| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the maximum receive unit (MRU) of the interface in bytes (incoming packet sizes must be less than or equal to the MRU, or the packets are dropped). The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                 | <div>  <p><b>NOTE:</b> You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the <code>mtu</code> statement at the [edit <a href="#">interfaces interface-name</a>] hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | <p>For priority 3 traffic, the default MRU value is 2500 bytes.</p> <p>For priority 4 traffic, the default MRU value is 9612 bytes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <b>mru-value</b> —Value of the maximum packet receive unit size in bytes (generally from 1500 to 9216 bytes, but there is no configuration restriction).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description** Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level** storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

| <b>Description</b>              | Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <b>no-auto-negotiation</b> —Disable automatic negotiation of PFC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                            |                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>queue-num <i>queue-number</i> &lt;no-loss&gt;;</code>                                                                                 |
| <b>Hierarchy Level</b>     | [edit <code>class-of-service forwarding-classes class <i>class-name</i></code> ]                                                            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>No-loss option introduced in Junos OS Release 12.3 for the QFX Series. |
| <b>Description</b>         | Map a forwarding class to an output queue number. Optionally, configure the forwarding class as a lossless forwarding class.                |

You can map some or all of the eight unicast forwarding classes to a unicast queue (0 through 7) or some or all of the four multdestination (multicast, broadcast, destination lookup fail) forwarding classes to the same multdestination queue (8 through 11), providing that you do not map one forwarding class to more than one queue. The queue to which you map a forwarding class determines if the forwarding class is a unicast or multdestination forwarding class.

You cannot configure weighted random early detection (WRED) packet drop on forwarding classes configured with the no-loss packet drop attribute. Do not associate a drop profile with lossless forwarding classes.

**NOTE:** If you map more than one forwarding class to a queue, all of the forwarding classes mapped to the queue must have the same packet drop attribute (all of the forwarding classes must be lossy, or all of the forwarding classes mapped to a queue must be lossless).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

If you are using Junos OS Release 12.3 or later, the default configuration is the same as the default configuration for Junos OS Release 12.2, and the default behavior is the same (the fcoe and no-loss forwarding classes receive lossless treatment). However, if you explicitly configure lossless forwarding classes, you can configure up to six lossless forwarding classes by specifying the no-loss option. If you do not specify the no-loss option in an explicit forwarding class configuration, the forwarding class is lossy. For example, if you explicitly configure the fcoe forwarding class and you do not include the no-loss option, the fcoe forwarding class is lossy, not lossless.

|                                 |                                                                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <p><b>queue-number</b>—Number of the CoS unicast queue (0 through 7) or the CoS multidestination queue (8 through 11).</p> <p><b>no-loss</b>—Optional packet drop attribute keyword to configure the forwarding class as lossless.</p> |

## rewrite-value (Fibre Channel Interfaces)

```
Syntax  rewrite-value {
        input {
            ieee-802.1p {
                code-point code-point-bits;
            }
        }
    }
```

**Hierarchy Level** [edit [class-of-service interfaces](#) *fibre-channel-interface-name*]

**Description** Configure the IEEE 802.1p code point value (priority) for all traffic received from the Fibre Channel (FC) network on the specified FC interface. Instead of using the default priority 3 (011) for FCoE traffic, the priority is rewritten to the specified priority before being forwarded. This works in conjunction with configuring a fixed classifier on the FC interface. The fixed classifier maps all traffic from the FC network into one lossless forwarding class (the lossless forwarding class must be mapped to the code point specified in the rewrite value). Traffic mapped to the lossless forwarding class uses the IEEE 802.1p priority specified by the code point bits in the rewrite value.

FCoE traffic typically uses priority 3 (IEEE code point 011). The QFX Series default configuration uses IEEE 802.1p priority 3 for FCoE traffic. Rewriting the code point value enables you to change the IEEE 802.1p priority of the FCoE traffic if the Ethernet network uses a different priority than priority 3 (code point 011) for FCoE traffic.

The system supports only one IEEE 802.1p code point value per FC interface, so you cannot configure more than one IEEE 802.1p rewrite value per FC interface. In addition, you can specify only one rewrite value per local FCoE-FC gateway fabric; all interfaces in the local fabric must use the same rewrite value. Attempting to configure FC interfaces in the same local fabric with different rewrite values generates a commit error. You can specify different rewrite values for interfaces that belong to different local FCoE-FC gateway fabrics.

**NOTE:** In order to avoid fate sharing (separate flows that affect each others' throughput), the code point used for the rewrite value should be the only code point used for the lossless FCoE forwarding class (the forwarding class used for the fixed classifier on the Fibre Channel interface). When you configure classifiers for ingress Ethernet interfaces, map only the rewrite value code point to the forwarding class.

For example, if the rewrite value uses code point 101 for lossless FCoE forwarding class `fcoe_fc1`, then in the classifier configuration attached to ingress Ethernet interfaces, code point 101 is the only code point that should be classified to the `fcoe_fc1` forwarding class. Now if you also attach a classifier to an interface that maps code point 110 to forwarding class `fcoe_fc1`, then congestion on priority 110 unfairly (and unintentionally) affects the FCoE traffic that uses priority 101. Both priorities 101 and 110 are classified into

forwarding class `fcoe_fc1`, so the traffic from both priorities shares the same fate.

.....  
The remaining statements are described separately.

| <b>Description</b>              | <p>Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>rx-buffers</b> statement with the <b>tx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> <div style="margin-top: 20px;">  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Configure the shaping rate. The shaping rate throttles the rate of packet transmission by setting a maximum bandwidth (rate in bits per second) or a maximum percentage of bandwidth for a queue or a forwarding class set. You specify the maximum bandwidth for a queue by using a scheduler map to associate a forwarding class (queue) with a scheduler that has a configured shaping rate. You specify the maximum bandwidth for a forwarding class set by setting the shaping rate for a traffic control profile, and then applying the traffic control profile and a forwarding class set to an interface.</p> <p>We recommend that you configure the shaping rate as an absolute maximum usage and not as additional usage beyond the configured transmit rate (the minimum guaranteed bandwidth for a queue) or the configured guaranteed rate (the minimum guaranteed bandwidth for a forwarding class set).</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;">  <p><b>NOTE:</b> When you set the maximum bandwidth (<code>shaping-rate</code> value) for a queue or for a priority group at 100 Kbps or less, the traffic shaping behavior is accurate only within +/- 20 percent of the configured <code>shaping-rate</code> value.</p> </div> |
| <b>Default</b>                  | If you do not configure a shaping rate, the default shaping rate is 100 percent (all of the available bandwidth), which is the equivalent of no rate shaping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## shared-buffer

```
Syntax  shared-buffer {
        egress {
            buffer-partition (lossless | lossy | multicast) {
                percent percent
            }
            percent percent;
        }
        ingress {
            percent percent;
            buffer-partition (lossless | lossless-headroom | lossy) {
                percent percent
            }
        }
    }
```

Hierarchy Level [edit [class-of-service](#)]

Release Information Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** Configure the global shared buffer pool allocation to ports. Shared buffers are a pool of buffer space that the system can allocate dynamically across all of its ports as memory space is needed. Some buffer space is reserved for dedicated buffers (buffers allocated permanently to ports), headroom buffers (buffers that help prevent packet loss on lossless flows), and other buffers.

Configure the way the system uses the available (user-configurable) buffer space by setting the **shared-buffer** percentage for the ingress buffer pool and for the egress buffer pool.

The percentage you specify is the percentage of available buffer space allocated to the global shared ingress buffer pool or to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports.)

**CAUTION:** Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until the buffer reprogramming is complete.

You can also partition the ingress shared buffer pool and the egress shared buffer pool to adjust the buffer allocations for different mixes of network traffic (best-effort, lossless, multicast) using the **buffer-partition** statement.

**Options** The statements are explained separately.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## traceoptions (Class of Service)

**Syntax** traceoptions {  
     file *filename* <size *size*> <files *number*>  
     <world-readable | no-world-readable>;  
     flag *flag* <flag-modifier>;  
     no-remote-trace  
 }

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Set class-of-service (CoS) tracing options.

**NOTE:** The `traceoptions` statement is not supported on the QFabric system.

**Default** Traceoptions is disabled.

**Options** **file *filename***—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Traceoption output files are located in the `/var/log/` directory.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. The traceoption output continues in a second trace file named **trace-file.1**. When **trace-file.1** reaches its maximum size, output continues in a third file named **trace-file.2**, and so on. When the maximum number of trace files is reached, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

**Range:** 2 through 1000 files

**Default:** 1 trace file

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Trace all operations.
- **asynch**—Trace asynchronous configuration processing.
- **chassis-scheduler**—Trace chassis stream scheduler processing.
- **cos-adjustment**—Trace CoS rate adjustments.
- **dynamic**—Trace dynamic CoS functions.
- **hardware-database**—Trace the chassis hardware database related processing.
- **init**—Trace initialization events.

- **performance-monitor**—Trace performance monitor counters.
- **process**—Trace configuration processing.
- **restart**—Trace restart processing.
- **route-socket**—Trace route-socket events.
- **show**—Trace show command servicing.
- **snmp**—Trace SNMP-related processing.
- **util**—Trace utilities.

The following are the global tracing options:

- **all**—Perform all tracing operations
- **parse**—Trace parser processing.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming tracefile data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size of 4 GB (maximum is lower if 4 GB is not supported on your system)

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

## transmit-rate

---

**Syntax** `transmit-rate (rate | percent percentage);`

**Hierarchy Level** [edit `class-of-service schedulers scheduler-name`]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Specify the minimum transmission rate or percentage for a queue (forwarding class) scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share. Extra priority group bandwidth is allocated among the queues in the priority group in proportion to the transmit rate of each queue.

.....

**NOTE:** The `transmit-rate` setting works only if you also configure the `guaranteed-rate` in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the `transmit-rate` statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.

.....

.....

**NOTE:** You cannot configure a transmit rate for strict-high priority queues. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has strict-high priority queues.

.....

.....

**NOTE:** For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

.....

**Default** If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

| Queue Number        | Default Minimum Guaranteed Bandwidth |
|---------------------|--------------------------------------|
| 0 (best-effort)     | 5 %                                  |
| 1                   | 0                                    |
| 2                   | 0                                    |
| 3 (fcoe)            | 35 %                                 |
| 4 (no-loss)         | 35 %                                 |
| 5                   | 0                                    |
| 6                   | 0                                    |
| 7 (network control) | 5 %                                  |
| 8 (mcast)           | 20 %                                 |
| 9                   | 0                                    |
| 10                  | 0                                    |
| 11                  | 0                                    |

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

- Options**
- rate**—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).  
**Range:** 1000 through 10,000,000,000 bps
- percent** **percentage**—Minimum percentage of transmission capacity allocated to the queue. A percentage of zero means that there is no minimum bandwidth guarantee for the queue.  
**Range:** 0 through 100 percent
- remainder**—Remaining rate available.

**Required Privilege Level**

interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>tx-buffers</b> statement with the <b>rx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> <div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <b>on   off</b> —Enable or disable an interface to respond to an Ethernet PAUSE message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## unit

---

**Syntax**     `unit logical-unit-number {  
                   classifiers {  
                     (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);  
                   }  
                   forwarding-class class-name;  
                   rewrite-rules {  
                     (dscp | dscp-ipv6 | ieee-802.1) (classifier-name | default);  
                   }  
                 }`

**Hierarchy Level**     [edit **class-of-service interfaces** *interface-name*]

**Release Information**     Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**     Configure a logical interface on the physical device. You must configure a logical interface to use the physical device.

**Options**     *logical-unit-number*—Number of the logical unit.

**Range:** 0 through 16,385

The remaining statements are explained separately.

**Required Privilege Level**     interfaces—To view this statement in the configuration.  
                                          interface-control—To add this statement to the configuration.

## Monitoring CoS Classifiers

**Purpose** Display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

**Action** To monitor CoS classifiers in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier
```

To monitor a particular classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier name classifier-name
```

To monitor a particular type of classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier type classifier-type
```

**Meaning** [Table 441 on page 5265](#) summarizes key output fields for CoS classifiers.

**Table 441: Summary of Key CoS Classifier Output Fields**

| Field      | Values                |
|------------|-----------------------|
| Classifier | Name of a classifier. |

Table 441: Summary of Key CoS Classifier Output Fields (*continued*)

| Field            | Values                                                                                                                                                                                                                                                                    |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Code point type  | Type of classifier: <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>ieee-mcast</b>—All classifiers of the IEEE 802.1 multicast type.</li> </ul> |
| Index            | Internal index of the classifier.                                                                                                                                                                                                                                         |
| Code point       | DSCP or IEEE 802.1 code point value of the incoming packets, in bits. These values are used for classification.                                                                                                                                                           |
| Forwarding Class | Name of the forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.                                                                       |
| Loss Priority    | Loss priority value that the classifier assigns to the incoming packet based on its code point value.                                                                                                                                                                     |

## Monitoring CoS Forwarding Classes

**Purpose** Use the monitoring functionality to view the current assignment of CoS forwarding classes to queue numbers on the system.

**Action** To monitor CoS forwarding classes in the CLI, enter the following CLI command:

```
user@switch> show class-of-service forwarding-class
```

**Meaning** [Table 442 on page 5267](#) summarizes key output fields for CoS forwarding classes.

Table 442: Summary of Key CoS Forwarding Class Output Fields

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding Class | <p>Names of forwarding classes assigned to queue numbers. By default, the following unicast forwarding classes are assigned to queues 0, 3, 4, and 7, respectively:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.</li> <li>• <b>fcoe</b>—Provides guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.</li> <li>• <b>no-loss</b>—Provides guaranteed delivery for TCP lossless traffic</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> <p>By default, the following multdestination forwarding class is assigned to queue 8:</p> <ul style="list-style-type: none"> <li>• <b>mcast</b>—Provides no special CoS handling of packets.</li> </ul> |
| Queue            | <p>Queue number corresponding to the forwarding class name.</p> <p>By default, four queues (0, 3, 4, and 7) are assigned to unicast forwarding classes and one queue (8) is assigned to a multdestination forwarding class.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| No-Loss          | <p>Packet drop attribute associated with each forwarding class:</p> <ul style="list-style-type: none"> <li>• Disabled—The forwarding class is configured for lossy transport (packets might drop during periods of congestion)</li> <li>• Enabled—The forwarding class is configured for lossless transport</li> </ul> <p><b>NOTE:</b> To achieve lossless transport, you must ensure that priority-based flow control (PFC) and DCBX are properly configured on the lossless priority (IEEE 802.1p code point), and that sufficient port bandwidth is reserved for the lossless traffic flows.</p>                                                                                                                                                                                                                      |

## Monitoring Interfaces That Have CoS Components

**Purpose** Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

**Action** To monitor interfaces that have CoS components in the CLI, enter the command:

```
user@switch> show class-of-service interface
```

To monitor a specific interface in the CLI, enter the command:

```
user@switch> show class-of-service interface interface-name
```

**Meaning** [Table 443 on page 5268](#) summarizes key output fields for CoS interfaces.

Table 443: Summary of Key CoS Interfaces Output Fields

| Field                         | Values                                                                                                                                                                                                                                        |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface            | Name of a physical interface to which CoS components are assigned.                                                                                                                                                                            |
| Index                         | Index of this interface or the internal index of a specific object.                                                                                                                                                                           |
| Queues supported              | Number of queues you can configure on the interface.                                                                                                                                                                                          |
| Queues in use                 | Number of queues currently configured.                                                                                                                                                                                                        |
| Scheduler map                 | Name of the scheduler map associated with this interface.                                                                                                                                                                                     |
| Congestion-notification       | Status of congestion notification (enabled or disabled).                                                                                                                                                                                      |
| Rewrite Input IEEE Code-point | (Fibre Channel NP_Port interfaces only) IEEE 802.1p code point (priority) the interface assigns to incoming Fibre Channel (FC) traffic when the interface encapsulates the FC traffic in Ethernet before forwarding it onto the FCoE network. |
| Logical Interface             | Name of a logical interface on the physical interface to which CoS components are assigned.                                                                                                                                                   |
| Object                        | Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> .                                                                                                                                             |
| Name                          | Name of the object—for example, <b>ba-classifier</b> .                                                                                                                                                                                        |
| Type                          | Type of the object—for example, <b>ieee8021p</b> for a classifier.                                                                                                                                                                            |

## Monitoring CoS Rewrite Rules

**Purpose** Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action** To monitor CoS rewrite rules in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule
```

To monitor a particular rewrite rule in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule name rewrite-rule-name
```

To monitor a particular type of rewrite rule (for example, DSCP, DSCP IPv6, or IEEE-802.1) in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule type rewrite-rule-type
```

**Meaning** [Table 444 on page 5269](#) summarizes key output fields for CoS rewrite rules.

**Table 444: Summary of Key CoS Rewrite Rule Output Fields**

| Field            | Values                                                                                                                                                                                                                                     |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rewrite rule     | Name of the rewrite rule.                                                                                                                                                                                                                  |
| Code point type  | Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>dscp-ipv6</b>—For IPv6 Diffserv traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> </ul>                     |
| Index            | Internal index for the rewrite rule.                                                                                                                                                                                                       |
| Forwarding class | Name of the forwarding class that is used to determine CoS values for rewriting in combination with loss priority.<br><br>Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting. |
| Loss priority    | Level of loss priority that is used to determine CoS values for rewriting in combination with forwarding class.                                                                                                                            |
| Code point       | Rewrite code point value.                                                                                                                                                                                                                  |

## Monitoring CoS Scheduler Maps

**Purpose** Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

**Action** To monitor CoS scheduler maps in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map
```

To monitor a specific scheduler map in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map scheduler-map-name
```

**Meaning** [Table 445 on page 5269](#) summarizes key output fields for CoS scheduler maps.

**Table 445: Summary of Key CoS Scheduler Maps Output Fields**

| Field         | Values                                                                   |
|---------------|--------------------------------------------------------------------------|
| Scheduler map | Name of the scheduler map.                                               |
| Index         | Index of a specific object—scheduler maps, schedulers, or drop profiles. |

Table 445: Summary of Key CoS Scheduler Maps Output Fields (*continued*)

| Field            | Values                                                                                                                                                                                                                                                                                                                                                      |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler        | Name of the scheduler.                                                                                                                                                                                                                                                                                                                                      |
| Forwarding class | Names of the forwarding classes to which the scheduler is assigned.                                                                                                                                                                                                                                                                                         |
| Transmit rate    | Configured transmit rate of the scheduler as a percentage of the total interface bandwidth.                                                                                                                                                                                                                                                                 |
| Priority         | <p>Scheduling priority of a queue:</p> <ul style="list-style-type: none"> <li>• <b>strict-high</b> or <b>high</b>—Packets in this queue are transmitted first. Only one queue can be configured as <b>strict-high</b> or <b>high</b>.</li> <li>• <b>low</b>—Packets in this queue are transmitted after packets in the <b>strict-high</b> queue.</li> </ul> |
| Drop Profiles    | Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.                                                                                                                                                                                                                                                            |
| Loss Priority    | Drop profile associated with each packet loss priority. You can configure different drop profiles for <b>low</b> , <b>medium-high</b> , and <b>high</b> loss priority traffic.                                                                                                                                                                              |
| Protocol         | Transport protocol of the drop profile for the particular priority.                                                                                                                                                                                                                                                                                         |
| Name             | Name of the drop profile.                                                                                                                                                                                                                                                                                                                                   |

## Monitoring CoS Value Aliases

**Purpose** Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP and IEEE 802.1p code point bits.

**Action** To monitor CoS value aliases in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases
```

To monitor a specific type of code-point alias (for example, DSCP or IEEE 802.1) in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases ieee-802.1
```

**Meaning** [Table 446 on page 5271](#) summarizes key output fields for CoS value aliases.

Table 446: Summary of Key CoS Value Alias Output Fields

| Field           | Values                                                                                                                                                                                                                                    |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Code point type | Type of the CoS value: <ul style="list-style-type: none"><li>• <b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li><li>• <b>ieee-802.1</b>—Examines Layer 2 packet headers for packet classification.</li></ul> |
| Alias           | Name given to a set of bits—for example, <b>af11</b> is a name for bits <b>001010</b> .                                                                                                                                                   |
| Bit pattern     | Set of bits associated with the alias.                                                                                                                                                                                                    |

| <b>Output Fields</b>            | Table 447 on page 5272 lists the output fields for the <b>show class-of-service</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                         |

**Table 447: show class-of-service Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                             | Level of Output |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Forwarding class</b> | The forwarding class configuration: <ul style="list-style-type: none"> <li>• <b>Forwarding class</b>—Name of the forwarding class.</li> <li>• <b>ID</b>—Forwarding class ID.</li> <li>• <b>Queue</b>—Queue number.</li> </ul> | All levels      |
| <b>Code point type</b>  | The type of code-point alias: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Aliases for DiffServ code point (DSCP) values.</li> <li>• <b>ieee-802.1</b>—Aliases for IEEE 802.1p values.</li> </ul>                     | All levels      |
| <b>Alias</b>            | Names given to CoS values.                                                                                                                                                                                                    | All levels      |
| <b>Bit pattern</b>      | Set of bits associated with an alias.                                                                                                                                                                                         | All levels      |
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                                                                       | All levels      |
| <b>Code point</b>       | Code-point values.                                                                                                                                                                                                            | All levels      |
| <b>Loss priority</b>    | Loss priority assigned to specific CoS values and aliases of the classifier.                                                                                                                                                  | All levels      |
| <b>Rewrite rule</b>     | Name of the rewrite rule if one has been configured.                                                                                                                                                                          | All levels      |

Table 447: show class-of-service Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                     | Level of Output |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Drop profile</b>            | Name of the drop profile.                                                                                                                             | All levels      |
| <b>Type</b>                    | Type of drop profile. QFX Series supports only the <b>discrete</b> type of drop-profile.                                                              | All levels      |
| <b>Fill level</b>              | Percentage of queue buffer fullness in a drop profile at which packets begin to drop during periods of congestion.                                    | All levels      |
| <b>Scheduler map</b>           | Name of the scheduler map.                                                                                                                            | All levels      |
| <b>Scheduler</b>               | Name of the scheduler.                                                                                                                                | All levels      |
| <b>Transmit rate</b>           | Transmission rate of the scheduler.                                                                                                                   | All levels      |
| <b>Buffer size</b>             | Delay buffer size in the queue.                                                                                                                       | All levels      |
| <b>Drop profiles</b>           | Drop profiles configured for the specified scheduler.                                                                                                 | All levels      |
| <b>Protocol</b>                | Transport protocol corresponding to the drop profile.                                                                                                 | All levels      |
| <b>Name</b>                    | Name of the drop profile.                                                                                                                             | All levels      |
| <b>Queues supported</b>        | Number of queues that can be configured on the interface.                                                                                             | All levels      |
| <b>Queues in use</b>           | Number of queues currently configured.                                                                                                                | All levels      |
| <b>Physical interface</b>      | Name of the physical interface.                                                                                                                       | All levels      |
| <b>Scheduler map</b>           | Name of the scheduler map.                                                                                                                            | All levels      |
| <b>Congestion-notification</b> | Enabled if a congestion notification profile is applied to the interface; disabled if no congestion notification profile is applied to the interface. | All levels      |
| <b>Forwarding class set</b>    | Name of the forwarding class set (priority group).                                                                                                    |                 |
| <b>Index</b>                   | Internal index of an object.                                                                                                                          | All levels      |

| <b>Output Fields</b>            | Table 448 on page 5277 describes the output fields for the <b>show class-of-service classifier</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 448: show class-of-service classifier Output Fields**

| Field Name              | Field Description                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                 |
| <b>Code point type</b>  | Type of the classifier: <b>exp</b> (not on EX Series switch), <b>dscp</b> , <b>dscp-ipv6</b> (not on EX Series switch), <b>ieee-802.1</b> , or <b>inet-precedence</b> . |
| <b>Index</b>            | Internal index of the classifier.                                                                                                                                       |
| <b>Code point</b>       | Code point value used for classification                                                                                                                                |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                        |

Table 448: show class-of-service classifier Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loss priority | Loss priority value used for classification. For most platforms, the value is <b>high</b> or <b>low</b> . For some platforms, the value is <b>high</b> , <b>medium-high</b> , <b>medium-low</b> , or <b>low</b> . |

## Sample Output

show class-of-service  
classifier type  
ieee-802.1

```
user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point      Forwarding Class      Loss priority
000             best-effort           low
001             best-effort           high
010             expedited-forwarding  low
011             expedited-forwarding  high
100             assured-forwarding    low
101             assured-forwarding    medium-high
110             network-control       low
111             network-control       high

Classifier: users-ieee802.1, Code point type: ieee-802.1
Code point      Forwarding class      Loss priority
100             expedited-forwarding  low
```

show class-of-service  
classifier type  
ieee-802.1 (QFX  
Series)

```
user@switch> show class-of-service classifier type ieee-802.1
Classifier: ieee8021p-default, Code point type: ieee-802.1, Index: 11
Code point      Forwarding class      Loss priority
000             best-effort           low
001             best-effort           low
010             best-effort           low
011             fcoe                  low
100             no-loss               low
101             best-effort           low
110             network-control       low
111             network-control       low

Classifier: ieee-mcast, Code point type: ieee-802.1, Index: 46
Code point      Forwarding class      Loss priority
000             mcast                 low
001             mcast                 low

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                  |
| <b>Description</b>              | Display whether priority-based flow control (PFC) is enabled for each IEEE 802.1p code point.                                                                                                                    |
| <b>Options</b>                  | <b>none</b> —Display the PFC state for all IEEE 802.1p code points.                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 450 on page 5281</a> describes the output fields for the <b>show class-of-service congestion-notification</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 450: show class-of-service congestion-notification Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>                | Type of interfaces on which congestion notification is applied. Congestion notification is applied on input interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Index</b>               | Index of this congestion notification profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Name</b>                | Name of the congestion notification profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Cable Length</b>        | Length of the attached physical cable in meters. The default value is 100 meters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Priority</b>            | IEEE 802.1p code point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>PFC</b>                 | State of PFC for the corresponding code point, either <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>MRU</b>                 | <p>Maximum receive unit of the interface in bytes. (Incoming traffic that exceeds the MRU size of an interface is dropped.) The default values are:</p> <ul style="list-style-type: none"> <li>2500 bytes for priority 3 traffic</li> <li>9216 bytes for priority 4 traffic</li> </ul> <p><b>NOTE:</b> If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.</p> |
| <b>Flow-Control-Queues</b> | Output queue mapping to IEEE 802.1p code points (priorities). Explicit output queue to priority mapping overwrites the default configuration, and only explicitly mapped queues are displayed in the output. Flow control is only enabled on a queue when you enable PFC on the corresponding priority in the input stanza of the congestion notification profile.                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | Table 452 on page 5286 describes the output fields for the <b>show class-of-service forwarding-class</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                     |

**Table 452: show class-of-service forwarding-class Output Fields**

| Field Name               | Field Description                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b>  | Name of the forwarding class.                                                                                                                                      |
| <b>ID</b>                | Forwarding class identifier.                                                                                                                                       |
| <b>Queue</b>             | CoS queue mapped to the forwarding class.                                                                                                                          |
| <b>Policing priority</b> | Not supported on EX Series switches or the QFX Series and can be ignored.                                                                                          |
| <b>Fabric priority</b>   | (EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets entering the switch fabric. |

Table 452: show class-of-service forwarding-class Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No-Loss</b> | <p>(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes:</p> <ul style="list-style-type: none"> <li>Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is <b>drop</b>).</li> <li>Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is <b>no-loss</b>).</li> </ul> |

### Sample Output

show class-of-service forwarding-class

```
user@switch> show class-of-service forwarding-class
```

| Forwarding class     | ID | Queue | Policing | priority |
|----------------------|----|-------|----------|----------|
| best-effort          | 0  | 0     |          | normal   |
| expedited-forwarding | 1  | 5     |          | normal   |
| assured-forwarding   | 2  | 1     |          | normal   |
| network-control      | 3  | 7     |          | normal   |

### Sample Output

show class-of-service forwarding-class (EX8200 Switch)

```
user@switch> show class-of-service forwarding-class
```

| Forwarding class     | ID | Queue | Fabric | priority |
|----------------------|----|-------|--------|----------|
| best-effort          | 0  | 0     | low    |          |
| expedited-forwarding | 1  | 5     | low    |          |
| assured-forwarding   | 2  | 1     | low    |          |
| network-control      | 3  | 7     | low    |          |
| mcast-be             | 4  | 2     | low    |          |
| mcast-ef             | 5  | 4     | low    |          |
| mcast-af             | 6  | 6     | low    |          |

### Sample Output

show class-of-service forwarding-class (QFX Series)

```
user@switch> show class-of-service forwarding-class
```

| Forwarding class | ID | Queue | Policing | priority | No-Loss  |
|------------------|----|-------|----------|----------|----------|
| best-effort      | 0  | 0     | normal   |          | Disabled |
| fcoe             | 1  | 3     | normal   |          | Enabled  |
| no-loss          | 2  | 4     | normal   |          | Enabled  |
| network-control  | 3  | 7     | normal   |          | Disabled |
| mcast            | 8  | 8     | normal   |          | Disabled |

| Description                                  | Display the entire class-of-service (CoS) configuration as it exists in the forwarding table. Executing this command is equivalent to executing all <b>show class-of-service forwarding-table</b> commands in succession.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Options                                      | <b>lcc <i>number</i></b> —(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the forwarding table configuration for a specific T640 router (or line-card chassis) configured in a routing matrix. On a TX Matrix Plus router, display the forwarding table configuration for a specific T1600 router (or line-card chassis) configured in the routing matrix. Replace <i>number</i> with a value from 0 through 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Required Privilege Level                     | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | <a href="#">Table 454 on page 5293</a> describes the output fields for the <b>show class-of-service forwarding-table classifier</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 454: show class-of-service forwarding-table classifier Output Fields**

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Classifier table index</b> | Index of the classifier table.                                                                                                                                                                                                                                                                                                                                                   |
| <b>entries</b>                | Total number of entries.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Table type</b>             | Type of code points in the table: <b>DSCP</b> , <b>EXP</b> (not on the QFX Series), <b>IEEE 802.1</b> , <b>IPv4 precedence</b> (not on the QFX Series), or <b>IPv6 DSCP</b> .                                                                                                                                                                                                    |
| <b>Entry #</b>                | Entry number.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Code point</b>             | Code point value used for classification.                                                                                                                                                                                                                                                                                                                                        |
| <b>Forwarding-class #</b>     | Forwarding class to which the code point is assigned.                                                                                                                                                                                                                                                                                                                            |
| <b>PLP</b>                    | Packet loss priority value set by classification. For most platforms, the value can be <b>0</b> or <b>1</b> . For some platforms, the value is <b>0</b> , <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>0</b> represents low PLP. The value <b>1</b> represents <b>high</b> PLP. The value <b>2</b> represents medium-low PLP. The value <b>3</b> represents medium-high PLP. |

## Sample Output

```
show class-of-service forwarding-table classifier
Classifier table index: 62436, # entries: 64, Table type: DSCP
```

| Entry # | Code point | Forwarding-class # | PLP |
|---------|------------|--------------------|-----|
| 0       | 000000     | 0                  | 0   |

| <b>Output Fields</b>            | <a href="#">Table 459 on page 5301</a> describes the output fields for the <b>show class-of-service forwarding-table scheduler-map</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 459: show class-of-service forwarding-table scheduler-map Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | Name of the physical interface.                                                                                                                                                                                                                                                             |
| Index              | Physical interface index.                                                                                                                                                                                                                                                                   |
| Map index          | Scheduler map index.                                                                                                                                                                                                                                                                        |
| Num of queues      | Number of queues defined in this scheduler map.                                                                                                                                                                                                                                             |
| Entry              | Number of this entry in the scheduler map.                                                                                                                                                                                                                                                  |
| Scheduler index    | Scheduler policy index.                                                                                                                                                                                                                                                                     |
| Forwarding-class # | Forwarding class number to which this entry is applied.                                                                                                                                                                                                                                     |
| Tx rate            | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                      |
| Max buffer delay   | Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword <b>remainder</b> , which indicates that the buffer is sized according to what remains after other scheduler buffer allocations. |
| Priority           | <ul style="list-style-type: none"> <li><b>high</b>—Queue priority is high.</li> <li><b>low</b>—Queue priority is low.</li> </ul>                                                                                                                                                            |
| PLP high           | Drop profile index for a high packet loss priority profile.                                                                                                                                                                                                                                 |

Table 459: show class-of-service forwarding-table scheduler-map Output Fields (*continued*)

| Field Name      | Field Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| PLP low         | Drop profile index for a low packet loss priority profile.                                                  |
| PLP medium-high | Drop profile index for a medium-high packet loss priority profile.                                          |
| PLP medium-low  | Drop profile index for a medium-low packet loss priority profile.                                           |
| TCP PLP high    | Drop profile index for a high TCP packet loss priority profile.                                             |
| TCP PLP low     | Drop profile index for a low TCP packet loss priority profile.                                              |
| Policy is exact | If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled. |

## Sample Output

### show class-of-service forwarding-table scheduler-map

```

**Output Fields** Table 460 on page 5304 describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 460: show class-of-service interface Output Fields**

| Field Name                              | Field Description                                                                                                                                                                                                                                                                             |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical interface</b>               | Name of a physical interface.                                                                                                                                                                                                                                                                 |
| <b>Index</b>                            | Index of this interface or the internal index of this object.                                                                                                                                                                                                                                 |
| <b>Dedicated Queues</b>                 | Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                        |
| <b>Queues supported</b>                 | Number of queues you can configure on the interface.                                                                                                                                                                                                                                          |
| <b>Queues in use</b>                    | Number of queues currently configured.                                                                                                                                                                                                                                                        |
| <b>Total non-default queues created</b> | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                   |
| <b>Rewrite Input IEEE Code-point</b>    | (QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value. |
| <b>Shaping rate</b>                     | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.            |
| <b>Scheduler map</b>                    | Name of the output scheduler map associated with this interface.                                                                                                                                                                                                                              |
| <b>Input shaping rate</b>               | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                              |
| <b>Input scheduler map</b>              | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                |
| <b>Chassis scheduler map</b>            | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                             |
| <b>Rewrite</b>                          | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                            |
| <b>Classifier</b>                       | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                  |
| <b>Forwarding-class-map</b>             | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                                    |
| <b>Congestion-notification</b>          | (QFX Series only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                          |

Table 460: show class-of-service interface Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Logical interface</b> | Name of a logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Object</b>            | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , or <b>Translation Table</b> (for IQE PICs only).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Input errors</b>  | <p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |
| <b>Output errors</b> | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Egress queues</b> | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 460: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters</b>                       | CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SONET alarms</b><br><b>SONET defects</b> | (SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b> , <b>SONET section</b> , <b>SONET line</b> , and <b>SONET path</b> .                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SONET PHY</b>                            | Counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET PHY</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>PLL Lock</b>—Phase-locked loop</li> <li>• <b>PHY Light</b>—Loss of optical signal</li> </ul>                                                                                                                                                                                                                                                                                        |
| <b>SONET section</b>                        | Counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. | Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Received SONET overhead                | Values of the received and transmitted SONET overhead: <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1</b> and <b>K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-N signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-N signal.</li> <li>• <b>Z3</b> and <b>Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                    |
| Transmitted SONET overhead             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Received path trace                    | SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmitted path trace                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Transmitted Packets  | Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                         |
| <b>Description</b>              | For each class-of-service (CoS) multideestination classifier, display the classifier type.                                                                                                                 |
| <b>Options</b>                  | <b>none</b> —Display all multideestination classifiers.                                                                                                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                       |
| <b>Output Fields</b>            | <a href="#">Table 461 on page 5329</a> describes the output fields for the <b>show class-of-service multi-destination</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 461: show class-of-service multi-destination Output Fields**

| Field Name       | Field Description                                          |
|------------------|------------------------------------------------------------|
| Family ethernet  | Family to which the classifier belongs.                    |
| Classifier Name  | Name of the classifier.                                    |
| Classifier Type  | Type of the classifier: <b>dscp</b> or <b>ieee-802.1</b> . |
| Classifier Index | Internal index of the classifier.                          |

## Sample Output

### show class-of-service multi-destination

```
user@switch> show class-of-service multi-destination
```

```
Family ethernet:
Classifier Name      Classifier Type      Classifier Index
ba-mcast-classifier  ieee-802.1         62376
```

**Table 462: show class-of-service rewrite-rule Output Fields**

| Field Name              | Field Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rewrite rule</b>     | Name of the rewrite rule.                                                                                                                  |
| <b>Code point type</b>  | Type of rewrite rule: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>frame-relay-de</b> , or <b>inet-precedence</b> .                    |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch. |
| <b>Index</b>            | Internal index for this particular rewrite rule.                                                                                           |
| <b>Loss priority</b>    | Loss priority for rewriting.                                                                                                               |

Table 462: show class-of-service rewrite-rule Output Fields (*continued*)

| Field Name | Field Description            |
|------------|------------------------------|
| Code point | Code point value to rewrite. |

## Sample Output

**show class-of-service  
rewrite-rule type dscp**

```

user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
  Forwarding class      Loss priority      Code point
  gold                  high              000000
  silver               low              110000
  silver               high              111000
  bronze               low              001010
  bronze               high              001100
  lead                 high              101110

Rewrite rule: abc-dscp-rewrite, Code point type: dscp, Index: 3245
  Forwarding class      Loss priority      Code point
  gold                  low               000111
  gold                  high              001010
  silver               low              110000
  silver               high              111000
  bronze               high              001100
  lead                 low              101110
  lead                 high              110111

```

## Sample Output

**show class-of-service  
rewrite-rule type dscp  
(QFX Series)**

```

user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp, Index: 31
  Forwarding class      Loss priority      Code point
  best-effort           low               000000
  best-effort           high              000000
  fcoe                  low              101110
  fcoe                  high              101110
  no-loss               low              001010
  no-loss               high              001100
  network-control       low              110000
  network-control       high              111000

```

Table 463: show class-of-service scheduler-map Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduler map</b>        | Name of the scheduler map.                                                                                                                                                                                                                                                                                 |
| <b>Index</b>                | Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.                                                                                                                                                                                |
| <b>Scheduler</b>            | Name of the scheduler.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding class</b>     | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                                                                                                                                                           |
| <b>Transmit rate</b>        | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                                     |
| <b>Rate Limit</b>           | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                          |
| <b>Maximum buffer delay</b> | Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations. |
| <b>Priority</b>             | Scheduling priority: <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                           |

Table 463: show class-of-service scheduler-map Output Fields (*continued*)

| Field Name      | Field Description                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------|
| Excess priority | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> . |
| Adjust minimum  | Minimum shaping rate for an adjusted queue, in bps.                                                                |
| Adjust percent  | Bandwidth adjustment applied to a queue, in percent.                                                               |
| Drop profiles   | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.     |
| Loss priority   | Packet loss priority for drop profile assignment.                                                                  |
| Protocol        | Transport protocol for drop profile assignment.                                                                    |
| Name            | Name of the drop profile.                                                                                          |

## Sample Output

**show class-of-service  
scheduler-map**

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84
```

```
Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

```
Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

## show class-of-service shared-buffer

| <b>Output Fields</b>            | Table 464 on page 5334 describes the output fields for the <b>show class-of-service shared-buffer</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 464: show class-of-service shared-buffer Output Fields**

| Field Name       | Field Description                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------|
| Ingress          | Ingress shared buffer configuration.                                                                                |
| Total Buffer     | Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool. |
| Dedicated Buffer | Buffer space allocated to the dedicated buffer pool in KB.                                                          |
| Shared Buffer    | Buffer space allocated to the shared buffer pool in KB.                                                             |
| Lossless         | Buffer space allocated to the lossless traffic buffer pool in KB.                                                   |

Table 464: show class-of-service shared-buffer Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Lossless Headroom</b>             | Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)                                            |
| <b>Lossy</b>                         | Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.                                                                                                                                |
| <b>Lossless Headroom Utilization</b> | Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.) |
| <b>Node Device</b>                   | Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).                                                                                                    |
| <b>Total</b>                         | Size of the lossless headroom ingress buffer pool in KB.                                                                                                                                                    |
| <b>Used</b>                          | Amount in KB of lossless headroom ingress buffer used.                                                                                                                                                      |
| <b>Free</b>                          | Amount in KB of lossless headroom ingress buffer free (unused).                                                                                                                                             |
| <b>Egress</b>                        | Egress shared buffer configuration.                                                                                                                                                                         |
| <b>Multicast</b>                     | Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)                                                                                                                     |

## Sample Output

**show class-of-service  
shared-buffer**

```
user@switch> show class-of-service shared-buffer
```

Ingress:

```
Total Buffer      : 9360.00 KB
Dedicated Buffer  : 2158.00 KB
Shared Buffer     : 7202.00 KB
  Lossless       : 648.18 KB
  Lossless Headroom : 3240.90 KB
  Lossy          : 3312.92 KB
```

Lossless Headroom Utilization:

| Node Device | Total      | Used    | Free       |
|-------------|------------|---------|------------|
| 0           | 3240.90 KB | 0.00 KB | 3240.90 KB |

Egress:

```
Total Buffer      : 9360.00 KB
Dedicated Buffer  : 2704.00 KB
Shared Buffer     : 6656.00 KB
  Lossless       : 3328.00 KB
  Multicast      : 1264.64 KB
  Lossy          : 2063.36 KB
```

## show class-of-service traffic-control-profile

| <b>Shaping rate burst</b>           | Configured burst size for the shaping rate, in bytes.<br><br><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.                                                                                                                                                                                                                                                                                                                                      |
| <b>Shaping rate priority high</b>   | Configured shaping rate for high-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Shaping rate priority medium</b> | Configured shaping rate for medium-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Shaping rate priority low</b>    | Configured shaping rate for low-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Shaping rate excess high</b>     | Configured shaping rate for high-priority excess traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Shaping rate excess low</b>      | Configured shaping rate for low-priority excess traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Scheduler map</b>                | Name of the associated scheduler map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Delay Buffer rate</b>            | Configured delay buffer rate, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Excess rate</b>                  | Configured excess rate, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Excess rate high</b>             | Configured excess rate for high priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Excess rate low</b>              | Configured excess rate for low priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Guaranteed rate</b>              | Configured guaranteed rate, in bps or cps.<br><br><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul> |
| <b>Guaranteed rate burst</b>        | Configured burst size for the guaranteed rate, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>adjust-minimum</b>               | Configured minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 465: show class-of-service traffic-control-profile Output Fields (*continued*)

| Field Name                      | Field Description                                                |
|---------------------------------|------------------------------------------------------------------|
| <b>overhead accounting mode</b> | Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> . |
| <b>Overhead bytes</b>           | Configured byte adjustment value.                                |

## Sample Output

### show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
  .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
  ..adjust-minimum 20000000

```

### show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode

```

### show class-of-service traffic-control-profile (ACX Series routers)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps

```

with ATM IMA  
pseudowire interfaces)

Shaping rate burst: 200 cells  
Scheduler map: <default>  
Delay Buffer rate: 1000 cps  
Guaranteed rate: 1700 cps

## show dcbx

## show interfaces queue

**Syntax** show interfaces queue  
 <aggregate | remaining-traffic>  
 <both-ingress-egress>  
 <egress>  
 <forwarding-class *forwarding-class*>  
 <ingress>  
 <interface-name *interface-name*>  
 <l2-statistics>  
 <remaining-traffic>

**Release Information** Command introduced before Junos OS Release 7.4.  
**both-ingress-egress**, **egress**, and **ingress** options introduced in Junos OS Release 7.6.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
**l2-statistics** option introduced in Junos OS Release 12.1.

**Description** Display class-of-service (CoS) queue information for physical interfaces.

**Options** **none**—Show detailed CoS queue statistics for all physical interfaces.

**aggregate**—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

**both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

**egress**—(Optional) Display egress queue statistics.

**forwarding-class *forwarding-class***—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

**ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

**interface-name *interface-name***—(Optional) Show detailed CoS queue statistics for the specified interface.

**l2-statistics**—(optional) Display layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 170 on page 2206](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the layer 3 level. In the case of link fragmentation and interleaving (LFI) for which not fragmentation is applied, corresponding layer 2 overheads are added, as shown in [Table 170 on page 2206](#).

Table 468: Layer 2 Overhead, Transmitted Packets/Bytes

| Protocol       | Fragmentation       |                            | LFI |
|----------------|---------------------|----------------------------|-----|
|                | First fragmentation | Second to n fragmentations |     |
|                | Bytes               | Bytes                      |     |
| MLPPP (Long)   | 13                  | 12                         | 8   |
| MLPPP (short)  | 11                  | 10                         | 8   |
| MLFR (FRF15)   | 12                  | 10                         | 8   |
| MFR (FRF16)    | 10                  | 8                          | -   |
| MCMLPPP(Long)  | 13                  | 12                         | -   |
| MCMLPPP(Short) | 11                  | 10                         | -   |

## Layer 2 Statistics - Fragmentation Overhead Calculation

### MLPPP/MC-MLPPP Overhead details:

=====

#### Fragment 1:

|                                     |                      |
|-------------------------------------|----------------------|
| Outer PPP header                    | : 4 bytes            |
| Long or short sequence MLPPP header | : 4 bytes or 2 bytes |
| Inner PPP header                    | : 1 byte             |
| HDLC flag and FCS bytes             | : 4 bytes            |

#### Fragments 2 .. n :

|                                     |                      |
|-------------------------------------|----------------------|
| Outer PPP header                    | : 4 bytes            |
| Long or short sequence MLPPP header | : 4 bytes or 2 bytes |
| HDLC flag and FCS bytes             | : 4 bytes            |

### MLFR (FRF15) Overhead details:

=====

#### Fragment 1:

|                     |           |
|---------------------|-----------|
| Framereelay header  | : 2 bytes |
| Control,NLPID       | : 2 bytes |
| Fragmentaion header | : 2 bytes |
| Inner proto         | : 2 bytes |
| HDLC flag and FCS   | : 4 bytes |

#### Fragments 2 ...n :

|                     |           |
|---------------------|-----------|
| Framereelay header  | : 2 bytes |
| Control,NLPID       | : 2 bytes |
| Fragmentaion header | : 2 bytes |
| HDLC flag and FCS   | : 4 bytes |

### MFR (FRF16) Overhead details:

=====

#### Fragment 1:

|                     |           |
|---------------------|-----------|
| Fragmentaion header | : 2 bytes |
| Framereelay header  | : 2 bytes |
| Inner proto         | : 2 bytes |
| HDLC flag and FCS   | : 4 bytes |

#### Fragments 2 ...n :

|                     |           |
|---------------------|-----------|
| Fragmentaion header | : 2 bytes |
| Framereelay header  | : 2 bytes |
| HDLC flag and FCS   | : 4 bytes |

## Overhead with LFI

### MLPPP(Long & short sequence):

=====

|                   |           |
|-------------------|-----------|
| Outer PPP header  | : 4 bytes |
| HDLC flag and FCS | : 4 bytes |

### MLFR (FRF15):

=====

|                    |           |
|--------------------|-----------|
| Framereelay header | : 2 bytes |
| Control,NLPID      | : 2 bytes |
| HDLC flag and FCS  | : 4 bytes |

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

**Additional Information** On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the Junos® OS Network Interfaces. For related CoS operational mode commands, see the Junos OS Operational Mode Commands.

**Required Privilege Level** view

**Output Fields** [Table 171 on page 2209](#) lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

**Table 469: show interfaces queue Output Fields**

| Field Name                   | Field Description                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Physical interface           | Name of the physical interface.                                                                                              |
| Enabled                      | State of the interface. Possible values are described in the "Enabled Field" section under Common Output Fields Description. |
| Interface index              | Physical interface's index number, which reflects its initialization sequence.                                               |
| SNMP ifIndex                 | SNMP index number for the interface.                                                                                         |
| Forwarding classes supported | Total number of forwarding classes supported on the specified interface.                                                     |
| Forwarding classes in use    | Total number of forwarding classes in use on the specified interface.                                                        |
| Ingress queues supported     | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.                      |
| Ingress queues in use        | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.                         |
| Output queues supported      | Total number of output queues supported on the specified interface.                                                          |
| Output queues in use         | Total number of output queues in use on the specified interface.                                                             |
| Egress queues supported      | Total number of egress queues supported on the specified interface.                                                          |
| Egress queues in use         | Total number of egress queues in use on the specified interface.                                                             |
| Queue                        | Queue number.                                                                                                                |

Table 469: show interfaces queue Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters (Ingress)</b> | CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                     |
| <b>Burst size</b>               | (Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Forwarding classes</b>       | Forwarding class name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Queued Packets</b>           | Number of packets queued to this queue.<br><br><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.                                                                                                                                                                         |
| <b>Queued Bytes</b>             | Number of bytes queued to this queue. The byte counts vary by PIC type. For more information, see <a href="#">Table 172 on page 2212</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Transmitted Packets</b>      | Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.<br><br><b>NOTE:</b> For layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2205</a>                                                                                                                                           |
| <b>Transmitted Bytes</b>        | Number of bytes transmitted by this queue. The byte counts vary by PIC type. For more information, see <a href="#">Table 172 on page 2212</a> .<br><br><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.<br><br><b>NOTE:</b> For layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2205</a> |
| <b>Tail-dropped packets</b>     | Number of packets dropped because of tail drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 469: show interfaces queue Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RED-dropped packets | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> |
| RED-dropped bytes   | <p>Number of bytes dropped because of RED. The byte counts vary by PIC type. For more information, see <a href="#">Table 172 on page 2212</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. Byte counts vary by PIC type. [Table 172 on page 2212](#) shows how the byte counts on the outbound interfaces vary depending on the PIC type. [Table 172 on page 2212](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 470: Byte Count by PIC Type

| PIC Type                         | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Comments                                                                                                                                                                                                     |

Table 470: Byte Count by PIC Type (*continued*)

| PIC Type                                             | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comments                                                                                                                           |
|------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| IQ and IQE PICs with a SONET/SDH interface           | Interface                   | <p>Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p>                                                                                                                                                                                                                       | The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.                                                   |
|                                                      | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes</p>                                                                                                                                                                                                                                                                                                                              | For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.                      |
| Non-IQ PIC with a SONET/SDH interface                | Interface                   | <p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 478 bytes of Layer 3 packet.</li> </ul> <p>M Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes</li> <li>RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet</li> </ul> | For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP). |
| Interfaces configured with Frame Relay Encapsulation | Interface                   | The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                    |
| 1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs        | Interface                   | <p>Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p> <p>Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p>                                                                                                                                                                                                                                                                                                                        | The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.                                               |

## Sample Output

### show interfaces queue (Aggregated Ethernet on a T320 Router)

The following example shows that the aggregated Ethernet interface, **ae1**, has traffic on queues **af1** and **af12**:

```

user@host> show interfaces queue ae1
Physical interface: ae1, Enabled, Physical link is Up
Interface index: 158, SNMP ifIndex: 33 Forwarding classes: 8 supported, 8 in use
Output queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: be
  Queued:

| <b>Syntax (TX Matrix and TX Matrix Plus Routers)</b> | <pre>show pfe route &lt;fpc slot&gt; &lt;&lt;inet6   ip   iso&gt; &lt;prefix prefix&gt;   &lt;table &lt;table-name&gt; &lt;index index&gt; &lt;prefix prefix&gt;&gt;&gt; &lt;lcc number&gt; &lt;mpls&gt; &lt;summary&gt;</pre> |

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

**NOTE:** The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the `show route forwarding table` command. For more information, see the Junos OS Operational Mode Commands.

**Options** **none**—Display all Packet Forwarding Engine forwarding table information.

**fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**index *index***—(Optional) Display table index.

**inet6**—(Optional) Display Packet Forwarding Engine IPv6 routes.

**ip**—(Optional) Display Packet Forwarding Engine IPv4 routes.

**iso** —(Optional) Display ISO version routing tables.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the T1600 router (or line-card chassis) that houses the FPC. Replace ***number*** with a value from 0 through 3.

**mpls**—(Optional) Display Packet Forwarding Engine MPLS information.

**prefix *prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

**summary**—(Optional) Display summary of Packet Forwarding Engine information.

**table <*table-name*>**—(Optional) Display table information.

**Required Privilege  
Level**

admin

**List of Sample Output**

[show pfe route ip on page 5410](#)

[show pfe route iso on page 5410](#)

[show pfe route lcc summary \(TX Matrix Router\) on page 5410](#)

[show pfe route lcc summary \(TX Matrix Plus Router\) on page 5411](#)

## Sample Output

### show pfe route ip

```
user@host> show pfe route ip
```

```
IPv4 Route Table 0, default.0, 0x0:
```

| Destination      | NH IP Addr     | Type    | NH ID | Interface  |

### Troubleshooting Dropped FCoE Traffic

**Problem** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 4509 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause** Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution** The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Troubleshooting an Unexpected Rewrite Value

**Problem** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause** If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution** If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause** Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution** If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 471 on page 5425](#) shows the topology for this example:

## Understanding Device and Network Management Features

After you install a QFX Series product in your network, you need to manage the device. The QFX Series products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

[Table 472 on page 5429](#) lists the device and network management features on the QFX Series.

**Table 472: Device and Network Management Features on the QFX Series**

| Feature                                                                                                                                                                                                                                                          | Typical Uses     | Documentation                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------------------------------------------------------|
| AI-Scripts and Advanced Insight Manager (AIM)—Automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems, and submit problem reports to Juniper Support Systems. | Fault management | <a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a> |

Table 472: Device and Network Management Features on the QFX Series (*continued*)

| Feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Typical Uses                                                                                                                                                                         | Documentation                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.                                                                                                                                                                                                                                                                                                                                                                                     | Fault management                                                                                                                                                                     | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 5826</a>                                                                                                                                                                        |
| Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.                                                                                                                                                                                                                                                                                                                                                                 | Performance management                                                                                                                                                               | <ul style="list-style-type: none"> <li>• <a href="#">Routing Policy Configuration Guide</a></li> <li>• <a href="#">Overview of Firewall Filters on page 4071</a></li> </ul>                                                                      |
| In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.                                                                                                                              | Remote access management                                                                                                                                                             | <ul style="list-style-type: none"> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1229</a></li> <li>• <a href="#">Configuring Telnet Service for Remote Access to a Router or Switch</a></li> </ul> |
| Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management.                                                                                                                    | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>                                           | <a href="#">Junos OS Configuration and Operations Automation Guide</a>                                                                                                                                                                           |
| Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.                                                                                                                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• User access management</li> <li>• Remote access management</li> </ul> | <a href="#">CLI User Guide</a>                                                                                                                                                                                                                   |
| Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control.                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>                                           | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Junos Space Support on page 5453</a></li> <li>• <a href="#">Junos Space Network Application Platform User Guide</a></li> </ul>                                                |
| Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements. | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>                                           | <ul style="list-style-type: none"> <li>• <a href="#">Junos XML API Configuration Reference</a></li> <li>• <a href="#">Junos XML API Operational Reference</a></li> </ul>                                                                         |

Table 472: Device and Network Management Features on the QFX Series (*continued*)

| Feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Typical Uses                                                                                                                               | Documentation                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul> | <i>NETCONF XML Management Protocol Guide</i>                                                                                                                                                                                                                                       |
| Operational mode commands—May be used to do the following: <ul style="list-style-type: none"> <li>• Monitor switch performance. For example, the <b>show chassis routing-engine</b> command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch.</li> <li>• View current activity and status of the device or network. For example, you can use the <b>ping</b> command to monitor and diagnose connectivity problems, and the <b>traceroute</b> command to locate points of failure on the network.</li> </ul>                          | <ul style="list-style-type: none"> <li>• Performance management</li> <li>• Fault management</li> </ul>                                     | Junos OS Operational Mode Commands                                                                                                                                                                                                                                                 |
| Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch.                                                                                                    | Remote access management                                                                                                                   | <ul style="list-style-type: none"> <li>• Connecting a QFX3500 Device to a Network for Out-of-Band Management</li> <li>• Connecting a QFX Series Device to a Management Console</li> <li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 552</a></li> </ul> |
| SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable.                                                                                                                                                                                                                                                        | Configuration management                                                                                                                   | SNMP MIBs and Traps Reference                                                                                                                                                                                                                                                      |

Table 472: Device and Network Management Features on the QFX Series (*continued*)

| Feature                                                                                                                                                                                                                                                                                                                               | Typical Uses                                                                                       | Documentation                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as <b>get</b> and <b>walk</b> to monitor and view system activity.</p> <p>The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps.</p> | Fault management                                                                                   | <ul style="list-style-type: none"> <li>SNMP MIBs and Traps Reference</li> <li><a href="#">Understanding the Implementation of SNMP on page 5459</a></li> </ul>                                                                                                               |
| System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                     | <ul style="list-style-type: none"> <li>Fault management</li> <li>User access management</li> </ul> | <ul style="list-style-type: none"> <li><i>Junos OS System Log Messages Reference</i></li> <li><a href="#">Overview of Junos OS System Log Messages on page 5505</a></li> <li><a href="#">Overview of Single-Chassis System Logging Configuration on page 5505</a></li> </ul> |

## Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view messages.
- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

## Understanding Telnet on the QFabric System

This topic describes the support for the Telnet protocol on QFabric systems.

Telnet service is available for devices running Junos OS, including QFX Series devices. However, on QFabric systems, Telnet support is limited and the following conditions apply:

- You can telnet from a QFabric system to external devices that are connected to the QFabric system by way of the network Node group. To connect to these external devices, issue the **telnet** command from the QFabric default partition CLI.
- You cannot use the Telnet protocol to connect from the QFabric system default partition CLI to individual components. To access system components, you must issue the **request component login** command instead.

## Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the **/var/log** directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

**NOTE:** The **tracing** statement is not supported on the QFX3000 QFabric system.

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog** statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

You can define tracing operations in different portions of the switch configuration:

- **SNMP agent activity tracing operations**—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- **Global switching tracing operations**—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.
- **Protocol-specific tracing operations**—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- **Tracing operations within individual routing protocol entities**—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- **Interface tracing operations**—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- **Remote tracing**—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the [edit **process-name traceoptions file**] hierarchy level) in the Program field in the **/etc/syslog.conf** file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

**NOTE:** During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

**NOTE:** Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules

and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location:  
`/pbdata/mgd_shared/partition-ip/var/db/scripts`. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

## How Commit Scripts Work

You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning, and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration

before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

[Figure 193 on page 5437](#) shows the flow of commit script input and output.

**Figure 193: Commit Script Input and Output**

Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- [Commit Script Input on page 5437](#)
- [Commit Script Output on page 5438](#)
- [Commit Scripts and the Junos OS Commit Model on page 5439](#)

### Commit Script Input

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the CLI User Guide.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

### Commit Script Output

---

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog> <message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**  
    **<xsl:with-param name="content">**—Generates a persistent change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**  
    **<xsl:with-param name="tag" select="transient-change"/>**  
    **<xsl:with-param name="content">**—Generates a transient change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**  
    **<xsl:with-param name="message">**  
    **<xsl:text>**—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

**NOTE:** System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

### Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

#### Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. [Figure 194 on page 5439](#) and the accompanying discussion explain how the standard commit model works:

**Figure 194: Standard Commit Model**

In the standard commit model, the software performs the following steps:

1. When the candidate configuration is committed, it is copied to become the checkout configuration.
2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

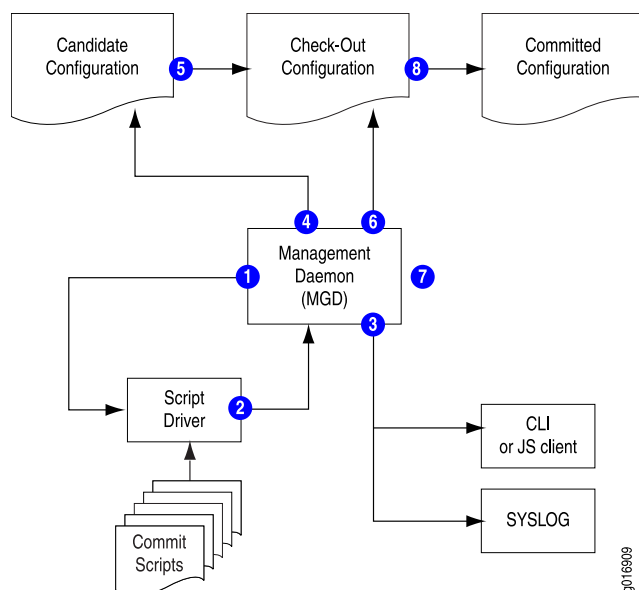

#### Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update

the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. [Figure 195 on page 5440](#) and the accompanying discussion explain this process.

**Figure 195: Commit Model with Commit Scripts Added**

In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
  - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.
  - **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
  - **<syslog>**—The mgd process forwards the message to the system log process.
4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.

7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

**NOTE:** Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see [“Avoiding Potential Conflicts When Using Multiple Commit Scripts” on page 5441](#).

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in [Controlling Execution of Commit Scripts During Commit Operations](#)), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see [“Overview of Generating Persistent or Transient Configuration Changes” on page 5442](#).

Documentation**

- [Avoiding Potential Conflicts When Using Multiple Commit Scripts on page 5441](#)

## Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the `[edit system scripts commit]` hierarchy level, as illustrated in [Figure 196 on page 5442](#).

Figure 196: Configuration Evaluation by Multiple Commit Scripts

As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address 192.168.0.255. Later, the DNS server's address is changed to 192.168.255.255 and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of 192.168.0.255 is configured, script **B.xsl** changes it to 192.168.255.255. However, if the correct address of 192.168.255.255 is configured, script **A.xsl** changes it to the incorrect value 192.168.0.255.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

## Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have

decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

### Differences Between Persistent and Transient Changes

---

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute to a configuration element produces the same behavior as a **replace:** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are

validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in [Table 473 on page 5444](#).

**Table 473: Differences Between Persistent and Transient Changes**

| Persistent Changes                                                                                                                                                                                                                                                                                                                                           | Transient Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p>You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.</p>                                                                                                                                                    | <p>Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.</p>                                                                                                                                                                                           | <p>For transient changes to be loaded, you must include the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. If you enable a commit script that generates transient changes and you do not include the <b>allow-transients</b> statement in the configuration, the CLI generates an error message and the commit operation fails.</p> <p>Like persistent changes, transient changes must pass the standard Junos OS validity check.</p> <p>You cannot use a commit script to generate the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. Rather, you must include this statement directly by using the CLI.</p> |

Table 473: Differences Between Persistent and Transient Changes (*continued*)

| Persistent Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Transient Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Persistent changes work like the <b>load replace</b> configuration mode command, and the change is added to the candidate configuration.</p> <p>When generating a persistent change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p> | <p>Transient changes work like the <b>load replace</b> configuration mode command, and the change is added to the checkout configuration.</p> <p>When generating a transient change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p> <p>Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.</p> |
| <p>After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration.</p> <p>After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.</p>                                                                                                                                                                                                  | <p>Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p>After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the <b>show</b> configuration mode command:</p> <pre>user@host# show</pre> <p>This command displays persistent changes only, not transient changes.</p>                                                                                                                                                                                                                                                                                                                                                     | <p>After committing a script that causes a transient change to be generated, you can view the transient change by issuing the <b>show   display commit-scripts</b> configuration mode command:</p> <pre>user@host# show   display commit-scripts</pre> <p>This command displays both persistent and transient changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>Persistent changes must conform to your custom configuration design rules as dictated by commit scripts.</p> <p>This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.</p>                                                                                                                                                                 | <p>Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in <a href="#">“Commit Scripts and the Junos OS Commit Model” on page 5439</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 473: Differences Between Persistent and Transient Changes (*continued*)

| Persistent Changes                                                                                                                                                                                                                                                                                                                                                                                                                       | Transient Changes                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the <b>commit</b> command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another <b>commit</b> command. | You cannot remove a transient change by rolling back to a previous configuration.                                                                                                                                                                                                              |
| You can alter persistent changes directly by editing the configuration using the CLI.                                                                                                                                                                                                                                                                                                                                                    | <p>You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration.</p> <p>To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.</p> |

### Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

**CAUTION:** Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group, be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a load replace operation on the group during each commit operation.

For more information about configuration groups, see the CLI User Guide.

### Tag Elements and Templates for Generating Changes

To generate changes, you can use the **jcs:emit-change** template, which implicitly includes **<change>** and **<transient-change>** XML elements; or you can explicitly include **<change>**

and `<transient-change>` XML elements. Using the `jcs:emit-change` template allows you to set the hierarchical context of the change once rather than multiple times.

The `<change>` and `<transient-change>` elements are similar to the `<load-configuration>` operation defined by the Junos XML management protocol. The possible contents of the `<change>` and `<transient-change>` elements are the same as the contents of the `<configuration>` tag element used in the Junos XML protocol operation `<load-configuration>`. For complete details about the `<load-configuration>` element, see the *Junos XML Management Protocol Guide*.

## Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called `junos.xsl`. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Commit Scripts

```

1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7    <xsl:import href="../../../import/junos.xsl"/>

8    <xsl:template match="configuration">
9      <!-- ... Insert your code here ... -->
10   </xsl:template>
11 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1  <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of the Junos OS. The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7 <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the `<configuration>` element, which is the node selected by the `<xsl:template match="/">` template, contained in the `junos.xsl` import file. The `<xsl:template match="configuration">` element allows you to exclude the `/configuration/` root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```
8 <xsl:template match="configuration">
```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```
9 </xsl:template>
```

Line 10 closes the style sheet and the commit script.

```
10 </xsl:stylesheet>
```

### SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match configuration {
/*
* Insert your code here
*/
}
```

## How Op Scripts Work

Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op filename** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 197 on page 5449 shows a high-level view of the flow of op script input and output.

**Figure 197: Op Script Input and Output**

## Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xml**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Op Scripts

```

1 <?xml version="1.0" standalone="yes"?>
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7   <xsl:import href="../import/junos.xml"/>
8   <xsl:template match="/">

```

```
9      <op-script-results>
      <!-- ... insert your code here ... -->
10     </op-script-results>
11   </xsl:template>
      <!-- ... insert additional template definitions here ... -->
12 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1 <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2 <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of Junos OS (in the file `/usr/libdata/cscript/import/junos.xsl`). The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in Junos Script Automation: Named Templates in the jcs Namespace Overview and Junos Named Templates in the jcs Namespace Summary.

```
7   <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the `</>` element. The `<xsl:template match="/">` element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see XPath Overview.

```
8   <xsl:template match="/">
```

After the `<xsl:template match="/">` tag element, the `<op-script-results>` and `</op-script-results>` container tags must be the top-level child tags, as shown in Lines 9 and 10.

```
9      <op-script-results>
      <!-- ... insert your code here ... -->
10     </op-script-results>
```

Line 11 closes the template.

```
11   </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the `<xsl:template match="/">` template.

Line 12 closes the style sheet and the op script.

```
12 </xsl:stylesheet>
```

### SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match / {
  <op-script-results> {
    /*
     * Insert your code here
     */
  }
}
```

## Fabric OAM

- [Overview of Internal Fabric Monitoring on page 5451](#)

### Overview of Internal Fabric Monitoring

Internal fabric monitoring is a feature of the Operation, Administration, and Maintenance (OAM) of the QFabric system. This feature enables you to validate the flow path of protocol data units (PDUs) across a given VLAN on the QFabric system using the unicast ping, multicast ping, and traceroute operations.

Internal fabric monitoring is useful for fault detection on the QFabric system. For example, if a PDU reaches a destination that is not part of the VLAN configuration, the operation (unicast ping, multicast ping, or traceroute) displays the exception on the console at runtime.

The unicast and multicast ping operations send PDUs from a source interface (called the source fabric maintenance endpoint [FMEP]) to a destination FMEP. The destination FMEP sends a response to the source FMEP when the PDUs are received.

The traceroute operation, also called a flow linktrace, traces the path taken by a specific, learned unicast flow from a source FMEP to a destination FMEP in a VLAN. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices. The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the PDU travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

The following internal fabric monitoring commands are supported:

- **show oam fabric flow specification**
- **show oam fabric interfaces**
- **ping fabric unicast-flow**
- **ping fabric multicast-flow**
- **traceroute fabric unicast-flow**

The following are the main components of the internal fabric monitoring feature:

- **FMEP**—Represents the source or destination point (endpoint) in the monitoring operations. An FMEP is an interface through which PDUs are sent (source FMEP) or received (destination FMEP). Upon receipt of the PDUs, the destination FMEP sends a response to the source FMEP to validate the monitoring flow. FMEPs are associated with a VLAN in the fabric maintenance association (FMA) configuration, and the source and destination FMEP addresses are configured in the flow specification.
- **FMA**—Associates a set of FMEPs with a VLAN. The FMA defines the VLAN and FMEP parameters, including the VLAN name, FMEP identifiers, FMEP names, and the interface names of the FMEPs. The FMEPs defined in the FMA are the source and destination FMEPs used in the monitoring commands.

**NOTE:** A default FMA is automatically created for each Node group in the QFabric system. The default FMA is used to send error response PDUs (for example, in the case of a VLAN leak) and responses to PDUs that are not mapped to a specific interface in the QFabric system.

---

- **Flow specification**—Configures the flow type and FMEP addressing parameters. Unicast flow types include an Ethernet type (other than IPv4) and Ethernet IPv4. Multicast flow types include the Ethernet IPv4 and VLAN flood type. The flow specification also defines parameters within each flow type, such as MAC or IPv4 addresses of the source and destination FMEPs. The names and identifiers of these FMEPs are configured in the FMA parameters.

To enable internal fabric monitoring, configure the **fabric-maintenance-associations** and **flow-specs** statements at the **[edit protocols oam fabric]** hierarchy level.

The **ping fabric unicast-flow**, **ping fabric multicast-flow**, and **traceroute fabric unicast-flow** commands require that you specify the flow specification and FMA names, as well as the source and destination FMEP names.

## Junos Space

---

- [Understanding Junos Space Support on page 5453](#)
- [Preparing the Device for Junos Space Management on page 5456](#)

### Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space software comprises various applications for network management and configuration. Starting with Junos Space Release 11.1, the following Junos Space applications provide support for the QFX Series devices:

- Network Application Platform (Platform) automates network management operations, including device discovery and management, device templates for configuration, scripts management, image management, and SSH secure console.
- Ethernet Design provides tools to simultaneously configure and manage multiple Junos OS devices within a network. You can manage and customize port profiles, and apply port profiles to your devices.
- Service Now enables you to display and manage information about problem events. When problems are detected on the device by Advanced Insight Scripts (AI-Scripts) that are installed on the device, the data is collected and sent to Service Now for your review and action. This application is available only if you have a Juniper Networks service contract.
- Service Insight provides proactive support in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their end of life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. This application is available only if you have a Juniper Networks service contract.
- Virtual Control is a web-based solution that enables you to manage virtual networks deployed in virtualized environments in data centers. It provides a single management interface for you to monitor and control the virtual and physical elements of the virtual environment.
- IBM Systems Director and Junos Space Launch in Context (LiC) integrate the IBM Systems Director and Junos Space software to manage Juniper Networks devices.

For more information about Junos Space, go to:

[http://www.juniper.net/techpubs/en\\_US/release-independent/junos-space/](http://www.juniper.net/techpubs/en_US/release-independent/junos-space/)

**NOTE:** Before you can perform the tasks listed in [Table 474 on page 5454](#), you must first ensure the configuration on the device meets the requirements for device discovery in Junos Space. For more information, see [“Preparing the Device for Junos Space Management” on page 5456](#).

[Table 474 on page 5454](#) lists some device and network management tasks you can perform in Junos Space.

**Table 474: Device and Network Management Tasks in Junos Space**

| Task                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Application Workspace Task                                                      | Documentation                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set up and manage user access                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>Platform &gt; Administration &gt; Users &gt; Create User</b>                 | <i>Junos Space Network Application Platform User Guide</i>                                                                                                                                             |
| Bring the device under Junos Space management (device discovery)<br><br><b>NOTE:</b> Before the device can be discovered in Junos Space, the following requirements must be met: <ul style="list-style-type: none"> <li>• The device configuration has a static management IP address that is reachable from the Junos Space server.</li> <li>• There is a user with full administrative privileges for Junos Space administration.</li> <li>• If you plan on using SNMP to probe devices as part of device discovery, SNMP is enabled with appropriate read-only v1/v2c/v3 credentials.</li> </ul> | <b>Platform &gt; Devices &gt; Discover Devices</b>                              | <ul style="list-style-type: none"> <li>• <a href="#">Preparing the Device for Junos Space Management on page 5456</a></li> <li>• <i>Junos Space Network Application Platform User Guide</i></li> </ul> |
| View the hardware inventory or status of physical interfaces on the device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>Platform &gt; Devices &gt; Manage Devices</b>                                | <i>Junos Space Network Application Platform User Guide</i>                                                                                                                                             |
| Upload Junos OS software image, deploy the image on the device, and manage device images                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Platform &gt; Device Images &gt; Manage Images</b>                           |                                                                                                                                                                                                        |

## Preparing the Device for Junos Space Management

Before you can use the Juniper Networks Junos Space application to manage the QFX Series device, you must ensure that the configuration on the device meets the following requirements for device discovery in Junos Space:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

To prepare the device before using Junos Space:

1. Perform the initial configuration of the device through the console port using the Junos OS CLI. This task includes the configuration of a static management IP address and a user with root administrative privileges.

For the QFX3500 switch, see [“Configuring a QFX3500 Device as a Standalone Switch” on page 138](#).

For the QFabric system, see QFabric System Initial and Default Configuration Information and Performing the QFabric System Initial Setup on a QFX3100 Director Group.

2. (Optional) Configure SNMP if you plan on using SNMP to probe devices during device discovery.

See [“Configuring SNMP” on page 1223](#).

3. (Optional) Enable SSH if you wish to use the Secure Console feature in Junos Space.

See [“Configuring SSH Service for Remote Access to the Router or Switch” on page 1229](#).

4. In Junos Space, set up a default DMI schema by navigating to **Network Application Platform > Administration > Manage DMI Schemas**.

For more information, see “Managing DMI Schemas” in the *Junos Space Network Application Platform User Guide* at:

[http://www.juniper.net/techpubs/en\\_US/release-independent/junos-space/](http://www.juniper.net/techpubs/en_US/release-independent/junos-space/) .

## sFlow Technology

- [Overview of sFlow Technology on page 5456](#)

### Overview of sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed

on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

sFlow technology implements the following two sampling mechanisms:

- **Packet-based sampling**—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. You configure packet-based sampling when you specify a sample rate.
- **Time-based sampling**—Samples interface statistics (counters) at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. You configure time-based sampling when you specify a polling interval.

An sFlow monitoring system consists of an sFlow agent embedded in the device and up to four external collectors. On a QFX Series standalone switch, the sFlow agent performs packet sampling and gathers interface statistics, and then combines the information into UDP datagrams that are sent to the sFlow collectors.

On a QFabric system, a distributed sFlow architecture is implemented. The sFlow agent has a separate sampling entity, known as a *subagent*, running on each Node device. Each subagent has its own independent state and forwards its own sample information (datagrams) directly to the sFlow collectors. Since sampling is distributed across subagents, the protocol overhead associated with sFlow is significantly reduced at the Routing Engine and the collectors.

The sFlow monitoring global configuration that is defined on the QFabric system Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

Regardless of the rate of traffic or the configured sampling interval, a datagram is sent whenever its size reaches the maximum Ethernet transmission unit (MTU) of 1500 bytes, or whenever a 250-ms timer expires, whichever occurs first. The timer ensures that a collector receives regularly sampled data.

Support for sFlow traffic sampling has the following limitations:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.
- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The **out-priority** field for a VLAN is always set to 0 (zero) on ingress and egress samples.

To ensure sampling accuracy and efficiency, QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every 5 seconds and identifies five interfaces with the highest number of samples. When the CPU processing limit is reached, a binary backoff algorithm is implemented to reduce the sampling load of the top five interfaces by half. The adapted sampling rate is then applied to other interfaces.

On the QFabric system, interfaces on each Node device are monitored together as a group, and the binary backoff algorithm is implemented based on the traffic on that group of interfaces.

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

The sFlow collector uses the IP address of the sFlow agent to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID for the sFlow agent remains constant. If you do not assign an IP address to the agent, an IP address will be assigned to the agent using the IP address of a configured interface. The following priority is used to determine which interface will be used:

1. Management Ethernet interface **me0** IP address
2. Any Layer 3 interface if the **me0** IP address is not available

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent.

In addition, you can explicitly configure the IP address for the source data (sFlow datagrams). If you do not configure that address, the following priority is used:

- Any Layer 3 interface IP address
- The **me0** IP address if no Layer 3 interface IP address is available

## Understanding the Implementation of SNMP

The QFX Series products support the Simple Network Management Protocol (SNMP) that is implemented in the Junos OS software.

**NOTE:** By default, SNMP is not enabled on devices running Junos OS. For information on enabling SNMP on a device running Junos OS, see [“Configuring SNMP” on page 1223](#).

A typical SNMP implementation includes the following components:

- **Network management system (NMS)**—The NMS is a combination of hardware and software that is used to monitor and administer a network. Software running on the NMS includes the SNMP manager, which collects information about network connectivity, activity, and events by polling the managed devices.
- **Managed device**—A managed device (also called a network element) is any device managed by the NMS. Routers and switches are common examples of managed devices. The SNMP agent is the SNMP process that resides on the managed device and communicates with the NMS.
- **SNMP agent**—The SNMP agent exchanges network management information with SNMP manager software running on an NMS, or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent’s MIB, the collection of objects that can be viewed or changed by the SNMP manager.

SNMP data is stored in a highly structured, hierarchical format known as a management information base (MIB). The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device. The SNMP implementation in Junos OS uses both standard

(developed by IETF and documented in RFCs) and Juniper Networks enterprise-specific MIBs.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

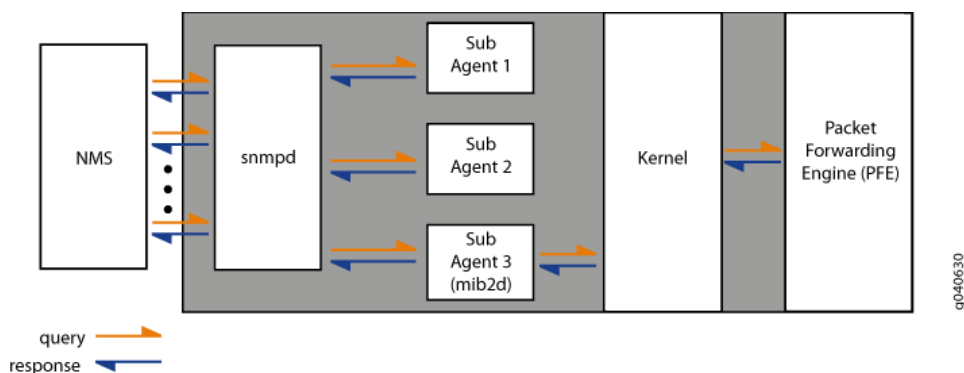

The processes maintaining the SNMP management data include:

- A master SNMP agent (known as SNMP process, or `snmpd`) that resides on the managed device and is managed by the NMS or host.
- Various subagents that reside on different modules of Junos OS, such as the Routing Engine, and are managed by the master SNMP agent.
- Junos OS processes that share data with the subagents when polled for SNMP data (for example, interface-related MIBs).

When an NMS polls the master agent for data, the master agent immediately shares the data with the NMS if the requested data is available from the master agent or one of the subagents. However, if the requested data is not maintained by the master agent or subagents, the subagent polls the Junos OS kernel or the process that maintains that data. The Junos OS kernel may need to get the data from the Packet Forwarding Engine. On receiving the required data, the subagent passes the response back on to the master agent, which in turn passes it on to the NMS.

Figure 198 on page 5460 shows the communication flow among the NMS, SNMP master agent (`snmpd`), SNMP subagents, Junos OS kernel, and Packet Forwarding Engine.

Figure 198: SNMP Communication Flow

When a significant event, most often an error or a failure, occurs on a network device, the SNMP agent sends notifications to the SNMP manager. SNMP notifications can be sent as traps (unconfirmed notifications) or inform requests (confirmed notifications).

Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and control the trap traffic. On QFX Series products, the maximum size of trap queues (throttle queue plus destination queue) is 40,960 traps. The maximum size of any one queue is 20,480 traps.

Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and it adds the subsequent traps to the same destination to the queue. Junos OS checks for availability of routes every 30 seconds, and sends the traps from the destination queue in a round-robin fashion.

If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is ten. After ten unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

Junos OS also has a throttle mechanism to control the number of traps (throttle threshold) sent during a particular time period (throttle interval). The throttle mechanism ensures consistency in trap traffic, especially when large numbers of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The default throttle threshold is 500 traps, and the throttle interval default is 5 seconds.

**NOTE:** You cannot configure trap queueing in Junos OS. You cannot view information about trap queues except for what is provided in the system logs.

## Understanding the Implementation of SNMP on the QFabric System

Simple Network Management Protocol (SNMP) monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

**NOTE:** In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your `mibwalk` command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*
  - RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
  - RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*

## Fabric Chassis MIB

The Juniper Networks enterprise-specific SNMP Fabric Chassis MIB (mib-jnx-fabric-chassis) provides hardware information about the QFabric system and its component devices in a single MIB. The Fabric Chassis MIB is based on the Juniper Networks enterprise-specific Chassis MIB that provides information for individual devices. Unlike the Chassis MIB, the Fabric Chassis MIB represents the QFabric system component devices as part of the QFabric system. Only the information from the Fabric Chassis MIB (and not from individual Chassis MIBs) is available to SNMP management clients of the QFabric system.

The Fabric Chassis MIB uses the basic information structure of the Chassis MIB, but adds another level of indexing that provides detailed information about QFabric system devices. Each physical device in a QFabric system (such as a Node device or an Interconnect device) is represented with its hardware components, including the power supply, fans, and front and rear cards.

**NOTE:** Information about the Director group and the Virtual Chassis is not available in the Fabric Chassis MIB at this time.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent (snmpd) resides in the QFabric system Director software and is responsible for receiving and distributing all traps as well as responding to all queries from the SNMP manager. In addition, there is an SNMP subagent running in the Routing Engine of each Node group and Interconnect device. The SNMP subagent manages the information about the component device, and that information is communicated to the SNMP agent in the Director software as needed. Traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

Tables and objects in the Fabric Chassis MIB include:

- Tables that have counterparts in the Chassis MIB:
  - jnxFabricContainersTable—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.2. Provides information about different types of containers in QFabric system devices. Containers for Interconnect devices include fan trays, power supply units, and control boards, and so on. Containers for Node devices include fan trays, power supply units, Flexible PIC Concentrator (FPC), PICs, and so on.
  - jnxFabricContentsTable—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.3. Contains contents that are present across all devices represented in the jnxFabricDeviceTable object. Contents in the Interconnect devices include fan trays and control boards. Contents

in the Node devices include fan trays and power supply units. This table includes all field replaceable units (FRUs) and non-FRUs for QFabric system devices.

- `jnxFabricFilledTable`—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.4. Shows the status of containers in QFabric devices. The `jnxFabricFilledState` object represents the state of the component: unknown (1), empty (2), or filled (3).
- `jnxFabricOperatingTable`—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.5. Represents different operating parameters for the contents that are populated in the `jnxFabricContentsTable` object. Contents include fan trays, power supply units, FPC, PIC, and Routing Engine on each Node device and Interconnect device. The `jnxFabricOperatingState` object provides the state of the device: unknown (1), running (2), ready (3), reset (4), runningAtFullSpeed (5, for fans only), down (6), off (6, for power supply units), or standby (7).
- `jnxFabricRedundancyTable`—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.6. Represents the redundancy information that is available at different subsystem levels across the QFabric system. Information about the Routing Engines in Node devices is included, but there are no corresponding entries for Interconnect devices in this table. The `jnxFabricRedundancyState` object indicates the state of the subsystem: unknown (1), master (2), backup (3), or disabled (4).

**NOTE:** Information about redundant Director devices, virtual machines (VMs) within Director groups, and Virtual Chassis devices are not available at this time.

- `jnxFabricFruTable`—Root OID is 1.3.6.1.4.1.2636.3.42.2.2.7. Contains all FRUs for the QFabric system in the `jnxFabricDeviceTable` table. The FRUs are listed regardless of whether or not they are installed or online. The `jnxFabricFruState` object represents the state of the FRU, including online, offline, or empty, and so on. This table also contains information about each FRU, such as name, type, temperature, time last powered on, and time last powered off.
- A table specific to the Fabric Chassis MIB called `jnxFabricDeviceTable` that contains information about all devices in the QFabric system. This table organizes scalar variables represented in the Chassis MIB into a table format for the QFabric system component devices. Columns in this table include device information such as model, device alias, and serial number. The `jnxFabricDeviceIndex` identifies each QFabric system device (Node device and Interconnect device). The root OID is 1.3.6.1.4.1.2636.42.2.2.1.

**NOTE:** At this time, information about the Director group and the Virtual Chassis is not available. In addition, the following objects are not supported: `jnxFabricDeviceEntryRevision`, `jnxFabricDeviceEntryFirmwareRevision`, and `jnxFabricDeviceEntryKernelMemoryUsedPercent`.

- Scalar variables that describe the QFabric system as a whole (root OID is 1.3.6.1.4.1.2636.3.42.2.1):

- jnxFabricClass
- jnxFabricDescr
- jnxFabricSerialNo
- jnxFabricRevision
- jnxFabricLastInstalled
- jnxFabricContentsLastChange
- jnxFabricFilledLastChange

**NOTE:** The jnxFabricFirmwareRevision scalar variable is not supported at this time.

- Two groups of SNMPv2 traps that are defined in the MIB:
  - Traps in the jnxFabricChassisTraps group indicate an alarm condition. The root OID for this trap group is 1.3.6.1.4.1.2636.4.19:
    - jnxFabricPowerSupplyFailure
    - jnxFabricFanFailure
    - jnxFabricOverTemperature
    - jnxFabricRedundancySwitchover
    - jnxFabricFruRemoval
    - jnxFabricFruInsertion
    - jnxFabricFruPowerOff
    - jnxFabricFruPowerOn
    - jnxFabricFruFailed
    - jnxFabricFruOffline
    - jnxFabricFruOnline
    - jnxFabricFruCheck
    - jnxFabricFEBSwitchover
    - jnxFabricHardDiskFailed
    - jnxFabricHardDiskMissing
    - jnxFabricBootFromBackup
  - Traps in the jnxFabricChassisOKTraps group indicate an alarm cleared condition. The root OID for this trap group is 1.3.6.1.4.1.2636.4.20:
    - jnxFabricPowerSupplyOK
    - jnxFabricFanOK

- jnxFabricTemperatureOK
- jnxFabricFruOK

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

For more information, see the Fabric Chassis MIB at:

[http://www.juniper.net/techpubs/en\\_US/junos12.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt](http://www.juniper.net/techpubs/en_US/junos12.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt)

## Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is `{jnxUtilMibRoot1}`, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt).

## SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

## Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

**NOTE:** You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  security-name security-name;
}
target-address target-address-name {
  address address;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  local-engine {
    user username {
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
}
```

```
    }  
  }  
  security-to-group {  
    security-model (usm | v1 | v2c) {  
      security-name security-name {  
        group group-name;  
      }  
    }  
  }  
}
```

## Understanding RMON

- [RMON Overview on page 5470](#)
- [Alarm Thresholds and Events on page 5471](#)

### RMON Overview

---

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

1. Configure SNMP, including trap groups. You configure SNMP at the `[edit snmp]` hierarchy level.
2. Configure rising and falling events in the `eventTable`, including the event types and trap groups. You can also configure events using the CLI at the `[edit snmp rmon event]` hierarchy level.
3. Configure alarms in the `alarmTable`, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the `[edit snmp rmon alarm]` hierarchy level.

Extensions to the `alarmTable` are defined in the Juniper Networks enterprise-specific MIB `jnxRmon` (`mib-jnx-rmon.txt`).

### Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see [Figure 199 on page 5471](#)).

Figure 199: Setting Thresholds

Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least

3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

## RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

[Table 475 on page 5472](#) provides each field in the RMON **eventTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the **[edit snmp rmon]** hierarchy level.

**Table 475: RMON Event Table**

| Field                   | Description                                                                                                                     | Statement [edit snmp rmon] |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>eventDescription</b> | Text description of this event.                                                                                                 | <b>description</b>         |
| <b>eventType</b>        | Type of event (for example, <b>log</b> , <b>trap</b> , or <b>log and trap</b> ).                                                | <b>type</b>                |
| <b>eventCommunity</b>   | Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.) | <b>community</b>           |
| <b>eventOwner</b>       | Entity (for example, <b>manager</b> ) that created this event.                                                                  | —                          |
| <b>eventStatus</b>      | Status of this row (for example, <b>valid</b> , <b>invalid</b> , or <b>createRequest</b> ).                                     | —                          |

[Table 476 on page 5472](#) provides each field in the RMON **alarmTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the **[edit snmp rmon]** hierarchy level.

**Table 476: RMON Alarm Table**

| Field                | Description                                                                                | Statement [edit snmp rmon] |
|----------------------|--------------------------------------------------------------------------------------------|----------------------------|
| <b>alarmStatus</b>   | Status of this row (for example, <b>valid</b> , <b>invalid</b> , or <b>createRequest</b> ) | —                          |
| <b>alarmInterval</b> | Sampling period (in seconds) of the monitored variable                                     | <b>interval</b>            |
| <b>alarmVariable</b> | Object identifier (OID) and instance of the variable to be monitored                       | —                          |

Table 476: RMON Alarm Table (*continued*)

| Field                         | Description                                                         | Statement [edit snmp rmon] |
|-------------------------------|---------------------------------------------------------------------|----------------------------|
| <b>alarmValue</b>             | Actual value of the sampled variable                                | —                          |
| <b>alarmSampleType</b>        | Sample type ( <b>absolute</b> or <b>delta</b> changes)              | <b>sample-type</b>         |
| <b>alarmStartupAlarm</b>      | Initial alarm ( <b>rising</b> , <b>falling</b> , or <b>either</b> ) | <b>startup-alarm</b>       |
| <b>alarmRisingThreshold</b>   | Rising threshold against which to compare the value                 | <b>rising-threshold</b>    |
| <b>alarmFallingThreshold</b>  | Falling threshold against which to compare the value                | <b>falling-threshold</b>   |
| <b>alarmRisingEventIndex</b>  | Index (row) of the rising event in the event table                  | <b>rising-event-index</b>  |
| <b>alarmFallingEventIndex</b> | Index (row) of the falling event in the event table                 | <b>falling-event-index</b> |

Table 477 on page 5473 provides each field in the **jnxRmon jnxRmonAlarmTable**, which is an extension to the RMON **alarmTable**. You can troubleshoot the RMON agent, **rmopd**, that runs on a switch by inspecting the contents of the **jnxRmonAlarmTable** object.

Table 477: jnxRmon Alarm Table

| Field                            | Description                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------|
| <b>jnxRmonAlarmGetFailCnt</b>    | Number of times the internal <b>Get</b> request for the variable failed           |
| <b>jnxRmonAlarmGetFailTime</b>   | Value of the <b>sysUpTime</b> object when the last failure occurred               |
| <b>jnxRmonAlarmGetFailReason</b> | Reason why the <b>Get</b> request failed                                          |
| <b>jnxRmonAlarmGetOkTime</b>     | Value of the <b>sysUpTime</b> object when the variable moved out of failure state |
| <b>jnxRmonAlarmState</b>         | Status of this alarm entry                                                        |

Table 478 on page 5473 provides each field in the RMON **historyControlTable**, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the **[edit snmp rmon history]** hierarchy level. The **historyControlTable** controls the RMON **etherHistoryTable**.

Table 478: RMON History Control Table

| Field                           | Description                                                                | Statement [edit snmp rmon history] |
|---------------------------------|----------------------------------------------------------------------------|------------------------------------|
| <b>historyControlDataSource</b> | Identifies the source of the data for which historical data was collected. | <b>interface</b>                   |

Table 478: RMON History Control Table (*continued*)

| Field                                       | Description                                                                 | Statement [edit snmp rmon history] |
|---------------------------------------------|-----------------------------------------------------------------------------|------------------------------------|
| <code>historyControlBucketsRequested</code> | Requested number of discrete time intervals over which data is to be saved. | <b>bucket-size</b>                 |
| <code>historyControlBucketsGranted</code>   | Number of discrete sampling intervals over which data is to be saved.       | —                                  |
| <code>historyControlInterval</code>         | Interval, in seconds, over which the data is sampled for each bucket.       | <b>interval</b>                    |
| <code>historyControlOwner</code>            | Entity that configured this entry.                                          | <b>owner</b>                       |

## Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding **HEALTHMONITOR** tag and not a generic **SNMPD\_RMON\_EVENTLOG** tag. However, the health monitor sends generic RMON **risingThreshold** and **fallingThreshold** traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 479 on page 5475](#).

**Table 479: Monitored Object Instances**

| Object                                 | Description                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>jnxHrStoragePercentUsed.1</code> | Monitors the <code>/dev/ad0s1a</code> : file system on the switch. This is the root file system mounted on <code>/</code> .                         |
| <code>jnxHrStoragePercentUsed.2</code> | Monitors the <code>/dev/ad0s1e</code> : file system on the switch. This is the configuration file system mounted on <code>/config</code> .          |
| <code>jnxOperatingCPU (RE0)</code>     | Monitors CPU usage by the Routing Engine (RE0).                                                                                                     |
| <code>jnxOperatingBuffer (RE0)</code>  | Monitors the amount of memory available on the Routing Engine (RE0).                                                                                |
| <code>sysApplElmtRunCPU</code>         | Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately. |
| <code>sysApplElmtRunMemory</code>      | Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.                   |

## Standard SNMP MIBs

Standard SNMP MIBs and RFCs are supported on the QFX3500 and QFX3600 switches, and QFabric systems.

For more information about platform support:

- See [Table 480 on page 5476](#) for standard MIBs supported on QFX3500 and QFX3600 switches.
- See [Table 481 on page 5480](#) for standard MIBs supported on QFabric systems.

For RFC information, go to: <http://www.ietf.org>.

Table 480: Standard MIBs Supported on QFX3500 and QFX3600 Switches

| RFC                                                                                                   | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| RFC 2787, <i>Definitions of Managed Objects for the Virtual Router Redundancy Protocol</i>                                     | Support does not include row creation, the <b>Set</b> operation, and the <b>vrpStatsPacketLengthErrors</b> object.                                                                                                                                                                                                                                                                                           |
| RFC 2790, <i>Host Resources MIB</i>                                                                                            | Support is limited to the following objects: <ul style="list-style-type: none"> <li>Only <b>hrStorageTable</b>. The file systems <b>/</b>, <b>/config</b>, <b>/var</b>, and <b>/tmp</b> always return the same index number. When SNMP restarts, the index numbers for the remaining file systems might change.</li> <li>Only the objects of the <b>hrSystem</b> and <b>hrSWInstalled</b> groups.</li> </ul> |
| RFC 2819, <i>Remote Network Monitoring Management Information Base</i>                                                         | The following objects are supported: <ul style="list-style-type: none"> <li><b>etherStatsTable</b> (for Ethernet interfaces only), <b>alarmTable</b>, <b>eventTable</b>, and <b>logTable</b>.</li> <li><b>historyControlTable</b> and <b>etherHistoryTable</b> (except the <b>etherHistoryUtilization</b> object).</li> </ul>                                                                                |
| RFC 2863, <i>The Interfaces Group MIB</i>                                                                                      | <b>NOTE:</b> RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.                                                                                                                                                                                                                                                                                                  |
| RFC 2932, <i>IPv4 Multicast Routing MIB</i>                                                                                    | —                                                                                                                                                                                                                                                                                                                                                                                                            |
| RFC 2933, <i>Internet Group Management Protocol (IGMP) MIB</i>                                                                 | —                                                                                                                                                                                                                                                                                                                                                                                                            |
| RFC 2934, <i>Protocol Independent Multicast MIB for IPv4</i>                                                                   | In Junos OS, RFC 2934 is implemented based on a draft version, <i>pimmib.mib</i> , of the now standard RFC.                                                                                                                                                                                                                                                                                                  |

Table 480: Standard MIBs Supported on QFX3500 and QFX3600 Switches (*continued*)

| RFC                                                                                                                            | Additional Information                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| RFC 3410, <i>Introduction and Applicability Statements for Internet Standard Management Framework</i>                          | —                                                                                               |
| RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i>                | <b>NOTE:</b> RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571. |
| RFC 3412, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i>                          | <b>NOTE:</b> RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572. |
| RFC 3413, <i>Simple Network Management Protocol (SNMP) Applications</i>                                                        | All MIBs are supported except for the Proxy MIB.                                                |
| RFC 3414, <i>User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)</i>              | —                                                                                               |
| RFC 3415, <i>View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)</i>                      | —                                                                                               |
| RFC 3416, <i>Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)</i>                        | <b>NOTE:</b> RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.   |
| RFC 3417, <i>Transport Mappings for the Simple Network Management Protocol (SNMP)</i>                                          | —                                                                                               |
| RFC 3418, <i>Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)</i>                           | <b>NOTE:</b> RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.   |
| RFC 3584, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i> | —                                                                                               |
| RFC 3826, <i>The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model</i>                 | —                                                                                               |

Table 480: Standard MIBs Supported on QFX3500 and QFX3600 Switches (*continued*)

| RFC                                                                                                                                                               | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Juniper Networks Enterprise-Specific MIBs

Juniper Networks enterprise-specific MIBs are supported on QFX3500 and QFX3600 switches, and QFabric systems.

For more information, see:

- [Table 482 on page 5484](#) for Juniper Networks enterprise-specific MIBs supported on QFX3500 and QFX3600 switches.
- [Table 483 on page 5488](#) for Juniper Networks enterprise-specific MIBs supported on QFabric systems.

Table 482: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches

| MIB                               | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarm MIB (mib-jnx-chassis-alarm) | <p>Provides support for alarms from the switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis-alarm.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis-alarm.txt</a>.</p> <p>For more information, see Alarm MIB.</p>                   |
| Analyzer MIB (mib-jnx-analyzer)   | <p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-analyzer.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-analyzer.txt</a>.</p> <p>For more information, see Analyzer MIB.</p> |

| MIB                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chassis MIB (mib-jnx-chassis)                                   | <p>Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis.txt</a>.</p> <p>For more information, see Chassis MIBs.</p>                                                                                                                                                                              |
| Chassis Definitions for Router Model MIB (mib-jnx-chas-defines) | <p>Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chas-defines.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chas-defines.txt</a>.</p> <p>For more information, see Chassis MIBs.</p>                                                                    |
| Class-of-Service MIB (mib-jnx-cos)                              | <p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cos.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cos.txt</a>.</p> <p>For more information, see Class-of-Service MIB.</p>                                                                                                                                                                                                                                                                            |
| Configuration Management MIB (mib-jnx-cfgmgmt)                  | <p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see Configuration Management MIB.</p> |
| Ethernet MAC MIB (mib-jnx-mac)                                  | <p>Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-mac.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-mac.txt</a>.</p> <p>For more information, see Ethernet MAC MIB.</p>                                                                                                               |

**Table 482: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches** (*continued*)

| MIB                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event MIB (mib-jnx-event)                          | <p>Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-event.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-event.txt</a>.</p> <p>For more information, see Event MIB.</p>                                                                                                                                                                         |
| Firewall MIB (mib-jnx-firewall)                    | <p>Provides support for monitoring firewall filter counters.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-firewall.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-firewall.txt</a>.</p> <p>For more information, see Firewall MIB.</p>                                                                                                                                                                                                                                                                                                                 |
| Host Resources MIB (mib-jnx-hostresources)         | <p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see Host Resources MIB.</p> |
| Interface MIB (Extensions) (mib-jnx-if-extensions) | <p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see Interface MIB.</p>                                                                                                                                                                                   |
| Ping MIB (mib-jnx-ping)                            | <p>Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in the pingCtlTable table of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-ping.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-ping.txt</a>.</p> <p>For more information, see PING MIB.</p>                                                                                                                                                                      |

**Table 482: Juniper Networks Enterprise-Specific MIBs Supported on QFX3500 and QFX3600 Switches (continued)**

| MIB                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RMON Events and Alarms MIB (mib-jnx-rmon)             | <p>Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-rmon.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-rmon.txt</a>.</p> <p>For more information, see RMON Events and Alarms MIB.</p>                                              |
| Structure of Management Information MIB (mib-jnx-smi) | <p>Explains how the Juniper Networks enterprise-specific MIBs are structured.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-smi.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-smi.txt</a>.</p> <p>For more information, see Structure of Management Information MIB.</p>                                                                                                                                                                                                                                                          |
| System Log MIB (mib-jnx-syslog)                       | <p>Enables notification of an SNMP trap-based application when an important system log message occurs.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-syslog.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-syslog.txt</a>.</p> <p>For more information, see System Log MIB.</p>                                                                                                                                                                                                                                                    |
| Utility MIB (mib-jnx-util)                            | <p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 5467 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 5735.</p> |
| VLAN MIB (mib-jnx-vlan)                               | <p>Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-vlan.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-vlan.txt</a>.</p> <p>For more information, see VLAN MIB.</p>                                                                                                                                                                                                                                                       |

Table 483: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems

| MIB                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Analyzer MIB (mib-jnx-analyzer)                | <p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>The QFabric system supports:</p> <ul style="list-style-type: none"> <li>Analyzer table—jnxAnalyzerName, jnxMirroringRatio, jnxLossPriority.</li> <li>Analyzer input table—jnxAnalyzerInputValue, jnxAnalyzerInputOption, jnxAnalyzerInputType.</li> <li>, Analyzer output table—jnx AnalyzerOutputValue, jnxAnalyzerOutputType.</li> </ul> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-analyzer.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-analyzer.txt</a>.</p> <p>For more information, see Analyzer MIB.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Chassis MIB (mib-jnx-chassis)                  | <p>Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-chassis.txt</a>.</p> <p><b>NOTE:</b> On the QFabric system, support for scalar variables (such as memory usage) for the Chassis MIB is limited to the following objects: jnxBoxClass, jnxBoxDescr, and jnxBoxSerialNo.</p> <p>For more information, see Chassis MIBs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Configuration Management MIB (mib-jnx-cfgmgmt) | <p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p><b>NOTE:</b> On the QFabric system, these conditions apply:</p> <ul style="list-style-type: none"> <li>All scalar variables under the jnxCmCfgChg table are supported.</li> <li>Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries.</li> <li>Scalar variables under the jnxCmRescueChg table are not supported.</li> </ul> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see Configuration Management MIB.</p> |

**Table 483: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)**

| MIB                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fabric Chassis MIB<br>(mib-jnx-fabric-chassis)        | <p>Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-fabric-chassis.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-fabric-chassis.txt</a>.</p> <p>For more information, see "Fabric Chassis MIB" on page 5464.</p>                                                                           |
| Host Resources MIB<br>(mib-jnx-hostresources)         | <p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see Host Resources MIB.</p> |
| Interface MIB (Extensions)<br>(mib-jnx-if-extensions) | <p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables are not supported.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see Interface MIB.</p>                                                                                                    |
| Power Supply Unit MIB<br>(mib-jnx-power-supply-unit)  | <p>Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-power-supply-unit.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-power-supply-unit.txt</a>.</p> <p>For more information, see Power Supply Unit MIB.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.</p>                                                                          |
| QFabric MIB (jnx-qf-smi)                              | <p>Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-qf-smi.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-qf-smi.txt</a>.</p>                                                                                                                                                                                                   |

**Table 483: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)**

| MIB                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Utility MIB (mib-jnx-util) | <p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos12.3/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 5467 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 5735.</p> |

### QFX3500 and QFX3600 Switches

```

jnxProductLineQFXSwitch      OBJECT IDENTIFIER ::= { jnxProductLine      82 }
jnxProductNameQFXSwitch      OBJECT IDENTIFIER ::= { jnxProductName      82 }
jnxProductModelQFXSwitch     OBJECT IDENTIFIER ::= { jnxProductModel     82 }
jnxProductVariationQFXSwitch OBJECT IDENTIFIER ::= { jnxProductVariation 82 }
  jnxProductQFX3500s         OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 1 }
  jnxProductQFX360016QS      OBJECT IDENTIFIER ::= { jnxProductVariationQFXSwitch 2 }

jnxChassisQFXSwitch          OBJECT IDENTIFIER ::= { jnxChassis          82 }

jnxSlotQFXSwitch             OBJECT IDENTIFIER ::= { jnxSlot             82 }
  jnxQFXSwitchSlotFPC        OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch    1 }
  jnxQFXSwitchSlotHM         OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch    2 }
  jnxQFXSwitchSlotPower      OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch    3 }
  jnxQFXSwitchSlotFan        OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch    4 }
  jnxQFXSwitchSlotFPB        OBJECT IDENTIFIER ::= { jnxSlotQFXSwitch    5 }

jnxMediaCardSpaceQFXSwitch   OBJECT IDENTIFIER ::= { jnxMediaCardSpace  82 }
  jnxQFXSwitchMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXSwitch 1 }

```

### QFabric Systems

```

jnxProductLineQFX3000        OBJECT IDENTIFIER ::= { jnxProductLine 84 }
jnxProductNameQFX3000        OBJECT IDENTIFIER ::= { jnxProductName 84 }
jnxProductModelQFX3000       OBJECT IDENTIFIER ::= { jnxProductModel 84 }
jnxProductVariationQFX3000   OBJECT IDENTIFIER ::= { jnxProductVariation 84 }
  jnxProductQFX3000-G         OBJECT IDENTIFIER ::= { jnxProductVariationQFX3000 1 }
  jnxProductQFX3000-M         OBJECT IDENTIFIER ::= { jnxProductVariationQFX3000 2 }
jnxChassisQFX3000            OBJECT IDENTIFIER ::= { jnxChassis      84 }

```

### QFabric System Node Devices

```

jnxProductLineQFXNode        OBJECT IDENTIFIER ::= { jnxProductLine 61 }
jnxProductNameQFXNode        OBJECT IDENTIFIER ::= { jnxProductName 61 }
jnxProductModelQFXNode       OBJECT IDENTIFIER ::= { jnxProductModel 61 }
jnxProductVariationQFXNode   OBJECT IDENTIFIER ::= { jnxProductVariation 61 }
  jnxProductQFX3500          OBJECT IDENTIFIER ::= { jnxProductVariationQFXNode 1 }
  jnxProductQFX360016Q       OBJECT IDENTIFIER ::= { jnxProductVariationQFXNode 3 }

jnxChassisQFXNode            OBJECT IDENTIFIER ::= { jnxChassis        61 }

jnxSlotQFXNode               OBJECT IDENTIFIER ::= { jnxSlot           61 }
  jnxQFXNodeSlotFPC          OBJECT IDENTIFIER ::= { jnxSlotQFXNode     1 }
  jnxQFXNodeSlotHM           OBJECT IDENTIFIER ::= { jnxSlotQFXNode     2 }
  jnxQFXNodeSlotPower        OBJECT IDENTIFIER ::= { jnxSlotQFXNode     3 }
  jnxQFXNodeSlotFan          OBJECT IDENTIFIER ::= { jnxSlotQFXNode     4 }
  jnxQFXNodeSlotFPB          OBJECT IDENTIFIER ::= { jnxSlotQFXNode     5 }

jnxMediaCardSpaceQFXNode     OBJECT IDENTIFIER ::= { jnxMediaCardSpace 61 }
  jnxQFXNodeMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXNode 1 }

```

### QFabric System QFX3008-I Interconnect Device

```

jnxProductLineQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductLine 60 }
jnxProductNameQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductName 60 }
jnxProductModelQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductModel 60 }
jnxProductVariationQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductVariation 60 }

```

```

jnxProductQFX3008          OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 1 }

jnxChassisQFXInterconnect  OBJECT IDENTIFIER ::= { jnxChassis          60 }

jnxSlotQFXInterconnect     OBJECT IDENTIFIER ::= { jnxSlot          60 }
  jnxQFXInterconnectSlotFPC OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 1 }
  jnxQFXInterconnectSlotHM  OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 2 }
  jnxQFXInterconnectSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 3 }
  jnxQFXInterconnectSlotFan  OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 4 }
  jnxQFXInterconnectSlotCBD  OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 5 }
  jnxQFXInterconnectSlotFPB  OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 6 }

jnxMediaCardSpaceQFXInterconnect OBJECT IDENTIFIER ::= { jnxMediaCardSpace 60 }
  jnxQFXInterconnectMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXInterconnect 1 }

jnxMidplaneQFXInterconnect  OBJECT IDENTIFIER ::= { jnxBackplane          60 }

```

### QFabric System QFX3600-I Interconnect Device

```

jnxProductLineQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductLine 91 }
jnxProductNameQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductName 91 }
jnxProductModelQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductModel 91 }
jnxProductVariationQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductVariation 91 }
  jnxProductQFX3600I          OBJECT IDENTIFIER ::= { jnxProductVariationQFXMInterconnect 1 }

jnxChassisQFXMInterconnect     OBJECT IDENTIFIER ::= { jnxChassis          91 }

jnxSlotQFXMInterconnect        OBJECT IDENTIFIER ::= { jnxSlot          91 }
  jnxQFXMInterconnectSlotFPC   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 1 }
  jnxQFXMInterconnectSlotHM    OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 2 }
  jnxQFXMInterconnectSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 3 }
  jnxQFXMInterconnectSlotFan    OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 4 }
  jnxQFXMInterconnectSlotFPB   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 5 }

jnxMediaCardSpaceQFXMInterconnect OBJECT IDENTIFIER ::= { jnxMediaCardSpace 91 }
  jnxQFXMInterconnectMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXMInterconnect 1 }

```

### Virtual Chassis (Control Plane Switch)

```

jnxProductLineQFXJVRE          OBJECT IDENTIFIER ::= { jnxProductLine 62 }
jnxProductNameQFXJVRE          OBJECT IDENTIFIER ::= { jnxProductName 62 }
jnxProductModelQFXJVRE         OBJECT IDENTIFIER ::= { jnxProductModel 62 }
jnxChassisQFXJVRE              OBJECT IDENTIFIER ::= { jnxChassis      62 }

jnxSlotQFXJVRE                 OBJECT IDENTIFIER ::= { jnxSlot          62 }
  jnxQFXJVRESlotFPC             OBJECT IDENTIFIER ::= { jnxSlotQFXJVRE 1 }
  jnxQFXJVRESlotHM              OBJECT IDENTIFIER ::= { jnxSlotQFXJVRE 2 }
  jnxQFXJVRESlotPower           OBJECT IDENTIFIER ::= { jnxSlotQFXJVRE 3 }
  jnxQFXJVRESlotFan             OBJECT IDENTIFIER ::= { jnxSlotQFXJVRE 4 }
  jnxQFXJVRESlotFPB            OBJECT IDENTIFIER ::= { jnxSlotQFXJVRE 5 }

jnxMediaCardSpaceQFXJVRE       OBJECT IDENTIFIER ::= { jnxMediaCardSpace 62 }
  jnxQFXJVREMediaCardSpacePIC   OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXJVRE 1 }

```

## Standard SNMP Version 1 Traps

Table 484 on page 5493 lists the standard traps for SNMP Version 1 supported by the QFX Series. The traps are organized first by trap category and then by trap name. The system

logging severity levels are listed for those traps that have them with their corresponding system log tag. Traps that do not have corresponding system logging severity levels are marked with an en dash (–) in the table.

**NOTE:** SNMPv1 traps are not supported on QFabric systems.

**Table 484: Standard SNMP Version 1 Traps Supported**

| Defined in                                                                                            | Trap Name                    | Enterprise ID    | Generic Trap Number | Specific Trap Number | System Logging Severity Level | Syslog Tag                        |
|-------------------------------------------------------------------------------------------------------|------------------------------|------------------|---------------------|----------------------|-------------------------------|-----------------------------------|
| <b>Startup Notifications</b>                                                                          |                              |                  |                     |                      |                               |                                   |
| RFC 1215,<br><i>Conventions for Defining Traps for Use with the SNMP</i>                              | <b>authenticationFailure</b> | 1.3.6.1.4.1.2636 | 4                   | 0                    | Notice                        | SNMPD_TRAP_GEN_FAILURE            |
|                                                                                                       | <b>coldStart</b>             | 1.3.6.1.4.1.2636 | 0                   | 0                    | Critical                      | SNMPD_TRAP_COLD_START             |
|                                                                                                       | <b>warmStart</b>             | 1.3.6.1.4.1.2636 | 1                   | 0                    | Error                         | SNMPD_TRAP_WARM_START             |
| <b>Link Notifications</b>                                                                             |                              |                  |                     |                      |                               |                                   |

## Standard SNMP Version 2 Traps

Standard SNMP Version 2 (v2) traps are supported on QFX3500 and QFX3600 switches, and QFabric systems. For more information, see:

- [Table 485 on page 5495](#) for traps supported on QFX3500 and QFX3600 switches.
- [Table 486 on page 5497](#) for traps supported on QFabric systems.

### Juniper Networks Enterprise-Specific SNMP Version 1 Traps

Table 487 on page 5498 lists the standard SNMP Version 1 (v1) traps supported on the QFX3500 and QFX3600 switches. The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

**NOTE:** SNMPv1 traps are not supported on the QFabric system.

## Juniper Networks Enterprise-Specific SNMP Version 2 Traps

Juniper Networks enterprise-specific SNMP Version 2 (v2) traps are supported on QFX3500 and QFX3600 switches, and QFabric systems. For more information, see:

- [Table 488 on page 5501](#) for traps supported on QFX3500 and QFX3600 switches.
- [Table 489 on page 5503](#) for traps supported on QFabric systems.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

## System Log Messages

---

- [Overview of Junos OS System Log Messages on page 5505](#)
- [Overview of Single-Chassis System Logging Configuration on page 5505](#)
- [Understanding the Implementation of System Log Messages on the QFabric System on page 5507](#)

### Overview of Junos OS System Log Messages

The Junos OS, running on the QFX Series, generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

### Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see “[Specifying the Facility and Severity of Messages to Include in the Log](#)” on page 5565.

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See [“Directing System Log Messages to a Log File” on page 5553](#).
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See [“Directing System Log Messages to a User Terminal” on page 5554](#).
- To the switch console, by including the **console** statement. See [“Directing System Log Messages to the Console” on page 5555](#).
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See [“Directing System Log Messages to a Remote Machine” on page 5554](#).

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see [“Logging Messages in Structured-Data Format” on page 5559](#).
- A message's facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 5557](#).
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see [“Including the Year or Millisecond in Timestamps” on page 5558](#).
- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see [“Directing System Log Messages to a Remote Machine” on page 5554](#).
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 5570](#).

**NOTE:** During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log messages (syslog) as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Messages are stored in the QFabric system database for viewing only using the **show log** command. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view the messages.

**NOTE:** On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of **any any** and a file size of 100 MB. If you do not specify a filename, you can use the default filename **messages** with the **show log** command.

The QFabric system supports the following system log message features:

- The **file filename** and **host hostname** statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log filename** command by configuring the **file filename archive maximum-file-size** statement.
- You can specify one or more system log message servers to receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.

- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- Time resolution is supported in seconds, and data in milliseconds is not available. If you attempt to configure milliseconds support, the log output displays the data as **000**.

Unsupported syslog features include:

- File access to syslog messages
- Syslog output in the structured data format
- Monitoring of syslog messages

### Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also

analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default `/var/log` directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named **cli-commands** and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

The following example shows how to log all alarms state changes to the file `/var/log/alarms`:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user **alex**, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
  file security {
    authorization info;
    interactive-commands info;
  }
  /* write messages about potential problems to file /var/log/messages: */
  /* messages from "authorization" facility at level "notice" and above, */
  /* messages from all other facilities at level "warning" and above */
  file messages {
    authorization notice;
    any warning;
  }
  /* write all messages at level "critical" and above to terminal of user
  "alex" if */
  /* that user is logged in */
  user alex {
```

```

        any critical;
    }
    /* write all messages from the &ldquo;daemon&rdquo; facility at level &ldquo;info&rdquo;
       and above, and */
    /* messages from all other facilities at level &ldquo;warning&rdquo; and above, to the
       */
    /* machine monitor.mycompany.com */
    host monitor.mycompany.com {
        daemon info;
        any warning;
    }
    /* write all messages at level &ldquo;error&rdquo; and above to the system console */
    console {
        any error;
    }
}

```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the **interactive-commands** facility at the **info**, **notice**, and **warning** severity levels:

```

[edit system]
file user-actions {
    interactive-commands info;
}
user philip {
    interactive-commands notice;
}
console {
    interactive-commands warning;
}
}

```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file `/var/log/user-actions`.
- **notice**—Logs a message when users issue the configuration mode commands **rollback** and **commit**. The example writes the messages to the terminal of user **philip**.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

#### Related Documentation

- [Overview of Single-Chassis System Logging Configuration on page 5505](#)

### Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

### Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Messages are stored in the QFabric system database for viewing only using the **show log** command. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis.

This example describes how to configure system log messages on the QFabric system.

- [Requirements on page 5513](#)
- [Overview on page 5513](#)
- [Configuration on page 5513](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

## Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
```

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

**NOTE:** You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

- 
2. (Optional) Specify a filename to capture log messages.

**NOTE:** On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of any any and a file size of 100 MBs. Therefore, you cannot specify the filename **messages** in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

- [Requirements on page 5515](#)
- [Overview on page 5515](#)
- [Configuration on page 5516](#)
- [Verification on page 5517](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.3 or later
- One QFX3500 switch

## Overview

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

Figure 200 on page 5515 depicts the basic elements of an sFlow system.

Figure 200: sFlow Technology Monitoring System

## Configuration

---

**CLI Quick Configuration** To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

**Step-by-Step Procedure** To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@switch# set collector 10.204.32.46 udp-port 5600
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@switch# set interfaces xe-0/0/1.0
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

**NOTE:** Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
```

```

}
interfaces xe-0/0/1.0 {
  polling-interval 20;
  sample-rate 1000;
}
}

```

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That sFlow Technology Has Been Configured Properly on page 5517](#)
- [Verifying That sFlow Technology Is Enabled on an Interface on page 5517](#)
- [Verifying the sFlow Collector Configuration on page 5518](#)

#### *Verifying That sFlow Technology Has Been Configured Properly*

**Purpose** Verify that sFlow technology has been configured properly.

**Action** Enter the **show sflow** operational mode command:

```

user@switch> show sflow
sFlow          : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate     : 1:1000
Agent ID       : 10.1.1.2

```

**NOTE:** The sample limit cannot be configured and is set to 300 packets per second.

**Meaning** The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

#### *Verifying That sFlow Technology Is Enabled on an Interface*

**Purpose** Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

**Action** Enter the **show sflow interface** operational mode command:

```

user@switch> show sflow interface
Interface      Status      Sample    Polling
                rate      rate      interval
xe-0/0/1.0     Enabled    1000      20

```

**Meaning** The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

### *Verifying the sFlow Collector Configuration*

**Purpose** Verify the sFlow collector configuration.

**Action** Enter the **show sflow collector** operational mode command:

```
user@switch> show sflow collector
Collector      Udp-port      No. of samples
address
10.204.32.46      5600          7516
```

**Meaning** The output displays the IP address of the collector, the UDP port, and the number of samples collected.

**Related Documentation**

- [Overview of sFlow Technology on page 5456](#)

## Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- [Requirements on page 5518](#)
- [Overview on page 5518](#)
- [Configuration on page 5519](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

### Overview

---

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name "snmp qfabric" description "qfabric0 switch"
set snmp location "Lab 4 Row 11" contact "qfabric-admin@qfabric0"
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To configure SNMP on the QFabric system:

**NOTE:** If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

```
[edit snmp]
user@switch# set name "snmp qfabric"
```

2. Specify a description.

```
[edit snmp]
user@switch# set description "qfabric0 system"
```

This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

```
[edit snmp]
user@switch# set location "Lab 4 Row 11"
```

This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

```
[edit snmp]
user@switch# set contact "qfabric-admin@qfabric0"
```

This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

**NOTE:** The read-write option is not supported on the QFabric system.

```
[edit snmp]
user@switch# set community public authorization read-only
```

6. Create a client list with a set of IP addresses that can use the SNMP community.

```
[edit snmp]
user@switch# set client-list list0 192.168.0.0/24
user@switch# set community public client-list-name list0
```

7. Specify IP addresses of clients that are restricted from using the community.

```
[edit snmp]
user@switch# set community public clients 192.170.0.0/24 restrict
```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**NOTE:** You do not need to include the `destination-port` statement if you use the default port 162.

The trap group `qf-traps` is configured to send traps to 192.168.0.100.

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
snmp {
  name "snmp qfabric";
  description "qfabric0 system";
  location "Lab 4 Row 11";
  contact "qfabric-admin@qfabric0";
  client-list list0 {
    192.168.0.0/24;
  }
  community public {
    authorization read-only;
    clients {
      192.170.0.0/24 restrict;
    }
  }
  trap-group qf-traps {
    destination-port 155;
    targets {
      192.168.0.100;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuration Tasks for Network Management

- [Configuring Console and Auxiliary Port Properties on page 5521](#)
- [Configuring SSH Service for Remote Access to the Router or Switch on page 5522](#)
- [Configuring Telnet Service for Remote Access to a Switch on page 5524](#)

### Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default, and its speed is 9600 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

- Related Documentation**
- [auxiliary on page 210](#)
  - [console \(Physical Port\) on page 219](#)
  - [ports on page 245](#)

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 5522](#)
- [Configuring the SSH Protocol Version on page 5523](#)
- [Configuring the Client Alive Mechanism on page 5523](#)

---

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

## Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from 1 through 250. The default is 75.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from 1 through 250. The default is 150.

To configure Telnet service:

1. To specify the connection limit:

```
[edit system services]
user@switch# set telnet connection-limit connection-limit
```

2. To specify the rate limit:

```
[edit system services]
user@switch# set telnet rate-limit rate-limit
```

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
telnet {
  connection-limit 50;
  rate-limit 100;
}
```

---

## Configuration Tasks for Automation Scripts

- [Controlling the Execution of Commit Scripts on page 5524](#)

### Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the in the **/pbdata/mgd\_shared/partition-ip/var/db/scripts/commit** directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the **show** command to display the files included at the **[edit system scripts commit]** hierarchy level. To ensure that the enabled files are on the device, list the contents of the

`/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory using the **file list** operational mode command.

See the following tasks:

- [Enabling Commit Scripts to Execute on page 5525](#)
- [Removing Commit Scripts from the Configuration on page 5525](#)
- [Deactivating Commit Scripts on page 5526](#)
- [Activating Inactive Commit Scripts on page 5526](#)

### Enabling Commit Scripts to Execute

The commit operation requires that all scripts be included in configuration at the **[edit system scripts commit file]** hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

**CAUTION:** When you include the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level, no error message is generated during the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory:  
`/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory on the Director device.

2. Configure the commit script.

```
[edit system scripts commit]
user@switch# set file filename <optional>
```

3. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

### Removing Commit Scripts from the Configuration

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

**NOTE:** You can also deactivate a script using the **deactivate** statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

```
[edit system scripts commit]
user@switch# delete file filename
```

2. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

3. Remove the commit script from the `/pbdata/mgd_shared/` directory on the Director device.

**BEST PRACTICE:** Although removing the commit script is not necessary, we recommend deleting unused files from the system.

---

## Deactivating Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

```
[edit]
user@switch deactivate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

3. Verify that the commit script is deactivated.

```
[edit]
user@switch# show system scripts commit
inactive: file mycommit.slax
```

---

## Activating Inactive Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

```
[edit]
user@switch# activate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

## Configuration Tasks for Fabric OAM

- [Configuring a Fabric Maintenance Association on page 5527](#)
- [Configuring Flow Specifications on page 5528](#)

### Configuring a Fabric Maintenance Association

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a fabric maintenance association (FMA) be configured in addition to a flow specification. The FMA associates a particular VLAN with a set of source and destination interfaces called fabric maintenance endpoints (FMEPs) that are used for tracing the flow path between the endpoints. Configuration of the VLAN name is mandatory.

Before configuring the FMA, configure a VLAN name (and not a VLAN ID) for the VLAN in which the internal fabric monitoring occurs. If you already configured a VLAN ID instead of a VLAN name, you must first delete the VLAN ID and then specify a VLAN name before you configure the FMA.

**NOTE:** Because each FMA and VLAN have a one-to-one correspondence, an FMA in each QFabric system must be given a unique name.

To configure an FMA:

1. Configure an FMA name that is unique within the QFabric system:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name
```

2. (Optional) Configure the FMA description:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name description string
```

3. Configure the VLAN name:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name vlan-name vlan-name
```

4. Configure an FMEP, including the identifier, name, description, and associated interface:

```
[edit protocols oam fabric]
```

```
user@host# set fabric-maintenance-associations fma-name
fabric-maintenance-end-points fmeop-id fmeop-name name description string
fmeop-interface interface-name
```

5. Repeat Step 4 to configure additional FMEPs.

**Related  
Documentation**

- [Overview of Internal Fabric Monitoring on page 5451](#)
- [Configuring Flow Specifications on page 5528](#)
- [fabric \(OAM\) on page 5599](#)

- [ping fabric unicast-flow on page 5759](#)
- [traceroute fabric unicast-flow on page 5806](#)

## Configuring Flow Specifications

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a flow specification be configured in addition to a fabric maintenance association (FMA). A flow specification is used to determine the contents of the packet that is used for a particular operation. For example, an Ethernet type flow specification describes the contents of a pure Layer 2 packet, whereas an Ethernet IPv4 type flow specification describes an Ethernet IPv4 packet.

**NOTE:** In the flow specification configuration, some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets:

- Unicast Ethernet—Source MAC address, destination MAC address, Ethertype
- Unicast IPv4—Source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address

The configuration for each flow specification type includes parameters specific to that particular type. Use one of the following procedures to configure the flow specification for your flow type:

- [Configuring a Unicast Ethernet Flow Specification on page 5529](#)
- [Configuring a Unicast Ethernet IPv4 Flow Specification on page 5530](#)
- [Configuring a Multicast IPv4 Flow Specification on page 5531](#)
- [Configuring a Multicast VLAN Flood Flow Specification on page 5531](#)

## Configuring a Unicast Ethernet Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet flow type. This configuration is applicable for the unicast ping and traceroute operations.

**NOTE:** Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source MAC address, destination MAC address, and Ethertype.

To configure a unicast Ethernet flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. (Optional) Set the Ethernet frame size:

```
[edit protocols oam fabric]
user@host# set ethernet-frame-size ethernet-frame-size
```

3. Set the flow specification type as unicast Ethernet and specify the EtherType:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set unicast-ethernet ethertype ethertype
```

4. (Optional) Set the MAC address and the MAC address range of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet]
user@host# set source-mac source-mac-address source-mac-mask source-mac-mask
```

**NOTE:** Configuration of the source-mac and source-mac-mask parameters is optional, but the source-mac-mask parameter can be specified only if the source-mac parameter is also configured.

5. (Optional) Set the MAC address or address range mask for the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet]
user@host# set destination-mac destination-mac-address destination-mac-mask destination-mac-mask
```

**NOTE:** Configuration of the destination-mac and destination-mac-mask parameters is optional, but the destination-mac-mask parameter can be specified only if the destination-mac parameter is also configured.

## Configuring a Unicast Ethernet IPv4 Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet IPv4 flow type. This configuration is applicable for the unicast ping and traceroute operations.

**NOTE:** All parameters except the flow specification name are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address.

To configure a unicast Ethernet IPv4 flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. (Optional) Set the Ethernet frame size:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set ethernet-frame-size size
```

3. Set the flow specification type as unicast Ethernet IPv4:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set unicast-ethernet-ipv4
```

4. (Optional) Set the IPv4 address or the address range of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set source-ip source-ip-address
```

or

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set source-ip-mask source-ip-mask
```

5. (Optional) Set the IPv4 address or the address range of the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set destination-ip destination-ip-address
```

or

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set destination-ip-mask destination-ip-mask
```

6. (Optional) Set the IPv4 protocol type:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# ip-protocol protocol
```

7. (Optional) Set the L4 port (TCP or UDP port number) of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# source-l4-port source-l4-port-number
```

8. (Optional) Set the L4 port of the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# destination-l4-port destination-l4-port-number
```

### Configuring a Multicast IPv4 Flow Specification

This procedure describes how to configure a flow specification for a multicast IPv4 flow type.

**NOTE:** Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

To configure a multicast IPv4 flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. Set the flow specification type as multicast IPv4:

```
[edit protocols oam fabric flow-specification-name]
user@host# set multicast-ipv4
```

3. (Optional) Set the IPv4 address of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name multicast-ipv4]
user@host# set source-ip ipv4-address
```

4. Set the IPv4 multicast group address:

```
[edit protocols oam fabric flow-specs flow-specification-name multicast-ipv4]
user@host# set dest-ip-multicast-group ipv4-mcast-address
```

### Configuring a Multicast VLAN Flood Flow Specification

This procedure describes how to configure a flow specification for a multicast VLAN flood flow type.

To configure a multicast VLAN flood flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. Set the flow specification type as multicast VLAN flood:

```
[edit protocols oam fabric flow-specification-name]
user@host# set multicast-vlan-flood
```

## Configuration Tasks for sFlow Technology

---

- [Configuring sFlow Technology on page 5532](#)

### Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a QFX Series device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@host# set collector ip-address udp-port port-number
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@host# set interfaces interface-name
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@host# set polling-interval seconds
```

**NOTE:** Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a **number** of 1000 sets a sample rate of 1 in 1000 packets.

```
[edit protocols sflow]
user@host# set sample-rate number
```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

```
[edit protocols sflow]
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

**NOTE:** The interface-level configuration overrides the global configuration for the specified interface.

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    view view-name;
  }
  contact contact;
  description description;
  filter-duplicates;
  filter-interfaces;
  health-monitor {
    falling-threshold integer;
    interval seconds;
    rising-threshold integer;
  }
  interface [ interface-names ];
  location location;
  name name;
  nonvolatile {
    commit-delay seconds;
  }
  rmon {
    alarm index {
      description description;
      falling-event-index index;
      falling-threshold integer;
      falling-threshold-interval seconds;
      interval seconds;
      request-type;
      rising-event-index index;
      rising-threshold integer;
      sample-type (absolute-value | delta-value);
    }
  }
}
```

```

    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
}
event index {
    community community-name;
    description description;
    type type;
}
history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
}
}
}
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
        regular-expression>;
    flag flag;
}
}
trap-group group-name {
    categories {
        category;
    }
    destination-port port-number;
    targets {
        address;
    }
    version (all | v1 | v2);
}
}
trap-options {
    agent-address outgoing-interface;
    source-address address;
}
}
v3 {
    notify name {
        tag tag-name;
        type trap;
    }
    notify-filter profile-name {
        oid object-identifier (include | exclude);
    }
    snmp-community community-index {
        community-name community-name;
        security-name security-name;
        tag tag-name;
    }
    }
    target-address target-address-name {
        address address;
        address-mask address-mask;
        port port-number;
        retry-count number;
        tag-list tag-list;
        target-parameters target-parameters-name;
        timeout seconds;
    }
}

```

```
}
target-parameters target-parameters-name {
  notify-filter profile-name;

        authentication-password authentication-password;
      }
      authentication-none;
      privacy-aes128 {
        privacy-password privacy-password;
      }
      privacy-des {
        privacy-password privacy-password;
      }
      privacy-3des {
        privacy-password privacy-password;
      }
      privacy-none {
        privacy-password privacy-password;
      }
    }
  }
}
```

```

vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix) {
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
  security-to-group {
    security-model (usm | v1 | v2c) {
      security-name security-name {
        group group-name;
      }
    }
  }
  view view-name {
    oid object-identifier (include | exclude);
  }
}

```

**Related  
Documentation**

- [Understanding the Implementation of SNMP on page 5459](#)
- [snmp on page 1325](#)

## Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```

[edit snmp]
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}

```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported

MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 5541](#).

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

**NOTE:** Community names must be unique within each SNMP system.

**Related Documentation**

- [Configuring SNMP on page 1223](#)

## Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications

- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

## Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name** *name* statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list** statement, see the Routing Policy Configuration Guide.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community community-name]** hierarchy level:

```
[edit snmp community community-name]
  client-list-name client-list-name;
```

**NOTE:** The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clentlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
```

```
}  
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]  
snmp {  
  community community1 {  
    authorization read-only;  
    client-list-name clientlist1;  
  }  
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]  
policy-options {  
  prefix-list prefixlist {  
    10.3.3.3/32;  
    10.5.5.5/32;  
  }  
}  
snmp {  
  community community2 {  
    client-list-name prefixlist;  
  }  
}
```

- Related Documentation**
- [client-list on page 1278](#)
  - [client-list-name on page 1279](#)

## Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

- Related Documentation**
- [Configuring SNMP on a Device Running Junos OS](#)
  - [Configuration Statements at the \[edit snmp\] Hierarchy Level](#)
  - [Example: Configuring Secured Access List Checking](#)
  - [Configuring SNMP on page 1223](#)

## Configuring MIB Views

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (\*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

**NOTE:** To remove an OID completely, use the **delete view all oid oid-number** command but omit the include parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community community-name]** hierarchy level:

```
[edit snmp community community-name]
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the PING MIB topic in the SNMP MIBs and Traps Reference.

- [oid](#)

## Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and

its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. [Configuring SNMP on page 5542](#)
2. [Configuring an Event on page 5542](#)
3. [Configuring an Alarm on page 5543](#)

---

## Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

```
[edit snmp]
user@switch# set community community-name authorization authorization
For example:
```

```
[edit snmp]
user@switch# set community public authorization read-only
```

2. Grant read-write access to the RMON and jnx-rmon MIBs:

```
[edit snmp]
user@switch# set view view-name oid object-identifier include
user@switch# set view view-name oid object-identifier include
user@switch# set community community-name authorization authorization view view-name
For example:
```

```
[edit snmp]
user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
user@switch# set community private authorization read-write view rmon-mib-view
```

OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the RMON and jnxRmon MIBs.

3. Configure an SNMP trap group:

```
[edit snmp]
user@switch# set trap-group group-name categories category
user@switch# set trap-group group-name targets address
For example:
```

```
[edit snmp]
user@switch# set trap-group rmon-trap-group categories rmon-alarm
user@switch# set trap-group rmon-trap-group targets 192.168.5.5
```

The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

---

## Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

```
[edit snmp rmon]
user@switch# set event index community community-name type type
For example:
```

```
[edit snmp rmon]
```

```
user@switch# set event 1 community rmon-trap-group type log-and-trap
```

The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

```
[edit snmp rmon]
user@switch# set event index description description
```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description "rmon event"
```

## Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

```
[edit snmp rmon]
user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold
integer rising-event-index index falling-event-index index
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75
rising-threshold 90 rising-event-index 1 falling-event-index 1
```

The variable `.1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0` corresponds to the **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

```
[edit snmp rmon]
user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value)
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 interval 30 sample-type absolute-value
startup-alarm rising-or-falling-alarm
```

The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

## Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage, CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

```
[edit snmp]
user@switch# set health-monitor
```

2. Configure the falling threshold:

```
[edit snmp]
user@switch# set health-monitor falling-threshold percentage
```

For example:

```
user@switch# set health-monitor falling-threshold 85
```

3. Configure the rising threshold:

```
[edit snmp]
user@switch# set health-monitor rising-threshold percentage
```

For example:

```
user@switch# set health-monitor rising-threshold 75
```

4. Configure the interval:

```
[edit snmp]
user@switch# set health-monitor interval seconds
```

For example:

```
user@switch# set health-monitor interval 600
```

### Related Documentation

## Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

**NOTE:** You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

**username** is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

## Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

**NOTE:** You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

```
[edit snmp v3 vacm access]
user@switch# edit group group-name
```

2. To configure the context prefix of the SNMP instance for the group:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit (default-context-prefix | context-prefix context-prefix)
```

For example, to configure the default context prefix:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit default-context-prefix
```

3. To configure the security model:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model (any | usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model usm
```

4. To configure the security level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level (authentication | none | privacy)
```

For example, to configure a security level requiring user authentication and encryption:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level privacy
```

**NOTE:** Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use *none* as your security level. If you are configuring the SNMPv3 security model (USM), use the *authentication*, *none*, or *privacy* security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit read-view view-name
```

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit notify-view view-name
```

7. (Optional) To associate a MIB view with write permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit write-view view-name
```

## Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model (usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model usm
```

2. To associate the security name with a group:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
user@switch# edit security-name security-name
```

3. To configure a group of SNMPv3 security names with the same security policy:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
security-name]
user@switch# edit group group-name
```

## Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 5549](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

**NOTE:** When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
notify name {
  tag tag-name;
  type trap;
}
notify-filter name {
  oid object-identifier (include | exclude);
}
target-address target-address-name {
  address address;
  address-mask address-mask;
  logical-system (SNMP logical-system);
  port port-number;
```

```

routing-instance instance;
tag-list tag-list;
target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}

```

## Configuring SNMP Informs

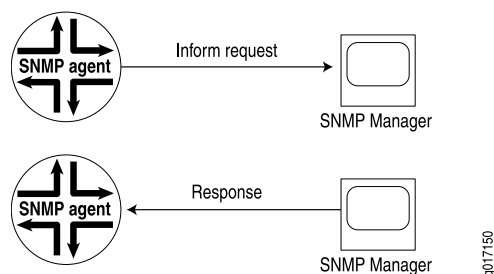

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 201 on page 5550](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

**Figure 201: Inform Request and Response**

For information about configuring SNMP traps, see [“Configuring SNMPv3 Traps on a Device Running Junos OS” on page 5548](#).

## Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in [Table 490 on page 5551](#). For more information about the configuration statements, see [Single-Chassis System Logging Configuration Overview](#).

**Table 490: Minimum Configuration Statements for System Logging**

| Destination                                                        | Minimum Configuration Statements                                                                              |
|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| File                                                               | <pre>[edit system syslog] file <i>filename</i> {   <i>facility severity</i>; }</pre>                          |
| Terminal session of one, several, or all users                     | <pre>[edit system syslog] user (<i>username</i>   *) {   <i>facility severity</i>; }</pre>                    |
| Router or switch console                                           | <pre>[edit system syslog] console {   <i>facility severity</i>; }</pre>                                       |
| Remote machine or the other Routing Engine on the router or switch | <pre>[edit system syslog] host (<i>hostname</i>   other-routing-engine) {   <i>facility severity</i>; }</pre> |

### Related Documentation

- [Overview of Junos OS System Log Messages on page 5505](#)
- [Overview of Single-Chassis System Logging Configuration on page 5505](#)

## Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```
[edit system]
syslog {
  archive <files number> <size size> <world-readable | no-world-readable>;
  console {
    facility severity;
  }
  file filename {
    facility severity;
  }
}
```

```
archive <archive-sites (ftp-url <password password>) > <files number> <size size>
    <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
    no-world-readable>;
explicit-priority;
match "regular-expression";
structured-data {
    brief;
}
}
host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
}
source-address source-address;
time-format (year | millisecond | year millisecond);
user (username | *) {
    facility severity;
    match "regular-expression";
}
}
```

**Related Documentation**

- [Overview of Junos OS System Log Messages on page 5505](#)

## Adding a Text String to System Log Messages

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign ( = ) and the colon ( : ). It also cannot include the space character; do not enclose the string in quotation marks ( " ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string **M120** to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine **hardware-logger.mycompany.com**:

```
[edit system syslog]
host hardware-logger.mycompany.com {
    any info;
    log-prefix M120;
}
```

When these configuration statements are included on an M120 router called **origin1**, a message in the system log on **hardware-logger.mycompany.com** looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run show version'
```

**Related Documentation**

- [Single-Chassis System Logging Configuration Overview](#)
- [Specifying Log File Size, Number, and Archiving Properties on page 5563](#)
- [Overview of Single-Chassis System Logging Configuration on page 5505](#)

## Directing System Log Messages to a Log File

To direct system log messages to a file in the **/var/log** directory of the local Routing Engine, include the **file** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>) > <files number> <size size>
        <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
        no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
        brief;
    }
}
```

For the list of facilities and severity levels, see [Specifying the Facility and Severity of Messages to Include in the Log](#).

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the **archive** statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see [“Specifying Log File Size, Number, and Archiving Properties” on page 5563](#).

For information about the following statements, see the indicated sections:

- **explicit-priority**—See [“Including Priority Information in System Log Messages” on page 5557](#)
- **match**—See [“Using Regular Expressions to Refine the Set of Logged Messages” on page 5570](#)
- **structured-data**—See [Logging Messages in Structured-Data Format](#)

## Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host hostname** statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 5565](#).

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 5557](#).

For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 5570](#).

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

## Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

```
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (\*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see [Specifying the Facility and Severity of Messages to Include in the Log](#). For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages”](#) on page 5570.

## Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see [Specifying the Facility and Severity of Messages to Include in the Log](#).

## Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
    any error;
    daemon none;
    kernel none;
}
```

```
file internals {
  daemon info;
  kernel info;
}
```

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysAppElemRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElemRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the **daemon** facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
```

```
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

## Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
facility severity;
explicit-priority;
```

**NOTE:** Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
explicit-priority;
```

**NOTE:** The **other-routing-engine** option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see [“Changing the Alternative Facility Name for Remote System Log Messages” on page 5569](#).

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

**FACILITY-severity[-TAG]**

(The tag is a unique identifier assigned to some Junos OS system log messages; for more information, see the *Junos OS System Log Messages Reference*.)

In the following example, the **CHASSISD\_PARSE\_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info (6)**:

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
configuration
```

For more information about message formatting, see the *Junos OS System Log Messages Reference*.

## Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

**NOTE:** By default, messages logged in structured-data format include the year and millisecond. If you include the `structured-data` statement at the `[edit system syslog file filename]` hierarchy level along with the `time-format` statement, the `time-format` statement is ignored and messages are logged in structured-data format.

For information about the `structured-data` statement, see [“Logging Messages in Structured-Data Format” on page 5559](#). For information about interpreting messages in a structured-data format, see [“Interpreting Messages Generated in Structured-Data Format” on page 5560](#).

## Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft **draft-ietf-syslog-protocol-21.txt**. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the `[edit system syslog file filename]` hierarchy level:

```
[edit system syslog file filename]
  facility severity;
  structured-data {
    brief;
  }
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data-format message, see [“Interpreting Messages Generated in Structured-Data Format” on page 5560](#).

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

**NOTE:** If you include either or both of the `explicit-priority` and `time-format` statements along with the `structured-data` statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

## Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see [Logging Messages in Structured-Data Format](#).

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

[Table 491 on page 5560](#) describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen ( - ) appears instead.

**Table 491: Fields in Structured-Data Messages**

| Field                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Examples                                                                                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;priority code&gt;</i> | Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see <a href="#">Specifying the Facility and Severity of Messages to Include in the Log</a> .                                                                                                                                                 | <165> for a message from the pfe facility (facility=20) with severity notice (severity=5).                                                                                   |
| <i>version</i>               | Version of the Internet Engineering Task Force (IETF) system logging protocol specification.                                                                                                                                                                                                                                                                                                                                                                                            | 1 for the initial version                                                                                                                                                    |
| <i>timestamp</i>             | Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> <li>YYYY-MM-DDTHH:MM:SS.MSZ is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC)</li> <li>YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC</li> </ul> | 2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007.<br>2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States. |
| <i>hostname</i>              | Name of the host that originally generated the message.                                                                                                                                                                                                                                                                                                                                                                                                                                 | switch1                                                                                                                                                                      |

Table 491: Fields in Structured-Data Messages (*continued*)

| Field                       | Description                                                                                                                                                                                                                    | Examples                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| <i>process</i>              | Name of the Junos OS process that generated the message.                                                                                                                                                                       | mgd                                       |
| <i>processID</i>            | UNIX process ID (PID) of the Junos process that generated the message.                                                                                                                                                         | 3046                                      |
| <i>TAG</i>                  | Junos OS system log message tag, which uniquely identifies the message.                                                                                                                                                        | UI_DBASE_LOGOUT_EVENT                     |
| <i>junos@2636.platform</i>  | An identifier for the type of hardware platform that generated the message. The junos@2636 prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type. | junos@2636.1.1.1.2.18                     |
| <i>variable-value-pairs</i> | A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable</i> = " <i>value</i> ".            | username="regress"                        |
| <i>message-text</i>         | English-language description of the event or error (omitted if the brief statement is included at the [edit system syslog file <i>filename</i> structured-data] hierarchy level).                                              | User 'regress' exiting configuration mode |

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [edit system syslog file *filename* structured-data ] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"]
```

Table 492 on page 5562 maps the codes that appear in the *priority-code* field to facility and severity level.

**NOTE:** Not all of the facilities and severities listed in Table 492 on page 5562 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see “Specifying the Facility and Severity of Messages to Include in the Log” on page 5565.

Table 492: Facility and Severity Codes in the priority-code Field

| Facility (number)             | Severity<br>emergency | alert | critical | error | warning | notice | info | debug |
|-------------------------------|-----------------------|-------|----------|-------|---------|--------|------|-------|
| kernel (0)                    | 1                     | 1     | 2        | 3     | 4       | 5      | 6    | 7     |
| user (1)                      | 8                     | 9     | 10       | 11    | 12      | 13     | 14   | 15    |
| mail (2)                      | 16                    | 17    | 18       | 19    | 20      | 21     | 22   | 23    |
| daemon (3)                    | 24                    | 25    | 26       | 27    | 28      | 29     | 30   | 31    |
| authorization (4)             | 32                    | 33    | 34       | 35    | 36      | 37     | 38   | 39    |
| syslog (5)                    | 40                    | 41    | 42       | 43    | 44      | 45     | 46   | 47    |
| printer (6)                   | 48                    | 49    | 50       | 51    | 52      | 53     | 54   | 55    |
| news (7)                      | 56                    | 57    | 58       | 59    | 60      | 61     | 62   | 63    |
| uucp (8)                      | 64                    | 65    | 66       | 67    | 68      | 69     | 70   | 71    |
| clock (9)                     | 72                    | 73    | 74       | 75    | 76      | 77     | 78   | 79    |

## Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the **[edit system syslog file *filename*]** or **[edit system syslog host *hostname*]** hierarchy level, a system log message has the following syntax:

```
timestamp message-source: %facility-severity-TAG: message-text
```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

```
timestamp message-source: TAG: message-text
```

Table 493 on page 5563 describes the message fields.

**Table 493: Fields in Standard-Format Messages**

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>timestamp</i>      | Time at which the message was logged.                                                                                                                                                                                                                                                                                                                                                           |
| <i>message-source</i> | Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format:<br><br><i>hostname process[process-ID]</i> |
| <i>facility</i>       | Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: <b>Facility Codes Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 5557.                                                                                                                                  |
| <i>severity</i>       | Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: <b>Numerical Codes for Severity Levels Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 5557.                                                                                                 |
| <i>TAG</i>            | Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix.<br><br>Not all processes on a routing platform use tags, so this field does not always appear. |
| <i>message-text</i>   | Text of the message.                                                                                                                                                                                                                                                                                                                                                                            |

## Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are

referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches and J Series routers
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called **logfile** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file **logfile.0.gz**. The logging utility then opens and writes to a new active file called **logfile**. This process is also known as file rotation. When the new **logfile** reaches the configured maximum size, **logfile.0.gz** is renamed **logfile.1.gz**, and the new **logfile** is closed, compressed, and renamed **logfile.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have the Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

```
archive <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
archive <archive-sites (ftp-url <password password>)> <files number> <size size>  
<start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |  
no-world-readable>;
```

**archive-sites *site-name*** specifies a list of archive sites that you want to use for storing files. The ***site-name*** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see [“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 48](#).

**binary-data** Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

**files *number*** specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

**size *size*** specifies the maximum size of each file. The value can be from 64 KB (**64k**) through 1 gigabyte (**1g**); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

**start-time "YYYY-MM-DD.hh:mm"** defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval*** defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

**world-readable** enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

## Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
    facility severity;
}
```

## Junos OS System Logging Facilities and Message Severity Levels

Table 494 on page 5566 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

**Table 494: Junos OS System Logging Facilities**

| Facility                    | Type of Event or Error                                                                                                                            |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                  | All (messages from all facilities)                                                                                                                |
| <b>authorization</b>        | Authentication and authorization attempts                                                                                                         |
| <b>change-log</b>           | Changes to the Junos OS configuration                                                                                                             |
| <b>conflict-log</b>         | Specified configuration is invalid on the router type                                                                                             |
| <b>daemon</b>               | Actions performed or errors encountered by system processes                                                                                       |
| <b>dfc</b>                  | Events related to dynamic flow capture                                                                                                            |
| <b>firewall</b>             | Packet filtering actions performed by a firewall filter                                                                                           |
| <b>ftp</b>                  | Actions performed or errors encountered by the FTP process                                                                                        |
| <b>interactive-commands</b> | Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client |
| <b>kernel</b>               | Actions performed or errors encountered by the Junos OS kernel                                                                                    |
| <b>pfe</b>                  | Actions performed or errors encountered by the Packet Forwarding Engine                                                                           |
| <b>user</b>                 | Actions performed or errors encountered by user-space processes                                                                                   |

Table 495 on page 5566 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see “Disabling the System Logging of a Facility” on page 5555.

**Table 495: System Log Message Severity Levels**

| Severity Level | Description                                                  |
|----------------|--------------------------------------------------------------|
| <b>any</b>     | Includes all severity levels                                 |
| <b>none</b>    | Disables logging of the associated facility to a destination |

Table 495: System Log Message Severity Levels (*continued*)

| Severity Level   | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>emergency</b> | System panic or other condition that causes the router to stop functioning                                              |
| <b>alert</b>     | Conditions that require immediate correction, such as a corrupted system database                                       |
| <b>critical</b>  | Critical conditions, such as hard errors                                                                                |
| <b>error</b>     | Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels |
| <b>warning</b>   | Conditions that warrant monitoring                                                                                      |
| <b>notice</b>    | Conditions that are not errors but might warrant special handling                                                       |
| <b>info</b>      | Events or nonerror conditions of interest                                                                               |

### System Log Default Facilities for Messages Directed to a Remote Destination

Table 496 on page 5567 lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

Table 496: Default Facilities for Messages Directed to a Remote Destination

| Junos OS-specific Local Facility | Default Facility When Directed to Remote Destination |
|----------------------------------|------------------------------------------------------|
| <b>change-log</b>                | <b>local6</b>                                        |
| <b>conflict-log</b>              | <b>local5</b>                                        |
| <b>dfc</b>                       | <b>local1</b>                                        |
| <b>firewall</b>                  | <b>local3</b>                                        |
| <b>interactive-commands</b>      | <b>local7</b>                                        |
| <b>pfe</b>                       | <b>local4</b>                                        |

## Junos OS System Log Alternate Facilities for Remote Logging

Table 497 on page 5568 lists the facilities that you can specify in the **facility-override** statement.

**Table 497: Facilities for the facility-override Statement**

| Facility             | Description                                                     |
|----------------------|-----------------------------------------------------------------|
| <b>authorization</b> | Authentication and authorization attempts                       |
| <b>daemon</b>        | Actions performed or errors encountered by system processes     |
| <b>ftp</b>           | Actions performed or errors encountered by the FTP process      |
| <b>kernel</b>        | Actions performed or errors encountered by the Junos OS kernel  |
| <b>local0</b>        | Local facility number 0                                         |
| <b>local1</b>        | Local facility number 1                                         |
| <b>local2</b>        | Local facility number 2                                         |
| <b>local3</b>        | Local facility number 3                                         |
| <b>local4</b>        | Local facility number 4                                         |
| <b>local5</b>        | Local facility number 5                                         |
| <b>local6</b>        | Local facility number 6                                         |
| <b>local7</b>        | Local facility number 7                                         |
| <b>user</b>          | Actions performed or errors encountered by user-space processes |

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

  - [Single-Chassis System Logging Configuration Overview](#)
  - [Overview of Single-Chassis System Logging Configuration on page 5505](#)

## Changing the Alternative Facility Name for Remote System Log Messages

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see [Table 494 on page 5566](#)). In the recommended configuration, a remote machine designated at the `[edit system syslog host hostname]` hierarchy level is not a Juniper Networks router or switch, so its **syslogd** utility cannot interpret the Junos OS-specific names. To enable the standard **syslogd** utility to handle messages from these facilities when messages are directed to a remote machine, a standard **localX** facility name is used instead of the Junos OS-specific facility name.

[Table 496 on page 5567](#) lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The **syslogd** utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  authorization info;
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the **syslogd** utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file `/var/log/auth-attempts`, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the **syslogd** utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the `[edit system syslog host hostname]` hierarchy level:

```
[edit system syslog host hostname]
  facility severity;
  facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **localX** facilities. On the remote machine, you must also configure the **syslogd** utility to handle the messages in the desired manner.

[Table 497 on page 5568](#) lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the **error** level or higher to the **local0** facility on the remote machine called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- Configure California routers to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- Configure New York routers to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On **central-logger**, you can then configure the system logging utility to write messages from the **local0** facility to the file **california-config** and the messages from the **local2** facility to the file **new-york-config**.

## Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | \*)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | other-routing-engine)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

Table 498 on page 5571 specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

**NOTE:** The match statement is not case-sensitive.

**Table 498: Regular Expression Operators for the match Statement**

| Operator              | Matches                                                                                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| . (period)            | One instance of any character except the space.                                                                                                                                                                     |
| * (asterisk)          | Zero or more instances of the immediately preceding term.                                                                                                                                                           |
| + (plus sign)         | One or more instances of the immediately preceding term.                                                                                                                                                            |
| ? (question mark)     | Zero or one instance of the immediately preceding term.                                                                                                                                                             |
| (pipe)                | One of the terms that appears on either side of the pipe operator.                                                                                                                                                  |
| ! (exclamation point) | Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.                                        |
| ^ (caret)             | Start of a line, when the caret appears outside square brackets.<br><br>One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets. |
| \$ (dollar sign)      | End of a line.                                                                                                                                                                                                      |

**Table 498: Regular Expression Operators for the match Statement (*continued*)**

| Operator                     | Matches                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ ] (paired square brackets) | One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen ( - ) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number. |
| ( ) (paired parentheses)     | One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.                                                                                        |

**Using Regular Expressions** Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (snmpd), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
  match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

|                                 |                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | allow-transients;                                                                                                                                                                                                                                      |
| <b>Hierarchy Level</b>          | [edit system scripts commit]                                                                                                                                                                                                                           |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                     |
| <b>Description</b>              | For Junos OS commit scripts, enable transient configuration changes to be committed.                                                                                                                                                                   |
| <b>Default</b>                  | Transient changes are disabled by default. If you do not include the <b>allow-transients</b> statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails. |
| <b>Required Privilege Level</b> | maintenance—To view this statement in the configuration.<br>maintenance-control—To add this statement to the configuration.                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>With commit script macros, use custom syntax in your configuration.</p> <p>Macros work by locating <b>apply-macro</b> statements that you include in the candidate configuration and using the values specified in the <b>apply-macro</b> statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.</p> <p>In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or <i>hooks</i>) that are used by a commit script macros.</p> <p>You can include the <b>apply-macro</b> statement at any level of the configuration hierarchy. You can include multiple <b>apply-macro</b> statements at each level of the configuration hierarchy; however, each must have a unique name.</p> |
| <b>Options</b>                  | <p><b><i>apply-macro-name</i></b>—Name of the <b>apply-macro</b> statement.</p> <p><b><i>parameter-name</i></b>—One or more parameters. Parameters can be any text you want to include in your configuration.</p> <p><b><i>parameter-value</i></b>—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Required Privilege Level</b> | configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <b>md5 hash</b> —MD5 checksum of this script.<br><br><b>sha-256 hash</b> —SHA-256 checksum of this script.<br><br><b>sha1 hash</b> —SHA-1 checksum of this script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## file (Op Scripts)

**Syntax**

```
file filename {
  arguments {
    argument-name {
      description descriptive-text;
    }
  }
  checksum (md5 | sha-256 | sha1) hash;
  command filename-alias;
  description descriptive-text;
  refresh;
  refresh-from url;
  source url;
}
```

**Hierarchy Level** [edit system **scripts op**]

**Release Information** Statement introduced in Junos OS Release 7.6.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Junos OS op scripts, enable an op script that is located in the `/var/db/scripts/op` directory.

**Options** *filename*—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an op script.

The statements are explained separately.

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

Hierarchy Level [edit system]

**Release Information** Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Junos OS commit or op scripts, configure scripting mechanisms.

NOTE: The `traceoptions` statement is not supported on QFabric systems.

| Release Information | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                         |
| Description         | For Junos OS commit scripts, specify the location of the source file for an enabled script located in the <code>/var/db/scripts/commit</code> directory. When you include the <b>refresh</b> statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL. |

NOTE: On the QFabric system, commit scripts are stored in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/op/` directory on the Director device.

                fmep-name name;
            }
        }
        vlan-name vlan-name;
    }
}
```

**Hierarchy Level** [edit protocols oam fabric]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Configure the fabric maintenance association (FMA) parameters for internal fabric monitoring. The FMA defines a set of QFabric system interfaces (fabric maintenance endpoints [FMEPs]) that are members of a given VLAN which are used in internal fabric monitoring operations. The FMA associates the set of FMEPs with a VLAN. Configuration of the VLAN is mandatory.

The remaining statements under this hierarchy level are explained separately.

**Options** **description *string***—Description of the FMA.

**Syntax:** 1 to 128 alphanumeric characters

**fma-name**—Name of the FMA.

**Syntax:** 1 to 20 alphanumeric characters

**vlan-name *vlan-name***—Name of the VLAN for which the FMA is defined.

**NOTE:** Configuring the VLAN option is mandatory.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure the fabric flow specification parameters for internal fabric monitoring. The following conditions apply:</p> <ul style="list-style-type: none"> <li>You must specify a protocol type for each flow specification: <b>unicast-ethernet</b>, <b>unicast-ethernet-ipv4</b>, <b>multicast-ipv4</b>, or <b>multicast-vlan-flood</b>.</li> <li>You can specify only one type for each flow specification.</li> <li>All other parameters are optional.</li> </ul> <p>The remaining statements under this hierarchy level are explained separately.</p>                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>flow-specification-name</b>—Name of the flow specification.</p> <p><b>Syntax:</b> 1 to 20 alphanumeric characters</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

**Syntax:** Dotted decimal notation without the prefix

**Values:** Maximum of 6 contiguous masked bits, or a mask range of 64

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Define tracing operations for sFlow technology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | The <b>tracoptions</b> feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the <b>/var/log/</b> directory.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>. Incoming trace file data is logged in the now empty <b>trace-file</b>. When <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify the maximum number of files, you must also specify the maximum file size using the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all sFlow monitoring events.</li><li>• <b>client-server</b>—Trace sFlow monitoring client-server events.</li><li>• <b>configuration</b>—Trace sFlow monitoring configuration events.</li><li>• <b>interface</b>—Trace sFlow monitoring interface events.</li><li>• <b>rtsock</b>—Trace routing socket code events.</li></ul> <p><b>no-stamp</b>—(Optional) Do not place timestamp information at the beginning of each line in the trace file.</p> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the trace file.</p> <p><b>replace</b>—(Optional) Replace an existing trace file if there is one.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches its maximum size, it</p> |

is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the trace file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

- [Overview of sFlow Technology on page 5456](#)

## udp-port

**Syntax** `udp-port port-number;`

**Hierarchy Level** [edit protocols [sflow collector](#)]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.

**Default** Port 6343

**Options** *port-number*—UDP port number for this collector.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## Configuration Statements for SNMP

---

### access (SNMP)

---

**Syntax**

```
access {  
  group group-name {  
    (default-context-prefix | context-prefix context-prefix) {  
      security-model (any | usm | v1 | v2c) {  
        security-level (authentication | none | privacy) {  
          notify-view view-name;  
          read-view view-name;  
          write-view view-name;  
        }  
      }  
    }  
  }  
}
```

**Hierarchy Level** [edit snmp v3 vacm]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Set SNMP access limits.

The remaining statements are explained separately.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

### address (SNMP)

---

**Syntax** address *address*;

**Hierarchy Level** [edit snmp v3 target-address *target-address-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Specify the SNMP target address for receiving traps or informs.

**Options** *address*—IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## address-mask

---

|                                 |                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>address-mask <i>address-mask</i>;</code>                                                                                                                                                |
| <b>Hierarchy Level</b>          | <code>[edit snmp v3 target-address <i>target-address-name</i>]</code>                                                                                                                         |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 on the QFX Series. |
| <b>Description</b>              | Define and verify the source addresses for a group of target addresses for SNMP traps and informs.                                                                                            |
| <b>Options</b>                  | <b><i>address-mask</i></b> —Define a range of addresses.                                                                                                                                      |
| <b>Required Privilege Level</b> | <code>snmp</code> —To view this statement in the configuration.<br><code>snmp-control</code> —To add this statement to the configuration.                                                     |

## agent-address

---

|                                 |                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>agent-address outgoing-interface;</code>                                                                                                                                                                                                                                                                                         |
| <b>Hierarchy Level</b>          | <code>[edit snmp trap-options]</code>                                                                                                                                                                                                                                                                                                  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.                                                                                        |
| <b>Options</b>                  | <b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.<br><b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps). |
| <b>Required Privilege Level</b> | <code>snmp</code> —To view this statement in the configuration.<br><code>snmp-control</code> —To add this statement to the configuration.                                                                                                                                                                                              |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>Configuring the Agent Address for SNMP Traps</li> </ul>                                                                                                                                                                                                                                         |

## alarm (SNMP RMON)

---

**Syntax**    alarm *index* {  
              description *description*;  
              falling-event-index *index*;  
              falling-threshold *integer*;  
              falling-threshold-interval *seconds*;  
              interval *seconds*;  
              request-type (get-next-request | get-request | walk-request);  
              rising-event-index *index*;  
              rising-threshold *integer*;  
              sample-type (absolute-value | delta-value);  
              startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);  
              syslog-subtag *syslog-subtag*;  
              variable *oid-variable*;  
              }

**Hierarchy Level**    [edit snmp rmon]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure RMON alarm entries.

**Options**    *index*—Identifies this alarm entry as an integer.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure the SNMP trap group that is used when generating a trap (if the <b>eventType</b> object is configured to send traps). If that trap group has the <b>rmon-alarm</b> trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of <b>eventCommunity</b>). If nothing is configured, traps are sent to each group that has the <b>rmon-alarm</b> category configured.</p> <p>The event community is not the same as an SNMP community.</p> |
| <b>Options</b>                  | <b><i>community-name</i></b> —Name of the trap group that is used when generating a trap if the event is configured to send traps.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | <b>snmp</b> —To view this statement in the configuration.<br><b>snmp-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11. for the QFX Series.                                                                                                                                                      |
| <b>Description</b>         | Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects. |
| <b>Options</b>             | <b><i>community-name</i></b> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").                                                                                                                                 |

**NOTE:** Community names must be unique. You cannot configure the same community name at the `[edit snmp community]` and `[edit snmp v3 snmp-community community-index]` hierarchy levels.

The community name at the `[edit snmp v3 snmp-community community-index]` hierarchy level is encrypted and not displayed in the command-line interface (CLI).

| <b>Description</b>              | <p>Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> and cannot be configured. The suffix is configured here.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.</p> <p>By default, the engine ID suffix is configured with the MAC address of the management interface (the <i>use-mac-address</i> option) on the QFX Series. You can override this configuration by using the local <i>engine-id-suffix</i> or <i>use-default-ip-address</i> option.</p> </div> |
| <b>Default</b>                  | use-mac-address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Set the index number of the event entry that is used when a falling threshold is crossed. You specify the falling-event index when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.                                                                                                                                                                                                    |

| <b>Description</b>              | <p>Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The <b>default-context-prefix</b> statement, when included, adds all the contexts configured on the device to the group, whereas the <b>context-prefix <i>context-prefix</i></b> statement enables you to specify a context and to add that particular context to the group.</p> <p>(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, <b>context-prefix default</b>), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as <b>logical system/routing instance</b>. For example, to specify routing instance <i>ri1</i> in logical system <i>ls1</i>, include <b>context-prefix ls1/ri1</b>.</p> <p>The remaining statements under this hierarchy are explained separately.</p> |
| <b>Options</b>                  | <b><i>group-name</i></b> —SNMPv3 group name created for the SNMPv3 group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.</p> <p>The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the <b>history</b> statement, you must also configure the <b>interface <i>interface-name</i></b> statement.</p> |
| <b>Options</b>                  | <p><b>history-index</b>—Provide a number for this history entry.</p> <p><b>Range:</b> 1 through 65535</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Hierarchy Level** [edit snmp v3 [usm](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure local engine information for the user-based security model (USM).  
  
The remaining statements are explained separately.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Release Information**    Statement introduced in Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the remote engine information for the user-based security model (USM). To send inform messages to an SNMPv3 user on a remote device, you must configure the engine identifier for the SNMP agent on the remote device where the user resides.

**Options**    *engine-id*—Engine identifier. Used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host.

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

| <b>Description</b>              | Set the upper threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.                                                                                                                                           |
| <b>Options</b>                  | <b><i>integer</i></b> —Upper threshold for the alarm entry.<br><b>Range:</b> -2,147,483,648 through 2,147,483,647                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <b>snmp</b> —To view this statement in the configuration.<br><b>snmp-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                         |

## rmon

```
Syntax  rmon {
        alarm index {
            description description;
            falling-event-index index;
            falling-threshold integer;
            falling-threshold-interval seconds;
            interval seconds;
            request-type;
            rising-event-index index;
            rising-threshold integer;
            sample-type (absolute-value | delta-value);
            startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
            syslog-subtag syslog-subtag;
            variable oid-variable;
        }
        event index {
            community community-name;
            description description;
            type (RMON Notification) type;
        }
        history history-index {
            bucket-size number;
            interface interface-name;
            interval seconds;
            owner owner-name;
        }
    }
```

**Hierarchy Level** [edit snmp]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

**Default** Disabled.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.                                                                                                                                                                                       |
| <b>Options</b>                  | <i>address</i> —Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b> .<br><br><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.) |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                   |

## tag (Configuring Notification Targets)

---

|                                 |                                                                                                                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>tag <i>tag-name</i>;</code>                                                                                                                                                                                                       |
| <b>Hierarchy Level</b>          | [edit snmp v3 notify <i>name</i> ]                                                                                                                                                                                                      |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                       |
| <b>Description</b>              | Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).                                                                                                                                           |
| <b>Options</b>                  | <b>tag-name</b> —Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The <b>tag-name</b> is not included in the notification. |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                                                                                           |

## tag (Configuring the SNMP Community)

---

|                            |                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>tag tag-name;</code>                                                                                   |
| <b>Hierarchy Level</b>     | <code>[edit snmp v3 snmp-community community-index]</code>                                                   |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                            |
| <b>Description</b>         | Configure a set of SNMP managers that are authorized to use a community string.                              |
| <b>Options</b>             | <b>tag-name</b> —Identify the set of addresses for the SNMP managers authorized to use the community string. |
| <b>Required Privilege</b>  | snmp—To view this statement in the configuration.                                                            |
| <b>Level</b>               | snmp-control—To add this statement to the configuration.                                                     |

## tag-list

---

|                              |                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                | <code>tag-list tag-list;</code>                                                                                                                                                                |
| <b>Hierarchy Level</b>       | <code>[edit snmp v3 target-address target-address-name]</code>                                                                                                                                 |
| <b>Release Information</b>   | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| <b>Description</b>           | Configure an SNMP tag list used to select target addresses.                                                                                                                                    |
| <b>Options</b>               | <b>tag-list</b> —Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.                          |
| <b>Required Privilege</b>    | snmp—To view this statement in the configuration.                                                                                                                                              |
| <b>Level</b>                 | snmp-control—To add this statement to the configuration.                                                                                                                                       |
| <b>Related Documentation</b> | <ul style="list-style-type: none"><li>Configuring the Trap Target Address</li></ul>                                                                                                            |

---

## target-address

---

**Syntax**    `target-address target-address-name {  
                  address address;  
                  address-mask address-mask;  
                  port port-number;  
                  retry-count number;  
                  tag-list tag-list;  
                  target-parameters target-parameters-name;  
                  timeout seconds;  
                  }`

**Hierarchy Level**    [edit snmp v3]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the address of an SNMP management application and the parameters to be used in sending notifications.

**Options**    *target-address-name*—String that identifies the target address.

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

## target-parameters

---

**Syntax** At the **[edit snmp v3]** hierarchy level:

```
target-parameters target-parameters-name {  
  profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);  
    security-model (usm | v1 | v2c);  
    security-name security-name;  
  }  
}
```

At the **[edit snmp v3 target-address *target-address-name*]** hierarchy level:

```
target-parameters target-parameters-name;
```

**Hierarchy Level** [edit snmp v3]  
[edit snmp v3 target-address *target-address-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the **[edit snmp v3]** hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the **[edit snmp v3 target-parameters *target-parameters-name*]** hierarchy level to the target address configuration at the **[edit snmp v3]** hierarchy level.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## timeout

---

|                                 |                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>timeout <i>seconds</i>;</code>                                                                                                                                    |
| <b>Hierarchy Level</b>          | <code>[edit snmp v3 target-address <i>target-address-name</i>]</code>                                                                                                   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                       |
| <b>Description</b>              | Configure the timeout period (in seconds) for SNMP informs.                                                                                                             |
| <b>Default</b>                  | 15 seconds                                                                                                                                                              |
| <b>Options</b>                  | <b><i>seconds</i></b> —Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted. |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                           |

## traceoptions (SNMP)

---

**Syntax**    `traceoptions {  
              file filename <files number> <match regular-expression> <size size> <world-readable |  
              no-world-readable>;  
              flag flag;  
              no-remote-trace;  
          }`

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Track the activities of SNMP agents on the switch and record the information in log files.

**NOTE:** The **traceoptions** statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

**Options**    **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, **mib2d** or **snmpd**). Use this option to specify another name.

**files *number***—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, **snmpd**) reaches its maximum size, it is archived by being renamed to **snmpd.0**. The previous **snmpd.1** is renamed to **snmpd.2**, and so on. The oldest archived file is deleted.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**size *size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

**Range:** 10 KB through 1 GB

**Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

**Required Privilege Level**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Set the object identifier (OID) of the MIB object (also called variable) to be monitored when you configure an SNMP RMON alarm. If the value of the monitored variable exceeds the configured rising threshold or falling threshold, an alarm is triggered and a corresponding event may be generated.                                                                                                                      |
| <b>Options</b>                  | <i>oid-variable</i> —OID of the MIB variable that is being monitored. The OID can be a dotted decimal (for example, <code>1.3.6.1.2.1.2.1.2.1.10.1</code> ) or the name of the MIB object—for example, <code>ifInOctets.1</code> .                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                               |

| <b>Syntax</b>                   | <code>view <i>view-name</i> {<br/>    oid <i>object-identifier</i> (include   exclude);<br/>}</code>                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Hierarchy Level</b>          | [edit snmp]                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The <b>view</b> statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the <b>view</b> statement at the <b>[edit snmp community <i>community-name</i>]</b> hierarchy level. |
|                                 | <div>  <p><b>NOTE:</b> To remove an OID completely, use the <code>delete view all oid oid-number</code> command but omit the <code>include</code> parameter.</p> </div>                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b><i>view-name</i></b>—Name of the view.</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | <p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>         | Configure archiving properties for all system log files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>files <i>number</i></b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <b>logfile</b>, it closes the file, compresses it, and renames it <b>logfile.0.gz</b> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <b>logfile</b>. When the new file reaches the maximum size, the <b>logfile.0.gz</b> file is renamed to <b>logfile.1.gz</b>, and the new file is closed, compressed, and renamed <b>logfile.0.gz</b>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>size <i>size</i></b>—Maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b>). The utility then opens and writes to a new file called <b>logfile</b>.</p> <p><b>Syntax:</b> <i>x k</i> to specify the number of kilobytes, <i>x m</i> for the number of megabytes, or <i>x g</i> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>• 128 KB for EX Series switches and J Series routers</li><li>• 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch</li><li>• 10 MB for TX Matrix and TX Matrix Plus routers</li></ul> <p><b>binary-data   no-binary-data</b>—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..</p> <p><b>Default:</b> no-binary-data</p> <p><b>world-readable   no-world-readable</b>—Grant all users permission to read archived log files, or restrict the permission only to the <b>root</b> user and users who have the Junos OS <b>maintenance</b> permission.</p> <p><b>Default:</b> no-world-readable</p> |

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

| <b>Description</b>         | Configure archiving properties for a specific system log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>archive-sites <i>site-name</i></b>—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see <a href="#">“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 48</a>). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the <b>[edit system syslog]</b> hierarchy level.</p> <p><b>files <i>number</i></b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i>, it closes the file, compresses it, and renames it <i>logfile.0.gz</i> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <i>logfile</i>. When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i>, and the new file is closed, compressed, and renamed <i>logfile.0.gz</i>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>password <i>password</i></b>—Password for authenticating with the site specified by the <b>archive-sites</b> statement.</p> <p><b>size <i>size</i></b>—Maximum amount of data that the Junos OS logging utility writes to a log file <i>logfile</i> before archiving it (closing it, compressing it, and changing its name to <i>logfile.0.gz</i>). The utility then opens and writes to a new file called <i>logfile</i>.</p> <p><b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b> 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers</p> |

**start-time "YYYY-MM-DD.hh:mm"**—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval***—Interval at which to transfer the log file to an archive site.

**Range:** 5 through 2880 minutes

**world-readable | no-world-readable**—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

**Default:** no-world-readable

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## archive (QFabric System)

**Syntax** archive {  
size *size*;  
}

**Hierarchy Level** [edit system [syslog](#) file *filename*]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the archiving properties for the system message log file.

**Options** **size *size***—Maximum amount of system log message data that the QFabric system stores in the log file.

**Syntax:** *xk* to specify the number of kilobytes, *xm* for the number of megabytes, or *xg* for the number of gigabytes

**Range:** 65 KB through 1 GB

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## file (QFabric System)

---

**Syntax**    file *filename* {  
              **explicit-priority**;  
              *facility severity*;  
              **match** "regular-expression";  
              }

**Hierarchy Level**    [edit system **syslog**]

**Release Information**    Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Configure the logging of system messages to a file.

**NOTE:** On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of **any any** and a size of 100 MBs. Therefore, you cannot specify the filename **messages** in your configuration, and automatic command completion does not work for that filename.

**Options**    *facility*—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements.

*filename*—Filename that you specify with the **show log** command.

**Default:** Filename **messages**

*severity*—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities at the specified level and higher are logged.

The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the logging of system messages to a file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <a href="#">Table 494 on page 5566</a>.</p> <p><b><i>file filename</i></b>—File in the <code>/var/log</code> directory in which to log messages from the specified facility. To log messages to more than one file, include more than one <b><i>file</i></b> statement.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <a href="#">Table 495 on page 5566</a>.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see <a href="#">size</a> ). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file). |
| <b>Options</b>                  | <i>number</i> —Maximum number of archived files.<br><b>Range:</b> 1 through 1000<br><b>Default:</b> 10 files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>                             | Configure the logging of system messages to a remote destination.                                                                                                                                                                                                          |

- Options**
- facility**—Class of messages to log. To specify multiple classes, include multiple **facility severity** statements. For a list of the facilities, see [Table 494 on page 5566](#).
  - hostname**—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.
  - other-routing-engine**—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.
-  **NOTE:** The **other-routing-engine** option is not applicable to the QFX Series.
- port**—Port number of the remote syslog server that can be modified.
- scc-master**—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.
- severity**—Severity of the messages that belong to the facility specified by the paired **facility** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see [Table 495 on page 5566](#).
- sfc0-master**—(TX Matrix Plus routers only) On a T1600 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b> ). The utility then opens and writes to a new file called <b>logfile</b> . For information about the number of archive files that the utility creates in this way, see <a href="#">files</a> . |
| <b>Options</b>                  | <b>size</b> —Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).<br><b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes<br><b>Range:</b> 64 KB through 1 GB<br><b>Default:</b> 1 MB for MX Series routers and the QFX Series                                           |

| <b>Description</b>              | <p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b>, <b>console</b>, or <b>user</b> statement at the <code>[edit system syslog]</code> hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a <b>host</b> statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b>. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p> |
|                                 | <div><p><b>NOTE:</b> When the <b>structured-data</b> statement is included at the <code>[edit system syslog file <i>filename</i>]</code> hierarchy level, this statement is ignored for the file.</p></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
```

```

process): new instance detected (variable: sysAppElemRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElemRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages

```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the **daemon** facility.

```

user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...

```

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 5724](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 5725](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

## Sample Output

```

user@host> monitor interface traffic
host name          Seconds: 15          Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0    Down      0          (0)      0          (0)
so-1/1/0    Down      0          (0)      0          (0)
so-1/1/1    Down      0          (0)      0          (0)
so-1/1/2    Down      0          (0)      0          (0)
so-1/1/3    Down      0          (0)      0          (0)
t3-1/2/0    Down      0          (0)      0          (0)
t3-1/2/1    Down      0          (0)      0          (0)
t3-1/2/2    Down      0          (0)      0          (0)
t3-1/2/3    Down      0          (0)      0          (0)
so-2/0/0     Up    211035      (1)    36778      (0)
so-2/0/1     Up    192753      (1)    36782      (0)
so-2/0/2     Up    211020      (1)    36779      (0)
so-2/0/3     Up    211029      (1)    36776      (0)
so-2/1/0     Up    189378      (1)    36349      (0)
so-2/1/1     Down      0          (0)    18747      (0)
so-2/1/2     Down      0          (0)    16078      (0)
so-2/1/3     Up      0          (0)    80338      (0)
at-2/3/0     Up      0          (0)      0          (0)
at-2/3/1     Down      0          (0)      0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D

```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

## Sample Output

```

user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:                5856541 (88 bps)
  Output bytes:               6271468 (96 bps)
  Input packets:              157629 (0 pps)
  Output packets:             157024 (0 pps)
Encapsulation statistics:
  Input keepalives:           42353
  Output keepalives:          42320
  LCP state: Opened
Error statistics:
  Input errors:                0
  Input drops:                 0
  Input framing errors:        0
  Input runs:                  0
  Input giants:                0
  Policed discards:           0
  L3 incompletes:              0
  L2 channel errors:           0
  L2 mismatch timeouts:        0
  Carrier transitions:         1
  Output errors:               0
  Output drops:                0
  Aged packets:                0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count                    1
  LOF count                    1
  SEF count                    1
  ES-S                         77
  SES-S                        77
SONET statistics:
  BIP-B1                       0
  BIP-B2                       0
  REI-L                        0
  BIP-B3                       0
  REI-P                        0
Received SONET overhead:  F1      : 0x00  J0      : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see Checklist for Tracking Error Conditions.

To control the output of the command while it is running, use the keys shown in [Table 499 on page 5727](#).

Table 499: Output Control Keys for the monitor interface Command

| Action                                                                                                                                                                                                                       | Key      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command. | <b>N</b> |
| Display information about a different interface. The command prompts you for the name of a specific interface.                                                                                                               | <b>I</b> |
| Freeze the display, halting the display of updated statistics.                                                                                                                                                               | <b>F</b> |
| Thaw the display, resuming the display of updated statistics.                                                                                                                                                                | <b>T</b> |
| Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.                                                                                              | <b>C</b> |
| Stop the <b>monitor interface</b> command.                                                                                                                                                                                   | <b>Q</b> |

See the Junos OS Operational Mode Commands for details on using match conditions with the **monitor traffic** command.

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State
      5  monitor
      jnxOperatingCPU.9.1.0.0                        5 falling threshold

Event
Index  Type                               Last Event
      1  log and trap                     2010-07-10 11:34:17 PDT
Event Index: 1
Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
Time: 2010-07-10 11:34:07 PDT
Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the **logTable** in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

  - [clear snmp history on page 5740](#)

## Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

| Alarm |                                                                              |       |        |
|-------|------------------------------------------------------------------------------|-------|--------|
| Index | Variable description                                                         | Value | State  |
| 32768 | Health Monitor: root file system utilization<br>jnxHrStoragePercentUsed.1    | 58    | active |
| 32769 | Health Monitor: /config file system utilization<br>jnxHrStoragePercentUsed.2 | 0     | active |
| 32770 | Health Monitor: RE 0 CPU utilization<br>jnxOperatingCPU.9.1.0.0              | 0     | active |
| 32773 | Health Monitor: RE 0 Memory utilization<br>jnxOperatingBuffer.9.1.0.0        | 35    | active |
| 32775 | Health Monitor: jkernel daemon CPU utilization                               |       |        |
|       | Init daemon                                                                  | 0     | active |
|       | Chassis daemon                                                               | 50    | active |
|       | Firewall daemon                                                              | 0     | active |
|       | Interface daemon                                                             | 5     | active |
|       | SNMP daemon                                                                  | 11    | active |
|       | MIB2 daemon                                                                  | 42    | active |
|       | ...                                                                          |       |        |

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0      = Juniper Networks, Inc. qfx3500s internet router, kernel
```

```
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0 = 24444184
sysContact.0 = J Smith
sysName.0 = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

```
SNMP statistics:
```

```
Input:
```

```
Packets: 0, Bad versions: 0, Bad community names: 0,
Bad community uses: 0, ASN parse errors: 0,
Too big: 0, No such names: 0, Bad values: 0,
Read only: 0, General errors: 0,
Total request varbinds: 0, Total set varbinds: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

## Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
    for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
    for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
    for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user **jsmith**.

## Pinging Hosts

**Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

**Action** To use the **ping** command to send four requests (ping count) to **host3**:

**ping *host* count *number***

## Sample Output

```
ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

- Meaning**
- The **ping** results show the following information:
    - Size of the ping response packet (in bytes).
    - IP address of the host from which the response was sent.
    - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
    - Time-to-live (ttl) hop-count value of the ping response packet.
    - Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
    - Number of ping requests (probes) sent to the host.
    - Number of ping responses received from the host.
    - Packet loss percentage.
    - Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d

- `rmopd`
- `serviced`
- `snmpd`
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (`/var/log`) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the `[edit snmp]` hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 5732](#)
- [Configuring Access to the Log File on page 5733](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 5733](#)
- [Configuring the Trace Operations on page 5733](#)

### Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed **filename.0**, then **filename.1**, and so on, until there are three trace files. Then the oldest trace file (**filename.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the `[edit snmp traceoptions]` hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (**filename**) reaches 2 MB, **filename** is renamed **filename.0**, and a new file called **filename** is created. When the new **filename** reaches 2 MB, **filename.0** is renamed **filename.1** and **filename** is renamed **filename.0**. This process repeats until there are 20 trace files. Then the oldest file (**filename.19**) is overwritten by the newest file (**filename.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 500 on page 5734 describes the meaning of the SNMP tracing flags.

Table 500: SNMP Tracing Flags

| Flag                     | Description                                                                 | Default Setting |
|--------------------------|-----------------------------------------------------------------------------|-----------------|
| <b>all</b>               | Log all operations.                                                         | Off             |
| <b>configuration</b>     | Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level. | Off             |
| <b>database</b>          | Log events involving storage and retrieval in the events database.          | Off             |
| <b>events</b>            | Log important events.                                                       | Off             |
| <b>general</b>           | Log general events.                                                         | Off             |
| <b>interface-stats</b>   | Log physical and logical interface statistics.                              | Off             |
| <b>nonvolatile-set</b>   | Log nonvolatile SNMP set request handling.                                  | Off             |
| <b>pdu</b>               | Log SNMP request and response packets.                                      | Off             |
| <b>policy</b>            | Log policy processing.                                                      | Off             |
| <b>protocol-timeouts</b> | Log SNMP response timeouts.                                                 | Off             |
| <b>routing-socket</b>    | Log routing socket calls.                                                   | Off             |
| <b>server</b>            | Log communication with processes that are generating events.                | Off             |
| <b>subagent</b>          | Log subagent restarts.                                                      | Off             |
| <b>timer</b>             | Log internal timer events.                                                  | Off             |
| <b>varbind-error</b>     | Log variable binding errors.                                                | Off             |

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

## Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- `request snmp utility-mib set instance name object-type <counter | counter 64 | integer | string | unsigned integer> object-value value`
- `request snmp utility-mib clear instance name object-type <counter | counter 64 | integer | string | unsigned integer>`

The `instance name` option of the `request snmp utility-mib <set | clear>` command specifies the name of the data instance and is the main identifier of the data. The `object-type <counter | counter 64 | integer | string | unsigned integer>` option enables you specify the object type, and the `object-value value` option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run `show system buffers` every hour and to store the `show system buffers` data in Utility MIB objects by running an event script (`check-mbufs.slax`).

### Event Policy Configuration

To configure an event policy that runs the `show system buffers` command every hour and invokes `check-mbufs.slax` to store the `show system buffers` data into Utility MIB objects, include the following statements at the `[edit]` hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 600;
  }
  policy Mbufs {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

**check-mbufs.slax** The following example shows the **check-mbufs.slax** script that is stored under **Script** **/var/db/scripts/event/**:

```

----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
    var $cmd = <command> "show system buffers";
    var $out = jcs:invoke($cmd);

    var $lines = jcs:break_lines($out);
    for-each ($lines) {
      if (contains(., "current/peak/max")) {
        var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
        var $split = jcs:regex($pattern, .);
        var $result = $split[2];

        var $rpc = <request-snmp-utility-mib-set> {
          <object-type> "integer";
          <instance> "current-mbufs";
          <object-value> $result;
        }
        var $res = jcs:invoke($rpc);
      }
    }
  }
}
----- script END -----

```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```

user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>

```

**NOTE:** The **show snmp mib walk** command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

## Displaying Commit Script Output

[Table 501 on page 5737](#) summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the `cscript.log` file, see [Tracing Commit Script Processing](#).

**NOTE:** Tracing commit script processing, including the `cscript.log` file, is not supported on the QFX3000-G QFabric system.

**Table 501: Commit Script Configuration and Operational Mode Commands**

| Task                                                                                                                                                                 | Command                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Configuration Mode Commands</b>                                                                                                                                   |                                                                                        |
| Display errors and warnings generated by commit scripts.                                                                                                             | <code>commit</code> or <code>commit check</code>                                       |
| Display detailed information.                                                                                                                                        | <code>commit   display detail</code>                                                   |
| Display the underlying Extensible Markup Language (XML) data.                                                                                                        | <code>commit   display xml</code>                                                      |
| Display the postinheritance contents of the configuration database. This view includes transient changes, but does not include changes made in configuration groups. | <code>show   display commit-scripts</code>                                             |
| Display the postinheritance contents of the configuration database. This view excludes transient changes.                                                            | <code>show   display commit-scripts no-transients</code>                               |
| Display the postinheritance configuration in XML format.                                                                                                             | <code>show   display commit-scripts view</code>                                        |
| Viewing the configuration in XML format can be helpful when you are writing XML Path Language (XPath) expressions and configuration element tags.                    |                                                                                        |
| Display the postinheritance configuration in XML format, but exclude transient changes.                                                                              | <code>show   display commit-scripts view   display commit-scripts no-transients</code> |
| Display all configuration groups data, including script-generated changes to the groups.                                                                             | <code>show groups   display commit-scripts</code>                                      |

**Table 501: Commit Script Configuration and Operational Mode Commands** (*continued*)

| Task                                                                                       | Command                                                       |
|--------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Display a particular configuration group, including script-generated changes to the group. | <b>show groups <i>group-name</i>   display commit-scripts</b> |
| <b>Operational Mode Commands</b>                                                           |                                                               |
| Display logging data associated with all commit script processing.                         | <b>show log cscript.log</b>                                   |
| Display processing for only the most recent commit operation.                              | <b>show log cscript.log   last</b>                            |
| Display processing for script errors.                                                      | <b>show log cscript.log   match error</b>                     |
| Display processing for a particular script.                                                | <b>show log cscript.log   match <i>filename</i></b>           |

### Sample Output

#### clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          3174
10.1.2.1       6343          3562
```

```
user@host> clear sflow collector statistics
```

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          0
10.1.2.1       6343          0
```

## clear snmp history

## Sample Output

### clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 0, Total set varbinds: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 0, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 0, Traps: 0
```

## monitor traffic

**Syntax**    monitor traffic  
               <brief | detail | extensive>  
               <absolute-sequence>  
               <count *count*>  
               <interface *interface-name*>  
               <layer2-headers>  
               <matching *matching*>  
               <no-domain-names>  
               <no-promiscuous>  
               <no-resolve>  
               <no-timestamp>  
               <print-ascii>  
               <print-hex>  
               <resolve-timeout>  
               <size *size*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

**NOTE:** This command is not supported on the QFabric system.

**Options**    **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**absolute-sequence**—(Optional) Display absolute TCP sequence numbers.

**count *count***—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The **monitor traffic** command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

**monitor traffic matching "*expression*"**

Replace ***expression*** with one or more of the match conditions listed in [Table 502 on page 5745](#).

Table 502: Match Conditions for the monitor traffic Command

| Match Type    | Condition                                             | Description                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entity        | <b>host</b> [ <i>address</i>   <i>hostname</i> ]      | Matches packets that contain the specified address or hostname.<br><br>The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.                                         |
|               | <b>net</b> <i>address</i>                             | Matches packets with source or destination addresses containing the specified network address.                                                                                                                                                                                         |
|               | <b>net</b> <i>address mask mask</i>                   | Matches packets containing the specified network address and subnet mask.                                                                                                                                                                                                              |
|               | <b>port</b> ( <i>port-number</i>   <i>port-name</i> ) | Matches packets containing the specified source or destination TCP or UDP port number or port name.<br><br>In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed). |
| Directional   | <b>dst</b>                                            | Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                  |
|               | <b>src</b>                                            | Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                             |
|               | <b>src and dst</b>                                    | Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                         |
|               | <b>src or dst</b>                                     | Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                        |
| Packet Length | <b>less</b> <i>value</i>                              | Matches packets shorter than or equal to the specified value, in bytes.                                                                                                                                                                                                                |
|               | <b>greater</b> <i>value</i>                           | Matches packets longer than or equal to the specified value, in bytes.                                                                                                                                                                                                                 |

Table 502: Match Conditions for the monitor traffic Command (*continued*)

| Match Type | Condition                                                | Description                                                                                                                                                                                                                                                                                                                     |
|------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol   | <b>amt</b>                                               | Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.                                                                                                                                                                                                |
|            | <b>arp</b>                                               | Matches all ARP packets.                                                                                                                                                                                                                                                                                                        |
|            | <b>ether</b>                                             | Matches all Ethernet packets.                                                                                                                                                                                                                                                                                                   |
|            | <b>ether (broadcast   multicast)</b>                     | Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .                                                                                                                                                                                                          |
|            | <b>ether protocol (address   (arp   ip   rarp))</b>      | Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition. |
|            | <b>icmp</b>                                              | Matches all ICMP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>ip</b>                                                | Matches all IP packets.                                                                                                                                                                                                                                                                                                         |
|            | <b>ip (broadcast   multicast)</b>                        | Matches broadcast or multicast IP packets.                                                                                                                                                                                                                                                                                      |
|            | <b>ip protocol (address   (icmp   igmp   tcp   udp))</b> | Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.                                                 |
|            | <b>isis</b>                                              | Matches all IS-IS routing messages.                                                                                                                                                                                                                                                                                             |
|            | <b>rarp</b>                                              | Matches all RARP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>tcp</b>                                               | Matches all TCP datagrams.                                                                                                                                                                                                                                                                                                      |
|            | <b>udp</b>                                               | Matches all UDP datagrams.                                                                                                                                                                                                                                                                                                      |

To combine expressions, use the logical operators listed in [Table 503 on page 5746](#).

Table 503: Logical Operators for the monitor traffic Command

| Logical Operator (Highest to Lowest Precedence) | Description                                                                          |
|-------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>!</b>                                        | Logical NOT. If the first condition does not match, the next condition is evaluated. |

Table 503: Logical Operators for the monitor traffic Command (*continued*)

| Logical Operator (Highest to Lowest Precedence) | Description                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| &&                                              | Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped. |
|                                                 | Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.  |
| ()                                              | Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).        |

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 504 on page 5748](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 502 on page 5745](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 504: Arithmetic and Relational Operators for the monitor traffic Command**

| Arithmetic or Relational Operator                         | Description                                                                         |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Arithmetic Operator</b>                                |                                                                                     |
| +                                                         | Addition operator.                                                                  |

                               `<wait seconds>`

**Release Information**    Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO\_REQUEST messages to elicit ICMP ECHO\_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

**Options** **host**—IP address or hostname of the remote system to ping.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**count requests**—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

**detail**—(Optional) Include in the output the interface on which the ping reply was received.

**do-not-fragment**—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

**NOTE:** In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

**inet**—(Optional) Ping Packet Forwarding Engine IPv4 routes.

**inet6**—(Optional) Ping Packet Forwarding Engine IPv6 routes.

**interface source-interface**—(Optional) Interface to use to send the ping requests.

**interval seconds**—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

**logical-system logical-system-name**—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router, enter the **clear cli logical-system** command.

**loose-source value**—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

**Required Privilege Level** network

**List of Sample Output** [ping hostname on page 5756](#)  
[ping hostname rapid on page 5756](#)

[ping hostname size count on page 5756](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms
64 bytes from 192.168.169.254: icmp_seq=2 ttl=253 time=1.025 ms
64 bytes from 192.168.169.254: icmp_seq=3 ttl=253 time=1.098 ms
64 bytes from 192.168.169.254: icmp_seq=4 ttl=253 time=1.032 ms
64 bytes from 192.168.169.254: icmp_seq=5 ttl=253 time=1.044 ms
^C [abort]
```

### ping hostname rapid

```
user@host> ping skye rapid

| <b>Output Fields</b>            | <a href="#">Table 505 on page 5757</a> lists the output fields for the <b>ping fabric-multicast-flow</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                         |

**Table 505: ping fabric multicast-flow Output Fields**

| Field Name                      | Field Description                              |
|---------------------------------|------------------------------------------------|
| Using fabric flow-specification | Name of the flow specification.                |
| Ethernet frame-size             | Ethernet frame size in bytes.                  |
| Source-IP                       | MAC address of the source FMEP interface.      |
| Destination-IP                  | MAC address of the destination FMEP interface. |

Table 505: ping fabric multicast-flow Output Fields (*continued*)

| Field Name                     | Field Description                          |
|--------------------------------|--------------------------------------------|
| Protocol                       | IP protocol.                               |
| received response from fmep-id | FMEP ID from which responses are received. |

## Sample Output

ping fabric  
multicast-flow

```
user@host> ping fabric multicast-flow source-fmep-id 3 fma-name fma1 flow-spec-name fspec2  
verbose
```

```
Using fabric flow-specification: fspec2  
Ethernet frame-size: 256  
Source-IP: 87.238.205.21  
Destination-IP: 225.0.0.1 IP  
Protocol: 17  
received response from fmep-id 32775...  
received response from fmep-id 32794...  
received response from fmep-id 32795...  
sent 1 requests, received 3 responses
```

## ping fabric unicast-flow

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Output Fields</b>            | <a href="#">Table 506 on page 5760</a> lists the output fields for the <b>ping fabric-unicast-flow</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 506: ping fabric unicast-flow Output Fields

| Field Name                                                                                       | Field Description                                                      |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Fabric flow ping between source <i>source-fmep-name</i> destination <i>destination-fmep-name</i> | Path of the unicast-flow ping between the source and detination FMEPs. |
| Using fabric flow-specification                                                                  | Name of the flow specification.                                        |
| Ethernet frame-size                                                                              | Ethernet frame size in bytes.                                          |
| Source-MAC                                                                                       | MAC address of the source FMEP interface.                              |
| Destination-MAC                                                                                  | MAC address of the destination FMEP interface.                         |
| Ethertype                                                                                        | EtherType protocol.                                                    |
| received response from fmep-id                                                                   | ID of the FMEP sending the response.                                   |

## Sample Output

### ping fabric unicast-flow

```
user@host> ping fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1 verbose
```

```
Fabric flow ping between source ED1494 destination ED1497
Using fabric flow-specification: fspec1
Ethernet frame-size: 256
Source-MAC: 0:2:B1:61:3B:96
Destination-MAC: 0:26:78:90:70:21
EtherType: 8295
received response from fmep-id 2...
sent 1 requests, received 1 responses
```

### ping fabric unicast-flow (With

```
user@host> ping fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1 verbose
```

```
Fabric flow ping between source ED1494 destination ED1497
```

**Masking Enabled on  
the Flow Specification)**

```
Using fabric flow-specification: fspec1
Ethernet frame-size: 256
Source-MAC: 0:1:20:A0:0:1
Destination-MAC: 0:8A:3A:B3:7D:67
Source-MAC Mask: FF:F8:FF:FF:FF:FF
Ethertype: 26785
Current Source-MAC value: 0:1:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:2:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:3:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:4:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:5:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:6:20:a0:0:1
received response from fmep-id 2...
Current Source-MAC value: 0:7:20:a0:0:1
received response from fmep-id 2...
sent 7 requests, received 7 responses

| Description              | Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options                  | <b>&lt;trap&gt;</b> —Name of the trap to spoof.<br><br><b>variable-bindings &lt;object&gt; &lt;instance&gt; &lt;value&gt;</b> —(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, <b>ifIndex[14] = 14</b> ). Enclose the list of variable bindings in quotation marks ( " ") and use a comma to separate each object name, instance, and value definition (for example, <b>variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"</b> ). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.<br><br><b>&lt;dummy name&gt;</b> —A dummy trap name to display the list of available traps.<br><br><b>Question mark (?)</b> —Question mark? to display possible completions. |
| Required Privilege Level | request                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

request snmp  
spooof-trap (with  
Variable Bindings)

```
user@host> request snmp spooof-trap linkUp variable-bindings "ifIndex[14] = 14, ifAdminStatus[14]
= 1, ifOperStatus[14] = 2"
Spooof trap request result: trap sent successfully
```

request snmp  
spooof-trap (Illegal  
Trap Name)

```
user@host> request snmp spooof-trap xx
Spooof trap request result: trap not found
```

```

| Ethernet frame size     | Ethernet frame size in bytes.                                                                                                                                                    |
| Ether type              | EtherType protocol.                                                                                                                                                              |
| Source-MAC              | MAC address of the source FMEP interface.                                                                                                                                        |

Table 507: show oam fabric flow-specification Output Fields (*continued*)

| Field Name                     | Field Description                                   |
|--------------------------------|-----------------------------------------------------|
| Source-MAC Mask                | MAC address mask of the source FMEP interface.      |
| Destination-MAC                | MAC address of the destination FMEP interface.      |
| Destination-MAC Mask           | MAC address mask of the destination FMEP interface. |
| Source-IP                      | IP address of the source FMEP interface.            |
| Source-IP Mask                 | IP address mask of the source FMEP interface.       |
| Destination-IP                 | IP address of the destination FMEP interface.       |
| Destination-IP mask            | IP address mask of the destination FMEP interface.  |
| IP-Protocol                    | IPv4 protocol configured.                           |
| Source-L4-Port                 | Source TCP or UDP port.                             |
| Destination-L4-Port            | Destination TCP or UDP port.                        |
| Destination multicast group IP | IP address of the destination multicast group.      |

## Sample Output

show oam fabric  
flow-specification (All)

```
user@host> show oam fabric flow-specification

Flow specification name : fspec1 Type : Ethernet
  Ethernet frame size : Unspecified
  Ether type : Unspecified
  Source-MAC : Unspecified
  Source-MAC Mask : Unspecified
  Destination-MAC : Unspecified
  Destination-MAC Mask : Unspecified
Flow specification name : fspec2 Type : Ethernet
  Ethernet frame size : Unspecified
  Ether type : 1792
  Source-MAC : 0:0:a0:f0:cc:22
  Source-MAC Mask : Unspecified
  Destination-MAC : 0:11:22:33:a0:e2
  Destination-MAC Mask : Unspecified
Flow specification name : fspec3 Type : Ethernet Unicast IPv4
  Ethernet frame size : Unspecified
  Source-IP : 121.0.0.1
  Source-IP Mask : Unspecified
  Destination-IP : 132.1.0.1
  Destination-IP Mask : Unspecified
  Destination-mac : Unspecified
  IP-protocol : TCP
  Source-L4-port : 270
  Destination-L4-port : Unspecified
Flow specification name : fspec4 Type : Multicast IPv4
  Ethernet frame size : Unspecified
  Source IP : 100.0.0.23
  Destination multicast group IP: 225.0.0.1
Flow specification name : fspec5 Type : Multicast VLAN flood
  Ethernet frame size : Unspecified
```

show oam fabric  
flow-specification  
(Flow Specification  
Specified)

```
user@host> show oam fabric flow-specification fspec3

Flow specification name : fspec3 Type : Ethernet Unicast IPv4
  Ethernet frame size : Unspecified
  Source-IP : 121.0.0.1
  Source-IP Mask : Unspecified
  Destination-IP : 132.1.0.1
  Destination-IP Mask : Unspecified
  Destination-mac : Unspecified
  IP-protocol : TCP
  Source-L4-port : 270
  Destination-L4-port : Unspecified
```

**Table 509: show sflow Output Fields**

| Field Name          | Field Description                                                                                                  | Level of Output |
|---------------------|--------------------------------------------------------------------------------------------------------------------|-----------------|
| sFlow               | Status of the feature: <b>Enabled</b> or <b>Disabled</b> .                                                         | All levels      |
| Sample limit        | Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second. | All levels      |
| Polling interval    | Interval at which the sFlow agent polls the interface.                                                             | All levels      |
| Sample rate egress  | Rate at which egress packets are sampled.                                                                          | All levels      |
| Sample rate ingress | Rate at which ingress packets are sampled.                                                                         | All levels      |
| Agent ID            | IP address assigned to the sFlow agent.                                                                            | All levels      |
| Source IP address   | Source IP address for the sFlow packets.                                                                           | All levels      |

## Sample Output

```
show sflow                user@host> show sflow

sFlow                      : Enabled
Sample limit               : 300 packets/second
Polling interval          : 20 second
Sample rate egress         : 1:2048: Disabled
Sample rate ingress        : 1:1000: Enabled
Agent ID                   : 10.93.54.7
Source IP address          : 10.93.54.7
```

Output fields are listed in the approximate order in which they appear.                                                                                                                                              |

**Table 511: show sflow interface Output Fields**

| Field Name                  | Field Description                                      | Level of Output |
|-----------------------------|--------------------------------------------------------|-----------------|
| Interface                   | Interface on which sFlow technology is enabled.        | All levels      |
| Status Egress               | Indicates whether an egress sample rate is enabled.    | All levels      |
| Status Ingress              | Indicates whether an ingress sample rate is enabled.   | All levels      |
| Sample rate Egress          | Rate at which egress packets are sampled.              | All levels      |
| Sample rate Ingress         | Rate at which ingress packets are sampled.             | All levels      |
| Adapted sample rate Egress  | Adapted rate at which egress packets are sampled.      | All levels      |
| Adapted sample rate Ingress | Adapted rate at which ingress packets are sampled.     | All levels      |
| Polling-interval            | Interval at which the sFlow agent polls the interface. | All levels      |

## Sample Output

**show sflow interface**  
(QFX3500 Switch in  
Standalone Mode)

```
user@host> show sflow interface
Interface  Status      Sample rate      Adapted sample rate  Polling-interval
          Egress Ingress  Egress Ingress  Egress Ingress
xe-0/0/0.0  Enabled Disabled  1000    2048    1000    2048
xe-1/0/1.0  Enabled Disabled  1000    2048    1000    2048
   20
   20
```

## Sample Output

**show sflow interface**  
(QFabric System)

```
user@host> show sflow interface
Interface  Status      Sample rate      Adapted sample rate  Polling-interval
          Egress Ingress  Egress Ingress  Egress Ingress
node1:xe-0/0/0.0  Enabled Disabled  1000    2048    1000    2048
20
node2:xe-1/0/1.0  Enabled Disabled  1000    2048    1000    2048
20
node4:xe-1/0/0.0  Enabled Disabled  1000    2048    1000    2048
20
```

## show snmp health-monitor

| <b>Output Fields</b>            | <a href="#">Table 513 on page 5788</a> describes the output fields for the <b>show snmp inform-statistics</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 513: show snmp inform-statistics Output Fields**

| Field Name            | Field Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Target Name</b>    | Name of the device configured to receive and respond to SNMP informs.                                                                              |
| <b>Address</b>        | IP address of the target device.                                                                                                                   |
| <b>Sent</b>           | Number of informs sent to the target device and acknowledged by the target device.                                                                 |
| <b>Pending</b>        | Number of informs held in memory pending a response from the target device.                                                                        |
| <b>Discarded</b>      | Number of informs discarded after the specified number of retransmissions to the target device were attempted.                                     |
| <b>Timeouts</b>       | Number of informs that did not receive an acknowledgement from the target device within the timeout specified.                                     |
| <b>Probe Failures</b> | Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address). |

## Sample Output

`show snmp`  
`inform-statistics`

```
user@host> show snmp inform-statistics
Inform Request Statistics:
Target Name: TA1_v3_md5_none Address: 172.17.20.184
Sent: 176, Pending: 0
Discarded: 0, Timeouts: 0, Probe Failures: 0
Target Name: TA2_v3_sha_none Address: 192.168.110.59
Sent: 0, Pending: 4
Discarded: 84, Timeouts: 0, Probe Failures: 258
Target Name: TA5_v2_none Address: 172.17.20.184
Sent: 0, Pending: 0
Discarded: 2, Timeouts: 10, Probe Failures: 0
```

## show snmp mib

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>get</b>—Retrieve and display one or more SNMP object values.</p> <p><b>get-next</b>—Retrieve and display the next SNMP object values.</p> <p><b>walk</b>—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p><b>ascii</b>—Display the SNMP object's string indices as an ASCII-key representation.</p> <p><b>decimal</b>—Display the SNMP object values in the decimal (default) format. The <b>decimal</b> option is the default option for this command. Therefore, issuing the <b>show snmp mib (get   get-next   walk) decimal object-id</b> and the <b>show snmp mib (get   get-next   walk) object-id</b> commands display the same output.</p> <p><b>object-id</b>—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as <b>interfaces</b>). When entering multiple objects, enclose the objects in quotation marks.</p> |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Current value</b>       | Current value of the monitored variable in the most recent sample interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |

## Sample Output

### show snmp rmon

```
user@host> show snmp rmon
Alarm
Index Variable description Value State

5 monitor
jnxOperatingCPU.9.1.0.0 5 falling threshold

Event
Index Type Last Event
1 log and trap 2009-07-10 11:34:17 PDT
Event Index: 1
Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
Time: 2009-07-10 11:34:07 PDT
Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
Time: 2009-07-10 11:34:17 PDT
```

### show snmp rmon alarms detail

```
user@host> show snmp rmon alarms detail
Alarm Index 5:
Variable name jnxOperatingCPU.9.1.0.0
Variable OID 1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0
Sample type absolute value
Startup alarm rising or falling alarm
Owner monitor

Creator CLI
State active
Sample interval 5 seconds
Rising threshold 90
Falling threshold 75
Rising event index 1
Falling event index 1
Instance Value: 4
Instance State: falling threshold
```

### show snmp rmon events detail

```
user@host> show snmp rmon events detail
Event Index 1:
Description rmon event
Type log and trap
Community rmon-trap-group
Last event 2009-07-10 11:34:17 PDT
Creator CLI

## traceroute fabric unicast-flow

**Syntax** `traceroute fabric unicast-flow flow-spec-name flow-specification-name fma fma-name  
 <source-fmep fmep-name>  
 <dest-fmep fmep-name>  
 <forced-fte-interface fte-interface>  
 <count count>  
 <verbose>`

**Release Information** Command introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Trace the path taken by a specific unicast flow (ping) operation across a VLAN on the QFabric system from a source maintenance endpoint (FMEP) to a destination FMEP. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices.

The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the protocol data unit (PDU) travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

**NOTE:** This command is not supported on the QFX3000-M QFabric system.

**Options** `dest-fmep-id source-fmep-id`—(Optional) ID of the destination FMEP of the traceroute operation.

`flow-spec-name flow-specification-name`—Name of the flow specification that defines the parameters of the traceroute operation.

`fma-name fma-name`—Name of the FMA that associates a VLAN with the FMEPs.

`forced-fte-interface fte-interface`—(Optional) Option to force the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.

`source-fmep-id source-fmep-id`—(Optional) ID of the FMEP that is the source of the traceroute operation.

`verbose`—(Optional) Detailed version of the output display.

**Required Privilege Level** `interface`—To view this statement in the configuration.  
`interface-control`—To add this statement to the configuration.

**Output Fields**    [Table 518 on page 5807](#) lists the output fields for the **traceroute fabric-unicast-flow** command. Output fields are listed in the approximate order in which they appear.

**Table 518: traceroute fabric unicast-flow Output Fields**

| Field Name                                                                                             | Field Description                                                                                      |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Fabric flow traceroute between source <i>source-fmep-name</i> destination <i>destination-fmep-name</i> | Source and destination FMEP names.                                                                     |
| Using fabric flow-specification                                                                        | Name of the flow specification.                                                                        |
| Ethernet frame-size                                                                                    | Ethernet frame size.                                                                                   |
| Source-MAC                                                                                             | MAC address of the source FMEP interface.                                                              |
| Destination-MAC                                                                                        | MAC address of the destination FMEP interface.                                                         |
| Ethertype                                                                                              | EtherType protocol.                                                                                    |
| Received response from fmip-id, interface                                                              | FMIP identifier and interface name of the FMIP that received the PDU and responded to the source FMEP. |
| Received total <i>number</i> responses                                                                 | Number of responses that are received after the traceroute operation has finished.                     |

## Sample Output

**traceroute fabric  
unicast-flow**

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2  
flow-spec-name fspec1  
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2  
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8  
Received response from fmep-id 2  
Received total 3 responses
```

## Sample Output

**traceroute fabric  
unicast-flow  
(Verbose)**

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2  
flow-spec-name fspec1 verbose  
Fabric flow traceroute between source ED1494 destination ED1497  
Using fabric flow-specification: fspec1  
Ethernet frame-size: 256  
Source-MAC: 0:EF:7:99:85:10  
Destination-MAC: 0:D3:A6:11:39:21  
Ethertype: 11564  
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2  
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8  
Received response from fmep-id 2  
Received total 3 responses
```

## Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 519 on page 5809](#) provides a list of some of the troubleshooting resources.

**Table 519: Troubleshooting Resources on the QFX Series**

| Troubleshooting Resource              | Description                                                                                                                                               | Documentation                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Chassis alarms                        | Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch. | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 5826</a> |
| Chassis Status LEDs and Fan Tray LEDs | A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.                | Chassis Status LEDs on a QFX3500 Device                                   |
| Interface alarms                      | A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.                                           | <a href="#">“Interface Alarm Messages” on page 5829</a>                   |
| System alarms                         | A predefined alarm is triggered by a missing rescue configuration or problem with the software license.                                                   | <a href="#">“Understanding Alarms” on page 5825</a>                       |

Table 519: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource                      | Description                                                                                                                                                                                                                                                                                                                                                                                                | Documentation                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System log messages                           | The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 5505</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 5551</a></li> </ul>                                                                                                                                                                                                     |
| Junos OS operational mode commands            | Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 277</a></li> <li>• <a href="#">Monitoring System Properties on page 278</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>                                                                                                                                                                                           |
| Junos OS automation scripts (event scripts)   | Event scripts can be used to automate network troubleshooting and management tasks.                                                                                                                                                                                                                                                                                                                        | Junos OS Configuration and Operations Automation Guide                                                                                                                                                                                                                                                                                                                                                                            |
| Junos OS XML operational tags                 | XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.                                                                                                                                                                                                                                                    | <i>Junos XML API Operational Reference</i>                                                                                                                                                                                                                                                                                                                                                                                        |
| NETCONF XML management protocol               | The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <i>NETCONF XML Management Protocol Guide</i>                                                                                                                                                                                                                                                                                                                                                                                      |
| SNMP MIBs and traps                           | MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• <a href="#">Juniper Networks Enterprise-Specific MIBs on page 5484</a></li> <li>• <a href="#">Juniper Networks Enterprise-Specific SNMP Version 1 Traps on page 5498</a></li> <li>• <a href="#">Juniper Networks Enterprise-Specific SNMP Version 2 Traps on page 5500</a></li> <li>• <a href="#">Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS</a></li> </ul> |
| AI-Scripts and Advanced Insight Manager (AIM) | AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.                                                                                                                                                   | <i>Advanced Insight Scripts (AI-Scripts) Release Notes</i>                                                                                                                                                                                                                                                                                                                                                                        |

| Troubleshooting Resource        | Description                                                                                                                                                                                                                                                                                                                                 | Documentation                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Junos Space Service Now         | This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.                                                          | Service Automation                                        |
| Junos Space Service Insight     | This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. | Service Automation                                        |
| Juniper Networks Knowledge Base | You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.                                                                                                                                                                                                                        | <a href="http://kb.juniper.net">http://kb.juniper.net</a> |

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 520 on page 5811](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 520: Troubleshooting on the QFX Series

| Problem Category           | Symptom or Problem                                                          | Recommended Action                                                                             |
|----------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Switch hardware components | LCD panel shows a chassis alarm count.                                      | See “Chassis Alarm Messages on a QFX3500 Device” on page 5826.                                 |
|                            | Fan tray LED is blinking amber.                                             | See Fan Tray LED on a QFX3500 Device.                                                          |
|                            | Chassis status LED for the power is blinking amber.                         | See Chassis Status LEDs on a QFX3500 Device.                                                   |
|                            | Chassis status LED for the fan (on the management board) is blinking amber. | Replace the management board as soon as possible. See Chassis Status LEDs on a QFX3500 Device. |

Table 520: Troubleshooting on the QFX Series (*continued*)

| Problem Category               | Symptom or Problem                                                                                          | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port configuration             | Cannot configure a port as a Gigabit Ethernet port.                                                         | <p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                | Cannot configure a port as a Fibre Channel port.                                                            | <p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | Cannot configure a port as a 10-Gigabit Ethernet port.                                                      | <p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p> |
|                                | Cannot configure a 40-Gbps QSFP+ interface.                                                                 | <p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                         |
| External devices (USB devices) | Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state. | Unplug the USB device and reboot the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Initial device configuration   | Cannot configure management Ethernet ports.                                                                 | <p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. ## Recovering from a Failed Software Installation

**Problem** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **ftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

```
rollback <number>
```

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.

- **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
- **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.

7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into.  
  
The terminal emulation screen on your management device displays the switch's boot sequence.
10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:  
  
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
  
ok **boot -s**
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
  
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  
  
user@switch# **set system root-authentication plain-text-password**
15. At the following prompt, enter the new root password. For example:  
  
New password: **juniper1**  
Retype new password:
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  
  
root@host# **commit**  
commit complete
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.  
  
Reboot the system? [y/n] **y**

## Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 519 on page 5809](#) provides a list of some of the troubleshooting resources.

**Table 521: Troubleshooting Resources on the QFX Series**

| Troubleshooting Resource              | Description                                                                                                                                               | Documentation                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Chassis alarms                        | Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch. | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 5826</a> |
| Chassis Status LEDs and Fan Tray LEDs | A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.                | Chassis Status LEDs on a QFX3500 Device                                   |
| Interface alarms                      | A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.                                           | <a href="#">“Interface Alarm Messages” on page 5829</a>                   |
| System alarms                         | A predefined alarm is triggered by a missing rescue configuration or problem with the software license.                                                   | <a href="#">“Understanding Alarms” on page 5825</a>                       |

Table 521: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource                      | Description                                                                                                                                                                                                                                                                                                                                                                                                | Documentation                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System log messages                           | The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 5505</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 5551</a></li> </ul>                                                                                                                                                                                                     |
| Junos OS operational mode commands            | Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 277</a></li> <li>• <a href="#">Monitoring System Properties on page 278</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>                                                                                                                                                                                           |
| Junos OS automation scripts (event scripts)   | Event scripts can be used to automate network troubleshooting and management tasks.                                                                                                                                                                                                                                                                                                                        | Junos OS Configuration and Operations Automation Guide                                                                                                                                                                                                                                                                                                                                                                            |
| Junos OS XML operational tags                 | XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.                                                                                                                                                                                                                                                    | <i>Junos XML API Operational Reference</i>                                                                                                                                                                                                                                                                                                                                                                                        |
| NETCONF XML management protocol               | The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <i>NETCONF XML Management Protocol Guide</i>                                                                                                                                                                                                                                                                                                                                                                                      |
| SNMP MIBs and traps                           | MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• <a href="#">Juniper Networks Enterprise-Specific MIBs on page 5484</a></li> <li>• <a href="#">Juniper Networks Enterprise-Specific SNMP Version 1 Traps on page 5498</a></li> <li>• <a href="#">Juniper Networks Enterprise-Specific SNMP Version 2 Traps on page 5500</a></li> <li>• <a href="#">Using the Traceroute MIB for Remote Monitoring Devices Running Junos OS</a></li> </ul> |
| AI-Scripts and Advanced Insight Manager (AIM) | AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.                                                                                                                                                   | <i>Advanced Insight Scripts (AI-Scripts) Release Notes</i>                                                                                                                                                                                                                                                                                                                                                                        |

Table 521: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource        | Description                                                                                                                                                                                                                                                                                                                                 | Documentation                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Junos Space Service Now         | This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.                                                          | Service Automation                                        |
| Junos Space Service Insight     | This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. | Service Automation                                        |
| Juniper Networks Knowledge Base | You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.                                                                                                                                                                                                                        | <a href="http://kb.juniper.net">http://kb.juniper.net</a> |

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 520 on page 5811](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 522: Troubleshooting on the QFX Series

| Problem Category           | Symptom or Problem                                                          | Recommended Action                                                                             |
|----------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Switch hardware components | LCD panel shows a chassis alarm count.                                      | See “Chassis Alarm Messages on a QFX3500 Device” on page 5826.                                 |
|                            | Fan tray LED is blinking amber.                                             | See Fan Tray LED on a QFX3500 Device.                                                          |
|                            | Chassis status LED for the power is blinking amber.                         | See Chassis Status LEDs on a QFX3500 Device.                                                   |
|                            | Chassis status LED for the fan (on the management board) is blinking amber. | Replace the management board as soon as possible. See Chassis Status LEDs on a QFX3500 Device. |

## Understanding Alarms

The QFX Series support different alarm types and severity levels. [Table 523 on page 5826](#) provides a list of alarm terms and definitions that may help you in monitoring the device.

Table 523: Alarm Terms and Definitions

| Term                  | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarm                 | Signal alerting you to conditions that might prevent normal operation. On the device, alarm indicators include the LCD panel and LEDs on the front. The LCD panel displays the chassis alarm message count. Blinking amber LEDs indicate yellow alarm conditions for chassis components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Alarm condition       | Failure event that triggers an alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Alarm severity levels | <p>Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).</p> <ul style="list-style-type: none"> <li>Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action. <ul style="list-style-type: none"> <li>One or more hardware components have failed.</li> <li>One or more hardware components have exceeded temperature thresholds.</li> <li>An alarm condition configured on an interface has triggered a critical warning.</li> </ul> </li> <li>Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance. For example, a missing rescue configuration generates a yellow system alarm.</li> </ul> |
| Alarm types           | <p>Alarms include the following types:</p> <ul style="list-style-type: none"> <li>Chassis alarm—Predefined alarm triggered by a physical condition on the device such as a power supply failure or excessive component temperature.</li> <li>Interface alarm—Alarm you configure to alert you when an interface link is down. Applies to <b>ethernet</b>, <b>fibre-channel</b>, and <b>management-ethernet</b> interfaces. You can configure a red (major) or yellow (minor) alarm for the link-down condition, or have the condition ignored.</li> <li>System alarm—Predefined alarm triggered by a missing rescue configuration or failure to install a license for a licensed software feature.</li> </ul>                                                                                                                                                                                                             |

## Chassis Alarm Messages on a QFX3500 Device

Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

The chassis alarm message count is displayed on the LCD panel on the front of the device. To view the chassis alarm message text remotely, use the **show chassis lcd** CLI command.

Chassis alarms on QFX3500 devices have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the conditions described in [Table 524 on page 5827](#). A red alarm condition requires immediate action.

- Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

Table 524 on page 5827 describes the chassis alarm messages on QFX3500 devices.

**Table 524: QFX3500 Chassis Alarm Messages**

| Component | Alarm Type  | CLI Message                               | Recommended Action                                                                                                                                                                                                                                                                                                        |
|-----------|-------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fans      | Major (red) | <b>Fan/Blower Absent</b>                  | The fan is missing. Install a fan.                                                                                                                                                                                                                                                                                        |
|           |             | <b>Fan Failure</b>                        | Replace the fan and report the failure to customer support.                                                                                                                                                                                                                                                               |
|           |             | <b>Fan I2C Failure</b>                    | Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li>• <b>CM ENV Monitor: Get fan speed failed.</b></li> <li>• <b><i>Fan-number</i> is NOT spinning @ correct speed</b>, where <i>fan-number</i> may be 1, 2, or 3.</li> </ul> |
|           |             | <b>Fan <i>fan-number</i> Not Spinning</b> | Remove and check the fan for obstructions, and then reinsert the fan. If the problem persists, replace the fan.                                                                                                                                                                                                           |

Table 524: QFX3500 Chassis Alarm Messages (*continued*)

| Component      | Alarm Type     | CLI Message                                                       | Recommended Action                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|----------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power supplies | Major (red)    | <b>PEM <i>pem-number</i> Airflow not matching Chassis Airflow</b> | The power supply airflow direction is the opposite of the chassis airflow direction. Replace the power supply with a power supply that supports the same airflow direction as the chassis.                                                                                                                                                                                           |
|                |                | <b>PEM <i>pem-number</i> I2C Failure</b>                          | Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li><b>I2C Read failed for device <i>number</i>,</b> where <i>number</i> may be from 123 to 125.</li> <li><b>PS <i>number</i>: Transitioning from online to offline,</b> where power supply (PS) <i>number</i> may be 1 or 2.</li> </ul> |
|                |                | <b>PEM <i>pem-number</i> is not powered</b>                       | For information only. Check the power cord connection and reconnect it if necessary.                                                                                                                                                                                                                                                                                                 |
|                |                | <b>PEM <i>pem-number</i> is not supported</b>                     | Indicates a power supply problem, or the power supply is not supported on the device. Report the problem to customer support.                                                                                                                                                                                                                                                        |
|                |                | <b>PEM <i>pem-number</i> Not OK</b>                               | Indicates a problem with the incoming AC or outgoing DC power. Replace the power supply.                                                                                                                                                                                                                                                                                             |
|                | Minor (yellow) | <b>PEM <i>pem-number</i> Absent</b>                               | For information only. Indicates the device was powered on with two power supplies installed, but now one is missing. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.                                                                                                               |
|                |                | <b>PEM <i>pem-number</i> Power Supply Type Mismatch</b>           | For information only. Indicates that an AC power supply and DC power supply have been installed in the same chassis. If you wish to remove this alarm message, reboot the device with two AC power supplies or two DC power supplies.                                                                                                                                                |
|                |                | <b>PEM <i>pem-number</i> Removed</b>                              | For information only. Indicates the device was powered on with two power supplies installed, but one has been removed. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.                                                                                                             |

Table 524: QFX3500 Chassis Alarm Messages (*continued*)

## Interface Alarm Messages

Interface alarms are alarms that you configure to alert you when an interface is down.

To configure an interface link-down condition to trigger a red or yellow alarm, or to configure the link-down condition to be ignored, use the **alarm** statement at the **[edit chassis]** hierarchy level. You can specify the **ethernet**, **fibre-channel**, or **management-ethernet** interface type.

**NOTE:** Fibre Channel alarms are only valid on QFX3500 devices.

By default, major alarms are configured for interface link-down conditions on the control plane and management network interfaces in a QFabric system. The link-down alarms indicate that connectivity to the control plane network is down. You can configure these alarms to be ignored using the **alarm** statement at the **[edit chassis]** hierarchy level.

NOTE: If you configure a yellow alarm on the QFX3008-I Interconnect device, it will be handled as a red alarm.

## Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

```
Alarm
```

| Index | Variable description                                                         | Value | State  |
|-------|------------------------------------------------------------------------------|-------|--------|
| 32768 | Health Monitor: root file system utilization<br>jnxHrStoragePercentUsed.1    | 58    | active |
| 32769 | Health Monitor: /config file system utilization<br>jnxHrStoragePercentUsed.2 | 0     | active |

```
32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0            35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                          0 active
      Chassis daemon                      50 active
      Firewall daemon                     0 active
      Interface daemon                    5 active
      SNMP daemon                         11 active
      MIB2 daemon                         42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

```
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
    file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
    flag flag;
    no-remote-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 5834](#)
- [Configuring Access to the Log File on page 5834](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 5834](#)
- [Configuring the Trace Operations on page 5834](#)

### Configuring the Number and Size of SNMP Log Files

---

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### Configuring Access to the Log File

---

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

---

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

---

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
```

```

configuration;
database;
events;
general;
interface-stats;
nonvolatile-sets;
pdu;
policy;
protocol-timeouts;
routing-socket;
server;
subagent;
timer;
varbind-error;
}

```

Table 500 on page 5734 describes the meaning of the SNMP tracing flags.

**Table 525: SNMP Tracing Flags**

| Flag                     | Description                                                                 | Default Setting |
|--------------------------|-----------------------------------------------------------------------------|-----------------|
| <b>all</b>               | Log all operations.                                                         | Off             |
| <b>configuration</b>     | Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level. | Off             |
| <b>database</b>          | Log events involving storage and retrieval in the events database.          | Off             |
| <b>events</b>            | Log important events.                                                       | Off             |
| <b>general</b>           | Log general events.                                                         | Off             |
| <b>interface-stats</b>   | Log physical and logical interface statistics.                              | Off             |
| <b>nonvolatile-set</b>   | Log nonvolatile SNMP set request handling.                                  | Off             |
| <b>pdu</b>               | Log SNMP request and response packets.                                      | Off             |
| <b>policy</b>            | Log policy processing.                                                      | Off             |
| <b>protocol-timeouts</b> | Log SNMP response timeouts.                                                 | Off             |
| <b>routing-socket</b>    | Log routing socket calls.                                                   | Off             |
| <b>server</b>            | Log communication with processes that are generating events.                | Off             |
| <b>subagent</b>          | Log subagent restarts.                                                      | Off             |
| <b>timer</b>             | Log internal timer events.                                                  | Off             |

Table 525: SNMP Tracing Flags (*continued*)

| Flag                 | Description                  | Default Setting |
|----------------------|------------------------------|-----------------|
| <b>varbind-error</b> | Log variable binding errors. | Off             |

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State
-----
5 monitor
   jnxOperatingCPU.9.1.0.0                          5 falling threshold

Event
Index  Type                               Last Event
-----
1 log and trap                         2010-07-10 11:34:17 PDT
Event Index: 1
  Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
  Time: 2010-07-10 11:34:07 PDT
  Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
  Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the **logTable** in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system such as the QFX3500 switch, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysAppElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the **daemon** facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
```

```
SNMP trap: cold start
...
```

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

### Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user **jsmith**.

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 5839](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 5839](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

### Sample Output

```
user@host> monitor interface traffic
host name                               Seconds: 15                               Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0   Down    0              (0)      0              (0)
so-1/1/0   Down    0              (0)      0              (0)
so-1/1/1   Down    0              (0)      0              (0)
so-1/1/2   Down    0              (0)      0              (0)
so-1/1/3   Down    0              (0)      0              (0)
t3-1/2/0   Down    0              (0)      0              (0)
t3-1/2/1   Down    0              (0)      0              (0)
t3-1/2/2   Down    0              (0)      0              (0)
t3-1/2/3   Down    0              (0)      0              (0)
so-2/0/0   Up      211035         (1)      36778          (0)
so-2/0/1   Up      192753         (1)      36782          (0)
so-2/0/2   Up      211020         (1)      36779          (0)
so-2/0/3   Up      211029         (1)      36776          (0)
so-2/1/0   Up      189378         (1)      36349          (0)
so-2/1/1   Down    0              (0)      18747          (0)
so-2/1/2   Down    0              (0)      16078          (0)
so-2/1/3   Up      0              (0)      80338          (0)
at-2/3/0   Up      0              (0)      0              (0)
at-2/3/1   Down    0              (0)      0              (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

## Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:                5856541 (88 bps)
  Output bytes:               6271468 (96 bps)
  Input packets:              157629 (0 pps)
  Output packets:             157024 (0 pps)
Encapsulation statistics:
  Input keepalives:           42353
  Output keepalives:          42320
LCP state: Opened
Error statistics:
  Input errors:                0
  Input drops:                 0
  Input framing errors:        0
  Input runs:                  0
  Input giants:                0
  Policed discards:            0
  L3 incompletes:              0
  L2 channel errors:           0
  L2 mismatch timeouts:        0
  Carrier transitions:         1
  Output errors:               0
  Output drops:                0
  Aged packets:                0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count                    1
  LOF count                    1
  SEF count                    1
  ES-S                         77
  SES-S                        77
SONET statistics:
  BIP-B1                       0
  BIP-B2                       0
  REI-L                        0
  BIP-B3                       0
  REI-P                        0
Received SONET overhead:  F1      : 0x00  J0      : 0xZ
```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see Checklist for Tracking Error Conditions.

To control the output of the command while it is running, use the keys shown in [Table 499 on page 5727](#).

Table 526: Output Control Keys for the monitor interface Command

| Action                                                                                                                                                                                                                       | Key      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command. | <b>N</b> |
| Display information about a different interface. The command prompts you for the name of a specific interface.                                                                                                               | <b>I</b> |
| Freeze the display, halting the display of updated statistics.                                                                                                                                                               | <b>F</b> |
| Thaw the display, resuming the display of updated statistics.                                                                                                                                                                | <b>T</b> |
| Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.                                                                                              | <b>C</b> |
| Stop the <b>monitor interface</b> command.                                                                                                                                                                                   | <b>Q</b> |

See the Junos OS Operational Mode Commands for details on using match conditions with the **monitor traffic** command.

## Pinging Hosts

**Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

**Action** To use the **ping** command to send four requests (ping count) to **host3**:  
**ping host count number**

## Sample Output

```
ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

**Meaning**

- The **ping** results show the following information:
  - Size of the ping response packet (in bytes).
  - IP address of the host from which the response was sent.

- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

## Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
```

Possible completions:

|           |                                             |
|-----------|---------------------------------------------|
| <[Enter]> | Execute this command                        |
| at        | Time at which to perform the operation      |
| in        | Number of minutes to delay before operation |
| media     | Boot media for next boot                    |
| message   | Message to display to all users             |
|           | Pipe through a command                      |

```
user@switch> request system reboot
```

```
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
at             Time at which to perform the operation
in            Number of minutes to delay before operation
media         Boot media for next boot
message       Message to display to all users
|             Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

## Recovering from a Failed Software Installation

**Problem** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.

2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **ftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.

4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:

- Bits per second: 9600
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None

9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into

The terminal emulation screen on your management device displays the switch's boot sequence.

10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot-s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1  
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit  
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.
  20. At the prompt, enter **y** to reboot the switch.
- ```
Reboot the system? [y/n] y
```

Documentation**

- [Configuring the Root Password on page 1222](#)

## Creating an Emergency Boot Device for a QFX Series Device

If Junos OS on the QFX Series is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX3500 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device from a QFX3500 device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the QFX3500 device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the QFX3500 device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
```

```
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

#### Related Documentation

## Performing a Recovery Installation on a QFX3008-I, QFX3600-I, QFX3600, or QFX3500 Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device for a QFX Series Device” on page 140](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September 4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September 4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September 4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.

7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- [\(Optional\) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 5851](#)
- [Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 5852](#)

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The **Junos Platforms Download Software** page appears.

2. In the **QFX Series** section of the **Junos Platforms - Download Software** download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the **Release:** pull-down window to the right of the tabs on the **Download Software** page.
4. Click the **Software** tab and select the complete install media you want to download in the **QFabric System Install Media** section.

A login screen appears.

5. Enter your name and password and press **Enter**.
6. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
7. Log in and save the install media file to your UNIX workstation.
8. Use FTP to access the UNIX workstation where the install media resides.

```
ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz
```

9. When prompted, enter your username and password.
10. Make sure you are in binary mode by entering **binary** at the prompt.

**binary**

11. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

```
get install-media-qfabric-<version>.img.tgz
```

12. Close the FTP session:

**bye**

13. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.

```
tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
```

14. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.

15. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

```
dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
```

```
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```

16. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 89](#) to continue with the recovery installation.

### Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

---

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n]

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the **mount** directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n] y

Initial Configuration

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n] : y

Please specify the full path of the configuration backup file. :  
/mnt/myusb/mybackup-20110907

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```
Saving temporary configuration...
```

```
Configuring peer...
```

```
connect error for 1.1.1.2:9001
```

```
Configuring local interfaces...
```

```
Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]
```

```
Configured interface eth0 with [10.49.213.163/24:10.49.213.254]
```

```
Configuring QFabric software with initial pool of 4000 MAC addresses
[00:10:00:00:00:00 - 00:10:00:00:0f:3b]
Configuring QFabric address [10.49.213.50]
Reconfiguring QFabric software static configuration
Applying the new Director Device password
Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed.  
Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

## Configuration and File Management

- [Loading a Previous Configuration File on page 5856](#)
- [Reverting to the Default Factory Configuration on page 5857](#)
- [Reverting to the Rescue Configuration on page 5857](#)
- [Cleaning Up the System File Storage Space on page 5858](#)

### Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

```
rollback <number>
```

#### Options

- **none**—Return to the most recently saved configuration.
- ***number***—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 29](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related Documentation**

- [Understanding Configuration Files on page 1113](#)
- [Loading a Previous Configuration File on page 1122](#)
- [Reverting to the Rescue Configuration on page 150](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.
- ```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

#### Related Documentation

- [Setting or Deleting the Rescue Configuration on page 1131](#)
- [Reverting to the Default Factory Configuration on page 148](#)
- [Configuration File Terms on page 29](#)

## Cleaning Up the System File Storage Space

**Problem** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

```
user@switch% cli
user@switch> configure
/var: write failed, filesystem is full
```

**Solution** Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

```
user@switch> request system storage cleanup
```

The list of files to be deleted is displayed.

List of files to delete:

- [Troubleshooting Q-in-Q and VLAN Translation Configuration on page 5863](#)

## Troubleshooting Ethernet Switching

**Problem** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution** Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)
 

```
[edit system arp]
user@switch# set aging-timer 3
```
2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)
 

```
[edit vlans]
```

```
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

## Troubleshooting Layer 2 Protocol Tunneling

- [Drop Threshold Statistics Might Be Incorrect on page 5860](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 5860](#)

### Drop Threshold Statistics Might Be Incorrect

**Problem** L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

**Solution** This is expected behavior.

### Egress Filtering of L2PT Traffic Not Supported

**Problem** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

## Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

- [Limitations of Private VLANs on page 5861](#)
- [Forwarding with Private VLANs on page 5861](#)
- [Egress Firewall Filters with Private VLANs on page 5862](#)

### Limitations of Private VLANs

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

### Forwarding with Private VLANs

- Problem**
- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the `show ethernet-switching table` command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
  - If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
  - If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
    - The packet has a community VLAN tag.
    - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
  - If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
    - The packet has an isolated VLAN tag.
    - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.
  - If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
  - If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
    - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.

- Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
- Primary VLAN pvlan100 exists on both switches.

If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

**Solution** These are expected behaviors.

---

### Egress Firewall Filters with Private VLANs

---

**Problem** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

## Troubleshooting Q-in-Q and VLAN Translation Configuration

- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 5863](#)
- [Egress Port Mirroring with VLAN Translation on page 5863](#)

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same EtherType.

### Egress Port Mirroring with VLAN Translation

**Problem** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

  - [Example: Setting Up Q-in-Q Tunneling on page 1541](#)

## High Availability

---

- [Troubleshooting VRRP on page 5864](#)

### Troubleshooting VRRP

**Problem** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution** Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

**Related Documentation** • [failover-delay on page 1822](#)

## Interfaces

---

- [Troubleshooting an Aggregated Ethernet Interface on page 5864](#)
- [Troubleshooting Network Interfaces on page 5865](#)

### Troubleshooting an Aggregated Ethernet Interface

**Problem** The `show interfaces terse` command shows that the LAG is down.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

**Related Documentation** • [Verifying the Status of a LAG Interface on page 2124](#)  
• [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 1950](#)

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

**Problem** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Layer 3 Protocols

- [Troubleshooting Virtual Routing Instances on page 5865](#)

## Troubleshooting Virtual Routing Instances

- [Direct Routes Not Leaked Between Routing Instances on page 5865](#)

### Direct Routes Not Leaked Between Routing Instances

**Problem** Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- QFX switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the QFX switch connects to the upstream device over a direct route and these routes are not leaked between instances.

**NOTE:** You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the QFX switch over indirect routes.

**Solution** This is expected behavior.

---

#### [Firewall Filter Configuration Returns a No Space Available in TCAM Message](#)

---

**Problem** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.  
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

### Filter Counts Previously Dropped Packet

---

**Problem** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:

- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
- You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

**Solution** This is expected behavior.

### Matching Packets Not Counted

---

**Problem** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.

For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **admin** VLAN, and interface xe-0/0/1 is a member of that VLAN.

- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

**Solution** This is expected behavior.

### Counter Reset When Editing Filter

**Problem** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

### Cannot Include loss-priority and policer Actions in Same Term

**Problem** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: "cannot support policer action if loss-priority is configured."

**Solution** This is expected behavior.

### Cannot Egress Filter Certain Traffic Originating on QFX Switch

**Problem** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

**Solution** This is expected behavior.

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service

VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same EtherType.

---

### Egress Firewall Filters with Private VLANs

---

**Problem** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

### Egress Filtering of L2PT Traffic Not Supported

**Problem** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

### Cannot Drop BGP Packets in Certain Circumstances

**Problem** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

**Solution** This is expected behavior.

### Invalid Statistics for Policer

**Problem** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

- [Counter Reset When Editing Filter on page 5872](#)
- [Invalid Statistics for Policer on page 5872](#)
- [Egress Policers on QFX3500 Might Allow More Throughput Than is Configured on page 5872](#)

### Incomplete Count of Packet Drops

**Problem** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between

ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

**Solution** This is expected behavior.

---

#### Counter Reset When Editing Filter

**Problem** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

---

#### Invalid Statistics for Policer

**Problem** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

---

#### Egress Policers on QFX3500 Might Allow More Throughput Than is Configured

**Problem** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or node, the measured aggregate policed rate might be twice the configured rate, depending on which interfaces you apply the policer to. This occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15

For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each group is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

This behavior occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

**Solution** This is expected behavior.

- [Troubleshooting Port Mirroring on page 5873](#)

### Troubleshooting Port Mirroring

- [Port Mirroring Constraints and Limitations on page 5873](#)
- [Egress Port Mirroring with VLAN Translation on page 5875](#)

#### Port Mirroring Constraints and Limitations

---

- [Local and Remote Port Mirroring on page 5873](#)
- [Remote Port Mirroring Only on page 5875](#)

#### ***Local and Remote Port Mirroring***

The following constraints and limitations apply to local and remote port mirroring with the QFX Series:

- You can create a total of four port-mirroring configurations on the QFX Series (standalone switches and QFabric systems), subject to the following limits:
  - There can be no more than two configurations that mirror ingress traffic.

- There can be no more than two configurations that mirror egress traffic.
- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a QFX3500 device or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

**Remote Port Mirroring Only**

The following constraints and limitations apply to remote port mirroring with the QFX Series:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

**Egress Port Mirroring with VLAN Translation**

**Problem** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

**Troubleshooting Dropped FCoE Traffic**

**Problem** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

.....

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

.....

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 4509 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Fibre Channel Interface Deletion

**Problem** You deleted a Fibre Channel (FC) interface at the **[edit interfaces]** hierarchy level, but the commit check fails so the interface is not deleted.

**Cause** You must first delete the FC interface from the FC fabric on the QFX Series before you can delete the FC interface at the **[edit interfaces]** hierarchy level. You must perform both operations to delete a FC interface.

**Solution** First delete the interface from the FC fabric and then delete the interface from the QFX Series:

1. Delete the FC interface from the FC fabric to which it belongs:

```
[edit]
user@switch# delete fc-fabrics fabric-name interface interface-name
```

For example, to delete the FC interface **fc-0/0/3.0** from an FC fabric named **sanfab1**:

```
[edit]
user@switch# delete fc-fabrics sanfab1 interface fc-0/0/3.0
```

2. Delete the FC interface at the **[edit interfaces]** hierarchy level:

```
[edit]
user@switch: delete interfaces interface-name
```

For example, to delete the interface **fc-0/0/3.0** from the switch:

```
[edit]
user@switch: delete interfaces fc-0/0/3.0
```

- Related Documentation**

## Troubleshooting Dropped FIP Traffic

**Problem** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped on the QFX Series.

**Cause** The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

**Solution** Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

**NOTE:** Make sure that the native VLAN you are using on the QFX Series is the same native VLAN that the FCoE devices use for Ethernet traffic.

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching port-mode
tagged-access
```

For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure a native VLAN on the interface:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching native-vlan-id
vlan-id
```

For example, to set the native VLAN ID to 1 for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
```

3. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID 1:

```
[edit]
user@switch# set vlans native vlan-id 1
```

## Traffic Management

- [Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth on page 5880](#)
- [Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth on page 5881](#)
- [Troubleshooting Egress Queue Bandwidth Impacted by Congestion on page 5882](#)
- [Troubleshooting an Unexpected Rewrite Value on page 5883](#)
- [Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic on page 5884](#)

### Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG

are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

- Related Documentation**
- [shaping-rate on page 5253](#)
  - [Example: Configuring Maximum Output Bandwidth on page 5044](#)
  - [Example: Configuring Queue Schedulers on page 5030](#)
  - [Understanding CoS Output Queue Schedulers on page 4876](#)

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port

bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause** Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution** The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a tail-drop profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

**Related  
Documentation**

## Troubleshooting an Unexpected Rewrite Value

**Problem** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause** If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution** If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause** Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution** If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 471 on page 5425](#) shows the topology for this example:
