control (PFC)
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 4694</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li> <li>• <a href="#">Example: Configuring CoS Hierarchical Port Scheduling (ETS) on page 4962</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li> </ul>

## ether-type

---

<b>Syntax</b>	<code>ether-type <i>ether-type</i>;</code>
<b>Hierarchy Level</b>	[edit applications <a href="#">application</a> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Two-octet field in an Ethernet frame that defines the protocol encapsulated in the frame payload. See <a href="http://standards.ieee.org/develop/regauth/ethertype/eth.txt">http://standards.ieee.org/develop/regauth/ethertype/eth.txt</a> for a list of Institute of Electrical and Electronics Engineers (IEEE) EtherTypes.
<div> <b>NOTE:</b> To create a FIP application, use the EtherType 0x8914.</div>	
<b>Options</b>	<i>type</i> —Identifier for the EtherType.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 4604</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 4472</a></li></ul>

## examine-fip

<b>Syntax</b>	<pre>examine-fip {   examine-vn2vn {     beacon-period <i>milliseconds</i>;   }   fc-map <i>fc-map-value</i>; }</pre>
<b>Hierarchy Level</b>	[edit ethernet-switching-options secure-access-port vlan (all   <i>vlan-name</i> )]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement <b>examine-vn2vn</b> introduced in Junos OS Release 12.2 for the QFX Series.</p>
<b>Description</b>	<p>Enable FIP snooping on a specified VLAN. Ensure that the VLAN is a dedicated FCoE VLAN that transports only FCoE traffic.</p> <p>(QFX Series only) Enable VN_Port to VN_Port (VN2VN_Port) FIP snooping on a specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only VN2VN_Port traffic. One FCoE VLAN cannot support both VN_Port to VF_Port (VN2VF_Port) FIP snooping and VN2VN_Port FIP snooping. Configure separate, dedicated FCoE VLANs for VN2VN_Port FIP snooping and VN2VN_Port FIP snooping.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>vlan</li> <li>Example: Configuring an FCoE Transit Switch</li> <li><a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> </ul>

## examine-vn2vn

---

<b>Syntax</b>	<code>examine-vn2vn {     beacon-period milliseconds; }</code>
<b>Hierarchy Level</b>	[edit ethernet-switching options secure-access-port vlan (all   <i>vlan-name</i> ) <b>examine-fip</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Enable VN_Port to VN_Port (VN2VN) FIP snooping on a specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only FCoE traffic. A VLAN cannot support VN2VN FIP snooping and VN_Port to VF_Port FIP snooping (VN2VF) simultaneously. Configure separate VLANs for VN2VN FIP snooping and VN2VF FIP snooping.</p> <p>When you enable VN2VN FIP snooping on a VLAN, the VN2VF session filters are removed and the all existing VN2VF sessions are terminated.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch) on page 4551</a></li><li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches) on page 4555</a></li><li>• <a href="#">Example: Configuring VN2VN_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch) on page 4563</a></li></ul>

## fabric-id

---

<b>Syntax</b>	<code>fabric-id <i>fc-fabric-id</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a unique identifier for the FC fabric.

**NOTE:** Changing the ID of an FC fabric causes all logins to drop and forces the ENodes to log in again.

<b>Options</b>	<i>fc-fabric-id</i> —Unique identifier of the FC fabric.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel fabric on page 4718</a></li> <li>• <a href="#">Configuring an FCoE-FC Gateway Fibre Channel Fabric on page 4576</a></li> <li>• <a href="#">Understanding an FCoE-FC Gateway on page 4399</a></li> </ul>

## fabric-type

---

<b>Syntax</b>	<code>fabric-type proxy;</code>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify that the FC fabric be an FCoE-FC gateway fabric.
<b>Options</b>	<i>proxy</i> —Specify that the switch be an FCoE-FC gateway fabric.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel fabric on page 4718</a></li> <li>• <a href="#">Configuring an FCoE-FC Gateway Fibre Channel Fabric on page 4576</a></li> <li>• <a href="#">Understanding an FCoE-FC Gateway on page 4399</a></li> </ul>

## family fcoe

---

<b>Syntax</b>	<pre>family fcoe {     oxid (enable   disable); }</pre>
<b>Hierarchy Level</b>	[edit forwarding-options hash-key]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure whether or not to use the originator exchange identifier (OxID) field for hash control for FCoE traffic load balancing.
<b>Options</b>	The statement is explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling and Disabling CoS OxID Hash Control on page 4589</a></li><li>• <a href="#">Understanding OxID Hash Control for FCoE Traffic Load Balancing on page 4447</a></li></ul>

## fc2

---

<b>Syntax</b>	<pre>fc2 {     traceoptions {         file <i>filename</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;;         &lt;world-readable   no-world-readable&gt;;         flag <i>flag</i> &lt;flag-modifier&gt;;     } }</pre>
<b>Hierarchy Level</b>	[edit <b>fc-fabrics</b> <i>fc-fabric-name</i> ]
<b>Description</b>	Fibre Channel network layer (FC2) configuration.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.

## fc-fabrics

```

Syntax  fc-fabrics {
        fc-fabric-name {
            description
            fabric-id fc-fabric-id;
            fabric-type proxy;
            interface {

<b>Syntax</b>	<code>fc-map <i>fc-map-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit ethernet-switching options secure-access-port vlan (all   <i>vlan-name</i>) <a href="#">examine-fip</a>]</p> <p>For the QFX Series only:</p> <p>[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">protocols fip</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).</p> <p>You can configure the FC-MAP value or use the default value. The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN_Port MAC address.</p> <p>When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.</p>
	<div>  <p><b>NOTE:</b> Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.</p> </div>
<b>Options</b>	<p><b><i>fc-map-value</i></b>—FC-MAP value, hexadecimal value preceded by “0x”.</p> <p><b>Range:</b> 0x0EFC00 through 0x0EFCFF</p> <p><b>Default:</b> 0xEFC00</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">examine-fip on page 4242</a></li> <li>• <a href="#">show fip snooping on page 4770</a></li> <li>• Example: Configuring an FCoE Transit Switch</li> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> </ul>

## fc-options

---

<b>Syntax</b>	<code>fc-options</code> <code>max-login-sessions-per-node</code> <i>max-login-sessions-per-node</i> ; <code>traceoptions</code> { file <i>filename</i> <replace> <size <i>size</i> > <files <i>number</i> > <no-stamp>; <world-readable   no-world-readable>; flag <i>flag</i> < <i>flag-modifier</i> > <disable>; }
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set Fibre Channel options.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.

## fcoe-trusted

---

<b>Syntax</b>	fcoe-trusted;
<b>Hierarchy Level</b>	<p>[edit ethernet-switching-options secure-access-port interface <i>interface-name</i>]</p> <p>For the QFX Series only:</p> <p>[edit fc-fabrics <i>fc-fabric-name</i> protocols fip]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced for the FC fabric in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.</p> <p>(QFX Series only) Configure the specified local Fibre Channel fabric to trust FCoE traffic on all ports in the fabric. Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted by removing the <b>fcoe-trusted</b> configuration from the fabric forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN_Ports log in again, the switch can build the appropriate FIP snooping filters.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fip snooping on page 4770</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> </ul>

## fibre-channel (Family Interfaces)

---

<b>Syntax</b>	<code>fibre-channel {     port-mode (f-port   np-port); }</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> vlan <a href="#">unit</a> <i>logical-unit-number</i> <a href="#">family</a> ], [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> <a href="#">family</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the port mode for FCoE VLAN interfaces and native FC interfaces.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li><li>• <a href="#">Configuring an FCoE VLAN Interface on page 4582</a></li><li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li><li>• <a href="#">show fibre-channel interfaces on page 4751</a></li><li>• <a href="#">show vlans on page 1752</a></li><li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li></ul>

## fibre-channel (Port)

<b>Syntax</b>	<pre>fibre-channel {   port-range {     port-range-low port-range-high;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">chassis fpc fpc-id pic pic-id</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a range of ports to carry FC traffic when the switch is configured as an FCoE-FC gateway.
<b>Options</b>	The statement is explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li> <li>• <a href="#">Configuring a Physical Fibre Channel Interface on page 4578</a></li> <li>• <a href="#">show fibre-channel interfaces on page 4751</a></li> <li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li> </ul>

## fibrechannel-options

<b>Syntax</b>	<pre>fibrechannel-options {   bb-sc-n   (loopback   no-loopback);   speed (auto-negotiation   2g   4g   8g); }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces interface-name</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure FC interface properties such as speed and loopback mode.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel interfaces on page 4751</a></li> <li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li> </ul>

## fip

---

**Syntax**    `fip {  
          fcoe-trusted;  
          fc-map fc-map-value;  
          fka-adv-period milliseconds;  
          interface {  
            interface-name {  
              fka-adv-period milliseconds;  
              priority priority;  
            }  
          }  
          max-sessions-per-enode max-sessions-per-enode;  
          priority priority;  
          traceoptions {  
            file filename <replace> <size size> <files number> <no-stamp>;  
            <world-readable | no-world-readable>;  
            flag flag <flag-modifier> <disable>;  
          }  
          }  
          }`

**Hierarchy Level**    [edit `fc-fabrics` *fc-fabric-name* `protocols`]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure global or interface-specific FIP options. Individual interface settings override global settings.

**Options**    The statements are explained separately.

**Required Privilege Level**    storage—To view this statement in the configuration.  
                                  storage-control—To add this statement to the configuration.

## interface (FIP)

---

<b>Syntax</b>	<pre>interface {     <i>interface-name</i> {         <i>fka-adv-period</i> <i>milliseconds</i>;         <i>priority</i> <i>priority</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">protocols fip</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure FIP options on a per-interface basis. (Override global FIP configuration for a specified interface.)
<b>Options</b>	<p><i>interface-name</i>—Name of the interface.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>storage—To view this statement in the configuration.</p> <p>storage-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fip on page 4724</a></li><li>• <a href="#">Configuring FIP on an FCoE-FC Gateway on page 4589</a></li><li>• <a href="#">Overview of FIP on page 4384</a></li></ul>

## load-balance-algorithm

<b>Syntax</b>	load-balance-algorithm (simple   enode-based   flogi-based);
<b>Hierarchy Level</b>	[edit <b>fc-fabrics</b> <i>fabric-name</i> <b>proxy</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Set the load-balancing algorithm that the QFX Series uses to distribute FCoE sessions (FLOGI and FDISC sessions from the FCoE devices in the Ethernet network) among the NP_Port links to the FC switch.

**NOTE:** Changing the load-balancing algorithm when FCoE sessions are running forces the FCoE sessions to log out, then log in again.

<b>Options</b>	<p><b>simple</b>—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link. When a link load rebalance occurs, the system minimizes disruption by using an algorithm to log out only the sessions that need to be moved to other links to balance the link load. To further minimize disruption, the algorithm logs out the sessions with the fewest dependencies (for example, FDISC sessions are logged out before FLOGI sessions). When the sessions log in again, they are placed on NP_Port interfaces in a manner that balances the link loads. This is the default load-balancing algorithm.</p> <p><b>enode-based</b>—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. When a link load rebalance occurs, the system logs off all sessions. The sessions log in again and are placed on NP_Port interfaces in a balanced manner.</p> <p><b>flogi-based</b>—FLOGI-based load balancing is similar to ENode-based load balancing, but the behavior when the loads are rebalanced is different. Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. When a link load rebalance occurs, the system minimizes disruption by using an algorithm to log out only the sessions that need to be moved to other links to balance the link load. When the logged out sessions log back in, they are placed on NP_Port interfaces in a manner that balances the link loads.</p>
<b>Required Privilege Level</b>	<p>storage—To view this statement in the configuration.</p> <p>storage-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Defining the Proxy Load-Balancing Algorithm on page 4586</a></li> <li>• <a href="#">Example: Configuring Automated Fibre Channel Interface Load Rebalancing on page 4572</a></li> </ul>

## loopback (Fibre Channel Interface)

---

<b>Syntax</b>	(loopback   no-loopback);
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">fibrechannel-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Enable or disable loopback mode for FC interfaces.
<b>Default</b>	By default, loopback mode is disabled on FC interfaces.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel interfaces on page 4751</a></li><li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li></ul>

## max-login-sessions

<b>Syntax</b>	<code>max-login-sessions <i>max-login-sessions</i>;</code>
<b>Hierarchy Level</b>	<code>[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i>];</code> <code>[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">interface</a> <i>interface-name</i>];</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Set the maximum number of FCoE initialization protocol (FIP) session logins permitted for an individual NP_Port interface in an FCoE-FC gateway fabric (FC fabric) or for the entire FCoE-FC gateway fabric. You can set a maximum FIP session limit for each NP_Port interface connected to an FC switch. You can also set a maximum FIP session limit for the entire FC fabric. The sum of the maximum login sessions permitted on the NP_Port interfaces in an FC fabric should not exceed the maximum login sessions configured for that FC fabric.</p> <p>The maximum number of FIP sessions (the combined total of all VN2VF_Port and VN2VN_Port sessions on the system) is 2500 sessions.</p>
<b>Options</b>	<p><i>max-login-sessions</i>—Maximum number of FIP login sessions.</p> <p><b>Range:</b> 128 through 2500</p> <p><b>Default:</b> 2500</p>
<b>Required Privilege Level</b>	<p>storage—To view this statement in the configuration.</p> <p>storage-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">max-login-sessions-per-node on page 4642</a></li> <li>• <a href="#">Setting the Maximum Number of FIP Login Sessions per FC Interface on page 4593</a></li> <li>• <a href="#">Setting the Maximum Number of FIP Login Sessions per FC Fabric on page 4594</a></li> <li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li> </ul>

## max-login-sessions-per-node

---

<b>Syntax</b>	<code>max-login-sessions-per-node</code> <i>max-login-sessions-per-node</i> ;
<b>Hierarchy Level</b>	[edit <a href="#">fc-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Set the maximum number of FCoE initialization protocol (FIP) session logins permitted on a Node device. (This is the combined total of all VN2VF_Port and VN2VN_Port sessions on the Node device.)</p> <p>On a QFX3500 switch, the <b>max-login-sessions-per-node</b> command sets the maximum FIP session login limit for all of the FC fabrics configured on the device. The combined number of FIP sessions on all FC fabrics on the device should not exceed this limit.</p> <p>On a QFabric system, the <b>max-login-sessions-per-node</b> command globally sets the maximum FIP session login limit for each QFabric system Node device in the QFabric system. For example, if you set the Node limit to 2000 login sessions, then each QFabric Node device supports up to 2000 FIP login sessions. The total configured maximum number of login sessions of all of the FC fabrics on a Node device should not exceed the Node session limit.</p>
	<div><p><b>NOTE:</b> FIP login session limits configured at the FC fabric level or at the FC fabric interface level might limit a Node device to fewer total sessions than the configured Node limit.</p></div>
<b>Options</b>	<p><b>max-login-sessions-per-node</b>—Maximum number of FIP login sessions.</p> <p><b>Range:</b> 128 through 2500</p> <p><b>Default:</b> 2500</p>
<b>Required Privilege Level</b>	<p>storage—To view this statement in the configuration.</p> <p>storage-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">max-login-sessions on page 4641</a></li><li>• <a href="#">Setting the Maximum Number of FIP Login Sessions per Node Device on page 4595</a></li><li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li></ul>

## max-sessions-per-enode

<b>Syntax</b>	<code>max-sessions-per-enode <i>max-sessions-per-enode</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">protocols</a> <a href="#">fip</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Set the maximum number of FCoE login sessions (FLOGI plus FDISC) from a single ENode allowed on the gateway FC fabric (the fabric configured on the QFabric system). The maximum number of logins per ENode is 2000 sessions.
	<div>  <p><b>NOTE:</b> A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions. There is no limit to the number of end-to-end storage sessions.</p> </div>
<b>Options</b>	<p><b><i>max-sessions-per-enode</i></b>—Maximum number of FCoE sessions a single ENode can establish on the switch.</p> <p><b>Range:</b> 32 through 2000</p> <p><b>Default:</b> 32</p>
<b>Required Privilege Level</b>	<p><b>storage</b>—To view this statement in the configuration.</p> <p><b>storage-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">fcoe-trusted on page 4244</a></li> <li>• <a href="#">show fibre-channel fip on page 4724</a></li> <li>• <a href="#">Configuring FIP on an FCoE-FC Gateway on page 4589</a></li> <li>• <a href="#">Understanding FIP Parameters on an FCoE-FC Gateway on page 4416</a></li> </ul>

## mode (DCBX)

---

<b>Syntax</b>	<code>mode (auto-negotiate   ieee-dcbx   dcbx-version-1.01);</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	<p>Set the DCBX mode for the specified interface or interfaces.</p> <p>QFX3500 switches come up in IEEE DCBX mode and then autonegotiate with the connected peer to set the DCBX mode.</p> <p>QFabric system Node devices come up in version 1.01 DCBX mode and then autonegotiate with the connected peer to set the DCBX mode.</p>
<b>Default</b>	The default DCBX mode is autonegotiation.
<b>Options</b>	<p><b>auto-negotiate</b>—Automatically negotiate the DCBX mode with the connected peer.</p> <p><b>ieee-dcbx</b>—Force the interface to use IEEE DCBX mode, regardless of the peer configuration.</p> <p><b>dcbx-version-1.01</b>—Force the interface to use version 1.01 DCBX mode, regardless of the peer configuration.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 4694</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li><li>• <a href="#">Understanding DCBX on page 4463</a></li></ul>

## no-fabric-wwn-verify

<b>Syntax</b>	no-fabric-wwn-verify;
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fabric-name</i> <a href="#">proxy</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable the fabric worldwide name (WWN) verification check in the fabric login accept message (FLOGI-ACC) for implicit FLOGIs. If you enable this option, when a QFX Series NP_Port performs a FLOGI to the FC fabric, the QFX Series does not verify the fabric WWN in the FLOGI-ACC against the current fabric WWN.
	<div>  <p><b>NOTE:</b> Disabling or enabling the fabric WWN verification check logs out all FCoE sessions.</p> </div>
<b>Default</b>	Disabled. By default, all implicit FLOGIs from the QFX Series NP_Ports to the FC fabric are verified against the current fabric WWN.
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel proxy fabric-state on page 4757</a></li> <li>• <a href="#">Understanding FCoE-FC Gateway Functions on page 4403</a></li> </ul>

## oxid

---

<b>Syntax</b>	oxid (enable   disable)
<b>Hierarchy Level</b>	[edit forwarding-options hash-key <a href="#">family fcoe</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Enable or disable whether the switch uses the originator exchange identifier (OxID) field for hash control for FCoE traffic load balancing.
<b>Default</b>	OxID hash control is enabled by default.
<b>Options</b>	<b>oxid (enable   disable)</b> —Enable or disable whether the switch uses the OxID hash control field for FCoE traffic load balancing.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling and Disabling CoS OxID Hash Control on page 4589</a></li><li>• <a href="#">Understanding OxID Hash Control for FCoE Traffic Load Balancing on page 4447</a></li></ul>

## policy-options

```
Syntax  policy-options
        application-maps application-map-name {
            application application-name {
                code-points [ aliases ] [ bit-patterns ];
            }
        }
        policy-statement policy-name {
            term term-name {
                from {
                    family family-name;
                    match-conditions;
                    policy subroutine-policy-name;
                    prefix-list prefix-list-name;
                    prefix-list-filter prefix-list-name match-type <actions>;
                    route-filter destination-prefix match-type <actions>;
                    source-address-filter source-prefix match-type <actions>;
                }
                to {
                    match-conditions;
                    policy subroutine-policy-name;
                }
                then actions;
            }
        }
    }
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description** Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level** storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

## port-mode (Fibre Channel Interfaces)

---

<b>Syntax</b>	<code>port-mode (f-port   np-port);</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>vlan</i> <a href="#">unit</a> <i>unit</i> <a href="#">family</a> <i>fibre-channel</i> ], [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> <a href="#">family</a> <i>fibre-channel</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the FCoE VLAN interface port mode to F_Port to connect the switch to FCoE initiators, or configure the native FC interface port mode to proxy N_Port (NP_Port) to connect the switch to an FC switch fabric port (F_Port).
<b>Options</b>	<b>f-port</b> —Configure an FCoE VLAN interface to connect to FCoE initiator Virtual N_Ports (VN_Ports).  <b>np-port</b> —Configure a native FC port to connect to an FC switch F_Port.
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel interfaces on page 4751</a></li><li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li><li>• <a href="#">Configuring an FCoE VLAN Interface on page 4582</a></li><li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li><li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li></ul>

## port-range

<b>Syntax</b>	<code>port-range <i>port-range-low</i> <i>port-range-high</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">chassis fpc</a> <i>fpc-id</i> <a href="#">pic</a> <i>pic-id</i> <a href="#">fibre-channel</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure a contiguous block of ports as FC ports. You can configure the FC-capable ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47 to create blocks of native FC interfaces. You cannot individually configure a single port as a native FC interface. Within these port blocks, you cannot mix FC interfaces with Ethernet interfaces. All of the ports in a block must be either native FC interfaces or Ethernet interfaces.</p> <p>You can configure:</p> <ul style="list-style-type: none"> <li>• Six native FC interfaces by configuring either ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5, or ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.</li> <li>• Twelve native FC interfaces by configuring ports xe-0/0/0 through xe-0/0/5 as fc-0/0/0 through fc-0/0/5 and ports xe-0/0/42 through xe-0/0/47 as fc-0/0/42 through fc-0/0/47.</li> <li>• No native FC interfaces by leaving ports xe-0/0/0 through xe-0/0/5 and ports xe-0/0/42 through xe-0/0/47 in their default state as Ethernet interfaces.</li> </ul>
<b>Options</b>	<p><b><i>port-range-low</i></b>—Lowest-numbered port in the block of native FC interfaces, either 0 or 42.</p> <p><b><i>port-range-high</i></b>—Highest-numbered port in the block of native FC interfaces. The value is 5 if the <b><i>port-range-low</i></b> value is 0. The value is 47 if the <b><i>port-range-low</i></b> value is 42.</p>
	<div>  <p><b>NOTE:</b> Only a complete block of ports, xe-0/0/0 through xe-0/0/5, xe-0/0/42 through xe0/0/47, or both, can be configured as FC ports.</p> </div>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel interfaces on page 4751</a></li> <li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li> <li>• <a href="#">Configuring a Physical Fibre Channel Interface on page 4578</a></li> <li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li> </ul>

## priority (FIP)

---

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">protocols</a> <a href="#">fip</a> ], [edit <a href="#">fc-fabrics</a> <i>fc-fabric-name</i> <a href="#">protocols</a> <a href="#">fip</a> <a href="#">interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Sets the global or interface-specific priority value associated with the switch FCF-MAC. CNAs use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority. The switch advertises this value to the server ENodes on the FCoE network. A priority value set at the interface level overrides the global setting.
<b>Options</b>	<b><i>priority</i></b> —Value that determines the FCF an ENode selects to perform FIP FLOGI. The lower the priority number, the higher the priority of the FCF. <b>Range:</b> 0 through 255 <b>Default:</b> 128
<b>Required Privilege Level</b>	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fip on page 4724</a></li><li>• <a href="#">show fibre-channel fip interface on page 4739</a></li><li>• <a href="#">Overview of FIP on page 4384</a></li><li>• <a href="#">Configuring FIP on an FCoE-FC Gateway on page 4589</a></li></ul>

## priority-flow-control

---

<b>Syntax</b>	<code>priority-flow-control {     no-auto-negotiation; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">protocols dcbx interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.
<b>Options</b>	<b>no-auto-negotiation</b> —Disable automatic negotiation of PFC.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 4694</a></li> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 5145</a></li> <li>• <a href="#">Configuring Priority-Based Flow Control for an EX Series Switch (CLI Procedure)</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li> <li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 4509</a></li> <li>• <a href="#">Understanding Data Center Bridging Capability Exchange Protocol for EX Series Switches</a></li> <li>• <a href="#">Understanding Priority-Based Flow Control</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li> </ul>

## protocol (Applications)

---

<b>Syntax</b>	<code>protocol (tcp   udp);</code>
<b>Hierarchy Level</b>	[edit applications <a href="#">application</a> <i>application-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Networking protocol type, which combines with <b>destination-port</b> to identify an application type.
<div> <b>NOTE:</b> To create an application for iSCSI, use the protocol <code>tcp</code> with the destination port number 3260.</div>	
<b>Options</b>	<code>tcp</code> —Transmission Control Protocol  <code>udp</code> —User Datagram Protocol
<b>Required Privilege Level</b>	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Defining an Application for DCBX Application Protocol TLV Exchange on page 4604</a></li><li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li><li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on page 4472</a></li><li>• <a href="#">Understanding DCBX Application Protocol TLV Exchange on EX Series Switches</a></li></ul>

## protocols (FIP)

```
Syntax protocols {
    fip {
        fcoe-trusted;
        fc-map fc-map-value;
        fka-adv-period milliseconds;
        interface {
            interface-name {
                fka-adv-period milliseconds;
                priority priority;
            }
        }
        max-sessions-per-enode max-sessions-per-enode;
        priority priority;
        traceoptions {
            file filename <replace> <size size> <files number> <no-stamp>;
            <world-readable | no-world-readable>;
            flag flag <flag-modifier> <disable>;
        }
    }
}
```

**Hierarchy Level** [edit [fc-fabrics](#) *fc-fabric-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure global or interface-specific FC protocol options. Individual interface settings override global settings.

**Options** The statements are explained separately.

**Required Privilege Level** storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

**Related Documentation**

## proxy (Fibre Channel)

---

Syntax	<pre>proxy {   auto-load-rebalance   load-balance-algorithm (simple   enode-based   flog-based);   no-fabric-wwn-verify;   traceoptions {     file <i>filename</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;     &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;;   } }</pre>
Hierarchy Level	[edit <a href="#">fc-fabrics</a> <i>fabric-name</i> ]
Description	Configure proxy fabric operations.
Options	The statement is explained separately.
Required Privilege Level	storage—To view this statement in the configuration. storage-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Understanding FCoE-FC Gateway Functions on page 4403</a></li></ul>

## recommendation-tlv

---

Syntax	<pre>recommendation-tlv {   no-auto-negotiation; }</pre>
Hierarchy Level	[edit <a href="#">protocols dcbx interface</a> <i>interface-name</i> <a href="#">enhanced-transmission-selection</a> ]
Release Information	Statement introduced in Junos OS Release 12.2 for the QFX Series.
Description	Disable or enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.)
Default	DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.
Options	<b>no-auto-negotiation</b> —Disable sending of the ETS recommendation TLV.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 4694</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li></ul>

## speed (Fibre Channel Interfaces)

<b>Syntax</b>	speed (auto-negotiation   2g   4g   8g);
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">fibrechannel-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure FC interface speed.
<b>Options</b>	<p><b>auto-negotiation</b>—Automatically negotiate interface speed to match the speed of the attached link (2 Gbps, 4 Gbps, 8 Gbps).</p> <p><b>2g</b>—2 Gbps link speed</p> <p><b>4g</b>—4 Gbps link speed</p> <p><b>8g</b>—8 Gbps link speed</p> <p><b>Default:</b> auto-negotiation</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel interfaces on page 4751</a></li> <li>• <a href="#">Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric on page 4495</a></li> <li>• <a href="#">Configuring a Fibre Channel Interface on page 4579</a></li> <li>• <a href="#">Configuring a Physical Fibre Channel Interface on page 4578</a></li> <li>• <a href="#">Understanding Interfaces on an FCoE-FC Gateway on page 4420</a></li> </ul>

## traceoptions (FC-2 Fibre Channel)

---

**Syntax**    `traceoptions {  
              file filename <replace> <size size> <files number> <no-stamp>;  
              <world-readable | no-world-readable>;  
              flag flag <flag-modifier>;  
          }`

**Hierarchy Level**    [edit `fc-fabrics fabric-name fc2`]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Set FC-2 protocol tracing options.

.....  
**NOTE:** The `traceoptions` statement is not supported on the QFabric system.  
.....

**Default**    Traceoptions is disabled.

**Options**    **file *name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***. The traceoption output continues in a second trace file named ***trace-file.1***. When ***trace-file.1*** reaches its maximum size, output continues in a third file named ***trace-file.2***, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **error**—Trace all error events
- **normal**—Trace all normal events.

**Default:** If you do not specify the **normal** option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **rx-frame**—(Optional) Trace received frames.
- **rx-frame-header**—(Optional) Trace received frame headers.

- **tx-frame**—(Optional) Trace transmitted frames.
- **tx-frame-header**—(Optional) Trace transmitted frame headers.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***. Incoming tracefile data is logged in the now empty ***trace-file***. When ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (the maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	storage—To view this statement in the configuration.
<b>Level</b>	storage-control—To add this statement to the configuration.

## traceoptions (Fibre Channel)

---

Syntax	<pre>traceoptions {     file <i>filename</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;     &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt;; }</pre>
Hierarchy Level	[edit <a href="#">fc-options</a> ]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set FC protocol tracing options.

**NOTE:** The **traceoptions** statement is not supported on the QFabric system.

**Default** Traceoptions is disabled.

**Options** **file *name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the **/var/log/** directory.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. The traceoption output continues in a second trace file named **trace-file.1**. When **trace-file.1** reaches its maximum size, output continues in a third file named **trace-file.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **fabric**—Trace virtual fabric events.
- **fc2**—Trace the FC2 (network layer protocols) events.
- **fip**—Trace the Fibre Channel over Ethernet (FCoE) Initialization Protocol events.
- **flogi**—Trace the fabric login server events.
- **forwarding-database**—Trace the forwarding database and next-hop events.
- **interface**—Trace the interface events.

- **krt**—Trace the communication over the routing socket.
- **lib**—Trace library calls.
- **lif**—Trace Fibre Channel logical interface (fc-lif) events.
- **vswitch**—Trace virtual switch events.

The following are the global tracing options:

- **all**—All trace operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.O**. Incoming tracefile data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.O** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.O**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	storage—To view this statement in the configuration.
<b>Level</b>	storage-control—To add this statement to the configuration.

## traceoptions (FIP Protocol Fibre Channel)

**Syntax** `traceoptions {  
     file filename <replace> <size size> <files number> <no-stamp>  
     <world-readable | no-world-readable>;  
     flag flag <flag-modifier>  
 }`

**Hierarchy Level** [edit [fc-fabrics](#) *fabric-name* [protocols](#) [fip](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Set proxy FC protocol tracing options.

**NOTE:** The `traceoptions` statement is not supported on the QFabric system.

**Default** Traceoptions is disabled.

**Options** `file name`—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

`files number` —(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`. The traceoption output continues in a second trace file named `trace-file.1`. When `trace-file.1` reaches its maximum size, output continues in a third file named `trace-file.2`, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

`flag`—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements:

- `all`—Trace all operations.
- `error`—Trace all error events
- `normal`—Trace all normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- `packet`—Trace packet decoding operations
- `parse`—Trace configuration parsing.
- `state`—Trace state transitions.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming tracefile data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	<b>storage</b> —To view this statement in the configuration.
	<b>storage-control</b> —To add this statement to the configuration.

## traceoptions (Proxy Fibre Channel)

**Syntax** `traceoptions {  
     file filename <replace> <size size> <files number> <no-stamp>  
     <world-readable | no-world-readable>;  
     flag flag <flag-modifier>  
 }`

**Hierarchy Level** [edit **fc-fabrics** *fabric-name* **proxy**]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Set proxy FC protocol tracing options.

**NOTE:** The **traceoptions** statement is not supported on the QFabric system.

**Default** Traceoptions is disabled.

**Options** **file *name***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. The traceoption output continues in a second trace file named **trace-file.1**. When **trace-file.1** reaches its maximum size, output continues in a third file named **trace-file.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **error**—Trace all error events.
- **interface**—Trace the interface events.
- **normal**—Trace all normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **packet**—Trace packet decoding operations
- **parse**—Trace configuration parsing.

- **state**—Trace state transitions.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming tracefile data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege  
Level**

storage—To view this statement in the configuration.

storage-control—To add this statement to the configuration.

# Administration

- [Operational Commands on page 4670](#)

## Routine Monitoring

---

- [Monitoring Fibre Channel Interface Load Balancing on page 4665](#)

### Monitoring Fibre Channel Interface Load Balancing

You can use operational mode commands to monitor load balancing when the switch is in FCoE-FC gateway mode:

1. [Monitoring the Interface Load-Balancing State on page 4665](#)
2. [Monitoring the Fabric Load-Balancing Algorithm on page 4666](#)

#### Monitoring the Interface Load-Balancing State

---

**Purpose** Monitor the number of sessions, whether load balancing is enabled or disabled, and the load-balancing weight for each native Fibre Channel (FC) interface.

**NOTE:** A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

**Action** To monitor the load-balancing state of the native FC interfaces in the CLI, enter the following CLI command:

```
user@switch> show fibre-channel proxy np-port
```

For example:

```
user@switch> show fibre-channel proxy np-port
Fabric: sanfab1, Fabric-id: 10
NP-Port  State      Sessions    LB state  LB weight
fc-0/0/0.0  online        5           ON        4
fc-0/0/1.0  online        5           ON        4
fc-0/0/2.0  online       10           ON        8

Fabric: fc_fab2, Fabric-id: 200
```

```

NP-Port      State      Sessions      LB state      LB weight
fc-0/0/44.0  isolated    0             OFF           0

Fabric: fc_fabric_100, Fabric-id: 100
NP-Port      State      Sessions      LB state      LB weight
fc-0/0/46.0  online     1             ON            8

```

**Meaning** [Table 323 on page 4666](#) summarizes key output fields for the FC interface load-balancing state.

**Table 323: Summary of Key FC Interface Load-Balancing Output Fields**

Field	Values
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.
NP-Port	NP_Port interface connected to the FCoE forwarder (FCF) or the FC switch.
State	FCID state of the NP_Port interface: <ul style="list-style-type: none"> <li>• <b>online</b>—The port is online and connected to the FC switch. FCoE devices can log in to the FC switch using this port.</li> <li>• <b>isolated</b>—The port is isolated and is not part of the load-balancing function. FCoE devices cannot log in to the FC switch using this port.</li> <li>• <b>offline</b>—The port is offline.</li> </ul>
Sessions	Number of active sessions on the NP_Port interface.
LB state	Load-balancing state: <ul style="list-style-type: none"> <li>• <b>On</b>—Load balancing is on</li> <li>• <b>Off</b>—Load balancing is off.</li> </ul>
LB weight	Load-balancing weight, which reflects the port speed: <ul style="list-style-type: none"> <li>• <b>2</b>—Port speed is 2 Gbps.</li> <li>• <b>4</b>—Port speed is 4 Gbps.</li> <li>• <b>8</b>—Port speed is 8 Gbps.</li> </ul>

The gateway determines the least-loaded interface using the following weighted round-robin (WRR) algorithm:

$$(\text{number-of-sessions} * \text{max-weight}) / \text{weight}$$

where *max-weight* is an internal constant. If the load on the FC interfaces is equal, the session is assigned to the interface with the highest link speed (the greatest weight).

### Monitoring the Fabric Load-Balancing Algorithm

**Purpose** Monitor the type of load-balancing algorithm (simple, ENode-based, or FLOGI-based) used on the native FC interfaces, whether or not automated load rebalancing is enabled, and the load rebalancing state of the fabric.

**Action** To monitor the load-balancing algorithm used on the native FC interfaces and the load rebalancing state in the CLI, enter the following CLI command:

```
user@switch> show fibre-channel proxy fabric-state
```

For example:

```
user@switch> show fibre-channel proxy fabric-state
Fabric: sanfab1, Fabric-id: 10
Proxy load balance algorithm: Simple, Fabric WVN verification: Yes
Auto load rebalance enabled : No
Last rebalance start-time   : Never
Last rebalance end-time     : Never
Last rebalance trigger      : Link-up
Last rebalance trigger-time  : Mon Sep 10 21:42:30 2012 usec: 814602
Last rebalance trigger-result: Not-configured

Fabric: fc_fab2, Fabric-id: 200
Proxy load balance algorithm: ENode based, Fabric WVN verification: Yes
Auto load rebalance enabled : No
Last rebalance start-time   : Never
Last rebalance end-time     : Never
Last rebalance trigger      : Link-up
Last rebalance trigger-time  : Mon Sep 17 17:23:35 2012 usec: 619684
Last rebalance trigger-result: Not-configured

Fabric: fc_fabric_100, Fabric-id: 100
Proxy load balance algorithm: FLOGI based, Fabric WVN verification: No
Auto load rebalance enabled : Yes
Last rebalance start-time   : Never
Last rebalance end-time     : Never
Last rebalance trigger      : Config-CLI
Last rebalance trigger-time  : Fri Nov 2 08:56:16 2012 usec: 004487
Last rebalance trigger-result: Not-required
```

**Meaning** You can configure each local FC fabric on an FCoE-FC gateway to use one of three types of load-balancing algorithms, *simple*, *ENode-based*, or *FLOGI-based*. All of the native FC interfaces (NP\_Ports) in a particular gateway FC fabric use the same load-balancing algorithm (the load-balancing algorithm is applied on a per-fabric basis).

[Table 324 on page 4667](#) summarizes key output fields for the FC interface load-balancing algorithm and state.

**Table 324: show fibre-channel proxy fabric-state Output Fields**

Field Name	Field Description
<b>Fabric</b>	Name of the fabric.
<b>Fabric-id</b>	Fabric ID number.

**Table 324: show fibre-channel proxy fabric-state Output Fields (continued)**

Field Name	Field Description
<b>Proxy load balance algorithm</b>	<p>Load-balancing algorithm used on the FCoE-FC gateway FC fabric:</p> <ul style="list-style-type: none"> <li>Simple—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link.</li> </ul> <p>On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</p> <ul style="list-style-type: none"> <li>ENode-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link.</li> </ul> <p>On a link load rebalance, all sessions are logged out. When the sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</p> <ul style="list-style-type: none"> <li>FLOGI-based—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions (VN_Port sessions) associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link.</li> </ul> <p>On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</p>
<b>Fabric WWN verification</b>	<p>Fabric worldwide name (WWN) verification check state on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>Yes—Fabric WWN verification check is enabled.</li> <li>No—Fabric WWN verification check is disabled.</li> </ul>
<b>Auto load rebalance enabled</b>	<p>Automated link load rebalancing configuration for the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>No—Automated load balancing is disabled (default state).</li> <li>Yes—Automated load balancing is enabled.</li> </ul>
<b>Last rebalance start-time</b>	<p>Time that the last link load rebalance began on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>Never—The link load has never been rebalanced.</li> <li>Timestamp value—Time the last link load rebalancing started.</li> </ul>
<b>Last rebalance end-time</b>	<p>Time that the last link load rebalance ended on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>Never—The link load has never been rebalanced.</li> <li>Timestamp value—Time the last link load rebalancing ended.</li> </ul>

**Table 324: show fibre-channel proxy fabric-state Output Fields (continued)**

Field Name	Field Description
<b>Last rebalance trigger</b>	<p>Event that triggered the last link load rebalance on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• None—The link load has never been rebalanced.</li> <li>• Config-CLI—Configure (enable) automated load balancing.</li> <li>• Request-CLI—Rebalance requested from the CLI using the <b>request fibre-channel proxy load-rebalance fabric <i>fabric-name</i></b> operational command.</li> <li>• Preview-CLI—Rebalancing <i>dry run</i> requested from the CLI using the <b>request fibre-channel proxy load-rebalance dry-run fabric <i>fabric-name</i></b> operational command. Indicates that the switch completed the dry run. A dry run simulates a link load rebalance and displays a list of sessions that might be affected if you request an actual rebalance.</li> <li>• Link-up—New FC link (NP_Port) up on the FCoE-FC gateway fabric, which causes a rebalance to distribute sessions to the new link.</li> <li>• Restore-complete—If the FC process on the switch restarts, the switch attempts to restore the session state that existed before the restart. When automated rebalance is enabled, restore-complete indicates that the sessions have been restored and rebalanced.</li> </ul>
<b>Last rebalance trigger-time</b>	<p>Time that the last link load rebalance was triggered on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—Link load rebalancing has never been triggered.</li> <li>• Timestamp value—Time the last link load rebalancing was triggered.</li> </ul>
<b>Last rebalance trigger-result</b>	<p>Result of the last trigger event on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—Link load rebalancing has never been triggered.</li> <li>• Not-configured—Automated rebalancing is not configured on the FCoE-FC gateway fabric.</li> <li>• Not-required—Last rebalance trigger did not require rebalancing the link load (the link load was already balanced across the active NP_Port links).</li> <li>• In-progress—Link load rebalancing is in progress and has not finished yet.</li> <li>• Restore-in-progress—The switch is recovering from an FC process restart and is in the process of restoring the sessions to the active NP_Port links.</li> <li>• Success—Link load rebalancing was successful.</li> <li>• Logged-out-all—All sessions have been logged out.</li> <li>• Preview-complete—The switch has finished simulating a dry run rebalancing request from the CLI (<b>request fibre-channel proxy load-rebalance dry-run fabric <i>fabric-name</i></b> operational command) and reported the sessions that might be affected if you request an actual link load rebalance.</li> <li>• Fabric-deletion-in-progress—FCoE-FC gateway fabric is in the process of being deleted.</li> </ul> <p><b>NOTE:</b> A trigger event does not necessarily result in a rebalance action. Link load rebalancing only occurs if the NP_Port interface session load is not balanced at the time of the trigger event.</p>

## Operational Commands

---

---

## clear fibre-channel fc2 statistics

---

<b>Syntax</b>	<code>clear fibre-channel fc2 statistics</code> <code>&lt;fabric <i>fabric-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear FC-2 (network layer) Fibre Channel statistics globally or on a specified Fibre Channel fabric.
<b>Options</b>	<code>fabric <i>fabric-name</i></code> —(Optional) Clear FC-2 statistics only on the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fc2 statistics on page 4722</a></li><li>• <a href="#">show fibre-channel fc2 sessions on page 4720</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fibre-channel fc2 statistics on page 4671</a>

### Sample Output

`clear fibre-channel fc2 statistics`    `user@switch> clear fibre-channel fc2 statistics`

## clear fibre-channel fip enode

---

<b>Syntax</b>	<code>clear fibre-channel fip enode <i>enode-mac</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear Fibre Channel over Ethernet (FCoE) node (ENode) information for a specified ENode. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose the connection to the Fibre Channel (FC) fabric and to log in to the fabric again. If you clear an ENode, all VN_Ports associated with that ENode are also cleared and lose their connection to the FC fabric and must log in to the fabric again.
<b>Options</b>	<i>enode-mac</i> —MAC address of the ENode.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fip enode on page 4729</a></li><li>• <a href="#">clear fibre-channel fip statistics on page 4673</a></li><li>• <a href="#">clear fibre-channel fip vn-port on page 4674</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fibre-channel fip enode on page 4672</a>
<b>Sample Output</b>	
<code>clear fibre-channel fip enode</code>	<pre>user@switch&gt; clear fibre-channel fip enode 00:10:94:00:00:02</pre>

---

## clear fibre-channel fip statistics

---

<b>Syntax</b>	<code>clear fibre-channel fip statistics</code> <code>&lt;fabric <i>fabric-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear Fibre Channel over Ethernet (FCoE) initialization protocol (FIP) statistics.
<b>Options</b>	<code>fabric <i>fabric-name</i></code> —(Optional) Clear FIP statistics only on the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fip statistics on page 4742</a></li><li>• <a href="#">show fibre-channel fip on page 4724</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fibre-channel fip statistics on page 4673</a>

### Sample Output

`clear fibre-channel fip statistics`     `user@switch> clear fibre-channel fip statistics`

## clear fibre-channel fip vn-port

---

<b>Syntax</b>	<code>clear fibre-channel fip vn-port <i>vn-port</i>--<i>mac</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear virtual N_Port (VN_Port) information for a specified VN_Port. This operation deletes the VN_Port state from the switch database and from the FIP snooping firewall filters, which causes the VN_Port to lose its connection to the Fibre Channel fabric and to log in to the fabric again. When you clear a VN_Port, other VN_Ports associated with the same Fibre Channel over Ethernet (FCoE) Node (ENode) are not affected and are not cleared.
<b>Options</b>	<i>vn-port-mac</i> —MAC address of the VN_Port.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel fip enode on page 4729</a></li><li>• <a href="#">clear fibre-channel fip enode on page 4672</a></li><li>• <a href="#">clear fibre-channel fip statistics on page 4673</a></li></ul>

<b>Sample Output</b>	
<code>clear fibre-channel fip vn-port</code>	<pre>user@switch&gt; clear fibre-channel fip vn-port 00:10:94:00:00:08</pre>

## clear fibre-channel flogi statistics

---

<b>Syntax</b>	<code>clear fibre-channel flogi statistics</code> <code>&lt;fabric <i>fabric-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear fabric login (FLOGI) statistics globally or on a specified Fibre Channel fabric.
<b>Options</b>	<code>fabric <i>fabric-name</i></code> —(Optional) Clear FLOGI statistics only on the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel flogi statistics on page 4749</a></li> <li>• <a href="#">show fibre-channel flogi fport on page 4746</a></li> <li>• <a href="#">show fibre-channel flogi nport on page 4747</a></li> </ul>

### Sample Output

```
clear fibre-channel flogi statistics      user@switch> clear fibre-channel flogi statistics
```

## clear fibre-channel proxy statistics

---

<b>Syntax</b>	<b>clear fibre-channel proxy statistics</b> <b>&lt;fabric <i>fabric-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear Fibre Channel gateway statistics globally or on a specified Fibre Channel fabric.
<b>Options</b>	<b>fabric <i>fabric-name</i></b> —(Optional) Clear proxy statistics only on the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fibre-channel proxy statistics on page 4767</a></li><li>• <a href="#">show fibre-channel proxy login-table on page 4760</a></li><li>• <a href="#">show fibre-channel proxy np-port on page 4764</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fibre-channel proxy statistics on page 4676</a>

### Sample Output

<b>clear fibre-channel proxy statistics</b>	<b>user@switch&gt; clear fibre-channel proxy statistics</b>
---	---

## clear fip snooping enode

<b>Syntax</b>	<code>clear fip snooping enode <i>enode-mac</i></code> <code>&lt;vlan <i>vlan-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear FIP snooping information for the specified FCoE Node (ENode) or (optionally) only on a specified VLAN. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose its connection to the FCoE forwarder (FCF) and to log in to the FCF again.
<b>Options</b>	<i>enode-mac</i> —MAC address of the ENode.  <i>vlan vlan-name</i> —(Optional) Name of the VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fip snooping enode on page 4775</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear fip snooping enode enode-mac on page 4677</a>
<b>Sample Output</b>	
<code>clear fip snooping enode enode-mac</code>	<code>user@switch&gt; clear fip snooping enode 00:10:94:00:00:02</code>

## clear fip snooping statistics

---

<b>Syntax</b>	<code>clear fip snooping statistics</code> <code>&lt;vlan <i>vlan-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear FIP snooping statistics globally or on a specified VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fip snooping statistics on page 4783</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fip snooping statistics on page 4678</a>

### Sample Output

<code>clear fip snooping statistics</code>	<code>user@switch&gt; clear fip snooping statistics</code>
--	--

## clear fip snooping vlan

---

<b>Syntax</b>	<code>clear fip snooping vlan <i>vlan-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear FIP snooping information for the specified VLAN. This operation deletes all ENode and FCF information for the VLAN from the switch database and causes the ENodes to lose their connections to the FCFs. After clearing a VLAN, the switch relearns all of the FCFs and ENodes on the VLAN, and the ENodes must log in to the FCF again.
<b>Options</b>	<i>vlan-name</i> —Name of the VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fip snooping vlan on page 4786</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear fip snooping vlan vlan-name on page 4679</a>

### Sample Output

`clear fip snooping vlan`  
`clear fip snooping vlan fcoevlan1`  
`clear fip snooping vlan`  
`clear fip snooping vlan fcoevlan1`

## clear fip vlan-discovery statistics

---

<b>Syntax</b>	clear fip vlan-discovery statistics
<b>Release Information</b>	Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Clear FIP VLAN discovery statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show fip vlan-discovery on page 4790</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear fip vlan-discovery statistics on page 4680</a>

### Sample Output

`clear fip vlan-discovery statistics`     user@switch> clear fip vlan-discovery statistics

## request fibre-channel proxy load-rebalance

<b>Syntax</b>	request fibre-channel proxy load-rebalance <dry-run> fabric < <i>fabric-name</i> > <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Rebalance the link load on one or more FCoE-FC gateway proxy fabrics (local Fibre Channel fabrics on the gateway) on demand. Load rebalancing is a disruptive action that forces some or all sessions (depending on the configured load-balancing algorithm) to log out and then log in again. When sessions log in again, they are placed on NP_Port interfaces so that the link loads are balanced.</p> <p>Link load rebalancing occurs 10 seconds after you run the rebalancing command, unless another rebalancing trigger occurs before the 10 seconds elapse. If another rebalancing event occurs before the 10-second timer elapses, the timer is extended. Rebalancing occurs a maximum of 30 seconds after you run the rebalancing command, regardless of whether more rebalancing events occur.</p> <p>You can also perform a <i>dry run</i> to see a list of sessions that might be affected (logged out) if you request a load rebalance. A dry run does not rebalance the link loads; it only lists the sessions that might be affected if you rebalance.</p>
<b>Options</b>	<p><b>dry-run</b>—(Optional) Simulates performing link load rebalancing and displays a list of sessions that might be affected if you rebalance the link loads.</p> <p><b>fabric <i>fabric-name</i></b>—Name of the fabric on which you want to rebalance the link loads. If you do not specify a fabric name with the fabric keyword, all fabrics on the FCoE-FC gateway rebalance their link loads.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p>
<b>Additional Information</b>	Requesting link load rebalancing is a one-time, on-demand operation. You must explicitly request load rebalancing every time you want to rebalance the link loads. Alternatively, you can configure automated load rebalancing if you want the NP_Port links to be rebalanced automatically whenever a load-rebalancing trigger occurs.
<b>Required Privilege Level</b>	maintenance

**List of Sample Output** [request fibre-channel proxy load-rebalance dry-run fabric fc\\_fabric\\_100 on page 4682](#)

**Output Fields** [Table 325 on page 4682](#) lists the output fields for the **request fibre-channel proxy load-rebalance dry-run** command. Output fields are listed in the approximate order in which they appear.

**Table 325: request fibre-channel proxy load-rebalance dry-run Output Fields**

Field Name	Field Description
<b>Fabric</b>	Name of the fabric.
<b>Fabric-id</b>	Fabric ID number.
<b>F-Port</b>	FCoE VLAN interface (VF_Port interface to the FCoE network).
<b>FCID</b>	VN_Port Fibre Channel identifier provided by the Fibre Channel over Ethernet Forwarder (FCoE forwarder) or the Fibre Channel switch.
<b>Port-WWN</b>	Unique worldwide name (WWN) of the VN_Port.
<b>NP-Port</b>	Name of the native Fibre Channel interface.

## Sample Output

**request fibre-channel  
proxy load-rebalance  
dry-run fabric  
fc\_fabric\_100**

```
user@host> request fibre-channel proxy load-rebalance dry-run fabric fc_fabric_100
Fabric: fc_fabric_100, Fabric-id: 100
F-Port      FCID      Port-WWN      NP-Port
vlan.100    0x8a013a  02:01:00:64:00:00:00:2a  fc-0/0/1.0
vlan.100    0x8a013c  02:01:00:64:00:00:00:2b  fc-0/0/1.0
vlan.100    0x8a0146  02:01:00:64:00:00:00:2e  fc-0/0/1.0
vlan.100    0x8a014c  02:01:00:64:00:00:00:2f  fc-0/0/1.0
```

## restart

<b>Syntax</b>	<pre>restart &lt;adaptive-services   ancpd-service   application-identification   audit-process     auto-configuration   captive-portal-content-delivery   ce-l2tp-service   chassis-control     class-of-service   clksyncd-service   database-replication   datapath-trace-service     dhcp-service   diameter-service   disk-monitoring   dynamic-flow-capture     ecc-error-logging   ethernet-connectivity-fault-management     ethernet-link-fault-management   event-processing   firewall     general-authentication-service   gracefully   iccp-service   idp-policy   immediately     interface-control   ipsec-key-management   kernel-replication   l2-learning   l2cpd-service     l2tp-service   l2tp-universal-edge   lacp   license-service   link-management     local-policy-decision-function   mac-validation   mib-process   mobile-ip   mountd-service     mpls-traceroute   mspd   multicast-snooping   named-service   nfsd-service     packet-triggered-subscribers   peer-selection-service   pgcp-service   pgm     pic-services-logging   pki-service   ppp   ppp-service   pppoe     protected-system-domain-service   redundancy-interface-process   remote-operations     root-system-domain-service   routing &lt;logical-system <i>logical-system-name</i>&gt;   sampling     sbc-configuration-process   sdk-service   service-deployment   services   services pgcp   gateway <i>gateway-name</i>   snmp   soft   static-subscribers   statistics-service     subscriber-management   subscriber-management-helper   tunnel-oamd   usb-control     vrrp   web-management&gt; &lt;gracefully   immediately   soft&gt;</pre>

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.  Command introduced in Junos OS Release 9.0 for EX Series switches.  Command introduced in Junos OS Release 11.1 for the QFX Series.  Command introduced in Junos OS Release 12.2 for ACX Series routers.  Options added:</p> <ul style="list-style-type: none"> <li>• <b>dynamic-flow-capture</b> in Junos OS Release 7.4.</li> <li>• <b>dlsf</b> in Junos OS Release 7.5.</li> <li>• <b>event-processing</b> in Junos OS Release 7.5.</li> <li>• <b>ppp</b> in Junos OS Release 7.5.</li> <li>• <b>l2ald</b> in Junos OS Release 8.0.</li> <li>• <b>link-management</b> in Release 8.0.</li> <li>• <b>pgcp-service</b> in Junos OS Release 8.4.</li> <li>• <b>sbc-configuration-process</b> in Junos OS Release 9.5.</li> <li>• <b>services pgcp gateway</b> in Junos OS Release 9.6.</li> <li>• <b>sfc</b> and <b>all-sfc</b> for the TX Matrix Router in Junos OS Release 9.6.</li> </ul>
<b>Description</b>	Restart a Junos OS process.
	
<p><b>CAUTION:</b> Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.</p>	
<b>Options</b>	none—Same as <b>gracefully</b> .

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**— (EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**— (MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***— (MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**— (Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**— (Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**— (EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**— (Optional) Restart the MPLS Periodic Traceroute process.

**mspd**— (Optional) Restart the Multiservice process.

**multicast-snooping**— (EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**— (Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**— (J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**— (Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbcc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc number**—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway gateway-name**—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol

tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**

reset

[restart interfaces on page 4692](#)

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[restart interfaces](#)

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## show dcbx

<b>Syntax</b>	show dcbx
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 4694</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 326 on page 4693</a> lists the output fields for the <b>show dcbx</b> command. Output fields are listed in the approximate order in which they appear.

**Table 326: show dcbx output fields**

Field Name	Field Description
DCBX	Status of DCBX on the switch or for the specified interface: <ul style="list-style-type: none"> <li>• Enabled—DCBX is enabled on the switch or on the specified interface</li> <li>• Disabled—DCBX is disabled on the switch or on the specified interface</li> </ul>
Interface	Name of the interface

## Sample Output

```

show dcbx
user@switch> show dcbx
DCBX                               : Enabled
Interface      DCBX
xe-0/0/9.0     enabled
xe-0/0/32.0    enabled
xe-0/0/36.0    enabled

```

## show dcbx neighbors

<b>Syntax</b>	<b>show dcbx neighbors</b> <code>&lt;interface interface-name&gt;</code> <code>&lt;terse&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	Display information about Data Center Bridging Capability Exchange protocol (DCBX) neighbor interfaces.
<b>Options</b>	<b>none</b> —Display information about all DCBX neighbor interfaces. <b>interface-name</b> —(Optional) Display information for the specified interface. <b>terse</b> —Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring DCBX Autonegotiation on page 4601</a></li> <li>• <a href="#">Example: Configuring DCBX Application Protocol TLV Exchange on page 4540</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">Example: Configuring DCBX to Support an iSCSI Application</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 4389</a></li> <li>• <a href="#">Understanding Data Center Bridging Capability Exchange Protocol for EX Series Switches</a></li> <li>• <a href="#">dcbx on page 4617</a></li> </ul>

<b>Output Fields</b>	<a href="#">Table 327 on page 4694</a> lists the output fields for the <b>show dcbx neighbors</b> command. Output fields are listed in the approximate order in which they appear.

Table 327: show dcbx neighbors Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
Parent Interface	Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.
Active-application-map	Name of the application map applied to the interface.
Protocol-Mode	<p>(QFX Series) DCBX protocol mode the interface uses:</p> <ul style="list-style-type: none"> <li>IEEE DCBX Version—The interface uses IEEE DCBX mode.</li> <li>DCBX Version 1.01—The interface uses DCBX version 1.01.</li> </ul> <p><b>NOTE:</b> On interfaces that use the IEEE DCBX mode, the <b>show dcbx neighbors interface <i>interface-name</i></b> operational command does not include application, PFC, or ETS operational state in the output.</p>
Protocol-State	<p>(DCBX Version 1.01 only) DCBX protocol state synchronization status:</p> <ul style="list-style-type: none"> <li><b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> <li><b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> </ul>
Local-Advertisement	<p>(DCBX Version 1.01 only)</p> <p>Status of advertisements that the local interface sends to the peer.</p>
Operational version	Version of the DCBX standard used.
sequence-number	<p>Number of state change messages sent to the peer.</p> <p>If the interface <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p> <p>If the interface <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p>
acknowledge-id	<p>Number of acknowledge messages received from the peer.</p> <p>If the <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p> <p>If the <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Peer-Advertisement</b>	(DCBX Version 1.01 only)  Status of advertisements that the peer sends to the local interface.
<b>Operational version</b>	Version of the DCBX standard used.
<b>sequence-number</b>	Number of state change messages the peer sent to the local interface.  If this number matches the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized.  If this number does not match the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.
<b>acknowledge-id</b>	Number of acknowledge messages the peer has received from the local interface.  If this number matches the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization.  If this number does not match the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Feature: PFC</b>	Priority-based flow control (PFC) feature DCBX state information.
<b>Protocol-State</b>	(DCBX Version 1.01 only)  DCBX protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>not-applicable</b>—PFC autonegotiation is disabled.</li> </ul>
<b>Operational State</b>	(DCBX Version 1.01 only)  Operational state of the feature: <b>enabled</b> or <b>disabled</b> .
<b>Local-Advertisement</b>	Status of advertisements that the local interface sends to the peer.
<b>Enable</b>	(DCBX Version 1.01 only)  State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	Willingness of the local interface to learn the PFC configuration from the peer using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The local interface is willing to learn the PFC configuration from the peer.</li> <li>• <b>No</b>—The local interface is not willing to learn the PFC configuration from the peer.</li> </ul>
<b>Mac auth Bypass Capability</b>	(IEEE DCBX only)  (QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is <b>no</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Operational State</b>	<p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	<p>Largest number of traffic classes the local interface supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>
<b>Code Point</b>	<p>PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.</p>
<b>Admin Mode</b>	<p>PFC administrative state for each code point on the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled for the code point.</li> <li>• <b>Disabled</b>—PFC is disabled for the code point.</li> </ul>
<b>Operational Mode</b>	<p>(QFX Series) PFC operational mode for each code point:</p> <ul style="list-style-type: none"> <li>• <b>Enable</b>—PFC is enabled on the code point.</li> <li>• <b>Disable</b>—PFC is disabled on the code point.</li> </ul>
<b>Peer-Advertisement</b>	<p>Status of advertisements that the peer sends to the local interface.</p>
<b>Enable</b>	<p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	<p>Willingness of the peer to learn the PFC configuration from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the PFC configuration from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the PFC configuration from the local interface.</li> </ul>
<b>Error</b>	<p>(DCBX Version 1.01 only)</p> <p>Configuration compatibility error status:</p> <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Operational State</b>	<p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>
<b>Mac auth Bypass Capability</b>	<p>(IEEE DCBX only)</p> <p>(QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The connected peer supports MAC authentication bypass.</li> <li>• <b>No</b>—The connected peer does not support MAC authentication bypass.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	<p>Largest number of traffic classes the peer supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>
<b>Code Point</b>	<p>PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.</p>
<b>Admin Mode</b>	<p>PFC administrative state for each code point on the peer:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled for the code point.</li> <li>• <b>Disabled</b>—PFC is disabled for the code point.</li> </ul>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Feature: Application</b>	State information for the DCBX application.
<b>Protocol-State</b>	<p>(DCBX Version 1.01 only)</p> <p>DCBX protocol state synchronization status:</p> <ul style="list-style-type: none"> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface.</li> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface.</li> <li>• <b>not-applicable</b>—The local interface is set to <b>no-auto-negotiation</b> (autonegotiation is disabled). If the interface is associated with an FCoE forwarding class, the interface advertises FCoE capability even if the connected peer does not advertise FCoE capability.</li> </ul>
<b>Local-Advertisement</b>	<p>Status of advertisements that the local interface sends to the peer.</p> <p>If the local interface is set to <b>no-auto-negotiation</b> (autonegotiation is disabled), the local advertisement portion of the output is not shown.</p>
<b>Enable</b>	<p>(DCBX Version 1.01 only)</p> <p>State that the local interface advertises to the peer:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	<p>(DCBX Version 1.01 only)</p> <p>Willingness of the local interface to learn the FCoE interface state from the peer using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The local interface is willing to learn the FCoE interface state from the peer.</li> <li>• <b>No</b>—The local interface is not willing to learn the FCoE interface state from the peer.</li> </ul>
<b>Error</b>	<p>(DCBX Version 1.01 only)</p> <p>Configuration compatibility error status:</p> <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. The local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. The local and peer configuration are not compatible.</li> </ul>
<b>Appl-Name</b>	Name of the application:

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Ethernet-Type</b>	<p>(DCBX Version 1.01 only)</p> <p>Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>
<b>Socket-Number</b>	<p>Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>
<b>Priority-Field or Priority-Map</b>	<p>Priority assigned to the application.</p> <p>For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.</p>
<b>Status</b>	<p>(DCBX Version 1.01 only)</p> <p>Local status when autonegotiation is enabled:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul> <p><b>NOTE:</b> If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.</p>
<b>Peer-Advertisement</b>	<p>Status of advertisements that the peer sends to the local interface.</p>
<b>Enable</b>	<p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>Willing</b>	<p>(DCBX Version 1.01 only)</p> <p>Willingness of the peer to learn the FCoE interface state from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the FCoE interface state from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the FCoE interface state from the local interface.</li> </ul>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Error</b>	(DCBX Version 1.01 only)  Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>
<b>Appl-Name</b>	Name of the application: <ul style="list-style-type: none"> <li>• <b>FCoE</b>—Fibre Channel over Ethernet</li> </ul>
<b>Ethernet-Type</b>	Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.
<b>Socket-Number</b>	Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.
<b>Priority-Field or Priority-Map</b>	Priority assigned to the application.
<b>Status</b>	(DCBX Version 1.01 only)  Peer interface status: <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
<b>Feature: ETS</b>	Enhanced Transmission Selection (ETS) DCBX state information.
<b>Protocol-State</b>	(DCBX Version 1.01 only)  ETS protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> </ul>
<b>Operational State</b>	(DCBX Version 1.01 only)  Operational state of the feature, <b>enabled</b> or <b>disabled</b> .
<b>Local-Advertisement</b>	Status of advertisements that the local interface sends to the peer.
<b>Enable</b>	(DCBX Version 1.01 only)  State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>TLV Type</b>	(IEEE DCBX only)  Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Recommendation-or-Configuration</b>—Advertises both TLVs.</li> </ul>
<b>Willing</b>	Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise <b>No</b> for this field): <ul style="list-style-type: none"> <li>• <b>Yes</b>—Local interface is willing to learn the ETS state from the peer.</li> <li>• <b>No</b>—Local interface is not willing to learn the ETS state from the peer.</li> </ul>
<b>Credit Based Shaper</b>	

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	(IEEE DCBX only)  Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always <b>No</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error. This should always be the switch ETS error state.</li> <li>• <b>Yes</b>—Error detected.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	(DCBX Version 1.01 only)  Largest number of traffic classes the local interface supports for PFC.
<b>Maximum Traffic Classes supported</b>	(IEEE DCBX only)  Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
<b>Code Point</b>	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
<b>Priority-Group</b>	Class-of-service (CoS) priority group (forwarding class set) identification number.
<b>Percentage B/W</b>	Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
<b>Transmission Selection Algorithm</b>	(IEEE DCBX only)  The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is <b>ETS</b> .
<b>Peer-Advertisement</b>	Status of advertisements that the peer sends to the local interface.
<b>Enable</b>	

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	(DCBX Version 1.01 only)  State that the peer advertises to the local interface: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>
<b>TLV Type</b>	(IEEE DCBX only)  Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Configuration/Recommendation</b>—Advertises both TLVs.</li> </ul>
<b>Willing</b>	Willingness of the peer to learn the ETS state from the local interface using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—Peer is willing to learn the ETS state from the local interface.</li> <li>• <b>No</b>—Peer is not willing to learn the ETS state from the local interface.</li> </ul>
<b>Credit Based Shaper</b>	(IEEE DCBX only)  Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always <b>No</b> .
<b>Error</b>	(DCBX Version 1.01 only)  Configuration error status of the peer: <ul style="list-style-type: none"> <li>• <b>No</b>—No error in peer ETS TLV.</li> <li>• <b>Yes</b>—Error in peer ETS TLV.</li> </ul>
<b>Maximum Traffic Classes capable to support PFC</b>	(DCBX Version 1.01 only)  Largest number of traffic classes the local interface supports for PFC.
<b>Maximum Traffic Classes supported</b>	(IEEE DCBX only)  Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)
<b>Code Point</b>	

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
	PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.
<b>Priority-Group</b>	CoS priority group (forwarding class set) identification number.
<b>Percentage B/W</b>	Configured minimum percentage of link bandwidth allocated to the priority group. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.)
<b>Transmission Selection Algorithm</b>	(IEEE DCBX only)  Transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is <b>ETS</b> .
<b>PFC</b>	(QFX Series, <b>terse</b> option only) DCBX TLV advertisement state for PFC: <ul style="list-style-type: none"> <li>• Disabled—PFC configuration matches the configuration on the connected peer and PFC is disabled</li> <li>• Enabled—PFC configuration matches the configuration on the connected peer and PFC is enabled</li> <li>• Not Advt—Interface does not advertise PFC to the connected peer</li> </ul>
<b>ETS</b>	( <b>terse</b> option only) Local DCBX TLV advertisement state for ETS: <ul style="list-style-type: none"> <li>• Advt—Interface advertises ETS TLVs</li> <li>• Disabled—ETS is disabled on the interface (interface does not advertise ETS)</li> </ul>
<b>ETS Rec</b>	( <b>terse</b> option only) DCBX TLV peer advertisement state for ETS (state received from the connected DCBX peer): <ul style="list-style-type: none"> <li>• Advt—Peer interface advertises ETS TLVs</li> <li>• Not Advt—Peer interface does not advertise ETS</li> </ul> <p><b>NOTE:</b> When the DCBX mode is DCBX version 1.01, no peer information is displayed.</p>

Table 327: show dcbx neighbors Output Fields (*continued*)

Field Name	Field Description
Version	<p>(<b>terse</b> option only) The DCBX version used on the interface and whether the DCBX version was autonegotiated or explicitly configured:</p> <ul style="list-style-type: none"><li>• <b>IEEE</b>—The interface uses IEEE DCBX.</li><li>• <b>1.01</b>—The interface uses DCBX version 1.01.</li></ul> <p>When the DCBX version used is the result of autonegotiation, the term (<b>Auto</b>) appears next to the version. For example, <b>IEEE (Auto)</b> indicates that the interface autonegotiated with the connected peer to use IEEE DCBX. Autonegotiation is enabled by default.</p>

## Sample Output

```
show dcbx neighbors interface (QFX Series, user@switch> show dcbx neighbors interface xe-0/0/0
Interface : xe-0/0/0.0 - Parent Interface: ae0.0
Active-application-map: app-map-1
```

```

### show fibre-channel fabric extensive

```
user@switch> show fibre-channel fabric extensive
Fabric: proxy2, Created at: Mon Apr 19 14:02:58 2010
Fabric-ID: 200, Internal index: 2, Origin: Static
Description: srv-fabric, Type: PROXY, Fabric WWN: 10:00:00:05:33:51:d7:cd
Login sessions: 200, Configured max login sessions: 500
      fc-0/0/0.0, (untagged)
      fc-0/0/1.0, (untagged)
```

## show fibre-channel fc2 sessions

**Syntax** `show fibre-channel fc2 sessions`  
`<fabric fabric-name>`  
`<brief | detail>`

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display Fibre Channel FC-2 information.

**NOTE:** A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

**Options** `fabric fabric-name`—(Optional) Display output only for the specified fabric.  
`brief | detail`—(Optional) Display the specified level of output.

**Required Privilege Level** view

<b>Output Fields</b>	<a href="#">Table 330 on page 4722</a> lists the output fields for the <b>show fibre-channel fc2 statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 330: show fibre-channel fc2 statistics Output Fields**

Field Name	Field Description
<b>Global statistics</b>	Statistics for all fabrics.
<b>Frame buffers allocated</b>	Number of frame buffers currently allocated to all fabrics.
<b>Frame buffers freed</b>	Number of frame buffers freed.
<b>Frames dropped</b>	Number of dropped frames.
<b>Fabric statistics</b>	Fabric-specific statistics.
<b>Fabric</b>	Name of the fabric.
<b>Fabric-id</b>	Identification number of the fabric.
<b>Tx-FRJT</b>	Number of fabric frame rejects (F_RJT).
<b>Tx-PRJT</b>	Number of port frame rejects (P_RJT).
<b>Tx-LSRJT</b>	Number of link service rejections.
<b>Tx-ABTS</b>	Number of abort sequence frames sent.
<b>Rx-Drops</b>	Number of received frames dropped.

Table 330: show fibre-channel fc2 statistics Output Fields (*continued*)

Field Name	Field Description
Rx-ABTS	Number of abort sequence frames received.

## Sample Output

**show fibre-channel fc2 statistics**      user@switch> **show fibre-channel fc2 statistics**  
Global statistics:

Frame buffers allocated: 60  
Frame buffers freed:      60  
Frames dropped:           0

Fabric statistics:

Fabric : fip-proxy, Fabric-id: 1  
Tx-FRJT:      0  
Tx-PRJT:      0  
Tx-LSRJT:     0  
Tx-ABTS:      0  
Rx-Drops:     0  
Rx-ABTS:      0

## show fibre-channel fip

<b>Syntax</b>	<b>show fibre-channel fip</b> <b>&lt;brief   detail&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel over Ethernet Initialization Protocol (FIP) information.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring FIP on an FCoE-FC Gateway on page 4589</a></li> <li>• <a href="#">show fibre-channel fip enode on page 4729</a></li> <li>• <a href="#">show fibre-channel fip fabric on page 4733</a></li> <li>• <a href="#">show fibre-channel fip fcf on page 4736</a></li> <li>• <a href="#">show fibre-channel fip interface on page 4739</a></li> <li>• <a href="#">show fibre-channel fip statistics on page 4742</a></li> <li>• <a href="#">clear fibre-channel fip statistics on page 4673</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel fip on page 4727</a> <a href="#">show fibre-channel fip detail on page 4727</a>
<b>Output Fields</b>	Table 331 on page 4724 lists the output fields for the <b>show fibre-channel fip</b> command. Output fields are listed in the approximate order in which they appear. A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

**Table 331: show fibre-channel fip Output Fields**

Field Name	Field Description	Level of Output
Configured max FIP sessions per Node Device	<p>Configured maximum number of FIP sessions permitted on the Node device.</p> <p>For QFabric systems, this is the maximum number of FIP sessions permitted on each Node device in the fabric.</p> <p>For QFX3500 devices, this is the maximum number of FIP sessions permitted on the device.</p>	<b>detail</b>
Node Device	Node device identifier.	<b>detail</b>
Total FIP sessions	Total number of FIP sessions on the FCoE-FC gateway switch.	<b>detail</b>

Table 331: show fibre-channel fip Output Fields (*continued*)

Field Name	Field Description	Level of Output
Total FCoE filters	Total number of FIP filters on the FCoE-FC gateway switch.	<b>detail</b>
Fabric Name	Name of the fabric and in parentheses the fabric ID.	All
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the fabric.	<b>detail</b>
FKA-ADV-PERIOD	Period of time in milliseconds between FIP keepalive advertisements configured for the FC fabric.	<b>detail</b>
MAX-SESSIONS-PER-ENODE	Maximum number of concurrent sessions (FLOGI and FDISC combined) that each ENode can instantiate.	<b>detail</b>
FCoE trusted	Whether ports on the FC fabric are trusted or untrusted: <ul style="list-style-type: none"> <li>• <b>Yes</b>—Ports on the FC fabric are trusted; FIP snooping is turned off.</li> <li>• <b>No</b>—Ports on the FC fabric are not trusted; FIP snooping is turned on.</li> </ul>	<b>detail</b>
Member	Information about an FCF that is a member of the fabric.	All
	• FCF-MAC	MAC address used in discovery advertisements. All
	• FKA-ADV-PERIOD	Period of time in milliseconds between FIP keepalive advertisements configured for the FC interface. <b>detail</b>
	• FKA-ADV-D-BIT	Disable FIP keepalive advertisement monitoring bit. The state is always <b>off</b> . <b>detail</b>
	• Type	Type of interface: <b>detail</b> <ul style="list-style-type: none"> <li>• <b>VF_Port Capable</b>—Interface can act as a VF_Port interface.</li> </ul>
	• Priority	Priority value associated with the switch FCF-MAC. Converged network adapters (CNAs) use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority. <b>detail</b>  Value range: 0 through 255.
	• State	FIP state on the fabric: <b>detail</b> <ul style="list-style-type: none"> <li>• <b>Enable</b>—FIP is enabled on the fabric.</li> <li>• <b>Disable</b>—FIP is disabled on the fabric.</li> </ul>

Table 331: show fibre-channel fip Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>ENode</b>	Information about a connected FCoE node (ENode).	All
• <b>ENode-MAC</b>	MAC address of the connected ENode.	All
• <b>Enode State</b>	Login state internal to Junos OS.	All
• <b>Configured ENode timer</b>	User-configured FIP keepalive advertisement interval in milliseconds.	<b>detail</b>
• <b>Running ENode timer</b>	Runtime interval in milliseconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	<b>detail</b>
• <b>Active FIP Sessions</b>	Number of active FIP sessions on the ENode.	<b>detail</b>
• <b>VN-Port-MAC</b>	MAC address of a VN_Port on the ENode.	All
• <b>Session State</b>	Session state internal to Junos OS.	<b>detail</b>
• <b>Configured FKA-ADV</b>	User-configured FIP keepalive advertisement interval in milliseconds.	<b>detail</b>
• <b>Running FKA-ADV</b>	Runtime interval in milliseconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	<b>detail</b>
• <b>Configured VN-Port Timer</b>	Configured state of the VN_Port keepalive timer in milliseconds. This value is always 90 and is not user-configurable.	<b>detail</b>
• <b>Running VN-Port Timer</b>	Running state of the VN_Port keepalive timer in milliseconds.	<b>detail</b>
• <b>FCID</b>	Fibre Channel ID of the VN_Port.	<b>detail</b>
• <b>WWN</b>	Unique worldwide name of the VN_Port.	<b>detail</b>

## show fibre-channel fip enode

<b>Syntax</b>	<b>show fibre-channel fip enode <i>enode-mac</i></b> <b>&lt;brief   detail&gt;</b> <b>&lt;vn-port-mac <i>vn-port-mac</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) information for a specified ENode or a specified VN_Port on an ENode.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.  <b><i>enode-mac</i></b> —Display information for the ENode specified by the MAC address.  <b>vn-port-mac <i>vn-port-mac</i></b> —(Optional) Display information only for the specified VN_Port.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring FIP on an FCoE-FC Gateway on page 4589</a></li> <li>• <a href="#">show fibre-channel fip on page 4724</a></li> <li>• <a href="#">show fibre-channel fip fabric on page 4733</a></li> <li>• <a href="#">show fibre-channel fip fcf on page 4736</a></li> <li>• <a href="#">show fibre-channel fip interface on page 4739</a></li> <li>• <a href="#">show fibre-channel fip statistics on page 4742</a></li> <li>• <a href="#">clear fibre-channel fip enode on page 4672</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel fip enode on page 4732</a> <a href="#">show fibre-channel fip enode detail on page 4732</a>
<b>Output Fields</b>	Table 332 on page 4729 lists the output fields for the <b>show fibre-channel fip enode</b> command. Output fields are listed in the approximate order in which they appear. A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.

**Table 332: show fibre-channel fip enode Output Fields**

Field Name	Field Description	Level of Output
<b>Fabric Name</b>	Name of the fabric and in parentheses the fabric ID.	All
<b>FC-MAP</b>	FCoE mapped address prefix of the FCoE forwarder for the fabric.	<b>detail</b>
<b>FKA-ADV-PERIOD</b>	Period of time in milliseconds between FIP keepalive advertisements configured for the FC fabric.	<b>detail</b>

Table 332: show fibre-channel fip enode Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>MAX-SESSIONS-PER-ENODE</b>	Maximum number of concurrent sessions (FLOGI and FDISC combined) that each ENode can instantiate.	<b>detail</b>
<b>FCoE trusted</b>	Whether ports on the FC fabric are trusted or untrusted: <ul style="list-style-type: none"> <li><b>Yes</b>—Ports on the FC fabric are trusted; FIP snooping is turned off.</li> <li><b>No</b>—Ports on the FC fabric are not trusted; FIP snooping is turned on.</li> </ul>	<b>detail</b>
<b>Member</b>	Information about an FCF that is a member of the fabric.	All
• <b>FCF-MAC</b>	MAC address used in discovery advertisements.	All
• <b>FKA-ADV-PERIOD</b>	Period of time in milliseconds between FIP keepalive advertisements configured for the FC interface.	<b>detail</b>
• <b>FKA-ADV-D-BIT</b>	Disable FIP keepalive advertisement monitoring bit. The state is always <b>off</b> .	<b>detail</b>
• <b>Type</b>	Type of interface: <ul style="list-style-type: none"> <li><b>VF_Port Capable</b>—Interface can act as a VF_Port interface.</li> </ul>	<b>detail</b>
• <b>Priority</b>	Priority value associated with the switch FCF-MAC. Converged network adapters (CNAs) use the priority value to determine the switch with which they will perform FIP FLOGI. The lower the value, the higher the priority.  Value range: 0 through 255.	<b>detail</b>
• <b>State</b>	FIP state on the fabric: <ul style="list-style-type: none"> <li><b>Enable</b>—FIP is enabled on the fabric.</li> <li><b>Disable</b>—FIP is disabled on the fabric.</li> </ul>	<b>detail</b>

Table 332: show fibre-channel fip enode Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>ENode</b>	Information about a connected FCoE node (ENode).	All
• <b>ENode-MAC</b>	MAC address of the connected ENode.	All
• <b>ENode State</b>	Login state internal to Junos OS.	All
• <b>Configured ENode timer</b>	User-configured FIP keepalive advertisement interval in milliseconds.	<b>detail</b>
• <b>Running ENode timer</b>	Runtime interval in milliseconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	<b>detail</b>
• <b>Active FIP Sessions</b>	Number of active FIP sessions on the ENode.	<b>detail</b>
• <b>VN-Port-MAC</b>	MAC address of a VN_Port on the ENode.	<b>detail</b>
• <b>Session State</b>	Session state internal to Junos OS.	<b>detail</b>
• <b>Configured FKA-ADV</b>	User-configured FIP keepalive advertisement interval in milliseconds.	<b>detail</b>
• <b>Running FKA-ADV</b>	Runtime interval in seconds of the last FIP keepalive advertisement received. This value changes every time an FKA_ADV is received.	<b>detail</b>
• <b>Configured VN-Port Timer</b>	Configured state of the VN_Port keepalive timer in seconds. This value is always 90 and is not user-configurable.	<b>detail</b>
• <b>Running VN-Port Timer</b>	Running state of the VN_Port keepalive timer in seconds.	<b>detail</b>
• <b>FCID</b>	Fibre Channel ID of the VN_Port.	<b>detail</b>
• <b>WWN</b>	Unique worldwide name of the VN_Port.	<b>detail</b>

## show fibre-channel fip statistics

<b>Syntax</b>	<b>show fibre-channel fip statistics</b> <b>&lt;fabric <i>fabric-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel over Ethernet Initialization Protocol (FIP) statistics.
<b>Options</b>	<b>fabric <i>fabric-name</i></b> —(Optional) Display output only for the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel fip on page 4724</a></li> <li>• <a href="#">show fibre-channel fip enode on page 4729</a></li> <li>• <a href="#">show fibre-channel fip fabric on page 4733</a></li> <li>• <a href="#">show fibre-channel fip fcf on page 4736</a></li> <li>• <a href="#">show fibre-channel fip interface on page 4739</a></li> <li>• <a href="#">clear fibre-channel fip statistics on page 4673</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel fip statistics on page 4745</a>
<b>Output Fields</b>	<a href="#">Table 336 on page 4742</a> lists the output fields for the <b>show fibre-channel fip statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 336: show fibre-channel fip statistics Output Fields**

Field Name	Field Description
<b>Fabric name</b>	Name of the fabric.
<b>Interface name</b>	Name of the FCoE VLAN interface.

Table 336: show fibre-channel fip statistics Output Fields (*continued*)

Field Name	Field Description
<b>FIP Message Type</b>	Type of FIP message for the displayed row of statistics..
• MDS	Number of multicast discovery solicitations.
• UDS	Number of unicast discovery solicitations.
• FLOGI	Number of fabric login (FLOGI) messages.
• FDISC	Number of fabric discovery (FDISC) messages.
• LOGO	Number of fabric logout (LOGO) messages.
• ENODE KA	Number of ENode keepalive messages.
• VN_Port KA	Number of VN_Port keepalive messages.
• MDA	Number of multicast discovery advertisements.
• UDA	Number of unicast discovery advertisements.
• FLOGI ACC	Number of fabric login requests accepted.
• FLOGI RJT	Number of fabric login requests rejected.
• FDISC ACC	Number of fabric discovery requests accepted.
• FDISC RJT	Number of fabric discovery requests rejected.
• LOGO ACC	Number of logout requests accepted.
• LOGO RJT	Number of logout requests rejected.
• CVL	Number of clear virtual links (CVL) messages.
• CVL ALL	Number of CVL all messages.
<b>Received</b>	Number of messages received.
<b>Sent</b>	Number of messages sent.
<b>Rx errors</b>	Number of receive errors.

Table 336: show fibre-channel fip statistics Output Fields (*continued*)

Field Name		Field Description
<b>Dropped</b>		<p>Number of dropped messages.</p> <p><b>NOTE:</b> One cause of dropped messages is that the system limits the number of discovery solicitations (MDS and UDS) it accepts to a maximum of 100 outstanding requests at any given time. If the system has 100 discovery solicitations outstanding, the system does not respond to new discovery solicitations. Instead, the system drops new discovery solicitations and reports the number of dropped discovery solicitations in this field. When there are fewer than 100 outstanding discovery solicitations, the system responds to new requests as usual with a discovery advertisement.</p>
<b>General Statistics</b>	<b>Number of frames recvd with invalid src-mac</b>	Number of frames received that have an invalid source media access control (MAC) address.
	<b>Number of frames recvd with invalid version</b>	Number of FIP frames received with an Invalid FIP version.
	<b>Number of frames recvd with invalid opcode</b>	Number of FIP validation descriptors with an invalid opcode received.
	<b>Number of frames recvd with invalid subcode</b>	Number of FIP validation descriptors with an invalid subcode received.
	<b>Number of frames recvd on inactive FCF</b>	Number of frames received on a logical interface if FIP is not active on that logical interface (for example, if a WWN is not allocated to that logical interface).

## Sample Output

```

user@switch> show fibre-channel fip statistics
Fabric name: proxy2

Interface name: vlan.100
FIP Message type    Received    Sent    Rx errors    Dropped

Number of frame recvd with invalid opcode:       0
Number of frame recvd with invalid subcode:      0
Number of frame recvd on inactive FCF:           0

```

## show fibre-channel flogi fport

<b>Syntax</b>	<b>show fibre-channel flogi fport</b> <b>&lt;fabric <i>fabric-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel fabric login (FLOGI) F_Port information.
<b>Options</b>	<b>fabric <i>fabric-name</i></b> —(Optional) Display output only for the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show fibre-channel flogi nport on page 4747</a></li> <li>• <a href="#">show fibre-channel flogi statistics on page 4749</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel flogi fport on page 4746</a>
<b>Output Fields</b>	Table 337 on page 4746 lists the output fields for the <b>show fibre-channel flogi fport</b> command. Output fields are listed in the approximate order in which they appear.

**Table 337: show fibre-channel flogi fport Output Fields**

Field Name	Field Description
<b>Fabric</b>	Name of the fabric.
<b>Interface</b>	Name of the switch VF_Port interface.
<b>Mac-Address</b>	Media access control (MAC) address of the ENode.
<b>State</b>	Interface physical state: <b>up</b> or <b>down</b> .
<b>Logins</b>	Number of logins to the VF_Port.
<b>NPIV</b>	N_Port ID virtualization (NPIV) state: <b>Yes</b> or <b>No</b> .
<b>FLOGI-Port-WWN</b>	Unique worldwide name (WWN) of the VN_Port performing fabric login (FLOGI) to the switch VF_Port.

## Sample Output

### show fibre-channel flogi fport

```

user@switch> show fibre-channel flogi fport
Fabric: proxy2
Interface  Mac-Address      State  Logins  NPIV  FLOGI-Port-WWN
vlan.100   00:10:94:00:00:02    Up     2       Yes   20:00:10:94:00:01:00:01
vlan.100   00:10:94:00:00:03    Up     2       Yes   20:00:10:94:00:02:00:01

```

## show fibre-channel flogi nport

<b>Syntax</b>	<b>show fibre-channel flogi nport</b> <brief   detail> <fabric <i>fabric-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel fabric login (FLOGI) VN_Port information.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.  <b>fabric <i>fabric-name</i></b> —(Optional) Display output only for the specified fabric.
<b>Required Privilege Level</b>	view

<b>Output Fields</b>	<a href="#">Table 339 on page 4749</a> lists the output fields for the <b>show fibre-channel flogi statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 339: show fibre-channel flogi statistics Output Fields**

Field Name	Field Description
<b>Fabric</b>	Name of the fabric.
<b>FLOGI-Server Message type</b>	Type of message: <ul style="list-style-type: none"> <li>• <b>FLOGI</b>—Fabric login (FLOGI) messages.</li> <li>• <b>FDISC</b>—Fabric discovery (FDISC) messages.</li> <li>• <b>FLOGO</b>—Fabric logout messages.</li> <li>• <b>FLOGO-LS-ACC</b>—Fabric logout link service accept messages.</li> <li>• <b>LS-Accept</b>—Link service accept messages.</li> <li>• <b>LS-Reject</b>—Link service reject messages.</li> <li>• <b>invalid</b>—Invalid messages.</li> </ul>
<b>Received</b>	Number of messages received for a given message type.
<b>Sent</b>	Number of messages sent for a given message type.
<b>Fabric</b>	Name of the fabric.
<b>Rx errors</b>	Number of receive errors for a given type of message.

Table 339: show fibre-channel flogi statistics Output Fields (*continued*)

Field Name	Field Description
<b>General Statistics</b>	
• <b>Number of FC2 Header Parse Errors</b>	Number of errors parsing the FC-2 header.
• <b>Number of FLOGI Parse Errors</b>	Number of errors parsing fabric login requests.
• <b>Number of FDISC Parse Errors</b>	Number of errors parsing fabric discovery requests.
• <b>Number of FLOGO Parse Errors</b>	Number of errors parsing fabric logout requests.
• <b>Number of Logins Discarded as Domain-ID not available</b>	Number of discarded logins due to unavailability of a domain ID.
• <b>Number of Logins Discarded as FCID not available</b>	Number of discarded logins due to the unavailability of a Fibre Channel ID.
• <b>Number of FCID requests deferred</b>	Number of deferred FCID requests.
• <b>Number of deferred FCID requests failed</b>	Number of deferred FCID requests that failed.

## Sample Output

### show fibre-channel flogi statistics

```

user@switch> show fibre-channel flogi statistics
Fabric: proxy2

FLOGI-Server Message type   Received      Sent    Rx errors
FLOGI                       2             0        0
FDISC                       2             0        0
FLOGO                       0             0        0
FLOGO-LS-ACC                0             0        0
LS-Accept                   0             4        0
LS-Reject                   0             0        0
invalid                     0             0        0

General Statistics:

Number of FC2 Header Parse Errors:           0
Number of FLOGI Parse Errors:                 0
Number of FDISC Parse Errors:                 0
Number of FLOGO Parse Errors:                 0
Number of Logins Discarded as Domain-ID not available: 0
Number of Logins Discarded as FCID not available: 0
Number of FCID requests deferred:             0
Number of deferred FCID requests failed:      0

## show fibre-channel proxy fabric-state

<b>Syntax</b>	<b>show fibre-channel proxy fabric-state</b> <b>&lt;fabric <i>fabric-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel (FC) proxy fabric state information.
<b>Options</b>	<b>fabric <i>fabric-name</i></b> —(Optional) Display output only for the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring Fibre Channel Interface Load Balancing on page 4665</a></li> <li>• <a href="#">show fibre-channel proxy login-table on page 4760</a></li> <li>• <a href="#">show fibre-channel proxy np-port on page 4764</a></li> <li>• <a href="#">show fibre-channel proxy statistics on page 4767</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel proxy fabric-state on page 4759</a> <a href="#">show fibre-channel proxy fabric-state fabric on page 4759</a>
<b>Output Fields</b>	<a href="#">Table 343 on page 4757</a> lists the output fields for the <b>show fibre-channel proxy fabric-state</b> command. Output fields are listed in the approximate order in which they appear.

**Table 343: show fibre-channel proxy fabric-state Output Fields**

Field Name	Field Description
<b>Fabric</b>	Name of the fabric.
<b>Fabric-id</b>	Fabric ID number.
<b>Proxy load balance algorithm</b>	<p>Load-balancing algorithm used on the FCoE-FC gateway FC fabric:</p> <ul style="list-style-type: none"> <li>• <b>Simple</b>—Load balancing is based on the weighted utilization (load) of the NP_Ports connected to an FC fabric. Each new FLOGI or FDISC is assigned to the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</li> <li>• <b>ENode-based</b>—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, all sessions are logged out. When the sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</li> <li>• <b>FLOGI-based</b>—Load balancing is based on the ENode FLOGI. When an ENode logs in to the fabric, all subsequent FDISC sessions associated with that ENode are placed on the same link as the ENode FLOGI session, regardless of the link load. New ENode FLOGIs are placed on the least-loaded link. On a link load rebalance, only the sessions that need to be moved to another link are logged out. When those sessions log in again, they are placed on active NP_Port interfaces in a balanced manner.</li> </ul>

Table 343: show fibre-channel proxy fabric-state Output Fields (*continued*)

Field Name	Field Description
<b>Fabric WWN verification</b>	<p>Fabric worldwide name (WWN) verification check state on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Yes—Fabric WWN verification check is enabled.</li> <li>• No—Fabric WWN verification check is disabled.</li> </ul>
<b>Auto load rebalance enabled</b>	<p>Automated link load rebalancing configuration for the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• No—Automated load balancing is disabled (default state).</li> <li>• Yes—Automated load balancing is enabled.</li> </ul>
<b>Last rebalance start-time</b>	<p>Time that the last link load rebalance began on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—The link load has never been rebalanced.</li> <li>• Timestamp value—Time the last link load rebalancing started.</li> </ul>
<b>Last rebalance end-time</b>	<p>Time that the last link load rebalance ended on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—The link load has never been rebalanced.</li> <li>• Timestamp value—Time the last link load rebalancing ended.</li> </ul>
<b>Last rebalance trigger</b>	<p>Event that triggered the last link load rebalance on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• None—The link load has never been rebalanced.</li> <li>• Config-CLI—Configure (enable) automated load balancing.</li> <li>• Request-CLI—Rebalance requested from the CLI using the <b>request fibre-channel proxy load-rebalance fabric fabric-name</b> operational command.</li> <li>• Preview-CLI—Rebalancing <i>dry run</i> requested from the CLI using the <b>request fibre-channel proxy load-rebalance dry-run fabric fabric-name</b> operational command. Indicates that the switch completed the dry run. A dry run simulates a link load rebalance and displays a list of sessions that might be affected if you request an actual rebalance.</li> <li>• Link-up—New FC link (NP_Port) up on the FCoE-FC gateway fabric, which causes a rebalance to distribute sessions to the new link.</li> <li>• Restore-complete—If the FC process on the switch restarts, the switch attempts to restore the session state that existed before the restart. When automated rebalance is enabled, restore-complete indicates that the sessions have been restored and rebalanced.</li> </ul>
<b>Last rebalance trigger-time</b>	<p>Time that the last link load rebalance was triggered on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—Link load rebalancing has never been triggered.</li> <li>• Timestamp value—Time the last link load rebalancing was triggered.</li> </ul>

Table 343: show fibre-channel proxy fabric-state Output Fields (*continued*)

Field Name	Field Description
Last rebalance trigger-result	<p>Result of the last trigger event on the FCoE-FC gateway fabric:</p> <ul style="list-style-type: none"> <li>• Never—Link load rebalancing has never been triggered.</li> <li>• Not-configured—Automated rebalancing is not configured on the FCoE-FC gateway fabric.</li> <li>• Not-required—Last rebalance trigger did not require rebalancing the link load (the link load was already balanced across the active NP_Port links).</li> <li>• In-progress—Link load rebalancing is in progress and has not finished yet.</li> <li>• Restore-in-progress—The switch is recovering from an FC process restart and is in the process of restoring the sessions to the active NP_Port links.</li> <li>• Success—Link load rebalancing was successful.</li> <li>• Logged-out-all—All sessions have been logged out.</li> <li>• Preview-complete—The switch has finished simulating a dry run rebalancing request from the CLI (<code>request fibre-channel proxy load-rebalance dry-run fabric fabric-name</code> operational command) and reported the sessions that might be affected if you request an actual link load rebalance.</li> <li>• Fabric-deletion-in-progress—FCoE-FC gateway fabric is in the process of being deleted.</li> </ul> <p><b>NOTE:</b> A trigger event does not necessarily result in a rebalance action. Link load rebalancing only occurs if the NP_Port interface session load is not balanced at the time of the trigger event.</p>

## Sample Output

## show fibre-channel proxy np-port

<b>Syntax</b>	<code>show fibre-channel proxy np-port</code> <code>&lt;brief   detail&gt;</code> <code>&lt;fabric <i>fabric-name</i>&gt;</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel gateway fabric proxy Node Port (NP_Port) information.
<b>Options</b>	<code>brief   detail</code> —(Optional) Display the specified level of output.  <code>fabric <i>fabric-name</i></code> —(Optional) Display output only for the specified fabric.  <code>interface <i>interface-name</i></code> —(Optional) Display output only for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an FCoE-FC Gateway Fibre Channel Fabric on page 4576</a></li> <li>• <a href="#">Monitoring Fibre Channel Interface Load Balancing on page 4665</a></li> <li>• <a href="#">show fibre-channel proxy fabric-state on page 4757</a></li> <li>• <a href="#">show fibre-channel proxy login-table on page 4760</a></li> <li>• <a href="#">show fibre-channel proxy statistics on page 4767</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel proxy np-port on page 4766</a> <a href="#">show fibre-channel proxy np-port detail on page 4766</a>
<b>Output Fields</b>	<a href="#">Table 345 on page 4764</a> lists the output fields for the <b>show fibre-channel proxy np-port</b> command. Output fields are listed in the approximate order in which they appear.

**Table 345: show fibre-channel proxy np-port Output Fields**

Field Name	Field Description	Level of Output
<b>Fabric</b>	Name of the fabric.	All
<b>Fabric-id</b>	Fabric ID number.	All
<b>NP-Port</b>	NP_Port interface connected to the FCoE forwarder (FCF) or the Fibre Channel switch.	All
<b>State</b>	FCID state of the NP_Port interface.	All
<b>Sessions</b>	Number of active sessions on the NP_Port interface. A session is a FLOGI or FDISC login to the FC SAN fabric. Session does not refer to end-to-end storage sessions.	All

Table 345: show fibre-channel proxy np-port Output Fields (*continued*)

Field Name	Field Description	Level of Output
Configured max login sessions	Configured maximum number of FIP login sessions permitted on the interface.	detail
Enodes	Number of ENodes with sessions on the NP_Port.	detail
LB state	Load-balancing state: <ul style="list-style-type: none"> <li>• <b>On</b>—Load balancing is on</li> <li>• <b>Off</b>—Load balancing is off.</li> </ul>	All
LB weight	Load balance weight, which reflects the port speed: <ul style="list-style-type: none"> <li>• <b>2</b>—Port speed is 2 Gbps.</li> <li>• <b>4</b>—Port speed is 4 Gbps.</li> <li>• <b>8</b>—Port speed is 8 Gbps.</li> </ul>	All
Ref-count	Reference count internal to Junos OS.	detail
Flags	Flags internal to Junos OS.  <b>NOTE:</b> When an NP_Port interface reaches its configured maximum number of FIP sessions, the <b>Flags</b> field displays the flag <b>MAX-LOGINS-REACHED</b> .	detail

## Sample Output

### show fibre-channel proxy np-port

```
user@switch> show fibre-channel proxy np-port
Fabric: proxy1, Fabric-id: 10
NP-Port      State           Sessions      LB state  LB weight

Ref-count:        131
Flags:            UP MAX-LOGINS-REACHED
```

## show fibre-channel proxy statistics

<b>Syntax</b>	<b>show fibre-channel proxy statistics</b> <b>&lt;fabric <i>fabric-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Fibre Channel proxy fabric statistics.
<b>Options</b>	<b>fabric <i>fabric-name</i></b> —(Optional) Display output only for the specified fabric.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an FCoE-FC Gateway Fibre Channel Fabric on page 4576</a></li> <li>• <a href="#">show fibre-channel proxy fabric-state on page 4757</a></li> <li>• <a href="#">show fibre-channel proxy login-table on page 4760</a></li> <li>• <a href="#">show fibre-channel proxy np-port on page 4764</a></li> <li>• <a href="#">clear fibre-channel proxy statistics on page 4676</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fibre-channel proxy statistics on page 4769</a>
<b>Output Fields</b>	<a href="#">Table 346 on page 4767</a> lists the output fields for the <b>show fibre-channel proxy statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 346: show fibre-channel proxy statistics Output Fields**

Field Name	Field Description
Fabric	Name of the fabric.
Fabric-id	Fabric ID number.

Table 346: show fibre-channel proxy statistics Output Fields (*continued*)

Field Name	Field Description
<b>NP-Port Transmit Command Statistics</b>	Transmitted command statistics for the NP_Port.
<ul style="list-style-type: none"> <li><b>Command</b></li> </ul>	Type of command issued on the NP_Port: <ul style="list-style-type: none"> <li><b>FLOGI</b>—Fabric login commands issued.</li> <li><b>FDISC</b>—Fabric discovery commands issued.</li> <li><b>LOGO</b>—Logout commands issued.</li> <li><b>Others</b>—Other commands issued.</li> </ul>
<ul style="list-style-type: none"> <li><b>Tx</b></li> </ul>	Number of times the command type was transmitted.
<ul style="list-style-type: none"> <li><b>Rx-ACC</b></li> </ul>	Number of times the NP_Port transmitted a receive accept message for the command type.
<ul style="list-style-type: none"> <li><b>Rx-RJT</b></li> </ul>	Number of times the NP_Port transmitted a receive reject message for the command type.
<ul style="list-style-type: none"> <li><b>Abort</b></li> </ul>	Number of times the NP_Port transmitted an abort message for the command type.
<b>NP-Port Receive Command Statistics</b>	Received command statistics for the NP_Port.
<ul style="list-style-type: none"> <li><b>Command</b></li> </ul>	The type of command received on the NP_Port: <ul style="list-style-type: none"> <li><b>LOGO</b>—Logout commands issued.</li> <li><b>Others</b>—Other commands issued.</li> </ul>
<ul style="list-style-type: none"> <li><b>Rx</b></li> </ul>	Number of times the command type was received.
<ul style="list-style-type: none"> <li><b>Tx-ACC</b></li> </ul>	Number of times the NP_Port received a transmit accept message for the command type.
<ul style="list-style-type: none"> <li><b>Tx-RJT</b></li> </ul>	Number of times the NP_Port received a transmit reject message for the command type.
<ul style="list-style-type: none"> <li><b>Abort</b></li> </ul>	Number of times the NP_Port received an abort message for the command type.

## Sample Output

**show fibre-channel  
proxy statistics**

user@switch> **show fibre-channel proxy statistics**

Fabric: proxy1, Fabric-id: 10

NP-Port Transmit Command Statistics:

Command	Tx	Rx-ACC	Rx-RJT	Abort
FLOGI	3	3	0	0
FDISC	3	3	0	0
LOGO	0	0	0	0
Others	0	0	0	0

NP-Port Receive Command Statistics:

Command	Rx	Tx-ACC	Tx-RJT	Abort
LOGO	0	0	0	0
Others	0	0	0	0

## show fip snooping

<b>Syntax</b>	<b>show fip snooping</b> <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display FIP snooping information.
<b>Options</b>	<b>none</b> —Display FIP snooping information.  <b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">show fip snooping enode on page 4775</a></li> <li>• <a href="#">show fip snooping fcf on page 4778</a></li> <li>• <a href="#">show fip snooping interface on page 4780</a></li> <li>• <a href="#">show fip snooping statistics on page 4783</a></li> <li>• <a href="#">show fip snooping vlan on page 4786</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fip snooping on page 4773</a> <a href="#">show fip snooping brief (QFX Series) on page 4773</a> <a href="#">show fip snooping detail (QFX Series) on page 4773</a> <a href="#">show fip snooping detail on page 4773</a>
<b>Output Fields</b>	<a href="#">Table 347 on page 4770</a> lists the output fields for the <b>show fip snooping</b> command. Output fields are listed in the approximate order in which they appear.

**Table 347: show fip snooping Output Fields**

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Mode	(QFX Series only) Snooping mode enabled on the FCoE VLAN: <ul style="list-style-type: none"> <li>• VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port.</li> <li>• VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.</li> </ul>	All

Table 347: show fip snooping Output Fields (*continued*)

Field Name	Field Description	Level of Output
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the VLAN.	All
FCF or FCF-MAC	MAC address of the FCF.	All
Session Count or Active Sessions	Current number of virtual link sessions with VN_Ports.	All
VN_Port Count	(QFX Series only) Number of VN_Ports active on an ENode.	<b>brief</b>
Configured FKA-ADV	<p>FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>	<b>detail</b>
Running FKA-ADV	<p>Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>	<b>detail</b>
Beacon Period	(QFX Series only) Beacon period interval in milliseconds.	<b>detail</b>
VN2VN Mode	<p>(QFX Series only) Mode of VN2VN_Port snooping:</p> <ul style="list-style-type: none"> <li>Multi-Point—Multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN_Ports. This is analogous to the loop mode in traditional FC networks.</li> <li>Point-to-Point—Two ENodes are connected to the network and form a single VN_Port to VN_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.</li> </ul>	<b>detail</b>
ENode-MAC	MAC address of the connected FCoE node (ENode).	All
Interface	Interface connected to the ENode.	<b>detail</b>
VN-Port MAC	MAC address of a VN_Port on the ENode.	All

Table 347: show fip snooping Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>FKA-ADV</b>	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	<b>detail</b>
<b>Active VN_Ports</b>	(QFX Series only) Number of VN_Ports active on an ENode.	<b>detail</b>
<b>Vlink far-end VN-Port-MAC</b>	(QFX Series only) Media access control (MAC) address of the VN_Port at the other end of the virtual link.	<b>detail</b>

## Sample Output

### show fip snooping

```
user@switch> show fip snooping
VLAN : fcoevlan1      FC-MAP : 0e:fc:00
FCF : 00:10:94:00:00:01  Session Count : 2
  Enode-MAC : 00:10:94:00:00:02

<b>Output Fields</b>	<a href="#">Table 348 on page 4775</a> lists the output fields for the <b>show fip snooping enode</b> command. Output fields are listed in the approximate order in which they appear.

**Table 348: show fip snooping enode Output Fields**

Field Name	Field Description	Level of Output
ENode and ENode MAC	MAC address of the ENode.	All
VLAN	Name of the VLAN.	All
Interface	Interface connected to the ENode.	All

Table 348: show fip snooping enode Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Mode</b>	(QFX Series only) Snooping mode enabled on the FCoE VLAN: <ul style="list-style-type: none"> <li>VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port.</li> <li>VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.</li> </ul>	All
<b>VN_Port Count</b>	(QFX Series only) Number of VN_Ports active on an ENode.	<b>brief</b>
<b>Session Count</b>	Current number of virtual link sessions with VN_Ports.	All
<b>Configured FKA-ADV</b>	FIP keepalive interval in seconds configured on the FCoE forwarder (FCF) multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. This value remains constant.  For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	<b>detail</b>
<b>Running FKA-ADV</b>	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF. This value changes every time the ENode sends an FKA_ADV to the FCF.  For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.	<b>detail</b>
<b>VN-Port or VN-Port-MAC</b>	MAC address of a VN_Port on the ENode.	All
<b>FKA-ADV</b>	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	<b>detail</b>
<b>FCF or FCF-MAC</b>	MAC address of the FCF to which the VN_Port is connected.	All
<b>Beacon Period</b>	(QFX Series only) Beacon period interval in milliseconds.	<b>detail</b>

Table 348: show fip snooping enode Output Fields (*continued*)

Field Name	Field Description	Level of Output
VN2VN Mode	(QFX Series only) Mode of VN2VN_Port snooping: <ul style="list-style-type: none"> <li>Multi-Point—Multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN_Ports. This is analogous to the loop mode in traditional FC networks.</li> <li>Point-to-Point—Two ENodes are connected to the network and form a single VN_Port to VN_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.</li> </ul>	detail
Vlink far-end VN-Port-MAC	(QFX Series only) Media access control (MAC) address of the VN_Port at the other end of the virtual link.	detail

## Sample Output

### show fip snooping enode

```
user@switch> show fip snooping enode 00:10:94:00:00:02
Enode : 00:10:94:00:00:02   VLAN : vlan1   Interface : xe-0/0/1
      VN-Port-MAC         FCF-MAC
      0E:FC:00:00:00:05    00:10:94:00:00:01
      0E:FC:00:00:00:01    00:10:94:00:00:01
```

### show fip snooping enode brief (QFX Series)

```
user@switch> show fip snooping enode 10:10:94:01:00:02 brief
Enode: 10:10:94:01:00:02 , VLAN: vlan101, Interface: xe-0/0/10
Mode: VN2VF Snooping      VN_Port Count: 1
VN_Port Information
VN_Port Mac: 0e:fc:00:01:0a:01      Session Count: 2
```

### show fip snooping enode detail (QFX Series)

```
user@switch> show fip snooping enode 10:10:94:01:00:02 detail
Enode MAC: 10:10:94:01:00:02, VLAN: vlan101, Interface: xe-0/0/10
Mode: VN2VF Snooping      VN_Port Count: 1
Beacon_Period: 90000      VN2VN Mode: Multi-Point
VN_Port Information
VN_Port Mac: 0e:fc:00:01:0a:01      Session Count: 2
Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01
Vlink far-end VN-Port-MAC: 0e:fc:00:01:0c:01
```

### show fip snooping enode detail

```
user@switch> show fip snooping enode 00:10:94:00:00:02 detail
Enode MAC : 00:10:94:00:00:02   VLAN : vlan1   Interface : xe-0/0/1
Configured FKA-ADV : 258      Running FKA-ADV : 213
Session Information
VN-Port : 0E:FC:00:00:00:05    FKA-ADV : 229    FCF : 00:10:94:00:00:01
VN-Port : 0E:FC:00:00:00:01    FKA-ADV : 225    FCF : 00:10:94:00:00:01
```

## show fip snooping fcf

<b>Syntax</b>	<b>show fip snooping fcf <i>fcf-mac</i></b> <b>&lt;brief   detail&gt;</b> <b>&lt;vlan <i>vlan-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display FIP snooping FCoE forwarder (FCF) information.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.  <b><i>fcf-mac</i></b> —Display information for the FCF specified by the MAC address.  <b><i>vlan-name</i></b> —(Optional) Display FIP snooping information for the FCF on only the specified VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">show fip snooping on page 4770</a></li> <li>• <a href="#">show fip snooping enode on page 4775</a></li> <li>• <a href="#">show fip snooping interface on page 4780</a></li> <li>• <a href="#">show fip snooping statistics on page 4783</a></li> <li>• <a href="#">show fip snooping vlan on page 4786</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fip snooping fcf on page 4779</a> <a href="#">show fip snooping fcf detail on page 4779</a>
<b>Output Fields</b>	<a href="#">Table 349 on page 4778</a> lists the output fields for the <b>show fip snooping fcf</b> command. Output fields are listed in the approximate order in which they appear.

**Table 349: show fip snooping fcf Output Fields**

Field Name	Field Description	Level of Output
FCF or FCF-MAC	MAC address of the FCoE forwarder.	All
VLAN	Name of the VLAN.	All
Session Count	Current number of virtual link sessions with VN_Ports.	None

Table 349: show fip snooping fcf Output Fields (*continued*)

Field Name	Field Description	Level of Output
Configured FKA-ADV	FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258.	detail
Running FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV.	detail
ENode-MAC	MAC address of the connected ENode.	All
• Interface	Interface connected to the ENode.	detail
• Configured FKA-ADV	FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. This value remains constant.	detail
• Running FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF. This value changes every time the ENode sends an FKA_ADV to the FCF.	detail
• VN-Port MAC	MAC address of a VN_Port on the ENode.	All
• FKA-ADV	Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF on behalf of the VN_Port (VN_Port FKA_ADV). This value changes every time the ENode sends a VN_Port FKA_ADV to the FCF.	detail

## Sample Output

```

```

## show fip snooping interface

<b>Syntax</b>	<b>show fip snooping interface</b> <i>interface-name</i> <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display FIP snooping information for the specified interface.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.  <b>interface-name</b> —Display information for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping on an FCoE Transit Switch on page 4596</a></li> <li>• <a href="#">show fip snooping on page 4770</a></li> <li>• <a href="#">show fip snooping enode on page 4775</a></li> <li>• <a href="#">show fip snooping fcf on page 4778</a></li> <li>• <a href="#">show fip snooping statistics on page 4783</a></li> <li>• <a href="#">show fip snooping vlan on page 4786</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show fip snooping interface on page 4782</a> <a href="#">show fip snooping interface detail on page 4782</a>
<b>Output Fields</b>	<a href="#">Table 350 on page 4780</a> lists the output fields for the <b>show fip snooping interface interface-name</b> command. Output fields are listed in the approximate order in which they appear.

**Table 350: show fip snooping interface Output Fields**

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
FC-MAP	FCoE mapped address prefix of the FCoE forwarder for the VLAN.	All
FCF or FCF-MAC	MAC address of the FCF.	All
Session Count or Active Sessions	Current number of virtual link sessions with VN_Ports.	All

Table 350: show fip snooping interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Configured FKA-ADV	<p>FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>	detail
Running FKA-ADV	<p>Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>	detail
ENode-MAC	MAC address of the connected FCoE node (ENode).	All
Interface	Interface connected to the ENode.	detail
Configured FKA-ADV	<p>FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258. This value remains constant.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>	detail
Running FKA-ADV	<p>Runtime interval in seconds of the last FIP keepalive advertisement the ENode sent to the FCF. This value changes every time the ENode sends an FKA_ADV to the FCF.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. <b>Output Fields</b>	Table 351 on page 4783 lists the output fields for the <b>show fip snooping statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 351: show fip snooping statistics Output Fields**

Field Name	Field Description
<b>VLAN</b>	Name of the VLAN for which a set of statistics is displayed.
<b>Mode</b>	(QFX Series only) Snooping mode enabled on the FCoE VLAN: <ul style="list-style-type: none"> <li>• VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port.</li> <li>• VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.</li> </ul>
<b>Number of MDS</b>	Number of multicast discovery solicitation messages sent on the VLAN.
<b>Number of UDS</b>	Number of unicast discovery solicitation messages sent on the VLAN.

Table 351: show fip snooping statistics Output Fields (*continued*)

Field Name	Field Description
Number of FLOGI	Number of fabric logins on the VLAN.
Number of FDISC	Number of fabric discovery logins on the VLAN.
Number of LOGO	Number of fabric logouts on the VLAN.
Number of ENode-keep-alive	Number of ENode keepalive messages sent on the VLAN.
Number of VNPort-keep-alive	Number of VN_Port keepalive messages sent on the VLAN.
Number of MDA	Number of multicast discovery advertisement messages sent on the VLAN.
Number of UDA	Number of unicast discovery advertisement messages sent on the VLAN.
Number of FLOGI_ACC	Number of fabric logins accepted on the VLAN.
Number of FLOGI_RJT	Number of fabric logins rejected on the VLAN.
Number of FDISC_ACC	Number of fabric discoveries accepted on the VLAN.
Number of FDISC_RJT	Number of fabric discoveries rejected on the VLAN.
Number of LOGO_ACC	Number of fabric logouts accepted on the VLAN.
Number of LOGO_RJT	Number of fabric logouts rejected on the VLAN.
Number of CVL	Number of clear virtual links (CVL) actions on the VLAN.
Number of VN_Port Probes Req	(QFX Series only) Number of multicast N_Port_ID probes sent to the ALL-VN2VN-ENode-MACs multicast address on the VLAN.
Number of VN_Port Claim Notif	(QFX Series only) Number of multicast N_Port_ID claim notifications sent on the VLAN.
Number of VN_Port Beacons	(QFX Series only) Number of multicast beacons sent on the VLAN.
Number of VN_Port Probes Reply	(QFX Series only) Number of replies to N_Port_ID probes sent on the VLAN. Replies are unicast to the ENode MAC address of the probe requester.
Number of VN_Port Claim Reply	(QFX Series only) Number of replies to N_Port_ID claim notifications sent on the VLAN. Replies are unicast to the ENode MAC address of the claim notifier.

## Sample Output

show fip snooping  
statistics (FIP  
Snooping)

```

## Troubleshooting Procedures

---

- [Troubleshooting Dropped FCoE Traffic on page 4795](#)
- [Troubleshooting Fibre Channel Interface Deletion on page 4798](#)
- [Troubleshooting Dropped FIP Traffic on page 4799](#)

## Troubleshooting Dropped FCoE Traffic

**Problem** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

NOTE: If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 4509 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

- [Understanding CoS Flow Control \(Ethernet PAUSE and PFC\) on page 4476](#)

## Troubleshooting Fibre Channel Interface Deletion

**Problem** You deleted a Fibre Channel (FC) interface at the **[edit interfaces]** hierarchy level, but the commit check fails so the interface is not deleted.

**Cause** You must first delete the FC interface from the FC fabric on the QFX Series before you can delete the FC interface at the **[edit interfaces]** hierarchy level. You must perform both operations to delete a FC interface.

**Solution** First delete the interface from the FC fabric and then delete the interface from the QFX Series:

1. Delete the FC interface from the FC fabric to which it belongs:

```
[edit]
user@switch# delete fc-fabrics fabric-name interface interface-name
```

For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

```
[edit]
user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
```

2. Delete the FC interface at the **[edit interfaces]** hierarchy level:

```
[edit]
user@switch: delete interfaces interface-name
```

For example, to delete the interface **fc-0/0/3.0** from the switch:

```
[edit]
user@switch: delete interfaces fc-0/0/3.0
```

- Related Documentation**
- [fc-fabrics on page 4627](#)
  - [interface on page 4637](#)
  - [interfaces on page 2078](#)
  - [Understanding Interfaces on an FCoE-FC Gateway on page 4420](#)

## Troubleshooting Dropped FIP Traffic

**Problem** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped on the QFX Series.

**Cause** The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

**Solution** Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

**NOTE:** Make sure that the native VLAN you are using on the QFX Series is the same native VLAN that the FCoE devices use for Ethernet traffic.

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching port-mode
tagged-access
```

For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure a native VLAN on the interface:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching native-vlan-id
vlan-id
```

For example, to set the native VLAN ID to 1 for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
```

3. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID 1:

```
[edit]
user@switch# set vlans native vlan-id 1
```

## Overview of Junos OS CoS for the QFX Series

When a network experiences congestion and delay, some packets must be dropped. Junos OS class of service (CoS) enables you to divide traffic into classes and set various levels of throughput and packet loss when congestion occurs. You have greater control over packet loss because you can configure rules tailored to your needs.

You can configure CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP) or IEEE 802.1p code-point bits of packets leaving an interface, thus allowing you to tailor packets for the network requirements of the remote peers.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, schedule the transmission service level for each queue, and manage congestion using a random early detection (RED) algorithm.

In designing CoS applications, you must carefully consider your service needs, and you must thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because QFX Series implements CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet forwarding and switching performance.

**NOTE:** CoS policies can be enabled or disabled on each switch interface. Also, each physical and logical interface on the switch can have associated custom CoS rules.

When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

---

This topic describes:

- [CoS Standards on page 4804](#)
- [How Junos CoS Works on page 4805](#)
- [Default CoS Behavior on page 4806](#)

### CoS Standards

---

The following RFCs define the standards for the QFX Series CoS capabilities:

- RFC 2474, *Definition of the Differentiated Services Field in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 2698, *A Two Rate Three Color Marker*

QFX Series also supports the following data center bridging (DCB) standards to provide the CoS (and other characteristics) Fibre Channel requires for transmitting storage traffic over an Ethernet network:

- IEEE 802.1Qbb, priority-based flow control (PFC)
- IEEE 802.1Qaz, enhanced transmission selection (ETS)
- IEEE 802.1AB (LLDP) extension called Data Center Bridging Capability Exchange Protocol (DCBX)

### How Junos CoS Works

Junos CoS works by examining traffic entering at the edge of your network. The switch classifies traffic into defined service groups to provide the special treatment of traffic across the network. For example, you can send voice traffic across certain links and data traffic across other links. In addition, the data traffic streams can be serviced differently along the network path to ensure that higher-paying customers receive better service. As the traffic leaves the network at the far edge, you can reclassify the traffic to meet the policies of the targeted peer by rewriting the DSCP or IEEE 802.1 code-point bits.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings dictate which packets are transmitted first to the next downstream switch. Switches at the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

In [Figure 176 on page 4805](#), Switch A is receiving traffic. As each packet enters, Switch A examines the packet's current CoS settings and classifies the traffic into one of the groupings defined on the switch. This definition allows Switch A to prioritize its resources for servicing the traffic streams it receives. Switch A might alter the CoS settings (forwarding class and loss priority) of the packets to better match the defined traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packet according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can reclassify (rewrite) the CoS code-point bits of the packets before transmitting them.

**Figure 176: Packet Flow Across the Network**

## Default CoS Behavior

---

If you do not configure CoS settings, the software performs some CoS functions to ensure that the system forwards traffic and protocol packets with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

## Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multidestination forwarding classes

**CAUTION:** If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multidestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:  

```
user@switch# deactivate class-of-service
```
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.
3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:

- Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
  - Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
  - Remove the default multdestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multdestination traffic to use the new default multdestination forwarding class (**mcast**).
4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multdestination traffic to the default multdestination forwarding class (**mcast**).
  5. Activate the CoS configuration:  

```
user@switch# activate class-of-service
```
  6. Commit the CoS configuration:  

```
user@switch# commit
```

**NOTE:** If you configured the **transmit-rate** option for any queues under the **[edit class-of-service schedulers]** hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the **transmit-rate** option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the **transmit-rate** option as a percentage.

## Overview of CoS Upgrade Requirements to Junos OS Release 12.2

Before you upgrade to Junos OS Release 12.2, you might need to edit the class-of-service (CoS) configuration, because the way the QFX Series handles lossless forwarding classes has changed in Junos OS Release 12.2.

By default, the **fcoe** and **no-loss** forwarding classes are mapped to output queue 3 and output queue 4, respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport.

In Junos OS Release 12.1 and earlier, explicitly setting the lossless **fcoe** and **no-loss** forwarding classes resulted in the same CoS behavior as using the default configuration. However, in Junos OS Release 12.2, the behavior when you explicitly configure the lossless forwarding classes differs from the behavior when you use the default forwarding classes.

**NOTE:** The default behavior differs from the explicit configuration behavior even if the explicit configuration is exactly the same as the default configuration.

- If you use the default forwarding class configuration for the lossless queues (the configuration does not include explicit setting of the **fcoe** or the **no-loss** forwarding classes), then the **fcoe** and **no-loss** queues behave as lossless queues.

If your CoS configuration does not explicitly configure the **fcoe** and **no-loss** forwarding classes, you can upgrade from Junos OS Release 12.1 to Junos OS Release 12.2, and the behavior of the two lossless queues remains the lossless.

- If your configuration includes statements that explicitly configure the **fcoe** or the **no-loss** forwarding class (using the **[set class-of-service forwarding-classes class class-name queue-num queue-number]** statement), after you upgrade to Junos OS Release 12.2, those queues do *not* receive lossless treatment and behave as lossy (**best-effort**) queues.

If your CoS configuration explicitly configures the **fcoe** and **no-loss** forwarding classes, to retain the lossless behavior of those queues, you need to remove the explicit configuration for these two forwarding classes from the CoS configuration *before* you upgrade.

If you upgrade to Junos OS Release 12.2 and the **fcoe** and **no-loss** forwarding classes are explicitly configured, then those two queues continue to be used, but the traffic is treated as lossy traffic, not lossless traffic. To make the queues for these two forwarding classes lossless, you must delete the explicit forwarding class configuration.

**CAUTION:** If you explicitly configured the **fcoe** or the **no-loss** forwarding class and you upgrade to Junos OS Release 12.2, the system does not return an upgrade error or a commit error, or a generate a syslog message, to notify you that these forwarding classes are no longer lossless. Traffic mapped to

these forwarding classes is not treated as lossless traffic until you remove the explicit forwarding class configuration.

Before you upgrade, delete the **fcoe** and **no-loss** forwarding classes from the explicit configuration to preserve the lossless behavior of traffic mapped to these forwarding classes.

- To delete the explicit **fcoe** forwarding class configuration:

```
[edit]
user@switch# delete class-of-service forwarding-class class fcoe queue-num 3
user@switch# commit
```

- To delete the explicit **no-loss** forwarding class configuration:

```
[edit]
user@switch# delete class-of-service forwarding-class class no-loss queue-num 4
user@switch# commit
```

**NOTE:** If you try to delete these forwarding classes and they have not been explicitly configured on the system, the system returns the message warning: **statement not found**. This simply means that there is no explicit configuration to delete and does not change the lossless behavior of the **fcoe** and **no-loss** forwarding classes.

After you delete the explicit configuration for the **fcoe** and **no-loss** forwarding classes, traffic mapped to those forwarding classes retains its lossless behavior after the upgrade to Junos OS Release 12.2.

## Overview of CoS Upgrade Requirements to Junos OS Release 12.3

Before you upgrade to Junos OS Release 12.3, you might need to edit the class-of-service (CoS) configuration, because the way the QFX Series handles lossless forwarding classes has changed in Junos OS Release 12.3.

By default, the *fcoe* and *no-loss* forwarding classes are mapped to output queue 3 and output queue 4, respectively, and to IEEE 802.1p priority 3 (code point 011) and priority 4 (code point 100), respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport in the default configuration.

If you use the default CoS configuration, you do not need to edit the CoS configuration after upgrading to Junos OS Release 12.3 because the default CoS configuration is backward compatible.

Junos OS Release 12.3 increases the support for lossless forwarding classes (priorities) from two forwarding classes to six forwarding classes. To support configuring lossless forwarding classes, Junos OS Release 12.3 introduces a new option to forwarding class configuration: the *no-loss* packet drop attribute.

**NOTE:** The new *no-loss* packet drop attribute and the previously existing *no-loss* default forwarding class have the same name, but they are not the same. You can use the *no-loss* packet drop attribute on any unicast forwarding class.

If you explicitly configure any lossless forwarding class (including explicitly configuring the default *fcoe* and *no-loss* forwarding classes), you *must* specify the *no-loss* packet drop attribute to obtain lossless behavior. If you do not explicitly configure the *fcoe* and *no-loss* forwarding classes, those forwarding classes remain lossless.

The addition of the *no-loss* packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the *fcoe* and *no-loss* forwarding classes.

If you used the default forwarding class configuration for the *fcoe* and *no-loss* forwarding classes, the CoS configuration is backward compatible. You do not have to do anything to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the *no-loss* packet drop attribute.)

However, if you explicitly configured the *fcoe* or the *no-loss* forwarding class by including the **set forwarding-classes class forwarding-class-name queue-num queue-number** at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. In Junos OS Release 12.3 and later, you must include the *no-loss* packet drop attribute in any explicit forwarding class configuration to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3
```

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3 no-loss
```

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

```
user@switch# delete class-of-service forwarding-classes class fcoe queue-num 3
```

**NOTE:** The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes are lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding class retains its explicit configuration).

**NOTE:** To achieve lossless behavior for the traffic belonging to any forwarding class, you must also enable PFC on the IEEE 802.1p priority mapped to the forwarding class and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

## Overview of CoS Changes Introduced in Junos OS Release 11.3

Junos OS Release 11.3 introduces many changes to class-of-service (CoS) functionality and to the CoS default values. This overview summarizes the changes, which other documents describe in detail.

**NOTE:** Some of the CoS changes are not backward compatible with Junos OS Releases 11.1 and 11.2. “[Overview of CoS Upgrade Requirements \(Junos OS Release 11.1 or 11.2 to a Later Release\)](#)” on page 34 describes how to upgrade to Junos OS Release 11.3 if you have configured CoS on your QFX3500 switch.

This topic describes the following changes in CoS default values and behavior:

- [CoS Default Value Changes on page 4812](#)
- [Queue Priority Configuration Changes on page 4817](#)
- [Minimum Guaranteed Bandwidth \(Transmit Rate and Guaranteed Rate\) Changes on page 4818](#)
- [Excess Rate Statement Disabled on page 4818](#)
- [Queue Scheduling \(Low and Strict-High Priority Queues\) on page 4819](#)
- [Multidestination Traffic Changes on page 4819](#)

### CoS Default Value Changes

The default values of the following CoS components have changed in Junos OS Release 11.3:

- [Default Forwarding Classes on page 4812](#)
- [Default IEEE 802.1p Unicast Classifiers on page 4814](#)
- [Default IEEE 802.1p Multidestination Classifiers on page 4815](#)
- [Default Scheduler on page 4816](#)

#### **Default Forwarding Classes**

In Junos OS Releases 11.1 and 11.2, there were eight default forwarding classes, four unicast default forwarding classes and four default multidestination (multicast, broadcast, and destination lookup fail) forwarding classes. [Table 355 on page 4812](#) shows the old default forwarding classes and default queue mapping:

**Table 355: Junos OS Release 11.1 and 11.2 Default Forwarding Classes and Queue Mapping**

Default Forwarding Class	Description	Default Queue Mapping
best-effort (be)	Unicast best-effort traffic	0
no-loss	Unicast guaranteed delivery for TCP no-loss traffic	2

**Table 355: Junos OS Release 11.1 and 11.2 Default Forwarding Classes and Queue Mapping (*continued*)**

Default Forwarding Class	Description	Default Queue Mapping
fcoe	Unicast guaranteed delivery for FCoE traffic	3
network-control	Unicast network control traffic	7
multicast-best-effort (mcast-be)	Multidestination best-effort traffic	8
multicast-expedited-forwarding (mcast-ef)	Multidestination low-loss, low-latency traffic	9
multicast-assured-forwarding (mcast-af)	Multidestination assured forwarding traffic	10
multicast-network-control (mcast-nc)	Multidestination network control traffic	11

Junos OS Release 11.3 changes the default forwarding classes and queue mapping in the following ways:

- Instead of eight default forwarding classes, there are five default forwarding classes.
- The same four unicast default forwarding classes remain valid, but the default queue mapping of the no-loss forwarding class has changed from queue 2 to queue 4.
- There is now only one default multidestination forwarding class instead of four default multidestination forwarding classes. All multidestination traffic is assigned by default to the default multidestination forwarding class.

**NOTE:** The rest of the forwarding class characteristics remain the same as before. For example, the QFX Series still supports 12 forwarding classes and 12 output queues. You can still configure a total of eight unicast forwarding classes and four multidestination forwarding classes. The unicast queues are still queues 0 through 7 and the multidestination queues are still queues 8 through 11. Unicast traffic must be mapped to unicast queues, and multidestination traffic must be mapped to multidestination queues. The queue to which a forwarding class is mapped determines whether the forwarding class is unicast or multidestination.

[Table 356 on page 4813](#) shows the default forwarding classes and queue mapping in Junos OS 11.3 and later:

**Table 356: Junos OS Release 11.3 Default Forwarding Classes and Queue Mapping**

Default Forwarding Class	Description	Default Queue Mapping
best-effort (be)	Best-effort traffic class	0
fcoe	Guaranteed delivery for FCoE traffic	3

**Table 356: Junos OS Release 11.3 Default Forwarding Classes and Queue Mapping (*continued*)**

Default Forwarding Class	Description	Default Queue Mapping
no-loss	Guaranteed delivery for TCP no-loss traffic	4
network-control (nc)	Network control traffic	7
mcast	Multicast traffic	8

***Default IEEE 802.1p Unicast Classifiers***

In Junos OS Release 11.1 and 11.2, there were default unicast classifiers only for best-effort and network-control traffic, as shown in [Table 357 on page 4814](#):

**Table 357: Junos OS Release 11.1 and 11.2 Default IEEE 802.1 Unicast Classifiers**

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	best-effort	low
af11 (100)	best-effort	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

Junos OS Release 11.3 introduces new default classifiers for FCoE and no-loss traffic, replacing the best-effort classifiers mapped to IEEE 802.1p code points 011 and 100, respectively, as shown in [Table 358 on page 4814](#):

**Table 358: Junos OS Release 11.3 Default IEEE 802.1 Unicast Classifiers**

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low

**Table 358: Junos OS Release 11.3 Default IEEE 802.1 Unicast Classifiers (*continued*)**

Code Point	Forwarding Class	Loss Priority
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

***Default IEEE 802.1p Multidestination Classifiers***

In Junos OS Release 11.1 and 11.2, there were default multidestination classifiers for best-effort and network-control traffic, as shown in [Table 359 on page 4815](#):

**Table 359: Junos OS Release 11.1 and 11.2 Default IEEE 802.1 Multidestination Classifiers**

Code Point	Forwarding Class	Loss Priority
be (000)	mcast-be	low
be1 (001)	mcast-be	low
ef (010)	mcast-be	low
ef1 (011)	mcast-be	low
af11 (100)	mcast-be	low
af12 (101)	mcast-be	low
nc1 (110)	mcast-nc	low
nc2 (111)	mcast-nc	low

Junos OS Release 11.3 replaces the best-effort and network-control multidestination classifiers and maps all IEEE 802.1p code points to the new default multidestination forwarding class, as shown in [Table 360 on page 4815](#):

**Table 360: Junos OS Release 11.3 Default IEEE 802.1 Multidestination Classifiers**

Code Point	Forwarding Class	Loss Priority
be (000)	mcast	low
be1 (001)	mcast	low
ef (010)	mcast	low
ef1 (011)	mcast	low
af11 (100)	mcast	low

Table 360: Junos OS Release 11.3 Default IEEE 802.1 Multidestination Classifiers (*continued*)

Code Point	Forwarding Class	Loss Priority
af12 (101)	mcast	low
nc1 (110)	mcast	low
nc2 (111)	mcast	low

**Default Scheduler**

In Junos OS Release 11.1 and 11.2, there were four default schedulers:

- Unicast best effort
- Unicast network control
- Multidestination best effort
- Multidestination network control

[Table 361 on page 4816](#) shows the default scheduler configuration in Junos OS Release 11.1 and 11.2:

Table 361: Junos OS Release 11.1 and 11.2 Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Rate (Extra Bandwidth Sharing)	Priority
Best-effort scheduler (queue 0)	75%	None	25%	Low
Network-control scheduler (queue 7)	5%	None	25%	Low
Best-effort multidestination scheduler (queue 8)	15%	None	25%	Low
Network-control multidestination scheduler (queue 11)	5%	None	25%	Low

Junos OS Release 11.3 replaces the four old classifiers with five new classifiers:

- Unicast best effort
- FCoE
- No loss
- Unicast network control
- Multidestination

There are now four different default unicast classifiers to provide default CoS for lossless queues (FCoE and no-loss traffic). Because there is only one default multidestination forwarding class in Junos OS Release 11.3, there is only one default multidestination classifier for all multidestination traffic. Also, the excess rate default value is removed from the scheduler because the **excess-rate** statement is no longer supported, as described elsewhere in this document. [Table 362 on page 4817](#) shows the default scheduler configuration in Junos OS Releases 11.3:

Table 362: Default Schedulers

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority
Best-effort scheduler (queue 0)	5%	None	5%	Low
FCoE scheduler (queue 3)	35%	None	35%	Low
No-loss scheduler (queue 4)	35%	None	35%	Low
Network-control scheduler (queue 7)	5%	None	5%	Low
Multidestination scheduler (queue 8)	20%	None	20%	Low

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

### Queue Priority Configuration Changes

In Junos OS Release 11.1 and 11.2, you could configure strict-high priority queues with a guaranteed minimum bandwidth and configure forwarding class sets (priority groups) with a mix of low priority and strict-high priority queues. In Junos OS Release 11.3 and later, these configurations are invalid, and several other changes have also been implemented:

- Priority configuration in Junos OS Release 11.1 and 11.2 provided three priority levels: **strict-high**, **high**, and **low**. In Junos OS Release 11.3, the **high** priority option has been removed. Only the **strict-high** and **low** priority options are valid in Release 11.3.
- Minimum guaranteed bandwidth (transmit rate) is not allowed on strict-high priority queues. Minimum guaranteed bandwidth (guaranteed rate) is not allowed on forwarding class sets that contain strict-high priority queues.

- You cannot configure a multidestination queue as a strict-high priority queue. You cannot configure a queue as a strict-high priority queue if it belongs to the multidestination forwarding class set.
- Only one forwarding class set can contain strict-high priority queues. If you want to configure a strict-high priority queue, you must also configure a separate forwarding class set for the strict-high priority queue. A forwarding class set cannot contain a mixture of low priority and strict-high priority queues.

The rest of the queue priority characteristics remain the same as before. For example, you can configure only one queue as a strict-high priority queue.

**NOTE:** If you have configured strict-high or high priority queues in Junos OS Release 11.1 or 11.2, the changes in Release 11.3 are not backward compatible. Please read [“Overview of CoS Upgrade Requirements \(Junos OS Release 11.1 or 11.2 to a Later Release\)”](#) on page 34 before you upgrade to Release 11.3.

---

### Minimum Guaranteed Bandwidth (Transmit Rate and Guaranteed Rate) Changes

The following restrictions have been placed on minimum guaranteed bandwidth configuration in Junos OS Release 11.3:

- You cannot configure a guaranteed minimum bandwidth (transmit rate) for strict-high priority queues.
- Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.
- You cannot configure a guaranteed minimum bandwidth (guaranteed rate) for forwarding class sets that include strict-high priority queues.
- For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

---

### Excess Rate Statement Disabled

The **excess-rate** statement has been disabled in Junos OS Release 11.3. Excess rate was used to specify the way extra bandwidth was shared among queues.

The **excess-rate** statement was used at the **[edit class-of-service schedulers]** hierarchy level for queue scheduling configuration and at the **[edit class-of-service traffic-control-profiles]** hierarchy level for forwarding class set scheduling configuration.

In Junos OS Release 11.3, extra bandwidth sharing among queues is proportional to the minimum guaranteed bandwidth (transmit rate) of the queue. Extra bandwidth sharing among forwarding class sets (priority groups) is proportional to the minimum guaranteed bandwidth (guaranteed rate) of the forwarding class set.

**NOTE:** If you have configured the excess-rate option in Junos OS Release 11.1 or 11.2, the changes in Release 11.3 are not backward compatible. Please read [“Overview of CoS Upgrade Requirements \(Junos OS Release 11.1 or 11.2 to a Later Release\)”](#) on page 34 before you upgrade to Release 11.3.

### Queue Scheduling (Low and Strict-High Priority Queues)

In Junos OS Release 11.1 and 11.2, if you configured a guaranteed minimum bandwidth (transmit rate) for low-priority queues, the low-priority queues received their guaranteed minimum bandwidth from the same bandwidth pool as the strict-high priority queue, using round-robin scheduling. Until the minimum bandwidth requirements of all queues were met, the strict-high priority queue and low-priority queues that had a guaranteed minimum bandwidth were treated equally. After the minimum bandwidth requirements of all queues were met, the strict-high priority queue received as much of the leftover bandwidth as it needed. This meant that the only way to ensure that a strict-high priority queue received all of the bandwidth it needed was not to configure a guaranteed minimum bandwidth for other queues.

In Junos OS Release 11.3 and later, queue scheduling has changed so that queues receive bandwidth in the following sequence:

1. The strict-high priority queue receives all of the bandwidth it needs before any other queue is served. The strict-high priority queue can take the full port bandwidth if necessary and can starve other queues on the port.
2. The guaranteed minimum bandwidth (transmit rate) of low-priority queues is served until the minimum is met or the queues are empty.
3. All other low-priority queues and needs that exceed the minimum bandwidth are served.

### Multidestination Traffic Changes

The changes to the default forwarding classes and classifiers affects multidestination traffic handling in Junos OS Release 11.3:

- The number of default multidestination forwarding classes has been reduced from four default multidestination forwarding classes in Junos OS Release 11.1 and 11.2 to one default multidestination in Release 11.3 (see [Table 356 on page 4813](#)).
- The default classifier configuration for multidestination traffic has changed so that there is now one default classifier for all multidestination traffic (see [Table 360 on page 4815](#)).
- By default, all IEEE 802.1p code points map to the default multidestination forwarding class.

- The default scheduler for multidestination traffic has changed so that there is now one default scheduler for all multidestination traffic (see [Table 362 on page 4817](#)).
- You cannot configure multidestination queues as strict-high priority queues and you cannot include strict-high priority queues in a forwarding class set that contains multidestination queues.

## Overview of CoS Changes Introduced in Junos OS Release 12.2

Junos OS Release 12.2 introduces some changes to class-of-service (CoS) functionality and to the CoS default values. This overview summarizes the changes, which other documents describe in detail.

This topic describes the following changes in CoS default values and behavior:

- [Lossless Forwarding Classes \(fcoe and no-loss\) on page 4820](#)
- [Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes on page 4821](#)
- [CoS for Layer 3 Physical Interfaces on page 4821](#)
- [DSCP IPv6 Classifiers and Rewrite Rules on page 4821](#)

### Lossless Forwarding Classes (fcoe and no-loss)

---

The way the QFX Series handles lossless forwarding classes (the **fcoe** and **no-loss** forwarding classes) changes in Junos OS Release 12.2. In Junos OS Release 12.2 and in earlier releases, by default, the **fcoe** and **no-loss** forwarding classes are mapped to output queue 3 and output queue 4, respectively. These are the only two forwarding classes (and the only two queues) that support lossless transport.

In earlier releases, explicitly setting the lossless **fcoe** and **no-loss** forwarding classes resulted in the same CoS behavior as using the default configuration. However, in Junos OS Release 12.2, the behavior when you explicitly configure the lossless forwarding classes differs from the behavior when you use the default forwarding classes.

**NOTE:** The default behavior differs from the explicit configuration behavior even if the explicit configuration is exactly the same as the default configuration.

---

If you use the default forwarding class settings for the lossless queues (the configuration does not include explicit setting of the **fcoe** or the **no-loss** forwarding classes), then the **fcoe** and **no-loss** queues behave as lossless queues. When you upgrade to Junos OS Release 12.2, traffic assigned to the **fcoe** and **no-loss** queues continues to be treated as lossless traffic.

If your configuration explicitly sets the **fcoe** or the **no-loss** forwarding class (**set class-of-service forwarding-classes class class-name queue-num queue-number**), after you upgrade to Junos OS Release 12.2, those queues do *not* receive lossless treatment and behave as lossy (**best-effort**) queues. To retain lossless treatment of the **fcoe** and **no-loss** queues, delete the explicit lossless forwarding class configuration before you upgrade to Junos OS Release 12.2.

**CAUTION:** If you explicitly configured the **fcoe** or the **no-loss** forwarding class, and you upgrade to Junos OS Release 12.2, the system does not return an upgrade error or a commit error, or a generate a syslog message, to notify you that these forwarding classes are no longer lossless. Traffic mapped to these forwarding classes is not treated as lossless traffic until you remove the explicit forwarding class configuration.

### Default MTU for Headroom Buffer Calculation for Lossless Forwarding Classes

The default maximum transmission unit (MTU) the system uses for buffer headroom calculation is 2500 bytes for traffic classified into the **fcoe** forwarding class or the **no-loss** forwarding class.

In Junos OS Release 12.2, the default MTU used for buffer headroom calculation for the **fcoe** and **no-loss** forwarding classes remains 2500 bytes. However, if the buffer is filled, in Junos OS Release 12.2 you might experience commit failures.

### CoS for Layer 3 Physical Interfaces

Before Junos OS Release 12.2, the QFX Series supported only Layer 2 CoS. Junos OS Release 12.2 introduces CoS support for Layer 3 traffic at the physical interface level.

If a physical Layer 3 interface has at least one logical interface configured on it, you can configure Layer 3 CoS for the physical interface. The CoS configured on the physical interface applies to all of the logical Layer 3 interfaces on that physical interface. The system does not support Layer 3 CoS configuration on individual Layer 3 logical interfaces.

### DSCP IPv6 Classifiers and Rewrite Rules

Junos OS Release 12.2 introduces support for DSCP IPv6 classifiers and rewrite rules. The existing DSCP IP default classifier is now also the DSCP IPv6 default classifier.

You can configure and apply DSCP IPv6 classifiers and DSCP IPv6 rewrite rules to Layer 2 logical interfaces and to Layer 3 physical interfaces.

**NOTE:** DSCP IPv6 classifiers are not supported for multidestination (multicast, broadcast, and destination lookup fail) traffic.

## Overview of Policers

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

- [Policer Overview on page 4822](#)

### Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 147 on page 4097](#) illustrates this process.

Figure 177: Flow of Tricolor Marking Policer Operation

9017049

After you name and configure a policer, you use it by specifying it as an action in one or more firewall filters.

### Policer Types

A switch supports three types of policers:

- **Single-rate two-color marker**—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- **Single-rate three-color marker**—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- **Two-rate three-color marker**—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 282 on page 4098](#) for information about how metering results are applied for each of these policer types.

### Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 282 on page 4098](#) describes the policer actions.

**Table 363: Policer Actions**

Policer	Marking	Implicit Action	Configurable Action
Single-rate two-color	Green (conforming)	Assign low loss priority	None
	Red (nonconforming)	None	Discard
Single-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the EBS)	Assign high loss priority	Discard
Two-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the PIR and PBS)	Assign high loss priority	Discard

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is discard.

### Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

### Suggested Naming Convention for Policers

We recommend that you use the naming convention ***policertypeTCM#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named **srTCM1-ca**. The second two-rate, color-blind three-color configured would be named **trTCM2-cb**. The elements of this naming convention are explained below:

- sr (single-rate)
- tr (two-rate)
- TCM (tricolor marking)
- 1 or 2 (number of marker)
- ca (color-aware)
- cb (color-blind)

### Policer Counters

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

### Policer Algorithms

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

### How Many Policers are Supported?

---

You can configure and commit the following numbers of policers on QFX3500 and QFX3600 devices when they are operating as standalone switches:

- Two-color policers used in ingress firewall filters: 768
- Three-color policers used in ingress firewall filters: 768
- Two-color policers used in egress firewall filters: 510
- Three-color policers used in egress firewall filters: 255

- [Tail-Drop Profiles on page 4829](#)
- [Schedulers on page 4830](#)
- [Rewrite Rules on page 4830](#)

---

### Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers and rewrite rules.

---

### Policers

Policers limit traffic of a certain class to a specified bandwidth and burst size. Packets exceeding the policer limits can be discarded, or can be assigned to a different forwarding class, a different loss priority, or both. You define policers with filters that you can associate with input interfaces.

---

### Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In Junos OS, *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the

packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.

- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

You can create unicast classifiers for unicast traffic and multideestination classifiers for multicast, broadcast, and destination lookup fail traffic. You cannot assign unicast traffic and multideestination traffic to the same classifier.

You can apply unicast classifiers to one or more interfaces. Multideestination classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces.

### Forwarding Classes

---

Forwarding classes group packets for transmission and CoS. You assign each packet to an output queue based on the packet's forwarding class. Forwarding classes affect the forwarding, scheduling, and rewrite marking policies applied to packets as they transit the switch.

The switch provides five default forwarding classes:

- fcoe—Fibre Channel over Ethernet traffic
- no-loss—Lossless traffic
- be—Best-effort traffic
- nc—Network control traffic
- mcast—Multicast traffic

The switch supports a total of 12 forwarding classes (8 unicast forwarding classes and 4 multicast forwarding classes), which provide flexibility in classifying traffic.

### Forwarding Class Sets

---

You can group forwarding classes (output queues) into *forwarding class sets* in order to apply CoS to groups of traffic that require similar treatment. Forwarding class sets map traffic into priority groups to support enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. For example, you can configure different forwarding class sets to apply CoS to unicast groups of local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and configure another group for multicast traffic.

Within each forwarding class set, you can configure special CoS treatment for the traffic mapped to each individual queue. This provides the ability to configure CoS in a two-tier hierarchical manner. At the forwarding class set tier, you configure CoS for groups of traffic using a *traffic control profile*. At the queue tier, you configure CoS for individual

output queues within a forwarding class set using a *scheduler* that you map to a queue (forwarding class) using a *scheduler map*.

### Flow Control (Ethernet PAUSE and Priority-Based Flow Control)

Ethernet PAUSE (described in IEEE 802.3X) is a link-level flow control mechanism. During periods of network congestion, Ethernet PAUSE stops all traffic on a full-duplex Ethernet link for a period of time specified in the PAUSE message.

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is part of the IEEE data center bridging (DCB) specifications for creating a lossless Ethernet environment to transport loss-sensitive flows such as Fibre Channel over Ethernet (FCoE) traffic.

PFC is a link-level flow control mechanism similar to Ethernet PAUSE. However, Ethernet PAUSE stops all traffic on a link for a period of time. PFC decouples the pause function from the physical link and divides the traffic on the link into eight priorities (3-bit IEEE 802.1p code points). You can think of the eight priorities as eight “lanes” of traffic. You can apply pause selectively to the traffic on any priority without pausing the traffic on other priorities on the same link.

The granularity that PFC provides allows you to configure different levels of CoS for different types of traffic on the link. You can create lossless lanes for traffic such as FCoE, LAN backup, or management, while using standard frame-drop methods of congestion management for IP traffic on the same link.

**NOTE:** If you transport FCoE traffic, you must enable PFC on the priority assigned to FCoE traffic (usually code point 011 on interfaces that carry FCoE traffic).

### Tail-Drop Profiles

A tail-drop profile (drop profile) defines parameters that enable the network to drop packets during periods of congestion. A drop profile defines the conditions under which packets of different loss priorities drop, by determining the probability of dropping a packet for each loss priority when output queues become congested. Drop profiles essentially set a value for a level of queue fullness—when the queue fills to the level of the queue fullness value, packets drop.

You can associate different drop profiles with different loss priorities to set the probability of dropping packets. You can apply a drop profile for each loss priority to a forwarding class (output queue) by applying a drop profile to a scheduler, and then mapping the scheduler to a forwarding class using a scheduler map. When the queue mapped to the forwarding class experiences congestion, the drop profile determines the level of packet drop for traffic of each loss priority in that queue.

Loss priority affects the scheduling of a packet without affecting the packet’s relative ordering. Typically you mark packets exceeding a particular service level with a high loss priority.

## Schedulers

---

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This process often involves determining the sequence in which different types of packets should be transmitted.

You can define the priority (**priority**), minimum bandwidth (**transmit-rate**), maximum bandwidth (**shaping-rate**), and tail-drop profiles to be applied to a particular queue for packet transmission. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

## Rewrite Rules

---

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet. This allows the next downstream device to classify the packet into the appropriate service group. Rewriting (marking) outbound packets is useful when the switch is at the border of a network and must change the CoS values to meet the policies of the targeted peer.

**NOTE:** Ingress firewall filters can also rewrite forwarding class and loss priority values.

---

## Understanding CoS Packet Flow

When a packet traverses a QFX Series Node device, the Node device provides the appropriate level of service to the packet using either default class of service (CoS) settings or CoS settings that you configure. On ingress ports, the Node device classifies packets into appropriate forwarding classes and assigns a loss priority to the packets. On egress ports, the Node device applies packet scheduling and (if you have configured them) rewrite rules to re-mark packets.

On the QFX Series, you can configure CoS on Layer 2 logical interfaces, and you can configure CoS on Layer 3 physical interfaces if you have defined at least one logical interface on the Layer 3 physical interface. You cannot configure CoS on Layer 2 physical interfaces and Layer 3 logical interfaces.

For Layer 2 traffic, either use the default CoS settings or configure CoS on each logical interface. You can apply different CoS settings to different Layer 2 logical interfaces.

For Layer 3 traffic, either use the default CoS settings or configure CoS on the physical interface (not on the logical unit). The QFX Series uses the CoS applied on the physical Layer 3 interface for all logical Layer 3 interfaces configured on the physical Layer 3 interface.

The QFX Series applies to CoS to packets as they flow through the system:

- An interface has one or more classifiers of different types applied to it (configure this at the **[edit class-of-service interfaces]** hierarchy level). The classifier types are based on the portion of the incoming packet that the classifier examines (IEEE 802.1p code point bits or DSCP code point bits).
- When a packet enters an ingress port, the classifier assigns the packet to a forwarding class and a loss priority based on the code point bits of the packet (configure this at the **[edit class-of-service classifiers]** hierarchy level).
- The QFX Series assigns each forwarding class to an output queue (configure this at the **[edit class-of-service forwarding-classes]** hierarchy level).
- Input (and output) policers meter traffic and can change the forwarding class and loss priority if a traffic flow exceeds its service level.
- A scheduler map is applied to each interface. When a packet exits an egress port, the scheduler map controls how it is treated (configure this at the **[edit class-of-service interfaces]** hierarchy level). A scheduler map assigns schedulers to forwarding classes (configure this at the **[edit class-of-service scheduler-maps]** hierarchy level).
- A scheduler defines how traffic is treated at the egress interface output queue (configure this at the **[edit class-of-service schedulers]** hierarchy level). You control the transmit rate, shaping rate, priority, and drop profile of each forwarding class by mapping schedulers to forwarding classes in scheduler maps, then applying scheduler maps to interfaces.

- A drop-profile defines how aggressively to drop packets that are mapped to a particular scheduler (configure this at the **[edit class-of-service drop-profiles]** hierarchy level).
- A rewrite rule takes effect as the packet leaves an interface that has a rewrite rule configured (configure this at the **[edit class-of-service rewrite-rules]** hierarchy level). The rewrite rule writes information to the packet (for example, a rewrite rule can re-mark the code point bits of outgoing traffic) according to the forwarding class and loss priority of the packet.

Figure 178 on page 4832 is a high-level flow diagram of how packets from various sources enter QFX Series interfaces, are classified at the ingress, and then scheduled (provided bandwidth) at the egress queues.

Figure 178: CoS Classifier, Queues, and Scheduler

Figure 179 on page 4832 shows the packet flow through the CoS components that you can configure.

Figure 179: Packet Flow Through Configurable CoS Components

The middle box ("Forwarding Class and Loss Priority") represents two values that you can use on ingress and egress interfaces. The system uses these values for classifying traffic on ingress interfaces and for rewrite rule re-marking on egress interfaces. Each outer box represents a process component. The components in the top row apply to incoming packets. The components in the bottom row apply to outgoing packets.

The solid-line arrows show the direction of packet flow from ingress to egress. The dotted-line arrows show inputs and outputs or show settings and actions based on those settings.

For example, the BA classifier sets the forwarding class and loss priority of incoming packets, so the forwarding class and loss priority are outputs of the classifier and the arrow points away from the classifier. The scheduler receives the forwarding class and loss priority settings, and queues the outgoing packets based on those settings, so the arrow points toward the scheduler.

## CoS Inputs and Outputs Overview

Some CoS components map one set of values to another set of values. Each mapping contains one or more inputs and one or more outputs. When you configure a mapping, you set the outputs for a given set of inputs, as shown in [Table 364 on page 4833](#).

**Table 364: CoS Mappings—Inputs and Outputs**

CoS Mappings	Inputs	Outputs	Comments
<a href="#">classifiers</a>	<a href="#">code-points</a>	<a href="#">forwarding-class</a> , <a href="#">loss-priority</a>	The map sets the forwarding class and packet loss priority (PLP) for a specific set of code points.
<a href="#">drop-profile-map</a>	<a href="#">loss-priority</a> , <a href="#">protocol</a>	<a href="#">drop-profile</a>	The map sets the drop profile for a specific PLP and protocol type.

## Understanding Default CoS Settings

If you do not configure CoS settings on the QFX Series, Junos OS performs some CoS functions to ensure that traffic and protocol packets are forwarded with minimum delay when the network experiences congestion. Some default mappings are automatically applied to each logical interface that you configure.

You can display default CoS settings by issuing the **show class-of-service** operational mode command.

This topic describes the default configurations for the following CoS components:

- [Default Forwarding Classes and Queue Mapping on page 4834](#)
- [Default Forwarding Class Sets \(Priority Groups\) on page 4835](#)
- [Default Code-Point Aliases on page 4835](#)
- [Default Classifiers on page 4837](#)
- [Default Rewrite Rules on page 4840](#)
- [Default Drop Profile on page 4840](#)
- [Default Schedulers on page 4840](#)
- [Default Scheduler Maps on page 4840](#)
- [Default Shared Buffer Configuration on page 4841](#)

### Default Forwarding Classes and Queue Mapping

Table 365 on page 4834 shows the default mapping of the default forwarding classes to queues and packet drop attribute.

**Table 365: Default Forwarding Classes and Queue Mapping**

Default Forwarding Class	Description	Default Queue Mapping	Packet Drop Attribute
best-effort (be)	Best-effort traffic class (priority 0, IEEE 802.1p code point 000)	0	drop
fcoe	Guaranteed delivery for FCoE traffic (priority 3, IEEE 802.1p code point 011)	3	no-loss
no-loss	Guaranteed delivery for TCP no-loss traffic (priority 4, IEEE 802.1p code point 100)	4	no-loss

Table 365: Default Forwarding Classes and Queue Mapping (*continued*)

Default Forwarding Class	Description	Default Queue Mapping	Packet Drop Attribute
network-control (nc)	Network control traffic (priority 7, IEEE 802.1p code point 111)	7	drop
mcast	Multidestination traffic	8	drop

**NOTE:** You cannot configure multidestination forwarding classes as no-loss (lossless) traffic classes.

### Default Forwarding Class Sets (Priority Groups)

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set.

Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth.

The default forwarding class set is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

### Default Code-Point Aliases

Table 366 on page 4835 shows the default mapping of code-point aliases to IEEE code points.

Table 366: Default IEEE 802.1 Code-Point Aliases

### Default Classifiers

The QFX Series applies default unicast IEEE 802.1, unicast DSCP, and multidestination classifiers to each interface that does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

[Table 368 on page 4837](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

Table 368: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged Access Mode (Trusted Classifier)

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low

nc1 (110000)	network-control	low
nc2 (111000)	network-control	low

**NOTE:** There are no default DSCP IP or IPv6 classifiers for multidestination traffic. DSCP IPv6 classifiers are not supported for multidestination traffic.

### Default Rewrite Rules

There are no default rewrite rules. If you do not explicitly configure rewrite rules, the switch does not reclassify egress traffic.

### Default Drop Profile

Table 372 on page 4840 shows the default drop profile configuration.

**Table 372: Default Drop Profile**

Fill Level	Drop Probability
100	100

### Default Schedulers

Table 373 on page 4840 shows the default scheduler configuration.

**Table 373: Default Schedulers**

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	low	5%
FCoE scheduler (queue 3)	35%	None	35%	low	35%
No-loss scheduler (queue 4)	35%	None	35%	low	35%
Network-control scheduler (queue 7)	5%	None	5%	low	5%
Multidestination scheduler (queue 8)	20%	None	20%	low	20%

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

### Default Scheduler Maps

Table 374 on page 4840 shows the default mapping of forwarding classes to schedulers.

**Table 374: Default Scheduler Maps**

Forwarding Class	Scheduler
best-effort	Default BE scheduler

Table 374: Default Scheduler Maps (*continued*)

Forwarding Class	Scheduler
fcoe	Default FCoE scheduler
no-loss	No-loss scheduler
network-control	Default network-control scheduler
mcast-be	Default multidestination scheduler

### Default Shared Buffer Configuration

Table [Table 375 on page 4841](#) and [Table 376 on page 4841](#) show the default shared buffer allocations:

Table 375: Default Ingress Shared Buffer Configuration

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Table 376: Default Egress Shared Buffer Configuration

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

## Understanding Host Inbound Traffic Classification

The destination address of traffic that enters the switch can be an external device such as another switch, a router, or a server, or the destination can be the host (the switch

Routing Engine or CPU). When the destination is an external device, the DSCP and IEEE 802.1p code-point bits of incoming traffic are preserved as the traffic travels through the switch to the egress port. At the egress port, the code-point bits are either preserved when the packets are sent to the next hop or they are rewritten according to the rewrite rule attached to the egress interface.

When the destination of incoming traffic is the host, DSCP bits are preserved. However, IEEE 802.1p bits are not preserved. The IEEE 802.1p bits of traffic destined for the host are set to zero (0). This does not affect system behavior because the switch prioritizes traffic destined for the host based on the protocol type. For example, the switch gives a higher priority to BPDU traffic than to ping traffic.

## Understanding Host Routing Engine Outbound Traffic Queues and Defaults

The host Routing Engine and CPU generate outbound traffic that is transmitted using different protocols. You cannot configure a classifier to map different types of outbound traffic that the host generates to forwarding classes (queues). The traffic that the host generates is assigned to forwarding classes by default as shown in [Table 377 on page 4843](#).

If you want to separate host outbound traffic from other traffic or if you want to assign that traffic to a particular queue, you can configure a single forwarding class for all traffic that the host generates. If you configure a forwarding class for outbound host traffic, that forwarding class is used globally for all traffic generated by the host. (That is, the host outbound traffic is mapped to the selected queue on all egress interfaces.) Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

Whether you use the default host outbound traffic forwarding class configuration or configure a forwarding class for all host outbound traffic, the configuration applies to all Layer 2 and Layer 3 protocols and to all application-level traffic such as FTP and ping operations.

If you configure a queue for host outbound traffic, the queue must be properly configured on all interfaces.

**NOTE:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the `fcoe` queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (`fcoe`) across the Interconnect device (`fabric`) and the egress Node device.

---

By default, traffic generated by the host is sent to the best effort queue (queue 0) or to the network control queue (queue 7). [Table 377 on page 4843](#) lists the default host traffic to output queue mapping.

Table 377: Routing Engine Protocol Default Queue Mapping

Routing Engine Protocol	Default Queue Mapping
Address Resolution Protocol (ARP) reply	Queue 0
ARP request	Queue 0
Border Gateway Protocol (BGP)	Queue 0
BGP TCP Retransmission	Queue 7
Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP)	Queue 3
File Transfer Protocol (FTP)	Queue 0

## Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs) and IEEE 802.1 bits to associate incoming packets with a particular CoS servicing level. You can assign a meaningful name or alias to the CoS values and use that alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure alias names for user-defined classifiers. If the value of an alias changes, it alters the behavior of any classifier that references it.

You can configure code-point aliases for the following type of CoS markers:

- dscp or dscp-ipv6—Handles incoming IP and IPv6 packets.
- ieee-802.1—Handles Layer 2 CoS.

This topic covers:

- [Default Code-Point Aliases on page 4844](#)

### Default Code-Point Aliases

[Table 378 on page 4844](#) shows the default mapping of code-point aliases to IEEE code points.

## Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and a loss priority, and assign packets to output queues based on the associated forwarding class. There are three general types of classifiers:

- Behavior aggregate (BA) classifiers—DSCP and DSCP IPv6 classify IP and IPv6 traffic, and IEEE 802.1p classifiers classify all other traffic.
  - Fixed classifiers—Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
  - Multifield (MF) classifiers—MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.
- [Interfaces and Output Queues on page 4846](#)
  - [Behavior Aggregate Classifiers on page 4847](#)
  - [Fixed Classifiers on Ethernet Interfaces on page 4850](#)
  - [Fixed Classifiers on Native Fibre Channel Interfaces \(NP\\_Ports\) on page 4850](#)
  - [Multifield Classifiers on page 4850](#)
  - [Packet Classification for Routed VLAN Interfaces \(RVIs\) on page 4851](#)

### Interfaces and Output Queues

On Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and link aggregation (LAG) interfaces, you can apply classifiers to Layer 2 logical interfaces and to Layer 3 physical interfaces if the Layer 3 physical interface has at least one defined logical interface. Classifiers applied to Layer 3 physical interfaces are used on all logical interfaces on that physical interface. “[Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces](#)” on page 4851 describes the interaction between classifiers and interfaces in greater detail.

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification is performed. If the

two classification results conflict, the MF classification result overrides the BA classification result.

You cannot configure a fixed classifier and a BA classifier on the same interface.

You can configure both a DSCP or a DSCP IPv6 classifier and an IEEE 802.1p classifier on the same interface. IP traffic uses the DSCP or DSCP IPv6 classifier. All other traffic uses the IEEE classifier. You can configure only one DSCP classifier on a physical interface (either one DSCP classifier or one DSCP IPv6 classifier, but not both).

You can create unicast BA classifiers for unicast traffic and multicast BA classifiers for multdestination traffic, which includes multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot assign unicast traffic and multdestination traffic to the same BA classifier.

On each interface, the switch has separate output queues for unicast traffic and for multdestination traffic:

- The switch supports 12 output queues, with 8 queues dedicated to unicast traffic and 4 queues dedicated to multdestination traffic.
- Queues 0 through 7 are unicast traffic queues. You can apply only unicast BA classifiers to unicast queues. A unicast BA classifier should contain only forwarding classes that are mapped to unicast queues.
- Queues 8 through 11 are multdestination traffic queues. You can apply only multdestination BA classifiers to multdestination queues. A multdestination BA classifier should contain only forwarding classes that are mapped to multdestination queues.

You can apply unicast classifiers to one or more interfaces. Multdestination classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces. Use the DSCP multdestination classifier for both IP and IPv6 multdestination traffic. The DSCP IPv6 classifier is not supported for multdestination traffic.

### Behavior Aggregate Classifiers

The behavior aggregate classifier maps a class-of-service (CoS) value to a forwarding class and loss priority. The forwarding class determines the output queue. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

The switch supports two types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ (IP and IPv6)
- IEEE 802.1p CoS bits

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore, core devices, which handle high traffic volumes, are normally configured to perform BA classification.

Unicast and multicast traffic cannot share the same classifier. You can map unicast traffic and multicast traffic to the same classifier CoS value, but the unicast traffic must

belong to a unicast classifier and the multicast traffic must belong to a multidestination classifier.

### **Default Behavior Aggregate Classification**

Juniper Networks Junos OS automatically assigns implicit default classifiers to all logical interfaces based on the type of interface. [Table 380 on page 4848](#) lists different types of interfaces and the corresponding implicit default BA classifiers.

**Table 380: Default BA Classification**

Type of Interface	Default BA Classification
Layer 2 interface in trunk mode or in tagged-access mode	ieee8021p-default
Layer 3 interface	dscp-default
Layer 2 interface in access mode	ieee8021p-untrusted

**NOTE:** There are default BA classifiers for the best-effort, fcoe, no-loss, network-control, and mcast forwarding classes.

When you explicitly associate a unicast classifier with a logical interface, you are overriding the default unicast classifier with the explicit unicast classifier.

**NOTE:** You can apply only one classifier of each type, DSCP and IEEE 802.1p, to a Layer 2 interface. If both types of classifiers are present, DSCP classifiers take precedence over IEEE 802.1p classifiers.

### **Importing a Classifier**

You can use any existing classifier, including the default classifiers, as the basis for defining a new classifier. You accomplish this using the **import** statement.

The imported classifier is used as a template and is not modified. The modifications you make become part of a new classifier (and a new template) identified by the name of the new classifier. Whenever you commit a configuration that assigns a new class-name and loss-priority value to a code-point alias or set of bits, it replaces that entry in the new classifier template. As a result, you must explicitly specify every CoS value in every designation that requires modification.

### **Multidestination Classifiers**

Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. You can configure both a DSCP multidestination classifier and an IEEE multidestination classifier. IP and IPv6 traffic use the DSCP classifier, and all other traffic uses the IEEE classifier.

DSCP IPv6 multdestination classifiers are not supported, so IPv6 traffic uses the DSCP multdestination classifier.

The default multdestination classifier is the IEEE 802.1p multdestination classifier.

### **PFC Priorities**

The eight IEEE 802.1p code points correspond to the eight priorities that priority-based flow control (PFC) uses to differentiate traffic classes for lossless transport. When you map a forwarding class (which maps to an output queue) to an IEEE 802.1p CoS value, the IEEE 802.1p CoS value identifies the priority.

Although you can map a priority to any output queue (by mapping the priority to a forwarding class), we recommend that the priority and the unicast forwarding class match in a one-to-one correspondence in which priority 0 is assigned to queue 0, priority 1 is assigned to queue 1, and so on, as shown in [Table 381 on page 4849](#). A one-to-one correspondence of queue and priority numbers makes it easier to configure and maintain the mapping of forwarding classes to priorities and queues.

**Table 381: Default IEEE 802.1p Code Point to PFC Priority, Output Queue, and Forwarding Class Mapping**

IEEE 802.1p Code Point	PFC Priority	Unicast Output Queue	Forwarding Class and Packet Drop Attribute
000	0	0	best-effort (drop)
001	1	1	best-effort (drop)
010	2	2	best-effort (drop)
011	3	3	fcoe (no-loss)
100	4	4	no-loss (no-loss)
101	5	5	best-effort (drop)
110	6	6	network-control (drop)
111	7	7	network-control (drop)

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the fcoe forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires. We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority.

### Fixed Classifiers on Ethernet Interfaces

---

Fixed classifiers map all traffic on an interface to a forwarding class and a loss priority. (As opposed to BA classifiers, which map traffic into multiple different forwarding classes based on the CoS field value in the packet header.) The forwarding class determines the output queue. Incoming traffic of all IEEE 802.1p priorities is classified into the forwarding class specified in the fixed classifier. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

You cannot configure a fixed classifier and a BA classifier on the same interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.

To switch from a fixed classifier to a BA classifier or to switch from a BA classifier to a fixed classifier, deactivate the existing classifier attachment on the interface, and then attach the new classifier to the interface.

**NOTE:** If you configure a fixed classifier that classifies all incoming traffic into the **fcoe** forwarding class (or any forwarding class designed to handle FCoE traffic), you must ensure that all traffic that enters the interface is FCoE traffic and is tagged with the FCoE IEEE 802.1p code point (priority).

---

### Fixed Classifiers on Native Fibre Channel Interfaces (NP\_Ports)

---

Applying a fixed classifier to a native Fibre Channel (FC) interface (NP\_Port) is a special case. By default, native FC interfaces classify incoming traffic from the FC SAN into the **fcoe** forwarding class and map the traffic to IEEE 802.1p priority 3 (code point 011). When you apply a fixed classifier to an FC interface, you also configure a priority rewrite value for the interface. The FC interface uses the priority rewrite value as the IEEE 802.1p tag value for all incoming packets instead of the default value of 3.

For example, if you specify a priority rewrite value of 5 (code point 101) for an FC interface, the interface tags all incoming traffic from the FC SAN with priority 5 and classifies the traffic into the forwarding class specified in the fixed classifier.

**NOTE:** The forwarding class specified in the fixed classifier on FC interfaces must be a lossless forwarding class.

---

### Multifield Classifiers

---

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of DiffServ code point (DSCP) support in end-user applications. On a switch at the edge of a network, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, a classifier performs matching operations on the selected fields against a configured value.

### Packet Classification for Routed VLAN Interfaces (RVIs)

You cannot apply classifiers directly to routed VLAN interfaces (RVIs) because the members of RVIs are VLANs, not ports. However, you can apply classifiers to the VLAN port members of an RVI. You can also apply MF classifiers to RVIs.

## Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces

At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p or DSCP class of service (CoS) code point bits in the packet header. At egress interfaces, you can use rewrite rules to change (re-mark) the code point bits before the interface forwards the packets. At ingress interfaces, classifiers group incoming traffic into classes based on the IEEE 802.1p or DSCP CoS code point bits in the packet header. At egress interfaces, rewrite rules can change (re-mark) the code point bits before the interface forwards the packets.

You can apply classifiers and rewrite rules to interfaces to control the level of CoS applied to each packet as it traverses the system and the network. This topic describes:

- [Supported Classifier and Rewrite Rule Types on page 4852](#)
- [Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration on page 4853](#)
- [Default Classifiers on page 4854](#)
- [Default Rewrite Rules on page 4855](#)
- [Classifier Precedence on page 4855](#)
- [Classifier Behavior and Limitations on page 4856](#)
- [Rewrite Rule Precedence and Behavior on page 4857](#)
- [Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration on page 4857](#)

## Supported Classifier and Rewrite Rule Types

Table 382 on page 4852 shows the types of classifiers and rewrite rules that the QFX Series supports:

**Table 382: Supported Classifiers and Rewrite Rules**

Classifier or Rewrite Rule Type	Description
Fixed classifier	Classifies all ingress traffic on a physical interface into one fixed forwarding class, regardless of the CoS bits in the packet header.
DSCP and DSCP IPv6 unicast classifiers	Classifies IP and IPv6 traffic into forwarding classes and assigns loss priorities to the traffic.
IEEE 802.1p unicast classifier	Classifies Ethernet traffic into forwarding classes and assigns loss priorities to the traffic.
DSCP multidestination classifier (also used for IPv6 multidestination traffic)	Classifies IP and IPv6 multicast, broadcast, and destination lookup fail (DLF) traffic into multidestination forwarding classes. Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces.
IEEE 802.1p multidestination classifier	Classifies Ethernet multicast, broadcast, and destination lookup fail (DLF) traffic into multidestination forwarding classes. Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces.
DSCP and DSCP IPv6 rewrite rules	Re-marks the DSCP code points of IP and IPv6 packets before forwarding the packets.
IEEE 802.1p rewrite rule	Re-marks the IEEE 802.1p code points of Ethernet packets before forwarding the packets.

**NOTE:** On native Fibre Channel (FC) interfaces (NP\_Ports) only, you can specify a rewrite value to set the IEEE 802.1p code point of incoming FC traffic when the NP\_Port encapsulates the FC packet in Ethernet before forwarding it to the FCoE network (see [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#)).

DSCP and IEEE classifiers are behavior aggregate (BA) classifiers. Multidestination classifiers apply to all interfaces; you cannot apply them to individual interfaces.

Classifying packets into forwarding classes assigns packets to the output queues associated with the forwarding classes. Classifying traffic into a forwarding class associates the CoS scheduling for the forwarding class with that traffic.

**NOTE:** In addition to BA classifiers and fixed classifiers, which classify traffic based on the CoS field in the packet header, you can use firewall filters to configure multifield (MF) classifiers. MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.

### Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration

To apply a classifier to incoming traffic or a rewrite rule to outgoing traffic, you need to apply the classifier or rewrite rule to one or more interfaces. When you apply a classifier or rewrite rule to an interface, the interface uses the classifier to group incoming traffic into forwarding classes and uses the rewrite rule to re-mark the CoS code point value of each packet before it leaves the system.

Not all interfaces types support all types of CoS configuration. This section describes:

- [Interface Types That Support Classifier and Rewrite Rule Configuration on page 4853](#)
- [Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support on page 4853](#)
- [Routed VLAN Interfaces \(RVIs\) on page 4854](#)

#### ***Interface Types That Support Classifier and Rewrite Rule Configuration***

You can apply classifiers to all Ethernet interfaces. For Layer 3 LAGs, configure BA or fixed classifiers on the LAG (ae) interface. The classifier configured on the LAG is valid on all of the LAG member interfaces.

You can apply fixed classifiers to native FC interfaces (NP\_Ports). You cannot apply other types of classifiers or rewrite rules to native FC interfaces. You can rewrite the value of the IEEE 802.1p code point of incoming FC traffic when the interface encapsulates it in Ethernet before forwarding it to the FCoE network as described in [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#).

#### ***Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support***

The QFX Series Ethernet ports can function as:

- Layer 2 physical interfaces (family ethernet-switching)
- Layer 2 logical interfaces (family ethernet-switching)
- Layer 3 physical interfaces (family inet/inet6)
- Layer 3 logical interfaces (family inet/inet6)

You can apply CoS classifiers and rewrite rules only to the following interfaces:

- Layer 2 logical interfaces
- Layer 3 physical interfaces if at least one logical Layer 3 interface is configured on the physical interface

**NOTE:** The CoS you configure on a Layer 3 physical interface is applied to all of the Layer 3 logical interfaces on that physical interface. This means that each Layer 3 interface uses the same classifiers and rewrite rules for all of the Layer 3 traffic on that interface.

You cannot apply classifiers or rewrite rules to Layer 2 physical interfaces or to Layer 3 logical interfaces. [Table 383 on page 4854](#) shows on which interfaces you can configure and apply classifiers and rewrite rules.

**Table 383: Ethernet Interface Support for Classifier and Rewrite Rule Configuration**

CoS Classifiers and Rewrite Rules	Layer 2 Physical Interfaces	Layer 2 Logical Interfaces	Layer 3 Physical Interfaces (If at Least One Logical Layer 3 Interface Is Defined)	Layer 3 Logical Interfaces
Fixed classifier	No	Yes	Yes	No
DSCP classifier	No	Yes	Yes	No
DSCP IPv6 classifier	No	Yes	Yes	No
IEEE 802.1p classifier	No	Yes	Yes	No
DSCP rewrite rule	No	Yes	Yes	No
DSCP IPv6 rewrite rule	No	Yes	Yes	No
IEEE 802.1p rewrite rule	No	Yes	Yes	No

**NOTE:** IEEE 802.1p and DSCP multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. No DSCP IPv6 multidestination classifier is supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

### ***Routed VLAN Interfaces (RVIs)***

You cannot apply classifiers and rewrite rules directly to routed VLAN interfaces (RVIs) because the members of RVIs are VLANs, not ports. However, you can apply classifiers and rewrite rules to the VLAN port members of an RVI. You can also apply MF classifiers to RVIs.

### **Default Classifiers**

If you do not explicitly configure classifiers on an Ethernet interface, the QFX Series applies default classifiers (see “[Understanding Default CoS Settings](#)” on page 4834) so that the traffic receives basic CoS treatment. The factors that determine the default classifier applied to the interface include the interface type (Layer 2 or Layer 3), the port mode

(trunk, tagged-access, or access), and whether logical interfaces have been configured. The system applies a default classifier using the following rules:

- If the physical interface has at least one Layer 3 logical interface configured, it uses the default DSCP classifier.
- If the physical interface has a Layer 2 logical interface in trunk mode or tagged-access mode, it uses the default trusted classifier.
- If the physical interface has a Layer 2 logical interface in access mode, it uses the default untrusted classifier.
- If the physical interface has no logical interface configured, no default classifier is applied.
- The default multidestination classifier is the IEEE 802.1p multidestination classifier.

### Default Rewrite Rules

No default rewrite rules are applied to interfaces. If you want to re-mark packets at the egress interface, you must explicitly configure a rewrite rule.

### Classifier Precedence

You can apply multiple unicast classifiers (MF, fixed, IEEE 802.1p, or DSCP) to a physical or logical Ethernet interface to handle different types of traffic. When you apply more than one classifier to an interface, the system uses an order of precedence to determine which classifier to use on physical and logical interfaces:

- [Unicast Classifier Precedence on Physical Ethernet Interfaces on page 4855](#)
- [Unicast Classifier Precedence on Logical Ethernet Interfaces on page 4856](#)

#### ***Unicast Classifier Precedence on Physical Ethernet Interfaces***

The precedence of unicast classifiers on physical interfaces, from the highest-priority classifier to the lowest-priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the physical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

You can apply both a DSCP classifier and an IEEE 802.1p classifier on a physical interface. When both a DSCP and an IEEE classifier are on an interface, IP traffic uses the DSCP classifier, and all other traffic uses the IEEE classifier.

**NOTE:** You cannot apply a fixed classifier and a DSCP or IEEE classifier to the same interface. If a DSCP classifier, an IEEE classifier, or both are on an interface, you cannot apply a fixed classifier to that interface unless you first delete the DSCP and IEEE classifiers. If a fixed classifier is on an interface, you cannot apply a DSCP classifier or an IEEE classifier unless you first delete the fixed classifier.

---

### ***Unicast Classifier Precedence on Logical Ethernet Interfaces***

The precedence of unicast classifiers on logical interfaces, from the highest priority classifier to the lowest priority classifier, is:

- MF classifier on a logical interface (no classifier has a higher priority than MF classifiers)
- Fixed classifier on the logical interface
- DSCP or DSCP IPv6 classifier on the physical interface
- IEEE 802.1p classifier on the physical interface

You can apply both a DSCP classifier and an IEEE 802.1p classifier on a logical interface. When both a DSCP and an IEEE classifier are on an interface, IP traffic uses the DSCP classifier, and all other traffic uses the IEEE classifier.

### **Classifier Behavior and Limitations**

---

Consider the following behaviors and constraints when you apply classifiers to physical and logical Ethernet interfaces:

- You can configure only one DSCP classifier (IP or IPv6) on a physical interface. You cannot configure both types of DSCP classifier on one physical interface. Both IP and IPv6 traffic use whichever DSCP classifier is configured on the interface.
- When you configure a DSCP or a DSCP IPv6 classifier on a physical interface and the physical interface has at least one logical Layer 3 interface, all packets (IP, IPv6, and non-IP) use that classifier.
- An interface with both a DSCP classifier (IP or IPv6) and an IEEE 802.1p classifier uses the DSCP classifier for IP and IPv6 packets, and uses the IEEE classifier for all other packets.
- Fixed classifiers and BA classifiers (DSCP and IEEE classifiers) are not permitted simultaneously on an interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.
- When you configure an IEEE 802.1p classifier on a physical interface and a DSCP classifier is not explicitly configured on that interface, the interface uses the IEEE classifier for all types of packets. No default DSCP classifier is applied to the interface. (In this case, if you want a DSCP classifier on the interface, you must explicitly configure it.)

- The system does not apply a default classifier to a physical interface until you create a logical interface on that physical interface. If you configure a Layer 3 logical interface, the system uses the default DSCP classifier. If you configure a Layer 2 logical interface, the system uses the default IEEE 802.1p trusted classifier if the port is in trunk mode or tagged-access mode, or the default IEEE 802.1p untrusted classifier if the port is in access mode.
- MF classifiers configured on logical interfaces take precedence over BA and fixed classifiers. (Use firewall filters to configure MF classifiers.) When BA or fixed classifiers are present on an interface, you can still configure an MF classifier on that interface.

### Rewrite Rule Precedence and Behavior

The following rules apply on both physical and logical Ethernet interfaces for rewrite rules:

- If you configure both one DSCP (or DSCP IPv6) rewrite rule and one IEEE 802.1p rewrite rule on an interface, both rewrite rules take effect. Traffic with IP and IPv6 headers use the DSCP rewrite rule, and traffic with a VLAN tag uses the IEEE rewrite rule.
- If you do not explicitly configure a rewrite rule, there is no default rewrite rule, so the system does not apply any rewrite rule to the interface.
- You can apply a DSCP rewrite rule or a DSCP IPv6 rewrite rule to an interface, but you cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6.

### Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration

You can apply classifiers and rewrite rules only on Layer 2 logical interfaces and Layer 3 physical interfaces (if the Layer 3 physical interface has at least one defined logical interface). This section focuses on BA classifiers, but the interaction between BA classifiers and interfaces described in this section also applies to fixed classifiers and rewrite rules.

There are two components to applying classifiers or rewrite rules to interfaces:

1. Setting the interface family (inet, inet6, or ethernet-switching; ethernet-switching is the default interface family) in the **[edit interfaces]** configuration hierarchy.
2. Applying a classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy.

These are separate operations that can be set and committed at different times. Because the type of classifier or rewrite rule you can apply to an interface depends on the interface family configuration, the system performs checks to ensure that the configuration is valid. The method the system uses to notify you of an invalid configuration depends on the **set** operation that causes the invalid configuration.

When applying the classifier or rewrite rule to the interface in the **[edit class-of-service]** hierarchy causes an invalid configuration, the system rejects the configuration and returns a commit check error.

When setting the interface family in the **[edit interfaces]** configuration hierarchy causes an invalid configuration, the system creates a syslog error message. When you receive the error message, you need to remove the classifier or rewrite rule configuration from the logical interface and apply it to the physical interface, or remove the classifier or rewrite rule configuration from the physical interface and apply it to the logical interface. For classifiers, if you do not take action to correct the error, the system programs the default classifier for the interface family on the interface. (There are no default rewrite rules. If the commit check fails, no rewrite rule is applied to the interface.)

Two scenarios illustrate these situations:

- [Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error on page 4858](#)
- [Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error on page 4859](#)

**NOTE:** Both of these scenarios also apply to fixed classifiers and rewrite rules.

---

### ***Scenario 1: Applying a Classifier to an Ethernet Interface Causes a Commit Check Error***

In Scenario 1, we set the interface family, and then specify an invalid classifier.

1. Set and commit the interface as a Layer 3 (family **inet**) interface:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family inet
user@switch# commit
```

This commit operation succeeds.

2. Set and commit a DSCP classifier on the logical interface (this example uses a DSCP classifier named **dscp1**):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
```

This configuration is not valid, because it attempts to apply a classifier to a Layer 3 logical interface. Because the failure is caused by the class-of-service configuration and not by the interface configuration, the system rejects the commit operation and issues a commit error, not a syslog message.

Note that the commit operation succeeds if you apply the classifier to the physical Layer 3 interface as follows:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 classifiers dscp dscp1
user@switch# commit
```

Because the logical unit is not specified, the classifier is applied to the physical Layer 3 interface in a valid configuration, and the commit check succeeds.

**Scenario 2: Configuring the Ethernet Interface Family Causes a Syslog Error**

In Scenario 2, we set the classifier first, then set an invalid interface type.

1. Set and commit a DSCP classifier on a Layer 3 logical interface, assuming that the interface has no existing configuration:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
```

This commit succeeds. Because no explicit configuration existed on the interface, it is by default a Layer 2 (**family ethernet-switching**) interface. Layer 2 logical interfaces support BA classifiers, so applying the classifier is a valid configuration.

2. Set and commit the interface as a Layer 3 interface (family **inet**) interface:

```
[edit interfaces]
user@switch# set xe-0/0/20 unit 0 family inet
user@switch# commit
```

This configuration is not valid because it attempts to change an interface from Layer 2 (**family ethernet-switching**) to Layer 3 (**family inet**) when a classifier has already been applied to a logical interface. Layer 3 logical interfaces do not support classifiers. Because the failure is caused by the interface configuration and not by the class-of-service configuration, the system does not issue a commit error, but instead issues a syslog message.

When the system issues the syslog message, it programs the default classifier for the interface type on the interface. In this scenario, the interface has been configured as a Layer 3 interface, so the system applies the default DSCP profile to the physical Layer 3 interface.

In this scenario, to install a configured DSCP classifier, you remove the misconfigured classifier from the Layer 3 logical interface and apply it to the Layer 3 physical interface. For example:

```
[edit]
user@switch# delete class-of-service interfaces xe-0/0/20 unit 0 classifiers dscp dscp1
user@switch# commit
user@switch# set class-of-service interfaces xe-0/0/20 classifiers dscp dscp1
user@switch# commit
```

## Understanding CoS Forwarding Classes

Forwarding classes group traffic and assign the traffic to output queues. Each forwarding class is mapped to an output queue. Classification identifies the output queue for each incoming packet by mapping the packet code point bits to forwarding classes. The forwarding class to queue mapping defines the output queue used for the packet.

A classifier must associate each packet with one of the following five default forwarding classes or with a user-configured forwarding class in order to assign an output queue to the packet:

- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.
- **no-loss**—Guaranteed delivery for TCP lossless traffic.
- **best-effort**—Provides best-effort delivery without a service profile. Loss priority is typically not carried in a class-of-service (CoS) value.
- **network-control**—Supports protocol control and is typically high priority.
- **mcast**—Provides no service profile for multdestination (multicast, broadcast, and destination lookup fail) packets.

The switch supports up to 12 forwarding classes, thus enabling flexible, differentiated, packet classification. For example, you can configure multiple classes of best-effort traffic such as **best-effort**, **best-effort1**, and **best-effort2**.

The switch supports up to 12 output queues: 8 output queues for unicast traffic (queues 0 through 7) and 4 output queues for multdestination traffic (queues 8 through 11). Forwarding classes mapped to unicast queues are associated with unicast traffic, and forwarding classes mapped to multdestination queues are associated with multdestination traffic. You cannot map unicast and multdestination traffic to the same queue. You cannot map a strict-high priority queue to a multdestination forwarding class (queues 8 through 11 do not support strict-high priority configuration).

- [Default Forwarding Classes on page 4860](#)
- [Forwarding Class Configuration Rules on page 4862](#)
- [Lossless Transport Support on page 4863](#)

---

### Default Forwarding Classes

[Table 384 on page 4861](#) shows the four default forwarding classes defined for unicast traffic, and [Table 385 on page 4862](#) shows the four default forwarding classes defined for multicast traffic.

If desired, you can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. CoS configurations can be

quite complicated, so unless it is required by your scenario, we recommend that you not alter the default class names or queue number associations.

**Table 384: Default Forwarding Classes for Unicast Packets**

Forwarding Class Name	Default Queue Mapping	Comments
best-effort (be)	0	<p>The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p>
fcoe	3	<p>The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end to end for packets in this service class. The software accepts excess traffic in this class, but in contrast to the assured forwarding class, the out-of-profile expedited-forwarding class packets can be forwarded out of sequence or dropped.</p> <p><b>NOTE:</b> By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the <b>fcoe</b> forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires.</p> <p>We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority.</p> <p>By default, this is a lossless forwarding class with a packet drop attribute of <b>no-loss</b>.</p>
no-loss	4	<p>The software offers a high level of assurance that the packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define.</p> <p>The software accepts excess traffic, but it applies a tail-drop profile to determine if the excess packets are dropped and not forwarded.</p> <p>Up to two drop probabilities (low and high) are defined for this service class.</p> <p>By default, this is a lossless forwarding class with a packet drop attribute of <b>no-loss</b>.</p>
network-control (nc)	7	<p>The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.)</p> <p>Typically, these packets represent routing protocol hello or keepalive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p>

Table 385: Default Forwarding Classes for Multicast Packets

Forwarding Class Name	Default Queue Mapping	Comments
mcast	8	<p>The software does not apply any special CoS handling to the multdestination packets. These packets are usually dropped under congested network conditions.</p> <p>By default, this is a lossy forwarding class with a packet drop attribute of <b>drop</b>.</p>

**NOTE:** Mirrored traffic is always sent to the queue that corresponds to the multdestination forwarding class. The switched copy of the mirrored traffic is forwarded with the priority determined by the behavior aggregate classification process.

### Forwarding Class Configuration Rules

Take the following rules into account when you configure forwarding classes:

- [Queue Assignment Rules on page 4862](#)
- [Scheduling Rules on page 4862](#)
- [Rewrite Rules on page 4863](#)

#### Queue Assignment Rules

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. The commit operation fails with a detailed message that states the total number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that appears in the default configuration is the forwarding class currently associated with that queue.
- Only unicast forwarding classes can be mapped to unicast queues (0 through 7), and only multdestination forwarding classes can be mapped to multdestination queues (8 through 11).
- Strict-high priority queues cannot be mapped to multdestination forwarding classes. (Strict-high priority traffic cannot be mapped to queues 8 through 11).
- If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

#### Scheduling Rules

When you define a forwarding class that is used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you

must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

### ***Rewrite Rules***

On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

### **Lossless Transport Support**

---

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p code point of lossless forwarding classes. The following limitations apply to support lossless transport:

- The external cable length from the QFX3500 or QFabric system Node device to other devices cannot exceed 300 meters.
- The internal cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.
- For FCoE traffic, the interface maximum transmission unit (MTU) must be at least 2180 bytes to accommodate the packet payload, headers, and checks.

.....

**NOTE:** Junos OS Release 12.2 introduces changes to the way the QFX Series handles lossless forwarding classes (the `fcoe` and `no-loss` forwarding classes).

In Junos OS Release 12.1, both explicitly configuring the `fcoe` and `no-loss` forwarding classes, and using the default configuration for these forwarding classes, resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the `fcoe` or the `no-loss` forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the `fcoe` or the `no-loss` forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the explicit `fcoe` and `no-loss` forwarding class configuration before you upgrade to Junos OS Release 12.2.

See [“Overview of CoS Changes Introduced in Junos OS Release 12.2” on page 4820](#) for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the `fcoe` and `no-loss` forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new `no-loss` packet drop attribute or the forwarding class is lossy.

## Understanding CoS Forwarding Class Sets (Priority Groups)

A forwarding class set is the Junos OS configuration construct that equates to a priority group in enhanced transmission selection (ETS, described in IEEE 802.1Qaz). The switch implements ETS using a two-tier hierarchical scheduler.

A priority group is a group of queues (priorities). Mapping a forwarding class to a queue defines the traffic for that queue, so a priority equates to a queue (forwarding class). The queues in a priority group share the port bandwidth allocated to that priority group. The traffic for queues in one priority group usually share similar traffic-handling requirements.

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. Only unicast forwarding classes can belong to unicast forwarding class sets. Only multicast forwarding classes can belong to the multicast forwarding class set.

If you configure a strict-high priority queue, you must observe the following rules when configuring forwarding class sets:

- You must create a separate forwarding class set for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.
- You cannot configure a guaranteed minimum bandwidth (guaranteed rate) for a forwarding class set that includes a strict-high priority queue. (You also cannot configure a guaranteed minimum bandwidth for a strict-high queue.)

You must use hierarchical scheduling to define CoS for output queues. The two-tier hierarchical scheduler defines bandwidth resources for the priority group, and then allocates those resources among the priorities that belong to the priority group.

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set. Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.

When you explicitly configure forwarding class sets and map them to an interface, any forwarding class that you do not map to a forwarding class set receives no guaranteed bandwidth on that interface. Forwarding classes that belong to the default forwarding class set might receive bandwidth if the other forwarding class sets are not using all of the port bandwidth. However, the amount of bandwidth forwarding classes that are not in explicitly configured forwarding class sets receive is not guaranteed. The bandwidth

for the default forwarding class depends on whether extra port bandwidth is available and therefore is not deterministic.

To guarantee bandwidth for forwarding classes in a predictable manner, be sure to map all forwarding classes that you expect to carry traffic on an interface to a forwarding class set and map the forwarding class set to the interface.

## Understanding Default CoS Scheduling and Classification

If you do not configure hierarchical scheduling on an interface, the switch uses the default classifiers for ingress traffic and the default schedulers for egress traffic. Default scheduling and classification handle all traffic types (best-effort, FCoE, no-loss, network-control, and multdestination traffic).

Hierarchical scheduling groups egress queues (priorities, configured as forwarding classes) into priority groups (forwarding class sets). If you use only the default traffic scheduling and classification, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default classifier settings. The default priority group is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

**NOTE:** If you explicitly configure one or more priority groups on an interface, any forwarding class that is not assigned to a priority group on that interface receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class (priority) that you want to forward traffic on that interface must belong to a forwarding class set (priority group).

The following sections describe:

- [Default Classification on page 4866](#)
- [Default Scheduling on page 4869](#)
- [Default DCBX Advertisement on page 4870](#)
- [Default Scheduling and Classification Summary on page 4870](#)

### Default Classification

---

The default classifiers assign unicast and multicast best-effort and network-control ingress traffic to forwarding classes and loss priorities. The QFX Series applies default unicast IEEE 802.1, unicast DSCP, and multdestination classifiers to each interface that

does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

[Table 386 on page 4867](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

**Table 386: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged-Access Mode (Trusted Classifier)**

Code Point	Forwarding Class	Loss Priority
be (000)	best-effort	low
be1 (001)	best-effort	low
ef (010)	best-effort	low
ef1 (011)	fcoe	low
af11 (100)	no-loss	low
af12 (101)	best-effort	low
nc1 (110)	network-control	low
nc2 (111)	network-control	low

[Table 387 on page 4867](#) shows the default mapping of IEEE 802.1p code-point values to unicast forwarding classes and loss priorities for ports in access mode (all incoming traffic is mapped to best-effort forwarding classes).

**Table 387: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier)**

Code Point	Forwarding Class	Loss Priority
000	best-effort	low
001	best-effort	low
010	best-effort	low
011	best-effort	low
100	best-effort	low
101	best-effort	low

**Table 387: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier) (continued)**

Code Point	Forwarding Class	Loss Priority
110	best-effort	low
111	best-effort	low

[Table 388 on page 4868](#) shows the default mapping of IEEE 802.1 code-point values to multdestination (multicast, broadcast, and destination lookup fail traffic) forwarding classes and loss priorities.

**Table 388: Default IEEE 802.1 Multidestination Classifiers**

**NOTE:** There are no default DSCP IP or IPv6 multdestination classifiers for multdestination traffic. DSCP IPv6 multdestination classifiers are not supported for multdestination traffic.

### Default Scheduling

The default schedulers allocate egress bandwidth resources to unicast and multicast best-effort and network-control egress traffic as shown in [Table 390 on page 4869](#):

Table 390: Default Scheduler Configuration

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	low	5%

Table 390: Default Scheduler Configuration (*continued*)

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
FCoE scheduler (queue 3)	35%	None	35%	low	35%
No-loss scheduler (queue 4)	35%	None	35%	low	35%
Network-control scheduler (queue 7)	5%	None	5%	low	5%
Multidestination scheduler (queue 8)	20%	None	20%	low	20%

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

#### Default DCBX Advertisement

When you configure hierarchical scheduling on an interface, DCBX advertises each priority group, the priorities in each priority group, and the bandwidth properties of each priority and priority group.

If you do not configure hierarchical scheduling on an interface, DCBX advertises the automatically created default priority group and its priorities. DCBX also advertises the default bandwidth allocation of the priority group, which is 100 percent of the port bandwidth.

#### Default Scheduling and Classification Summary

If you do not configure hierarchical scheduling on an interface:

- Default classifiers classify ingress traffic.
- Default schedulers schedule egress traffic.
- DCBX advertises a single default priority group with 100 percent of the port bandwidth allocated to that priority group. All priorities (forwarding classes) are assigned to the default priority group and receive bandwidth based on their default schedulers. The default priority group is generated automatically and is not user-configurable.

## Understanding CoS Hierarchical Port Scheduling (ETS)

Scheduling defines the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the queue priority, and the drop profiles associated with the queue.

Hierarchical port scheduling is a two-tier process that provides better port bandwidth utilization and greater flexibility to allocate resources to queues and to groups of queues. Hierarchical scheduling includes the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

The two tiers used in hierarchical scheduling are priorities and priority groups, as shown in [Table 391 on page 4872](#).

**Table 391: Hierarchical Scheduling Tiers**

Junos OS Configuration Construct	Equivalent ETS Construct	Description
Forwarding class	Priority	<p>Think about priorities (forwarding classes) as output queues. You map forwarding classes to queues, so each forwarding class is in essence an output queue.</p> <p>When you use a classifier to map a forwarding class to an IEEE 802.1p code point, the code point identifies that traffic's priority for priority-based flow control (PFC). Thus the forwarding class, the queue mapped to the forwarding class, and the priority mapped to the forwarding class all identify the same traffic.</p>
Forwarding class set	Priority group	<p>Priority groups (forwarding class sets) are groups of priorities. Forwarding class membership in a forwarding class set defines the priority group to which each priority belongs.</p> <p>You can configure up to three unicast priority groups and one multicast forwarding class set.</p>

**NOTE:** If you explicitly configure one or more priority groups on an interface, any priority that is not assigned to a priority group on that interface is assigned to an automatically generated default priority group and receives *no bandwidth*. This means that if you configure hierarchical scheduling on an interface, every forwarding class that you want to forward traffic on that interface must belong to a forwarding class set.

This topic describes:

- [Hierarchical Scheduling and ETS on page 4873](#)
- [ETS Advertisement in DCBX on page 4874](#)

- [Strict-High Priority Queues and Hierarchical Scheduling on page 4875](#)
- [Default Hierarchical Scheduling on page 4875](#)

### Hierarchical Scheduling and ETS

Two-tier hierarchical scheduling enables you to manage bandwidth efficiently by enabling you to define the CoS properties for each priority group and for each priority. One tier of the hierarchical scheduler allocates port bandwidth to a priority group. The other tier of the hierarchical scheduler determines the portion of the priority group bandwidth that a queue can use.

The CoS properties you configure for a priority group define the port bandwidth resources available to the queues in that priority group. The CoS properties you configure for each queue specify the portion or percentage of the total bandwidth configured for the priority group that is available to the queue. [Figure 180 on page 4873](#) shows the relationship of port resource allocation to priority groups and priority group resource allocation to queues (priorities).

**Figure 180: Hierarchical Scheduling Tiers**

9040722

If a queue is not using its allocated bandwidth, ETS shares the unused bandwidth among the other queues in the priority group. If link bandwidth is available or if a priority group on a link is not using its allocated bandwidth, ETS shares the unused bandwidth with other priority groups on the link. In this way ETS improves link bandwidth utilization and provides each queue with the maximum bandwidth. Priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

**NOTE:** The available link bandwidth is the bandwidth remaining after servicing strict-high priority flows.

### ETS Advertisement in DCBX

---

When you configure hierarchical scheduling on a port, Data Center Bridging Capability Exchange Protocol (DCBX) advertises:

- Each priority group
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

When you configure hierarchical scheduling on a port, any priority that is not part of an explicitly configured priority group is assigned to the automatically generated default priority group and receives no bandwidth. The default priority group is transparent. It does not appear in the configuration.

### Hierarchical Scheduling Process

---

Hierarchical scheduling consists of multiple configuration steps that create the priorities and the priority groups, schedule their resources, and assign them to interfaces. The steps below correspond to the six blocks in the packet flow diagram shown in [Figure 181 on page 4875](#):

1. Packet classification:
  - Classify incoming traffic into priorities. This consists of either using the default classifiers or configuring classifiers to map IEEE 802.1p code points and loss priorities to the forwarding classes.
  - Apply the classifiers to ingress interfaces. This groups incoming traffic into forwarding classes (priorities) by mapping code points to forwarding classes and loss priorities on the specified interface.
2. Configure the output queues for the forwarding classes (priorities). This consists of either using the default forwarding classes and forwarding-class-to-queue mapping or creating your own forwarding classes and mapping them to queues.
3. Allocate resources to the forwarding classes:
  - Define resources for the priorities. This consists of configuring schedulers to set minimum guaranteed bandwidth, maximum bandwidth, drop profiles for Weighted Random Early Detection (WRED), and bandwidth priority to apply to a forwarding class. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.
  - Map resources to priorities. This consists of mapping forwarding classes to schedulers by using a scheduler map.
4. Configure priority groups. This consists of mapping forwarding classes (priorities) to forwarding class sets (priority groups) to define the priorities that belong to each priority group.
5. Define resources for the priority groups. This consists of configuring traffic control profiles to set minimum guaranteed bandwidth and maximum bandwidth for a priority group. Traffic control profiles also specify a scheduler map, which defines the resources

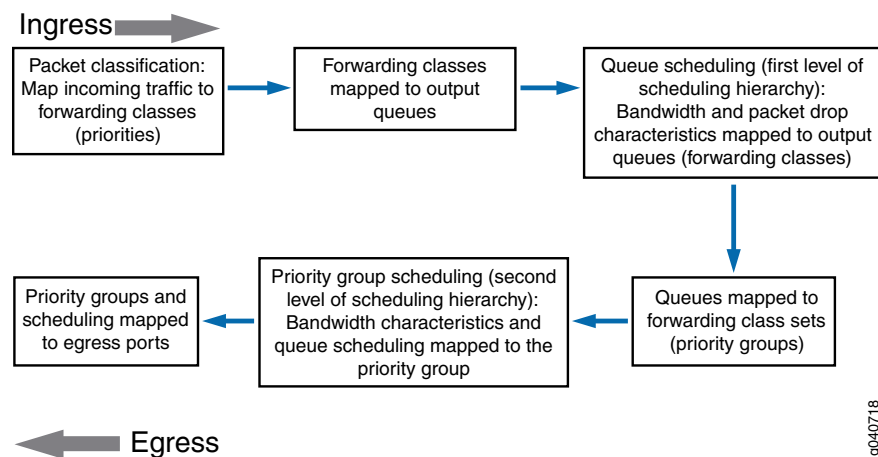

(schedulers) for the priorities in the priority group. Extra port bandwidth is shared among priority groups in proportion to the minimum guaranteed bandwidth of each priority group.

The traffic control profile bandwidth settings determine the port resources available to the priority group, and the schedulers specified in the scheduler map determine the amount of the priority group resources that each priority receives.

6. Apply the hierarchical scheduling to a port. This consists of attaching one or more priority groups to a port interface. For each priority group, you also attach a traffic control profile. Different priority groups on the same port can use different traffic control profiles.

Figure 181: Hierarchical Scheduling Packet Flow

### Strict-High Priority Queues and Hierarchical Scheduling

If you configure a strict-high priority queue, you must observe the following rules:

- You must create a separate forwarding class set (priority group) for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.

### Default Hierarchical Scheduling

If you do not explicitly configure hierarchical scheduling, the switch uses the default settings:

- The switch automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The switch assigns 100 percent of the port output bandwidth to the default forwarding class set. The default forwarding class set is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange Protocol (DCBX) advertisement.

- Ingress traffic is classified based on the default classifier settings.
- The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings.

## Understanding CoS Output Queue Schedulers

Output queue scheduling defines the class-of-service (CoS) properties of output queues (priorities). Queue scheduling works with priority group scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates bandwidth to a group of queues (priority group), and queue scheduling determines the portion of the priority group's bandwidth that a particular queue can use.

Scheduler maps associate queue schedulers with forwarding classes (output queues). You can associate each scheduler map with a traffic control profile, and then associate each traffic control profile with a forwarding class set (priority group) and a port interface. In conjunction with the priority group scheduling configured in the traffic control profile, queue scheduling configures the output queues, packet schedulers, and tail-drop processes that operate according to this mapping.

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

### Output Queue Scheduling Components

[Table 392 on page 4877](#) provides a quick reference to the scheduler components you can configure to determine the bandwidth properties of output queues, and [Table 393 on page 4877](#) provides a quick reference to some related scheduling configuration components.

**Table 392: Output Queue Scheduler Components**

Output Queue Scheduler Component	Description
Priority	Sets the scheduling priority applied to the queue.
Shaping rate	Sets the maximum bandwidth the queue can consume.
Transmit rate	Sets the minimum guaranteed bandwidth for the queue. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.
Drop profile	Sets the probability of dropping packets as the queue fills up.
Loss priority	Sets the traffic loss priority to which a drop profile applies.
Drop profile map	Maps a drop profile to a loss priority.
Buffer size	Sets the size of the queue buffer.

**Table 393: Other Scheduling Components**

Other Scheduling Components	Description
Scheduler map	Maps schedulers to queues (forwarding classes, also called priorities).
Forwarding class	Maps traffic to a queue (priority).
Traffic control profile	Sets scheduling for the forwarding class set (priority group) and associates a scheduler map with the forwarding class set to apply queue scheduling to the forwarding classes in the forwarding class set. Extra port bandwidth is shared among forwarding class sets in proportion to the minimum guaranteed bandwidth of each forwarding class set.
Forwarding class set	Name of a priority group. You map forwarding classes to priority groups. A forwarding class set consists of one or more forwarding classes.

## Default Schedulers

Each forwarding class requires an associated scheduler. The default configuration uses only four forwarding classes, unicast best-effort (queue 0), unicast network-control (queue 3), multicast best-effort (queue 8), and multicast network control (queue 11). You can use the default schedulers or you can define new schedulers for these four forwarding classes. For any other forwarding class, you must explicitly configure a scheduler.

Table 394 on page 4878 shows the default schedulers.

**Table 394: Default Schedulers**

Default Scheduler and Queue Number	Guaranteed Rate (Minimum Bandwidth)	Shaping Rate (Maximum Bandwidth)	Excess Bandwidth Sharing	Priority	Buffer Size
Best-effort scheduler (queue 0)	5%	None	5%	Low	5%
FCoE scheduler (queue 3)	35%	None	35%	Low	35%
No-loss scheduler (queue 4)	35%	None	35%	Low	35%
Network-control scheduler (queue 7)	5%	None	5%	Low	5%
Multidestination scheduler (queue 8)	20%	None	20%	Low	20%

**NOTE:** The minimum guaranteed bandwidth rate also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the minimum guaranteed bandwidth rate of each queue.

There are no resources assigned by default to queues 1, 2, 5, 6, 9, 10, and 11. You can define new unicast forwarding classes to assign to queues 1, 2, 5, and 6, and new multidestination forwarding classes to assign to queues 9, 10, and 11, which do not have default mappings to a forwarding class. You can assign resources to these queues manually using schedulers. In addition, you can change the default forwarding-class-to-queue mappings and the default schedulers.

By default, each queue can exceed the assigned bandwidth if additional bandwidth is available from other queues in the forwarding class set. When a forwarding class does not fully use the allocated minimum transmission bandwidth (transmit rate), other forwarding classes in the forwarding class set can use the remaining bandwidth if those forwarding classes receive more traffic than their allocated bandwidth.

### Transmit Rate (Minimum Guaranteed Bandwidth)

The transmit rate determines the minimum guaranteed bandwidth for each forwarding class. It also determines how much excess (extra) bandwidth each low-priority queue can share; each queue shares extra bandwidth in proportion to its transmit rate. You specify the rate in bits per second as a fixed value such as 1 Mbps or as a percentage of the total forwarding class set minimum guaranteed bandwidth (the guaranteed rate set in the traffic control profile). Either the default scheduler or a scheduler you configure allocates a portion of the outgoing interface bandwidth to each forwarding class.

**NOTE:** For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

The allocated bandwidth can exceed the configured minimum rate if additional bandwidth is available from other queues in the forwarding class set. In case of congestion, the configured transmit rate is guaranteed for the queue. This property enables you to ensure that each queue receives the amount of bandwidth appropriate to its level of service.

**NOTE:** Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

### Sharing Extra Bandwidth

Extra bandwidth is available to low-priority queues when the minimum guaranteed bandwidth of the queues does not use the full amount of forwarding class set bandwidth. This extra bandwidth is shared among the forwarding classes in the set based on the minimum guaranteed bandwidth of each queue.

For example, in a forwarding class set, Queue A has a transmit rate of 1 Gbps, Queue B has a transmit rate of 1 Gbps, and Queue C has a transmit rate of 2 Gbps. After servicing the minimum guaranteed bandwidth of these queues, the forwarding class set has an extra 2 Gbps of bandwidth available, and all three queues still have packets to forward. The queues receive the extra bandwidth in proportion to their transmit rates, so Queue A

receives an extra 500 Mbps, Queue B receives an extra 500 Mbps, and Queue C receives an extra 1 Gbps.

### Shaping Rate (Maximum Bandwidth)

---

The shaping rate determines the maximum bandwidth each forwarding class can consume. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total forwarding class set maximum bandwidth (the shaping rate set in the traffic control profile).

The maximum bandwidth for a queue depends on the total bandwidth available to the forwarding class set to which the queue belongs and how much bandwidth the other queues in the forwarding class set consume.

**NOTE:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. A strict-high priority queue (or several queues with higher priorities than the starved queue) can consume all of the port bandwidth and prevent another queue from transmitting packets. To prevent a queue from being starved for bandwidth, you can configure a shaping rate on the queue or queues to prevent them from consuming all of the port bandwidth.

---

### Scheduling Priority

---

Scheduling priority determines the order in which an output interface transmits traffic from the queues, thus ensuring that queues containing important traffic receive better access to the outgoing interface. The priority setting in the scheduler determines the priority for the queue.

Two levels of scheduling priority are supported:

- **Low**—Low-priority queues transmit traffic based on the weighted round robin (WRR) algorithm. The scheduler first determines if an individual queue is within its defined bandwidth profile. The scheduler then regularly reevaluates whether each individual queue is within its defined bandwidth profile and compares the amount of data the queue transmits to the amount of bandwidth the scheduler allocates to the queue. When the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when its transmitted amount is larger than its allocated amount. Out of profile queue data is transmitted only if bandwidth is available. Otherwise, it is buffered if buffer space is available. If no buffer space is available, the traffic may be dropped.
- **Strict-high**—You can configure only one queue as **strict-high** priority. The other 11 queues are **low** priority.

The **strict-high** priority queue receives preferential treatment over the low-priority queues. The **strict-high** priority queue receives all of its configured bandwidth before low-priority queues are serviced. Low-priority queues do not transmit traffic until the strict-high priority queue is empty. Carefully consider how much bandwidth you want to allocate to the **strict-high** priority queue to avoid starving the low-priority queues.

If you configure a strict-high priority queue, you must observe the following rules:

- You must create a separate forwarding class set (priority group) for the strict-high priority queue.
- Only one forwarding class set can contain strict-high priority queues.
- Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
- A strict-high priority queue cannot belong to a multidestination forwarding class set.
- You cannot configure a minimum guaranteed bandwidth for a strict-high priority queue. (You cannot configure a transmit rate for a strict-high priority queue scheduler, and you cannot configure a guaranteed rate for a forwarding class set that has a strict-high priority queue.)

Junos OS performs priority queueing using the following steps:

1. Services the strict-high priority queue before any other queues are served
2. Services the minimum bandwidth (transmit rate) of low-priority queues until the minimum is met or the queues are empty
3. Services all other low-priority queues and needs that exceed the minimum bandwidth

### Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type:

- PLP—Low, medium-high, high. You configure the PLP during classifier configuration. When you use a scheduler map to associate a forwarding class with a scheduler, you can use a drop-profile map to map different drop profiles to the forwarding class for different PLPs.
- Protocol type—Drop profiles match all protocol types.

### Buffer Size

Most of the total system buffer space is divided into two buffer pools, shared buffers and dedicated buffers. Shared buffers are a global pool that the ports share dynamically as needed. Dedicated buffers are a reserved portion of the buffer pool that is distributed evenly to all of the ports. Each port receives an equal allocation of dedicated buffer space. The dedicated buffer allocation to ports is not configurable because it is reserved for the ports.

The queue buffers are allocated from the dedicated buffer pool assigned to the port. By default, ports divide their allocation of dedicated buffers among the egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (**transmit-rate**) for traffic. Only the queues included in the default scheduler receive dedicated buffers.

If you do not use the default configuration, you can explicitly configure the queue buffer size in either of two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is mapped to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining port dedicated buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler means no dedicated buffer allocation for the queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

---

For a complete discussion about queue buffer configuration in the context of ingress and egress port buffer configuration, see [“Understanding CoS Buffer Configuration” on page 4914](#).

### Scheduler Maps

---

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map, associate the scheduler map with a traffic control profile, and then associate the traffic control profile with an interface and a forwarding class set.

You can associate up to four user-defined scheduler maps with traffic control profiles.

## Understanding CoS Priority Group Scheduling

Priority group scheduling defines the class-of-service (CoS) properties of a group of output queues (priorities). Priority group scheduling works with output queue scheduling to create a two-tier hierarchical scheduler. The hierarchical scheduler allocates bandwidth to a group of queues (a priority group, called a forwarding class set in Junos OS configuration). Queue scheduling determines the portion of the priority group bandwidth that the particular queue can use.

You configure priority group scheduling in a traffic control profile and then associate the traffic control profile with a forwarding class set and an interface. You attach a scheduler map to the traffic control profile to specify the queue scheduling characteristics.

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

### Priority Group Scheduling Components

[Table 395 on page 4883](#) provides a quick reference to the traffic control profile components you can configure to determine the bandwidth properties of priority groups, and [Table 396 on page 4884](#) provides a quick reference to some related scheduling configuration components.

**Table 395: Priority Group Scheduler Components**

Traffic Control Profile Component	Description
Guaranteed rate	Sets the minimum guaranteed port bandwidth for the priority group. Extra port bandwidth is shared among priority groups in proportion to the guaranteed rate of each priority group on the port.
Shaping rate	Sets the maximum port bandwidth the priority group can consume.
Scheduler map	Maps schedulers to queues (forwarding classes, also called priorities). This determines the portion of the priority group bandwidth that a queue receives.

Table 396: Other Scheduling Components

Other Scheduling Components	Description
Forwarding class	Maps traffic to a queue (priority).
Forwarding class set	Name of a priority group. You map forwarding classes to priority groups. A forwarding class set consists of one or more forwarding classes.
Scheduler	Sets the bandwidth and scheduling priority of individual queues (forwarding classes).

### Default Traffic Control Profile

There is no default traffic control profile.

### Guaranteed Rate (Minimum Guaranteed Bandwidth)

The guaranteed rate determines the minimum guaranteed bandwidth for each priority group. It also determines how much excess (extra) port bandwidth the priority group can share; each priority group shares extra port bandwidth in proportion to its guaranteed rate. You specify the rate in bits per second as a fixed value such as 3 Mbps or as a percentage of the total port bandwidth.

The minimum transmission bandwidth can exceed the configured rate if additional bandwidth is available from other priority groups on the port. In case of congestion, the configured guaranteed rate is guaranteed for the priority group. This property enables you to ensure that each priority group receives the amount of bandwidth appropriate to its level of service.

**NOTE:** Configuring the minimum guaranteed bandwidth (transmit rate) for a forwarding class does not work unless you also configure the minimum guaranteed bandwidth (guaranteed rate) for the forwarding class set in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

You cannot configure a guaranteed rate for forwarding class sets that include strict-high priority queues.

### Sharing Extra Bandwidth

Extra bandwidth is available to priority groups when the priority groups do not use the full amount of available port bandwidth. This extra port bandwidth is shared among the priority groups based on the minimum guaranteed bandwidth of each priority group.

For example, Port A has three priority groups: fc-set-1, fc-set-2, and fc-set-3. Fc-set-1 has a guaranteed rate of 2 Gbps, fc-set-2 has a guaranteed rate of 2 Gbps, and fc-set-3 has a guaranteed rate of 4 Gbps. After servicing the minimum guaranteed bandwidth of these priority groups, the port has an extra 2 Gbps of available bandwidth, and all three priority groups have still have packets to forward. The priority groups receive the extra bandwidth in proportion to their guaranteed rates, so fc-set-1 receives an extra 500 Mbps, fc-set-2 receives an extra 500 Mbps, and fc-set-3 receives an extra 1 Gbps.

### Shaping Rate (Maximum Bandwidth)

The shaping rate determines the maximum bandwidth the priority group can consume. You specify the rate in bits per second as a fixed value such as 5 Mbps or as a percentage of the total port bandwidth.

The maximum bandwidth for a priority group depends on the total bandwidth available on the port and how much bandwidth the other priority groups on the port consume.

### Scheduler Maps

A scheduler map maps schedulers to queues. When you associate a scheduler map with a traffic control profile, then associate the traffic control profile with an interface and a forwarding class set, the scheduling defined by the scheduler map determines the portion of the priority group resources that each individual queue can use.

You can associate up to four user-defined scheduler maps with traffic control profiles.

## Understanding CoS Traffic Control Profiles

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth that you assign to the forwarding class set in the traffic control profile.

This two-tier hierarchical scheduling architecture provides flexibility in allocating resources among queues and:

- Assigns a portion of port bandwidth to a priority group. You define the port resources for the priority group in a traffic control profile.
- Allocates priority group bandwidth among the queues that belong to the priority group. A scheduler map attached to the traffic control profile defines the amount of the priority group's resources that each queue can use.

Attaching a priority group and traffic control profile to a port defines the hierarchical scheduling properties of the group and the queues that belong to the group.

The ability to create priority groups supports enhanced transmission selection (ETS, described in IEEE 802.1Qaz). When a priority group does not use its allocated port bandwidth, ETS shares the excess port bandwidth among other priority groups on the port in proportion to their guaranteed minimum bandwidth (guaranteed rate). This utilizes the port bandwidth better than scheduling schemes that require setting strict priorities that reserve bandwidth for all groups whether it is needed or not. ETS allows traffic groups that need extra bandwidth to use it if the bandwidth is available, while preserving the ability to specify the minimum guaranteed bandwidth for traffic groups.

Traffic control profiles define the following CoS properties for priority groups:

- Minimum guaranteed bandwidth—Also known as the committed information rate (CIR). This is the minimum amount of port bandwidth the priority group receives. Priorities in the priority group receive their minimum guaranteed bandwidth as a portion of the priority group's minimum guaranteed bandwidth. The **guaranteed-rate** statement defines the minimum guaranteed bandwidth.

**NOTE:** You cannot apply a traffic control profile with a minimum guaranteed bandwidth to a priority group that includes strict-high priority queues.

---

- Shared excess (extra) bandwidth—When the priority groups on a port do not consume the full amount of bandwidth allocated to them or there is unallocated link bandwidth available, priority groups can contend for that extra bandwidth if they need it. Priorities in the priority group contend for extra bandwidth as a portion of the priority group's extra bandwidth. The amount of extra bandwidth for which a priority group can contend is proportional to the priority group's guaranteed minimum bandwidth (guaranteed rate).

- **Maximum bandwidth**—Also known as peak information rate (PIR). This is the maximum amount of port bandwidth the priority group receives. Priorities in the priority group receive their maximum bandwidth as a portion of the priority group's maximum bandwidth. The **shaping-rate** statement defines the maximum bandwidth.
- **Queue scheduling**—Each traffic control profile includes a scheduler map. The scheduler map maps priorities (forwarding classes) to schedulers to define the scheduling characteristics of the individual priorities in the priority group. The resources scheduled for each priority represent portions of the resources that the traffic control profile schedules for the entire priority group, not portions of the total link bandwidth. The **scheduler-maps** statement defines the mapping of forwarding classes to schedulers.

## Understanding CoS Priority Group and Queue Guaranteed Rates (Minimum Bandwidth)

You can set a guaranteed minimum bandwidth for individual forwarding classes (queues) and for groups of forwarding classes called forwarding class sets (priority groups). Setting a minimum guaranteed bandwidth ensures that priority groups and queues receive the bandwidth required to support the expected traffic.

This topic covers:

- [Guaranteeing Bandwidth Using Hierarchical Scheduling on page 4887](#)
- [Priority Group Guaranteed Rate \(Minimum Bandwidth\) on page 4889](#)
- [Queue Transmit Rate \(Minimum Bandwidth\) on page 4889](#)

### Guaranteeing Bandwidth Using Hierarchical Scheduling

The **guaranteed-rate** value for the priority group defines the minimum amount of bandwidth allocated to a forwarding class set on a port, whereas the **transmit-rate** value of the queue defines the minimum amount of bandwidth allocated to a particular queue in a priority group. The queue bandwidth is a portion of the priority group bandwidth.

**NOTE:** You cannot configure a minimum guaranteed bandwidth (transmit rate) for a forwarding class that is mapped to a strict-high priority queue, and you cannot configure a minimum guaranteed bandwidth (guaranteed rate) for a priority group that includes strict-high priority queues.

[Figure 182 on page 4888](#) shows how the total port bandwidth is allocated to priority groups (forwarding class sets) based on the guaranteed rate of each priority group. It also shows how the guaranteed bandwidth of each priority group is allocated to the queues in the priority group based on the transmit rate of each queue.

**Figure 182: Allocating Guaranteed Bandwidth Using Hierarchical Scheduling**

The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue transmit rates cannot exceed the total guaranteed rate of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

**NOTE:** You must set both the priority group **guaranteed-rate** value and the queue **transmit-rate** value in order to configure the minimum bandwidth for individual queues. If you set the **transmit-rate** value but do not set the **guaranteed-rate** value, the configuration fails.

You can set the **guaranteed-rate** value for a priority group without setting the **transmit-rate** value for individual queues in the priority group. However, queues that do not have a configured **transmit-rate** value can become starved for bandwidth if other higher-priority queues need the priority group's bandwidth. To avoid starving a queue, it is a good practice to configure a **transmit-rate** value for most queues.

If you configure the guaranteed rate of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

### Priority Group Guaranteed Rate (Minimum Bandwidth)

Setting a priority group **guaranteed-rate** enables you to reserve a portion of the port bandwidth for the forwarding classes (queues) in that forwarding class set. The minimum bandwidth (**guaranteed-rate**) that you configure for a priority group sets the minimum bandwidth available to all of the forwarding classes in the forwarding class set.

The combined **guaranteed-rate** value of all of the forwarding class sets associated with an interface cannot exceed the amount of bandwidth available on that interface.

You configure the priority group **guaranteed-rate** in the traffic control profile. You cannot apply a traffic control profile that has a guaranteed rate to a priority group that includes strict-high priority queues.

### Queue Transmit Rate (Minimum Bandwidth)

Setting a queue **transmit-rate** enables you to reserve a portion of the priority group bandwidth for the individual queue. For example, a queue that handles Fibre Channel over Ethernet (FCoE) traffic might require a minimum rate of 4 Gbps to ensure the class of service that storage area network (SAN) traffic requires.

The priority group **guaranteed-rate** sets the aggregate minimum amount of bandwidth available to the queues that belong to the priority group. The cumulative total minimum bandwidth the queues consume cannot exceed the minimum bandwidth allocated to the priority group to which they belong. (The combined transmit rates of the queues in a priority group cannot exceed the priority group's guaranteed rate.)

You must configure the **guaranteed-rate** value of the priority group in order to set a **transmit-rate** value for individual queues that belong to the priority group. The reason is that if there is no guaranteed bandwidth for a priority group, there is no way to guarantee bandwidth for queues in that priority group.

You configure the queue **transmit-rate** in the scheduler configuration. You cannot configure a transmit rate for strict-high priority queues.

## Understanding CoS Priority Group Shaping and Queue Shaping (Maximum Bandwidth)

If the amount of traffic on an interface exceeds the maximum bandwidth of the interface, it leads to congestion. You can use priority group (forwarding class set) shaping and queue shaping to manage the excess traffic and avoid congestion.

The maximum bandwidth sets the most bandwidth a priority group or a queue can use after all of the priority group and queue minimum bandwidth requirements are met, even if more bandwidth is available.

This topic covers:

- [Priority Group Shaping on page 4890](#)
- [Queue Shaping on page 4890](#)
- [Shaping Maximum Bandwidth Using Hierarchical Scheduling on page 4891](#)

### Priority Group Shaping

---

Priority group shaping enables you to shape the aggregate traffic of a forwarding class set on a port to a maximum rate that is less than the line or port rate. The maximum bandwidth (**shaping-rate**) that you configure for a priority group sets the maximum bandwidth available to all of the forwarding classes (queues) in the forwarding class set.

If a port has more than one priority group and the combined **shaping-rate** value of the priority groups is greater than the amount of port bandwidth available, the bandwidth is shared proportionally among the priority groups.

You configure the priority group **shaping-rate** in the traffic control profile.

### Queue Shaping

---

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-high priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping (**shaping-rate**) to set the maximum bandwidth for a particular queue.

The **shaping-rate** value of the priority group sets the aggregate maximum amount of bandwidth available to the queues that belong to the priority group. The cumulative total bandwidth the queues consume cannot exceed the maximum bandwidth of the priority group to which they belong on a port.

If a priority group has more than queue and the combined **shaping-rate** value of the queues is greater than the amount of bandwidth available to the priority group, the bandwidth is shared proportionally among the queues.

You configure the queue **shaping-rate** in the scheduler configuration.

### Shaping Maximum Bandwidth Using Hierarchical Scheduling

Priority group shaping defines the maximum bandwidth allocated to a forwarding class set on a port, whereas queue shaping defines a limit on maximum bandwidth usage per queue. The queue bandwidth is a portion of the priority group bandwidth.

Figure 183 on page 4891 shows how the port bandwidth is allocated to priority groups (forwarding class sets) based on the shaping rate of each priority group, and how the bandwidth of each priority group is allocated to the queues in the priority group based on the shaping rate of each queue.

**Figure 183: Setting Maximum Bandwidth Using Hierarchical Scheduling**

## Understanding CoS Scheduling Behavior and Configuration Considerations

Many factors affect scheduling configuration and bandwidth requirements, including:

- When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.
- When you define a forwarding class that will be used on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:
  - Mapping a scheduler to the forwarding class in a scheduler map
  - Including the forwarding class in a forwarding class set
  - Associating the scheduler map with a traffic control profile
  - Attaching the traffic control profile to a forwarding class set and an interface
- On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.
- For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.
- Configuring the minimum guaranteed bandwidth (**transmit-rate**) for a queue (forwarding class) does not work unless you also configure the minimum guaranteed bandwidth (**guaranteed-rate**) for the priority group (forwarding class set) in the traffic control profile.

Additionally, the sum of the transmit rates of the queues in a forwarding class set should not exceed the guaranteed rate for the forwarding class set. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.) If you configure transmit rates whose sum exceeds the guaranteed rate of the forwarding class set, the commit check fails and the system rejects the configuration.

- The sum of the priority group guaranteed rates cannot exceed the total port bandwidth. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

- If you configure the **guaranteed-rate** of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.
- There are several factors to consider if you want to configure strict-high priority queues:
  - You cannot configure a minimum guaranteed bandwidth (**transmit-rate**) for a strict-high priority queue. You cannot configure a minimum guaranteed bandwidth (**guaranteed-rate**) for a forwarding class set that includes a strict-high priority queue.
  - You must create a separate forwarding class set for the strict-high priority queue.
  - Only one forwarding class set can contain strict-high priority queues.
  - Strict-high priority queues cannot belong to the same forwarding class set as queues that are not strict-high priority.
  - A strict-high priority queue cannot belong to a multidestination forwarding class set.
- In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets. Failure of a queue to transmit packets for 12 consecutive seconds may be due to:
  - A strict-high priority queue consuming all of the port bandwidth
  - Several queues consuming all of the port bandwidth
  - Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
  - Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

If the cause is a strict-high priority queue consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the strict-high priority queue and prevent it from using all of the port bandwidth. To configure rate shaping, include the **shaping-rate (rate | percent percentage)** statement at the **[edit class-of-service schedulers scheduler-name]** hierarchy level and apply the shaping rate to the strict-high priority scheduler.

If several queues consume all of the port bandwidth, you can use a scheduler to rate shape those queues and prevent them from using all of the port bandwidth.

- For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.
- When you set the maximum bandwidth for a queue or for a priority group (**shaping-rate**) at 100 Kbps or lower, the traffic shaping behavior is accurate only within +/– 20 percent of the configured **shaping-rate**.
- Queues might not receive the egress bandwidth configured in the queue scheduler when a port's egress queues are congested. This can occur when the ingress port buffer fills above a certain threshold. If this happens, configure a drop profile for the queue

on the port that is receiving its configured bandwidth (this queue is preventing the other queues on the port from receiving their configured bandwidth). The drop profile applies a weighted random early detection (WRED) algorithm to the queue and prevents the queue from affecting the other queues on the port.

- On an ingress port, do not configure classifiers that map the same IEEE 802.1p code point to both a multdestination traffic flow and a lossless unicast traffic flow (such as the default lossless **fcoe** or **no-loss** forwarding classes). Any code point used for multdestination traffic on a port should not be used to classify unicast traffic into a lossless forwarding class on the same port. If a multdestination traffic flow and a lossless unicast traffic flow use the same code point on a port, the multdestination traffic is treated the same way as the lossless traffic. For example, if priority-based flow control (PFC) is applied to the lossless traffic, the multdestination traffic of the same code point is also paused. During periods of congestion, treating multdestination traffic the same as lossless unicast traffic can create head-of-line (HOL) blocking for the multdestination traffic and affect the multdestination traffic on all of the egress ports the multdestination traffic uses.

For example, the following configuration can cause HOL blocking for the multdestination flow:

1. For unicast traffic, IEEE 802.1p code point 011 is classified into the **fcoe** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 ucast-cl forwarding-class fcoe  
loss-priority low code-points 011
```

2. For multdestination traffic, IEEE 802.1p code point 011 is classified into the **mcast** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast  
loss-priority low code-points 011
```

3. The unicast classifier that maps traffic with code point 011 to the **fcoe** forwarding class is mapped to interface **xe-0/0/1**:

```
user@switch# set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast-cl
```

4. The multdestination classifier that maps traffic with code point 011 to the **mcast** forwarding class is mapped to all interfaces (multdestination traffic maps to all interfaces and cannot be mapped to individual interfaces):

```
user@switch# set class-of-service multi-destination classifiers ieee-802.1 mcast-cl
```

Because the same code point (011) maps unicast traffic to a lossless traffic flow and also maps multdestination traffic to a multdestination traffic flow, the multdestination traffic flow might experience HOL blocking during periods of congestion.

To avoid HOL blocking, do not map the code point used by the multdestination traffic to lossless unicast traffic. For example:

1. Instead of classifying code point **011** into the **fcoe** forwarding class, classify code point **011** into the **best-effort** forwarding class:

```
user@switch# set class-of-service classifiers ieee-802.1 ucast-cl forwarding-class  
best-effort loss-priority low code-points 011
```

2. user@switch# set class-of-service classifiers ieee-802.1 mcast-cl forwarding-class mcast  
loss-priority low code-points 011

3. user@switch# set class-of-service interfaces xe-0/0/1 unit 0 classifiers ieee-802.1 ucast-cl

4. user@switch# set class-of-service multi-destination classifiers ieee-802.1 mcast-cl

Because the code point **011** does not map unicast traffic to a lossless traffic flow, the multidestination traffic flow does not experience HOL blocking during periods of congestion.

The best practice is to classify unicast traffic with IEEE 802.1p code points that are also used for multidestination traffic into best-effort forwarding classes.

## Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows

Junos OS Release 12.3 supports six lossless forwarding classes; each forwarding class is mapped to an IEEE 802.1p code point (priority). Earlier Junos OS software releases supported two lossless forwarding classes, the *fcoe* and *no-loss* forwarding classes, which are mapped by default to IEEE 802.1p priorities 3 (code point 011) and 4 (code point 100), respectively. Junos OS Release 12.3 also introduces a new output stanza in the congestion notification profile (CNP) to configure priority-based flow control (PFC) on output queues.

The default configuration is the same as the default configuration in Junos OS Release 12.2 and is backward-compatible. If you need only two (or fewer) lossless forwarding classes, use the default configuration.

The increased support for lossless transport includes:

- Configuring up to six lossless forwarding classes
- Configuring PFC pause on output queues to program the output queues that can respond to PFC pause messages received from the connected peer. The priorities you pause on output queues must match the priorities on which you enable PFC on the corresponding ingress interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101), then you must also enable pause on priorities 3 and 5 on the corresponding ingress interfaces. Configuring flow control on the output queues and enabling PFC on the corresponding input queues allows you to pause up to six priorities (forwarding classes).
- Controlling the headroom buffer on Ethernet interfaces by configuring the maximum receive unit (MRU) size for the traffic mapped to an IEEE 802.1p priority (configured per priority) and the length of the attached cable (configured per interface). The MRU size can range up to full Jumbo packet size (9216 bytes).
- Remapping (rewriting) IEEE 802.1p priorities on native Fibre Channel (FC) interfaces when the system is acting as an FCoE-FC gateway. If the Ethernet (FCoE) network uses a different IEEE 802.1p priority than priority 3 (011) for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that different priority (see [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#)).

Lossless transport still requires configuring previously existing features, including enabling PFC on the lossless priorities on ingress interfaces, and configuring classifiers to classify incoming traffic into lossless forwarding classes based on the IEEE 802.1p priority tag of the packet.

**NOTE:** If you expect a large amount of lossless traffic on your network and configure multiple lossless traffic classes, ensure that you reserve enough scheduling resources (bandwidth) to support the lossless flows.

---

- [Configuring Lossless Priorities on page 4899](#)
- [Backward Compatibility with Junos OS Releases Earlier Than Release 12.3 on page 4909](#)
- [Configuration Rules and Recommendations on page 4910](#)

### Default Lossless Priority Configuration

If you do not explicitly configure lossless forwarding classes, the system uses the default forwarding class configuration. Forwarding classes are global on the QFX Series and are not configured per-interface, so any changes to forwarding classes apply to all interfaces on the device.

If you do not explicitly configure classifiers and flow control to pause output queues (configured in the output stanza of the CNP), the default classifier and the default output queue pause configuration are applied to all interfaces on the QFX Series. You can override the default classifier and the default output queue pause configuration on a per-interface basis by applying an explicit configuration to an interface. The default configuration is used on all interfaces that do not have an explicit configuration.

**NOTE:** If you do not configure flow control on output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause.

In the default configuration, only queue 3 and queue 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza.

The default configuration is the same as the default configuration in earlier software releases, and has the same lossless behavior:

- There are two lossless forwarding classes (the no-loss packet drop attribute is applied automatically):  
fcoe—Mapped to output queue 3  
no-loss—Mapped to output queue 4
- A classifier maps the fcoe forwarding class to IEEE 802.1p priority 3 (011) and the no-loss forwarding class to IEEE 802.1p priority 4 (100)
- Flow control (PFC) is enabled on Ethernet interface output queues 3 and 4 when those queues carry lossless traffic (traffic mapped to the fcoe and no-loss forwarding classes, respectively). In Junos OS software releases earlier than Release 12.3, output queue flow control was not user-configurable.

Flow control is enabled on native FC interface (NP\_Port) output queue 3 (IEEE 802.1p priority 3) for FCoE/FC traffic

- PFC must be enabled explicitly on the lossless IEEE 802.1p priorities (code points) on ingress Ethernet interfaces; no default PFC configuration is applied at ingress interfaces. If you do not enable PFC on lossless priorities, those priorities might experience packet loss during periods of congestion.
- On Ethernet ports, PFC buffer calculations use the following default values to determine the headroom buffer size:  
Cable length—100 meters (approximately 328 feet)  
MRU for priority 3 traffic—2500 bytes  
MRU for priority 4 traffic—9216 bytes  
Maximum transmission unit (MTU)—1522 (or the configured MTU value for the interface)

**NOTE:** If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.

- DCBX is enabled on all interfaces in autonegotiation mode, and automatically exchanges FCoE application protocol type, length, and values (TLVs) on interfaces that carry FCoE traffic. If you explicitly configure DCBX protocol TLV exchange for any application, then you must explicitly configure every application for which you want DCBX to exchange TLVs, including FCoE.

The default CoS configuration is backward compatible with the *default* CoS configuration of previous software releases. If you explicitly configure lossless transport, ensure that the input and output queues corresponding to the lossless forwarding classes are explicitly configured for PFC pause.

**NOTE:** If you *explicitly* configured the lossless fcoe or no-loss forwarding classes before upgrading to Junos OS Release 12.3, those forwarding classes are *not* lossless after the upgrade to Release 12.3. To regain lossless behavior, you can delete the explicit configuration and use the default lossless forwarding classes, or you can use the no-loss packet drop attribute introduced in Junos OS Release 12.3 to configure the forwarding classes for lossless behavior.

Table 397 on page 4898 summarizes the default unicast forwarding classes and their mapping to output queues, IEEE 802.1p priorities, and drop attributes.

**Table 397: Mapping of Default Unicast Forwarding Class to Queue, IEEE 802.1p Priority, and Drop Attribute**

Forwarding Class Name	Output Queue	Priority	Drop Attribute
best-effort	0	0	drop
fcoe	3	3	no-loss

**Table 397: Mapping of Default Unicast Forwarding Class to Queue, IEEE 802.1p Priority, and Drop Attribute (*continued*)**

Forwarding Class Name	Output Queue	Priority	Drop Attribute
no-loss	4	4	no-loss
network-control	7	7	drop

There is one default multidestination forwarding class named *mcast* for multicast, broadcast, and destination lookup fail (DLF) traffic that is mapped to output queue 8 with a drop attribute of drop. (Incoming multidestination traffic on all IEEE 802.1p priorities is mapped to the *mcast* forwarding class by default.)

### Configuring Lossless Priorities

Configuring more than two lossless priorities (forwarding classes) or changing the default mapping of lossless forwarding classes to priorities and paused output queues requires explicit configuration. This includes configuring forwarding classes with the no-loss packet drop attribute, using a CNP to configure PFC on ingress interfaces and flow control (PFC) on egress interfaces, and configuring a classifier to map IEEE 802.1p priorities (code points) to the correct forwarding classes.

### Configuring Lossless Forwarding Classes (Packet Drop Attribute)

Junos OS Release 12.3 introduces the *no-loss* parameter for forwarding class configuration. (This is not the no-loss default forwarding class name. It is a packet drop attribute you can specify to configure any unicast forwarding class as a lossless forwarding class.)

You can configure up to six forwarding classes as lossless forwarding classes by including the **no-loss** drop attribute at the **[edit class-of-service forwarding-classes class forwarding-class-name queue-num queue-number]** hierarchy level.

If you do not explicitly configure the *fcoe* or *no-loss* forwarding classes, they include the no-loss drop attribute by default. If you explicitly configure the *fcoe* or *no-loss* forwarding classes and you want to retain their lossless behavior, you must include the no-loss drop attribute in the configuration.

**NOTE:** All forwarding classes mapped to the same output queue must have the same packet drop attribute. (All forwarding classes mapped to the same output queue must be either lossy or lossless. You cannot map a lossy and a lossless forwarding class to the same queue.)

To avoid fate sharing (different flows receiving the same CoS treatment), use a one-to-one mapping of lossless forwarding classes to IEEE 802.1p code points (priorities) and queues. (Each forwarding class should be mapped to a different queue and classified into a different priority.) The classifier attached to the interface determines the forwarding class to priority mapping.

The fcoe and no-loss forwarding classes are special cases because in the default configuration, they are configured for lossless behavior (providing that you also enable PFC on the priorities mapped to the fcoe and no-loss forwarding classes in the CNP input stanza).

[Table 398 on page 4900](#) provides a summary of the possible configurations of the fcoe and no-loss forwarding classes in Junos OS Release 12.3, and the result of those configurations in terms of lossless traffic behavior. It is assumed that PFC, DCBX, and classifiers are properly configured.

**Table 398: FCoE and No-Loss Forwarding Class Configuration in Junos OS Release 12.3**

Explicit or Default Forwarding Class Configuration	Packet Drop Attribute	Result and Notes
Default	Default	<p>The fcoe and no-loss forwarding classes are lossless.</p> <p><b>NOTE:</b> Even if you explicitly configure other forwarding classes (lossy or other lossless forwarding classes), the fcoe and no-loss forwarding classes are lossless because they are not explicitly configured.</p>
Explicit	Not specified in the explicit forwarding class configuration	The fcoe and no-loss forwarding classes are lossy because they do not include the no-loss drop attribute.
Explicit	No-loss	The fcoe and no-loss forwarding classes are lossless.

**Table 398: FCoE and No-Loss Forwarding Class Configuration in Junos OS Release 12.3 (*continued*)**

Explicit or Default Forwarding Class Configuration	Packet Drop Attribute	Result and Notes
Explicit, configured in Junos OS Release 12.2 or earlier	Not specified (packet drop attribute was not available before Junos OS Release 12.3)	<p>The fcoe and no-loss forwarding classes are lossy in Junos OS Release 12.3 because they do not include the no-loss drop attribute.</p> <p><b>NOTE:</b> To retain lossless behavior, delete the explicit configuration so that the system uses the default configuration before you upgrade to Junos OS Release 12.3, or configure the forwarding classes with the no-loss packet drop attribute after upgrading to Junos OS Release 12.3.</p>

For all other forwarding classes, you must explicitly configure lossless transport because the default configuration for all other forwarding classes is lossy.

#### ***Congestion Notification Profiles***

Use CNPs to configure lossless characteristics on input and output interfaces. Input CNPs enable PFC on specified IEEE 802.1p priorities (code points) and fine-tune headroom buffer settings on ingress interfaces. Output CNPs enable PFC on output queues for specified IEEE 802.1p priorities so that the queues can respond to PFC pause messages from the connected peer.

To achieve lossless transport, the priority paused at the ingress interfaces must match the priority paused at the egress interfaces for a given traffic flow. For example, if you configure ingress interfaces to pause traffic tagged with IEEE 802.1p priority 5 (code point 101) and priority 5 traffic is mapped to output queue 5, then you must also configure the corresponding output interfaces to pause priority 5 on queue 5. In addition, the forwarding class mapped to queue 5 must be configured as a lossless forwarding class (using the no-loss drop attribute).

#### ***Configuring Input Interface Flow Control (PFC and Headroom Buffer Calculation)***

On ingress Ethernet interfaces, input CNPs enable PFC on specified priorities. Input CNPs also fine-tune the headroom buffers used for PFC support if you do not want to use the default configuration.

Headroom buffers support lossless transport by storing the traffic that arrives at an interface after the interface sends a PFC flow control message to pause incoming traffic. Until the connected peer receives the flow control message and pauses traffic, the interface continues to receive traffic and must buffer it to prevent packet loss.

The system uses the MRU and the length of the attached physical cable to calculate buffer headroom allocation. The default configuration values are:

- MRU for priority 3 traffic—2500 bytes

- MRU for priority 4 traffic—9216 bytes
- Cable length—100 meters (approximately 328 feet)

**NOTE:** If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.

You can fine-tune the MRU and the cable length to adjust the size of the headroom buffer on an interface. The QFX Series has a shared global buffer pool and dynamically allocates headroom buffer space to lossless queues as needed.

A lower MRU or a shorter cable length reduces the amount of headroom buffer required on an interface and leaves more headroom buffer space for other interfaces. A higher MRU or a longer cable length increases the amount of headroom buffer space required on an interface and leaves less headroom buffer space for other interfaces.

In many cases, you can better utilize the headroom buffers by reducing the MRU value (for example, an MRU of 2180 is sufficient for most FCoE networks) and by reducing the cable length value if the physical cable is less than 100 meters long.

**NOTE:** When you configure the headroom buffers and commit the configuration, the system performs a commit check and rejects the configuration if sufficient headroom buffer space is not available.

However the system does not perform a commit check but instead returns a syslog error if:

- The buffers are configured on a LAG interface
- The default classifier is used on the interface (instead of a user-configured classifier)
- The interface has not been created

---

### ***Configuring Output Interface Flow Control (PFC)***

On Ethernet interfaces, you can use an output CNP to configure flow control on unicast output queues and enable PFC pause response on specified IEEE 802.1p priorities. By default, output queues 3 and 4 are enabled for PFC pause on priorities 3 (IEEE 802.1p code point 011) and 4 (IEEE 802.1p code point 100) to support the default lossless forwarding class configuration, which maps the fcoe forwarding class to queue 3 and priority 3, and maps the no-loss forwarding class to queue 4 and priority 4.

Configuring flow control on output queues enables you to pause any priority on any unicast output queue on any interface. This enables you to use more than two output queues to support lossless traffic flows (you can configure up to six lossless forwarding classes and map them to different output queues that are enabled for PFC pause).

Output queue flow control also enables you to support multiple lossless forwarding classes (each mapped to a different priority and output queue) for one class of traffic.

For example, if the converged Ethernet network uses two different priorities for FCoE traffic (for example, priority 3 and priority 5), then you can classify those priorities into different lossless forwarding classes that are mapped to different output queues by:

1. Configuring two lossless forwarding classes for FCoE traffic, with each forwarding class mapped to a different output queue. For example, you could use the default `fcoe` forwarding class, which is mapped to queue 3, and you could configure a second lossless forwarding class called `fcoe1` and map it to queue 5. The `fcoe` forwarding class is for priority 3 FCoE traffic (code point 011) and the `fcoe1` forwarding class is for priority 5 (code point 101) FCoE traffic.
2. Configuring a classifier that maps each forwarding class to the desired IEEE 802.1p code point (priority). If FCoE traffic on both priorities uses one interface, the classifier must classify both forwarding classes to the correct priorities. If FCoE traffic of different priorities uses different interfaces, the classifier configuration on each interface must map the correct priority to the corresponding lossless forwarding class.
3. Applying the classifier to the interfaces that carry FCoE traffic. The classifier determines the mapping of forwarding classes to priorities on each interface.

To configure lossless transport for these forwarding classes, you also need to:

- In the CNP input stanza, enable PFC on the two priorities at the ingress interfaces.
- In the CNP output stanza, configure flow control (PFC) on the output queues and priorities for the forwarding classes so that the interface can respond to pause messages received from the connected peer.
- Configure DCBX to exchange application protocol TLVs on both FCoE priorities.

**NOTE:** If you do not configure flow control to pause output queues, the default configuration uses a one-to-one mapping of IEEE 802.1p code points (priorities) to output queues by number. For example, priority 0 (code point 000) is mapped to queue 0, priority 1 (code point 001) is mapped to queue 1, and so on. By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer, and you must explicitly enable PFC on the corresponding priorities in the CNP input stanza to achieve lossless behavior.

If you do not use the default configuration, you must explicitly configure flow control on each output queue that you want to enable for PFC pause. For example, if you explicitly configure flow control on output queue 5, the default configuration is no longer valid and only output queue 5 is enabled for PFC pause. Output queues 3 and 4 are no longer enabled for PFC pause, so traffic using those queues no longer responds to PFC pause messages even if the corresponding forwarding class is configured with the no-loss drop attribute. To retain the pause configuration on output queues 3 and 4 and configure flow control on queue 5, you need to explicitly configure flow control on queues 3, 4, and 5.

You cannot configure flow control to pause a multidestination output queue. You can configure flow control to pause only unicast output queues.

### ***Configuring DCBX (Application Protocol TLV Exchange)***

DCBX exchanges the protocol TLVs for applications that require lossless transport with the connected peer interface. By default, DCBX advertises FCoE application protocol TLVs on all interfaces that are enabled for DCBX, and by default, DCBX is enabled on all interfaces. DCBX advertises no other applications by default.

For each application (for example, iSCSI) that you want to configure for lossless transport, you must enable the interfaces which carry that application traffic to exchange DCBX protocol TLVs with the connected peer. The TLV exchange allows the peer interfaces to negotiate a compatible configuration to support the application.

If you configure DCBX to advertise any application, the default DCBX advertisement is overridden, and DCBX advertises only the configured applications. If you want an interface to advertise only the FCoE application, you do not have to configure DCBX application protocol TLV exchange; instead, you can use the default configuration.

If you want DCBX to advertise other applications, you must explicitly configure an application map and apply it to the interfaces on which you want to exchange protocol TLVs for those applications. If you want to exchange FCoE application protocol TLVs in addition to other application protocol TLVs, you must also explicitly configure the FCoE application in the application map. [“Understanding DCBX Application Protocol TLV Exchange” on page 4472](#) describes how application mapping works.

**NOTE:** Lossless transport also requires that you enable PFC on the correct priority (IEEE 802.1p code point) on the ingress interfaces using an input CNP. If the priority you pause at the ingress interfaces is not mapped to queue 3 or queue 4 (the two output queues that are enabled for PFC pause flow control by default), then you must also enable the output queues that correspond to paused input priorities to pause using an output CNP.

### *Fate Sharing Among Traffic Classes*

You can configure different lossless (or lossy) traffic flows to share fate—that is, to receive the same CoS treatment.

Fate sharing is not desirable for IO/convergence. Instead of independent control of the fate of each flow, different types of flows receive the same treatment. Fate sharing is particularly undesirable for lossless flows, because if one flow experiences congestion and must be paused, that congestion can affect the other flow and cause head-of-line blocking even if the other flow is not experiencing congestion. If your network requires that all 802.1p priorities are lossless, you can achieve that by allowing some fate sharing among the 8 priorities by spreading them across up to 6 lossless forwarding classes.

If the number of lossless priorities is less than or equal to the number of configured lossless forwarding classes, then you can avoid fate sharing by configuring a one-to-one mapping of forwarding classes to IEEE 802.1p code points and output queues. (Each forwarding class should be mapped to a different output queue and classified to a different priority.)

If you want to configure different traffic flows to share fate, the QFX Series supports two fate-sharing configurations: mapping one forwarding class to more than one IEEE 802.1p code point (priority), and mapping two forwarding classes to the same output queue:

1. If you map one lossless forwarding class to more than one priority, the traffic tagged with each of the priorities uses the same forwarding class and the CoS properties associated with that forwarding class. For example, configuring a forwarding class called `fc1`, mapping it to queue 1, and mapping it to code points 101 and 110 using a classifier named `classify1` results in the traffic tagged with priorities 101 and 110 sharing fate:

```
user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 101
user@switch# set class-of-service classifiers ieee-802.1 classify1 forwarding class fc1
loss-priority low code-points 110
```

In this case, if the traffic mapped to either priority experiences congestion, both priorities are paused because they are mapped to the same forwarding class and are therefore treated similarly.

2. If you map multiple lossless forwarding classes to the same output queue, the traffic mapped to the forwarding classes uses the same output queue. This increases the amount of traffic the queue needs to buffer and forward, and can create congestion that affects all of the traffic flows that are mapped to the queue. For example,

configuring two forwarding classes called fc1 and fc2, mapping both forwarding classes to queue 1, and mapping the forwarding classes to code points 101 and 110 (respectively) using a classifier named classify1 results in the traffic tagged with priorities 101 and 110 sharing fate on the same output queue:

```
user@switch# set class-of-service forwarding-classes class fc1 queue-num 1 no-loss
user@switch# set class-of-service forwarding-classes class fc2 queue-num 1 no-loss
user@switch# set class-of-service classifiers ieee-802.1p classify1 forwarding class fc1
loss-priority low code-points 101
user@switch# set class-of-service classifiers ieee-802.1p classify1 forwarding class fc2
loss-priority low code-points 110
```

in this case, even though the two forwarding classes use different IEEE 802.1p priorities, if one forwarding class experiences congestion, it affects the other forwarding class. This is because if the output queue is paused because of congestion on either forwarding class, all traffic that uses that queue is paused. Since both forwarding classes are mapped to the queue, the traffic mapped to both forwarding classes is paused.

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

---

### ***Transit Switch Configuration Versus FCoE-FC Gateway Configuration***

On a transit switch (all Ethernet ports) that forwards FCoE traffic (and potentially other traffic that requires lossless transport across the Ethernet network), the configuration of classifiers, lossless forwarding classes, DCBX, and PFC on ingress and egress interfaces to support lossless transport is as described in this document.

When the QFX Series acts as an FCoE-FC gateway, the system uses native FC interfaces to connect to the FC switch (or FCoE forwarder) at the FC network edge. You cannot apply CNPs to native FC interfaces, only to Ethernet interfaces.

The Ethernet interface configuration of classifiers, DCBX, and PFC on an FCoE-FC gateway is the same as the Ethernet interface configuration on a transit switch. The configuration of lossless forwarding classes is also the same.

However, supporting lossless transport on native FC interfaces requires that you rewrite the IEEE 802.1p priority value if your network uses any priority other than 3 (IEEE code point 011) for FCoE traffic. If your network uses priority 3 for FCoE traffic, you can and should use the default configuration on FC interfaces.

By default, native FC interfaces tag packets with priority 3 when they encapsulate the incoming FC packets in Ethernet. If your FCoE network uses a different priority than 3 for FCoE traffic, you need to rewrite the priority value to the value your network uses on the FC interface, classify the FCoE traffic to the correct priority on the Ethernet interfaces, and enable pause on the correct priority on the Ethernet interfaces, as described in [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#).

### Configuration Results and Commit Checks

Different configurations of forwarding classes and their drop attributes, classifiers, CNPs (flow control), and Ethernet PAUSE (IEEE 802.3X flow control) result in different system behaviors.

[Table 399 on page 4907](#) describes the results of the possible lossless transport configurations in each case. The assumption in the *Result* column is that the system's buffer headroom calculation resulted in a successful configuration.

However, if the system calculates that there is insufficient buffer space to support the configuration, a commit check prevents you from committing the configuration on an individual Ethernet interface. For LAG interfaces, the system does not issue a commit check error but instead issues a syslog message. After you configure lossless transport for a LAG interface, be sure to check the syslog messages to confirm that the commit was successful.

**Table 399: Results of Lossless Priority Configuration**

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
None (default classifier)	None	None	System default configuration. You must configure a CNP to enable PFC on the fcoe and no-loss forwarding class IEEE 802.1p code points (011 and 100 respectively) to achieve lossless behavior.
Classifier with no lossless forwarding classes	None	None	No lossless traffic flows are configured; all traffic is best effort.
Classifier with at least one lossless forwarding class	None	None	Because there is no CNP attached to interfaces, PFC is not enabled on the code point of the lossless traffic and no headroom buffer is allocated to the lossless queue, so packets can drop during periods of congestion. This configuration does not achieve lossless behavior.
None (default classifier)	PFC enabled on the fcoe and no-loss forwarding class code points (priorities)	None	The default classifier classifies traffic into two lossless forwarding classes, fcoe and no-loss. The CNP enables PFC on both lossless forwarding classes, resulting in lossless behavior for traffic mapped to the fcoe and no-loss forwarding classes.

Table 399: Results of Lossless Priority Configuration (*continued*)

Classifier Configuration	Congestion Notification Profile Configuration	Ethernet PAUSE (IEEE 802.3X) Configuration	Result
None (default classifier)	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length. The system does not calculate buffer headroom for individual priorities (output queues). Because Ethernet PAUSE is enabled on the link instead of PFC being enabled on the lossless priorities, the entire link is paused during periods of congestion. This configuration results in lossless behavior for all of the forwarding classes on the link, but because all traffic is paused, this can cause greater overall network congestion.
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	None	Headroom buffer allocated only to priorities that are mapped to the lossless forwarding classes and on which PFC is enabled. This configuration achieves lossless behavior for the lossless forwarding classes.
Classifier with no lossless forwarding classes	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	None	Flow control enabled	The system calculates buffer headroom for the physical link based on the interface MTU and the default cable length, and it pauses all traffic on the link during periods of congestion.
Classifier with at least one lossless forwarding class	PFC enabled on the lossless forwarding class code points (priorities)	Flow control enabled on a different interface than the interface with the CNP	The system checks the available buffer space for both the PFC-enabled priorities and for the other link. If sufficient buffer space is available, the lossless forwarding classes configured with PFC on one interface and also all of the traffic on the link with Ethernet PAUSE enabled achieve lossless behavior.

**NOTE:** If you attempt to configure both PFC and Ethernet PAUSE on a link, the system returns a commit error. PFC and Ethernet PAUSE are mutually exclusive configurations on an interface.

### Backward Compatibility with Junos OS Releases Earlier Than Release 12.3

The addition of the **no-loss** packet drop attribute to forwarding class configuration means that when you upgrade from an earlier release to Junos OS Release 12.3, the new software might not preserve the lossless forwarding class configuration of the fcoe and no-loss forwarding classes.

If you used the default forwarding class configuration for the fcoe and no-loss forwarding classes, the CoS configuration is backward compatible. You do not have to do anything to preserve the lossless behavior of traffic that uses those forwarding classes when you upgrade to Junos OS Release 12.3. (This is because the default configuration of these two forwarding classes includes the no-loss packet drop attribute.)

However, if you explicitly configured the fcoe or the no-loss forwarding class by including the **set forwarding-classes class forwarding-class-name queue-num queue-number** at the **[edit class-of-service]** hierarchy level, then those forwarding classes are no longer lossless, they are lossy. In Junos OS Release 12.3 and later, you must include the **no-loss** packet drop attribute in any explicit forwarding class configuration to configure a lossless forwarding class.

For example, before Junos OS Release 12.3, the following explicit configuration resulted in a lossless forwarding class:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3
```

However, in Junos OS Release 12.3, this configuration is lossy because it does not include the no-loss packet drop attribute. To preserve lossless behavior, after upgrading to Junos OS Release 12.3, you need to add the no-loss drop attribute:

```
user@switch# set class-of-service forwarding-classes class fcoe queue-num 3 no-loss
```

Alternatively, you can delete the explicit configuration before you upgrade to Junos OS Release 12.3 so that the system uses the default forwarding class, which is lossless:

```
user@switch# delete class-of-service forwarding-classes class fcoe queue-num 3
```

**NOTE:** The explicit configuration of other forwarding classes does not affect the lossless (or lossy) state of the fcoe and no-loss forwarding classes, because only the fcoe and no-loss forwarding classes are lossless forwarding classes before Junos OS Release 12.3. For example, if you explicitly configured the best-effort forwarding class but you used the default fcoe and no-loss forwarding classes in Junos OS Release 12.2, then when you upgrade to Junos OS Release 12.3, the fcoe and no-loss forwarding classes are still lossless (and the best-effort forwarding classes retains its explicit configuration).

**NOTE:** To achieve lossless behavior for the traffic belonging to any forwarding class, you must also enable PFC on the IEEE 802.1p priority mapped to the forwarding class and ensure that DCBX exchanges the protocol TLVs for the application with the connected peer.

### Configuration Rules and Recommendations

---

Keep in mind the following configuration rules and recommendations when you configure the system to handle lossless traffic flows:

- You can configure a maximum of six lossless forwarding classes (forwarding classes with the no-loss packet drop attribute).
- All forwarding classes that you map to the same queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).
- You cannot configure flow control to pause a multidestination output queue. You can configure flow control only to pause unicast output queues.
- Forwarding classes mapped to multidestination queues (queues 8 through 11) cannot have the no-loss packet drop attribute. (Multidestination forwarding classes cannot be configured as lossless forwarding classes.)
- Do not configure weighted random early detection (WRED) on lossless forwarding classes. (Do not associate a drop profile with a forwarding class that has the no-loss packet drop attribute.)

## Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

When the QFX Series acts as an FCoE-FC gateway, it connects an Ethernet network that carries Fibre Channel over Ethernet (FCoE) traffic to a Fibre Channel (FC) network. Ethernet interfaces connect to the FCoE network. Native FC interfaces (NP\_Ports) connect to the FC network.

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). The QFX Series default configuration maps priority 3 traffic to the FCoE forwarding class. If your FCoE network uses priority 3 for FCoE traffic, you do not need to remap priorities, because the default configuration maps priority 3 to the FCoE forwarding class. (But you do need to enable PFC on IEEE 802.1p code point 3 on the Ethernet interfaces to achieve lossless behavior.)

However, if the FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority (and classified to that priority on the FCoE Ethernet interfaces in the ingress classifier). You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP\_Port) interface. All traffic received from the FC SAN on that NP\_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

- [Priority Remapping Configuration on page 4911](#)
- [Configuration Rules on page 4912](#)
- [Fate Sharing on page 4913](#)

### Priority Remapping Configuration

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority. (This is similar to the rewrite rules you can configure to remap forwarding classes to code points on Ethernet egress interfaces, but the rewrite takes place at the ingress FC interface so that the QFX Series uses the correct priority for FCoE traffic on the converged Ethernet network.)

To support lossless traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE

network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default *fcoe* forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet ingress interfaces

The ingress and egress configurations must match to achieve lossless behavior. The priority and the forwarding class specified in the BA classifier and in the CNP on the Ethernet ingress interfaces must match the fixed classifier and rewrite value on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

For example, if you configure a lossless forwarding class named *my\_fcoe\_fc* and your Ethernet network uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic, then:

- The forwarding class configuration, the BA classifier, and the fixed classifier all specify *my\_fcoe\_fc* as the forwarding class
- The BA classifier, the input CNP, and the rewrite value all specify the IEEE 802.1p code point 101

### Configuration Rules

---

The following configuration rules apply when you remap priorities on an FCoE-FC gateway:

- Each native FC interface (NP\_Port) supports one IEEE 802.1p priority value. The interface rewrites the IEEE 802.1p code point of all incoming traffic on the interface to the rewrite value. (The FC interface uses either the default value of 3 or the rewrite value for all incoming traffic.)
- Ports in the same FCoE-FC gateway local fc-fabric must use the same rewrite value. For example, if ports fc-0/0/0 and fc-0/0/1 are in the same local FCoE-FC gateway fabric, they must use the same rewrite value. If you attempt to commit a configuration that uses different IEEE 802.1p priority rewrite values, the system returns a commit error.
- Ports in different FCoE-FC gateway local fc-fabrics can use different rewrite values. An example scenario is:

- Interfaces fc-0/0/0 and fc-0/0/1 are in FCoE-FC gateway fc-fabric *my\_fc\_fab1*.
- Interfaces fc-0/0/4 and fc-0/0/5 are in FCoE-FC gateway fc-fabric *my\_fc\_fab2*.

In this scenario, interfaces fc-0/0/0 and fc-0/0/1 must use the same rewrite value because they belong to the same local FC fabric on the gateway. Interfaces fc-0/0/4 and fc-0/0/5 also must use the same rewrite value because they belong to the same local FC fabric. However, the rewrite value you use for interfaces fc-0/0/0 and fc-0/0/1 can be different than the rewrite value you use for interfaces fc-0/0/4 and fc-0/0/5 because the interfaces belong to different local FC fabrics.

- You can apply the rewrite value only to native FC interfaces; you cannot apply the rewrite value configuration to Ethernet interfaces.
- The forwarding class specified in the fixed classifier on the native FC interface must be a lossless forwarding class. You cannot apply a fixed classifier to a native FC interface unless the associated forwarding class is lossless. (The forwarding class must be one of the two default lossless forwarding classes, or you must explicitly configure the forwarding class with the *no-loss* drop attribute.)
- The lossless forwarding class and IEEE 802.1p priority configuration must match on the FCoE-FC gateway native FC interfaces and Ethernet interfaces:
  - The same IEEE 802.1p priority (code point) must be paused on the Ethernet ingress interfaces, classified to the lossless forwarding class used in the native FC interface fixed classifier, and set as the rewrite value on the native FC interfaces.
  - The same lossless forwarding class must be used in the fixed classifier on the native FC interfaces and in the classifier configuration on the Ethernet interfaces.

### Fate Sharing

To ensure that congestion on one interface does not affect the fate of traffic on a native FC interface on which you remap priorities, avoid fate sharing (different traffic flows receiving the same CoS treatment) configurations.

You can avoid fate sharing by ensuring that the remapping priority (code point) on the native FC interface is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class *myfcoe1* and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class *myfcoe1*. If you classify priority 6 on another interface to forwarding class *myfcoe1*, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

## Understanding CoS Buffer Configuration

The QFX3500 switch has 9 MB of packet forwarding engine (PFE) wide common packet buffer memory that is used to store packets as the packets traverse the switch. The buffer memory has separate ingress and egress accounting to make accept, drop, or pause decisions. Because the switch has a single pool of memory with separate ingress and egress accounting, the full amount of buffer memory is available from both ingress and egress perspective. Packets are accounted for as they enter and leave the switch, but there is no concept of a packet arriving at an ingress buffer and then being moved to an egress buffer.

The buffers are divided into two pools from both an ingress and an egress perspective:

1. *Shared buffers* are a global memory pool that the switch allocates dynamically to ports as needed, so the buffers are shared among the switch ports. The global buffer is further partitioned into buffers for best-effort unicast and multdestination (broadcast, multicast, and destination lookup fail), and PFC (lossless) traffic types.
2. *Dedicated buffers* are a memory pool divided equally among the switch ports. Each port receives a minimum guaranteed amount of buffer space, dedicated to each port, not shared among ports. You can divide the dedicated buffer allocation for a port among the port queues on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic.)

The switch reserves nonconfigurable buffer space to ensure that ports and queues receive a minimum allocation. You can configure how the system uses the rest of the buffer space to optimize the allocation for your mix of network traffic. You can configure the percentage of available buffer space used as shared buffer space versus dedicated buffer space. You can also configure how shared buffer space is allocated to different types of traffic. You can optimize the buffer settings for the traffic on your network.

The default buffer configuration is designed for networks that have a balance of best-effort and lossless traffic.

**NOTE:** Lossless traffic is traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link enabled for Ethernet PAUSE (IEEE 802.3x).

---

The default class-of-service configuration provides two lossless queues (**fcoe** and **no-loss**), a best-effort unicast queue, a network control traffic queue, and one multdestination—multicast, broadcast, and destination lookup fail—queue. The default configuration allocates the buffers in a manner that supports a moderate amount of lossless traffic while still providing the ability to absorb bursts in best-effort traffic transmission.

Changing the buffer settings changes the abilities of the buffers to absorb traffic bursts and handle lossless traffic. For example, networks with mostly best-effort traffic require allocating most of the shared buffer space to best-effort buffers. This provides deep,

flexible buffers that can absorb traffic bursts with minimal packet loss, at the expense of buffer availability for lossless traffic.

Conversely, networks with mostly lossless traffic require allocating most of the shared buffer space to lossless headroom buffers. This prevents packet loss on lossless flows at the expense of absorbing bursty best-effort traffic efficiently.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

This topic describes the buffer architecture and settings:

- [Buffer Pools on page 4915](#)
- [Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios on page 4923](#)
- [Optimizing the Buffer Configuration on page 4926](#)

### Buffer Pools

Both from an ingress and an egress perspective, the 9 MB buffer is split into two main pools:

- **Shared buffer pool**—A global memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different buffer partitions to better support different mixes of network traffic. The larger the shared buffer pool, the better the switch can absorb traffic bursts because more shared memory is available for the traffic.
- **Dedicated buffer pool**—A reserved global memory space allocated equally to each port. The switch reserves a minimum dedicated buffer pool that is not user-configurable. On each egress port, you can configure the amount of the port dedicated buffer that is allocated to each of the port queues. A larger dedicated buffer pool means a larger amount of dedicated buffer space for each port, so congestion on one port is less likely to affect traffic on another port because the traffic does not need to use as much shared buffer space. However, the larger the dedicated buffer pool, the less bursty traffic the switch can handle because there is less dynamic shared buffer memory.

A portion of the total 9 MB of buffer space is reserved so that there is always a minimum amount of shared and dedicated buffer space available to each port. You can configure the way the rest of the buffer space is allocated to the global shared buffer pool and the dedicated shared buffer pool by configuring the ingress and egress shared buffer percentages. The buffer space that is not reserved is the available buffer space.

By default, 100 percent of the remaining available buffer space is allocated to the shared buffer pool. If you change the percentage, the available buffer space that is not allocated to the shared buffer is allocated to the dedicated buffer. For example, if you configure the ingress shared buffer pool as 80 percent, the remaining 20 percent of the available buffer space is allocated to the dedicated buffer pool and divided equally across the ports.

**NOTE:** If 100 percent of the available (user-configurable) buffers are allocated to the shared buffer pool, the switch still has a reserved minimum dedicated buffer pool that is necessary for proper operation.

You can separately configure ingress and egress shared buffer pool allocations. You can also partition the ingress and egress shared buffer pool to allocate percentages of the shared buffer pool to specific types of traffic. If you do not use the default configuration or one of the recommended configurations, pay particular attention to the ingress configuration of the lossless and lossless headroom buffers (to handle PFC pause during periods of congestion) and to the egress configuration of the best-effort buffers to handle incast congestion.

In addition to the shared buffer pool and the dedicated buffer pool, there is also a small ingress global headroom buffer pool that is reserved and is not configurable.

When contention for buffer space occurs, the switch uses an internal algorithm to ensure that the buffer pools are distributed fairly among competing flows. When traffic for a given flow exceeds the amount of dedicated buffer reserved for that flow, the flow begins to consume memory from the dynamic shared buffer pool. The flow is a competing flow because it competes with other flows that have exhausted their dedicated buffers for shared buffer memory. When there is no congestion, there are no competing flows.

- [Shared Buffer Pool on page 4916](#)
- [Dedicated Buffer Pool on page 4918](#)
- [Tradeoff Between Shared Buffer Space and Dedicated Buffer Space on page 4921](#)
- [Order of Buffer Consumption on page 4922](#)

#### ***Buffer Handling of Lossless Flows (PFC) Versus Ethernet PAUSE***

When we discuss lossless buffers in the following sections, we mean buffers that handle traffic on which you enable PFC to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x). The lossless ingress and egress shared buffers, and the ingress lossless headroom shared buffer, are used only for traffic on which you enable PFC.

**NOTE:** To support lossless flows, you must configure the appropriate data center bridging capabilities (PFC, DCBX, or ETS) and scheduling.

#### ***Shared Buffer Pool***

The shared buffer pool is a global memory space that all of the ports on the switch share dynamically as they need buffers. The switch uses the shared buffer pool to absorb traffic bursts after the dedicated buffer pool for a port is exhausted.

You can divide both the ingress shared buffer pool and the egress shared buffer pool into three partitions to allocate percentages of the buffer pool to different types of traffic. When you partition the ingress or egress shared buffer:

- If you explicitly configure one ingress shared buffer partition, you must explicitly configure all three ingress shared buffer partitions.
- The total percentages of the three ingress shared buffer partitions must total exactly 100 percent.
- If you explicitly configure one egress shared buffer partition, you must explicitly configure all three egress shared buffer partitions.
- The total percentages of the three egress shared buffer partitions must total exactly 100 percent.
- If you explicitly partition one set of shared buffers, you do not have to explicitly partition the other set of shared buffers. For example, you can explicitly configure ingress shared buffer partitions and use the default egress shared buffer partitions (no explicit egress shared buffer partition configuration). However, if you change the buffer partitions for the ingress buffer pool to match the expected types of traffic flows, you probably would also want to change the buffer partitions for the egress buffer pool to match those traffic flows.

The switch returns a commit error if you do not explicitly configure all three partitions when configuring the ingress or egress shared buffer partitions.

When you explicitly configure the shared buffer partitions, the switch returns a commit error if the total percentage of the three partitions does not equal 100 percent.

You can configure the percentage of available (user-configurable) buffer space allocated to the global ingress and egress shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available ingress and egress buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If PFC is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)

- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for best-effort buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and best-effort buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for best-effort buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

### ***Dedicated Buffer Pool***

The global dedicated buffer pool is memory that is allocated equally to each port, so each port receives a guaranteed minimum amount of buffer space. Dedicated buffers are not shared among ports. Each port receives an equal proportion of the total dedicated buffer pool. The amount of dedicated buffers per port is not user-configurable and depends on the total size of the dedicated buffer pool.

When traffic enters and exits the switch, the switch ports first use their dedicated buffer space to store packets. If the dedicated buffers are not sufficient to handle the traffic, the switch uses shared buffers. The only way to increase the dedicated buffer pool is to decrease the shared buffer pool from its default value of 100 percent of available buffers.

**NOTE:** If 100 percent of the available (user-configurable) buffers are allocated to the shared buffer pool, the switch still has a reserved minimum dedicated buffer pool.

---

A smaller dedicated buffer pool means a larger shared buffer pool, and better burst absorption across the ports. A larger dedicated buffer pool means a larger amount of dedicated buffer space for each port, so congestion on one port is less likely to affect traffic on another port because the traffic does not need to use as much shared buffer space.

You can divide the dedicated buffer allocation for an egress port among the port queues by including the **buffer-size** statement in the scheduler configuration. This enables you to control the egress dedicated buffer allocation on a per-port, per-queue basis. (For example, this enables you to dedicate more buffer space to queues that transport lossless traffic, or to stop the port from reserving buffers for queues that do not carry traffic.) Egress dedicated buffer allocation is a hierarchical structure that allocates a global dedicated buffer pool evenly among ports, and then divides the allocation for each port among the port queues.

By default, ports divide their allocation of dedicated buffers among the egress queues in the same proportion as the default scheduler sets the minimum guaranteed transmission rates (**transmit-rate**) for traffic. Only the queues included in the default scheduler receive bandwidth and dedicated buffers, in the proportions shown in [Table 400 on page 4919](#):

**Table 400: Default Dedicated Buffer Allocation to Egress Queues (Based on Default Scheduler)**

Forwarding Class	Queue	Minimum Guaranteed Bandwidth	Proportion of Reserved Dedicated Buffers
best-effort	0	5%	5%
fcoe	3	35%	35%
no-loss	4	35%	35%
network-control	7	5%	5%
mcast	8	20%	20%

In the default configuration, no other egress queues than the ones shown in [Table 400 on page 4919](#) receive an allocation of dedicated port buffers.

**NOTE:** The switch uses hierarchical scheduling to control port and queue bandwidth allocation, as described in “[Understanding CoS Hierarchical Port Scheduling \(ETS\)](#)” on page 4872 and shown in “[Example: Configuring CoS Hierarchical Port Scheduling \(ETS\)](#)” on page 4962. For egress queue buffer size configuration, when you associate a traffic control profile (includes the queue scheduler information) with a port, the dedicated egress buffers on the port are divided among the queues as configured in the scheduler.

If you do not want to use the default allocation of dedicated port buffers to queues, you can configure the dedicated buffer allocation for each egress queue on a particular port. Configure the dedicated buffer allocation to a queue in the scheduler that is mapped to the egress queue by using the **buffer-size** option. You can configure the dedicated buffer allocation to queues in two ways:

- As a percentage—The queue receives the specified percentage of dedicated port buffers when the queue is mapped to the scheduler and the scheduler is mapped to a port.
- As a remainder—After the port services the queues that have an explicit percentage buffer size configuration, the remaining port dedicated buffer space is divided equally among the other queues to which a scheduler is attached. (No default or explicit scheduler means no dedicated buffer allocation for the queue.) If you configure a scheduler and you do not specify a buffer size as a percentage, *remainder* is the default setting.

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

In a port configuration that includes multiple forwarding class sets, with multiple forwarding classes mapped to multiple schedulers, the allocation of port dedicated buffers to queues depends on the mix of queues with buffer sizes configured as explicit percentages and queues configured with (or defaulted to) the **remainder** option.

The best way to demonstrate how using the percentage and remainder options affects port buffer allocation to queues is by showing an example of queue buffer allocation, and then showing how the queue buffer allocation changes when you add another forwarding class (queue) to the port.

Table 401 on page 4920 shows an initial configuration that includes four forwarding class sets, the five default forwarding classes (mapped to the five default queues for those forwarding classes), the **buffer-size** option configuration, and the resulting buffer allocation for each queue. Table 402 on page 4921 shows the same configuration after we add another forwarding class (queue) to the best-effort forwarding class set. Comparing the buffer allocations in each table shows you how adding another queue affects buffer allocation when you use remainders and explicit percentages to configure the buffer allocation for different queues.

**Table 401: Example 1: Egress Queue Dedicated Buffer Allocation**

Forwarding Class Set (Priority Group)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	15%
fc-set-mcast	mcast	8	remainder	15%

In this first example, 70 percent of the egress port dedicated buffer pool is explicitly allocated to the best-effort, fcoe, and no-loss queues. The remaining 30 percent of the port dedicated buffer pool is split between the two queues that use the **remainder** option (network-control and mcast), so each queue receives 15 percent of the dedicated buffer pool.

Now we add another forwarding class (queue) to the best-effort priority group (fc-set-be) and configure it with a buffer size of remainder instead of configuring a specific percentage. Because a third queue now shares the remaining dedicated buffers, the queues that share the remainder receive fewer dedicated buffers, as shown in [Table 402 on page 4921](#). The queues with explicitly configured percentages receive the configured percentage of dedicated buffers.

**Table 402: Example 2: Egress Queue Dedicated Buffer Allocation with Another Remainder Queue**

Priority Group (fc-set)	Forwarding Class	Queue	Scheduler Buffer Size Configuration	Buffer Allocation per Queue (Percentage)
fc-set-be	best-effort	0	10%	10%
	best-effort-2	1	remainder	10%
fc-set-lossless	fcoe	3	20%	20%
	no-loss	4	40%	40%
fc-set-strict-high	network-control	7	remainder	10%
fc-set-mcast	mcast	8	remainder	10%

The two tables show how the port divides the dedicated buffer space that remains after servicing the queues that have an explicitly configured percentage of dedicated buffer space.

#### ***Tradeoff Between Shared Buffer Space and Dedicated Buffer Space***

The tradeoff between shared buffer space and dedicated buffer space is:

- Shared buffers provide better absorption of traffic bursts because there is a larger pool of dynamic buffers that ports can use as needed to handle traffic bursts. However, all flows that exhaust their dedicated buffer space compete for the shared buffer pool. A larger shared buffer pool means a smaller dedicated buffer pool, and therefore more competition for the shared buffer pool because more flows exhaust their dedicated buffer allocation.
- Dedicated buffers provide guaranteed buffer space to each port. The larger the dedicated buffer pool, the less likely that congestion on one port affects traffic on another port, because the traffic does not need to use as much shared buffer space. However, less shared buffer space means less ability to dynamically absorb traffic bursts.

When there is too much shared buffer space and too little dedicated buffer space, the result can be too much competition for the shared buffers because the flows exhaust their dedicated buffers too quickly. To maintain fairness, no single flow receives very much shared buffer space.

When there is too much dedicated buffer space and too little shared buffer space, there is less competition for the shared buffer pool because the dedicated buffer space is enough to service most flows. However, a smaller shared buffer pool leaves fewer buffers available to absorb traffic bursts.

For optimal burst absorption, the switch needs enough dedicated buffer space to avoid persistent competition for the shared buffer space. When fewer flows compete for the shared buffers, the flows that need shared buffer space to absorb bursts receive more of the shared buffer because fewer flows exhaust their dedicated buffer space.

The default configuration and all of the recommended configurations allocate 100 percent of the user-configurable memory space to the global shared buffer pool because the amount of nonconfigurable buffer space reserved for dedicated buffers provides enough dedicated buffers to avoid persistent competition for dynamic shared buffers. This results in fewer flows competing for the shared buffers, so the competing flows receive more of the buffer space.

#### ***Order of Buffer Consumption***

The total buffer pool is divided into ingress and egress shared buffer pools and dedicated buffer pools. When traffic flows through the switch, the buffer space is used in a particular order that depends on the type of traffic.

On ingress, the order of buffer consumption is:

- Best-effort unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)
- Lossless unicast traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Lossless headroom buffers
  4. Global headroom buffers (very small)
- Multidestination traffic:
  1. Dedicated buffers
  2. Shared buffers
  3. Global headroom buffers (very small)

On egress, the order of buffer consumption is the same for unicast best-effort, lossless unicast, and multidestination traffic:

- Dedicated buffers
- Shared buffers

In all cases on all ports, the switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for the port or queue is exhausted. This reserves the maximum amount of dynamic shared buffer space to absorb traffic bursts.

### Shared Buffer Configuration Recommendations for Different Network Traffic Scenarios

The way you configure the shared buffer pool depends on the mix of traffic on your network. This section provides shared buffer configuration recommendations for four basic network traffic scenarios:

- **Balanced traffic**—The network carries a balanced mix of unicast best-effort, lossless, and multicast traffic.
- **Best-effort unicast traffic**—The network carries mostly unicast best-effort traffic.
- **Best-effort multicast traffic**—The network carries mostly multicast best-effort traffic.
- **Lossless traffic**—The network carries mostly lossless traffic (traffic on which PFC is enabled).

**NOTE:** Lossless traffic is defined as traffic on which you enable PFC to ensure lossless transport. Lossless traffic does not refer to best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3X).

The lossless traffic configuration recommendation does not apply to networks that carry large amounts of best-effort traffic that is subject to Ethernet PAUSE. The best-effort traffic configuration also does not apply to networks that carry large amounts of Ethernet PAUSE traffic. You might have to adjust the buffer settings from the default configuration to optimize buffer utilization for networks with heavy Ethernet PAUSE traffic.

Start with the recommended shared buffer configuration for your network traffic conditions:

- [Balanced Traffic \(Default Configuration\) on page 4923](#)
- [Best-Effort Unicast Traffic on page 4924](#)
- [Best-Effort Multicast \(Multidestination\) Traffic on page 4925](#)
- [Lossless Traffic on page 4925](#)

#### ***Balanced Traffic (Default Configuration)***

The default shared buffer configuration is optimized for networks that carry a balanced mix of best-effort unicast, lossless, and multidestination (multicast, broadcast, and

destination lookup fail) traffic. The default class of service (CoS) configuration is also optimized for networks that carry a balanced mix of traffic.

We recommend that you use the default shared buffer configuration for networks that carry a balanced mix of traffic, especially if you are using the default CoS settings. Table [Table 403 on page 4924](#) shows the default ingress shared buffer allocations:

**Table 403: Default Ingress Shared Buffer Configuration**

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	9%	45%	46%

Table [Table 404 on page 4924](#) shows the default egress shared buffer allocations:

**Table 404: Default Egress Shared Buffer Configuration**

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	50%	31%	19%

#### ***Best-Effort Unicast Traffic***

If your network carries mostly best-effort (lossy) unicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 405 on page 4924](#)) and egress shared buffer settings (see [Table 406 on page 4924](#)):

**Table 405: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic**

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

**Table 406: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Unicast Traffic**

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	75%	20%

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic](#)” on page 5103 for an example that shows you how to configure the recommended buffer settings shown in [Table 405 on page 4924](#) and [Table 406 on page 4924](#).

**Best-Effort Multicast (Multidestination) Traffic**

If your network carries mostly best-effort (lossy) multicast traffic, then the default shared buffer configuration allocates too much buffer space to support lossless transport. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 407 on page 4925](#)) and egress shared buffer settings (see [Table 408 on page 4925](#)):

**Table 407: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Best -Effort Multicast Traffic**

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	5%	0%	95%

**Table 408: Recommended Egress Shared Buffer Configuration for Networks with Mostly Best-Effort Multicast Traffic**

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	5%	20%	75%

See “[Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic](#)” on page 5109 for an example that shows you how to configure the recommended buffer settings shown in [Table 407 on page 4925](#) and [Table 408 on page 4925](#).

**Lossless Traffic**

If your network carries mostly lossless traffic, then the default shared buffer configuration allocates too much buffer space to support best-effort traffic. Instead of wasting those buffers, we recommend that you use the following ingress shared buffer settings (see [Table 409 on page 4925](#)) and egress shared buffer settings (see [Table 410 on page 4925](#)):

**Table 409: Recommended Ingress Shared Buffer Configuration for Networks with Mostly Lossless Traffic**

Total Shared Ingress Buffer	Lossless Buffer	Lossless-Headroom Buffer	Lossy Buffer
100%	15%	80%	5%

**Table 410: Recommended Egress Shared Buffer Configuration for Networks with Mostly Lossless Traffic**

Total Shared Egress Buffer	Lossless Buffer	Lossy Buffer	Multicast Buffer
100%	90%	5%	5%

See [“Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic” on page 5114](#) for an example that shows you how to configure the recommended buffer settings shown in [Table 409 on page 4925](#) and [Table 410 on page 4925](#).

### Optimizing the Buffer Configuration

---

Instead of using the default buffer configuration or one of the recommended buffer configurations, you can optimize the buffer configuration to best support the mix of traffic on your network:

- [Optimizing Buffer Configuration on page 4926](#)
- [General Rules and Considerations on page 4927](#)

#### **Optimizing Buffer Configuration**

If you feel that the recommended shared buffer configurations are not optimized enough for your network, adjust the settings gradually to fine-tune the shared buffer allocation. Use caution when adjusting the shared buffer configuration, not just when you fine-tune the ingress and egress buffer partitions, but also when you fine-tune the total ingress and egress shared buffer percentage. (Remember that if you allocate less than 100 percent of the available buffers to the shared buffers, the remaining buffers are added to the dedicated buffers). Tuning the buffers incorrectly can cause problems such as head-of-line blocking (HOLB).

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on all ports until buffer reprogramming is complete.

---

The relationship between the sizes of the ingress buffer pool and the egress buffer pool affects when and where packets are dropped. The buffer pool sizes include the shared buffers and the dedicated buffers. In general, if there are more ingress buffers than egress buffers, the switch can experience HOLB because egress queues fill before ingress queues can empty.

Use the [show class-of-service shared-buffer](#) operational command to see the sizes in kilobytes (KB) of the dedicated and shared buffers and of the shared buffer partitions.

For best-effort traffic (unicast and multdestination), the combined ingress lossy shared buffer partition and ingress dedicated buffers must be *less than* the combined egress lossy and multicast shared buffer partitions plus the egress dedicated buffers. This prevents HOLB and ensures that if packets are dropped, they are dropped at the egress queues. (Packets dropping at the ingress prevents the egress schedulers from working properly.)

For lossless traffic (traffic on which you enable PFC), the combined ingress lossless shared buffer partition and a reasonable portion of the ingress headroom buffer partition, plus the dedicated buffers, must be *less than* the total egress lossless shared buffer partition and dedicated buffers. (A reasonable portion of the ingress headroom buffer is approximately 20 to 25 percent of the buffer space, but this varies depending on how much buffer headroom is required to support the lossless traffic.) When these conditions

are met, if there is HOLB, the HOLB triggers PFC on the ingress port to prevent packet loss. If the total lossless ingress buffers exceed the total lossless egress buffers, packets could be dropped at the egress instead of PFC being applied at the ingress to prevent packet loss.

**NOTE:** If you commit a buffer configuration that the switch cannot satisfy, the switch might log an error instead of returning a commit error. After you commit a buffer configuration, check the syslog messages to ensure that the new buffer configuration did not fail to commit.

If the buffer configuration commits but you receive a syslog message that indicates the configuration cannot be satisfied, you can:

- Reconfigure the buffers or reconfigure other parameters (for example, the PFC configuration, which affects the need for lossless headroom buffers and lossless buffers—the more priorities you pause, the more lossless and lossless headroom buffer space you need), then attempt the commit operation again.
- Rollback the switch to the last successful configuration.

If you receive a syslog message that says the buffer configuration cannot be satisfied, you must take corrective action. If you do not fix the configuration or rollback to a previous successful configuration, the system behavior is unpredictable.

### ***General Rules and Considerations***

Keep the following rules and considerations in mind when you configure the buffers:

- Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.
- If you configure the ingress or egress shared buffer percentages as less than 100 percent, the remaining percentage of buffer space is added to the reserved (not user-configurable) dedicated buffer pool.
- The sum of all of the ingress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent except the lossless headroom buffer, which can have a value of 0 percent.
- The sum of all of the egress shared buffer partitions must equal 100 percent. Each partition must be configured with a value of at least 5 percent.
- Lossless and lossless headroom shared buffers serve traffic on which you enable PFC, and do not serve traffic subject to Ethernet PAUSE.
- The switch uses the dedicated buffer pool first and the shared buffer pool only after the dedicated buffer pool for the port or queue is exhausted.
- Too little dedicated buffer space results in too much competition for shared buffer space.

- Too much dedicated buffer space results in poorer burst absorption because there is less shared buffer space available.
- Always check the syslog messages after you commit a new buffer configuration.
- The optimal buffer configuration for your network depends on the types of traffic on the network. If your network carries less traffic of a certain type (for example, lossless traffic), then reduce the size of the buffers allocated to that type of traffic (for example, reduce the sizes of the lossless and lossless headroom buffers).

## Understanding CoS Tail-Drop Profiles

When the number of packets queued is greater than the ability of the switch to empty an output queue, the queue requires a method for determining which packets to drop to relieve the congestion. Weighted random early detection (WRED) drop profiles define the drop probability of packets as the output queue fills. During periods of congestion, as the output queue fills, the switch drops incoming packets as determined by a drop profile until the output queue becomes less congested.

Depending on the drop probabilities, a drop profile can drop many packets long before the buffer becomes full, or it can drop only a few packets even if the buffer is almost full.

You configure drop profiles in the drop profile section of the class-of-service (CoS) configuration hierarchy. You apply drop profiles using a drop profile map in each scheduler configuration. For each scheduler, you can configure separate drop profiles for each combination of loss priority (low, medium-high, and high) and protocol.

Drop profiles define the meaning of each of the loss priorities by setting the values for when to drop packets and the probability that packets will drop.

You can configure a maximum of 32 drop profiles.

**NOTE:** You cannot apply drop profiles to multidestination (multicast) queues.

Do not apply drop profiles to lossless flows such as FCoE traffic, because the corresponding queues require lossless behavior. Use priority-based flow control (PFC) to prevent packet drop.

- [Drop Profile Parameters on page 4929](#)
- [Default Drop Profile on page 4930](#)
- [Packet Drop Method on page 4931](#)
- [Drop Profile Maps on page 4932](#)
- [Congestion Prevention on page 4932](#)

### Drop Profile Parameters

Drop profiles specify two values:

- **Fill level**—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- **Drop probability**—The percentage value that corresponds to the likelihood that an individual packet is dropped.

You set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always 0 (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in [Figure 184 on page 4930](#). After the drop end point, all packets drop.

**Figure 184: Tail-Drop Profile Packet Drop**

The thick line in [Figure 184 on page 4930](#) shows the packet drop characteristics for a sample tail-drop profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

### Default Drop Profile

If you do not configure default profiles and apply them to queue schedulers, the switch uses the default drop profile for lossy traffic classes. In the default drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent. As soon as packets arrive on a queue, the default profile might begin to drop packets.

---

## Packet Drop Method

---

When a packet reaches the head of the queue, the switch generates a random number between 0 and 100. The switch plots the random number against the drop profile using the current fullness of the queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped.

To create the linear drop pattern from the drop start point to the drop end point, the drop probabilities are derived using a linear approximation with eight sections, or steps, from the minimum queue fill level to the maximum queue fill level. The fill levels are divided into the eight sections equally, starting at the minimum fill level and ending at the maximum fill level. As the queue fills, the percentage of dropped packets increases. The percentage of packets dropped is based on the maximum drop rate.

For example, the default drop profile (which specifies a maximum drop rate of 100 percent) has the following drop probabilities at each section, or step, in the eight-section linear drop pattern:

- First section—The minimum drop probability is 6.25 percent of the maximum drop rate. The maximum drop probability is 12.5 percent of the maximum drop rate.
- Second section—The minimum drop probability is 18.75 percent of the maximum drop rate. The maximum drop probability is 25 percent of the maximum drop rate.
- Third section—The minimum drop probability is 30.25 percent of the maximum drop rate. The maximum drop probability is 37.5 percent of the maximum drop rate.
- Fourth section—The minimum drop probability is 43.75 percent of the maximum drop rate. The maximum drop probability is 50 percent of the maximum drop rate.
- Fifth section—The minimum drop probability is 56.25 percent of the maximum drop rate. The maximum drop probability is 62 percent of the maximum drop rate.
- Sixth section—The minimum drop probability is 68.75 percent of the maximum drop rate. The maximum drop probability is 75.5 percent of the maximum drop rate.
- Seventh section—The minimum drop probability is 81.25 percent of the maximum drop rate. The maximum drop probability is 87.5 percent of the maximum drop rate.
- Eighth section—The minimum drop probability is 92.75 percent of the maximum drop rate. The maximum drop probability is 100 percent of the maximum drop rate.

Packets drop even when there is no congestion, because packet drops begin at the drop start point regardless of whether congestion exists on the port. The default drop profile example represents the worst-case scenario, because the drop start point fill level is 0 percent, so packet drop begins when the queue starts to receive packets.

You can specify when packets begin to drop by configuring a drop start point at a fill level greater than 0 percent. For example, if you configure a drop profile that has a drop start point of 30 percent, packets do not drop until the queue is 30 percent full.

The smaller the gap between the minimum drop rate (which is always 0) and the maximum drop rate, the smaller the gap between the minimum drop probability and the

maximum drop probability at each section (step) of the linear drop pattern. The default drop profile, which has the maximum gap between the minimum drop rate (0 percent) and the maximum drop rate (100 percent), has the highest gap between the minimum drop probability and the maximum drop probability at each step. Configuring a lower maximum drop rate for a drop profile reduces the gap between the minimum drop probability and the maximum drop probability.

### Drop Profile Maps

---

Drop profile maps are part of scheduler configuration. A drop profile map maps a drop profile to a loss priority and a protocol. Specifying the drop profile map in a scheduler associates the drop profile with the queues (forwarding classes) that you map to the scheduler in a scheduler map.

You configure loss priority for a queue in the classifier section of the CoS configuration hierarchy, and the loss priority is applied to the queue at the ingress interface.

Each scheduler can have multiple drop profile maps, one for each combination of loss priority and protocol.

### Congestion Prevention

---

Configuring drop profiles on output queues prevents them from impacting other queues on the egress ports. If you do not configure drop profiles and map them to output queues, output queues without drop profiles can impact the bandwidth available to other output queues.

**NOTE:** Do not configure drop profiles for lossless traffic such as the default FCoE and no-loss forwarding classes because queues mapped to lossless forwarding classes require lossless behavior. Use priority-based flow control (PFC) to prevent packet drop.

---

For example, queues might not receive the egress bandwidth configured in the queue scheduler when a port's egress queues are congested because the ingress port buffer fills above a certain threshold. If this happens, configuring a drop profile for the queue on the port that is receiving its configured bandwidth alleviates the problem by preventing the queue from impacting the other queues on the port.

## Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. Rewrite rules set the value of the CoS bits within the header of the outgoing packet. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. Rewrite rules must be assigned to an interface for rewrites to be activated.

You can apply (bind) one DSCP or DSCP IPv6 rewrite rule and one IEEE 802.1p rewrite rule to each interface as described in [“Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces” on page 4851](#).

You cannot apply both a DSCP and a DSCP IPv6 rewrite rule to the same interface; each interface supports only one DSCP rewrite rule. Both IP and IPv6 packets use the same DSCP rewrite rule, regardless if the configured rewrite rule is DSCP or DSCP IPv6.

**NOTE:** There are no default rewrite rules.

You can look at behavior aggregate (BA) classifiers and rewrite rules as two sides of the same coin. A BA classifier reads the CoS bits of incoming packets and classifies the packets into forwarding classes, then the system applies the CoS configured for the forwarding class to those packets. Rewrite rules rewrite the CoS bits just before the packets leave the system so that the next switch can apply the appropriate level of CoS to the packets. When you apply a rewrite rule to an interface, the rewrite rule is the last CoS action performed on the packet before it is forwarded.

Rewrite rules alter CoS values in outgoing packets on the outbound interfaces of an edge switch to accommodate the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

QFX Series does not have default rewrite rules. If you want to apply a rewrite rule to outgoing packets, you must explicitly configure the rewrite rule.

**NOTE:** Rewrite rules are applied *before* the egress filter is matched to traffic. Because the code point rewrite occurs before the egress filter is matched to traffic, the egress filter match is based on the rewrite value, not on the original code point value in the packet.

For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

## Understanding DCB Features and Requirements

Data center bridging (DCB) is a set of enhancements to the IEEE 802.1 bridge specifications. DCB modifies and extends Ethernet behavior to support I/O convergence in the data center. I/O convergence includes but is not limited to the transport of Ethernet LAN traffic and Fibre Channel (FC) storage area network (SAN) traffic on the same physical Ethernet network infrastructure.

A converged architecture saves cost by reducing the number of networks and switches required to support both types of traffic, reducing the number of interfaces required, reducing cable complexity, and reducing administration activities.

The Juniper Networks QFX Series supports the DCB features required to transport converged Ethernet and FC traffic while providing the class-of-service (CoS) and other characteristics FC requires for transmitting storage traffic. To accommodate FC traffic, DCB specifications provide:

- A flow control mechanism called priority-based flow control (PFC, described in IEEE 802.1Qbb) to help provide lossless transport.
- A discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network, called Data Center Bridging Capability Exchange protocol (DCBX), which is an extension of Link Layer Data Protocol (LLDP, described in IEEE 802.1AB).
- A bandwidth management mechanism called enhanced transmission selection (ETS, described in IEEE 802.1Qaz).
- A congestion management mechanism called quantized congestion notification (QCN, described in IEEE 802.1Qau).

The switch supports the PFC, DCBX, and ETS standards but does not support QCN. The switch also provides the high-bandwidth interfaces (10-Gbps minimum) required to support DCB and converged traffic.

This topic describes the DCB standards and requirements the switch supports:

- [Lossless Transport on page 4935](#)
- [ETS on page 4936](#)
- [DCBX on page 4936](#)

---

## Lossless Transport

---

FC traffic requires lossless transport (defined as no frames dropped because of congestion). Standard Ethernet does not support lossless transport, but the DCB extensions to Ethernet along with proper buffer management enable an Ethernet network to provide the level of class of service (CoS) necessary to transport FC frames encapsulated in Ethernet over an Ethernet network.

This section describes these factors in creating lossless transport over Ethernet:

- [PFC on page 4935](#)
- [Buffer Management on page 4935](#)
- [Physical Interfaces on page 4935](#)

### ***PFC***

PFC is a link-level flow control mechanism similar to Ethernet PAUSE (described in IEEE 802.3x). Ethernet PAUSE stops all traffic on a link for a period of time. PFC enables you to divide traffic on a link into eight priorities and stop the traffic of a selected priority without stopping the traffic assigned to other priorities on the link.

Pausing the traffic of a selected priority enables you to provide lossless transport for traffic assigned that priority and at the same time use standard lossy Ethernet transport for the rest of the link traffic.

### ***Buffer Management***

Buffer management is critical to the proper functioning of PFC, because if buffers are allowed to overflow, frames are dropped and transport is not lossless.

For each lossless flow priority, the switch requires sufficient buffer space to:

- Store frames sent during the time it takes to send the PFC pause frame across the cable between devices.
- Store the frames that are already on the wire when the sender receives the PFC pause frame.

The propagation delay due to cable length and speed, as well as processing speed, determines the amount of buffer space needed to prevent frame loss due to congestion.

The switch automatically sets the threshold for sending PFC pause frames to accommodate delay from cables as long as 150 meters (492 feet) and to accommodate large frames that might be on the wire when the switch sends the pause frame. This ensures that the switch sends pause frames early enough to allow the sender to stop transmitting before the receive buffers on the switch overflow.

### ***Physical Interfaces***

The switch supports 10-Gbps, full-duplex interfaces. The switch enables DCB capability only on 10-Gbps (or faster) Ethernet interfaces.

## ETS

---

PFC divides traffic into up to eight separate streams (priorities, configured on the switch as forwarding classes) on a physical link. ETS enables you to manage the link bandwidth by:

- Grouping the priorities into priority groups (configured on the switch as forwarding class sets).
- Specifying the bandwidth available to each of the priority groups as a percentage of the total available link bandwidth.
- Allocating the bandwidth to the individual priorities in the priority group.

The available link bandwidth is the bandwidth remaining after servicing strict priority flows.

Managing link bandwidth with ETS provides several advantages:

- There is uniform management of all types of traffic on the link, both congestion-managed traffic and standard Ethernet traffic.
- When a priority group does not use all of its allocated bandwidth, other priority groups on the link can use that bandwidth as needed.

When a priority in a priority group does not use all of its allocated bandwidth, other priorities in the group can use that bandwidth.

The result is better bandwidth utilization, because priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

- You can assign traffic types with different service needs to different priorities so that each traffic type receives appropriate treatment.
- Strict priority traffic retains its allocated bandwidth.

## DCBX

---

DCB devices use DCBX to exchange configuration information with directly connected peers (switches and endpoints such as servers). DCBX is an extension of LLDP. If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit fails.

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for PFC, ETS, and for Layer 2 and Layer 4 applications such as FCoE and iSCSI. DCBX is enabled or disabled on a per-interface basis.

## Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows so that frames are not dropped during periods of congestion. Flow control stops and resumes the transmission of network traffic between two nodes on a full-duplex Ethernet physical link. Controlling the flow prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

The QFX Series supports two methods of flow control:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Both Ethernet PAUSE and PFC are link-level flow control mechanisms.

Ethernet PAUSE pauses transmission of all traffic on a link.

PFC decouples the pause function from the physical link and enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

**NOTE:** Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause head-of-line blocking and spread congestion through the network.

If you attempt to configure both Ethernet PAUSE and PFC on a link, the switch returns a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

### Ethernet PAUSE

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop

the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends a PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives a PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

In this scenario, if Node B sends a PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

*Symmetric flow control* means an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

*Asymmetric flow control* allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) The QFX Series supports both symmetric and asymmetric flow control.

- [Symmetric Flow Control on page 4939](#)
- [Asymmetric Flow Control on page 4940](#)

### ***Symmetric Flow Control***

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send PAUSE messages and respond to them (flow control is enabled), or the interface cannot send PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the

interface can perform any PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to PAUSE messages.)

### **Asymmetric Flow Control**

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric PAUSE. [Table 309 on page 4478](#) describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

**Table 411: Asymmetric Ethernet PAUSE Flow Control Configuration**

Receive (Rx) Buffer	Transmit (Tx) Buffer	Configured Flow Control State
On	Off	Interface generates and sends Ethernet PAUSE messages. Interface does not respond to PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).
Off	On	Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send PAUSE messages. (The interface does not request that the connected peer stop sending traffic.)
On	On	Same functionality as symmetric Ethernet PAUSE. Interface generates and sends PAUSE messages and responds to received PAUSE messages.
Off	Off	Ethernet PAUSE flow control is disabled.

The configured flow control is the PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, the QFX Series supports autonegotiation of Ethernet PAUSE with the connected peer. (The QFX Series does not support autonegotiation on 10-Gigabit Ethernet interfaces.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the PAUSE and ASM\_DIR bits, as described in [Table 310 on page 4479](#):

Table 412: Flow Control State Advertised to the Connected Peer (Autonegotiation)

Rx Buffer State	Tx Buffer State	PAUSE Bit	ASM_DIR Bit	Description
Off	Off	0	0	The interface advertises no PAUSE capability. This is equivalent to disabling flow control on an interface.
On	On	1	0	The interface advertises symmetric flow control (both the transmission of PAUSE messages and the ability to receive and respond to PAUSE messages).
On	Off	0	1	The interface advertises asymmetric flow control (the transmission of PAUSE messages, but not the ability to receive and respond to PAUSE messages).
Off	On	1	1	The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send PAUSE requests to the peer, the interface supports both symmetric and asymmetric PAUSE configuration on the peer because the peer is not affected if the peer does not receive PAUSE requests. (If the interface responds to the peer's PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.)

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in [Table 311 on page 4480](#). The first four columns show the PAUSE configuration on the local QFX Series and on the connected peer (also known as the link partner). The last two columns show the PAUSE resolution that results from the local and peer configurations on each interface. This illustrates how the PAUSE configuration of each interface affects the PAUSE behavior on the other interface.

**NOTE:** In the Resolution columns of the table, disabling PAUSE transmit means that the interface receive buffers do not generate and send PAUSE messages to the peer. Disabling PAUSE receive means that the interface transmit buffers do not respond to PAUSE messages received from the peer.

Table 413: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces

Local Interface (QFX Series)		Peer Interface		Local Resolution	Peer Resolution
PAUSE Bit	ASM_DIR Bit	PAUSE Bit	ASM_DIR Bit		
0	0	Don't care	Don't care	Disable PAUSE transmit and receive	Disable PAUSE transmit and receive
0	1	0	Don't care	Disable PAUSE transmit and receive	Disable PAUSE transmit and receive
0	1	1	0	Disable PAUSE transmit and receive	Disable PAUSE transmit and receive
0	1	1	1	Enable PAUSE transmit and disable PAUSE receive	Disable PAUSE transmit and enable PAUSE receive
1	0	0	Don't care	Disable PAUSE transmit and receive	Disable PAUSE transmit and receive
1	0	1	Don't care	Enable PAUSE transmit and receive	Enable PAUSE transmit and receive
1	1	0	0	Disable PAUSE transmit and receive	Disable PAUSE transmit and receive
1	1	0	1	Enable PAUSE receive and disable PAUSE transmit	Enable PAUSE transmit and disable PAUSE receive
1	1	Don't care	Don't care	Enable PAUSE transmit and receive	Enable PAUSE transmit and receive

**NOTE:** For your convenience, [Table 311 on page 4480](#) replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

## PFC

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the switch receive buffer fills to a threshold, the switch sends a pause frame to the sender to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

All of the other priorities on the link continue to send frames. Only the frames sent with the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Head-of-line blocking
- A paused priority that caused upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic.
- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames.

When it receives a PFC frame, the QFX Series pauses traffic on egress queues based on the priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in [Table 312 on page 4481](#):

**Table 414: Default PFC Priority to Queue and Forwarding Class Mapping**

IEEE 802.1p Priority (Code Point)	Queue	Forwarding Class
0 (000)	0	best-effort
1 (001)	1	best-effort
2 (010)	2	best-effort
3 (011)	3	fcoe
4 (100)	4	no-loss
5 (101)	5	best-effort
6 (110)	6	network-control
7 (111)	7	network-control

For example, when the QFX Series receives a PFC pause frame that pauses priority 3, queue 3 is paused. If you do not want to use the default configuration, you can configure customized mapping of priorities to different queues and forwarding classes.

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the `fcoe` forwarding class as a lossless forwarding class that is mapped to queue 3, and default classifiers map incoming priority 3 traffic to the `fcoe` forwarding class. However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires. If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 802.1p priority as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 4896](#) and [“Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway” on page 4911](#).

You enable PFC on a priority on an ingress interface by configuring an input CNP and then associating the CNP with an interface. The CNP enables PFC on a specified IEEE 802.1 code point. When you associate the CNP with an interface, ingress traffic mapped to that priority uses PFC to pause transmission whenever the queue buffer fills to the pause threshold.

Although unicast traffic and multdestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multdestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multdestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

**NOTE:** You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs.

---

### Lossless Transport Support

---

The QFX Series supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priority (code point) of lossless forwarding classes.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, `fcoe` and `no-loss`. If you explicitly configure lossless forwarding classes, you must include the `no-loss` packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit configuration, you must configure CNPs to enable PFC on the priority of the lossless traffic.

**NOTE:** Junos OS Release 12.2 introduced changes to the way the QFX Series handles lossless forwarding classes (the fcoe and no-loss forwarding classes).

In Junos OS Release 12.1, both explicitly configuring the the fcoe and no-loss forwarding classes and using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the fcoe or the no-loss forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the fcoe or the no-loss forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the the explicit fcoe and no-loss forwarding class configuration before you upgrade to Junos OS Release 12.2.

See “[Overview of CoS Changes Introduced in Junos OS Release 12.2](#)” on [page 4820](#) for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the fcoe and no-loss forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new no-loss packet drop attribute or the forwarding class is lossy.

## Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

This topic describes:

- [DCBX Basics on page 4946](#)
- [DCBX Modes and Support on page 4947](#)
- [DCBX Attribute Types on page 4950](#)
- [DCBX Application Protocol TLV Exchange on page 4951](#)
- [DCBX and PFC on page 4952](#)
- [DCBX and ETS on page 4952](#)

---

### DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

### DCBX Modes and Support

This section describes DCBX support on the QFX Series:

- [DCBX Modes \(Versions\) on page 4947](#)
- [Autonegotiation on page 4949](#)
- [CNA Support for DCBX Modes on page 4950](#)
- [Interface Support for DCBX on page 4950](#)

#### **DCBX Modes (Versions)**

The QFX Series supports the two most common DCBX modes:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

**NOTE:** The QFX Series does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The QFX Series drops LLDP frames that contain pre-CEE DCBX TLVs.

[Table 308 on page 4465](#) summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

**Table 415: Summary of Differences Between IEEE DCBX and DCBX Version 1.01**

Characteristic	IEEE DCBX	DCBX Version 1.01
OUI	0x0080c2	0x001b21
Frame Format	Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs	Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The “willing” bit determines whether or not an interface can change its configuration to match the connected peer.
Symmetric/asymmetric configuration with peer	Asymmetric or symmetric	Symmetric only
Differences in the <b>show dcbx interface interface-name</b> operational command	<ul style="list-style-type: none"> <li>• Synchronization information is not shown because symmetric configuration is not required.</li> <li>• Operational state information is not shown because the operational states do not have to be symmetric.</li> <li>• TLV type is shown because unique TLVs are sent for each DCBX attribute.</li> <li>• ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.</li> </ul>	<ul style="list-style-type: none"> <li>• Synchronization information is shown because symmetric configuration is required.</li> <li>• Operational state information is shown because the operational states do have to be symmetric.</li> <li>• TLV type is not shown because one TLV is used for all attribute information.</li> <li>• Recommendation TLV is not sent (DCBX Version 1.01 uses the “willing” bit to determine whether or not an interface uses the peer interface configuration).</li> </ul>

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—<http://www.ieee802.org/1/files/public/docs2008/az-wadelaar-dcbx-capability-exchange-discovery-protocol-T108-v101.pdf>
- For IEEE DCBX—<http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf>

**NOTE:** As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.

- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

**NOTE:** On interfaces that use the IEEE DCBX mode, the `show dcbx neighbors interface interface-name operational` command does not include application, PFC, or ETS operational state in the output.

### ***Autonegotiation***

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on QFX3500 switches and QFabric systems:

- QFX3500 switch—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

**NOTE:** If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

### ***CNA Support for DCBX Modes***

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on QFX Series interfaces depends on the DCBX features that the CNAs in your network support.

### ***Interface Support for DCBX***

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

### ***DCBX Attribute Types***

---

DCBX has three attribute types:

- **Informational**—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- **Asymmetric**—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- **Symmetric**—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- [Asymmetric Attributes on page 4950](#)
- [Symmetric Attributes on page 4951](#)

### ***Asymmetric Attributes***

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- **Configuration TLV**—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing,” the configuration on the interface cannot be overridden by the peer interface configuration.
- **Recommendation TLV**—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface

sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

### ***Symmetric Attributes***

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

### **DCBX Application Protocol TLV Exchange**

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

- [Application Protocol TLV Exchange on page 4951](#)
- [FCoE Application Protocol TLV Exchange on page 4951](#)
- [Disabling Application Protocol TLV Exchange on page 4952](#)

### ***Application Protocol TLV Exchange***

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

### ***FCoE Application Protocol TLV Exchange***

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

**NOTE:** If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

**NOTE:** If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as “FCoE down,” and FCoE is disabled on that interface.

#### ***Disabling Application Protocol TLV Exchange***

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

---

#### **DCBX and PFC**

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

---

#### **DCBX and ETS**

This section describes:

- [Default DCBX ETS Advertisement on page 4953](#)
- [ETS Advertisement and Peer Configuration on page 4953](#)
- [ETS Recommendation TLV on page 4953](#)

### ***Default DCBX ETS Advertisement***

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

### ***ETS Advertisement and Peer Configuration***

DCBX does not control the switch's ETS (hierarchical scheduling) operational state. If the connected peer is configured as "willing," DCBX pushes the switch's ETS configuration to the switch's peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer, but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

### ***ETS Recommendation TLV***

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is "willing," it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **recommendation-tlv no-auto-negotiation** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

**NOTE:** You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

## Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see [“Applications” on page 4472](#)) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see [“Application Maps” on page 4473](#)) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

- [Applications on page 4955](#)
- [Application Maps on page 4956](#)
- [Classifying and Prioritizing Application Traffic on page 4957](#)
- [Enabling Interfaces to Exchange Application Protocol Information on page 4958](#)
- [Disabling DCBX Application Protocol Exchange on page 4958](#)

### Applications

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

**NOTE:** If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

---

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see <http://standards.ieee.org/develop/regauth/ethertype/eth.txt> on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at <http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml> on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

### Application Maps

---

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

### Classifying and Prioritizing Application Traffic

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

### Enabling Interfaces to Exchange Application Protocol Information

---

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

**NOTE:** You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.

---

### Disabling DCBX Application Protocol Exchange

---

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

## Example: Configuring CoS Hierarchical Port Scheduling (ETS)

Hierarchical port scheduling defines the class-of-service (CoS) properties of output queues, which are mapped to forwarding classes (forwarding classes are mapped to IEEE 802.1p priorities, so mapping queues to forwarding classes also maps queues to priorities). Hierarchical port scheduling enables you to group priorities that require similar CoS resources into priority groups. You define the port bandwidth resources for a priority group, and you define the amount of the priority group's resources that each priority in the group can use.

Hierarchical port scheduling is the Junos OS implementation of enhanced transmission selection (ETS, described in IEEE 802.1Qaz). One major benefit of hierarchical port scheduling is greater port bandwidth utilization. If a priority group on a port does not use all of its allocated bandwidth, other priority groups on that port can use that bandwidth. Also, if a priority within a priority group does not use its allocated bandwidth, other priorities within that priority group can use that bandwidth.

Configuring hierarchical scheduling is a multistep procedure that includes:

- Mapping forwarding classes to queues
- Defining forwarding class sets (priority groups)
- Defining behavior aggregate classifiers
- Configuring priority-based flow control (PFC) for lossless priorities (queues)
- Applying classifiers and PFC configuration to ingress interfaces
- Defining drop profiles
- Defining schedulers
- Mapping forwarding classes to schedulers
- Defining traffic control profiles
- Assigning priority groups and traffic control profiles to egress ports

This example describes how to configure hierarchical scheduling:

- [Requirements on page 4963](#)
- [Overview on page 4963](#)
- [Configuration on page 4966](#)
- [Verification on page 4974](#)

## Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

Keep the following considerations in mind when you plan the port bandwidth allocation for priority groups and for individual priorities:

- How much traffic and what types of traffic you expect to traverse the system.
- How you want to divide different types of traffic into priorities (forwarding classes, also called queues) to apply different CoS treatment to the traffic. Dividing traffic into priorities includes:
  - Mapping the code points of ingress traffic to forwarding classes using behavior aggregate (BA) classifiers. This classifies incoming traffic into the appropriate forwarding class.
  - Mapping forwarding classes to output queues. This defines the output queue for each type of traffic.
  - Attaching the BA classifier to the desired ingress interfaces so that incoming traffic maps to the desired forwarding classes and queues.
- How you want to organize priorities into priority groups (forwarding class sets).
 

Traffic that requires similar treatment usually belongs in the same priority group. To do this, place forwarding classes that require similar bandwidth, loss, and other characteristics in the same forwarding class set. For example, you can map all types of best-effort traffic forwarding classes into one forwarding class set.
- How much of the port bandwidth you want to allocate to each priority group and to each of the priorities in each priority group. The following considerations apply to bandwidth allocation:
  - Estimate how much traffic you expect in each forwarding class (output queue) and how much traffic you expect in each forwarding class set (the aggregate amount of traffic in the forwarding classes that belong to the forwarding class set).
  - The combined minimum guaranteed bandwidth of the priorities (forwarding classes) in a priority group should not exceed the minimum guaranteed bandwidth of the priority group. The transmit rate scheduler parameter defines the minimum guaranteed bandwidth for forwarding classes. Scheduler maps associate schedulers with forwarding classes.
  - The combined minimum guaranteed bandwidth of the priority groups (forwarding class sets) on a port should not exceed the port's total bandwidth. Traffic control profiles define the minimum bandwidth for a forwarding class set. Associating a scheduler map with a traffic control profile sets the scheduling for the individual forwarding classes in the forwarding class set.

This example creates hierarchical port scheduling by defining priority groups for best effort, guaranteed delivery, and high-performance computing (HPC) traffic. Each priority group includes priorities that need to receive similar CoS treatment. Each priority group and each priority within each priority group receive the CoS resources needed to service their flows. Lossless priorities use PFC to prevent packet loss when the network experiences congestion.

### Topology

Table 416 on page 4964 shows the configuration components for this example.

**Table 416: Components of the Hierarchical Port Scheduling (ETS) Configuration Topology**

### Configuration

#### CLI Quick Configuration

To quickly configure hierarchical port scheduling, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network

configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set forwarding-classes class best-effort queue-num 0
set forwarding-classes class be2 queue-num 1
set forwarding-classes class hpc queue-num 5
set forwarding-classes class network-control queue-num 7
set forwarding-class-sets best-effort-pg class best-effort
set forwarding-class-sets best-effort-pg class be2
set forwarding-class-sets best-effort-pg class network-control
set forwarding-class-sets guar-delivery-pg class fcoe
set forwarding-class-sets guar-delivery-pg class no-loss
set forwarding-class-sets hpc-pg class hpc
set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort loss-priority low code-points 000
set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority high code-points 001
set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority low code-points 011
set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority low code-points 100
set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low code-points 101
set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control loss-priority low code-points 110
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011 pfc
set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100 pfc
set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1
set interfaces xe-0/0/20 congestion-notification-profile gd-cnp
set interfaces xe-0/0/21 congestion-notification-profile gd-cnp
set drop-profiles dp-be-low interpolate fill-level 25 fill-level 50 drop-probability 0 drop-probability 80
set drop-profiles dp-be-high interpolate fill-level 10 fill-level 40 drop-probability 0 drop-probability 100
set drop-profiles dp-nc interpolate fill-level 80 fill-level 100 drop-probability 0 drop-probability 100
set drop-profiles dp-hpc interpolate fill-level 75 fill-level 90 drop-probability 0 drop-probability 75
set schedulers be-sched priority low transmit-rate 3g
set schedulers be-sched shaping-rate percent 100
set schedulers be-sched drop-profile-map loss-priority low protocol any drop-profile dp-be-low
set schedulers be-sched drop-profile-map loss-priority high protocol any drop-profile dp-be-high
set schedulers fcoe-sched priority low transmit-rate 2500m
set schedulers fcoe-sched shaping-rate percent 100
set schedulers hpc-sched priority low transmit-rate 2g
set schedulers hpc-sched shaping-rate percent 100
set schedulers hpc-sched drop-profile-map loss-priority low protocol any drop-profile dp-hpc
set schedulers nc-sched priority low transmit-rate 500m
set schedulers nc-sched shaping-rate percent 100
set schedulers nc-sched drop-profile-map loss-priority low protocol any drop-profile dp-nc
set schedulers nl-sched priority low transmit-rate 2g
set schedulers nl-sched shaping-rate percent 100
set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
set scheduler-maps be-map forwarding-class be2 scheduler be-sched
set scheduler-maps be-map forwarding-class network-control scheduler nc-sched
set scheduler-maps gd-map forwarding-class fcoe scheduler fcoe-sched
set scheduler-maps gd-map forwarding-class no-loss scheduler nl-sched
set scheduler-maps hpc-map forwarding-class hpc scheduler hpc-sched
set traffic-control-profiles be-tcp scheduler-map be-map guaranteed-rate 3500m
set traffic-control-profiles be-tcp shaping-rate percent 100
set traffic-control-profiles gd-tcp scheduler-map gd-map guaranteed-rate 4500m
set traffic-control-profiles gd-tcp shaping-rate percent 100
```

```

set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate 2g
set traffic-control-profiles hpc-tcp shaping-rate percent 100
set interfaces xe-0/0/20 forwarding-class-set best-effort-pg output-traffic-control-profile be-tcp
set interfaces xe-0/0/20 forwarding-class-set guar-delivery-pg output-traffic-control-profile
gd-tcp
set interfaces xe-0/0/20 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp
set interfaces xe-0/0/21 forwarding-class-set best-effort-pg output-traffic-control-profile be-tcp
set interfaces xe-0/0/21 forwarding-class-set guar-delivery-pg output-traffic-control-profile
gd-tcp
set interfaces xe-0/0/21 forwarding-class-set hpc-pg output-traffic-control-profile hpc-tcp

```

### Step-by-Step Procedure

To perform a step-by-step configuration of the forwarding classes (priorities), forwarding class sets (priority groups), classifiers, queue schedulers, PFC, traffic control profiles, and interfaces to set up hierarchical port scheduling (ETS):

1. Configure the forwarding classes (priorities) and map them to unicast output queues (do not explicitly map the **fcoe** and **no-loss** forwarding classes to output queues; use the default configuration):

```

[edit class-of-service]
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class be2 queue-num 1
user@switch# set forwarding-classes class hpc queue-num 5
user@switch# set forwarding-classes class network-control queue-num 7

```

2. Configure forwarding class sets (priority groups) to group forwarding classes (priorities) that require similar CoS treatment:

```

[edit class-of-service]
user@switch# set forwarding-class-sets best-effort-pg class best-effort
user@switch# set forwarding-class-sets best-effort-pg class be2
user@switch# set forwarding-class-sets best-effort-pg class network-control
user@switch# set forwarding-class-sets guar-delivery-pg class fcoe
user@switch# set forwarding-class-sets guar-delivery-pg class no-loss
user@switch# set forwarding-class-sets hpc-pg class hpc

```

3. Configure a classifier to set the loss priority and IEEE 802.1 code points assigned to each forwarding class at the ingress:

```

[edit class-of-service]
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class best-effort
loss-priority low code-points 000
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class be2 loss-priority
high code-points 001
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class fcoe loss-priority
low code-points 011
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class no-loss loss-priority
low code-points 100
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class hpc loss-priority low
code-points 101
user@switch# set classifiers ieee-802.1 hsclassifier1 forwarding-class network-control
loss-priority low code-points 110

```

4. Configure a congestion notification profile to enable PFC on the FCoE and no-loss queue IEEE 802.1 code points:

```

[edit class-of-service]
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 011
pfc
user@switch# set congestion-notification-profile gd-cnp input ieee-802.1 code-point 100
pfc

```

5. Assign the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 hsclassifier1
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 hsclassifier1
```

6. Apply the PFC configuration to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile gd-cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile gd-cnp
```

7. Configure the drop profile for the best-effort low loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-low interpolate fill-level 25 fill-level 50
drop-probability 0 drop-probability 80
```

8. Configure the drop profile for the best-effort high loss-priority queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-be-high interpolate fill-level 10 fill-level 40
drop-probability 0 drop-probability 100
```

9. Configure the drop profile for the network-control queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-nc interpolate fill-level 80 fill-level 100 drop-probability
0 drop-probability 100
```

10. Configure the drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set drop-profiles dp-hpc interpolate fill-level 75 fill-level 90 drop-probability
0 drop-probability 75
```

11. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profiles for the best-effort queue:

```
[edit class-of-service]
user@switch# set schedulers be-sched priority low transmit-rate 3g
user@switch# set schedulers be-sched shaping-rate percent 100
user@switch# set schedulers be-sched drop-profile-map loss-priority low protocol any
drop-profile dp-be-low
user@switch# set schedulers be-sched drop-profile-map loss-priority high protocol any
drop-profile dp-be-high
```

12. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 2500m
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

13. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the high-performance computing queue:

```
[edit class-of-service]
user@switch# set schedulers hpc-sched priority low transmit-rate 2g
user@switch# set schedulers hpc-sched shaping-rate percent 100
user@switch# set schedulers hpc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-hpc
```

14. Define the minimum guaranteed bandwidth, priority, maximum bandwidth, and drop profile for the network-control queue:  

```
[edit class-of-service]
user@switch# set schedulers nc-sched priority low transmit-rate 500m
user@switch# set schedulers nc-sched shaping-rate percent 100
user@switch# set schedulers nc-sched drop-profile-map loss-priority low protocol any
drop-profile dp-nc
```
15. Define the minimum guaranteed bandwidth, priority, and maximum bandwidth for the no-loss queue:  

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low transmit-rate 2g
user@switch# set schedulers nl-sched shaping-rate percent 100
```
16. Map the schedulers to the appropriate forwarding classes (queues):  

```
[edit class-of-service]
user@switch# set scheduler-maps be-map forwarding-class best-effort scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class be2 scheduler be-sched
user@switch# set scheduler-maps be-map forwarding-class network-control scheduler
nc-sched
user@switch# set scheduler-maps gd-map forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps gd-map forwarding-class no-loss scheduler nl-sched
user@switch# set scheduler-maps hpc-map forwarding-class hpc scheduler hpc-sched
```
17. Define the traffic control profile for the best-effort priority group (queue scheduler to mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles be-tcp scheduler-map be-map guaranteed-rate
3500m
user@switch# set traffic-control-profiles be-tcp shaping-rate percent 100
```
18. Define the traffic control profile for the guaranteed delivery priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles gd-tcp scheduler-map gd-map guaranteed-rate
4500m
user@switch# set traffic-control-profiles gd-tcp shaping-rate percent 100
```
19. Define the traffic control profile for the high-performance computing priority group (queue to scheduler mapping, minimum guaranteed bandwidth, and maximum bandwidth):  

```
[edit class-of-service]
user@switch# set traffic-control-profiles hpc-tcp scheduler-map hpc-map guaranteed-rate
2g
user@switch# set traffic-control-profiles hpc-tcp shaping-rate percent 100
```
20. Apply the three priority groups (forwarding class sets) and the appropriate traffic control profiles to the egress ports:  

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 forwarding-class-set best-effort-pg
output-traffic-control-profile be-tcp

### Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** and **no-loss** lossless forwarding classes):

```

user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 hsclassifier1 {
    forwarding-class best-effort {
      loss-priority low code-points 000;
    }
    forwarding-class be2 {
      loss-priority high code-points 001;
    }
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
    forwarding-class no-loss {
      loss-priority low code-points 100;
    }
    forwarding-class hpc {
      loss-priority low code-points 101;
    }
    forwarding-class network-control {
      loss-priority low code-points 110;
    }
  }
}
drop-profiles {

    priority low;
  }
}
```

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command, and then copy the hierarchy and paste it into the switch terminal window.

---

## Verification

To verify that the hierarchical port scheduling components have been created and are operating properly, perform these tasks:

- [Verifying That the Forwarding Classes \(Priorities\) Have Been Created on page 4975](#)
- [Verifying That the Forwarding Class Sets \(Priority Groups\) Have Been Created on page 4975](#)
- [Verifying That the Classifier Has Been Created on page 4976](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 4976](#)
- [Verifying That the Output Queue Schedulers Have Been Created on page 4977](#)
- [Verifying That the Drop Profiles Have Been Created on page 4980](#)

- [Verifying That the Priority Group Output Schedulers \(Traffic Control Profiles\) Have Been Created on page 4981](#)
- [Verifying the Interface Configuration on page 4982](#)

### *Verifying That the Forwarding Classes (Priorities) Have Been Created*

**Purpose** Verify that the forwarding classes have been created and mapped to the correct queues. (The system shows only the explicitly configured forwarding classes. It does not show default forwarding classes such as **fcoe** and **no-loss**.)

**Action** List the forwarding classes using the operational mode command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
be2	1	3	normal	Disabled
hpc	2	4	normal	Disabled
network-control	3	7	normal	Disabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command lists all of the configured forwarding classes, the internal identification number of each forwarding class, the queues that are mapped to the forwarding classes, the policing priority, and whether the forwarding class is lossless (no-loss packet drop attribute enabled) or lossy forwarding class (no-loss packet drop attribute disabled). The command output shows that:

- Forwarding class **best-effort** maps to queue **0** and is lossy
- Forwarding class **be2** maps to queue **1** and is lossy
- Forwarding class **hpc** maps to queue **5** and is lossy
- Forwarding class **network-control** maps to queue **7** and is lossy

In addition, the command lists the default multicast (multidestination) forwarding class and the default queue to which it is mapped.

### *Verifying That the Forwarding Class Sets (Priority Groups) Have Been Created*

**Purpose** Verify that the priority groups have been created and that the correct priorities (forwarding classes) belong to the appropriate priority group.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set**:

```
user@switch> show class-of-service forwarding-class-set
```

```
Forwarding class set: best-effort-pg, Type: normal-type, Forwarding class set
index: 19907
```

Forwarding class	Index
best-effort	0

be2	1
network-control	5

Forwarding class set: guar-delivery-pg, Type: normal-type, Forwarding class set index: 43700

Forwarding class	Index
fcoe	2
no-loss	3

Forwarding class set: hpc-pg, Type: normal-type, Forwarding class set index: 60758

Forwarding class	Index
hpc	4

**Meaning** The **show class-of-service forwarding-class-set** command lists all of the configured forwarding class sets (priority groups), the forwarding classes (priorities) that belong to each priority group, and the internal index number of each priority group. The command output shows that:

- The forwarding class set **best-effort-pg** includes the forwarding classes **best-effort**, **be2**, and **network-control**.
- The forwarding class set **guar-delivery-pg** includes the forwarding classes **fcoe** and **no-loss**.
- The forwarding class set **hpc-pg** includes the forwarding class **hpc**.

#### *Verifying That the Classifier Has Been Created*

**Purpose** Verify that the classifier maps forwarding classes to the correct IEEE 802.1p code points and packet loss priorities.

**Action** List the classifier configured for hierarchical port scheduling using the operational mode command **show class-of-service classifier name hsclassifier1**:

```
user@switch> show class-of-service classifier name hsclassifier1
Classifier: hsclassifier1, Code point type: ieee-802.1p, Index: 43607
Code point      Forwarding class      Loss priority
000             best-effort            low
001             be2                   high
011             fcoe                  low
100             no-loss               low
101             hpc                   low
110             network-control       low
```

**Meaning** The **show class-of-service classifier name hsclassifier1** command lists all of the IEEE 802.1p code points and the loss priorities mapped to all of the forwarding classes in the classifier. The command output shows that the forwarding classes **best-effort**, **be2**, **no-loss**, **fcoe**, **hpc**, and **network-control** have been created and mapped to IEEE 802.1p code points and loss priorities.

#### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the correct priorities for lossless transport.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: gd-cnp, Index: 51687
```

```
Cable Length: 100 m
```

Priority	PFC	MRU
000	Disabled	
001	Disabled	
010	Disabled	
011	Enabled	2500
100	Enabled	2500
101	Disabled	
110	Disabled	
111	Disabled	

```
Type: Output
```

Priority	Flow-Control-Queues
000	0
001	0
010	1
011	2
100	3
101	4
110	5
111	6
	7

**Meaning** The **show class-of-service congestion-notification** command lists all of the congestion notification profiles and the IEEE 802.1p code points with PFC enabled. The command output shows that PFC is enabled for code points **011** (**fcoe** priority and queue) and **100** (**no-loss** priority and queue) for the **gd-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### *Verifying That the Output Queue Schedulers Have Been Created*

**Purpose** Verify that the output queue schedulers have been created with the correct bandwidth parameters and priorities, mapped to the correct queues, and mapped to the correct drop profiles.

**Action** List the scheduler maps using the operational mode command **show class-of-service scheduler-map**:

```
user@switch> show class-of-service scheduler-map
```

```
Scheduler map: be-map, Index: 64023
```

```
Scheduler: be-sched, Forwarding class: best-effort, Index: 13005
Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
```

Buffer Limit: none, Priority: low  
 Excess Priority: unspecified  
 Shaping rate: 100 percent,  
 drop-profile-map-set-type: mark  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	55387	dp-be-low
Medium high	any	1	<default-drop-profile>
High	any	4369	dp-be-high

Scheduler: be-sched, Forwarding class: be2, Index: 13005  
 Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,  
 Buffer Limit: none, Priority: low  
 Excess Priority: unspecified  
 Shaping rate: 100 percent,  
 drop-profile-map-set-type: mark  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	55387	dp-be-low
Medium high	any	1	<default-drop-profile>
High	any	4369	dp-be-high

Scheduler: nc-sched, Forwarding class: network-control, Index: 45740  
 Transmit rate: 5000000000 bps, Rate Limit: none, Buffer size: remainder,  
 Buffer Limit: none, Priority: low  
 Excess Priority: unspecified  
 Shaping rate: 100 percent,  
 drop-profile-map-set-type: mark  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	44207	dp-nc
Medium high	any	1	<default-drop-profile>
High	any	1	<default-drop-profile>

Scheduler map: gd-map, Index: 61447

Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289  
 Transmit rate: 25000000000 bps, Rate Limit: none, Buffer size: remainder,  
 Buffer Limit: none, Priority: low  
 Excess Priority: unspecified  
 Shaping rate: 100 percent,  
 drop-profile-map-set-type: mark  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	44207	<default-drop-profile>
Medium high	any	1	<default-drop-profile>
High	any	1	<default-drop-profile>

Scheduler: nl-sched, Forwarding class: no-loss, Index: 29359  
 Transmit rate: 20000000000 bps, Rate Limit: none, Buffer size: remainder,  
 Buffer Limit: none, Priority: low  
 Excess Priority: unspecified  
 Shaping rate: 100 percent,  
 drop-profile-map-set-type: mark  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	44207	<default-drop-profile>
Medium high	any	1	<default-drop-profile>
High	any	1	<default-drop-profile>

Scheduler map: hpc-map, Index: 56941

```
Scheduler: hpc-sched, Forwarding class: hpc, Index: 55900
Transmit rate: 2000000000 bps, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified
Shaping rate: 100 percent,
drop-profile-map-set-type: mark
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any       57716  dp-hpc
  Medium high   any       1      <default-drop-profile>
  High          any       1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map** command lists all of the configured scheduler maps. For each scheduler map, the command output includes:

- The name of the scheduler map (**scheduler-map** field)
- The name of the scheduler (**scheduler** field)
- The forwarding classes mapped to the scheduler (**forwarding-class** field)
- The minimum guaranteed queue bandwidth (**transmit-rate** field)
- The scheduling priority (**priority** field)
- The maximum bandwidth in the priority group the queue can consume (**shaping-rate** field)
- The drop profile loss priority (**loss priority** field) for each drop profile name (**name** field)

The command output shows that:

- The scheduler map **be-map** has been created and has these properties:
  - There are two schedulers, **be-sched** and **nc-sched**.
  - The scheduler **be-sched** has two forwarding classes, **best-effort** and **be2**.
  - Scheduler **be-sched** forwarding classes **best-effort** and **be2** share a minimum guaranteed bandwidth of **3000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and use the drop profile **dp-be-low** for low loss-priority traffic, the default drop profile for medium-high loss-priority traffic, and the drop profile **dp-be-high** for high loss-priority traffic.
  - The scheduler **nc-sched** has one forwarding class, **network-control**.
  - The **network-control** forwarding class has a minimum guaranteed bandwidth of **5000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-nc** for low loss-priority traffic and the default drop profile for medium-high and high loss priority traffic.
- The scheduler map **gd-map** has been created and has these properties:
  - There are two schedulers, **fcoe-sched** and **nl-sched**.
  - The scheduler **fcoe-sched** has one forwarding class, **fcoe**.

- The **fcoe** forwarding class has a minimum guaranteed bandwidth of **2500000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler **nl-sched** has one forwarding class, **no-loss**.
- The **no-loss** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, and can consume a maximum of **100 percent** of the priority group bandwidth.
- The scheduler map **hpc-map** has been created and has these properties:
  - There is one scheduler, **hpc-sched**.
  - The scheduler **hpc-sched** has one forwarding class, **hpc**.
  - The **hpc** forwarding class has a minimum guaranteed bandwidth of **2000000000 bps**, can consume a maximum of **100 percent** of the priority group bandwidth, and uses the drop profile **dp-hpc** for low loss-priority traffic and the default drop profile for medium-high and high loss-priority traffic.

#### *Verifying That the Drop Profiles Have Been Created*

**Purpose** Verify that the drop profiles **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc** have been created with the correct fill levels and drop probabilities.

**Action** List the drop profiles using the operational mode command **show configuration class-of-service drop-profiles**:

```
user@switch> show configuration class-of-service drop-profiles
dp-be-low {
    interpolate {
        fill-level [ 25 50 ];
        drop-probability [ 0 80 ];
    }
}
dp-be-high {
    interpolate {
        fill-level [ 10 40 ];
        drop-probability [ 0 100 ];
    }
}
dp-hpc {
    interpolate {
        fill-level [ 75 90 ];
        drop-probability [ 0 75 ];
    }
}
dp-nc {
    interpolate {
        fill-level [ 80 100 ];
        drop-probability [ 0 100 ];
    }
}
```

**Meaning** The **show configuration class-of-service drop-profiles** command lists the drop profiles and their properties. The command output shows that there are four drop profiles configured, **dp-be-high**, **dp-be-low**, **dp-hpc**, and **dp-nc**. The output also shows that:

- For **dp-be-low**, the drop start point (the first fill level) is when the queue is 25 percent filled, the drop end point (the second fill level) occurs when the queue is 50 percent filled, and the drop probability at the drop end point is 80 percent.
- For **dp-be-high**, the drop start point (the first fill level) is when the queue is 10 percent filled, the drop end point (the second fill level) occurs when the queue is 40 percent filled, and the drop probability at the drop end point is 100 percent.
- For **dp-hpc**, the drop start point (the first fill level) is when the queue is 75 percent filled, the drop end point (the second fill level) occurs when the queue is 90 percent filled, and the drop probability at the drop end point is 75 percent.
- For **dp-nc**, the drop start point (the first fill level) is when the queue is 80 percent filled, the drop end point (the second fill level) occurs when the queue is 100 percent filled, and the drop probability at the drop end point is 100 percent.

***Verifying That the Priority Group Output Schedulers (Traffic Control Profiles) Have Been Created***

**Purpose** Verify that the traffic control profiles **be-tcp**, **gd-tcp**, and **hpc-tcp** have been created with the correct bandwidth parameters and scheduler mapping.

**Action** List the traffic control profiles using the operational mode command **show class-of-service traffic-control-profile**:

```
user@switch> show class-of-service traffic-control-profile
Traffic control profile: be-tcp, Index: 40535
  Shaping rate: 100 percent
  Scheduler map: be-map
  Guaranteed rate: 3500000000

Traffic control profile: gd-tcp, Index: 37959
  Shaping rate: 100 percent
  Scheduler map: gd-map
  Guaranteed rate: 4500000000

Traffic control profile: hpc-tcp, Index: 47661
  Shaping rate: 100 percent
  Scheduler map: hpc-map
  Guaranteed rate: 2000000000
```

**Meaning** The **show class-of-service traffic-control-profile** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**traffic-control-profile**)
- The maximum port bandwidth the priority group can consume (**shaping-rate**)
- The scheduler map associated with the traffic control profile (**scheduler-map**)
- The minimum guaranteed priority group port bandwidth (**guaranteed-rate**)

The command output shows that:

- The traffic control profile **be-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **be-map**, and has a minimum guaranteed bandwidth of **3500000000 bps**.
- The traffic control profile **gd-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **gd-map**, and has a minimum guaranteed bandwidth of **4500000000 bps**.
- The traffic control profile **hpc-tcp** can consume a maximum of **100 percent** of the port bandwidth, is associated with the scheduler map **hpc-map**, and has a minimum guaranteed bandwidth of **2000000000 bps**.

### *Verifying the Interface Configuration*

**Purpose** Verify that the classifier, the congestion notification profile, and the forwarding class sets are configured on interfaces **xe-0/0/20** and **xe-0/0/21**.

**Action** List the interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hscclassifier1;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
forwarding-class-set {
    best-effort-gp {
        output-traffic-control-profile be-tcp;
    }
    guar-delivery-pg {
        output-traffic-control-profile gd-tcp;
    }
    hpc-pg {
        output-traffic-control-profile hpc-tcp;
    }
}
congestion-notification-profile gd_cnp;
unit 0 {
    classifiers {
        ieee-802.1 hscclassifier1;
    }
}
```

```
    }
}
```

**Meaning** The **show configuration class-of-service interfaces** *interface-name* command shows that each interface includes the forwarding class sets **best-effort-pg**, **guar-delivery-pg**, and **hpc-pg**, congestion notification profile **gd-cnp**, and the IEEE 802.1p classifier **hsclassifier1**.

## Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.

- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

---

This example describes how to configure PFC for FCoE traffic:

- [Requirements on page 4984](#)
- [Overview on page 4984](#)
- [Configuration on page 4986](#)
- [Verification on page 4989](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).
- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

**Topology**

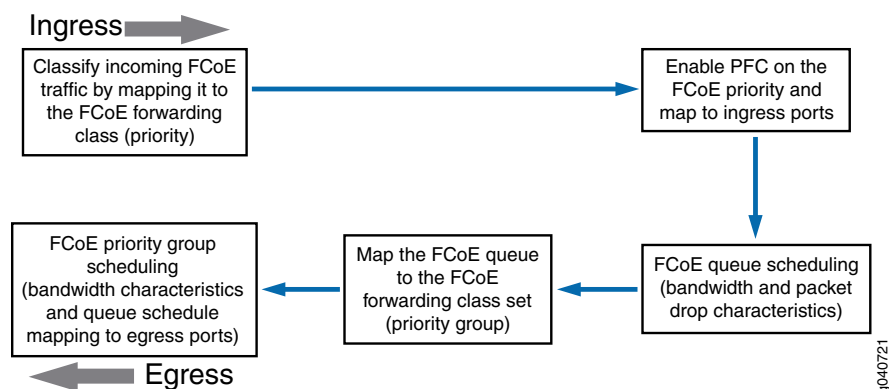

Table 315 on page 4510 shows the configuration components for this example.

**Table 417: Components of the PFC for FCoE Traffic Configuration Topology**

Component	Settings
Hardware	QFX3500 switch
Behavior aggregate classifier (maps the FCoE forwarding class to incoming packets by IEEE 802.1 code point)	Code point <b>011</b> to forwarding class <b>fcoe</b> and loss priority <b>low</b> Ingress interfaces: <b>xe-0/0/31, xe-0/0/32, xe-0/0/33, xe-0/0/34</b>

Figure 171 on page 4511 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

**Figure 187: PFC for FCoE Traffic Configuration Components Block Diagram**

## Configuration

### CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100
set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
```

### Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

```
[edit class-of-service]
user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point 011:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
```

3. Apply the PFC configuration to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
```

4. Assign the classifier to the ingress interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
```

5. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

6. Map the FCoE forwarding class to the FCoE scheduler:

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

7. Configure the forwarding class set for the FCoE traffic:

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```

8. Define the traffic control profile for the FCoE forwarding class set:

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

### Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
classifiers {
  ieee-802.1 fcoe-classifier {
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
  }
}
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
```

```
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
}
interfaces {
    xe-0/0/31 {
        congestion-notification-profile fcoe-cnp;
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-classifier;
            }
        }
    }
    xe-0/0/32 {
        congestion-notification-profile fcoe-cnp;
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-classifier;
            }
        }
    }
    xe-0/0/33 {
        congestion-notification-profile fcoe-cnp;
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        unit 0 {
            classifiers {
                ieee-802.1 fcoe-classifier;
            }
        }
    }
    xe-0/0/34 {
        congestion-notification-profile fcoe-cnp;
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        unit 0 {
```

```

        classifiers {
            ieee-802.1 fcoe-classifier;
        }
    }
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {
        transmit-rate 30000000000;
        shaping-rate percent 100;
        priority low;
    }
}

```

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command and then copy the hierarchy and paste it into the switch terminal window.

## Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- [Verifying That Priority-Based Flow Control Has Been Enabled on page 4989](#)
- [Verifying the Ingress Interface PFC Configuration on page 4990](#)

### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE queue to enable lossless transport.

**Action** List the congestion notification profiles using the operational mode command `show class-of-service congestion-notification`:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: fcoe-cnp, Index: 51697
```

```
Cable Length: 100 m
```

Priority	PFC	MRU
000	Disabled	
001	Disabled	
010	Disabled	
011	Enabled	2500
100	Disabled	
101	Disabled	
110	Disabled	
111	Disabled	

```
Type: Output
```

Priority	Flow-Control-Queues
000	

	0
001	
	1
010	
	2
011	
	3
100	
	4
101	
	5
110	
	6
111	
	7

**Meaning** The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point **011** for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### *Verifying the Ingress Interface PFC Configuration*

**Purpose** Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

**Action** List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

```

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

```

**Meaning** The `show configuration class-of-service interfaces` commands list the congestion notification profile that is mapped to the interface (`fcoe-cnp`) and the IEEE 802.1p classifier associated with the interface (`fcoe-classifier`).

### Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX3500 switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX3500 switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

**NOTE:** This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX3500 switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX3500 switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see [“Example: Configuring Multichassis Link Aggregation” on page 1958](#). However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

QFX3500 Node devices support MC-LAGs. QFabric system Node devices do not support MC-LAGs.

This topic describes:

- [Requirements on page 4992](#)
- [Overview on page 4992](#)
- [Configuration on page 4997](#)
- [Verification on page 5005](#)

---

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX3500 Switches that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX3500 Switches that provide FCoE server access in transit switch mode, and connect to the MC-LAG switches. These switches can be standalone QFX3500 switches or they can be Node devices in a QFabric system.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 12.2 or later for the QFX Series.

---

## Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX3500 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).
- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Disable IGMP snooping on the FCoE VLAN.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

This example does not show how to configure the MC-LAG itself. This example does include a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

## Topology

QFX3500 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in [Figure 172 on page 4519](#):

Figure 188: Supported Topology for an MC-LAG on an FCoE Transit Switch

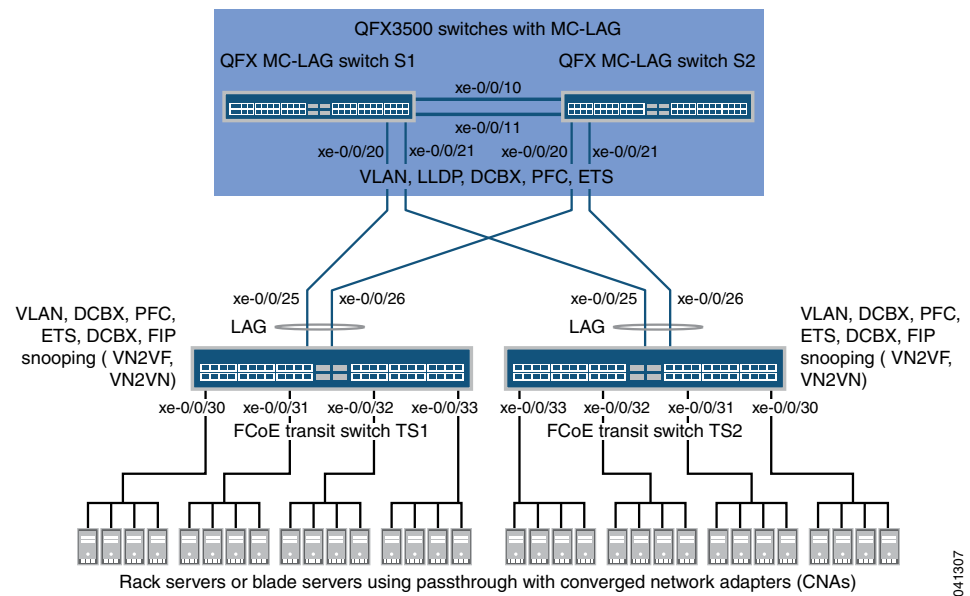

Table 316 on page 4519 shows the configuration components for this example.

Table 418: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology

Component	Settings
Hardware	Four QFX3500 switches (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access)
Forwarding class (all switches)	Default <b>fcoe</b> forwarding class.
Classifier (forwarding class mapping of incoming traffic to IEEE priority)	Default IEEE 802.1p trusted classifier on all FCoE interfaces.

FCoE VLAN name and tag ID	<p>Name—<b>fcoe_vlan</b> ID—100</p> <p>Include the FCoE VLAN on the interfaces that carry FCoE traffic on all four switches.</p> <p>Disable IGMP snooping on the FCoE VLAN on all four switches.</p>
FIP snooping	<p>Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping.</p> <p>This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration.</p>

**NOTE:** This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode and tagged access mode ports if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is **queue 3**.

**NOTE:** In Junos OS Release 12.2, traffic mapped to explicitly configured forwarding classes, even lossless forwarding classes such as **fcoe**, is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment. To receive lossless treatment in release 12.2, traffic must use one of the default lossless forwarding classes (**fcoe** or **no-loss**).

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in the explicit forwarding class configuration to configure a lossless forwarding class.

- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk and tagged-access port modes. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (011) to the FCoE forwarding class. You can configure the BA classifier if you wish, but you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.
- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers and how to disable IGMP snooping on the FCoE VLAN. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required

to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ([“Example: Configuring Multichassis Link Aggregation” on page 1958](#) describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ([“Configuring Link Aggregation” on page 2033](#) describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

### Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- [Configuring MC-LAG Switches S1 and S2 on page 4999](#)
- [Configuring FCoE Transit Switches TS1 and TS2 on page 5000](#)
- [Results on page 5002](#)

#### CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the [edit] hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100
set class-of-service scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set class-of-service forwarding-class-sets fcoe-pg class fcoe
set class-of-service traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate
3g
set class-of-service traffic-control-profiles fcoe-tcp shaping-rate percent 100
set class-of-service interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces ae0 congestion-notification-profile fcoe-cnp
set class-of-service interfaces ae1 congestion-notification-profile fcoe-cnp
set vlans fcoe_vlan vlan-id 100
set protocols igmp-snooping vlan fcoe_vlan disable

```

**Configuring MC-LAG Switches S1 and S2**

**Step-by-Step Procedure** To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:
 

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```
2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):
 

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```
3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:
 

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
```
6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:
 

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
7. Apply the PFC configuration to the LAG and MC-LAG interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```
8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):
 

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
9. Disable IGMP snooping on the FCoE VLAN:
 

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```

10. Add the member interfaces to the LAG between the two MC-LAG switches:

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```

11. Add the member interfaces to the MC-LAG:

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```

12. Configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and MC-LAG interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```

14. Set the LAG and MC-LAG interfaces as FCoE trusted ports (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae0 fcoe-trusted
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

### *Configuring FCoE Transit Switches TS1 and TS2*

#### **Step-by-Step Procedure**

The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

- ```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:
 

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
  5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```
  6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point 011:
 

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
  7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:
 

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile
fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile
fcoe-cnp
```
  8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):
 

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
  9. Disable IGMP snooping on the FCoE VLAN:
 

```
[edit protocols]
user@switch# set igmp-snooping vlan fcoe_vlan disable
```
  10. Add the member interfaces to the LAG:
 

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```
  11. On the LAG (**ae1**), configure the port mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching port-mode trunk vlan
members fcoe_vlan
```

12. On the FCoE access interfaces (xe-0/0/30, xe-0/0/31, xe-0/0/32, xe-0/0/33), configure the port mode as **tagged-access** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching port-mode
tagged-access vlan members fcoe_vlan
```

13. Set the MTU to **2180** for the LAG and FCoE access interfaces (2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes):

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

14. Set the LAG interface as an FCoE trusted port (ports that connect to other switches should be trusted and should not perform FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port interface ae1 fcoe-trusted
```

15. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN\_Port FIP snooping; the example is equally valid if you use VN2VF\_Port FIP snooping):

```
user@switch# set ethernet-switching-options secure-access-port vlan fcoe_vlan
examine-fip examine-vn2v2 beacon-period 90000
```

## Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are similar):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 30000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
```

```

}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
interfaces {
  ae0 {

    shaping-rate percent 100;
    priority low;
  }
}
}

```

**NOTE:** The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

## Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- [Verifying That the Output Queue Schedulers Have Been Created on page 5006](#)
- [Verifying That the Priority Group Output Scheduler \(Traffic Control Profile\) Has Been Created on page 5006](#)
- [Verifying That the Forwarding Class Set \(Priority Group\) Has Been Created on page 5007](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 5007](#)
- [Verifying That the Interface Class of Service Configuration Has Been Created on page 5008](#)
- [Verifying That the Interfaces Are Correctly Configured on page 5010](#)
- [Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 5012](#)
- [Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2 on page 5013](#)
- [Verifying That IGMP Snooping Is Disabled on the FCoE VLAN on page 5013](#)

***Verifying That the Output Queue Schedulers Have Been Created***

**Purpose** Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

**Action** List the scheduler map using the operational mode command **show class-of-service scheduler-map fcoe-map**:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023
```

```
Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified
Shaping rate: 100 percent,
drop-profile-map-set-type: mark
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any       1      <default-drop-profile>
  Medium high   any       1      <default-drop-profile>
  High          any       1      <default-drop-profile>
```

**Meaning** The **show class-of-service scheduler-map fcoe-map** command lists the properties of the scheduler map **fcoe-map**. The command output includes:

- The name of the scheduler map (**fcoe-map**)
- The name of the scheduler (**fcoe-sched**)
- The forwarding classes mapped to the scheduler (**fcoe**)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

***Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created***

**Purpose** Verify that the traffic control profile **fcoe-tcp** has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

**Action** List the FCoE traffic control profile properties using the operational mode command **show class-of-service traffic-control-profile fcoe-tcp**:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
Shaping rate: 100 percent
```

Scheduler map: fcoe-map  
Guaranteed rate: 3000000000

**Meaning** The **show class-of-service traffic-control-profile fcoe-tcp** command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (**fcoe-tcp**)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (**fcoe-map**)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

#### *Verifying That the Forwarding Class Set (Priority Group) Has Been Created*

**Purpose** Verify that the FCoE priority group has been created and that the **fcoe** priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class          Index
  fcoe                      1
```

**Meaning** The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

#### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

**Action** List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority    PFC          MRU
  000        Disabled
  001        Disabled
  010        Disabled
  011        Enabled    2500
  100        Disabled
  101        Disabled
```

|              |                     |
|--------------|---------------------|
| 110          | Disabled            |
| 111          | Disabled            |
| Type: Output |                     |
| Priority     | Flow-Control-Queues |
| 000          |                     |
|              | 0                   |
| 001          |                     |
|              | 1                   |
| 010          |                     |
|              | 2                   |
| 011          |                     |
|              | 3                   |
| 100          |                     |
|              | 4                   |
| 101          |                     |
|              | 5                   |
| 110          |                     |
|              | 6                   |
| 111          |                     |
|              | 7                   |

**Meaning** The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point **011** (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

#### ***Verifying That the Interface Class of Service Configuration Has Been Created***

**Purpose** Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

**Action** List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}

ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
```

```
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/33 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
```

**Meaning** The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

**NOTE:** Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

### ***Verifying That the Interfaces Are Correctly Configured***

**Purpose** Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

**Action** List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
```

```

        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```

user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/32 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode tagged-access;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {

```

```
        port-mode tagged-access;
        vlan {
            members fcoe_vlan;
        }
    }
}

ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

**Meaning** The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The port mode (**trunk** mode for interfaces that connect two switches, **tagged-access** mode for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe\_vlan**)

***Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces***

**Purpose** Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

**Action** List the port security configuration on FCoE transit switches TS1 and TS2 using the operational mode command **show configuration ethernet-switching-options secure-access-port**:

```
user@switch> show configuration ethernet-switching-options secure-access-port
interface ae1.0 {
    fcoe-trusted;
}
vlan fcoe_vlan {
```

```
    examine-fip;
}
```

**Meaning** The `show configuration ethernet-switching-options secure-access-port` command lists port security information, including whether a port is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- FIP snooping is enabled (**examine-fip**) on the FCoE VLAN (**fcoe\_vlan**). On Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

#### *Verifying That the FIP Snooping Mode is Correct on FCoE Transit Switches TS1 and TS2*

**Purpose** Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Switch TS1 and TS2 FCoE access ports.

**Action** List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,    Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
...
```

**NOTE:** The output has been truncated to show only the relevant information.

**Meaning** The `show fip snooping brief` command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe\_vlan**
- The FIP snooping mode is VN2VN\_Port FIP snooping (**VN2VN Snooping**)

#### *Verifying That IGMP Snooping Is Disabled on the FCoE VLAN*

**Purpose** Verify that IGMP snooping is disabled on the FCoE VLAN on all four switches.

**Action** List the IGMP snooping protocol information on each of the four switches using the **show configuration protocols igmp-snooping** command:

```
user@switch> show configuration protocols igmp-snooping
vlan fcoe_vlan {
    disable;
}
```

**Meaning** The **show configuration protocols igmp-snooping** command lists the IGMP snooping configuration for the VLANs configured on the switch. The command output shows that IGMP snooping is disabled on the FCoE VLAN (**fcoe\_vlan**).

## Example: Configuring Unicast Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. You apply classifiers to ingress interfaces.

- [Requirements on page 5014](#)
- [Overview on page 5014](#)
- [Configuring Unicast Classifiers on page 5015](#)
- [Verification on page 5016](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP or DSCP IPv6) value or IEEE 802.1p value.

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**NOTE:** You must assign unicast traffic and multidestination (multicast, broadcast, and destination lookup fail) traffic to different classifiers. One classifier cannot include both unicast and multidestination forwarding classes. A unicast classifier can include only forwarding classes for unicast traffic.

This example describes how to configure a BA classifier called **ba-ucast-classifier** as the default IEEE 802.1 map and apply it to ingress interface **xe-0/0/10**. The BA classifier assigns loss priorities, as shown in [Table 419 on page 5015](#), to incoming packets in the four forwarding classes.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

**Table 419: ba-ucast-classifier Loss Priority Assignments**

| Unicast Forwarding Class | For CoS Traffic Type                                               | ba-ucast-classifier Loss Priority to IEEE 802.1p Code Point Mapping | Packet Drop Attribute |
|--------------------------|--------------------------------------------------------------------|---------------------------------------------------------------------|-----------------------|
| <b>be</b>                | Best-effort traffic                                                | Low loss priority code point: 000                                   | drop                  |
| <b>fcoe</b>              | Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic | Low loss priority code point: 011                                   | no-loss               |
| <b>no-loss</b>           | Guaranteed delivery for TCP traffic                                | Low loss priority code point: 100                                   | no-loss               |
| <b>nc</b>                | Network-control traffic                                            | Low loss priority code point: 110                                   | drop                  |

### Configuring Unicast Classifiers

To configure a unicast IEEE 802.1 BA classifier named **ba-ucast-classifier** as the default IEEE 802.1 map:

1. Associate code point 000 with forwarding class **be** and loss priority **low**:  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier import default forwarding-class be
loss-priority low code-points 000
```
2. Associate code point 011 with forwarding class **fcoe** and loss priority **low**:  

```
[edit class-of-service classifiers]
```

```
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class fcoe loss-priority low
code-points 011
```

3. Associate code point 100 with forwarding class **no-loss** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class no-loss loss-priority low
code-points 100
```

4. Associate code point 110 with forwarding class **nc** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-ucast-classifier forwarding-class nc loss-priority low
code-points 110
```

5. Apply the unicast classifier to ingress interface **xe-0/0/10**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/10 unit 0 classifiers ieee-802.1 ba-ucast-classifier
```

---

### Verification

To verify the unicast classifier configuration, perform these tasks:

- [Verifying the Unicast Classifier Configuration on page 5016](#)
- [Verifying the Ingress Interface Configuration on page 5016](#)

#### *Verifying the Unicast Classifier Configuration*

**Purpose** Verify that you configured the unicast classifier with the correct forwarding classes, loss priorities, and code points.

**Action** List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-ucast-classifier
  forwarding-class be {
    loss-priority low code-points 000;
  }
  forwarding-class fcoe {
    loss-priority low code-points 011;
  }
  forwarding-class no-loss {
    loss-priority low code-points 100;
  }
  forwarding-class nc
    loss-priority low code-points 110;
}
```

#### *Verifying the Ingress Interface Configuration*

**Purpose** Verify that the unicast classifier **ba-ucast-classifier** is attached to ingress interface **xe-0/0/10**.

**Action** List the ingress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/10**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/10
congestion-notification-profile fcoe-cnp;
unit 0 {
  classifiers {
```

```

        ieee-802.1 ba-ucast-classifier;
    }
}

```

### Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class.

- [Requirements on page 5017](#)
- [Overview on page 5017](#)
- [Configuring Multidestination Classifiers on page 5018](#)
- [Verification on page 5018](#)

#### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

#### Overview

Junos OS supports three general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.

**NOTE:** DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

- Fixed classifiers. Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.

- **Multifield traffic classifiers**—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

**NOTE:** You must assign unicast traffic and multicast traffic to different classifiers. One classifier cannot include both unicast and multicast forwarding classes. A multidestination classifier can include only forwarding classes for multicast traffic.

The following example describes how to configure a BA classifier called **ba-mcast-classifier**, which is applied to all of the switch interfaces. The BA classifier assigns loss priorities, as shown in [Table 420 on page 5018](#), to incoming packets in the multidestination forwarding class.

You can use the same procedure to set multifield classifiers (except that you use firewall filter rules).

**Table 420: BA-mcast-classifier Loss Priority Assignments**

| Multicast Forwarding Class | For CoS Traffic Type          | ba-mcast-classifier Assignment    |
|----------------------------|-------------------------------|-----------------------------------|
| <b>mcast</b>               | Best-effort multicast traffic | Low loss priority code point: 000 |

### Configuring Multidestination Classifiers

To configure a multicast IEEE 802.1 BA classifier named **ba-mcast-classifier**:

1. Associate code point **000** with forwarding class **mcast** and loss priority **low**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 ba-mcast-classifier forwarding-class mcast-be loss-priority
low code-points 000
```

2. Configure the classifier as a multidestination classifier:

```
[edit class-of-service]
user@switch# set multi-destination classifiers ieee-802.1 ba-mcast-classifier
```

### Verification

To verify the multidestination classifier configuration, perform these tasks:

- [Verifying the IEEE 802.1 Multidestination Classifier on page 5019](#)
- [Verifying the Multidestination Classifier Configuration on page 5019](#)

*Verifying the IEEE 802.1 Multidestination Classifier*

**Purpose** Verify that the classifier **ba-mcast-classifier** is configured as the IEEE 802.1 multidestination classifier:

**Action** Verify the results of the classifier configuration using the operational mode command **show configuration class-of-service multi-destination classifiers ieee-802.1**:

```
user@switch> show configuration class-of-service multi-destination classifiers ieee-802.1
ba-mcast-classifier;
```

*Verifying the Multidestination Classifier Configuration*

**Purpose** Verify that you configured the multidestination classifier with the correct forwarding classes, loss priorities, and code points.

**Action** List the classifier configuration using the operational mode command **show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier**:

```
user@switch> show configuration class-of-service classifiers ieee-802.1 ba-mcast-classifier
    forwarding-class mcast {
        loss-priority low code-points 000;
    }
```

  - [Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 4851](#)

**Example: Configuring Tail-Drop Profiles**

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

**NOTE:** You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

- [Requirements on page 5020](#)
- [Overview on page 5020](#)
- [Configuring a Drop Profile on page 5022](#)
- [Verification on page 5022](#)

## Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

---

You associate a tail-drop profile with a loss priority in a scheduler. When you attach the scheduler to a forwarding class (queue), you apply the interpolated drop profile to traffic of the specified loss priority in that queue. *Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point:

- Drop start point—Percentage of average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop.
- Drop end point—Average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.)
- Maximum drop rate—Drop probability when the average queue fill level reaches the drop end point.

You set the drop start point and the drop end point by specifying two queue fill level percentage values. The first value is the drop start point and the second value is the drop end point.

You set the maximum drop rate by specifying two drop probability percentage values. The first value is always zero (0), which is the minimum drop rate, the probability of dropping a packet at the drop start point. The second value is the maximum drop rate at the drop end point.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

[Figure 189 on page 5021](#) shows the graph for a drop profile with a drop start point of 30 percent, a drop end point of 50 percent, and a maximum drop rate of 80 percent.

Figure 189: Tail-Drop Profile Packet Drop Example

The graph shows that when the queue fill level is less than 30 percent, the packet drop rate is zero. When the queue fill level reaches 30 percent, packets begin to drop. As the queue fills, a higher percentage of packets drop. When the queue fill level reaches 50 percent, the packet drop rate has climbed to 80 percent. When the queue fill level exceeds 50 percent, all packets drop.

This example describes how to configure the drop profile shown in [Figure 189 on page 5021](#). The drop profile will have:

- The name **be-dp1**
- 30 percent for the drop start point (first **fill-level** setting)
- 50 percent for the drop end point (second **fill-level** setting)
- 0 percent for the minimum drop rate (first **drop-probability** setting)
- 80 percent for the maximum drop rate (second **drop-probability** setting)

You apply a drop profile by configuring a drop profile map that maps the drop profile to a packet loss priority and associates the drop profile and packet loss priority with a scheduler. When you associate the scheduler with a forwarding class (queue), the switch applies the drop profile to the packets in the forwarding class that have a matching packet loss priority.

### Configuring a Drop Profile

---

1. Set the drop start point at 30 percent, the drop end point at 50 percent, the minimum drop rate at 0 percent, and the maximum drop rate at 80 percent for the drop profile **be-dp1**:

```
[edit class-of-service]
user@switch# set drop-profile be-dp1 interpolate fill-level 30 fill-level 50 drop-probability
0 drop-probability 80
```

### Verification

---

#### Verifying the Drop Profile Configuration

- Purpose** Verify that you configured the drop profile **be-dp1** with the correct drop start and end points and with the correct drop rates.
- Action** Verify the results of the drop profile configuration using the operational mode command **show configuration class-of-service drop-profiles be-dp1**:
- ```
user@switch> show configuration class-of-service drop-profiles be-dp1
interpolate {
    fill-level [ 30 50 ];
    drop-probability [ 0 80 ];
}
```

  - [Understanding CoS Tail-Drop Profiles on page 4929](#)

### Example: Configuring Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

- [Requirements on page 5022](#)
- [Overview on page 5023](#)
- [Configuring a Drop Profile Map on page 5023](#)
- [Verification on page 5023](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

The following example describes how to configure a drop profile map for a scheduler named **mylan** that includes:

- A drop profile called **lp-profile** for low-priority traffic
- A drop profile called **mh-profile** for medium-high priority traffic
- A drop profile called **h-profile** for high-priority traffic

You apply the drop profiles in the drop profile map to a forwarding class by associating the scheduler **mylan** with a forwarding class in a scheduler map.

## Configuring a Drop Profile Map

1. Configure the drop profile for low-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority low protocol any
drop-profile lp-profile
```

2. Configure the drop profile for medium-high priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority medium-high protocol
any drop-profile mh-profile
```

3. Configure the drop profile for high-priority traffic:

```
[edit class-of-service]
user@switch# set schedulers mylan drop-profile-map loss-priority high protocol any
drop-profile h-profile
```

## Verification

### Verifying the Drop Profile Map Configuration

**Purpose** Verify that you configured the drop profile map for the scheduler **mylan** with the correct loss priorities and drop profiles.

**Action** Verify the results of the drop profile map configuration using the operational mode command **show configuration class-of-service schedulers mylan**:

```
user@switch> show configuration class-of-service schedulers mylan
transmit-rate 3g;
shaping-rate percent 100;
priority low;
drop-profile-map loss-priority low protocol any drop-profile lp-profile;
drop-profile-map loss-priority medium-high protocol any drop-profile mh-profile;
drop-profile-map loss-priority high protocol any drop-profile h-profile;
```

NOTE: This example does not include configuring scheduler bandwidth and priority. This information (transmit rate, shaping rate, and priority) is shown for completeness.

## Example: Configuring Forwarding Classes

Forwarding classes allow you to group packets for transmission. You assign packets to unicast or multdestination (multicast, broadcast, and destination lookup fail) output queues based on forwarding classes.

- [Requirements on page 5024](#)
- [Overview on page 5024](#)
- [Configuring Forwarding Classes on page 5026](#)
- [Verification on page 5026](#)

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

The switch supports a total of 12 forwarding classes. In order to forward traffic, you must map (assign) the forwarding classes to unicast or multdestination output queues. The switch has 12 queues. Queues 0 through 7 are for unicast traffic, and queues 8 through 11 are for multdestination traffic. The switch supports up to two lossless forwarding classes.

By default, four categories of unicast forwarding classes and one multdestination forwarding class are defined. You can define the remaining seven forwarding classes and configure them as unicast or multdestination by mapping them to unicast or multdestination queues. The type of queue, unicast or multdestination, determines the type of forwarding class.

The four default unicast forwarding classes are:

- **be**—Best-effort traffic
- **fcoe**—Guaranteed delivery for Fibre Channel over Ethernet traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **nc**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue. The statement format is:

```
[edit class-of-service forwarding-classes]
user@switch# class class-name queue-num queue-number;
```

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

**NOTE:** Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

```
[edit class-of-service forwarding-classes]
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

**NOTE:** The QFX Series uses hierarchical scheduling to control output queue forwarding. When you define a forwarding class that will carry traffic on the switch (the behavior aggregate classifier has a forwarding class and you expect traffic for the forwarding class), you must also define a scheduling policy for the forwarding class. Defining a scheduling policy means:

- Mapping a scheduler to the forwarding class in a scheduler map
- Including the forwarding class in a forwarding class set
- Associating the scheduler map with a traffic control profile
- Attaching the traffic control profile to a forwarding class set and an interface

Table 421 on page 5026 shows the configuration forwarding-class-to-queue mapping for this example:

**Table 421: Forwarding-Class-to-Queue Example Configuration**

Forwarding Class	Queue
best-effort	0
nc	7
mcast	8

### Configuring Forwarding Classes

To configure CoS forwarding classes, map the forwarding classes to queues:

1. Map the **best-effort** forwarding class to queue 0:

```
[edit class-of-service forwarding-classes]
user@switch# set class best-effort queue-num 0
```

2. Map the **nc** forwarding class to queue 7:

```
[edit class-of-service forwarding-classes]
user@switch# set class nc queue-num 7
```

3. Map the **mcast-be** forwarding class to queue 8:

```
[edit class-of-service forwarding-classes]
user@switch# set class mcast-be queue-num 8
```

### Verification

#### Verifying the Forwarding-Class-to-Queue Mapping

**Purpose** Verify the forwarding-class-to-queue mapping. (The system shows only the explicitly configured forwarding classes; it does not show default forwarding classes such as **fcoe** and **no-loss**.)

**Action** Verify the results of the forwarding class configuration using the operational mode command **show configuration class-of-service forwarding-classes**:

```
user@switch> show configuration class-of-service forwarding-classes
class best-effort queue-num 0;
class network-control queue-num 7;
class mcast queue-num 8;
```

## Example: Configuring Forwarding Class Sets

A forwarding class set (fc-set) is a priority group for enhanced transmission selection (ETS) traffic control. Each fc-set consists of one or more forwarding classes (output queues).

ETS enables you to configure link resources (bandwidth and bandwidth sharing characteristics) for a priority group, and then allocate the priority group's resources among the forwarding classes that belong to the priority group. This is called two-tier, or hierarchical, scheduling. Traffic control profiles control the scheduling for the priority group, and schedulers control the scheduling for individual forwarding classes.

- [Requirements on page 5027](#)
- [Overview on page 5027](#)
- [Configuring Forwarding Class Sets on page 5028](#)
- [Verification on page 5029](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

You can configure up to three unicast fc-sets and one multicast fc-set. A common way to configure unicast priority groups is to configure separate fc-sets for local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and then assign the appropriate forwarding classes to each fc-set.

**NOTE:** If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

To apply ETS, you map one or more fc-sets to a physical egress port. You can map up to three forwarding class sets to each port. When you map an fc-set to a port, the port uses hierarchical scheduling to allocate port resources to the priority group (fc-set) and to allocate the priority group resources to the queues (forwarding classes) that belong to the priority group.

This example describes how to:

- Configure three fc-sets called **lan-pg**, **san-pg**, and **hpc-pg**.
- Assign forwarding classes to each of the fc-sets.
- Apply the fc-sets and their output traffic control profiles to an egress interface.

This example does not describe how to configure the forwarding classes assigned to the fc-sets or how to configure traffic control profiles. [Table 422 on page 5028](#) shows the configuration components for this example:

**Table 422: Components of the Forwarding Class Sets Configuration Example**

Component	Settings
Hardware	QFX3500 switch
LAN traffic priority group	Forwarding class set: <b>lan-pg</b> Forwarding classes: <b>best-effort-1</b> , <b>best-effort-2</b>
SAN traffic priority group	Forwarding class set: <b>san-pg</b> Forwarding classes: <b>fcoe</b> , <b>fcoe-2</b>
HPC traffic priority group	Forwarding class set: <b>hpc-pg</b> Forwarding classes: <b>nc</b> , <b>high-perf</b>
Egress interface	<b>xe-0/0/7</b>

### Configuring Forwarding Class Sets

1. Define the **lan-pg** priority group (fc-set) and assign to it the forwarding classes **best-effort-1** and **best-effort-2**:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets lan-pg class best-effort-1
user@switch# set forwarding-class-sets lan-pg class best-effort-2
```
2. Define the **san-pg** priority group and assign to it the forwarding classes **fcoe** and **fcoe-2**:  

```
[edit class-of-service]
```

```

user@switch# set forwarding-class-sets san-pg class fcoe
user@switch# set forwarding-class-sets san-pg class fcoe-2

```

3. Define the **hpc-pg** priority group and assign to it the forwarding classes **nc** and **high-perf**:

```

[edit class-of-service]
user@switch# set forwarding-class-sets hpc-pg class nc
user@switch# set forwarding-class-sets hpc-pg class high-perf

```

4. Map the three forwarding class sets to an interface (the output traffic control profiles associated with the forwarding class sets determine the class of service scheduling for the priority groups):

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile lan-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set san-pg
output-traffic-control-profile san-tcp
user@switch# set interfaces xe-0/0/7 forwarding-class-set hpc-pg
output-traffic-control-profile hpc-tcp

```

### Verification

To verify the priority group configuration, perform these tasks:

- [Verifying Forwarding Class Set Membership on page 5029](#)
- [Verifying the Egress Interface Configuration on page 5029](#)

#### *Verifying Forwarding Class Set Membership*

**Purpose** Verify that you configured the **lan-pg**, **san-pg**, and **hpc-pg** priority groups with the correct forwarding classes.

**Action** List the forwarding class set member configuration using the operational mode command **show configuration class-of-service forwarding-class-sets**:

```

user@switch> show configuration class-of-service forwarding-class-sets
lan-pg {
    class best-effort-1;
    class best-effort-2;
}
san-pg {
    class fcoe;
    class fcoe-2;
}
hpc-pg {
    class high-perf;
    class nc;
}

```

#### *Verifying the Egress Interface Configuration*

**Purpose** Verify that egress interface **xe-0/0/7** is associated with the **lan-pg**, **san-pg**, and **hpc-pg** priority groups and with the correct output traffic control profiles.

**Action** Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
  lan-pg {
    output-traffic-control-profile lan-tcp;
  }
  san-pg {
    output-traffic-control-profile san-tcp;
  }
  hpc-pg {
    output-traffic-control-profile hpc-tcp;
  }
}
```

## Example: Configuring Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, and the tail-drop profiles associated with the queue.

- [Requirements on page 5030](#)
- [Overview on page 5030](#)
- [Configuring a CoS Scheduler on page 5033](#)
- [Verification on page 5033](#)

### Requirements

---

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

Scheduler parameters define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each queue mapped to the scheduler receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue. You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

**NOTE:** The **transmit-rate** setting works only if you also configure the **guaranteed-rate** in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the **guaranteed-rate**, the **transmit-rate** does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate. If you configure transmit rates whose sum exceeds the forwarding class set guaranteed rate, the commit check fails, and the system rejects the configuration.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each queue receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Mapping of a drop profile to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

**NOTE:** Queues might not receive the egress bandwidth configured in the queue scheduler when a port's egress queues are congested. This can occur when the ingress port buffer fills above a certain threshold. If this happens, configure a drop profile for the queue on the port that is receiving its configured bandwidth (this queue is preventing the other queues on the port from receiving their configured bandwidth). The drop profile applies a weighted random early detection (WRED) algorithm to the queue and prevents the queue from impacting the other queues on the port.

Scheduler maps associate schedulers with forwarding classes (queues). After defining schedulers and mapping them to queues in a scheduler map, to configure hardware queue scheduling (port scheduling) you:

1. Associate a scheduler map with a traffic control profile (a traffic control profile schedules resources for a group of forwarding classes, called a *forwarding class set* or *priority group*).
2. Attach a forwarding class and a traffic control profile to an interface.

You can associate up to four user-defined scheduler maps with forwarding class sets.

This process configures the hardware queues, packet schedulers, and WRED characteristics that operate according to the scheduler mapping. The traffic control profile uses the scheduler CoS properties to determine the resources that should be allocated to the individual output queues from the total resources available to the priority group.

Table 423 on page 5032 shows the configuration components for this example.

**Table 423: Components of the Queue Scheduler Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Scheduler	Name: <b>be-sched</b> Transmit rate: <b>20%</b> Shaping rate: <b>40%</b> Buffer size: <b>20%</b> Priority: <b>low</b> Drop profile: <b>be-dp</b>
Scheduler map	Name: <b>be-map</b> Forwarding class to associate with the <b>be-sched</b> scheduler: <b>best-effort</b>
Traffic control profile	Name: <b>be-tcp</b>  <b>NOTE:</b> This topic does not describe how to define a traffic control profile.
Forwarding class set	Name: <b>lan-pg</b>

## Configuring a CoS Scheduler

To configure a CoS scheduler using the CLI:

1. Create a scheduler (**be-sched**) with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, low priority, and map it to the drop profile **be-dp**:

```
[edit class-of-service schedulers]
user@switch# set be-sched transmit-rate percent 20
user@switch# set be-sched shaping-rate percent 40
user@switch# set be-sched buffer-size percent 20
user@switch# set be-sched priority low
user@switch# set be-sched drop-profile-map loss-priority low protocol any drop-profile
be-dp
```

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

3. Associate the scheduler map **be-map** with a traffic control profile (**be-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

4. Associate the traffic control profile **be-tcp** with a forwarding class set (**lan-pg**) and a 10-Gigabit Ethernet interface (**xe-0/0/7**):

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 forwarding-class-set lan-pg
output-traffic-control-profile be-tcp
```

5. Alternatively, you can assign the scheduler map (**be-map**) to all the 10-Gigabit Ethernet interfaces using wildcards (**xe-\***):

```
[edit class-of-service interfaces]
user@switch# set xe-* forwarding-class-set lan-pg output-traffic-control-profile be-tcp
```

## Verification

To verify that the queue scheduler has been created and is mapped to the correct interfaces, perform these tasks:

- [Verifying the Scheduler Configuration on page 5033](#)
- [Verifying the Scheduler Map Configuration on page 5034](#)
- [Verifying That the Scheduler Is Associated with the Interface on page 5034](#)

### Verifying the Scheduler Configuration

**Purpose** Verify that the queue scheduler **be-sched** has been created with a minimum guaranteed bandwidth of 2 Gbps, a maximum bandwidth of 4 Gbps, the priority set to **low**, and the drop profile **be-dp**.

**Action** Display the scheduler using the operational mode command **show configuration class-of-service schedulers be-sched**:

```
user@switch> show configuration class-of-service schedulers be-sched
```

```
transmit-rate percent 20;
shaping-rate percent 40;
buffer-size percent 20
priority low;
drop-profile-map loss-priority low protocol any drop-profile be-dp;
```

#### *Verifying the Scheduler Map Configuration*

**Purpose** Verify that the scheduler map **be-map** has been created and associates the forwarding class **best-effort** with the scheduler **be-sched**, and also that the scheduler map is attached to the traffic control profile **be-tcp**.

**Action** Display the scheduler map using the operational mode command **show configuration class-of-service scheduler-maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

Display the traffic control profile to verify that the scheduler map **be-map** is attached using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

**NOTE:** This topic does not describe how to configure a traffic control profile or its allocation of port bandwidth. Using a traffic control profile to configure the port resource allocation to the priority group is necessary to implement hierarchical scheduling.

#### *Verifying That the Scheduler Is Associated with the Interface*

**Purpose** Verify that the forwarding class set (**lan-pg**) and the traffic control profile (**be-tcp**) that are associated with the queue scheduler are attached to the interface **xe-0/0/7**.

**Action** List the interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
  lan-pg {
    output-traffic-control-profile be-tcp;
  }
}
```

## Example: Configuring Queue Scheduling Priority

You can configure the bandwidth scheduling priority of individual queues by specifying the priority in a scheduler, and then using a scheduler map to associate the scheduler with a queue.

- [Requirements on page 5035](#)
- [Overview on page 5035](#)
- [Configuring Queue Scheduling Priority on page 5036](#)
- [Verification on page 5036](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

Queues can have one of two bandwidth priorities:

- **strict-high**—You can configure only one queue as a strict-high or high-priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.

**NOTE:** If you configure strict-high priority queues, you must create an fc-set that is dedicated only to strict-high priority traffic. Only one fc-set can contain strict-high priority queues. Queues that are not strict-high priority cannot belong to the same fc-set as strict-high priority queues. The multidestination fc-set cannot contain strict-high priority queues.

- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.

[Table 424 on page 5036](#) shows the configuration components for this example.

This example describes how to set the queue priority for two forwarding classes (queues) named **fcoe** and **no-loss**. Both queues have a priority of **low**. The scheduler for the **fcoe** queue is named **fcoe-sched** and the scheduler for the **no-loss** queue is named **nl-sched**. One scheduler map, **schedmap1**, associates the schedulers to the queues.

**Table 424: Components of the Queue Scheduler Priority Configuration Example**

Component	Settings
Hardware	QFX3500 switch
Schedulers	<b>fcoe-sched</b> for FCoE traffic <b>nl-sched</b> for no-loss traffic
Priority	<b>low</b> for FCoE traffic <b>low</b> for no-loss traffic
Scheduler map	<b>schedmap1</b> : FCoE mapping: scheduler <b>fcoe-sched</b> to forwarding class <b>fcoe</b> No-loss mapping: scheduler <b>nl-sched</b> to forwarding class <b>no-loss</b>

### Configuring Queue Scheduling Priority

To configure queue priority using the CLI:

- Create the FCoE scheduler with **low** priority:  

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low
```
- Create the no-loss scheduler with **low** priority:  

```
[edit class-of-service]
user@switch# set schedulers nl-sched priority low
```
- Associate the schedulers with the desired queues in the scheduler map:  

```
[edit class-of-service]
user@switch# set scheduler-maps schedmap1 forwarding-class fcoe scheduler fcoe-sched
user@switch# set scheduler-maps schedmap1 forwarding-class no-loss scheduler nl-sched
```

### Verification

To verify that you configured the queue scheduling priority for bandwidth and mapped the schedulers to the correct forwarding classes, perform these tasks:

- [Verifying the Queue Scheduling Priority on page 5036](#)
- [Verifying the Scheduler-to-Forwarding-Class Mapping on page 5037](#)

#### Verifying the Queue Scheduling Priority

**Purpose** Verify that you configured the queue schedulers **fcoe-sched** and **nl-sched** with **low** queue scheduling priority.

**Action** Display the **fcoe-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers fcoe-sched priority**:

```
user@switch> show configuration class-of-service schedulers fcoe-sched priority
priority low;
```

Display the **nl-sched** scheduler priority configuration using the operational mode command **show configuration class-of-service schedulers nl-sched priority**:

```
user@switch> show configuration class-of-service schedulers nl-sched priority
priority low;
```

#### *Verifying the Scheduler-to-Forwarding-Class Mapping*

**Purpose** Verify that you configured the scheduler map **schedmap1** to map scheduler **fcoe-sched** to forwarding class **fcoe** and schedule **nl-sched** to forwarding class **no-loss**.

**Action** Display the scheduler map **schedmap1** using the operational mode command **show configuration class-of-service scheduler-maps schedmap1**:

```
user@switch> show configuration class-of-service scheduler-maps schedmap1
forwarding-class fcoe scheduler fcoe-sched;
forwarding-class no-loss scheduler nl-sched;
```

#### **Related Documentation**

### **Example: Configuring Traffic Control Profiles (Priority Group Scheduling)**

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) mapped to a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

- [Requirements on page 5037](#)
- [Overview on page 5038](#)
- [Configuring a Traffic Control Profile on page 5039](#)
- [Verification on page 5039](#)

#### **Requirements**

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch

- Junos OS Release 11.1 or later for the QFX Series

## Overview

---

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). Each priority group receives a minimum of either the configured amount of absolute bandwidth or the configured percentage of bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** In order for the **transmit-rate** option (minimum bandwidth for a queue that you set using scheduler configuration) to work properly, you must configure the **guaranteed-rate** for the priority group. If a priority group does not have a guaranteed minimum bandwidth, the queues (forwarding classes) that belong to the priority group cannot have a guaranteed minimum bandwidth.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR). Each priority group receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

**NOTE:** Include the preamble bytes and interframe gap bytes as well as the data bytes in your bandwidth calculations.

- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

**NOTE:** Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

For example, if you map three priority groups to a 10-Gigabit Ethernet port, the queues associated with all three of the priority groups share the 10-Gbps bandwidth as defined by the traffic control profiles. Therefore, the total combined guaranteed-rate value of the three priority groups should not exceed 10 Gbps. If you configure guaranteed rates whose sum exceeds the port bandwidth, the system sends a syslog message to notify you that the configuration is not valid. However, the system does not perform a commit check. If you commit a configuration in which the sum of the guaranteed rates exceeds the port bandwidth, the hierarchical scheduler behaves unpredictably.

The sum of the queue (forwarding class) transmit rates cannot exceed the total guaranteed-rate of the priority group to which the queues belong. If you configure transmit rates whose sum exceeds the priority group guaranteed rate, the commit check fails and the system rejects the configuration.

If you configure the guaranteed-rate of a priority group as a percentage, configure all of the transmit rates associated with that priority group as percentages. In this case, if any of the transmit rates are configured as absolute values instead of percentages, the configuration is not valid and the system sends a syslog message.

### Configuring a Traffic Control Profile

This example describes how to configure a traffic control profile named **san-tcp** with a scheduler map named **san-map1** and allocate to it a minimum bandwidth of 4 Gbps and a maximum bandwidth of 8 Gbps:

1. Create the traffic control profile and set the **guaranteed-rate** (minimum guaranteed bandwidth) to **4g**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp guaranteed-rate 4g
```

2. Set the **shaping-rate** (maximum guaranteed bandwidth) to **8g**:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp shaping-rate 8g
```

3. Associate the scheduler map **san-map1** with the traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles san-tcp scheduler-map san-map1
```

### Verification

#### Verifying the Traffic Control Profile Configuration

**Purpose** Verify that the traffic control profile **san-tcp** has been created with a minimum guaranteed bandwidth of 4 Gbps, a maximum bandwidth of 8 Gbps, and the scheduler map **san-map1**.

**Action** List the traffic control profile using the operational mode command **show configuration class-of-service traffic-control-profiles san-tcp**:

```
user@switch> show configuration class-of-service traffic-control-profiles san-tcp
scheduler-map san-map1;
shaping-rate percent 8g;
guaranteed-rate 4g;
```

## Example: Configuring Minimum Guaranteed Output Bandwidth

Scheduling the minimum guaranteed output bandwidth for a queue (forwarding class) requires configuring both tiers of the two-tier hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

- [Requirements on page 5040](#)
- [Overview on page 5040](#)
- [Configuring Guaranteed Minimum Bandwidth on page 5042](#)
- [Verification on page 5043](#)

### Requirements

---

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview

---

The priority group minimum guaranteed bandwidth defines the minimum total amount of bandwidth available for all of the queues in the priority group to meet their minimum bandwidth requirements.

The **transmit-rate** setting in the scheduler configuration determines the minimum guaranteed bandwidth for an individual queue. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

The **guaranteed-rate** setting in the traffic control profile configuration determines the minimum guaranteed bandwidth for a priority group. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** You must configure both the **transmit-rate** value for the queue and the **guaranteed-rate** value for the priority group in order to set a valid minimum bandwidth guarantee for a queue. (If the priority group does not have a guaranteed minimum bandwidth, there is no guaranteed bandwidth pool from which the queue can take its guaranteed minimum bandwidth.)

The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

**NOTE:** You cannot configure minimum guaranteed bandwidth on strict-high priority queues or on a priority group that contains strict-high priority queues.

This example describes how to:

- Configure a transmit rate (minimum guaranteed queue bandwidth) of 2 Gbps for queues in a scheduler named **be-sched**.
- Configure a guaranteed rate (minimum guaranteed priority group bandwidth) of 4 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the minimum guaranteed bandwidth scheduling to the egress interface **xe-0/0/7**.

Table 425 on page 5042 shows the configuration components for this example:

Table 425: Components of the Minimum Guaranteed Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Minimum guaranteed queue bandwidth	Transmit rate: 2g
Minimum guaranteed priority group bandwidth	Guaranteed rate: 4g
Scheduler	be-sched
Scheduler map	be-map
Traffic control profile	be-tcp
Forwarding class set (priority group)	be-pg
Queue (forwarding class)	best-effort
Egress interface	xe-0/0/7

### Configuring Guaranteed Minimum Bandwidth

To configure the minimum guaranteed bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the minimum guaranteed queue bandwidth of 2 Gbps for scheduler **be-sched**:

```
[edit class-of-service schedulers]
user@switch# set be-sched transmit-rate 2g
```

2. Configure the minimum guaranteed priority group bandwidth of 4 Gbps for traffic control profile **be-tcp**:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp guaranteed-rate 4g
```

3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

4. Associate the scheduler map with the traffic control profile:

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```

5. Assign the **best-effort** queue to the priority group **be-pg**:

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```

6. Apply the configuration to interface **xe-0/0/7**:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

## Verification

To verify the minimum guaranteed output bandwidth configuration, perform these tasks:

- [Verifying the Minimum Guaranteed Queue Bandwidth on page 5043](#)
- [Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association on page 5043](#)
- [Verifying the Scheduler Map Configuration on page 5043](#)
- [Verifying Queue \(Forwarding Class\) Membership in the Priority Group on page 5044](#)
- [Verifying the Egress Interface Configuration on page 5044](#)

### *Verifying the Minimum Guaranteed Queue Bandwidth*

**Purpose** Verify that you configured the minimum guaranteed queue bandwidth as **2g** in the scheduler **be-sched**.

**Action** Display the minimum guaranteed bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched transmit-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched transmit-rate
2g;
```

### *Verifying the Priority Group Minimum Guaranteed Bandwidth and Scheduler Map Association*

**Purpose** Verify that the minimum guaranteed priority group bandwidth is **4g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

**Action** Display the minimum guaranteed bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp guaranteed-rate
4g;
```

Display the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

### *Verifying the Scheduler Map Configuration*

**Purpose** Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

**Action** Display the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service schedulers maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
```

```
forwarding-class best-effort scheduler be-sched;
```

#### *Verifying Queue (Forwarding Class) Membership in the Priority Group*

- Purpose** Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.
- Action** Display the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:
- ```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

#### *Verifying the Egress Interface Configuration*

- Purpose** Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.
- Action** Display the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:
- ```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

## Example: Configuring Maximum Output Bandwidth

Scheduling the maximum output bandwidth for a queue (forwarding class) requires configuring both tiers of the hierarchical scheduler. One tier is scheduling the resources for the individual queue. The other tier is scheduling the resources for the priority group (forwarding class set) to which the queue belongs.

- [Requirements on page 5045](#)
- [Overview on page 5045](#)
- [Configuring Maximum Bandwidth on page 5046](#)
- [Verification on page 5047](#)

## Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

The priority group maximum bandwidth defines the maximum total amount of bandwidth available for all of the queues in the priority group.

The **shaping-rate** setting in the scheduler configuration determines the maximum bandwidth for an individual queue.

The **shaping-rate** setting in the traffic control profile configuration determines the maximum bandwidth for a priority group.

**NOTE:** When you configure bandwidth for a queue or a priority group, the switch considers only the data as the configured bandwidth. The switch does not account for the bandwidth consumed by the preamble and the interframe gap (IFG). Therefore, when you calculate and configure the bandwidth requirements for a queue or for a priority group, consider the preamble and the IFG as well as the data in the calculations.

**NOTE:** When you set the maximum bandwidth (**shaping-rate**) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/- 20 percent of the configured **shaping-rate** value.

This example describes how to:

- Configure a maximum rate of 4 Gbps for queues in a scheduler named **be-sched**.
- Configure a maximum rate of 6 Gbps for a priority group in a traffic control profile named **be-tcp**.
- Assign the scheduler to a queue named **best-effort** by using a scheduler map named **be-map**.
- Associate the scheduler map **be-map** with the traffic control profile **be-tcp**.
- Assign the queue **best-effort** to a priority group named **be-pg**.
- Assign the priority group and the bandwidth scheduling to the interface **xe-0/0/7**.

Table 426 on page 5046 shows the configuration components for this example:

Table 426: Components of the Maximum Output Bandwidth Configuration Example

Component	Settings
Hardware	QFX3500 switch
Maximum queue bandwidth	Shaping rate: <b>4g</b>
Maximum priority group bandwidth	Shaping rate: <b>6g</b>
Scheduler	<b>be-sched</b>
Scheduler map	<b>be-map</b>
Traffic control profile	<b>be-tcp</b>
Forwarding class set (priority group)	<b>be-pg</b>
Queue (forwarding class)	<b>best-effort</b>
Egress interface	<b>xe-0/0/7</b>

### Configuring Maximum Bandwidth

To configure the maximum bandwidth hierarchical scheduling for a queue and a priority group:

1. Configure the maximum queue bandwidth of 4 Gbps for scheduler **be-sched**:  

```
[edit class-of-service schedulers]
user@switch# set be-sched shaping-rate 4g
```
2. Configure the maximum priority group bandwidth of 6 Gbps for traffic control profile **be-tcp**:  

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp shaping-rate 6g
```
3. Associate the scheduler **be-sched** with the **best-effort** queue in the scheduler map **be-map**:  

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```
4. Associate the scheduler map with the traffic control profile:  

```
[edit class-of-service traffic-control-profiles]
user@switch# set be-tcp scheduler-map be-map
```
5. Assign the **best-effort** queue to the priority group **be-pg**:  

```
[edit class-of-service forwarding-class-sets]
user@switch# set be-pg class best-effort
```
6. Apply the configuration to interface **xe-0/0/7**:  

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set be-pg output-traffic-control-profile be-tcp
```

## Verification

To verify the maximum output bandwidth configuration, perform these tasks:

- [Verifying the Maximum Queue Bandwidth on page 5047](#)
- [Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association on page 5047](#)
- [Verifying the Scheduler Map Configuration on page 5047](#)
- [Verifying Queue \(Forwarding Class\) Membership in the Priority Group on page 5048](#)
- [Verifying the Egress Interface Configuration on page 5048](#)

### *Verifying the Maximum Queue Bandwidth*

**Purpose** Verify that you configured the maximum queue bandwidth as **4g** in the scheduler **be-sched**.

**Action** List the maximum bandwidth in the **be-sched** scheduler configuration using the operational mode command **show configuration class-of-service schedulers be-sched shaping-rate**:

```
user@switch> show configuration class-of-service schedulers be-sched shaping-rate
4g;
```

### *Verifying the Priority Group Maximum Bandwidth and Scheduler Map Association*

**Purpose** Verify that the maximum priority group bandwidth is **6g** and the attached scheduler map is **be-map** in the traffic control profile **be-tcp**.

**Action** List the maximum bandwidth in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp shaping-rate**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp shaping-rate
4g;
```

List the scheduler map in the **be-tcp** traffic control profile configuration using the operational mode command **show configuration class-of-service traffic-control-profiles be-tcp scheduler-map**:

```
user@switch> show configuration class-of-service traffic-control-profiles be-tcp scheduler-map
scheduler-map be-map;
```

### *Verifying the Scheduler Map Configuration*

**Purpose** Verify that the scheduler map **be-map** maps the forwarding class **best-effort** to the scheduler **be-sched**.

**Action** List the **be-map** scheduler map configuration using the operational mode command **show configuration class-of-service scheduler-maps be-map**:

```
user@switch> show configuration class-of-service scheduler-maps be-map
forwarding-class best-effort scheduler be-sched;
```

***Verifying Queue (Forwarding Class) Membership in the Priority Group***

**Purpose** Verify that the forwarding class set **be-pg** includes the forwarding class **best-effort**.

**Action** List the **be-pg** forwarding class set configuration using the operational mode command **show configuration class-of-service forwarding-class-sets be-pg**:

```
user@switch> show configuration class-of-service forwarding-class-sets be-pg
class best-effort;
```

***Verifying the Egress Interface Configuration***

**Purpose** Verify that the forwarding class set **be-pg** and the traffic control profile **be-tcp** are attached to egress interface **xe-0/0/7**.

**Action** List the egress interface using the operational mode command **show configuration class-of-service interfaces xe-0/0/7**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/7
forwarding-class-set {
    be-pg {
        output-traffic-control-profile be-tcp;
    }
}
```

**Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)**

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your network uses a different priority than 3 for FCoE traffic, you need to configure lossless FCoE transport on that priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic instead of using priority 3.

- [Requirements on page 5049](#)
- [Overview on page 5049](#)

- [Configuration on page 5051](#)
- [Verification on page 5052](#)

---

## Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

---

## Overview

Although FCoE traffic typically uses IEEE 802.1p priority 3 on converged Ethernet networks, some networks use a different priority for FCoE traffic. Regardless of the priority used, FCoE traffic must receive lossless treatment. Supporting lossless behavior for FCoE traffic when your network does not use priority 3 requires configuring:

- A lossless forwarding class for FCoE traffic.
- A behavior aggregate (BA) classifier to map the FCoE forwarding class to the appropriate IEEE 802.1p priority.
- A congestion notification profile (CNP) to enable PFC on the FCoE code point at the interface ingress and to configure flow control on the interface egress. Flow control on the interface egress enables the interface to respond to PFC messages received from the connected peer and pause the correct IEEE 802.1p priority on the correct output queue.
- A DCBX application and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priority. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

## Topology

This example shows how to configure one lossless FCoE traffic class, map it to a priority other than priority 3, and configure flow control to ensure lossless behavior on the interfaces. This example uses two Ethernet interfaces, xe-0/0/25 and xe-0/0/26. The interfaces connect to a converged Ethernet network that uses IEEE 802.1p priority 5 (code point 101) for FCoE traffic.

The configuration on the two interfaces is the same. Both interfaces use the same explicitly configured lossless FCoE forwarding class and the same ingress classifier. Both interfaces enable PFC on priority 5 and enable flow control on the same output queue (which is mapped to the lossless FCoE forwarding class).

Table 427 on page 5050 shows the configuration components for this example.

**Table 427: Components of the Configuration Topology for FCoE Traffic That Does Not Use Priority 3**

Component	Settings
Hardware	QFX3500 switch
Forwarding class	<p>Name—<b>fcoe1</b></p> <p>Queue mapping—<b>queue 5</b></p> <p>Packet drop attribute—<b>no-loss</b></p> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p>
BA classifier	<p>Name—<b>fcoe_p5</b></p> <p>FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b>.</p>
PFC configuration (CNPs)	<p>CNP name—<b>fcoe_p5_cnp</b></p> <p>Input CNP code point—<b>101</b></p> <p>MRU—<b>2240</b> bytes</p> <p>Cable length—<b>100</b> meters</p> <p>Output CNP code point—<b>101</b></p> <p>Output CNP flow control queue—<b>5</b></p> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.</p>
DCBX application mapping	<p>Application name—<b>fcoe_p5_app</b></p> <p>Application EtherType—<b>0x8906</b></p> <p>Application map name—<b>fcoe_p5_app_map</b></p> <p>Application map code points—<b>101</b></p> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p>

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure a lossless FCoE forwarding class that uses a different priority than IEEE 802.1p priority 3 for FCoE traffic on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

#### Configuring A Lossless FCoE Forwarding Class On IEEE 802.1p Priority 5

#### Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic on IEEE 802.1p priority 5 (code point 101), classify FCoE traffic into the lossless forwarding class, configure a congestion notification profile to enable PFC on the FCoE priority and output queue, and configure DCBX application protocol TLV exchange for traffic on the FCoE priority:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue 5) for FCoE traffic on IEEE 802.1p priority 5:

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```

2. Configure the ingress classifier (**fcoe\_p5**). The classifier maps the FCoE priority (code point 101) to the lossless FCoE forwarding class **fcoe1**:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
101
```

3. Apply the classifier to interfaces **xe-0/0/25** and **xe-0/0/26**:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/25 unit 0 classifiers ieee-802.1 fcoe_p5
user@switch# set interfaces xe-0/0/26 unit 0 classifiers ieee-802.1 fcoe_p5
```

4. Configure the CNP. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/25 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/26 congestion-notification-profile fcoe_p5_cnp
```

6. Configure the DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priority 5 instead of on the default priority 3:

```
[edit]
user@switch# set applications application fcoe_p5_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101
```

8. Apply the application map to the Ethernet interfaces so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/25 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/26 application-map fcoe_p5_app_map
```

---

## Verification

To verify the configuration and proper operation of the lossless forwarding class and IEEE 802.1p priority, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 5052](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 5053](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 5053](#)
- [Verifying the Interface Configuration on page 5054](#)
- [Verifying the DCBX Application Configuration on page 5055](#)
- [Verifying the DCBX Application Map Configuration on page 5055](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5055](#)

### *Verifying the Forwarding Class Configuration*

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
no-loss	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

#### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifier configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
```

```
Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065
```

Code point	Forwarding class	Loss priority
101	fcoe1	low

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe\_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**, and all other priorities to the **best-effort** forwarding class with a packet loss priority of **high**.

#### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priority and that flow control is configured on the correct output queue in the CNP.

**Action** Display the congestion notification profile using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_p5_cnp, Index: 12137
Type: Input
Cable Length: 100 m
  Priority  PFC          MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled    2240
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the configured CNPs.

The **fcoe\_p5\_cnp** CNP input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifier and congestion notification profile are configured on the interfaces.

**Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/25** and **show configuration class-of-service interfaces xe-0/0/26**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/25
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
  classifiers {
    ieee-802.1 fcoe_p5;
  }
}

user@switch> show configuration class-of-service interfaces xe-0/0/26
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
  classifiers {
    ieee-802.1 fcoe_p5;
  }
}
```

**Meaning** Both the **show configuration class-of-service interfaces xe-0/0/25** command and the **show configuration class-of-service interfaces xe-0/0/26** command show that the

congestion notification profile **fcoe\_p5\_cnp** is configured on each interface, and that the IEEE 802.1p classifier associated with each interface is **fcoe\_p5**.

#### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX application for FCoE is configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application fcoe_p5_app {
    ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_p5\_app** is configured with an EtherType of **0x8906**.

#### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map is configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe\_p5\_app\_map** consists of the application named **fcoe\_p5\_app**, which is mapped to IEEE 802.1p code point **101**.

#### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application map is applied to the correct interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/25.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/26.0 {
    application-map fcoe_p5_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/25.0** and **xe-0/0/26.0** use application map **fcoe\_p5\_app\_map**.

## Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface

The default system configuration supports FCoE traffic on priority 3 (IEEE 802.1p code point 011). If the FCoE traffic on your converged Ethernet network uses priority 3, the only user configuration required for lossless transport is to enable PFC on code point 011 on the FCoE ingress interfaces.

However, if your converged Ethernet network uses more than one priority for FCoE traffic, you need to configure lossless transport for each FCoE priority. This example shows you how to configure lossless FCoE transport on a converged Ethernet network that uses both priority 3 (IEEE 802.1p code point 011) and priority 5 (IEEE 802.1p code point 101) for FCoE traffic.

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

### Overview

---

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, a converged Ethernet network might include two separate FCoE networks that use different priorities to identify traffic. Interfaces that carry traffic for both FCoE networks need to support lossless FCoE transport on both priorities.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class).
- A behavior aggregate (BA) classifier to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities).
- A congestion notification profile (CNP) to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer.
- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifier, CNP, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

### **Topology**

This example shows how to configure two lossless FCoE traffic classes on an interface, map them to two different priorities, and configure flow control to ensure lossless behavior. This example uses two Ethernet interfaces, xe-0/0/20 and xe-0/0/21, that are connected to the converged Ethernet network. Both interfaces transport FCoE traffic on priorities 3 (011) and 5 (101), and must support lossless transport of that traffic.

[Table 428 on page 5057](#) shows the configuration components for this example.

**Table 428: Components of the Two Lossless FCoE Priorities on an Interface Configuration Topology**

### Configuration

#### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch interface, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 011 pfc
mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input ieee-802.1 code-point 101 pfc
mru 2240
set class-of-service congestion-notification-profile fcoe_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 011
pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_cnp output ieee-802.1 code-point 101
pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
set class-of-service interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
set applications application fcoe_app ether-type 0x8906
set policy-options application-maps fcoe_app_map application fcoe_app code-points [011 101]
set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

**Step-by-Step Procedure** To configure two lossless forwarding classes for FCoE traffic on the same interface, classify FCoE traffic into the forwarding classes, configure CNPs to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```

**NOTE:** This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier. The classifier maps the FCoE priorities (IEEE 802.1p code points 011 and 101) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_classifier forwarding-class fcoe1 loss-priority low
code-points 101
```

3. Apply the classifier to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_classifier
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_classifier
```

4. Configure the CNP. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point
011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

5. Apply the CNP to the interfaces:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_cnp
user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_cnp
```

6. Configure a DCBX application for FCoE to map to the Ethernet interfaces, so that DCBX can exchange application protocol TLVs on both of the IEEE 802.1p priorities used for FCoE transport:

```
[edit]
```

```
user@switch# set applications application fcoe_app ether-type 0x8906
```

7. Configure a DCBX application map to map the FCoE application to the correct IEEE 802.1p FCoE priorities:

```
[edit]
user@switch# set policy-options application-maps fcoe_app_map application fcoe_app
code-points [011 101]
```

8. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/20 application-map fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_app_map
```

### Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 5061](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 5062](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 5062](#)
- [Verifying the Interface Configuration on page 5063](#)
- [Verifying the DCBX Application Configuration on page 5063](#)
- [Verifying the DCBX Application Map Configuration on page 5064](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5064](#)

#### Verifying the Forwarding Class Configuration

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding-class**:

```
user@switch# show class-of-service forwarding-class
```

Forwarding class	ID	Queue	Policing priority	No-Loss
best-effort	0	0	normal	Disabled
fcoe	1	3	normal	Enabled
no-loss	2	4	normal	Enabled
network-control	3	7	normal	Disabled
fcoe1	4	5	normal	Enabled
mcast	8	8	normal	Disabled

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue 5 with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

#### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_classifier, Code point type: ieee-802.1, Index: 10964
  Code point      Forwarding class      Loss priority
  011             fcoe                      low
  101             fcoe1                     low
```

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier.

Classifier **fcoe\_classifier** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

#### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities.

**Action** List the CNPs using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
Name: fcoe_cnp, Index: 46504
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Enabled   2240
  100      Disabled
  101      Enabled   2240
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  011      3
  101      5
```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the CNP.

The CNP **fcoe\_cnp** input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the interface cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

### *Verifying the Interface Configuration*

- Purpose** Verify that the classifier and congestion notification profile are configured on the interfaces. Both interfaces should show the same configuration.
- Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20** and **show configuration class-of-service interfaces xe-0/0/21**:
- ```
user@switch> show configuration class-of-service interfaces xe-0/0/20
congestion-notification-profile fcoe_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}
```
- ```
user@switch> show configuration class-of-service interfaces xe-0/0/21
congestion-notification-profile fcoe_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_classifier;
    }
}
```
- Meaning** The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_classifier**.
- The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_classifier**.

### *Verifying the DCBX Application Configuration*

- Purpose** Verify that the DCBX application for FCoE is configured.
- Action** List the DCBX applications by using the configuration mode command **show applications**:
- ```
user@switch# show applications
application fcoe_app {
    ether-type 0x8906;
```
- Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_app** is configured with an EtherType of **0x8906**.

### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map is configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_app_map {
    application fcoe_app code-points [011 101];
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that application map **fcoe\_app\_map** consists of the application named **fcoe\_app**, which is mapped to IEEE 802.1p code points **011** and **101** (priorities 3 and 5, respectively).

### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application map is applied to the interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/20.0 {
    application-map fcoe_app_map;
}
interface xe-0/0/21.0 {
    application-map fcoe_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interfaces **xe-0/0/20.0** and **xe-0/0/21.0** use application map **fcoe\_app\_map**.

## Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic if it uses different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and map them to two different priorities on an FCoE transit switch.

- [Requirements on page 5065](#)
- [Overview on page 5065](#)
- [Configuration on page 5069](#)
- [Verification on page 5072](#)

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode
- Junos OS Release 12.3 or later for the QFX Series

### Overview

Some network topologies support FCoE traffic on more than one IEEE 802.1p priority. For example, when the QFX3500 switch acts as a transit switch, it could be connected to two QFX3500 switches in FCoE-FC gateway mode. Each of the gateway switches could connect a set of FCoE clients to a different SAN, and each set of FCoE clients could use a different priority for FCoE traffic to avoid fate sharing and maintain separation of the two FCoE networks. In this case, you need to configure two forwarding classes for FCoE traffic, each mapped to a different output queue and a different priority.

Supporting lossless behavior for two FCoE traffic classes requires configuring:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- Behavior aggregate (BA) classifiers to map the FCoE forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE code points at the interface ingress and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer
- DCBX applications and an application map to support DCBX application TLV exchange for the lossless FCoE traffic on the configured FCoE priorities. By default, DCBX is enabled on all Ethernet interfaces, but only on priority 3 (IEEE 802.1p code point 011).

To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

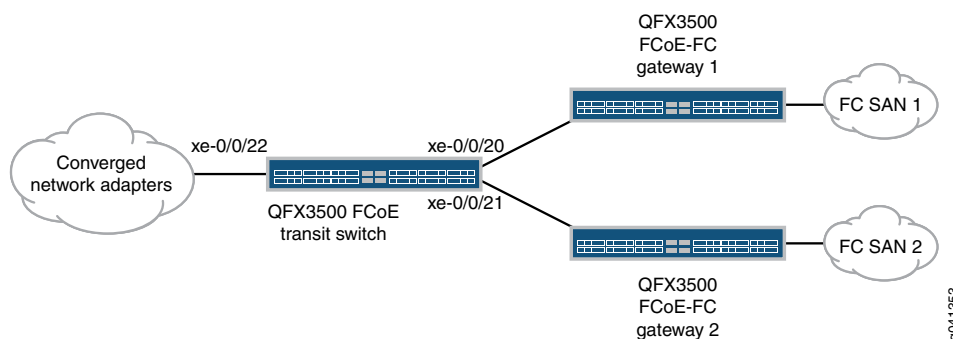

### Topology

This example shows how to configure two lossless FCoE traffic classes, map them to two different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses three Ethernet interfaces, xe-0/0/20, xe-0/0/21, and xe-0/0/22:

- Interface xe-0/0/20 connects to an FCoE-FC gateway that connects to Fibre Channel (FC) SAN 1. FCoE traffic to and from FC SAN 1 uses the default **fcoe** forwarding class and the default mapping to priority 3 (IEEE 802.1p code point 011) and output queue 3.
- Interface xe-0/0/21 connects to another FCoE-FC gateway that connects to Fibre Channel (FC) SAN 2. FCoE traffic to and from FC SAN-2 uses an explicitly configured FCoE forwarding class that is mapped to priority 5 (code point 101) and output queue 5.
- Interface xe-0/0/22 connects to FCoE devices on the converged Ethernet network and handles traffic destined for FC SAN 1 and FC SAN 2. Interface xe-0/0/22 must properly handle lossless FCoE traffic of both priorities (both FCoE forwarding classes), including pausing the traffic on ingress or egress as required.

Figure 190 on page 5066 shows the topology for this example, and Table 429 on page 5066 shows the configuration components for this example.

**Figure 190: Topology of the Two Lossless FCoE Priorities Example**

**Table 429: Components of the Two Lossless FCoE Priorities Configuration Topology**

| Component | Settings       |
|-----------|----------------|
| Hardware  | QFX3500 switch |

Table 429: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)

| Component          | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding classes | <p>Name—<b>fcoe1</b><br/> Queue mapping—queue 5<br/> Packet drop attribute—<b>no-loss</b></p> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p> <p>Name—<b>fcoe</b><br/> This is the default lossless FCoE forwarding class, so no configuration required. The <b>fcoe</b> forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of <b>no-loss</b></p>                                                                                                                                                                                                      |

Table 429: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)

| Component                | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PFC configuration (CNPs) | <p>Each interface requires a different CNP because each interface handles a different subset of FCoE traffic and must pause that traffic on different priorities.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/20 CNP:<br/>CNP name—<b>fcoe_p3_cnp</b><br/>Input CNP code point—<b>011</b><br/>MRU—2240 bytes<br/>Cable length—100 meters</li> </ul> <p><b>NOTE:</b> Because interface xe-0/0/20 uses the default FCoE configuration, output queue 3 is paused by default and you do not need to configure the output stanza of the CNP.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/21 CNP:<br/>CNP name—<b>fcoe_p5_cnp</b><br/>Input CNP code point—<b>101</b><br/>MRU—2240 bytes<br/>Cable length—150 meters<br/>Output CNP code point—<b>101</b><br/>Output CNP flow control queue—<b>5</b></li> <li>Interface xe-0/0/22 CNP:<br/>CNP name—<b>fcoe_p3_p5_cnp</b><br/>Input CNP code points—<b>011</b> and <b>101</b><br/>MRU—2240 bytes (both priorities)<br/>Cable length—100 meters<br/>Output CNP code points—<b>011</b> (for queue 3) and <b>101</b> (for queue 5)<br/>Output CNP flow control queues—<b>3</b> for priority 3 (code point 011) and <b>5</b> for priority 5 (code point 101)</li> </ul> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.</p> |

Table 429: Components of the Two Lossless FCoE Priorities Configuration Topology (*continued*)

| Component                | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DCBX application mapping | <p>Interface xe-0/0/20 does not need an application map because DCBX exchanges application protocol TLVs only on the default FCoE priority (priority 3).</p> <p>Interface xe-0/0/21 requires an application map that enables DCBX application protocol TLV exchange on priority 5 (code point 101) for FCoE traffic. Interface xe-0/0/22 requires an application map that enables DCBX application protocol TLV exchange both on priority 3 (code point 011) and on priority 5 (code point 101) for FCoE traffic.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/21 DCBX application mapping:           <ul style="list-style-type: none"> <li>Application name—<b>fcoe_p5_app</b></li> <li>Application ether-type—<b>0x8906</b></li> <li>Application map name—<b>fcoe_p5_app_map</b></li> <li>Application map code points—<b>101</b></li> </ul> </li> <li>Interface xe-0/0/22 DCBX application mapping:           <ul style="list-style-type: none"> <li>Application name—<b>fcoe_all_app</b></li> <li>Application ether-type—<b>0x8906</b></li> <li>Application map name—<b>fcoe_all_app_map</b></li> <li>Application map code points—<b>011 and 101</b></li> </ul> </li> </ul> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p> |

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes that use different priorities on an FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low
code-points 101
set class-of-service interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
set class-of-service interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
set class-of-service interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
set class-of-service congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011
pfc mru 2240
```

```

set class-of-service congestion-notification-profile fcoe_p3_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101
pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p5_cnp input cable-length 150
set class-of-service congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point
011 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point
011 pfc flow-control-queue 3
set class-of-service congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
set class-of-service interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
set class-of-service interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
set class-of-service interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp
set applications application fcoe_p5_app ether-type 0x8906
set applications application fcoe_all_app ether-type 0x8906
set policy-options application-maps fcoe_p5_app_map application fcoe_p5_app code-points 101
set policy-options application-maps fcoe_all_app_map application fcoe_all_app code-points [011
101]
set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map

```

### Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic on different interfaces, classify FCoE traffic into the forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding class **fcoe1** and map it to output queue **5** for FCoE traffic that uses IEEE 802.1p priority 5:

```

[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss

```

**NOTE:** This examples uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class.

2. Configure the ingress classifier (**fcoe\_p3**) for interface **xe-0/0/20**. The classifier maps the FCoE priority (IEEE 802.1p code point **011**) to lossless FCoE forwarding class **fcoe**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3 forwarding-class fcoe loss-priority low code-points
011

```

3. Configure the ingress classifier (**fcoe\_p5**) for interface **xe-0/0/21**. The classifier maps the FCoE priority (IEEE 802.1p code point **101**) to lossless FCoE forwarding class **fcoe1**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5 forwarding-class fcoe1 loss-priority low code-points
101

```

4. Configure the ingress classifier (**fcoe\_p3\_p5**) for interface **xe-0/0/22**. The classifier maps the two FCoE priorities (IEEE 802.1p code points **011** and **101**) to the two lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points 011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points 101
```

5. Apply each classifier to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 unit 0 classifiers ieee-802.1 fcoe_p3
user@switch# set interfaces xe-0/0/21 unit 0 classifiers ieee-802.1 fcoe_p5
user@switch# set interfaces xe-0/0/22 unit 0 classifiers ieee-802.1 fcoe_p3_p5
```

6. Configure the CNP input stanza for interface **xe-0/0/20** to enable PFC on the FCoE priority (IEEE 802.1p code point **011**), set the MRU value (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queue 3 is paused by default on priority 3, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100
```

7. Configure the CNP for interface **xe-0/0/21**. The input stanza enables PFC on the FCoE priority (IEEE 802.1p code point **101**), sets the MRU value (2240 bytes), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

8. Configure the CNP for interface **xe-0/0/22**. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points **011** and **101**), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1 code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1 code-point 101 pfc flow-control-queue 5
```

9. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/20 congestion-notification-profile fcoe_p3_cnp
```

```

user@switch# set interfaces xe-0/0/21 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/22 congestion-notification-profile fcoe_p3_p5_cnp

```

10. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/21. Interface xe-0/0/21 uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on priority 5 on interface xe-0/0/21. Configure an application named **fcoe\_p5\_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe\_p5\_app\_map** to map the application to code point 101:

```

[edit]
user@switch# set applications application fcoe_p5_app ether-type 0x8906
user@switch# set policy-options application-maps fcoe_p5_app_map application
fcoe_p5_app code-points 101

```

**NOTE:** Interface xe-0/0/20 uses the default FCoE configuration (priority 3). DCBX exchanges protocol TLVs for the FCoE application by default, so you do not need to configure DCBX explicitly on interface xe-0/0/20.

11. Configure the DCBX FCoE application and application map to apply to interface xe-0/0/22. Interface xe-0/0/22 uses both priority 3 (IEEE 802.1p code point 011) and priority 5 for FCoE traffic, which requires DCBX to exchange FCoE application protocol TLVs on both priority 3 and priority 5. Configure an application named **fcoe\_all\_app** for FCoE traffic (EtherType **0x8906**) and configure an application map named **fcoe\_all\_app\_map** to map the application to code points 011 and 101:

```

[edit]
user@switch# set applications application fcoe_all_app ether-type 0x8906
user@switch# set policy-options application-maps fcoe_all_app_map application
fcoe_all_app code-points [011 101]

```

12. Apply the application maps to the interfaces xe-0/0/21 and xe-0/0/22 so that DCBX exchanges FCoE application TLVs on the correct code points on each interface:

```

[edit]
user@switch# set protocols dcbx interface xe-0/0/21 application-map fcoe_p5_app_map
user@switch# set protocols dcbx interface xe-0/0/22 application-map fcoe_all_app_map

```

## Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 5073](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 5073](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 5074](#)
- [Verifying the Interface Configuration on page 5076](#)
- [Verifying the DCBX Application Configuration on page 5076](#)
- [Verifying the DCBX Application Map Configuration on page 5077](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5077](#)

**Verifying the Forwarding Class Configuration**

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
```

| Forwarding class | ID | Queue | Policing priority | No-Loss  |
|------------------|----|-------|-------------------|----------|
| best-effort      | 0  | 0     | normal            | Disabled |
| fcoe             | 1  | 3     | normal            | Enabled  |
| no-loss          | 2  | 4     | normal            | Enabled  |
| network-control  | 3  | 7     | normal            | Disabled |
| fcoe1            | 4  | 5     | normal            | Enabled  |
| mcast            | 8  | 8     | normal            | Disabled |

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue **5** with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

**Verifying the Behavior Aggregate Classifier Configuration**

**Purpose** Verify that the three classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
```

|                                                                   |                  |               |
|-------------------------------------------------------------------|------------------|---------------|
| Classifier: fcoe_p3, Code point type: ieee-802.1, Index: 13913    |                  |               |
| Code point                                                        | Forwarding class | Loss priority |
| 011                                                               | fcoe             | low           |
| Classifier: fcoe_p5, Code point type: ieee-802.1, Index: 63065    |                  |               |
| Code point                                                        | Forwarding class | Loss priority |
| 101                                                               | fcoe1            | low           |
| Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 10964 |                  |               |
| Code point                                                        | Forwarding class | Loss priority |
| 011                                                               | fcoe             | low           |
| 101                                                               | fcoe1            | low           |

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are three classifiers, **fcoe\_p3**, **fcoe\_p5**, and **fcoe\_p3\_p5**.

Classifier **fcoe\_p3** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**.

Classifier **fcoe\_p5** maps code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe\_p3\_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

### ***Verifying the PFC Flow Control Configuration (CNP)***

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Name: fcoe_p3_cnp, Index: 12037
```

```
Type: Input
```

```
Cable Length: 100 m
```

```

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the three CNPs. For CNP **fcoe\_p3\_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3), the MRU is **2240** bytes, and the cable length is **100** meters. The CNP output stanza shows the default mapping of priorities to output queues.

**NOTE:** By default, only queues 3 and 4 are enabled to respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queue 3 responds to pause messages from the connected peer on interfaces that use CNP **fcoe\_p3\_cnp**, because the input stanza enables PFC priority 3 only.

For CNP **fcoe\_p3\_p5\_cnp**, the input stanza shows that PFC is enabled on code points **011** and **101**, the MRU is **2240** bytes on both priorities, and the cable length is **100** meters. The CNP output stanza shows that output flow control is configured on queues **3** and **5** for code points **011** and **101**, respectively.

For CNP **fcoe\_p5\_cnp**, the input stanza shows that PFC is enabled on code point **101** (priority 5), the MRU is **2240** bytes, and the cable length is **150** meters. The CNP output stanza shows that output flow control is configured on queue **5** for code point **101** (priority 5).

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

**Action** List the ingress interfaces using the operational mode commands **show configuration class-of-service interfaces xe-0/0/20**, **show configuration class-of-service interfaces xe-0/0/21**, and **show configuration class-of-service interfaces xe-0/0/22**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/20
  congestion-notification-profile fcoe_p3_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p3;
    }
  }
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/21
  congestion-notification-profile fcoe_p5_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p5;
    }
  }
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/22
  congestion-notification-profile fcoe_p3_p5_cnp;
  unit 0 {
    classifiers {
      ieee-802.1p fcoe_p3_p5;
    }
  }
```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/20** command shows that the congestion notification profile **fcoe\_p3\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3**.

The **show configuration class-of-service interfaces xe-0/0/21** command shows that the congestion notification profile **fcoe\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p5**.

The **show configuration class-of-service interfaces xe-0/0/22** command shows that the congestion notification profile **fcoe\_p3\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_p5**.

### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the two DCBX applications for FCoE are configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
  application fcoe_all_app {
    ether-type 0x8906;
```

```
application fcoe_p5_app {
    ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **fcoe\_all\_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic) and that the application **fcoe\_p5\_app** is also configured with an EtherType of **0x8906**.

#### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application maps are configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
fcoe_all_app_map {
    application fcoe_all_app code-points [011 101];
}
fcoe_p5_app_map {
    application fcoe_p5_app code-points 101;
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there are two application maps.

Application map **fcoe\_all\_app\_map** consists of the application named **fcoe\_all\_app** mapped to IEEE 802.1p code points **011** (priority 3) and **101** (priority 5).

Application map **fcoe\_p5\_app\_map** consists of the application named **fcoe\_p5\_app** mapped to IEEE 802.1p code point **101** (priority 5).

#### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps are applied to the correct interfaces.

**Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/21.0 {
    application-map fcoe_p5_app_map;
}
interface xe-0/0/22.0 {
    application-map fcoe_all_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/21.0** uses application map **fcoe\_p5\_app\_map** and interface **xe-0/0/22.0** uses application map **fcoe\_all\_app\_map**.

**NOTE:** Because interface xe-0/0/20 uses the default lossless FCoE configuration, you do not configure application mapping to interface xe-0/0/20. The default configuration automatically exchanges application protocol TLVs for the default FCoE configuration on priority 3 (IEEE 802.1p code point 011).

## Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)

Although the default configuration provides two lossless forwarding classes mapped to two different IEEE 802.1p priorities (code points), you can explicitly configure up to six lossless forwarding classes and map them to different priorities. You can support up to six different types of lossless traffic, and you can support the same type of traffic on different priorities in different parts of your converged network.

This example shows you how to configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, and map the forwarding classes to three different priorities. (The converged Ethernet network includes two FCoE networks, each of which uses a different priority to identify FCoE traffic, and an iSCSI network.)

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch in transit switch (FIP snooping) mode

- Junos OS Release 12.3 or later for the QFX Series

## Overview

Some converged Ethernet networks support FCoE on more than one IEEE 802.1p priority and also require supporting other lossless traffic classes. Interfaces that carry multiple lossless forwarding classes need to support lossless behavior for the priorities mapped to those forwarding classes. To support the two FCoE forwarding classes and the iSCSI forwarding class used in this example, you need to configure:

- At least one lossless forwarding class for FCoE traffic (this example uses the default **fcoe** forwarding class as one of the two lossless FCoE forwarding classes, so we need to explicitly configure only one FCoE forwarding class)
- A lossless forwarding class for iSCSI traffic
- Behavior aggregate (BA) classifiers to map the lossless forwarding classes to the appropriate IEEE 802.1p code points (priorities) on each interface
- Congestion notification profiles (CNPs) for each interface to enable PFC on the FCoE and iSCSI code points at the interface ingress, and to configure PFC flow control on the interface egress so that the interface can respond to PFC messages received from the connected peer
- DCBX applications and an application map to support DCBX application TLV exchange for the FCoE and iSCSI traffic on the configured lossless priorities. By default, DCBX is enabled on all Ethernet interfaces for FCoE, but only on priority 3 (IEEE 802.1p code point 011). To support DCBX application TLV exchange when you are not using the default configuration, you must configure all of the applications and map them to interfaces and priorities.

The priorities specified in the BA classifiers, CNPs, and DCBX application map must match, or the configuration does not work. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

## Topology

This example shows how to configure two lossless FCoE traffic classes and one lossless iSCSI traffic class, map them to three different priorities, and configure flow control to ensure lossless behavior for those priorities on the interfaces. This example uses four Ethernet interfaces, xe-0/0/31, xe-0/0/32, xe-0/0/33, and xe-0/0/34:

- Interface xe-0/0/31 handles FCoE traffic on priority 3 (IEEE 802.1p code point 011) and iSCSI traffic on priority 4 (code point 100).
- Interface xe-0/0/32 handles FCoE traffic on priority 5 (code point 101) and iSCSI traffic on priority 4.
- Interface xe-0/0/33 handles FCoE traffic on priority 3 and priority 5.
- Interface xe-0/0/34 handles iSCSI traffic on priority 4.

Figure 191 on page 5080 shows the topology for this example, and Table 430 on page 5080 shows the configuration components for this example.

Figure 191: Topology of the Lossless FCoE and iSCSI Priorities Example

Table 430: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology

| Component          | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware           | QFX3500 switch                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Forwarding classes | <p>This example uses one explicitly configured lossless FCoE forwarding class, the default lossless FCoE forwarding class, and one explicitly configured iSCSI forwarding class.</p> <ul style="list-style-type: none"><li>iSCSI forwarding class:<br/>Name—<b>iscsi</b><br/>Queue mapping—queue 4<br/>Packet drop attribute—<b>no-loss</b></li><li>FCoE forwarding class (explicitly configured):<br/>Name—<b>fcoe1</b><br/>Queue mapping—queue 5<br/>Packet drop attribute—<b>no-loss</b></li></ul> <p><b>NOTE:</b> A lossless forwarding class can be mapped to any output queue. However, because the <b>fcoe1</b> forwarding class uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number.</p> <ul style="list-style-type: none"><li>FCoE forwarding class (default)<br/>Name—<b>fcoe</b><br/>The default <b>fcoe</b> forwarding class is mapped to priority 3 (IEEE 802.1p code point 011) and to output queue 3 with a packet drop attribute of <b>no-loss</b>.</li></ul> |

**Table 430: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (*continued*)**

| Component      | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BA classifiers | <p>Each interface requires a different classifier because each interface handles a different subset of FCoE traffic.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/31 classifier:<br/> Name—<b>fcoe_p3_iscsi</b><br/> FCoE priority mapping—Forwarding class <b>fcoe</b> mapped to code point <b>011</b> (IEEE 802.1p priority 3) and a packet loss priority of <b>low</b>.<br/> iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/32 classifier:<br/> Name—<b>fcoe_p5_iscsi</b><br/> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (IEEE 802.1p priority 5) and a packet loss priority of <b>low</b>.<br/> iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/33 classifier:<br/> Name—<b>fcoe_p3_p5</b><br/> FCoE priority mapping—Forwarding class <b>fcoe1</b> mapped to code point <b>101</b> (priority 5) and a packet loss priority of <b>low</b>, and forwarding class <b>fcoe</b> mapped to code point <b>011</b> and a packet loss priority of <b>low</b>.</li> <li>Interface xe-0/0/34 classifier:<br/> Name—<b>iscsi_classifier</b><br/> iSCSI priority mapping—Forwarding class <b>iscsi</b> mapped to code point <b>100</b> (priority 4) and a packet loss priority of <b>low</b>.</li> </ul> |

**Table 430: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (continued)**

| Component                | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PFC configuration (CNPs) | <p>Each interface requires a different CNP because each interface handles a different subset of FCoE and iSCSI traffic, and must pause that traffic on different priorities.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/31 CNP:<br/> CNP name—<b>fcoe_p3_cnp</b><br/> Input CNP code points—<b>011</b> and <b>100</b><br/> MRU—2240 bytes for code point <b>011</b>, default value (2500 bytes) for code point <b>100</b><br/> Cable length—100 meters</li> </ul> <p><b>NOTE:</b> On interface xe-0/0/31, the FCoE forwarding class is mapped to queue 3 and priority 3 (code point 011), and the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Therefore, interface xe-0/0/31 does not require an output CNP configuration because queue 3 and queue 4 are enabled for PFC flow control by default on code points 011 and 100, respectively.</p> <ul style="list-style-type: none"> <li>Interface xe-0/0/32 CNP:<br/> CNP name—<b>fcoe_p5_cnp</b><br/> Input CNP code points—<b>100</b> and <b>101</b><br/> MRU—Default value (2500 bytes) for code point <b>100</b>, <b>2240</b> bytes for code point <b>101</b><br/> Cable length—150 meters<br/> Output CNP code points—<b>100</b> and <b>101</b><br/> Output CNP flow control queues—<b>4</b> and <b>5</b></li> <li>Interface xe-0/0/33 CNP:<br/> CNP name—<b>fcoe_p3_p5_cnp</b><br/> Input CNP code points—<b>011</b> and <b>101</b><br/> MRU—2240 bytes (both priorities)<br/> Cable length—100 meters<br/> Output CNP code points—<b>011</b> and <b>101</b><br/> Output CNP flow control queues—<b>3</b> and <b>5</b></li> <li>Interface xe-0/0/34 CNP:<br/> CNP name—<b>iscsi_cnp</b><br/> Input CNP code point—<b>100</b><br/> MRU—2500 bytes (default value)<br/> Cable length—100 meters</li> </ul> <p><b>NOTE:</b> On interface xe-0/0/34, the iSCSI forwarding class is mapped to queue 4 and priority 4 (code point 100). Interface xe-0/0/34 does not require an output CNP configuration because queue 4 is enabled for PFC flow control by default on code point 100.</p> <p><b>NOTE:</b> When you apply a CNP with an explicit output queue flow control configuration to an interface, the explicit CNP overwrites the default output CNP. The output queues that are enabled for PFC pause in the default configuration (queues 3 and 4) are not enabled for pause unless they are included in the explicitly configured output CNP.</p> |

**Table 430: Components of the Lossless FCoE and iSCSI Priorities Configuration Topology (*continued*)**

| Component                | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DCBX application mapping | <p>This example requires configuring applications for FCoE and iSCSI, including them in the same application map, and applying the application map to all four interfaces.</p> <p>Application map name—<b>dcbx_iscsi_fcoe_app_map</b></p> <ul style="list-style-type: none"> <li>FCoE application name—<b>fcoe_app</b><br/>Application ether-type—<b>0x8906</b><br/>Application map code points—<b>011</b> and <b>101</b></li> <li>iSCSI application name—<b>iscsi_app</b><br/>Application protocol type—<b>tcp</b><br/>Application destination port—<b>3260</b><br/>Application map code point—<b>100</b></li> </ul> <p><b>NOTE:</b> LLDP and DCBX must be enabled on the interface. By default, LLDP and DCBX are enabled on all Ethernet interfaces.</p> |

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the FIP snooping configuration. This examples focuses only on the lossless FCoE priority configuration.

### Configuration

#### CLI Quick Configuration

To quickly configure two lossless FCoE forwarding classes and one lossless iSCSI forwarding class and map them to different priorities, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class iscsi queue-num 4 no-loss
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
set class-of-service classifiers ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100
set class-of-service classifiers ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low

```

### Step-by-Step Procedure

To configure two lossless forwarding classes for FCoE traffic and one lossless forwarding class for iSCSI traffic, classify the traffic into the three forwarding classes, configure congestion notification profiles to enable PFC on the FCoE priorities and output queues, and configure DCBX application protocol TLV exchange for traffic on both FCoE priorities:

1. Configure lossless forwarding classes **iscsi** for iSCSI traffic and **fcoe1** for FCoE traffic (this example uses the default **fcoe** forwarding class as the other lossless FCoE forwarding class) and map them to output queues:

```

[edit class-of-service]
user@switch# set forwarding-classes class iscsi queue-num 4 no-loss
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss

```

2. Configure the ingress classifier (**fcoe\_p3\_iscsi**) for interface **xe-0/0/31**. The classifier maps the FCoE priority (code point **011**) to lossless FCoE forwarding class **fcoe** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]

```

```

user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class fcoe loss-priority low
code-points 011
user@switch# set ieee-802.1 fcoe_p3_iscsi forwarding-class iscsi loss-priority low
code-points 100

```

3. Configure the ingress classifier (**fcoe\_p5\_iscsi**) for interface **xe-0/0/32**. The classifier maps the FCoE priority (code point **101**) to lossless FCoE forwarding class **fcoe1** and the iSCSI priority (code point **100**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class iscsi loss-priority low
code-points 100
user@switch# set ieee-802.1 fcoe_p5_iscsi forwarding-class fcoe1 loss-priority low
code-points 101

```

4. Configure the ingress classifier (**fcoe\_p3\_p5**) for interface **xe-0/0/33**. The classifier maps the two FCoE priorities (code points **011** and **101**) to lossless FCoE forwarding classes **fcoe** and **fcoe1**, respectively:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe loss-priority low code-points
011
user@switch# set ieee-802.1 fcoe_p3_p5 forwarding-class fcoe1 loss-priority low code-points
101

```

5. Configure the ingress classifier (**iscsi\_classifier**) for interface **xe-0/0/34**. The classifier maps the iSCSI priority (code point **101**) to lossless iSCSI forwarding class **iscsi**:

```

[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi_classifier forwarding-class iscsi loss-priority low
code-points 100

```

6. Apply each classifier to the appropriate interface:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe_p3_iscsi
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe_p5_iscsi
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe_p3_p5
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 iscsi_classifier

```

7. Configure the CNP input stanza for interface **xe-0/0/31** to enable PFC on the FCoE and iSCSI priorities that the interface handles (code points **011** and **100**), set the MRU value for the FCoE traffic (2240 bytes), and set the cable length value (100 meters). No output stanza is needed because queues 3 and 4 are paused by default on priorities 3 and 4, respectively, and we are not explicitly configuring output queue flow control for any other queues.

```

[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p3_cnp input cable-length 100

```

8. Configure the CNP for interface **xe-0/0/32**. The input stanza enables PFC on the FCoE priority (code point **101**), sets the MRU value for FCoE traffic (2240 bytes), enables PFC on the iSCSI priority (code point **100**), and sets the cable length value (150 meters). The output stanza configures flow control on output queue 5 on the FCoE priority and on output queue 4 on the iSCSI priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile fcoe_p5_cnp input ieee-802.1 code-point
101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p5_cnp input cable-length 150
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
100 pfc flow-control-queue 4
user@switch# set congestion-notification-profile fcoe_p5_cnp output ieee-802.1 code-point
101 pfc flow-control-queue 5
```

9. Configure the CNP for interface xe-0/0/33. The input stanza enables PFC on the FCoE priorities (IEEE 802.1p code points 011 and 101), sets the MRU value (2240 bytes), and sets the cable length value (100 meters). The output stanza configures flow control on output queues 3 and 5 on the FCoE priorities:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 011 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input ieee-802.1
code-point 101 pfc mru 2240
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp input cable-length 100
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 011 pfc flow-control-queue 3
user@switch# set congestion-notification-profile fcoe_p3_p5_cnp output ieee-802.1
code-point 101 pfc flow-control-queue 5
```

10. Configure the CNP input stanza for interface xe-0/0/34 to enable PFC on the iSCSI priority (code point 100) and set the cable length value (100 meters). No output stanza is needed because queue 4 is paused by default on priority 4, and we are not explicitly configuring output queue flow control for any other queues.

```
[edit class-of-service]
user@switch# set congestion-notification-profile iscsi_cnp input ieee-802.1 code-point
100 pfc
user@switch# set congestion-notification-profile iscsi_cnp input cable-length 100
```

11. Apply each CNP to the appropriate interface:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe_p3_cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe_p5_cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe_p3_p5_cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile iscsi_cnp
```

12. Configure the DCBX applications for FCoE and iSCSI to map to the interfaces so that DCBX can exchange application protocol TLVs on the IEEE 802.1p priorities used for FCoE and iSCSI traffic:

```
[edit]
user@switch# set applications application fcoe_app ether-type 0x8906
user@switch# set applications application iscsi_app protocol tcp destination-port 3260
```

13. Configure a DCBX application map to map the FCoE and iSCSI applications to the correct priorities:

```
[edit]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
fcoe_app code-points [011 101]
user@switch# set policy-options application-maps dcbx_iscsi_fcoe_app_map application
iscsi_app code-points 100
```

14. Apply the application map to the interfaces so that DCBX exchanges FCoE application TLVs on the correct code points:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/31 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/32 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/33 application-map
dcbx_iscsi_fcoe_app_map
user@switch# set protocols dcbx interface xe-0/0/34 application-map
dcbx_iscsi_fcoe_app_map
```

### Verification

To verify the configuration and proper operation of the lossless forwarding classes and IEEE 802.1p priorities, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 5087](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 5088](#)
- [Verifying the PFC Flow Control Configuration \(CNP\) on page 5088](#)
- [Verifying the Interface Configuration on page 5091](#)
- [Verifying the DCBX Application Configuration on page 5092](#)
- [Verifying the DCBX Application Map Configuration on page 5093](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5093](#)

#### Verifying the Forwarding Class Configuration

**Purpose** Verify that the lossless forwarding classes **iscsi** and **fcoe1** have been created and that the default lossless forwarding class **fcoe** is still enabled for lossless transport.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding-class**:

```
user@switch> show class-of-service forwarding-class
```

| Forwarding class | ID | Queue | Policing priority | No-Loss  |
|------------------|----|-------|-------------------|----------|
| best-effort      | 0  | 0     | normal            | Disabled |
| fcoe             | 1  | 3     | normal            | Enabled  |
| iscsi            | 2  | 4     | normal            | Enabled  |
| network-control  | 3  | 7     | normal            | Disabled |
| fcoe1            | 4  | 5     | normal            | Enabled  |
| mcast            | 8  | 8     | normal            | Disabled |

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **iscsi** and **fcoe1** forwarding classes are configured on output queues 4 and 5, respectively, with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default **fcoe** forwarding class, it remains in its default state (lossless configuration).

### *Verifying the Behavior Aggregate Classifier Configuration*

**Purpose** Verify that the four classifiers map the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifiers configured to support lossless FCoE transport using the operational mode command **show class-of-service classifier**:

```
user@switch> show class-of-service classifier
Classifier: fcoe_p3_iscsi, Code point type: ieee-802.1, Index: 13915
  Code point  Forwarding class  Loss priority
  011         fcoe             low
  100         iscsi            low
```

```
Classifier: fcoe_p5_iscsi, Code point type: ieee-802.1, Index: 62035
  Code point  Forwarding class  Loss priority
  100         iscsi            low
  101         fcoe1            low
```

```
Classifier: fcoe_p3_p5, Code point type: ieee-802.1, Index: 17774
  Code point  Forwarding class  Loss priority
  011         fcoe             low
  101         fcoe1            low
```

```
Classifier: iscsi_classifier, Code point type: ieee-802.1, Index: 31635
  Code point  Forwarding class  Loss priority
  100         iscsi            low
```

**Meaning** The **show class-of-service classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in each classifier. The command output shows that there are four classifiers, **fcoe\_p3\_iscsi**, **fcoe\_p5\_iscsi**, **fcoe\_p3\_p5**, and **iscsi\_classifier**.

Classifier **fcoe\_p3\_iscsi** maps code point **011** (priority 3) to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and code point **100** (priority 4) to explicitly configured lossless forwarding class **iscsi**.

Classifier **fcoe\_p5\_iscsi** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**, and code point **101** (priority 5) to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **fcoe\_p3\_p5** maps code point **011** to default lossless forwarding class **fcoe** and a packet loss priority of **low**, and maps code point **101** to explicitly configured lossless forwarding class **fcoe1** and a packet loss priority of **low**.

Classifier **iscsi\_classifier** maps code point **100** to explicitly configured forwarding class **iscsi** and a packet loss priority of **low**.

### *Verifying the PFC Flow Control Configuration (CNP)*

**Purpose** Verify that PFC is enabled on the correct input priorities and that flow control is configured on the correct output queues and priorities in each CNP.

**Action** List the congestion notification profiles using the operational mode command **show class-of-service congestion-notification**:

```
user@switch> show class-of-service congestion-notification
```

```
Name: fcoe_p3_cnp, Index: 12037
```

```
Type: Input
```

```
Cable Length: 100 m
```

| Priority | PFC      | MRU  |

**Meaning** The **show class-of-service congestion-notification** command shows the input and output stanzas of the four CNPs.

For CNP **fcoe\_p3\_cnp**, the input stanza shows that PFC is enabled on IEEE 802.1p code point **011** (priority 3) with an MRU of **2240** bytes, and cable length of **100** meters. The input stanza also shows that PFC is enabled on code point **100** (priority 4) with the default MRU value of **9216** bytes. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

**NOTE:** By default, only queues 3 and 4 are enabled respond to pause messages from the connected peer. For queue 3 to respond to pause messages, priority 3 (code point 011) must be enabled for PFC in the input stanza. For queue 4 to respond to pause messages, priority 4 (code point 100) must be enabled for PFC in the input stanza. In this example, only queues 3 and 4 respond to pause messages from the connected peer on interfaces that use CNP `fcoe_p3_cnp` because the input stanza enables PFC only on priorities 3 and 4.

For CNP `fcoe_p3_p5_cnp`, the input stanza shows that PFC is enabled on code points 011 and 101 (priority 5), the MRU is 2240 bytes on both priorities, and the cable length is 100 meters. The CNP output stanza shows that output flow control is configured on queues 3 and 5 for code points 011 and 101, respectively.

For CNP `fcoe_p5_cnp`, the input stanza shows that PFC is enabled on code points 100 and 101. The MRU for code point 101 (FCoE traffic) is 2240 bytes and the MRU for code point 100 is 9216. The interface cable length is 150 meters. The CNP output stanza shows that output flow control is configured on queue 4 for code point 100 and on queue 5 for code point 101.

For CNP `iscsi_cnp`, the input stanza shows that PFC is enabled on code point 100, the MRU value is 9216 bytes, and the interface cable length is 100 meters. The CNP output stanza shows the default mapping of priorities to output queues because no explicit output CNP is configured.

### *Verifying the Interface Configuration*

**Purpose** Verify that the correct classifiers and congestion notification profiles are configured on the correct interfaces.

**Action** List the ingress interfaces using the operational mode commands `show configuration class-of-service interfaces xe-0/0/31`, `show configuration class-of-service interfaces xe-0/0/32`, `show configuration class-of-service interfaces xe-0/0/33`, and `show configuration class-of-service interfaces xe-0/0/34`:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe_p3_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p3_iscsi;
    }
}
```

```
user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe_p5_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_p5_iscsi;
```

```
    }  
  }  
  
user@switch> show configuration class-of-service interfaces xe-0/0/33  
congestion-notification-profile fcoe_p3_p5_cnp;  
unit 0 {  
  classifiers {  
    ieee-802.1 fcoe_p3_p5;  
  }  
}  
  
user@switch> show configuration class-of-service interfaces xe-0/0/34  
congestion-notification-profile iscsi_cnp;  
unit 0 {  
  classifiers {  
    ieee-802.1 iscsi_classifier;  
  }  
}
```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/31** command shows that the congestion notification profile **fcoe\_p3\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/32** command shows that the congestion notification profile **fcoe\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p5\_iscsi**.

The **show configuration class-of-service interfaces xe-0/0/33** command shows that the congestion notification profile **fcoe\_p3\_p5\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_p3\_p5**.

The **show configuration class-of-service interfaces xe-0/0/34** command shows that the congestion notification profile **iscsi\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **iscsi\_classifier**.

#### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX applications for FCoE and iSCSI are configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications  
application iscsi_app {  
  protocol tcp;  
  destination-port 3260;  
}  
application fcoe_app {  
  ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **iscsi\_app** is configured with a protocol value of **tcp** and a destination port value of **3260**, and that the application **fcoe\_app** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

*Verifying the DCBX Application Map Configuration*

- Purpose** Verify that the application map is configured.
- Action** List the application maps by using the configuration mode command **show policy-options application-maps**:
- ```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iscsi_app code-points 100;
    application fcoe_app code-points [011 101];
}
```
- Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The output shows that there is one application map named **dcbx-iscsi-fcoe\_app\_map**. It consists of the application **iscsi\_app** mapped to code point **100** and the application **fcoe\_app** mapped to code points **011** and **101**.

*Verifying the DCBX Application Protocol Exchange Interface Configuration*

- Purpose** Verify that the application maps are applied to the correct interfaces.
- Action** List the application maps on each interface using the configuration mode command **show protocols dcbx**:
- ```
user@switch# show protocols dcbx
interface xe-0/0/31.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/32.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/33.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
interface xe-0/0/34.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}
```
- Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that all four interfaces use the application map **dcbx-iscsi-fcoe-app-map**.

### Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway

FCoE traffic typically uses IEEE 802.1p priority 3 (code point 011). However, if your FCoE network uses a different IEEE 802.1p priority than priority 3 for FCoE traffic, then you can use priority remapping to classify FCoE traffic into a lossless forwarding class mapped to that priority. You specify the lossless forwarding class used for the FCoE traffic by configuring a fixed classifier and applying it to the native FC (NP\_Port) interface. All traffic received from the FC SAN on that NP\_Port interface is classified into the forwarding class specified in the fixed classifier.

When native FC interfaces on the FCoE-FC gateway encapsulate incoming FC traffic in Ethernet to create FCoE frames, by default they assign IEEE 802.1p code point 011 to the FCoE traffic, forward the traffic internally to the gateway Ethernet interfaces, and then forward the traffic to the FCoE network. Setting a rewrite value for the IEEE 802.1p code point configures the gateway native FC interface to assign the rewrite value priority to the FCoE frames when the native FC interface forwards the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

This example shows how to configure FCoE priority remapping for a converged Ethernet network that uses priority 5 (IEEE code point 101) for FCoE traffic. If your network uses priority 3 for FCoE traffic, then you do not need to remap the FCoE priority, because the default configuration supports lossless FCoE transport on priority 3.

#### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

## Overview

Native FC interfaces on an FCoE-FC gateway receive native FC traffic from the FC SAN and encapsulate it in Ethernet to create FCoE frames. Priority remapping enables you to map the encapsulated FC traffic (the FCoE traffic) to any IEEE 802.1p priority.

To support lossless FCoE traffic flows, you must configure the remapped priority correctly on the native FC interfaces and also on the Ethernet interfaces that connect to the FCoE network. Achieving lossless behavior for FCoE traffic when you remap the FCoE priority requires configuring:

- A lossless forwarding class for FCoE traffic (or using the default **fcoe** forwarding class)
- A behavior aggregate (BA) classifier on the FCoE Ethernet interfaces to map the FCoE forwarding class to the IEEE 802.1p code points (priority) used for FCoE traffic on the FCoE network (the ingress classifier priority for the forwarding class must be the same as the rewrite value priority)
- A fixed classifier on the FCoE-FC gateway FC interface that maps all traffic from the FC network into the lossless FCoE forwarding class (the forwarding class must be lossless)
- A priority rewrite value that remaps the IEEE 802.1p code point on the FCoE-FC gateway FC interface to the priority used for FCoE traffic on the FCoE network
- An input congestion notification profile (CNP) to enable priority-based flow control (PFC) on the FCoE code point (the code point used as the rewrite value) at the Ethernet interface ingress and an output CNP to configure flow control to pause the correct output queue at the Ethernet interface egress
- A DCBX application and application map on the Ethernet interface to support DCBX application TLV exchange for the lossless FCoE traffic on the FCoE priority

The priority specified in the BA classifier, CNP, and DCBX application map on the Ethernet ingress interfaces must match the priority specified in the fixed classifier and rewrite value configurations on the FC interfaces. You must specify the same lossless FCoE forwarding class in each configuration and use the same IEEE 802.1p code point (priority) so that the FCoE traffic is properly classified into flows and so that those flows receive lossless treatment.

## Topology

This example shows how to configure priority remapping of FCoE traffic on one native FC interface (fc-0/0/2) connected to the FC SAN and on one Ethernet interface (xe-0/0/27) connected to the converged Ethernet (FCoE) network. Both the native FC interface and the Ethernet interface belong to the same local FC fabric on the FCoE-FC gateway.

The converged Ethernet network uses priority 5 (IEEE 802.1p code point 101) for FCoE traffic. The native FC interface on the FCoE-FC gateway receives FC traffic from the FC SAN. The native FC interface encapsulates the FC traffic in Ethernet to create FCoE frames, tags the frames with the IEEE 802.1p priority value 101, and then forwards the FCoE frames to the FCoE-FC gateway Ethernet interface. Because traffic marked with

IEEE 802.1p priority 5 is mapped to a lossless FCoE forwarding class, the traffic receives lossless treatment. The Ethernet interface forwards the FCoE traffic on to the Ethernet network.

FCoE traffic (tagged with priority 5) arriving at the FCoE-FC gateway from the Ethernet network receives lossless treatment and is forwarded to the native FC interface. The native FC interface removes the Ethernet encapsulation from the FCoE frames and forwards the resulting native FC traffic to the FC SAN.

Figure 192 on page 5096 shows the topology for this example, and Table 431 on page 5096 shows the configuration components for this example.

**Figure 192: Topology of the IEEE 802.1p Priority Remapping Example**

**Table 431: Components of the IEEE 802.1p Priority Remapping Configuration Topology**

| Component                              | Settings                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware                               | QFX3500 switch                                                                                                                                                                                                                                                                                                                                                                                                               |
| Forwarding class configuration         | Name— <b>fcoe1</b><br>Queue mapping—queue 5<br>Packet drop attribute— <b>no-loss</b><br><br><b>NOTE:</b> The lossless forwarding class can be mapped to any output queue. However, because FCoE uses priority 5 in this example, matching that traffic to a forwarding class that uses queue 5 creates a configuration that is logical and easy to map because the priority and the queue are identified by the same number. |
| BA classifier (Ethernet interface)     | Name— <b>fcoe_gw_classifier</b><br><br>Maps code point <b>101</b> (IEEE 802.1p priority 5) to the <b>fcoe1</b> forwarding class and assigns traffic a packet loss priority of <b>low</b> .<br><br>The classifier is applied to Ethernet interface <b>xe-0/0/27</b> .                                                                                                                                                         |

By default, LLDP and DCBX are enabled on all Ethernet interfaces. |

The priority used to identify FCoE traffic (5, IEEE 802.1p code point 101) is configured for lossless transport across the QFX device on interfaces xe-0/0/27 and fc-0/0/2, which belong to the same local FC fabric on the FCoE-FC gateway.

On the Ethernet interface, the classifier maps priority 5 to a lossless forwarding class (fcoe1), the input CNP enables PFC on incoming priority 5 traffic, and the output CNP enables output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5. On the native FC interface, FC traffic is remapped from priority 3 (the default mapping) to priority 5 and assigned to the same lossless forwarding class, fcoe1, because of the fixed classifier configuration. In this way, traffic tagged with priority 5 on interfaces xe-0/0/27 and fc-0/0/2 receives lossless treatment.

**NOTE:** To avoid fate sharing, ensure that the remapped priority is classified only to the forwarding class used in the fixed classifier on all other interfaces. For example, if you configure a fixed classifier on an FC interface that classifies all of the traffic into lossless forwarding class fcoe1 and remaps the priority to priority 5 (IEEE 802.1p code point 101), then in all other classifier configurations on all other interfaces, priority 5 should always be classified to forwarding class fcoe1. If you classify priority 6 on another interface to forwarding class fcoe1, then congestion on priority 6 traffic affects priority 5 traffic unfairly.

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or the local FC fabric configuration. This examples focuses only on priority remapping.

## Configuration

### CLI Quick Configuration

To quickly configure IEEE 802.1p priority remapping on an FCoE-FC gateway, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set class-of-service forwarding-classes class fcoe1 queue-num 5 no-loss
set class-of-service classifiers ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority
low code-points 101
set class-of-service interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
set class-of-service interfaces fc-0/0/2 forwarding-class fcoe1
set class-of-service interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1
code-point 101 pfc
set class-of-service congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1
code-point 101 flow-control-queue 5
set class-of-service interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
set applications application myfcoe5 ether-type 0x8906
set policy-options application-maps myfcoe5_app_map application myfcoe5 code-points 101
set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
```

### Step-by-Step Procedure

To configure a lossless forwarding class for FCoE traffic, classify FCoE traffic into that forwarding class, configure a rewrite value on the native FC interface for the FCoE traffic, and enable PFC on the Ethernet interface, and configure DCBX application protocol TLV exchange for FCoE traffic:

1. Configure the lossless forwarding class (named **fcoe1** and mapped to output queue **5**) for FCoE traffic that uses IEEE 802.1p priority **5**:  

```
[edit class-of-service]
user@switch# set forwarding-classes class fcoe1 queue-num 5 no-loss
```
2. Configure an ingress classifier named **fcoe\_gw\_classifier** to map the FCoE priority (IEEE 802.1p code point **101**) to the lossless FCoE forwarding class (**fcoe1**):  

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe_gw_classifier forwarding-class fcoe1 loss-priority low
code-points 101
```
3. Apply the classifier named **fcoe\_gw\_classifier** to Ethernet interface **xe-0/0/27**:  

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/27 unit 0 classifiers ieee-802.1 fcoe_gw_classifier
```
4. Configure the fixed classifier on the native FC interface, using the lossless FCoE forwarding class **fcoe1** (all traffic from the FC SAN is classified into the specified forwarding class). The traffic classified into this forwarding class is tagged with the priority value configured in the next step.  

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
```

5. Configure the rewrite value (IEEE 802.1p code point 101) applied to all incoming traffic from the FC SAN on the native FC interface. The rewrite value is the IEEE 802.1p priority that the encapsulated FCoE traffic classified into the **fcoe1** forwarding class uses on the converged Ethernet network.

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1p code-point 101
```

6. Configure the input stanza of the CNP (named **fcoe1\_p5\_rewrite\_cnp**) to enable PFC on the FCoE priority on the Ethernet interface:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp input ieee-802.1p code-point 101 pfc
```

7. Configure the output stanza of the CNP to enable output queue 5 to respond to pause messages received from the peer on traffic tagged with priority 5:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe1_p5_rewrite_cnp output ieee-802.1p code-point 101 flow-control-queue 5
```

8. Apply the CNP named **fcoe1\_p5\_rewrite\_cnp** to Ethernet interface **xe-0/0/27**:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/27 congestion-notification-profile fcoe1_p5_rewrite_cnp
```

9. Configure a DCBX application for FCoE to map to the Ethernet interface, so that DCBX can exchange application protocol TLVs on the correct (remapped) IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set applications application myfcoe5 ether-type 0x8906
```

10. Configure a DCBX application map to map the FCoE application to the correct (remapped) IEEE 802.1p FCoE priority:

```
[edit]
user@switch# set policy-options application-maps myfcoe5_app_map application myfcoe5 code-points 101
```

11. Apply the application map to the Ethernet interface so that DCBX exchanges FCoE application TLVs on the correct code point:

```
[edit]
user@switch# set protocols dcbx interface xe-0/0/27 application-map myfcoe5_app_map
```

## Verification

To verify the configuration and proper operation of IEEE 802.1p priority remapping on an FCoE-FC gateway, perform these tasks:

- [Verifying the Forwarding Class Configuration on page 5100](#)
- [Verifying the Behavior Aggregate Classifier Configuration on page 5100](#)
- [Verifying the FC Interface Configuration \(Fixed Classifier, Rewrite Value\) on page 5101](#)
- [Verifying the Ethernet Interface PFC Configuration \(CNP\) on page 5101](#)
- [Verifying the Ethernet Interface Configuration on page 5102](#)

- [Verifying the DCBX Application Configuration on page 5102](#)
- [Verifying the DCBX Application Map Configuration on page 5102](#)
- [Verifying the DCBX Application Protocol Exchange Interface Configuration on page 5103](#)

### ***Verifying the Forwarding Class Configuration***

**Purpose** Verify that the lossless forwarding class **fcoe1** has been created.

**Action** Show the forwarding class configuration by using the operational command **show class-of-service forwarding class**:

```
user@switch# show class-of-service forwarding-class
```

| Forwarding class | ID | Queue | Policing priority | No-Loss  |
|------------------|----|-------|-------------------|----------|
| best-effort      | 0  | 0     | normal            | Disabled |
| fcoe             | 1  | 3     | normal            | Enabled  |
| no-loss          | 2  | 4     | normal            | Enabled  |
| network-control  | 3  | 7     | normal            | Disabled |
| fcoe1            | 4  | 5     | normal            | Enabled  |
| mcast            | 8  | 8     | normal            | Disabled |

**Meaning** The **show class-of-service forwarding-class** command shows all of the forwarding classes. The command output shows that the **fcoe1** forwarding class is configured on output queue 5 with the no-loss packet drop attribute enabled.

Because we did not explicitly configure the default forwarding classes, they remain in their default state, including the lossless configuration of the **fcoe** and **no-loss** default forwarding classes.

### ***Verifying the Behavior Aggregate Classifier Configuration***

**Purpose** Verify that the classifier maps the forwarding classes to the correct IEEE 802.1p code points (priorities) and packet loss priorities.

**Action** List the classifier configured for priority remapping using the operational mode command **show class-of-service classifier name fcoe\_gw\_classifier**:

```
user@switch> show class-of-service classifier name fcoe_gw_classifier
```

| Classifier: fcoe_gw_classifier, Code point type: ieee-802.1, Index: 13100 | Code point | Forwarding class | Loss priority |
|---------------------------------------------------------------------------|------------|------------------|---------------|
|                                                                           | 101        | fcoe1            | low           |

**Meaning** The **show class-of-service classifier name fcoe\_gw\_classifier** command shows the IEEE 802.1p code points and the loss priorities that are mapped to the forwarding classes in the classifier. The command output shows that the classifier maps forwarding class **fcoe1** to IEEE 802.1p code point 101 (priority 5) with a packet loss priority of **low**.

**Verifying the FC Interface Configuration (Fixed Classifier, Rewrite Value)**

**Purpose** Verify that the native FC interface (NP\_Port) classifies incoming traffic into forwarding class **fcoe1** and that the interface rewrite value is priority 5 (IEEE code point 101).

**Action** Display the FC interface configuration using the operational mode command **show configuration class-of-service interfaces fc-0/0/2**:

```
user@switch> show configuration class-of-service interfaces fc-0/0/2
rewrite-value {
    input {
        ieee-802.1 {
            code-point {
                101;
            }
        }
    }
}
forwarding-class fcoe1;
```

**Meaning** The **show configuration class-of-service interfaces fc-0/0/2** command shows that the rewrite value for incoming (input) traffic is IEEE 802.1p code point **101** (priority 5), and that the interface uses forwarding class **fcoe1** as the fixed classifier for all incoming traffic.

**Verifying the Ethernet Interface PFC Configuration (CNP)**

**Purpose** Verify that PFC is enabled on the correct priority (IEEE 802.1p code point **101**) for lossless transport and that flow control is enabled on the correct output queue (queue **5**) on the Ethernet interface.

**Action** List the congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe1\_p5\_rewrite\_cnp**:

```
user@switch> show class-of-service congestion-notification fcoe1_p5_rewrite_cnp
Name: fcoe1_p5_rewrite_cnp, Index: 7061
Type: Input
Cable Length: 100 m
  Priority  PFC          MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled    2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101
      5
```

**Meaning** The **show class-of-service congestion-notification fcoe1\_p5\_rewrite\_cnp** command shows the input and output stanzas of the CNP. The input stanza shows that PFC is enabled on IEEE 802.1p code point 101 (priority 5). The input stanza also shows that the CNP uses

the default values of 100 meters for the cable length value and 2500 bytes for the maximum receive unit (MRU) value.

The output stanza shows that flow control is enabled on output queue 5 for IEEE 802.1p priority code point 101 (priority 5).

#### *Verifying the Ethernet Interface Configuration*

**Purpose** Verify that the classifier **fcoe\_gw\_classifier** and the congestion notification profile **fcoe1\_p5\_rewrite\_cnp** are configured on Ethernet interface **xe-0/0/27**.

**Action** List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces xe-0/0/27**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/27
congestion-notification-profile fcoe1_p5_rewrite_cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe_gw_classifier;
    }
}
```

**Meaning** The **show configuration class-of-service interfaces xe-0/0/27** command shows that the congestion notification profile **fcoe1\_p5\_rewrite\_cnp** is configured on the interface, and that the IEEE 802.1p classifier associated with the interface is **fcoe\_gw\_classifier**.

#### *Verifying the DCBX Application Configuration*

**Purpose** Verify that the DCBX application named **myfcoe5** for FCoE is configured.

**Action** List the DCBX applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application myfcoe5 {
    ether-type 0x8906;
```

**Meaning** The **show applications** configuration mode command shows all of the configured applications. The output shows that the application **myfcoe5** is configured with an EtherType of **0x8906** (the correct EtherType for FCoE traffic).

#### *Verifying the DCBX Application Map Configuration*

**Purpose** Verify that the application map **myfcoe5\_app\_map** is configured.

**Action** List the application map by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
myfcoe5_app_map {
    application myfcoe5 code-points 101;
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map.

The output shows that there is one application map, **myfcoe5\_app\_map**, which consists of the application named **myfcoe5** mapped to IEEE 802.1p code point **101** (priority 5).

### *Verifying the DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application map is applied to the correct interface (xe-0/0/27).

**Action** List the application maps using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/27.0 {
    application-map myfcoe5_app_map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists the application map association with interfaces. The output shows that interface **xe-0/0/27** uses application map **myfcoe5\_app\_map**.

## **Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic**

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly best-effort (lossy) unicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

## Requirements

---

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

## Overview

---

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly best-effort unicast traffic, more buffer space needs to be allocated to lossy buffers, and less buffer space should be allocated to lossless buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly unicast traffic.

### Topology

[Table 432 on page 5105](#) shows the configuration components for this example.

**Table 432: Components of the Recommended Shared Buffer Configuration for Best-Effort Unicast Network Topologies**

| Component             | Settings                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware              | QFX3500 switch                                                                                                                                                                                                                                                                                                                                                                                                           |
| Ingress shared buffer | Percentage of available ingress buffer space allocated to the ingress shared buffer: 100%<br>Percentage of ingress buffer space allocated to lossless traffic (lossless buffer partition): 5%<br>Percentage of ingress buffer space allocated to lossless headroom traffic (lossless-headroom buffer partition): 0%<br>Percentage of ingress buffer space allocated to best-effort traffic (lossy buffer partition): 95% |
| Egress shared buffer  | Percentage of available egress buffer space allocated to the egress shared buffer: 100%<br>Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 5%<br>Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 75%<br>Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 20%                       |

### Configuration

**CLI Quick Configuration** To quickly configure the recommended shared buffer settings for networks that carry mostly best-effort unicast traffic, copy the following commands, paste them in a text

file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 75
set egress buffer-partition multicast percent 20
```

### *Configuring the Global Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic*

**Step-by-Step Procedure** To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly best-effort unicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 0
user@switch# set ingress buffer-partition lossy percent 95
```
3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 75
user@switch# set egress buffer-partition multicast percent 20
```

### **Results**

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
```

```

}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 75;
    }
    buffer-partition multicast {
        percent 20;
    }
}

```

### Verification

Verify that the shared buffer configuration has been created properly.

#### Verifying the Shared Buffer Configuration

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```

user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer   : 2158.00 KB
  Shared Buffer      : 7202.00 KB
    Lossless        : 360.10 KB
    Lossless Headroom : 0.00 KB
    Lossy           : 6841.90 KB

  Lossless Headroom Utilization:
  Node Device      Total      Used      Free
  0                0.00 KB    0.00 KB    0.00 KB

Egress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer   : 2704.00 KB
  Shared Buffer      : 6656.00 KB
    Lossless        : 332.80 KB
    Multicast        : 1331.20 KB
    Lossy           : 4992.00 KB

```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved,

ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 1331.20 KB to multicast traffic
  - 4992 KB to lossy unicast traffic

## Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly multicast traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

### Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

### Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly multicast traffic, more buffer space needs to be allocated to lossy buffers, less buffer space should be allocated to lossless buffers, and more space needs to be allocated to egress multicast buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly multicast traffic.

### ***Topology***

[Table 433 on page 5111](#) shows the configuration components for this example.

Table 433: Components of the Recommended Shared Buffer Configuration for Multicast Network Topologies

| Component             | Settings                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Configuration

#### CLI Quick Configuration

To quickly configure the recommended shared buffer settings for networks that carry mostly multicast traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 5
set ingress buffer-partition lossless-headroom percent 0
set ingress buffer-partition lossy percent 95
set egress percent 100
set egress buffer-partition lossless percent 5
set egress buffer-partition lossy percent 20
set egress buffer-partition multicast percent 75
```

#### *Configuring the Global Shared Buffer Pool for Networks with Mostly Multicast Traffic*

#### Step-by-Step Procedure

To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly multicast traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 5
user@switch# set ingress buffer-partition lossless-headroom percent 0
user@switch# set ingress buffer-partition lossy percent 95
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 5
user@switch# set egress buffer-partition lossy percent 20
user@switch# set egress buffer-partition multicast percent 75
```

### Results

Display the results of the configuration:

```
root@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 95;
    }
    buffer-partition lossless-headroom {
        percent 0;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 5;
    }
    buffer-partition lossy {
        percent 20;
    }
    buffer-partition multicast {
        percent 75;
    }
}
```

---

### Verification

Verify that the shared buffer configuration has been created properly.

#### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
  Total Buffer      : 9360.00 KB
  Dedicated Buffer  : 2158.00 KB
```

```

Shared Buffer      : 7202.00 KB
Lossless          : 360.10 KB
Lossless Headroom : 0.00 KB
Lossy             : 6841.90 KB

```

Lossless Headroom Utilization:

| Node Device | Total   | Used    | Free    |
|-------------|---------|---------|---------|
| 0           | 0.00 KB | 0.00 KB | 0.00 KB |

Egress:

```

Total Buffer      : 9360.00 KB
Dedicated Buffer  : 2704.00 KB
Shared Buffer     : 6656.00 KB
Lossless         : 332.80 KB
Multicast        : 4992.00 KB
Lossy            : 1331.20 KB

```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 360.10 KB to lossless traffic
  - No space to lossless headroom traffic
  - 6841.90 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Because the lossless headroom buffer partition is set to 0 (zero) percent, the total amount of lossless headroom buffer space is 0 KB; therefore the amount of used and free lossless headroom buffer space is also 0 KB.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.

- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 332.80 KB to lossless traffic
  - 4992 KB to multicast traffic
  - 1331.20 KB to lossy unicast traffic

### Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic.

This example shows you the recommended configuration of the global shared buffer pool to support a network that carries mostly lossless traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

---

Use the default shared buffer settings (for a network with a balanced mix of lossless, best effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

**NOTE:** When we discuss lossless buffers, we mean buffers that handle traffic on which you enable priority-based flow control (PFC) to ensure lossless transport. The lossless buffers are not used for best-effort traffic on a link on which you enable Ethernet PAUSE (IEEE 802.3x).

After starting from the recommended configuration, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

### Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX3500 Switch
- Junos OS Release 12.3 or later for the QFX Series

### Overview

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- Lossless headroom buffers—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- Lossy buffers—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multidestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffers to support a network that carries mostly lossless traffic, more buffer space needs to be allocated to lossless buffers, and less buffer space should be allocated to lossy buffers. This example shows you how to configure the global shared buffer pool allocation that we recommend to support a network that carries mostly lossless traffic.

### Topology

[Table 434 on page 5116](#) shows the configuration components for this example.

**Table 434: Components of the Recommended Shared Buffer Configuration for Lossless Network Topologies**

| Component             | Settings                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware              | QFX3500 switch                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 434: Components of the Recommended Shared Buffer Configuration for Lossless Network Topologies (*continued*)

| Component            | Settings                                                                                          |
|----------------------|---------------------------------------------------------------------------------------------------|
| Egress shared buffer | Percentage of available egress buffer space allocated to the egress shared buffer: 100%           |
|                      | Percentage of egress buffer space allocated to lossless queues (lossless buffer partition): 90%   |
|                      | Percentage of egress buffer space allocated to best-effort queues (lossy buffer partition): 5%    |
|                      | Percentage of egress buffer space allocated to multicast traffic (multicast buffer partition): 5% |

### Configuration

**CLI Quick Configuration** To quickly configure the recommended shared buffer settings for networks that carry mostly lossless traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
[edit class-of-service shared-buffer]
set ingress percent 100
set ingress buffer-partition lossless percent 15
set ingress buffer-partition lossless-headroom percent 80
set ingress buffer-partition lossy percent 5
set egress percent 100
set egress buffer-partition lossless percent 90
set egress buffer-partition lossy percent 5
set egress buffer-partition multicast percent 5
```

### Configuring the Global Shared Buffer Pool for Networks with Mostly Lossless Traffic

**Step-by-Step Procedure** To configure the global ingress and egress shared buffer allocations and partitions for a network that carries mostly lossless traffic:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent 100
```
2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:  

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent 15
user@switch# set ingress buffer-partition lossless-headroom percent 80
user@switch# set ingress buffer-partition lossy percent 5
```
3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:  

```
[edit class-of-service shared-buffer]
user@switch# set egress percent 100
```
4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:  

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent 90
user@switch# set egress buffer-partition lossy percent 5
```

```
user@switch# set egress buffer-partition multicast percent 5
```

### Results

Display the results of the configuration:

```
rrroot@dcbg-tp-pa-02> show configuration class-of-service shared-buffer
ingress {
    percent 100;
    buffer-partition lossless {
        percent 15;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition lossless-headroom {
        percent 80;
    }
}
egress {
    percent 100;
    buffer-partition lossless {
        percent 90;
    }
    buffer-partition lossy {
        percent 5;
    }
    buffer-partition multicast {
        percent 5;
    }
}
```

---

### Verification

Verify that the shared buffer configuration has been created properly.

#### *Verifying the Shared Buffer Configuration*

**Purpose** Verify that the ingress and egress global shared buffer pools are correctly configured and partitioned among the shared buffer types.

**Action** List the global shared buffer configuration using the operational mode command **show class-of-service shared-buffer**:

```
user@switch> show class-of-service shared-buffer
root@dcbg-tp-pa-02> show class-of-service shared-buffer
Ingress:
Total Buffer      : 9360.00 KB
Dedicated Buffer  : 2158.00 KB
Shared Buffer     : 7202.00 KB
  Lossless       : 1080.30 KB
  Lossless Headroom : 5761.60 KB
  Lossy          : 360.10 KB

Lossless Headroom Utilization:
Node Device      Total      Used      Free
0                5761.60 KB  0.00 KB  5761.60 KB

Egress:
Total Buffer      : 9360.00 KB
```

```

Dedicated Buffer : 2704.00 KB
Shared Buffer    : 6656.00 KB
  Lossless      : 5990.40 KB
  Multicast     : 332.80 KB
  Lossy         : 332.80 KB

```

**Meaning** The **show class-of-service shared-buffer** operational command shows all of the ingress and egress global shared buffer settings, including the buffer partitioning.

For the ingress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2158 KB. This is the size of the global ingress dedicated buffer pool when you configure the ingress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, ingress dedicated ingress buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the ingress shared buffer pool configured as 100 percent of the available buffers, the total size of the ingress shared buffer pool is 7202 KB.
- The ingress shared buffer pool is partitioned to allocate:
  - 1080 KB to lossless traffic
  - 5761.60 KB to lossless headroom traffic
  - 360.10 KB to lossy unicast traffic
- The Lossless Headroom Utilization field shows how much of the buffer space reserved for paused traffic is used. Of the total available lossless headroom buffer space of 5761.60 KB, currently no buffer space is being used, so all 5761.60 KB of buffer space is free.

For the egress shared buffers, the command output shows:

- The total switch buffer pool is 9360 KB (9 MB).
- The dedicated buffer pool is 2704 KB. This is the size of the global egress dedicated buffer pool when you configure the egress shared buffer pool as 100 percent of the available (user-configurable) buffer space. This is the minimum size of the reserved, egress dedicated buffer pool (not user-configurable). If you configure the shared buffer as less than 100 percent of the available buffer pool, the remaining buffer space is added to the dedicated buffer pool.
- With the egress shared buffer pool configured as 100 percent of the available buffers, the total size of the egress shared buffer pool is 6656 KB. This is less than the ingress shared buffer pool because the switch reserves more egress dedicated buffer space than ingress dedicated buffer space. (More dedicated buffer space means less shared buffer space, and more shared buffer space means less dedicated buffer space.)
- The egress shared buffer pool is partitioned to allocate:
  - 5990.40 KB to lossless traffic

- 332.80 KB to multicast traffic
- 332.80 KB to lossy unicast traffic

## Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The QFX Series handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the QFX Series exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).
- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol

information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

## Requirements

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

## Overview

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

**NOTE:** DCBX also advertises PFC and enhanced transmission selection (ETS) information. See [“Configuring DCBX Autonegotiation” on page 4601](#) for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.
- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. [Table 317 on page 4542](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode

or tagged-access mode. [Table 318 on page 4542](#) shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

**Table 435: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | best-effort      | low           |
| be1 (001)  | best-effort      | low           |
| ef (010)   | best-effort      | low           |
| ef1 (011)  | fcoe             | low           |
| af11 (100) | no-loss          | low           |
| af12 (101) | best-effort      | low           |
| nc1 (110)  | network-control  | low           |
| nc2 (111)  | network-control  | low           |

**Table 436: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 000        | best-effort      | low           |
| 001        | best-effort      | low           |
| 010        | best-effort      | low           |
| 011        | best-effort      | low           |
| 100        | best-effort      | low           |
| 101        | best-effort      | low           |
| 110        | best-effort      | low           |
| 111        | best-effort      | low           |

### **Topology**

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and

FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

**NOTE:** You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 319 on page 4543 shows the configuration components for this example.

**Table 437: Components of DCBX Application Protocol Exchange Configuration Topology**

| Component                   | Settings                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hardware                    | QFX Series device                                                                                                                                                                                                                                                                                                                                            |
| LLDP                        | Enabled by default on Ethernet interfaces                                                                                                                                                                                                                                                                                                                    |
| DCBX                        | Enabled by default on Ethernet interfaces                                                                                                                                                                                                                                                                                                                    |

**Table 437: Components of DCBX Application Protocol Exchange Configuration Topology (*continued*)**

| Component                                                                                                         | Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces                                                                                                        | <p><b>xe-0/0/10</b>—Configured to exchange FCoE and iSCSI application TLVs (uses application map <b>dcbx-iscsi-fcoe-app-map</b>, carries FCoE traffic, and has PFC enabled on the FCoE priority)</p> <p><b>xe-0/0/11</b>—Configured to exchange iSCSI and PTP application TLVs (uses application map <b>dcbx-iscsi-ptp-app-map</b>)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PFC congestion notification profile for FCoE application exchange                                                 | <p><b>fcoe-cnp:</b></p> <ul style="list-style-type: none"> <li>Code point—<b>011</b></li> <li>Interface—<b>xe-0/0/10</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Behavior aggregate classifiers (map forwarding classes to incoming packets by the packet's IEEE 802.1 code point) | <p><b>fcoe-iscsi-cl1:</b></p> <ul style="list-style-type: none"> <li>Maps the <b>fcoe</b> forwarding class to the IEEE 802.1p code point used for the FCoE application (<b>011</b>) and a loss priority of <b>high</b></li> <li>Maps the <b>network-control</b> forwarding class to the IEEE 802.1p code point used for the iSCSI application (<b>111</b>) and a loss priority of <b>high</b></li> <li>Applied to interface <b>xe-0/0/10</b></li> </ul> <p><b>iscsi-ptp-cl2:</b></p> <ul style="list-style-type: none"> <li>Maps the <b>network-control</b> forwarding class to the IEEE 802.1p code point used for the iSCSI application (<b>111</b>) and a loss priority of <b>low</b></li> <li>Maps the <b>best-effort</b> forwarding class to the IEEE 802.1p code points used for the PTP application (<b>001</b> and <b>101</b>) and a loss priority of <b>low</b></li> <li>Applied to interface <b>xe-0/0/11</b></li> </ul> |

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

### Configuration

#### CLI Quick Configuration

To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]

```

```

set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe
loss-priority high code-points 011
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class
network-control loss-priority high code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class
network-control loss-priority low code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2

```

### Configuring DCBX Application Protocol TLV Exchange

**Step-by-Step Procedure** To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.  

```

[edit applications]
user@switch# set application iSCSI protocol tcp destination-port 3260
user@switch# set application FCoE ether-type 0x8906
user@switch# set application PTP ether-type 0x88F7

```
2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.  

```

[edit policy-options]
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011

```
3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.  

```

[edit policy-options]
user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]

```
4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.  

```

[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map

```
5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.  

```

[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp

```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority
high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control
loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

---

### Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- [Verifying the Application Configuration on page 5126](#)
- [Verifying the Application Map Configuration on page 5127](#)
- [Verifying DCBX Application Protocol Exchange Interface Configuration on page 5127](#)
- [Verifying the PFC Configuration on page 5128](#)
- [Verifying the Classifier Configuration on page 5128](#)

#### *Verifying the Application Configuration*

**Purpose** Verify that DCBX applications have been configured.

**Action** List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
application iSCSI {
  protocol tcp;
  destination-port 3260;
}

application fcoe {
  ether-type 0x8906;
}

application ptp {
  ether-type 0x88F7;
}
```

**Meaning** The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their

EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

### *Verifying the Application Map Configuration*

**Purpose** Verify that the application maps have been configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
    application iSCSI code-points 111;
    application FCoE code-points 011;
}

dcbx-iscsi-ntp-app-map {
    application iSCSI code-points 111;
    application PTP code-points [001 101];
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ntp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ntp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

### *Verifying DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps have been applied to the correct interfaces.

**Action** List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
    application-map dcbx-iscsi-ntp-app-map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command

output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

### *Verifying the PFC Configuration*

**Purpose** Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

**Action** Display the PFC configuration to verify that PFC is enabled on the FCoE code point (**011**) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
  input {
    ieee-802.1 {
      code-point 011 {
        pfc;
      }
    }
  }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
  congestion-notification-profile fcoe-cnp;
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

**Meaning** The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

### *Verifying the Classifier Configuration*

**Purpose** Verify that the classifiers have been configured and applied to the correct interfaces.

**Action** Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
  ieee-802.1 fcoe-iscsi-cl1 {
    import default;
    forwarding-class network-control {
      loss-priority high code-points 111;
    }
    forwarding-class fcoe {
      loss-priority high code-points 011;
    }
  }
  ieee-802.1 iscsi-ntp-cl2 {
    import default;
    forwarding-class network-control {
      loss-priority low code-points 111;
    }
    forwarding-class best-effort {
      loss-priority low code-points [ 001 101 ];
    }
  }
}
interfaces {
  xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-iscsi-cl1;
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      classifiers {
        ieee-802.1 iscsi-ntp-cl2;
      }
    }
  }
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

**Meaning** The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ntp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

## Configuring CoS

The class-of-service topics describe how to configure the Junos CoS components for the QFX Series. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components, you assign classifiers to the required physical and logical interfaces.

You can configure various CoS components individually or in combination to define CoS services.

**NOTE:** When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

The following topics describe how to configure CoS components :

## Defining CoS Code-Point Aliases

You can use code-point aliases to streamline the process of configuring CoS features on your switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP or DSCP IPv6—Handles incoming IPv4 or IPv6 packets.
- IEEE 802.1p—Handles Layer 2 CoS.

To configure a code-point alias:

1. Specify a CoS marker type (IEEE 802.1 or DSCP).
2. Assign an alias.
3. Specify the code point that corresponds to the alias.

```
[edit class-of-service code-point-aliases]
user@switch# set (dscp | dscp-ipv6 | ieee-802.1) alias-name code-point-bits
```

For example, to configure a code-point alias for an IEEE 802.1 CoS marker type that has the alias name `fcoe1` and maps to the code-point bits 011:

```
[edit class-of-service code-point-aliases]
user@switch# set ieee-802.1 fcoe1 011
```

### Related Documentation

## Defining CoS Unicast BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP or DSCP IPv6) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

Unicast traffic must use different classifiers than multdestination (multicast, broadcast, and destination lookup fail) traffic.

To configure a unicast BA classifier using the CLI:

1. Create a unicast BA classifier:

- To create a unicast BA classifier based on the default classifier, import the default DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name import default forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

- To create a unicast BA classifier that is not based on the default classifier, create a DSCP, DSCP IPv6, or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

2. Apply the unicast classifier to a specific 10-Gigabit Ethernet interface or to all 10-Gigabit Ethernet interfaces or to all Fibre Channel interfaces on the switch.

- To apply the classifier to a specific interface:

```
[edit class-of-service interfaces]
user@switch# set interface-name unit unit classifiers (dscp | ieee-802.1) classifier-name
```

- To apply the classifier to all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * classifiers (dscp | ieee-802.1) classifier-name
```

## Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. Behavior aggregate (BA) classifiers examine the Differentiated Services code point (DSCP) value or IEEE 802.1p CoS value in the packet header to determine the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the incoming CoS value.

**NOTE:** DSCP IPv6 multidestination classifiers are not supported. IPv6 multidestination traffic uses the DSCP multidestination classifier.

Multidestination classifiers apply to all of the switch interfaces and handle multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot apply a multidestination classifier to a single interface or to a range of interfaces.

Unicast and multidestination traffic must use different classifiers.

To configure a multidestination BA classifier using the CLI:

1. Create a DSCP or IEEE 802.1p classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1) classifier-name forwarding-class forwarding-class-name
loss-priority level code-points [aliases] [bit-patterns]
```

2. Configure the classifier as a multidestination classifier:

```
[edit class-of-service]
user@switch# set multi-destination classifiers (dscp | ieee-802.1) classifier-name
```

## Configuring CoS Tail-Drop Profiles

You can configure an interpolated weighted random early detection (WRED) tail-drop profile to control packet drop characteristics for different traffic loss priorities.

**NOTE:** You cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Also, do not enable WRED on lossless traffic flows. Use priority-based flow control (PFC) to prevent packet loss on lossless forwarding classes.

*Interpolated* means that the switch creates a smooth drop curve from a drop start point to a drop end point, with a maximum drop rate that is reached at the drop end point.

The drop start point is the average queue fill level when the WRED algorithm starts to drop packets. Before the drop start point, no packets are scheduled to drop. Specify the drop start point using the first of two **fill-level** statements.

The drop end point is the average queue fill level at which all subsequently arriving packets are dropped. When the queue fill levels falls below the drop end point, packets begin to be forwarded again. (At the drop end point, the packet drop probability becomes 100 percent.) Specify the drop end point using the second of two **fill-level** statements.

The minimum drop rate is always 0. Specify the minimum drop rate using the first of two **drop-probability** statements. The maximum drop rate is the drop probability when the average queue fill level reaches the drop end point. Specify the maximum drop rate using the second of two **drop-probability** statements.

The drop rate is zero until the queue fill level reaches the drop start point. As the queue continues to fill, packets drop in smooth linear curve until the queue reaches the drop end point, when packets drop at the maximum drop rate. If the queue fills beyond the drop end point, all packets that match the drop profile are dropped.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

- [Understanding CoS Tail-Drop Profiles on page 4929](#)

## Configuring CoS Drop Profile Maps

A drop-profile map associates a tail-drop profile for traffic of a specified loss priority with a scheduler. When you use a scheduler map to map a scheduler to a forwarding class, the drop profile map associated with the scheduler applies the specified tail-drop profile to traffic in the forwarding class that matches the specified loss priority.

Drop profile maps enable you to configure different drop profiles for traffic of different loss priorities within the same scheduler. You can associate different drop profiles with low-priority, medium-high priority, and high-priority traffic within a single scheduler, and then map that scheduler to a forwarding class. This applies the appropriate drop profile to traffic of each loss priority in a forwarding class. Drop profile maps apply to all traffic protocols.

To configure a drop-profile map using the CLI:

- For the desired scheduler, configure the traffic loss priority and specify the drop profile you want to use to control the drop characteristics for traffic of that loss priority:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name drop-profile-map loss-priority level protocol
any drop-profile drop-profile-name
```

## Defining CoS Forwarding Classes

Forwarding classes allow you to group packets for transmission. The switch supports a total of 12 forwarding classes. In order to forward traffic, you map (assign) the forwarding classes to unicast or multdestination (multicast, broadcast, and destination lookup fail) output queues.

The switch has 12 output queues. Queues 0 through 7 are for unicast traffic and queues 8 through 11 are for multicast traffic. Forwarding classes mapped to unicast queues must carry unicast traffic, and forwarding classes mapped to multdestination queues must carry multdestination traffic. There are four default unicast forwarding classes and one default multdestination forwarding class.

The default unicast forwarding classes are:

- **best-effort**—Best-effort traffic
- **fcoe**—Guaranteed delivery for FCoE traffic
- **no-loss**—Guaranteed delivery for TCP no-loss traffic
- **network-control**—Network control traffic

The default multidestination forwarding class is:

- **mcast**—Multidestination traffic

Map forwarding classes to queues using the **class** statement, which enables you to configure up to 12 forwarding classes. You can map more than one forwarding class to a single queue, but all forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. In addition, all forwarding classes mapped to a particular queue must be either lossless or lossy. You cannot mix lossless and lossy forwarding classes (traffic) on the same queue. Also, you cannot mix unicast and multicast forwarding classes on the same queue.

[edit [class-of-service forwarding-classes](#)]

```
user@switch# class class-name queue-num queue-number <no-loss>
```

---

**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (**best-effort**) traffic and does *not* receive lossless treatment unless you include the optional **no-loss** packet drop attribute introduced in Junos OS Release 12.3 in the forwarding class configuration..

---

**NOTE:** Junos OS Release 11.3R1 and earlier supported an alternate method of mapping forwarding classes to queues that allowed you to map only one forwarding class to a queue using the statement:

[edit [class-of-service forwarding-classes](#)]

```
user@switch# queue queue-number class-name
```

The **queue** statement has been deprecated and is no longer valid in Junos OS Release 11.3R2 and later. If you have a configuration that uses the **queue** statement to map forwarding classes to queues, edit the configuration to replace the **queue** statement with the **class** statement.

---

## Defining CoS Forwarding Class Sets

A forwarding class set is a priority group for enhanced transmission selection (ETS) traffic control. Each forwarding class set consists of one or more forwarding classes (priorities, which can also be considered as output queues).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set.

To configure a forwarding class set using the CLI:

1. Assign one or more forwarding classes to the forwarding class set:

```
[edit class-of-service]
user@switch# set forwarding-class-sets forwarding-class-set-name class
forwarding-class-name
```

2. Map the forwarding class set to an interface:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set forwarding-class-set-name
```

### Related Documentation

## Defining CoS Queue Schedulers

Schedulers define the CoS properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the priority of the queue, the tail-drop profiles associated with the queue, and the queue buffer size.

The parameters you configure in a scheduler define the following characteristics for the queues mapped to the scheduler:

- **transmit-rate**—Minimum bandwidth, also known as the committed information rate (CIR), set as a percentage rate or as an absolute value in bits per second. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

**NOTE:** Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

**NOTE:** You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR), set as a percentage rate or as an absolute value in bits per second.

**NOTE:** Include the preamble bytes and interframe gap (IFG) bytes as well as the data bytes in your bandwidth calculations.

- **priority**—One of two bandwidth priorities that queues associated with a scheduler can receive:
  - **low**—The scheduler has low priority.
  - **strict-high**—The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **drop-profile-map**—Drop profile mapping to a loss priority and protocol to apply WRED to the scheduler.
- **buffer-size**—Size of the queue buffer as a percentage of the dedicated buffer space on the port, or as a proportional share of the dedicated buffer space on the port that remains after the explicitly configured queues are served.

**NOTE:** Queues might not receive the egress bandwidth configured in the queue scheduler when a port's egress queues are congested. This can occur when the ingress port buffer fills above a certain threshold. If this happens, configure a drop profile for the queue on the port that is receiving its configured bandwidth (this queue is preventing the other queues on the port from receiving their configured bandwidth). The drop profile applies a weighted random early detection (WRED) algorithm to the queue and prevents the queue from impacting the other queues on the port.

To apply scheduling properties to traffic, map schedulers to forwarding classes using a scheduler map, and then associate the scheduler map with the interfaces. This applies the configured scheduling to the traffic in the specified forwarding class on the associated interface. Using different scheduler maps, you can map different schedulers to the same traffic (the same forwarding class) to apply different scheduling to that traffic on different interfaces.

To configure a scheduler using the CLI:

1. Name the scheduler and define the minimum guaranteed bandwidth for the queue:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name transmit-rate (rate | percent percentage)
```

2. Define the maximum bandwidth for the queue:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set shaping-rate (rate | percent percentage)
```

3. Define the queue priority:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set priority level
```

4. Define the drop profile using a drop profile map:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set drop-profile-map loss-priority (low | medium-high | high) protocol protocol
drop-profile drop-profile-name
```

5. Configure the size of the port dedicated buffer space for the queue:

```
[edit class-of-service schedulers scheduler-name]
user@switch# set buffer-size percent 20
```

6. Configure a scheduler map to map the scheduler to a forwarding class, which applies the scheduler's properties to the traffic in that forwarding class:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

7. Assign the scheduler map to one or more interfaces to apply the scheduling to the traffic that belongs to the specified forwarding class on those interfaces:

```
[edit class-of-service]
user@switch# set interfaces interface-name scheduler-map scheduler-map-name
```

## Defining CoS Queue Scheduling Priority

You can configure the scheduling priority of individual queues by specifying the priority in a scheduler, and then associating the scheduler with a queue by using a scheduler map. Queues can have one of two bandwidth priorities:

- **strict-high** —The scheduler has strict-high priority. You can configure only one queue as a strict-high priority queue. Strict-high priority allocates the scheduled bandwidth to the queue before any other queue receives bandwidth. Other queues receive the bandwidth that remains after the strict-high queue has been serviced.
- **low**—Low priority. Traffic with this priority is serviced after any queue that has a **strict-high** priority.
- To configure queue priority using the CLI:

```
[edit class-of-service]  
user@switch# set schedulers scheduler-name priority level
```

### Related Documentation

- [Example: Configuring Queue Scheduling Priority on page 5035](#)

## Changing the Host Outbound Traffic Default Queue Mapping

If you do not want to use the default mapping of host Routing Engine and CPU outbound traffic to queues, you can change the default output queue. You can also change the default DSCP bits used in the type of service (ToS) field of packets generated by the Routing Engine.

Configuring a queue for host outbound traffic maps all traffic that the host generates to one forwarding class (queue). The configuration is global and applies to all host-generated traffic on the switch. Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

**NOTE:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the `fcoe` queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (`fcoe`) across the Interconnect device (fabric) and the egress Node device.

To change the host outbound traffic egress queue by including the **host-outbound-traffic** statement at the **[edit class-of-service]** hierarchy level:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class class-name;
  dscp-code-point code-point;
}
```

For example, to map host outbound traffic to queue 7 (the network control forwarding class) and set the DSCP code point value to 101010:

```
[edit class-of-service]
host-outbound-traffic {
  forwarding-class network-control;
  dscp-code-point 101010
}
```

### Related Documentation

- [Understanding Host Routing Engine Outbound Traffic Queues and Defaults on page 4842](#)

## Defining CoS Traffic Control Profiles (Priority Group Scheduling)

A traffic control profile defines the output bandwidth and scheduling characteristics of forwarding class sets (priority groups). The forwarding classes (queues) contained in a forwarding class set share the bandwidth resources that you configure in the traffic control profile. A scheduler map associates forwarding classes with schedulers to define how the individual queues in a forwarding class set share the bandwidth allocated to that forwarding class set.

The parameters you configure in a traffic control profile define the following characteristics for the priority group:

- **guaranteed-rate**—Minimum bandwidth, also known as the committed information rate (CIR). The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.

**NOTE:** You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.

- **shaping-rate**—Maximum bandwidth, also known as the peak information rate (PIR).
- **scheduler-map**—Bandwidth and scheduling characteristics for the queues, defined by mapping forwarding classes to schedulers. (The queue scheduling characteristics represent amounts or percentages of the priority group bandwidth, not the amounts or percentages of total link bandwidth.)

**NOTE:** Because a port can have more than one priority group, when you assign resources to a priority group, keep in mind that the total port bandwidth must serve all of the queues associated with that port.

To configure a traffic control profile using the CLI:

1. Name the traffic control profile and define the minimum guaranteed bandwidth for the priority group:

```
[edit class-of-service ]
user@switch# set traffic-control-profiles traffic-control-profile-name guaranteed-rate (rate
| percent percentage)
```

2. Define the maximum bandwidth for the priority group:

```
[edit class-of-service traffic-control-profiles traffic-control-profile-name]
user@switch# set shaping-rate (rate | percent percentage)
```

3. Attach a scheduler map to the traffic control profile:

```
[edit class-of-service traffic-control-profiles traffic-control-profile-name]
user@switch# set scheduler-map scheduler-map-name
```

## Configuring CoS PFC (Congestion Notification Profiles)

A congestion notification profile (CNP) enables priority-based flow control (PFC) on specified IEEE 802.1p priorities (code points). A CNP has two components:

- Input CNP:
  - Enable PFC on a specified priority.
  - Configure the maximum receive unit (MRU) on an interface for traffic that matches the PFC priority (optional).
  - Specify the length of the attached cable on the ingress interface (optional)
- Output CNP (optional): Configure flow control to enable PFC pause on specific output queues for specified priorities.

**NOTE:** By default, output queues 3 and 4 (which are mapped to default lossless forwarding classes `fcoe` and `no-loss`, respectively) are configured to respond to PFC pause messages received from the connected peer on priorities 3 and 4 (code points 011 and 100, respectively). If you explicitly configure flow control on any output queue, you must configure flow control on every output queue that you want to respond to pause messages. (The explicit configuration overrides the default configuration.)

To achieve lossless behavior, the output queue priorities on which you enable PFC flow control must match the PFC priorities on which you enable PFC on the input interfaces. For example, if you program output queues to pause priorities 3 (011) and 5 (101) in the output component of the CNP, then you must also enable pause on priorities 3 and 5 on the input component of the CNP. (In addition, the forwarding classes mapped to the paused output queues must be lossless forwarding classes.)

Associating a CNP with an interface enables PFC on the ingress traffic that matches the priority specified in the input CNP, and programs the queues listed in the output CNP to pause when the interface receives a PFC pause message from the connected peer. Configure PFC on a priority end to end along the entire data path to create a lossless lane of traffic on the network.

**NOTE:** You must enable PFC on the priority used by FCoE traffic on ingress interfaces (input CNP). Enable PFC on the FCoE priority on every interface that carries FCoE traffic. By convention, FCoE traffic uses priority 3 (code point 011), which maps to queue 3. If your network uses priority 3 for FCoE traffic, the default forwarding class and classifier configuration support lossless transport, but you must still configure a CNP and apply it to the correct ingress interfaces to enable PFC and achieve lossless transport.

If your network does not use priority 3 for FCoE traffic, you need to configure a classifier that classifies FCoE traffic into a lossless forwarding class, based on the priority your network uses for FCoE traffic. If you are not using the default lossless forwarding class configuration, then you also need to ensure that the output queue mapped to the lossless FCoE forwarding class is programmed to pause.

You can attach only one CNP to an interface. There is no limit to the total number of CNPs you can create.

Configuring a CNP consists of:

- Naming the CNP.
- Specifying the IEEE 802.1 code point (priority) on which you want to enable PFC on ingress interfaces (input CNP).
- Optionally, specifying the MRU and the length of the attached cable on ingress interfaces (input CNP).
- Optionally, configuring flow control (PFC pause) on specified output queues if you want queues other than queues 3 and 4 to respond to pause messages received from the connected peer (output CNP).
- Mapping the CNP to an interface.

1. Enable PFC on the desired priority in the input CNP and optionally configure the interface MRU for traffic on that priority:

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name input ieee-802.1 code-point
code-point bits pfc mru mru-value
```

For example, to configure a CNP named **fcoe-cnp** that enables PFC on IEEE 802.1 code point **011** and configures an MRU value of **2240**:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011
pfc mru 2240
```

2. Configure the length of the cable attached to the ingress interface (optional):

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name input cable-length
cable-length-value
```

For example, to configure a CNP named **fcoe-cnp** that sets the length of the ingress interface cable to **100** meters:

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input cable-length 100
```

3. (Optional) Configure flow control on output queues:

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
code-point-bits flow-control-queue [queue | list-of-queues]
```

For example, to configure a CNP named **fcoe-cnp** that enables PFC pause flow control on output queues 3 and 5 for FCoE traffic that uses priority 3 (code point **011**) and on output queue 4 for traffic that uses priority 4 (code point **100**):

```
[edit class-of-service]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
011 flow-control-queue [3 5]
user@switch# set congestion-notification-profile cnp-name output ieee-802.1 code-point
100 flow-control-queue 4
```

4. Map the CNP to an interface:

```
[edit class-of-service]
user@switch# set interfaces interface congestion-notification-profile cnp-name
```

For example, to map the CNP **fcoe-cnp** to the interface **xe-0/0/7**:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/7 congestion-notification-profile fcoe-cnp
```

## Enabling and Disabling CoS Symmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to Ethernet link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Symmetric flow control means that an interface has the same PAUSE configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled, or they are both disabled.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. If you attempt to configure both features, the switch returns a commit error. Ethernet PAUSE and PFC are also mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

By default, all flow control features are disabled. You enable symmetric flow control on the interfaces on which you want to PAUSE all of the traffic on a link.

- To enable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]  
user@switch# set flow-control
```

- To disable symmetric flow control on an interface:

```
[edit interfaces interface-name ether-options]  
user@switch# set no-flow-control
```

## Configuring CoS Asymmetric Ethernet PAUSE Flow Control

Ethernet PAUSE flow control is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link, including Ethernet links that belong to link aggregated (LAG) interfaces. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to PAUSE messages it receives from the connected peer to stop sending traffic.

Asymmetric flow control allows you to configure the PAUSE functionality in each direction independently on an interface. The configuration for generating PAUSE messages and for responding to PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction.

Symmetric flow control means that the interface has the same configuration in both directions. The PAUSE generation and PAUSE response functions are both configured as enabled or they are both disabled. If you do not want to PAUSE all of the traffic on a link, you can use priority-based flow control (PFC) to selectively pause traffic based on its IEEE 802.1p code point.

Asymmetric flow control provides the ability to configure the receive buffer and transmit buffer Ethernet PAUSE actions independently on an interface. The buffers perform the following actions:

- The receive buffers generate and send PAUSE messages to the connected peer to ask the peer to stop sending traffic for a time period specified in the PAUSE frame. The peer interface's buffers may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.
- The transmit buffers respond to PAUSE messages received from the connected peer to stop sending traffic to the peer. The transmit buffer may store outgoing frames until the PAUSE period elapses and the interface can resume sending traffic.

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to PAUSE messages:

- Receive buffers on—Enable PAUSE transmission (generate and send PAUSE frames)
- Transmit buffers on—Enable PAUSE reception (respond to received PAUSE frames)

You must explicitly set both the receive buffer and the transmit buffer to configure asymmetric flow control.

- To configure asymmetric flow control on an interface:  
[edit **interfaces** *interface-name* **ether-options**]

```
user@switch# set configured-flow-control rx-buffers (on | off) tx-buffers (on | off)
```

For example, to configure interface **xe-0/0/24** to generate and send PAUSE messages but not to respond to received PAUSE messages:

```
set interfaces xe-0/0/24 ether-options configured-flow-control rx-buffers on tx-buffers off
```

For example, to configure interface **xe-0/0/30** to respond to received PAUSE messages but not to generate and send PAUSE messages:

```
set interfaces xe-0/0/30 ether-options configured-flow-control rx-buffers off tx-buffers on
```

**NOTE:** If you configure both buffers to be on, that is equivalent to symmetric flow control. If you configure both buffers to be off, there is no flow control (flow control is disabled).

## Configuring CoS Fixed Classifier Rewrite Values for Native FC Interfaces (NP\_Ports)

Fibre Channel over Ethernet (FCoE) traffic typically uses IEEE 802.1p priority 3 (code point 011). When Fibre Channel (FC) traffic arrives on a native FC interface (NP\_Port) on an FCoE-FC gateway, the interface encapsulates the FC traffic in Ethernet to create FCoE frames. By default, the native FC interface assigns priority 3 to the FCoE traffic. The traffic is then forwarded internally to the gateway Ethernet interfaces, and then forwarded to the FCoE network.

If your FCoE network uses priority 3 for FCoE traffic, you do not need to use a rewrite value to remap the FCoE priority on native FC interfaces, because the default configuration maps priority 3 to the FCoE forwarding class.

However, if the FCoE network uses a different priority than priority 3 for FCoE traffic, then you can configure a rewrite value to remap incoming traffic from the FC SAN to that priority after the interface encapsulates the FC packets in Ethernet. Setting a rewrite value for the IEEE 802.1p code point (priority) configures the gateway native FC interface to assign the rewrite value to the encapsulated FCoE frames before forwarding the FCoE frames to the gateway Ethernet interface. Instead of a priority of 3, the FCoE frames use the priority specified in the rewrite value.

Traffic coming from the FC SAN is classified into a lossless forwarding class, and that lossless forwarding class is mapped to the rewrite value (the priority used for FCoE traffic on the converged Ethernet network). You specify the lossless forwarding class used for FCoE traffic on a native FC interface by configuring a fixed classifier and applying it to the native FC interface. (The same forwarding class must also be mapped to the rewrite value priority in the ingress classifier applied to the FCoE Ethernet interfaces.) All traffic received from the FC SAN on that FC interface is encapsulated in Ethernet, classified into the forwarding class specified in the fixed classifier, and assigned the rewrite value priority.

Configuring a rewrite value consists of:

- Configuring a fixed classifier on the native FC interface. The fixed classifier assigns all the traffic that arrives at the interface from the connected peer in the FC SAN to one fixed forwarding class. The forwarding class must be a lossless forwarding class and must be classified to the rewrite value priority in the ingress classifier configuration on the FCoE Ethernet interfaces.
- Specifying an IEEE 802.1p rewrite value for the native FC interface. The traffic mapped to the forwarding class in the fixed classifier is marked with the priority you specify in the rewrite value when the traffic is encapsulated in Ethernet. The rewrite value must be the IEEE 802.1p priority used for FCoE traffic in your converged Ethernet network.

You can configure one rewrite value per native FC interface. Each native FC interface can use a different rewrite value.

1. Configure a fixed classifier on the native FC interface:

```
[edit class-of-service]
user@switch# set interfaces fc-interface-name forwarding-class
lossless-forwarding-class-name
```

For example, to configure a fixed classifier on native FC interface **fc-0/0/2** that specifies the lossless forwarding class **fcoe1**:

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 forwarding-class fcoe1
```

2. Configure a rewrite value for the traffic classified into the fixed classifier (this must be the IEEE 802.1p priority used for the traffic on your converged Ethernet network):

```
[edit class-of-service]
user@switch# set interfaces fc-interface-name rewrite-value input ieee-802.1 code-point
code-point-bits
```

For example, to configure a rewrite value on native FC interface **fc-0/0/2** that specifies an IEEE 802.1p priority of **101** (the lossless forwarding class specified in the fixed classifier must be classified to this priority in the ingress classifier configuration on the FCoE Ethernet interfaces):

```
[edit class-of-service]
user@switch# set interfaces fc-0/0/2 rewrite-value input ieee-802.1 code-point 101
```

In the example, all traffic from the FC SAN that arrives at FCoE-FC gateway interface **fc-0/0/2** is encapsulated in Ethernet, classified into the lossless **fcoe1** forwarding class, and tagged with the IEEE 802.1p priority 5 (code point 101). In this example, we assume that the converged Ethernet network uses priority 5 for FCoE traffic, and that the **fcoe1** forwarding class is mapped to priority 5 in the ingress classifier configuration on the Ethernet interfaces. To achieve lossless transport, you must also enable PFC on priority 5 on the Ethernet interfaces that connect the FCoE traffic to the Ethernet network.

**Related  
Documentation**

## Configuring Global Ingress and Egress Shared Buffers

Although the switch reserves some buffer space to ensure a minimum memory allocation for ports and queues, you can configure how the system uses the rest of the buffer space to optimize the buffer allocation for your particular mix of network traffic. The global shared buffer pool is memory space that all of the ports on the switch share dynamically as they need buffers. You can allocate global shared memory space to different types of ingress and egress buffers to better support different mixes of network traffic.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Use the default shared buffer settings (for a network with a balanced mix of lossless, best-effort, and multicast traffic) or one of the recommended shared buffer configurations for your mix of network traffic (mostly best-effort unicast traffic, mostly multicast traffic, or mostly lossless traffic). Either the default configuration or one of the recommended configurations provides a buffer allocation that satisfies the needs of most networks.

After starting from one of the recommended configurations, you can fine-tune the shared buffer settings, but do so with caution to prevent traffic loss due to buffer misconfiguration.

You can configure the percentage of available (user-configurable) buffer space allocated to the global shared buffers. Any space that you do not allocate to the global shared buffer pool is added to the dedicated buffer pool. The default configuration allocates 100 percent of the available buffer space to the global shared buffers.

You can partition the ingress and egress shared buffer pools to allocate more buffers to the types of traffic your network predominantly carries, and fewer buffers to other traffic. From the buffer space allocated to the ingress shared buffer pool, you can allocate space to:

- **Lossless buffers**—Percentage of shared buffer pool for all lossless ingress traffic. The minimum value for the lossless buffers is 5 percent.
- **Lossless headroom buffers**—Percentage of shared buffer pool for packets received while a pause is asserted. If Ethernet PAUSE is configured on a port or if priority-based flow control (PFC) is configured on priorities on a port, when the port sends a pause message to the connected peer, the port uses the headroom buffers to store the packets that arrive between the time the port sends the pause message and the time the last packet arrives after the peer pauses traffic. The minimum value for the lossless headroom buffers is 0 (zero) percent. (Lossless headroom buffers are the only buffers that can have a minimum value of less than 5 percent.)
- **Lossy buffers**—Percentage of shared buffer pool for all best-effort ingress traffic (best-effort unicast, multidestination, and strict-high priority traffic). The minimum value for the lossy buffers is 5 percent.

The combined percentage values of the ingress lossless, lossless headroom, and lossy buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All ingress

buffer partitions must be explicitly configured, even when the lossless headroom buffer partition has a value of 0 (zero) percent.

From the buffer space allocated to the egress shared buffer pool, you can allocate space to:

- Lossless buffers—Percentage of shared buffer pool for all lossless egress queues. The minimum value for the lossless buffers is 5 percent.
- Lossy buffers—Percentage of shared buffer pool for all best-effort egress queues (best-effort unicast, and strict-high priority queues). The minimum value for the lossy buffers is 5 percent.
- Multicast buffers—Percentage of shared buffer pool for all multdestination (multicast, broadcast, and destination lookup fail) egress queues. The minimum value for the multicast buffers is 5 percent.

The combined percentage values of the egress lossless, lossy, and multicast buffer partitions must total exactly 100 percent. If the buffer percentages total more than 100 percent or less than 100 percent, the switch returns a commit error. All egress buffer partitions must be explicitly configured and must have a value of at least 5 percent.

To configure the shared buffer allocation and partitioning using the CLI:

1. Configure the percentage of available (nonreserved) buffers used for the ingress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set ingress percent percent
```

2. Configure the global ingress buffer partitions for lossless, lossless-headroom, and lossy traffic:

```
[edit class-of-service shared-buffer]
user@switch# set ingress buffer-partition lossless percent percent
user@switch# set ingress buffer-partition lossless-headroom percent percent
user@switch# set ingress buffer-partition lossy percent percent
```

3. Configure the percentage of available (nonreserved) buffers used for the egress global shared buffer pool:

```
[edit class-of-service shared-buffer]
user@switch# set egress percent percent
```

4. Configure the global egress buffer partitions for lossless, lossy, and multicast queues:

```
[edit class-of-service shared-buffer]
user@switch# set egress buffer-partition lossless percent percent
user@switch# set egress buffer-partition lossy percent percent
user@switch# set egress buffer-partition multicast percent percent
```

## Defining CoS Rewrite Rules

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on an interface. You can also apply an existing rewrite rule on an interface.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rule rewrites only the outer VLAN tag.

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named **customup-rw** in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class fcoe loss-priority low code-point 011
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority low code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef-no-loss loss-priority high code-point 101
```

```
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low code-point 110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high code-point 111
```

- To enable an 802.1p rewrite rule named **customup-rw** on a Layer 2 interface:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/7 unit 0 rewrite-rules ieee-802.1
customup-rw
```

**NOTE:** All forwarding classes assigned to port xe-0/0/7 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

- To enable an 802.1p rewrite rule named **customup-rw** on all 10-Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical interface (unit) number:

```
[edit]
user@switch# set class-of-service interfaces xe-* unit * rewrite-rules customup-rw
```

**NOTE:** In this case, *all* forwarding classes assigned to *all* 10-Gigabit Ethernet ports must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same physical interface.

#### Related Documentation

## Assigning CoS Components to Interfaces

After you define the following CoS components, you assign them to physical or logical interfaces. Components that you assign to physical interfaces are valid for all of the logical interfaces configured on the physical interface. Components that you assign to a logical interface are valid only for that logical interface.

- Classifiers—Assign only to logical interfaces.
- Congestion notification profiles—Assign only to physical interfaces.
- Forwarding classes—Assign to interfaces by mapping to forwarding class sets.
- Forwarding class sets—Assign only to physical interfaces.
- Output traffic control profiles—Assign only to physical interfaces (with a forwarding class set).
- Rewrite rules—Assign only to logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wildcards. You can also assign a congestion notification profile or a forwarding class set globally to all interfaces.

To assign CoS components to interfaces:

Assign CoS components to a single interface by associating a CoS component (for example a forwarding class set named **san-priority-group**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/7 forwarding-class-set san-priority-group
```

Assign a CoS component to multiple interfaces by associating a CoS component (for example, a rewrite rule named **customup-rw**) to all 10-Gigabit Ethernet interfaces on the switch, use wildcard characters for the interface name and logical interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set xe-* unit * rewrite-rules ieee-802.1 customup-rw
```

Assign a congestion notification profile or a forwarding class set globally to all interfaces using the **set class-of-service interfaces all** statement. For example, to assign a forwarding class set named **be\_fcset** to all interfaces:

```
[edit class-of-service interfaces]
user@switch# set all forwarding-class-set be_fcset
```

**NOTE:** If there is an existing CoS configuration of any type on an interface, the global configuration is not applied to that particular interface. The global configuration is applied to all interfaces that do not have an existing CoS configuration.

For example, if you configure a rewrite rule, assign it to interfaces **xe-0/0/20.0** and **xe-0/0/22.0**, and then configure a congestion notification profile and apply it to all interfaces, the congestion notification profile is applied to every interface except **xe-0/0/20** and **xe-0/0/22**.

## Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. QFX Systems support three DCBX modes:

- **Autonegotiation**—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- **IEEE DCBX**—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- **DCBX Version 1.01**—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric Node devices come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

**NOTE:** QFX Systems do not support pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00. If a QFX Series interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

```
[edit protocols dcbx]  
user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |  
dcbx-version-1.01)
```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

## Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to

the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

**NOTE:** If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as “FCoE down” and disables FCoE on the interface.

---

When DCBX marks an interface as “FCoE down,” the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as “FCoE down.”

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

```
[edit]
user@switch# set protocols dcbx interface interface-name priority-flow-control
no-auto-negotiation
```

2. Turn off autonegotiation for applications.

```
[edit]
user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
```

3. Turn off autonegotiation for ETS.

```
[edit]
user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
no-auto-negotiation
```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# set enhanced-transmission-selection recommendation-tlv no-auto-negotiate

## Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

**NOTE:** Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# **set enhanced-transmission-selection recommendation-tlv no-auto-negotiate**

## Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

```
[edit applications]
user@switch# set application application-name ether-type ether-type
```

For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

```
user@switch# set applications application ptp ether-type 0x88F7
```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

```
[edit]
user@switch# set applications application application-name protocol (tcp | udp)
destination-port port-value
```

For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

```
user@switch# set applications application iscsi protocol tcp destination-port 3260
```

## Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

```
[edit policy-options]
user@switch# set application-maps application-map-name application application-name
code-points [ aliases ] [ bit-patterns ]
```

For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

```
user@switch# set policy-options application-maps ptp-app-map application ptp code points
[ 001 101 ]
```

## Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange

After you define applications and map them to IEEE 802.1p code points in an application map, apply the application map to the interfaces on which you want DCBX to exchange the application protocol information with connected peers. (See *Related Documentation* for how to define applications and configure application maps to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

- To apply an application map to a DCBX interface, specify the DCBX interface and the application map name:

```
[edit protocols]
```

```
user@switch# set dcbx interface interface-name application-map application-map-name
```

For example, to apply an application map named **ptp-app-map** on interface **xe-0/0/11**:

```
user@switch# set protocols dcbx interface xe-0/0/11 application-map ptp-app-map
```

## buffer-partition (Egress)

**Syntax** `buffer-partition (lossless | lossy | multicast) {  
percent percent;  
}`

**Hierarchy Level** [edit [class-of-service shared-buffer egress](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** The egress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best-effort, lossless, and multicast traffic (multicast also includes broadcast and destination lookup fail traffic). To better support the mix of traffic on your network, you can optimize the allocation of egress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three egress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ports. All ports on the switch receive the same allocation of egress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

**Default** The default egress buffer partition shown in [Table 438 on page 5172](#) supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

**Table 438: Default Egress Shared Buffer Partitioning**

| Lossless Partition | Lossy Partition | Multicast Partition |
|--------------------|-----------------|---------------------|
| 50%                | 31%             | 19%                 |

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages must always total 100 percent.

**Options** **lossless**—Shared buffer space reserved for all lossless egress traffic.

**lossy**—Shared buffer space for best-effort unicast egress traffic.

**multicast**—Shared buffer space reserved for all multicast (including broadcast and destination lookup fail) egress traffic.

**percent percent**—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossy, or multicast buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## buffer-partition (Ingress)

**Syntax** `buffer-partition (lossless | lossless-headroom | lossy) {  
percent percentage;  
}`

**Hierarchy Level** [edit [class-of-service shared-buffer ingress](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** The ingress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best effort (best-effort unicast and multicast) and lossless traffic. To better support the mix of traffic on your network, you can optimize the allocation of ingress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three ingress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ingress traffic. All ports on the switch receive the same allocation of ingress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

**Default** The default ingress buffer partition shown in [Table 439 on page 5174](#) supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

**Table 439: Default Ingress Shared Buffer Partitioning**

| Lossless Partition | Lossless-Headroom Partition | Lossy Partition |
|--------------------|-----------------------------|-----------------|
| 9%                 | 45%                         | 46%             |

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages always must total 100 percent.

**Options** **lossless**—Shared buffer space reserved for all lossless ingress traffic.

**lossless-headroom**—Shared buffer space reserved to store packets received while either an 802.3x Ethernet PAUSE or a priority-based flow control (PFC) pause is asserted. (When an ingress interface pauses traffic, it must have the buffer space to store all of the packets currently in the buffer, and also all of the packets received before the connected peer stops sending traffic and the wire is cleared of packets.)

**lossy**—Shared buffer space for best-effort ingress traffic.

**percent *percent***—The percentage of buffer space to allocate to the specified buffer partition (lossless, lossless-headroom, or lossy buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Syntax</b>              | <code>buffer-size (percent <i>percent</i>   remainder);</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Hierarchy Level</b>     | [edit <code>class-of-service schedulers <i>scheduler-name</i></code> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | <p>Set the dedicated buffer size of the egress queue that you bind the scheduler to in the scheduler map configuration. The switch allocates space from the global dedicated buffer pool to ports and queues in a hierarchical manner. The switch allocates an equal number of dedicated buffers to each egress port, so each egress port receives the same amount of dedicated buffer space. The amount of dedicated buffer space per port is not configurable.</p> <p>However, the <b>buffer-size</b> statement allows you to control the way each port allocates its share of dedicated buffers to its queues. For example, if a port only uses two queues to forward traffic, you can configure the port to allocate all of its dedicated buffer space to those two ports and avoid wasting buffer space on queues that are not in use. We recommend that the buffer size should be the same size as the minimum guaranteed transmission rate (the <b>transmit-rate</b>).</p> <p>You configure the proportion of port dedicated buffers allocated to a particular output queue using the following process:</p> <ol style="list-style-type: none"><li>1. Configure a scheduler and set the <b>buffer-size</b> option to match the scheduler <b>transmit-rate</b> value.</li><li>2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.</li></ol> <p>For example, suppose that you want to change the dedicated buffer allocation for FCoE traffic. FCoE traffic is mapped to the <code>fcoe</code> forwarding class, and the <code>fcoe</code> forwarding class is mapped to queue 3 (this is the default configuration). To use default FCoE traffic mapping, in the scheduler map configuration, map the scheduler to the <b>fcoe</b> forwarding class.</p> <ol style="list-style-type: none"><li>3. Associate the scheduler map with the traffic control profile you want to use on the egress ports that carry FCoE traffic.</li><li>4. Associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry FCoE traffic.</li></ol> <p>Queue 3, which is mapped to the <code>fcoe</code> forwarding class and therefore to the FCoE traffic, receives the dedicated buffer allocation specified in the <b>buffer-size</b> statement.</p> |

**NOTE:** The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

---

**Default** The port allocates dedicated buffers to queues that have an explicitly configured scheduler buffer size. If you do not explicitly configure a scheduler buffer size for a queue, the port serves the explicitly configured queues first. Then the port divides the remaining dedicated buffers equally among the queues that have an explicitly attached scheduler *without* an explicitly configured buffer size configuration. (If you configure a scheduler, but you do not configure the buffer size parameter, the default is equivalent to configuring the buffer size with the **remainder** option.)

If you use the default scheduler and scheduler map on a port (no explicit scheduler configuration), then the port allocates its dedicated buffer pool to queues based on the default scheduling, as shown in [Table 440 on page 5177](#). The default buffer size is the same as the default transmit rate for each default queue:

**Table 440: Default Output Queue Buffer Sizes**

| Queue Number | Forwarding Class | Transmit Rate | Buffer Size |
|--------------|------------------|---------------|-------------|
| 0            | best-effort      | 5%            | 5%          |
| 3            | fcoe             | 35%           | 35%         |
| 4            | no-loss          | 35%           | 35%         |

Because the default scheduler includes only five forwarding classes, only the queues mapped to those forwarding classes receive dedicated buffers from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

**Options** **percent *percent***—Percentage of the port dedicated buffer pool allocated to the queue (or queues) mapped to the scheduler.

**remainder**—Remaining dedicated buffer pool after the port satisfies the needs of the explicitly configured buffers. The port divides the remaining buffers equally among the queues that are explicitly attached to a scheduler but that do not have an explicit buffer size configuration (or are configured with **remainder** as the buffer size).

**Required Privilege Level** **interfaces**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Specify the length of the cable between the interface and its peer interface in meters. The system uses the cable length and the maximum receive unit (MRU) to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The the shorter the cable length and lower the MRU, the less headroom buffer space is required for PFC.</p>                                                                                                                             |
|                                 | <div><p><b>NOTE:</b> You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the <code>mtu</code> statement at the [edit <a href="#">interfaces <i>interface-name</i></a>] hierarchy level.</p></div>                                                                                                                                      |
| <b>Default</b>                  | The default cable length value is 100 meters (approximately 328 feet).                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <code><i>cable-length-value</i></code> —Length of the cable in meters. (Generally from 1 to 300 meters, but there is no configuration restriction.)                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <code>interfaces</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Map one or more forwarding classes to a single queue. You can map unicast forwarding classes to a unicast queue (0 through 7) and multdestination forwarding classes to a multicast queue (8 through 11). The queue to which you map a forwarding class determines if the forwarding class is a unicast or multicast forwarding class.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                 | <div>  <p><b>NOTE:</b> If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does <i>not</i> receive lossless treatment.</p> <p>If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.</p> </div> |
| <b>Options</b>                  | <p><b>class-name</b> —Name of the forwarding class.</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Configure the IEEE 802.1p code point value assigned to all traffic received from the Fibre Channel (FC) network on the specified FC interface (NP_Port). When native FC traffic from the FC SAN arrives at the NP_Port interface, the NP_Port interface encapsulates it in Ethernet to create FCoE packets before forwarding the traffic onto the FCoE network. Instead of using the default value of priority 3 (code point 011) for the FCoE traffic, the interface rewrites the IEEE 802.1p code point to the value specified in the rewrite value code points.</p> <p>After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.</p> <p>FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).</p> <p>The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.</p> |
| <b>Options</b>                  | <i>code-point-bits</i> —Value of the code-point bits, in decimal form.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Specify the IEEE 802.1p code point bits that identify the traffic you want to enable for priority-based flow control (PFC) pause.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | <p>By default, IEEE 802.1p priorities 3 and 4 (code points 011 and 100, respectively) are enabled for PFC pause on all Ethernet interfaces. If you explicitly configure priorities to pause and the output queues on which to enable pause, the explicit configuration overrides the default configuration. When you apply an explicit output congestion notification profile to an interface, only the priorities and queues specified in the output congestion notification profile are enabled for pause on that interface.</p> <p>For example, if you configure an output congestion notification profile that specifies priority 2 (code point 010), then traffic with IEEE 802.1p priority 2 is paused on the configured output queue during periods of congestion. However, traffic with priority 3 and priority 4 is not programmed to pause, because the explicit configuration overwrites the default configuration, and the explicit configuration does not pause priority 3 and priority 4. If you configure an explicit output congestion notification profile, all of the priorities you want to enable for PFC and all of the output queues you want to pause must be explicitly configured.</p> |
| <b>Options</b>                  | <p><i>code-point-bits</i>—3-bit value in decimal form.</p> <p>The remaining statements are described separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>Configure Ethernet PAUSE asymmetric flow control on an interface. You can set an interface to generate and send PAUSE messages, and you can set an interface to respond to PAUSE messages sent by the connected peer. You must set both the <b>rx-buffers</b> and the <b>tx-buffers</b> values when you configure asymmetric flow control.</p> <p>Use the <b>flow-control</b> and <b>no-flow-control</b> statements to enable and disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC) by applying a congestion notification profile to the interface.</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>                                   | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>                                           | Configure a congestion notification profile to enable priority-based flow control (PFC) on traffic specified by an IEEE 802.1 code point, and apply the profile to an interface.                                                                                                                                                                                                                                               |
|                                                              | <div>  <p><b>NOTE:</b> You must configure PFC for FCoE traffic. Each interface that carries FCoE traffic should be configured for PFC on the FCoE code point (usually 011).</p> </div>                                                                                                                                                      |
|                                                              | <p>You can attach a maximum of one congestion notification profile to an interface. There is no limit to the total number of congestion notification profiles you can create.</p>                                                                                                                                                                                                                                              |
| <b>Options</b>                                               | <p><i>profile-name</i>—Name of the congestion notification profile.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | When configuring WRED, map the packet <b>drop-probability</b> to the fullness of a queue ( <b>fill-level</b> ). You configure the <b>fill-level</b> and <b>drop-probability</b> statements in related pairs by specifying a low <b>fill-level</b> value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high <b>fill-level</b> value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability. |
| <b>Options</b>                  | <p><b>0</b>—Probability that packets will drop at the lowest <b>fill-level</b> value. This is always zero, because until the queue reaches the specified low <b>fill-level</b> value, no packets are scheduled to drop.</p> <p><b>high-value</b>—The maximum probability that packets will drop before queue fullness exceeds the high value of the queue <b>fill-level</b>, expressed as a percentage. If the queue fills beyond the high <b>fill-level</b> value, all packets drop.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                    |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Define drop profiles for weighted random early detection (WRED).</p> <p>For a packet to be dropped, it must match the drop profile. When a packet arrives, WRED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the WRED algorithm determines whether to drop the arriving packet.</p> |
| <b>Options</b>                  | <p><b>profile-name</b>—Name of the drop profile.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Configure the global shared buffer pool allocation for egress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for other buffers such as dedicated buffers (buffers allocated permanently to ports).</p> <p>The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports. However, on a port, you can configure the portion of dedicated port buffer space allocated to each queue in the scheduler configuration using the <b>buffer-size</b> option.)</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  <p><b>CAUTION:</b> Changing the buffer configuration is a disruptive event. Traffic stops on <i>all</i> ports until buffer reprogramming is complete.</p> </div> <p>You can also partition the shared buffer pool to adjust the egress buffer allocations for different mixes of network traffic using the <b>buffer-partition</b> statement.</p> |
| <b>Default</b>                  | The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>percent <i>percent</i></b>—Percentage of available egress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | When configuring random early detection (RED), map the fullness of a queue to a packet <a href="#">drop-probability</a> value. You configure the <b>fill-level</b> and <b>drop-probability</b> statements in related pairs by specifying a low <b>fill-level</b> value at which packets begin to drop (the drop probability is zero until the queue reaches this level of fullness) and a high <b>fill-level</b> value at which packets drop at the highest drop probability. As the queue fills from the low fill level to the high fill level, the rate of packet drop increases in a linear pattern from zero to the high drop probability. |
| <b>Options</b>                  | <p><b>low-value</b>—Fullness of the queue before packets begin to drop, expressed as a percentage. The low value must be less than the high value.</p> <p><b>Range:</b> 0 through 100</p> <p><b>high-value</b>—Fullness of the queue before it reaches the maximum drop probability. If the queue fills beyond the fill level high value, all packets drop. The high value must be greater than the low value.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                          |

| <b>Description</b>              | <p>Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.</p> <p>You can configure asymmetric flow control by including the <b>configured-flow-control</b> statement at the [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <div data-bbox="474 968 542 1035" data-label="Image"> </div> <div data-bbox="584 1010 1432 1173" data-label="Text"> <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |
| <b>Default</b>                  | Flow control is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default</b>                  | <p>Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.</p> <p>If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.</p> <p>For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.</p> <p>The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.</p> |
| <b>Options</b>                  | <code>[ <i>queue</i>   <i>list-of-queues</i> ]</code> —The output queue or a list of output queues to pause.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>         | <p>Configure a Layer 3 fixed classifier on a Fibre Channel (FC) interface. The fixed classifier places all traffic received from the FC network into the specified forwarding class. The forwarding class must be lossless. (That is, the forwarding class must be either the default <b>fcoe</b> or <b>no-loss</b> forwarding class, or the forwarding class must be configured with the <b>no-loss</b> drop attribute.) If you attempt to specify a lossy forwarding class, the system returns a commit error.</p> <p>FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. If the IEEE 802.1p code point value that the Ethernet network uses for FCoE traffic is different than code point 3, you can rewrite the code point to the value used in your Ethernet (FCoE) network. The lossless forwarding class specified in the fixed classifier uses the <b>rewrite-value</b> statement as the IEEE 802.1p code point (priority) for FCoE traffic on the FCoE network.</p> <p>To rewrite the code point value, include the <b>rewrite-value input ieee code-point code-point-bits</b> statement at the [edit <a href="#">class-of-service interfaces</a> <i>fc-interface-name</i>] hierarchy level.</p>                                                                                                                              |
|                            | <div>  <p><b>NOTE:</b> If you are not using the default configuration (priority 3 for FCoE traffic), the lossless forwarding class specified in the FC interface fixed classifier must be mapped to the IEEE 802.1p code point specified in the rewrite value statement.</p> </div> <p>In order to avoid fate sharing (separate flows that affect each other's throughput), the code point (priority) used for the lossless forwarding class (the code point specified in the rewrite value statement) should be the only code point classified to that forwarding class (at the [edit <a href="#">class-of-service classifiers</a>] hierarchy level). For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class <code>fcoe_fc1</code>, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the <code>fcoe_fc1</code> forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class <code>fcoe_fc1</code>, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into forwarding class <code>fcoe_fc1</code>, so the traffic from both priorities shares the same fate.</p> |
| <b>Options</b>             | <b><i>lossless-forwarding-class-name</i></b> —Name of the lossless forwarding class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>No-loss option introduced in Junos OS Release 12.3 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | <p>Map one or more forwarding classes to a single queue. You can configure up to 12 forwarding classes (8 unicast forwarding classes on queues 0 through 7 and 4 multidestination forwarding classes on queues 8 through 11) and map them to queues. You can map multiple forwarding classes to a single queue using the <b>class</b> statement. All forwarding classes mapped to a particular queue must be of the same type, either unicast or multicast. You cannot mix unicast and multicast forwarding classes on the same queue.</p> <p>You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.</p> |

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if

you explicitly configure the `fcoe` forwarding class and you do not include the `no-loss` option, the `fcoe` forwarding class is lossy, not lossless.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Configure a guaranteed minimum rate of transmission for a traffic control profile. The sum of the guaranteed rates of all of the forwarding class sets (priority groups) on a port should not exceed the total port bandwidth. The guaranteed rate also determines the amount of excess (extra) port bandwidth that the priority group (forwarding class set) can share. Extra port bandwidth is allocated among the priority groups on a port in proportion to the guaranteed rate of each priority group.                                                                                      |
|                                 | <div>  <p><b>NOTE:</b> You cannot configure a guaranteed rate for a forwarding class set (priority group) that includes strict-high priority queues. If the traffic control profile is for a forwarding class set that contains strict-high priority queues, do not configure a guaranteed rate.</p> </div>                                                                                                                                                                                                     |
| <b>Default</b>                  | If you do not specify a guaranteed rate, the guaranteed rate is zero (0) and there is no minimum guaranteed bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                 | <div>  <p><b>NOTE:</b> If you do not configure a guaranteed rate for a traffic control profile, the queues that belong to any forwarding class set (priority group) that uses that traffic control profile cannot have a configured transmit rate. The result is that there is no minimum guaranteed bandwidth for those queues and that those queues can be starved during periods of congestion.</p> </div>                                                                                                 |
| <b>Options</b>                  | <p><b>percent <i>percentage</i></b>—Minimum percentage of transmission capacity allocated to the forwarding class set or logical interface.</p> <p><b>Range:</b> 1 through 100 percent</p> <p><b><i>rate</i></b>—Minimum transmission rate allocated to the forwarding class set or logical interface, in bits per second (bps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1000 through 10,000,000,000 bps</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Allow queue selection for traffic generated by the Routing Engine (host). The selected queue must be configured properly. You can also configure specific DSCP code point bits for the type of service (ToS) field of the generated packets. This configuration does not affect transit packets or incoming packets. This is a global configuration that only affects packets originating on the Routing Engine. If you do not configure an output queue for host outbound traffic, the switch uses the default queue mapping. |
| <b>Options</b>                  | The statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## ieee-802.1 (Fibre Channel Interfaces)

---

**Syntax**    `ieee-802.1 {  
                  code-point code-point-bits;  
                  }`

**Hierarchy Level**    [edit [class-of-service interfaces](#) *fibre-channel-interface-name* [rewrite-value](#) *input*]

**Description**    Configure the IEEE 802.1p code point value to which all traffic received from the Fibre Channel (FC) network on the specified FC interface is rewritten. After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

The statement is described separately.

**Required Privilege Level**    interfaces—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the global shared buffer pool allocation for ingress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for buffers such as dedicated buffers (buffers allocated permanently to ports) and headroom buffers (buffers that help prevent packet loss on lossless flows).</p> <p>The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared ingress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  <p><b>CAUTION:</b> Changing the buffer configuration is a disruptive event. Traffic stops on <i>all</i> ports until buffer reprogramming is complete.</p> </div> <p>You can also partition the shared buffer pool to adjust the ingress buffer allocations for different mixes of network traffic using the <b>buffer-partition</b> statement.</p> |
| <b>Default</b>                  | The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>percent <i>percent</i></b>—Percentage of available ingress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## input (Congestion Notification)

**Syntax**

```
input {
  ieee-802.1 {
    code-point [code-point-bits] {
      pfc {
        mru mru-value;
      }
    }
  }
  cable-length cable-length-value;
}
```

**Hierarchy Level** [edit [class-of-service congestion-notification-profile](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure priority-based flow control (PFC) on incoming traffic.

**Options** The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## input (Fibre Channel Interfaces)

---

**Syntax**

```
input {  
    ieee-802.1p {  
        code-point code-point-bits;  
    }  
}
```

**Hierarchy Level** [edit [class-of-service interfaces](#) *fibre-channel-interface-name* [rewrite-value](#)]

**Description** Configure the IEEE 802.1p code point value to which all traffic received from the Fibre Channel (FC) network on the specified FC interface is rewritten. After the code point value is rewritten, the interface forwards the traffic to the Ethernet (FCoE) network. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE networks typically use priority 3 (IEEE code point 011) for FCoE traffic. The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011).

The system supports only one IEEE 802.1p code point value per FC interface. You cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

The statements are described separately.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

        forwarding-class class-name;
        rewrite-rules {
            (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);
        }
    }
}
```

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure interface-specific CoS properties for incoming packets.

**Options** *interface-name*—Name of the interface.

The statements are explained separately.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.
