## show system directory-usage

<b>Syntax</b>	show system directory-usage <depth <i>number</i> > <path>
<b>Syntax (EX Series)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (TX Matrix Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   scc> <depth <i>number</i> > <path>
<b>Syntax (TX Matrix Plus Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <depth <i>number</i> > <path>
<b>Syntax (MX Series Router)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (QFX Series)</b>	show system directory-usage <depth <i>number</i> > <path> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display directory usage information.
<b>Options</b>	<p><b>none</b>—Display all directory usage information.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router) or T1600 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.</p>

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

**depth *number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

**infrastructure *name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

**interconnect-device *name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

**node-group *name***— (QFabric systems only) (Optional) Display directory information for the Node group.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

***path***—(Optional) Path or root directory to traverse.

**scc**—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display directory information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

```

## show system license

<b>Syntax</b>	show system license <installed   keys   usage>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display licenses and information about how they are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system license on page 929</a> <a href="#">show system license installed on page 929</a> <a href="#">show system license keys on page 929</a> <a href="#">show system license usage on page 929</a> <a href="#">show system license (QFX Series) on page 930</a>
<b>Output Fields</b>	Table 72 on page 927 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

**Table 72: show system license Output Fields**

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
<b>Licenses used</b>	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>

Table 72: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses installed	<p>Information about the installed license key:</p> <ul style="list-style-type: none"><li>• <b>License identifier</b>—Identifier associated with a license key.</li><li>• <b>State</b>—State of the license key:<b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li><li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li><li>• <b>Valid for device</b>—Device that can use a license key.</li><li>• <b>Group defined</b>—Group membership of a device.</li><li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li></ul>
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

## Sample Output

**show system license**

user@host> show system license

License usage:

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>

- Description** Display information about software processes that are running on the router or switch and that have controlling terminals.
- Options** **none**—Display standard information about system processes.
- brief | detail | extensive | summary**—(Optional) Display the specified level of detail.
- adaptive-services**—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- alarm-control**—(Optional) Display the process to configure the system alarm.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.
- ancpd-service**—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Display the RADIUS accounting process.
- auto-configuration**—Display the Interface Auto-Configuration process.
- bootp**—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.
- captive-portal-content-delivery**—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**cfm**—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

**chassis-control**—(Optional) Display the chassis management process.

**class-of-service**—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**craft-control**—Display the process for the I/O of the craft interface.

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

**datapath-trace-service**—Display the packet path tracing process.

**dhcp-service**—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

**diameter-service**—(Optional) Display the diameter process.

**disk-monitoring**—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

**dynamic-flow-capture**—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**event-processing**—(Optional) Display the event process (eventd).

**firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.

**health** (*pid* ***process-identifier*** | ***process-name*** ***process-name***)—(Optional) Display process health information, either by process id (PID) or by process name.

**iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.

**ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

**inet-process**—Display the IP multicast family process.

**init**—Display the process that initializes the USB modem.

**interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.

**l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**lACP**—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

**local-policy-decision-function**—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**logical-system-mux**—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

**mac-validation**—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**mib-process**—(Optional) Display the MIB II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

**moundd-service**—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

**mpls-traceroute**—(Optional) Display the MPLS Periodic Traceroute process.

**mspd**—(Optional) Display the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**neighbor-liveness**—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

**nfsd-service**—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**ntp**—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

**packet-triggered-subscribers**—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

- pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.
- pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.
- ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.
- ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.
- pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.
- process-monitor**—Display the process health monitor process (pmond).
- providers**—(Optional) Display provider processes.
- redundancy-interface-process**—(Optional) Display the ASP redundancy process.
- remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.
- resource-cleanup**—Display the resource cleanup process.
- resource-limits (brief | detail) *process-name***—(Optional) Display process resource limits.
- routing**—(Optional) Display the routing protocol process.
- sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.
- sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).
- scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).
- sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.
- secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.
- send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

**Additional Information** By default, when you issue the **show system processes** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Output Fields** [Table 73 on page 938](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

**Table 73: show system processes Output Fields**

Field Name	Field Description	Level of Output
<b>last pid</b>	Last process identifier assigned to the process.	brief extensive summary
<b>load averages</b>	Three load averages followed by the current time.	brief extensive summary
<b>processes</b>	Number of existing processes and the number of processes in each state ( <b>sleeping</b> , <b>running</b> , <b>starting</b> , <b>zombies</b> , and <b>stopped</b> ).	brief extensive summary
<b>Mem</b>	Information about physical and virtual memory allocation.	brief extensive summary
<b>Swap</b>	Information about physical and virtual memory allocation.	brief extensive summary
<b>PID</b>	Process identifier.	detail extensive summary
<b>TT</b>	Control terminal name.	none detail

Table 73: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>STAT</b>	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> <li>• <b>D</b>—In disk or other short-term, uninterruptible wait</li> <li>• <b>I</b>—Idle (sleeping longer than about 20 seconds)</li> <li>• <b>R</b>—Runnable</li> <li>• <b>S</b>—Sleeping for less than 20 seconds</li> <li>• <b>T</b>—Stopped</li> <li>• <b>Z</b>—Dead (zombie)</li> <li>• <b>+</b> —The process is in the foreground process group of its control terminal.</li> <li>• <b>&lt;</b>—The process has raised CPU scheduling priority.</li> <li>• <b>&gt;</b>—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped.</li> <li>• <b>A</b>—The process requested random page replacement.</li> <li>• <b>E</b>—The process is trying to exit.</li> <li>• <b>L</b>—The process has pages locked in core.</li> <li>• <b>N</b>—The process has reduced CPU scheduling priority.</li> <li>• <b>S</b>—The process requested first-in, first-out (FIFO) page replacement.</li> <li>• <b>s</b>—The process is a session leader.</li> <li>• <b>V</b>—The process is temporarily suspended.</li> <li>• <b>W</b>—The process is swapped out.</li> <li>• <b>X</b>—The process is being traced or debugged.</li> </ul>	none <b>detail</b>
<b>UID</b>	User identifier.	<b>detail</b>
<b>USERNAME</b>	Process owner.	<b>extensive summary</b>
<b>PPID</b>	Parent process identifier.	<b>detail</b>
<b>CPU</b>	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	<b>detail extensive summary</b>
<b>RSS</b>	Resident set size.	<b>detail</b>
<b>WCHAN</b>	Symbolic name of the wait channel.	<b>detail</b>
<b>STARTED</b>	Local time when the process started running.	<b>detail</b>
<b>PRI</b>	Current priority of the process. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>NI or NICE</b>	UNIX "niceness" value. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>SIZE</b>	Total size of the process (text, data, and stack), in kilobytes.	<b>extensive summary</b>

Table 73: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, <b>sleep</b> , <b>wait</b> , <b>run</b> , <b>idle</b> , <b>zombie</b> , or <b>stop</b> ).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary

## show system reboot

<b>Syntax</b>	show system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   scc> <both-routing-engines>
<b>Syntax (TX Matrix Plus Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <both-routing-engines>
<b>Syntax (MX Series Router)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display pending system reboots or halts.
<b>Options</b>	<p><b>none</b>—Display pending reboots or halts on the active Routing Engine.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all the T1600 routers in the chassis that are connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display halt</p>

or reboot request information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure *name***—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router (or switch-fabric chassis).

**Additional Information** By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** maintenance

**List of Sample Output** [show system reboot on page 961](#)  
[show system reboot all-lcc \(TX Matrix Router\) on page 961](#)  
[show system reboot sfc \(TX Matrix Plus Router\) on page 961](#)  
[show system reboot \(QFX3500 Switch\) on page 961](#)

## Sample Output

**show system reboot**

```
user@host> show system reboot
reboot requested by root at Wed Feb 10 17:40:46 1999
[process id 17885]
```

**show system reboot  
all-lcc (TX Matrix  
Router)**

```
user@host> show system reboot all-lcc
lcc0-re0:
```

```
-----
No shutdown/reboot scheduled.
```

```
lcc2-re0:
```

```
-----
No shutdown/reboot scheduled.
```

**show system reboot  
sfc (TX Matrix Plus  
Router)**

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

**show system reboot  
(QFX3500 Switch)**

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```

## show system resource-cleanup processes

<b>Syntax</b>	show system resource-cleanup processes <detail> <pid <i>number</i> > <process-name <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the list of processes that have been registered for resource cleanup services.
<b>Options</b>	<p><b>detail</b>—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.</p> <p><b>pid <i>number</i></b>—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.</p> <p><b>process-name <i>name</i></b>—(Optional) Display a process that has been registered for resource cleanup services by name of the process.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show system resource-cleanup processes on page 963</a> <a href="#">show system resource-cleanup processes detail on page 963</a>
<b>Output Fields</b>	For a description of the output fields, see <a href="#">Table 74 on page 962</a> . Output fields are listed in the approximate order in which they appear.

**Table 74: show system resource-cleanup processes Output Fields**

Field Name	Field Description
PID	Process ID, a number that identifies a process.
Process name	String that identifies the process.
Resources to clean	Resources that have been registered to be cleaned up.

## Sample Output

**show system  
resource-cleanup  
processes**

```
user@host> show system resource-cleanup processes
PID      Process name      Resources to clean
420      jnx-exampld       GENCFG, SYSV shared memory
```

**show system  
resource-cleanup  
processes detail**

```
user@host> show system resource-cleanup processes detail
PID      Process name      Resources to clean
420      jnx-exampld       GENCFG blob major ID 0x8000, minor ID 0x0000
          SYSV shared memory ID 65536, key 1108955839
          SYSV shared memory ID 65537, key 1108955837
```

## show system rollback

---

**Syntax**    `show system rollback number`  
              `<compare number>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

.....  
**NOTE:** The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.  
.....

**Options**    *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

`compare number`—(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

**Required Privilege Level**    view

**List of Sample Output**    [show system rollback compare on page 965](#)

## Sample Output

```

show system rollback 3 compare 1
compare
user@host> show system rollback 3 compare 1
[edit]
+ interfaces {

```

## show system services service-deployment

<b>Syntax</b>	show system services service-deployment
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about a Session and Resource Control (SRC) client.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	system view
<b>List of Sample Output</b>	<a href="#">show system services service-deployment on page 966</a>
<b>Output Fields</b>	<a href="#">Table 75 on page 966</a> lists the output fields for the <b>show system services service-deployment</b> command. Output fields are listed in the approximate order in which they appear.

**Table 75: show system services service-deployment Output Fields**

Field Name	Field Description
PDT Keepalive settings	Configured PDT keepalive interval, in seconds.
Keepalives sent	Number of keepalives sent.
Notifications sent	Number of notifications sent.
Last update from peer	Time at which the last update from a peer was received.

## Sample Output

### show system services service-deployment

```
user@host> show system services service-deployment
Connected to 192.4.4.4 port 10288 since 2004-05-03 11:04:34 PDT Keepalive settings:
Interval 15 seconds Keepalives sent: 750 Notifications sent: 0 Last update from
peer: 00:00:06 ago
```

## show system software

<b>Syntax</b>	show system software <detail>
<b>Syntax (EX Series Switches)</b>	show system software <all-members> <detail> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system software <all-chassis   all-lcc   lcc <i>number</i>   scc> <detail>
<b>Syntax (TX Matrix Plus Router)</b>	show system software <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <detail>
<b>Syntax (J Series Routers)</b>	show system software <backup> <detail>
<b>Syntax (QFX Series)</b>	show system software <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the Junos OS extensions loaded on your router or switch.
<b>Options</b>	<p><b>none</b>—Display standard information about all loaded Junos OS extensions.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the T1600 routers (TX Matrix Plus Router) in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router</p> <p><b>all-members</b>—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.</p>

**backup**—(J Series routers only) (Optional) Display the status of old system software packages only.

**detail**—(Optional) Display detailed information about available Junos OS extensions.

**infrastructure *name***—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

**node-group *name***—(QFabric systems only) (Optional) Display the system software running on the Node group.

**scc**—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** maintenance

**List of Sample Output** [show system software on page 969](#)  
[show system software \(TX Matrix Plus Router\) on page 969](#)  
[show system software \(QFX Series\) on page 973](#)

**Output Fields** When you enter this command, you are provided a list of Junos OS packages installed on the router and their corresponding Junos OS release number.

## Sample Output

<b>Syntax (MX Series Router)</b>	show system statistics <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system statistics
<b>Release Information</b>	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display system-wide protocol-related statistics.
<b>Options</b>	<b>none</b> —Display system statistics for all the following protocols: <ul style="list-style-type: none"> <li>• <b>arp</b>—Address Resolution Protocol</li> <li>• <b>bridge</b>—IEEE 802.1 Bridging</li> <li>• <b>clns</b>—Connectionless Network Service</li> <li>• <b>esis</b>—End System-to-Intermediate System</li> <li>• <b>ethoamcfm</b>—Ethernet OAM protocol for connectivity fault management</li> <li>• <b>ethoamlfm</b>—Ethernet OAM protocol for link fault management</li> <li>• <b>icmp</b>—Internet Control Message Protocol</li> <li>• <b>icmp6</b>—Internet Control Message Protocol version 6</li> <li>• <b>igmp</b>—Internet Group Management Protocol</li> <li>• <b>ip</b>—Internet Protocol version 4</li> <li>• <b>ip6</b>—Internet Protocol version 6</li> <li>• <b>mpls</b>—Multiprotocol Label Switching</li> <li>• <b>rdp</b>—Reliable Datagram Protocol</li> </ul>

- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Additional Information** By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

## bridge:

## Input:

- 0 packets received
- 0 packets forwarded
- 0 packets failed to forward
- 0 packets dropped
- 0 packets with vmember lookup failures
- 0 packets with vlan lookup failures
- 0 packets with stp state lookup failures
- 0 packets dropped due to stp blocked/listening
- 0 packets dropped due to stp learning
- 0 packets with src MAC learning failures
- 0 packets with input control processing failures

## Forward:

- 0 packets sent successfully
- 0 packets with send failures
- 0 packets forwarded to l3 interface
- 0 packets with l3 send failures
- 0 packets discarded
- 0 packets with l2ifl store failures
- 0 packets with ifl mismatch failures
- 0 packets with packet duplication failures
- 0 packets with tag lookup failures
- 0 packets with no route for DMAC
- 0 packets with no route table
- 0 packets with no nexthop
- 0 packets with dead nexthop
- 0 packets with eof reached error

## Learning:

- 0 MACs learned
- 0 packets sent to l3 interface
- 0 packets with l3 send failures
- 0 packets hit holdq while learning
- 0 MAC moves
- 0 packets discarded
- 0 packets with no route for SMAC
- 0 packets with no nexthop
- 0 packets with dead nexthop
- 0 packets dropped due to no resolve route
- 0 packets with l3 ifd lookup failures
- 0 packets with l3 ifl lookup failures
- 0 packets with l3 invalid rnh
- 0 packets with no route for SMAC in clone learning
- 0 packets with no nexthop in clone learning
- 0 packets with dead nexthop in clone learning
- 0 packets dropped due to no resolve nh in clone learning

## Output:

- 0 packets forwarded
- 0 packets failed to forward
- 0 packets with vmember lookup failures
- 0 packets with vlan lookup failures
- 0 packets with input control processing failures

## Send:

- 0 packets sent successfully
- 0 packets with send failures
- 0 packets dropped due to interface down
- 0 packets with dev output failures
- 0 blocked ifl discards
- 0 packets with tag lookup failures
- 0 packets with stp state lookup failures
- 0 packets with tag insertion failures

```
0 packets with tag removal failures

## show system storage

<b>Syntax</b>	show system storage <detail>
<b>Syntax (EX Series Switches)</b>	show system storage <detail> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system storage <detail> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system storage <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system storage <detail> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system storage <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display statistics about the amount of free disk space in the router's or switch's file systems.
<b>Options</b>	<p><b>none</b>—Display standard information about the amount of free disk space in the router's or switch's file systems.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p>

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** By default, when you issue the **show system storage** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** view

**List of Sample Output** [show system storage on page 1014](#)  
[show system storage \(TX Matrix Plus Router\) on page 1014](#)  
[show system storage \(QFX3500 Switch\) on page 1016](#)

**Output Fields** [Table 76 on page 1013](#) describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

Table 76: show system storage Output Fields

Field Name	Field Description
<b>Filesystem</b>	Name of the filesystem.
<b>Size</b>	Size of the filesystem.
<b>Used</b>	Amount of space used in the filesystem.
<b>Avail</b>	Amount of space available in the filesystem.
<b>Capacity</b>	Percentage of the filesystem space that is being used.
<b>Mounted on</b>	Directory in which the filesystem is mounted.

## Sample Output

## show system uptime

<b>Syntax</b>	show system uptime
<b>Syntax (EX Series Switches)</b>	show system uptime <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (TX Matrix Router)</b>	show system uptime <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system uptime <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
<b>Options</b>	<p><b>none</b>—Show time since the system rebooted and processes started.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.</p>

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** By default, when you issue the **show system uptime** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**Output Fields** [Table 77 on page 1019](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

**Table 77: show system uptime Output Fields**

Field Name	Field Description
<b>Current time</b>	Current system time in UTC.
<b>System booted</b>	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
<b>Protocols started</b>	Date and time when the routing protocols were last started and how long they have been running.
<b>Last configured</b>	Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command.
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

## Sample Output

**show system uptime**

```
user@host> show system uptime

## show system users

<b>Syntax</b>	show system users <no-resolve>
<b>Syntax (TX Matrix Router)</b>	show system users <all-chassis   all-lcc   lccnumber   scc> <no-resolve>
<b>Syntax (TX Matrix Plus Router)</b>	show system users <detail> <all-chassis   all-lcc   lcc number   sfc number> <no-resolve>
<b>Syntax (MX Series Router)</b>	show system users <all-members> <local> <member member-id> <no-resolve>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	List information about the users who are currently logged in to the router or switch.
<div>  <p><b>NOTE:</b> The <code>show system users</code> command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.</p> </div>	
<b>Options</b>	<p><b>none</b>—List information about the users who are currently logged in to the router or switch.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.</p> <p><b>lccnumber</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific</p>

T1600 router that is connected to the TX Matrix Plus router. Replace **number** with a value from 0 through 3.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Additional Information** By default, when you issue the **show system users** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

## show system virtual-memory

<b>Syntax</b>	show system virtual-memory
<b>Syntax (EX Series)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the <b>show system virtual-memory</b> command for troubleshooting with Juniper Networks Customer Support.
<b>Options</b>	<p><b>none</b>—Display kernel dynamic memory usage information.</p> <p><b>all-chassis</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.</p> <p><b>all-lcc</b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.</p>

**infrastructure *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific T1600 router that is connected to the TX Matrix Plus router. Replace ***number*** with a value from 0 through 3.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**Additional Information** By default, when you issue the **show system virtual-memory** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**NOTE:** The **show system virtual-memory** command with the **| display XML** pipe option now displays XML output for the command in the parent tags: **<vmstat-memstat-malloc>**, **<vmstat-memstat-zone>**, **<vmstat-sumstat>**, **<vmstat-intr>**, and **<vmstat-kernel-state>** with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the **| display XML** option for this command does not have an XML API element and the entire output is displayed in a single **<output>** tag element.

<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show system virtual-memory on page 1032</a> <a href="#">show system virtual-memory scc (TX Matrix Router) on page 1036</a> <a href="#">show system virtual-memory sfc (TX Matrix Plus Router) on page 1036</a> <a href="#">show system virtual-memory   display xml on page 1040</a> <a href="#">show system virtual-memory (QFX Series) on page 1062</a>
<b>Output Fields</b>	<a href="#">Table 79 on page 1030</a> lists the output fields for the <b>show system virtual-memory</b> command. Output fields are listed in the approximate order in which they appear.

Table 79: show system virtual-memory Output Fields

Field Name	Field Description
<b>Memory statistics by bucket size</b>	
<b>Size</b>	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
<b>In Use</b>	Number of memory blocks of this size that are in use (bytes).
<b>Free</b>	Number of memory blocks of this size that are free (bytes).
<b>Requests</b>	Number of memory allocation requests made.
<b>HighWater</b>	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
<b>Couldfree</b>	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
<b>Memory usage type by bucket size</b>	
<b>Size</b>	Memory block size (bytes).
<b>Type(s)</b>	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
<b>Memory statistics by type</b>	
<b>Type</b>	Kernel module that is using dynamic memory.
<b>InUse</b>	Number of memory blocks used by this type. The number is rounded up.
<b>MemUse</b>	Amount of memory in use, in kilobytes (KB).
<b>HighUse</b>	Maximum memory ever used by this type.
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Requests</b>	Total number of dynamic memory allocation requests this type has made.
<b>Type Limit</b>	Number of times requests were blocked for reaching the maximum limit.
<b>Kern Limit</b>	Number of times requests were blocked for the kernel map.
<b>Size(s)</b>	Memory block sizes this type is using.
<b>Memory Totals</b>	
<b>In Use</b>	Total kernel dynamic memory in use (bytes, rounded up).
<b>Free</b>	Total kernel dynamic memory free (bytes, rounded up).

Table 79: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
<b>Requests</b>	Total number of memory allocation requests.
<b>ITEM</b>	Kernel module that is using memory.
<b>Size</b>	Memory block size (bytes).
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Used</b>	Number of memory blocks used by this type. The number is rounded up.
<b>Free</b>	Number of memory blocks available to this type.
<b>Requests</b>	Total number of memory allocation requests this type has made.
<b>interrupt</b>	Timer events and scheduling interruptions.
<b>total</b>	Total number of interruptions for each type.
<b>rate</b>	Interruption rate.
<b>Total</b>	Total for all interruptions.

<b>Syntax</b>	show version <brief   detail>
<b>Syntax (EX Series Switches)</b>	show version <all-members> <brief   detail> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show version <brief   detail> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show version <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <brief   detail>
<b>Syntax (MX Series Router)</b>	show version <brief   detail> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show version <brief   detail> <component <i>component-name</i>   all>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the hostname and version information about the software running on the router or switch.
<b>Options</b>	<p><b>none</b>—Display standard information about the hostname and version of the software running on the router or switch.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.</p> <p><b>component all</b>—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.</p> <p><b>component <i>component-name</i></b>—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace <i>component-name</i> with the name of the QFabric system component.</p>

component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level**

view

## start shell

<b>Syntax</b>	start shell (csh   sh) <user <i>username</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type <b>exit</b> from the shell.
<div>  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>To issue this command, the user must have the required login access privileges configured by including the <b>permissions</b> statement at the [edit system login class <i>class-name</i>] hierarchy level.</li> <li>UNIX wheel group membership or permissions are no longer required to issue this command.</li> </ul> </div>	
<b>Options</b>	<p><b>csh</b>—Create a UNIX C shell.</p> <p><b>sh</b>—Create a UNIX Bourne shell.</p> <p><b>user <i>username</i></b>—(Optional) Start the shell as another user.</p>
<b>Additional Information</b>	<p>When you are in the shell, the shell prompt has the following format:</p> <p><i>username@hostname%</i></p> <p>An example of the prompt is:</p> <p><b>root@host%</b></p>
<b>Required Privilege Level</b>	shell and maintenance
<b>List of Sample Output</b>	<a href="#">start shell csh on page 1094</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### start shell csh

```
user@host> start shell csh
%
```

```
exit
%
```

```
username@hostname% start shell sh
%
```

```
exit
user@host>
```

## test configuration

<b>Syntax</b>	<code>test configuration filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found.
<b>Options</b>	<b>filename</b> —Name of the configuration file.  <b>syntax-only</b> —Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">test configuration on page 1095</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
test configuration      user@host> test configuration terminal
                        [Type ^D to end input]
                        system {
                        host-name bluesky;
                        paris-23;
                        login;
                        }
                        terminal:3:(8) syntax error: paris
                        [edit system]
                        'paris-23;'
                        syntax error
                        terminal:4:(11) statement must contain additional statements: ;
                        [edit system login]
                        'login ;'
                        statement must contain additional statements
                        configuration syntax failed
```

## traceroute

---

<b>Syntax</b>	<pre>traceroute <i>host</i> &lt;as-number-lookup&gt; &lt;bypass-routing&gt; &lt;clns&gt; &lt;gateway <i>address</i>&gt; &lt;inet   inet6&gt; &lt;interface <i>interface-name</i>&gt; &lt;logical system <i>logical-system-name</i>&gt; &lt;monitor <i>host</i>&gt; &lt;mpls (<i>ldp FEC address</i>   <i>rsvp label-switched-path-name</i>)&gt; &lt;no-resolve&gt; &lt;propagate-ttl&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;source <i>source-address</i>&gt; &lt;tos <i>value</i>&gt; &lt;ttl <i>value</i>&gt; &lt;wait <i>seconds</i>&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>traceroute <i>host</i> &lt;as-number-lookup&gt; &lt;bypass-routing&gt; &lt;gateway <i>address</i>&gt; &lt;inet&gt; &lt;interface <i>interface-name</i>&gt; &lt;monitor <i>host</i>&gt; &lt;no-resolve&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;source <i>source-address</i>&gt; &lt;tos <i>value</i>&gt; &lt;ttl <i>value</i>&gt; &lt;wait <i>seconds</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>mpls</b> option introduced in Junos OS Release 9.2.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>propagate-ttl</b> option introduced in Junos OS Release 12.1.</p>
<b>Description</b>	Display the route that packets take to a specified network host. Use <b>traceroute</b> as a debugging tool to locate points of failure in a network.
<b>Options</b>	<p><b>host</b>—IP address or name of remote host.</p> <p><b>as-number-lookup</b>—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.</p>

**clns**—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface *interface-name***—(Optional) Name of the interface over which to send packets.

**logical-system *logical-system-name***—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor *host***—(Optional) Display real-time monitoring information for the specified host.

**mpls (*ldp FEC address | rsvp label-switched-path name*)**—(Optional) See **traceroute mpls ldp** and **traceroute mpls rsvp**.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE router, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the traceroute attempt.

**source *source-address***—(Optional) Source address of the outgoing traceroute packets.

**tos *value***—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl *value***—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait *seconds***—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level** network

**Output Fields** [Table 80 on page 1098](#) describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

**Table 80: traceroute Output Fields**

Field Name	Field Description
<b>traceroute to</b>	IP address of the receiver.
<b>hops max</b>	Maximum number of hops allowed.
<b>byte packets</b>	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).

## Sample Output

### traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254) 2.370 ms 2.853 ms 0.367 ms
 2 red14 (10.168.255.250) 0.778 ms 2.937 ms 0.446 ms
 3 yellow (10.156.169.254) 7.737 ms 89.905 ms 0.834 ms
```

### traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets

 3 vpn09.skybank.net (10.255.14.179) 0.783 ms 0.716 ms 0.686
```

### traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1 mpls1-sr0.company.net (10.168.200.101) 0.555 ms 0.393 ms 0.367 ms
   MPLS Label=1024 CoS=0 TTL=1
 2 mpls5-lo0.company.net (10.168.1.224) 0.420 ms 0.394 ms 0.401 ms
```

## traceroute monitor

---

<b>Syntax</b>	<code>traceroute monitor <i>host</i></code> <code>&lt;count <i>value</i>&gt;</code> <code>&lt;inet   inet 6&gt;</code> <code>&lt;interval <i>seconds</i>&gt;</code> <code>&lt;no resolve&gt;</code> <code>&lt;size <i>value</i>&gt;</code> <code>&lt;source <i>source-address</i>&gt;</code> <code>&lt;summary&gt;</code>
<b>Syntax (QFX Series)</b>	<code>traceroute monitor <i>host</i></code> <code>&lt;count <i>value</i>&gt;</code> <code>&lt;inet&gt;</code> <code>&lt;interval <i>seconds</i>&gt;</code> <code>&lt;no resolve&gt;</code> <code>&lt;size <i>value</i>&gt;</code> <code>&lt;source <i>source-address</i>&gt;</code> <code>&lt;summary&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.0 Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.
<b>Options</b>	<p><b><i>host</i></b>—IP address or name of remote host.</p> <p><b><i>count value</i></b>—Number of ping requests, in packets, to send in summary mode. The default value is <b>10</b>.</p> <p><b><i>inet   inet6</i></b>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><b><i>interval seconds</i></b>—(Optional) Number of seconds to wait before sending ping requests. The default value is <b>1</b>.</p> <p><b><i>no resolve</i></b>—(Optional) Do not attempt to display addresses symbolically.</p> <p><b><i>size value</i></b>—(Optional) Receive the specified number of bytes for each packet. The range is <b>0</b> through <b>65468</b> bytes. The default value is <b>64</b>.</p> <p><b><i>source source-address</i></b>—(Optional) Source address of the outgoing ping packets.</p> <p><b><i>summary</i></b>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<a href="#">traceroute monitor on page 1101</a>
<b>Output Fields</b>	<a href="#">Table 81 on page 1101</a> describes the output fields for the <b>traceroute monitor</b> command. Output fields are listed in the approximate order in which they appear.

Table 81: traceroute monitor Output Fields

Field Name	Field Description
<b>Host</b>	Hostname or IP address of the router at each hop.
<b>Loss%</b>	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
<b>Snt</b>	Number of ping requests sent to the router at this hop.
<b>Last</b>	Most recent round-trip time, in milliseconds, to the router at this hop.
<b>Avg</b>	Average round-trip time, in milliseconds, to the router at this hop.
<b>Best</b>	Shortest round-trip time, in milliseconds, to the router at this hop.
<b>Wrst</b>	Longest round-trip time, in milliseconds, to the router at this hop.
<b>StDev</b>	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

## Sample Output

### traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

	Loss%	Snt	Last	Avg	Best	Wrst	StDev
Host							
1. 10.17.41.254	0.0%	17	0.7	1.0	0.6	5.4	1.2
2. secret.net	0.0%	17	0.6	1.0	0.6	6.6	1.4
3. top-secret.net	0.0%	17	0.6	0.6	0.6	0.6	0.0

## CHAPTER 7

# Troubleshooting

- [Troubleshooting Procedures on page 1103](#)

### Troubleshooting Procedures

---

- [Rebooting and Halting a QFX Series Product on page 1103](#)
- [Recovering from a Failed Software Installation on page 1104](#)
- [Recovering the Root Password on page 1105](#)
- [Troubleshooting Network Interfaces on page 1106](#)
- [Troubleshooting an Aggregated Ethernet Interface on page 1107](#)

### Rebooting and Halting a QFX Series Product

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>      Execute this command
at             Time at which to perform the operation
in            Number of minutes to delay before operation
media         Boot media for next boot
message       Message to display to all users
|            Pipe through a command

user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
at             Time at which to perform the operation
in            Number of minutes to delay before operation
media         Boot media for next boot
message       Message to display to all users
|            Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the `request system halt` command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

**Related  
Documentation**

- [clear system reboot on page 290](#)
- [request system reboot on page 344](#)
- [request system halt on page 331](#)
- [request system power-off on page 340](#)
- [Connecting a QFX Series Device to a Management Console](#)

## Recovering from a Failed Software Installation

**Problem** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message `Loading /boot/defaults/loader.conf` appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The `loader>` prompt appears.

3. Enter the following command:

```
loader> install [--format] [--external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).

- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None

- Stop bits: 1
  - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into  
  
The terminal emulation screen on your management device displays the switch's boot sequence.
  10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:  
  
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
  11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
  
ok **boot -s**
  12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
  
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
  13. Enter configuration mode in the CLI.
  14. Set the root password. For example:  
  
user@switch# **set system root-authentication plain-text-password**
  15. At the following prompt, enter the new root password. For example:  
  
New password: **juniper1**  
Retype new password:
  16. At the second prompt, reenter the new root password.
  17. After you have finished configuring the password, commit the configuration.  
  
root@host# **commit**  
commit complete
  18. Exit configuration mode in the CLI.
  19. Exit operational mode in the CLI.
  20. At the prompt, enter **y** to reboot the switch.  
  
Reboot the system? [y/n] **y**

**Related  
Documentation**

- [Configuring the Root Password on page 1222](#)

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

---

**Problem** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting an Aggregated Ethernet Interface

**Problem** The `show interfaces terse` command shows that the LAG is down.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

## Configuration File Terms

[Table 18 on page 30](#) lists the various configuration file terms used for the QFX Series and their definitions.

**Table 82: Configuration File Terms**

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

### Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model: that is, a candidate configuration is modified as desired and then committed to the system. Once a configuration has been committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The former active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and all other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (1–49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

---

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the `commit synchronize force` CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the `synchronize` command.

## Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- `juniper.conf.gz`—The current active configuration.
- `juniper.conf.1.gz` to `juniper.conf.49.gz`—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

## Understanding How the Junos Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

The currently operational Junos OS configuration is stored in the file **juniper.conf** and the last three committed configurations are stored in the files **juniper.conf.1**, **juniper.conf.2**, and **juniper.conf.3**. These four files are located in the directory **/config**, which is on the switch's hard disk. The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

[edit]

```
user@host# show | compare (filename| rollback n)
```

**filename** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

**n** is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
```

```
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
  -type external;
  -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 90;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  advertise-inactive;
  peer-as 3333;
  allow 2.2.2.2/32;
}
```

## Compressing the Current Configuration File

By default, the current operational configuration file is compressed, and is stored in the file **juniper.conf.gz**, in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

**NOTE:** We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```

Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
```

```
user@host# commit
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

**Related  
Documentation**

- [Junos OS Commit Model for Router or Switch Configuration on page 31](#)

## Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the **rollback** command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
```

```

user@host# rollback rescue
load complete
[edit]
user@host# commit

```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```

user@host> request system configuration rescue delete
user@host>

```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the Junos OS Operational Mode Commands.

## Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```

[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
filename <relative>

```

For information about specifying the filename, see Viewing Files and Directories on a Device Running Junos OS.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Type ^D to end input.

```

[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>

```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. So if you saved a complete configuration, this is the option to use.

An override operation discards the current candidate configuration and loads the configuration in **filename** or the one that you type at the terminal. When you use the

**override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 13 on page 1146](#).

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 14 on page 1147](#).

If, in an override or merge operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, if you are adding a BGP configuration to the **[edit protocols]** level, where there was no BGP configuration before. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose you configure a routing policy on Device router1 and you want to replicate the policy configuration on Device router2, router3, and router4.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+ export default-static;
- export static-default
```

```
[edit policy-options]
+ policy-statement default-static {
+   from protocol static;
+   then accept;
+ }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On Device router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and type Ctrl-D to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
    bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 17 on page 1148](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the Junos OS Operational Mode Commands.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a **secret** attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

#### Related Documentation

- [Examples: Loading a Configuration from a File on page 1146](#)

## Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback** <*number*>

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 29](#)

## Returning to the Most Recently Committed Junos Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

## Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 1123](#)
- [Displaying Previous Configurations on page 1123](#)
- [Comparing Configuration Changes with a Prior Version on page 1124](#)
- [Creating and Returning to a Rescue Configuration on page 1126](#)
- [Saving a Configuration to a File on page 1127](#)

### Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

### Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename) rollback n)
```

***filename*** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

*n* is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
```

```
-type external;
-allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 90;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  advertise-inactive;
  peer-as 3333;
  allow 2.2.2.2/32;
}
```

---

### Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the Junos OS Operational Mode Commands.

### Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
  ospf {
```

```
        traffic-engineering;  
        reference-bandwidth 4g;  
        ...  
    }  
}
```

**Related

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]  
user@switch# load factory-default  
[edit]  
user@switch# delete system commit factory-settings  
[edit]  
user@switch# commit
```

**Related  
Documentation**

- [Understanding Configuration Files on page 1113](#)
- [Loading a Previous Configuration File on page 1122](#)
- [Reverting to the Rescue Configuration on page 150](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.  

```
[edit]  
user@switch# load override filename
```
2. Commit your changes.  

```
[edit]
```

```
user@switch# commit filename
```

## Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

## Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
}
isis {
  disable;
  interface all {
```

```

        level 1 disable;
    }
    interface fxp0.0 {
        disable;
    }
}
ospf {
    traffic-engineering;
    reference-bandwidth 4g;
    ...
}
}

```

## Setting or Deleting the Rescue Configuration

A rescue configuration is user-defined configuration that restores connectivity to switch. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

- [Junos OS Operational Mode Commands](#)

## Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference* at <http://www.juniper.net/techpubs/software/junos/index.html>.
2. In the configuration text file, use an option to perform the required action when the file is loaded. Table 83 on page 1132 lists and describes some options for the **load** command.

Table 83: Options for the load Command

Options	Description
<b>merge</b>	Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A <b>merge</b> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
<b>override</b>	Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the <b>override</b> option and commit the configuration, all system processes reparse the configuration. You can use the <b>override</b> option at any level of the hierarchy.
<b>replace</b>	Searches for the <b>replace</b> tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the <b>replace</b> operation adds the statements marked with the <b>replace</b> tag to the active configuration.  <b>NOTE:</b> For this operation to work, you must include <b>replace</b> tags in the text file or in the configuration you type at the terminal.

3. Press Ctrl+a to select all the text in the configuration file.
4. Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
5. Log in to the switch using your username and password.
6. To enter configuration mode:  

```
user@switch> configure
```

You will see this output, with the hash or pound mark indicating configuration mode.  
Entering configuration mode  
[edit]  
user@switch#
7. Load the configuration file:  

```
[edit]  
user@switch# load merge terminal
```
8. At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:  

```
[edit]  
user@switch# load merge terminal  
[Type ^D at a new line to end input]  
>Cursor is here. Paste the contents of the clipboard here<
```

9. Press Enter.
10. Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

## Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. [Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive on page 1133](#)
2. [Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1134](#)
3. [Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1134](#)
4. [Configuring Archive Sites for Transfer of Active Configuration Files on page 1134](#)

### Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username<:password>@host-address<:port>/url-path;
  scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, `"ftp://username<:password>@[ipv6-host-address]<:port>/url-path"`

### Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The **interval** is a period of time ranging from 15 through 2880 minutes.

### Configuring Transfer of the Current Active Configuration When a Configuration Is Committed

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
 "scp://username<:password>@[ipv6-host-address]<:port>/url-path"

### Configuring Archive Sites for Transfer of Active Configuration Files

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
  file://<path>/<filename>;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
 "scp://username<:password>@[ipv6-host-address]<:port>/url-path"

When you specify the archive site, do not add a forward slash (/) to the end of the URL. The format for the destination filename is as follows:

`<router-name>_juniper.conf[.gz]_YYYYMMDD_HHMMSS`

**NOTE:** The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

## Configuration Statements

### archival

**Syntax**

```

archival {
  configuration {
    archive-sites {
      file://<path>/<filename>;
      ftp://username@host:<port>url-path password password;
      http://username@host:<port>url-path password password;
      pasvftp://username@host:<port>url-path password password;
      scp://username@host:<port>url-path password password;
    }
    transfer-interval interval;
    transfer-on-commit;
  }
}

```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.

**NOTE:** The edit system archival hierarchy is not available on QFabric systems.

**Options** The remaining statements are explained separately.

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## Default Configurations

- [QFX3500 Switch Default Configuration on page 1140](#)

### QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

**NOTE:** In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```

protocols {
  igmp-snooping {
    vlan all;
  }
  rstp;
  lldp {
    interface all;
  }
}
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/1 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/2 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/3 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/4 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/5 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/6 {

## CHAPTER 10

# Administration

- [Operational Commands on page 1149](#)

### Operational Commands

---

## clear log

---

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<b><i>filename</i></b> —Name of the specific log file to delete.  <b>all</b> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show log on page 837</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 1150</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear system commit

---

<b>Syntax</b>	clear system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance (or the actual user who scheduled the commit)
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system commit on page 884</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear system commit on page 1151</a> <a href="#">clear system commit (None Pending) on page 1151</a> <a href="#">clear system commit (User Does Not Have Required Privilege Level) on page 1151</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

<b>clear system commit</b>	user@host> clear system commit Pending commit cleared.
<b>clear system commit (None Pending)</b>	user@host> clear system commit No commit scheduled.
<b>clear system commit (User Does Not Have Required Privilege Level)</b>	user@host> clear system commit error: Permission denied

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 1153</a> <a href="#">file archive (Single File) on page 1153</a> <a href="#">file archive (with Compression) on page 1153</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum sha-256 on page 298</a></li><li>• <a href="#">file checksum sha1 on page 297</a></li><li>• op</li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 1154</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
file checksum md5      user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 296</a></li> <li>• <a href="#">file checksum sha-256 on page 298</a></li> <li>• op</li> </ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha1 on page 1155</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

```
file checksum sha1      user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 296</a></li><li>• <a href="#">file checksum sha1 on page 297</a></li><li>• op</li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha-256 on page 1156</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

```
file checksum sha-256 user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>List of Sample Output</b>	<p><a href="#">file compare files on page 1158</a></p> <p><a href="#">file compare files context on page 1158</a></p> <p><a href="#">file compare files unified on page 1158</a></p> <p><a href="#">file compare files unified ignore-white-space on page 1158</a></p>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<          full-name "File 1";
---
>          full-name "File 2";

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 1160</a> <a href="#">file delete (Routing Matrix) on page 1160</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

---

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 1162</a> <a href="#">file list (Routing Matrix) on page 1162</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
```

```
-----
/var/tmp/:
.gdbinit

## file rename

---

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<b><i>destination</i></b> —New name for the file.  <b><i>source</i></b> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 1164</a> <a href="#">file rename (Routing Matrix) on page 1164</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file rename

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz

user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

---

## file show

---

<b>Syntax</b>	<code>file show <i>filename</i></code> <code>&lt;encoding (base64   raw)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b><i>filename</i></b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b>encoding (base64   raw)</b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 1166</a> <a href="#">file show (Routing Matrix) on page 1166</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

### file show (Routing Matrix)

```
user@host> file show lcc0-re0:/var/tmp/gdbinit
lcc0-re0:
-----
#####
# Settings
#####

set print pretty

#####
# Basic stuff
#####

define msgbuf
    printf "%s", msgbufp->msg_ptr
end
# hex dump of a block of memory
# usage: dump address length
define dump
    p $arg0, $arg1
    set $ch = $arg0
    set $j = 0
    set $n = $arg1
    while ($j < $n)
        #printf "%x %x ",&$ch[$j],$ch[$j]
        printf "%x ",$ch[$j]
        set $j = $j + 1
        if (!($j % 16))
            printf "\n"
        end
    end
end
end
```

## request system configuration rescue delete

<b>Syntax</b>	request system configuration rescue delete
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete an existing rescue configuration.
	<div>  <p><b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems.</p> </div>
<b>Options</b>	This command has no options.

    }
  }
}
....
```

## show system rollback

---

**Syntax**    `show system rollback number`  
              `<compare number>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

.....  
**NOTE:** The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.  
.....

**Options**    *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

`compare number`—(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

**Required Privilege Level**    view

**List of Sample Output**    [show system rollback compare on page 1175](#)

## Sample Output

                        statement must contain additional statements
                        configuration syntax failed
```

## CHAPTER 11

# Troubleshooting

- [Troubleshooting Procedures on page 1177](#)

## Troubleshooting Procedures

---

- [Loading a Previous Configuration File on page 1177](#)
- [Reverting to the Default Factory Configuration on page 1178](#)
- [Reverting to the Rescue Configuration on page 1178](#)

### Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** <*number*>

#### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
```

```
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 29](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related Documentation**

- [Understanding Configuration Files on page 1113](#)
- [Loading a Previous Configuration File on page 1122](#)
- [Reverting to the Rescue Configuration on page 150](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a QFX Series product and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 1181](#)
- [Understanding User and Access Management Features on the QFabric System on page 1183](#)

## Understanding Software Infrastructure and Processes

The QFX Series products run the Juniper Networks Junos OS. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1181](#)
- [Junos OS Processes on page 1182](#)

## Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 20 on page 44 describes the primary Junos OS processes.

**Table 85: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

Table 85: Junos OS Processes (*continued*)

Process	Name	Description
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

## Understanding User and Access Management Features on the QFabric System

The QFabric system supports the following user and access management features:

- User authentication
- RADIUS
- Link Layer Discovery Protocol (LLDP)

- SSH
- TACACS+
- Access privilege management

The specific functionality, features, options, syntax, and hierarchy levels of some of the user and access management commands and configuration statements implemented on the QFabric system may differ somewhat from the same commands and configuration statements on standard Junos OS. See the configuration statement or command topic in the documentation set for additional information, and use the help (?) command-line function to display specific information as needed.

Some user and access management features are not yet fully supported in the full QFabric architecture, although full support is planned for future releases. The user and access management features currently unsupported on the QFabric system include:

- Full RADIUS server support, including RADIUS accounting
- **accounting-options** configuration statement hierarchy
- **tacplus-options** configuration statement

## Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

## Understanding Login Authentication

You can control access to your network through the Juniper Networks QFX Series using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- [MAC RADIUS Authentication on page 1185](#)

### MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication on the QFX Series is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

- [Configuring RADIUS Authentication on page 1219](#)

## Understanding LLDP

The QFX Series product uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The QFX Series products support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The QFX Series products support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

## Understanding RADIUS Accounting

Juniper Networks QFX Series products support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the QFX Series supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.
4. The accounting server sends an *accounting-response* packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

## Understanding VSAs on the QFX Series

The Juniper Networks QFX Series products support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS).

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the switch as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches.

## Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 86 on page 1188](#) lists the Juniper Networks VSAs you can configure.

**Table 86: Juniper Networks Vendor-Specific RADIUS Attributes**

Name	Description	Type	Length	String
Juniper-Local-User-Name	Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets.	1	≥3	One or more octets containing printable ASCII characters.

Table 86: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

Name	Description	Type	Length	String
Juniper-Allow-Commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	2	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands"</a> on page 1206.
Juniper-Deny-Commands	Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	3	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands"</a> on page 1206.
Juniper-Allow-Configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	4	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies"</a> on page 1205.
Juniper-Deny-Configuration	Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	5	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies"</a> on page 1205.
Juniper-Interactive-Command	Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.	8	≥3	One or more octets containing printable ASCII characters.
Juniper-Configuration-Change	Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.	9	≥3	One or more octets containing printable ASCII characters.

Table 86: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

Name	Description	Type	Length	String
Juniper-User-Permissions	<p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p><b>NOTE:</b> When the <b>Juniper-User-Permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	10	≥3	<p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See <a href="#">Table 88 on page 1192</a>.</p>

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

## Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 87 on page 1190](#) lists the Juniper Networks VSAs you can configure.

Table 87: Juniper Networks Vendor-Specific TACACS+ Attributes

Name	Description	Length	String
local-user-name	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.

Table 87: Juniper Networks Vendor-Specific TACACS+ Attributes (*continued*)

Name	Description	Length	String
<b>allow-commands</b>	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 92 on page 1206</a> .
<b>allow-configuration</b>	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies” on page 1205</a> .
<b>deny-commands</b>	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 92 on page 1206</a> .
<b>deny-configuration</b>	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 91 on page 1205</a> .
<b>user-permissions</b>	<p>Contains information the server uses to specify user permissions.</p> <p><b>NOTE:</b> When the <b>user-permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	≥3	One or more octets containing printable ASCII characters. See <a href="#">Table 88 on page 1192</a> .

## Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1192](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1195](#)

### Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 88 on page 1192](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 88 on page 1192](#) lists the Junos® operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

**Table 88: Login Class Permission Flags**

Permission Flag	Description
<b>access</b>	Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>access-control</b>	Can view and configure access information at the <b>[edit access]</b> hierarchy level.
<b>admin</b>	Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.
<b>admin-control</b>	Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.

Table 88: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>all-control</b>	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
<b>clear</b>	Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.
<b>configure</b>	Can enter configuration mode by using the <b>configure</b> command.
<b>control</b>	Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.
<b>field</b>	Can view field debug commands. Reserved for debugging support.
<b>firewall</b>	Can view the firewall filter configuration in configuration mode.
<b>firewall-control</b>	Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.
<b>floppy</b>	Can read from and write to the removable media.
<b>flow-tap</b>	Can view the flow-tap configuration in configuration mode.
<b>flow-tap-control</b>	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.
<b>flow-tap-operation</b>	<p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have <b>flow-tap-operation</b> permission.</p> <p><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.</p>
<b>idp-profiler-operation</b>	Can view profiler data.
<b>interface</b>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 88: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>interface-control</b>	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul>
<b>maintenance</b>	Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router by using the <b>request system</b> commands.
<b>network</b>	Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view the <b>pgcp</b> session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify the <b>pgcp</b> session mirroring configuration.
<b>reset</b>	Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.
<b>rollback</b>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.
<b>routing</b>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<b>routing-control</b>	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level.
<b>secret</b>	Can view passwords and other authentication keys in the configuration.
<b>secret-control</b>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<b>security</b>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 88: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>security-control</b>	Can view and configure security information at the <b>[edit security]</b> hierarchy level.
<b>shell</b>	Can start a local shell on the router or switch by using the <b>start shell</b> command.
<b>snmp</b>	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
<b>snmp-control</b>	Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.
<b>system</b>	Can view system-level information in configuration and operational modes.
<b>system-control</b>	Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.
<b>trace</b>	Can view trace file settings and configure trace file properties.
<b>trace-control</b>	Can modify trace file settings and configure trace file properties.
<b>view</b>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
<b>view-configuration</b>	Can view all of the configuration excluding secrets, system scripts, and event options.  <b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration.

### Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration** and

**deny-configuration**, **allow-commands** and **deny-commands**, and all user permission bits.

- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

## Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

### Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

### Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

### Order of Authentication Attempts

[Table 89 on page 1198](#) describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 89: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
<b>authentication-order radius;</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS server is available but authentication is rejected, deny access.</li> <li>4. If RADIUS servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ radius password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.</li> </ol>

Table 89: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<code>authentication-order password;</code>	<ol style="list-style-type: none"> <li>1. Try to authenticate the user, using the password configured at the <code>[edit system login]</code> hierarchy level.</li> <li>2. If the authentication is accepted, grant access.</li> <li>3. If the authentication is rejected, deny access.</li> </ol>

**NOTE:** If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the `authentication-order` statement. If you want SSH logins to use the authentication methods configured in the `authentication-order` statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router or a TX Matrix Plus router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy on the TX Matrix or TX Matrix Plus router. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (or TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the `authentication-order` statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the `authentication-order` statement.

## Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

## Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1201](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User's full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must

be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.

- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in ["Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies"](#) on page 1205.
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]
user@switch# set authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
  - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
```

```
ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563
475784918273603361276441874265946893207739108344813125957722
625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in [“Configuring the Root Password” on page 1222](#).

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

#### Related Documentation

- [Configuring Junos OS User Accounts on page 1213](#)
- [Junos OS Login Classes Overview on page 1203](#)

## Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos OS contains a few predefined login classes, which are listed in [Table 90 on page 1203](#). The predefined login classes cannot be modified.

**Table 90: Predefined System Login Classes**

Login Class	Permission Flag Set
<b>operator</b>	clear, network, reset, trace, and view
<b>read-only</b>	view
<b>superuser or super-user</b>	all
<b>unauthorized</b>	None

**NOTE:**

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

**Related Documentation**

- Defining Junos OS Login Classes
- [Defining Junos OS Login Classes on page 1235](#)
- [Understanding QFabric System Login Classes on page 1204](#)

## Understanding QFabric System Login Classes

In some cases (such as device-level troubleshooting), it is useful to log in to individual QFabric system components so you can view and manage issues on a per-device basis. This topic explains the login classes that provide individual component access within a QFabric system.

**NOTE:** Under normal operating conditions, you should manage the QFabric system as a single entity by using the QFabric system default partition command-line interface (CLI). The default partition CLI provides you with the ability to configure and monitor your entire QFabric system from a central location and should be used as the primary way to manage the system.

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system:

- **qfabric-admin**—Provides the ability to log in to individual QFabric system components and manage them. This class is equivalent to setting the following permissions: **clear**, **network**, **reset**, **trace**, **view**, and **maintenance**. To provide QFabric system component-level login and management privileges, include the **qfabric-admin** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-operator**—Provides the privilege to log in to individual QFabric system components and view component operations and configurations. This class is equivalent to the preset Junos OS class of **read-only**. To provide QFabric system component-level read-only access, include the **qfabric-operator** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

- **qfabric-user**—Prevents access to individual QFabric system components. This class is the default setting for all QFabric system users and is equivalent to the preset Junos OS class of **unauthorized**. To prevent a user from accessing individual QFabric system components, include the **qfabric-user** statement at the **[edit system login user username authentication remote-debug-permission]** hierarchy level.

When you perform the initial setup for the Director group, you must specify a username and password for QFabric components. Once configured, this information is stored in the QFabric system and mapped to the QFabric system login classes. Such mapping allows users with the proper login class (**qfabric-admin** or **qfabric-operator**) to log in automatically to a component without being prompted for the username and password.

After you assign the **qfabric-admin** or **qfabric-operator** class to a user, the user can log in to an individual QFabric system component by issuing the **request component login component-name** command. You can access Node devices, Interconnect devices, and virtual Junos Routing Engines (diagnostics, fabric control, and fabric manager) one at a time when you issue this command. To leave the CLI prompt of a component and return to the QFabric system default partition CLI, issue the **exit** command from the component's operational mode CLI prompt.

## Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the **allow/deny-configuration-regexps** and **allow/deny-configuration** statements at the **[edit system login class]** hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 91 on page 1205](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

**Table 91: Configuration Mode Hierarchies—Common Regular Expression Operators**

Operator	Match
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .

**Table 91: Configuration Mode Hierarchies—Common Regular Expression Operators (*continued*)**

Operator	Match
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue <b>show interfaces detail</b> or <b>show interfaces extensive</b> .
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained.
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " ".

**Related Documentation**

- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies](#)
- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1238](#)

**Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands**

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 92 on page 1206](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

**Table 92: Common Regular Expression Operators to Allow or Deny Operational Mode Commands**

Operator	Match
	One of two or more terms separated by the pipe ( ) symbol. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.

Table 92: Common Regular Expression Operators to Allow or Deny Operational Mode Commands *(continued)*

Operator	Match
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue the <b>show interfaces detail</b> or <b>show interfaces extensive</b> command.
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 153](#)

Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 93 on page 1207](#) shows the default requirements.

Table 93: Special Requirements for Plain-Text Passwords

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.

Table 93: Special Requirements for Plain-Text Passwords (*continued*)

Junos OS	Junos-FIPS
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & \*, + < > ; :

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- [edit system diag-port-authentication]
- [edit system pic-console-authentication]
- [edit system root-authentication]
- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

```
MyPassWd@2
```

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (**M–y**, **y–P**, **P–a**, **a–W**, **W–d**, **d–@**, and **@–2**).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
  change-type character-sets;
  format md5;
  minimum-changes 1;
  minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
  change-type set-transitions;
  format sha1;
  maximum-length 20;
  minimum-changes 3;
  minimum-length 10;
}
```

## Changing the Requirements for Junos OS Plain-Text Passwords

To change the requirements for plain-text passwords, include the **password** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
password {
  change-type (set-transitions | character-set);
  change-type (md5 | sha1 | des);
  maximum-length length;
  minimum-changes number;
  minimum-length length;
}
```

**NOTE:** These statements apply to plain-text passwords only, not encrypted passwords.

### Related Documentation

- [Special Requirements for Junos OS Plain-Text Passwords on page 1207](#)
- [Configuring the Root Password on page 1222](#)

## Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
permissions [ permissions ];
```

### Related Documentation

- [Understanding Junos OS Access Privilege Levels on page 1192](#)
- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 153](#)
- `permissions`

## Configuring CLI Tips

The Junos OS CLI provides the option of configuring CLI tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

## Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
  class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

## Configuring LLDP

QFX Series products use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to identify a variety of devices quickly. The result is a LAN that interoperates smoothly and efficiently.

The LLDP protocol cannot be enabled by issuing the **set protocols lldp** statement at the **[edit]** hierarchy level. Enable the LLDP protocol by configuring it on all interfaces or on specific interfaces.

To configure basic LLDP options using the CLI:

1. Configure the advertisement interval in seconds:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

2. Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

3. Configure LLDP on all interfaces or on a specific interface:

```
[edit protocols lldp]
user@switch# set interface (LLDP) all
```

4. Configure tracing operations for the LLDP protocol:

```
[edit protocols lldp]
user@switch# set traceoptions file lldptrace
```

### Related Documentation

## Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]
authentication-order [ authentication-methods ];
```

Specify one or more of the following authentication methods in the preferred order, from first tried to last tried:

- **radius**—Verify the user using RADIUS authentication services
- **tacplus**—Verify the user using TACACS+ authentication services.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [ radius password ];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

## Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, the Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is

authenticated, the server returns the local username to the Junos OS, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, the Junos OS selects the appropriate local user template locally configured on the router. If a local user template does not exist for the authenticated user, the router defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user local-username** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
  full-name "Local user account";
  uid uid-value;
  class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
  login {
    user sales {
      uid uid-value;
      class class-name;
    }
    user engineering {
      uid uid-value;
      class class-name;
    }
  }
}

user = simon {
  ...
  service = junos-exec {
    local-user-name = sales
    allow-commands = "configure"
    deny-commands = "shutdown"
  }
}

user = rob {
  ...
  service = junos-exec {
    local-user-name = sales
    allow-commands = "(request system) | (show rip neighbor)"
    deny-commands = "clear"
  }
}

user = harold {
  ...
  service = junos-exec {
```

```

        local-user-name = engineering
        allow-commands = "monitor | help | show | ping | traceroute"
        deny-commands = "configure"
    }
}
user = jim {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "show bgp neighbor"
        deny-commands = "telnet | ssh"
    }
}

```

When the login users Simon and Rob are authenticated, the switch applies the sales local user template. When login users Harold and Jim are authenticated, the switch applies the engineering local user template.

## Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

## Configuring RADIUS Accounting

RADIUS accounting supports collecting statistical data about users logging in to or out of a LAN and sending to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure basic RADIUS accounting using the CLI:

1. Specify the accounting servers to which the switch forwards accounting statistics:

```

[edit access]
user@switch# set profile profile1 radius accounting-server [122.69.1.250 122.69.1.252]

```

2. Define the RADIUS accounting servers:

```

[edit access]
user@switch# set radius-server 122.69.1.250 secret juniper
user@switch# set radius-server 122.69.1.252 secret juniper1

```

3. Enable accounting for an access profile:

```

[edit access]

```

- ```

user@switch# set profile profile1 accounting

```
- Configure the RADIUS servers to use while sending accounting messages and updates:
 

```

[edit access]
user@switch# set profile profile1 accounting order radius none

```
  - Configure the statistics to be collected on the switch and forwarded to the accounting server:
 

```

[edit access]
user@switch# set profile profile1 accounting order accounting-stop-on-access-deny
user@switch# set profile profile1 accounting order accounting-stop-on-failure

```
  - Display accounting statistics collected on the switch:
 

```

user@switch> show network-access aaa statistics accounting
Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0

```
  - Open an accounting log on the RADIUS accounting server using the server's address, and view accounting statistics:
 

```

[root@freeradius]# cd /usr/local/var/log/radius/radacct/122.69.1.250
[root@freeradius 122.69.1.250]# ls

## Configuring RADIUS Authentication

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

- [Configuring RADIUS Server Details on page 1219](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1220](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1220](#)

### Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  secret password;
  source-address source-address;
  timeout seconds;
}
```

**server-address** is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]**

hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1185](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile *profile-name* radius-server *server-address*]**
2. **[edit access radius-server *server-address*]**
3. **[edit system radius-server *server-address*]**

---

### Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
      class operator;
    }
  }
}
```

---

### Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source

address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
  source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

## Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```
[edit system login]
  user remote {
    full-name "All remote users";
    uid uid-value;
    class class-name;
  }
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

## Configuring the Root Password

Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password.

**NOTE:** If you configure a blank password using the `encrypted-password` statement at the `[edit system root-authentication]` hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the `root-authentication` statement at the `[edit system]` hierarchy level:

```
[edit system]
root-authentication {
  (encrypted-password "password"| plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

If you configure the `plain-text-password` option, you are prompted to enter and confirm the password:

```
[edit system]
user@switch# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

To load an SSH key file, enter the `load-key-file` statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

You can also configure SSH RSA keys and SSH DSA keys to authenticate root logins. You can configure more than one public RSA or DSA key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the `load-key-file` statement. To view the SSH keys entries, use the configuration mode `show` command. For example:

```
[edit system]
user@switch# set root-authentication load-key-file my-host::ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
```

```
SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    view view-name;
  }
  contact contact;
  description description;
  filter-duplicates;
  filter-interfaces;
```

```
health-monitor {
  falling-threshold integer;
  interval seconds;
  rising-threshold integer;
}
interface [ interface-names ];
location location;
name name;
nonvolatile {
  commit-delay seconds;
}
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type type;
  }
  history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regular-expression>;
  flag flag;
}
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
trap-options {
  agent-address outgoing-interface;
  source-address address;
```

```

}
v3 {

## Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:

1. [Configuring SSH Known Hosts on page 1227](#)
2. [Configuring Support for SCP File Transfer on page 1228](#)
3. [Updating SSH Host Key Information on page 1228](#)

### Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
    dsa-key key;
}
host archive-server-url {
    rsa-key key;
}
host server-with-ssh-version-1, ip-address {
    rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key**—Base64 encoded Digital Signature Algorithm (DSA) key.
- **rsa-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures.
- **rsa1-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1 and SSH version 2.

## Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
  scp://username<:password>@host<:port>/url-path;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username<:password>@[host]<:port>/url-path";

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@switch# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
(yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical, accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

## Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. [Retrieving Host Key Information Manually on page 1228](#)
2. [Importing Host Key Information from a File on page 1228](#)

### Retrieving Host Key Information Manually

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@switch# set security ssh-known-hosts fetch-from-server <hostname>
```

### Importing Host Key Information from a File

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security**

**ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@switch# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 1230](#)
- [Configuring the SSH Protocol Version on page 1230](#)
- [Configuring the Client Alive Mechanism on page 1230](#)

### Configuring the Root Login Through SSH

---

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

---

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

---

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
```

```
client-alive-count-max 5;
client-alive-interval 20;
```

## Configuring TACACS+ Authentication

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure TACACS+ configuration are:

- [Configuring TACACS+ Server Details on page 1231](#)
- [Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 1232](#)
- [Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 1232](#)
- [Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 1233](#)

### Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
tacplus-server server-address {
  port port-number;
  secret password;
  single-connection;
  timeout seconds;
}
```

**server-address** is the address of the TACACS+ server.

**port-number** is the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password included spaces, enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can use the **single-connection** statement to have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt.

**NOTE:** Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, Junos OS will be unable to communicate with that TACACS+ server.

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level.

### Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the **[edit system tacplus-server server-address]** hierarchy level:

```
[edit system tacplus-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the **[edit system accounting destination tacplus server server-address]** hierarchy level:

```
[edit system accounting destination tacplus server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the **[edit system tacplus-server]** and **[edit system tacplus-options]** hierarchy levels. For information about how to configure a TACACS+ server at the **[edit system tacplus-server]** hierarchy level.

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
service-name service-name;
```

**service-name** is the name of the authentication service. By default, the service name is set to **junos-exec**.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
  10.2.2.2 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
  10.3.3.3 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
}
tacplus-options {
  service-name bob;
}
```

### Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

The Juniper Networks vendor-specific TACACS+ attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
  local-user-name = <username-local-to-router>
  allow-commands = "<allow-commands-regex>"
  allow-configuration = "<allow-configuration-regex>"
  deny-commands = "<deny-commands-regex>"
  deny-configuration = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

- [Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 1251](#)
- [Juniper Networks Vendor-Specific TACACS+ Attributes on page 1190](#)
- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1185](#)
- [Junos OS User Authentication Methods on page 1201](#)

### Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  tacplus {
    server {
```

```
server-address {  
    port port-number;  
    secret password;  
    single-connection;  
    timeout seconds;  
}  
}  
}
```

Tasks for configuring TACACS+ system accounting are:

1. [Specifying TACACS+ Auditing and Accounting Events on page 1234](#)
2. [Configuring TACACS+ Server Accounting on page 1234](#)

---

### Specifying TACACS+ Auditing and Accounting Events

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]  
events [ events ];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

---

### Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```
[edit system accounting destination tacplus]  
server {  
    server-address {  
        port port-number;  
        secret password;  
        single-connection;  
        timeout seconds;  
    }  
}
```

**server-address** specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

**NOTE:** If no TACACS+ servers are configured at the **[edit system accounting destination tacplus]** statement hierarchy level, Junos OS uses the TACACS+ servers configured at the **[edit system tacplus-server]** hierarchy level.

---

**port-number** specifies the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password contains spaces, enclose the entire password in quotation marks (" "). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

**Related Documentation**

- [Configuring TACACS+ Authentication on page 1231](#)

## Defining Junos OS Login Classes

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  permissions [ permissions ];
}
```

**Related Documentation**

- [Junos OS Login Classes Overview on page 1203](#)
- [Junos OS User Accounts Overview on page 1201](#)
- [Example: Creating Login Classes with Specific Privileges on page 1252](#)
- [Configuring the Junos OS to Display a System Login Announcement on page 127](#)

## Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
  tries-before-disconnect number;
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds
  minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time seconds**—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the **maximum-time** value, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

## Recovering the Root Password

If you forget the root password for the QFX3500 switch, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the QFX3500 switch power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the switch into the RJ-45-to-DB-9 serial port adapter supplied with the switch.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the switch.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the switch by (if necessary) plugging the power cords into the QFX3500 switch power supply, or turning on the power to the device or switch by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the switch's boot sequence.

10. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:  

```
New password: juniper1  
Retype new password:
```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  

```
root@host# commit  
commit complete
```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the switch.  

```
Reboot the system? [y/n] y
```

**Related Documentation** • [Configuring the Root Password on page 1222](#)

## Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

You can specify extended regular expressions with the **allow-configuration** and **deny-configuration** statements to define user access privileges to parts of the configuration hierarchy. Doing so overrides login class permission bits set for a user. You can also use wildcards to restrict access. When you define access privileges to parts of the configuration hierarchy, do the following tasks:

- Specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements.
- Put parentheses around an extended regular expression that connects two or more expressions with the pipe **|** symbol. For example:

```
[edit system login class class-name]  
user@switch# set deny-configuration "(system login class) | (system services)"
```

**NOTE:** Each expression separated by a pipe (**|**) symbol must be a complete standalone expression, and must be enclosed in parentheses (**()**). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (**|**) symbol. You cannot define access to keywords such as **set**, **edit**, or **activate**.

---

When you explicitly provide access to configuration mode hierarchies or regular expressions using the **allow-configuration** statement, you add to the regular permissions set with the **permissions** statement. If you explicitly deny access to configuration mode hierarchies or regular expressions using the **deny-configuration** statement, you remove permissions for the specified configuration mode hierarchy from the default permissions provided by the **permissions** statement.

To explicitly provide access to an individual configuration mode hierarchy that would otherwise be denied, include the **allow-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  allow-configuration "regular-expression";
```

To explicitly deny access to an individual configuration hierarchy that would otherwise be supported, include the **deny-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  deny-configuration "regular-expression";
```

You can include one **deny-configuration** and one **allow-configuration** statement in each login class.

If you allow and deny the same set of configuration hierarchy levels, regular expressions, or commands, the **allow-configuration** statement permissions take precedence over the permissions specified by the **deny-configuration** statement. For example, if you include **allow-configuration "system services"** and **deny-configuration "system services"**, the login class user can continue to edit the configuration or issue commands at the **edit system services** hierarchy level.

#### Related Documentation

- [Defining Access Privileges Using allow/deny-configuration Statements on page 1262](#)
- [Configuring Access Privilege Levels on page 1212](#)

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"** . Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

#### Related Documentation

- [Example: Configuring Access Privileges for Operational Mode Commands on page 1246](#)
- [Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands on page 1206](#)
- [allow-commands](#)
- [deny-commands](#)

## Using Junos OS to Configure Logical System Administrators

Using Junos OS, you can partition a single router or switch into multiple logical devices that perform independent routing or switching tasks. When creating logical systems, you must configure logical system administrators and interfaces, assign logical interfaces to logical systems, and configure various other logical system statements.

The master administrator can assign one or more logical system administrators to each logical system. Once assigned to a logical system, administrators are restricted to viewing only configurations of the logical system to which they are assigned and accessing only the operational commands that apply to that particular logical system. This restriction means that these administrators cannot access global configuration statements, and all command output is restricted to the logical system to which the administrators are assigned.

To configure logical system administrators, include the **logical-system *logical-system-name*** statement at the **[edit system login class *class-name*]** hierarchy level and apply the class to the user. For example:

```
[edit]
system {
  login {
    class admin1 {
      permissions all;
      logical-system logical-system-LS1;
    }
    class admin2 {
      permissions view; # Gives users assigned to class admin2 the ability to view
                        # but not to change the configuration.
      logical-system logical-system-LS2;
    }
    user user1 {
      class admin1;
    }
    user user2 {
      class admin2;
    }
  }
}
```

```
}  
}
```

Fully implementing logical systems requires that you also configure any protocols, routing statements, switching statements, and policy statements for the logical system.

## Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+= "cmd1"  
Juniper-Allow-Commands+= "cmd2"  
Juniper-Allow-Commands+= "cmdn"  
Juniper-Deny-Commands+= "cmd1"  
Juniper-Deny-Commands+= "cmd2"  
Juniper-Deny-Commands+= "cmdn"  
Juniper-Allow-Configuration+= "regex1"  
Juniper-Allow-Configuration+= "regex2"  
Juniper-Allow-Configuration+= "regexn"  
Juniper-Deny-Configuration+= "regex1"  
Juniper-Deny-Configuration+= "regex2"  
Juniper-Deny-Configuration+= "regexn"  
Juniper-User-Permissions+= "permission-flag1"  
Juniper-User-Permissions+= "permission-flag2"  
Juniper-User-Permissions+= "permission-flagn"
```

For a TACACS+ server, specify the individual regular expressions using the following syntax:

```
allow-commands1= "cmd1"  
allow-commands2= "cmd2"  
allow-commandsn= "cmdn"
```

```
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn "
```

**NOTE:**

- Numeric values 1 to *n* in the syntax (for a TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```
allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"
```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1188](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1190](#).

**NOTE:** When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the [edit system login class] hierarchy level using the `allow-commands`, `deny-commands`, `allow-configuration`, `deny-configuration`, or `permissions` statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

## VSA Match Conditions and Actions

EX Series switches and the QFX Series support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific

attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match 10.1.1.0/24 OR 11.1.1.0/24), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 94 on page 1244 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 94: Match Conditions

| Option                                    | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-mac</b> <i>mac-address</i> | Destination media access control (MAC) address of the packet.                                                                                                                                                                                                                                                                              |
| <b>source-vlan</b> <i>source-vlan</i>     | Name of the source VLAN.                                                                                                                                                                                                                                                                                                                   |
| <b>source-dot1q-tag</b> <i>tag</i>        | Tag value in the 802.1Q header, in the range 0 through 4095.                                                                                                                                                                                                                                                                               |
| <b>destination-ip</b> <i>ip-address</i>   | Address of the final destination node.                                                                                                                                                                                                                                                                                                     |
| <b>ip-protocol</b> <i>protocol-id</i>     | IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:<br><br><b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17) |
| <b>source-port</b> <i>port</i>            | TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .          |

Table 94: Match Conditions (*continued*)

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port</b> <i>port</i> | <p>TCP or UDP destination port field. Normally, you specify this match in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserver (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), telnet (23), tacacs-ds (65), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)</p> |

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 95 on page 1245](#) shows the actions that you can specify in a term.

Table 95: Actions for VSAs

| Option                                          | Description                                                                                                                                                                                                                        |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (allow   deny)                                  | Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                  |
| <b>forwarding-class</b> <i>class-of-service</i> | <p>(Optional) Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> </ul> |
| <b>loss-priority</b> (low   medium   high)      | (Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and loss priority.                                                                                |

### Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```
[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}
```

#### Related Documentation

- [Configuring Access Privilege Levels on page 1212](#)

### Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```
[edit]
system {
  # This login class has operator privileges and the additional ability
  # to reboot the router.
  login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
  }
}
```

```

}
# This login class has operator privileges but can't use any commands beginning
# with "set" .
# This login class has operator privileges
# but cannot use any commands beginning with "set"
class operator-no-set {
permissions [ clear network reset trace view ];
deny-commands "^set";
}
# This login class has operator privileges and can install software but not view
# BGP information, and can issue the show route command, without specifying
# commands or arguments under it.
class operator-and-install-but-no-bgp {
permissions [ clear network reset trace view ];
allow-commands "(request system software add)|(show route$)";
deny-commands "show bgp";
}
}
}

```

### Example: Configuring a Plain-Text Password for Root Logins

The following example shows how to set a plain-text password for root logins:

```

[edit]
user@switch# set system root-authentication plain-text-password
New password: type root password
Retype new password: retry root password
[edit]
user@switch# show
system {
  root-authentication {
    encrypted-password "$1$14c5.$sBopasddsdfs0";
  }
}

```

**Related Documentation** • [Configuring the Root Password](#)

### Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$9$aHlj8gqQ1gjjgjhggjiiiii"; # SECRET-DATA
  }
  name-server {
    10.1.1.1;
    10.1.1.2;
  }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
  radius-server {
    10.1.2.1 {
      secret "$9$aHlj8gqQ1sdjerrrhser"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
      secret "$9$aHlj8gqQ1csdoiuardwefoiud"; # SECRET-DATA
      timeout 5;
    }
  }
}
```

## Example: Configuring RADIUS System Accounting

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting.

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;

### Example: Configuring the Root Password

The following example shows how to configure the root password:

```

[edit]
user@switch# set system root-authentication encrypted-password
"$1$14c5.$sBopasddsdfs0"
[edit]
user@switch# show
system {
  root-authentication {
    encrypted-password "$1$14c5.$sBopasddsdfs0";
  }
}

```

### Example: Configuring SSH Authentication for Root Logins

The following example shows how to configure two public DSA keys for SSH authentication of root logins:

```

[edit system]
root-authentication {
  encrypted-password "$1$1wp5tqMX$uy/u5H7OdXTwfWTmeJWXe/";
  ## SECRET-DATA;
  ssh-dsa "2354 95 9304@boojum.per";
  ssh-dsa "0483 02 8362@ecbatana.per";
}

```

**Related Documentation**

## Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$1$poPPeY";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$1$14c5.$sBopasdFFdssdfFFdsdfs0";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
      class operator;
      authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
      }
    }
    user anonymous {
      class unauthorized;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

## Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1197](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
```

**NOTE:** For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1185](#).

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the **[edit system login user]** hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the **edit system login user remote** hierarchy level. The remote template account serves as a default template user account for all users that

are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

**Related  
Documentation**

- [Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1214](#)

## Example: Creating Login Classes with Specific Privileges

The following example shows how to create several user classes, each with specific privileges. In this example, you configure timeouts to disconnect the class members after a period of inactivity. Users' privilege levels, and therefore the classes of which they are members, should be dependent on their responsibilities within the organization, and the permissions shown here are only examples.

The first class of users (called “observation”) can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users (called “operation”) can view and modify the configuration. The third class of users (called “engineering”) has unlimited access and control.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
reset routing routing-control snmp snmp-control trace-control
firewall-control rollback ];
    }
    class engineering {
      idle-timeout 5;
      permissions all;
    }
  }
}
```

## Example: Configuring QFabric System Login Classes

This example shows you how to assign the correct login class to users so they can access components within a QFabric system.

- [Requirements on page 1253](#)
- [Overview on page 1254](#)
- [Configuration on page 1255](#)
- [Verification on page 1257](#)

### Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
  - Junos OS Release 12.2 for these QFX Series components
- Eight EX4200 switches, used to make two redundant Virtual Chassis with four members apiece

- Junos OS Release 12.1R1.9 for the EX Series switches used in the Virtual Chassis

Before you begin:

- Perform the initial setup of the QFabric system on the Director group, which includes the creation of a username and password for the QFabric system components. See [Performing the QFabric System Initial Setup on a QFX3100 Director Group](#).

## Overview

---

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system (such as Node devices and Interconnect devices). The *qfabric-admin* class provides the ability to log in to individual QFabric system components and manage them. The *qfabric-operator* class enables the user to log in to individual components and view component-level operations and configurations. The *qfabric-user* class prevents access to individual QFabric system components.

You include these classes in your configuration at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level. The key task is to decide which class you should apply to users based on their need to access QFabric system components.

**NOTE:** To set QFabric system login classes for a root user, include the **remote-debug-permission** statement at the **[edit system root-authentication]** hierarchy level and specify the *qfabric-admin* class.

If you assign the *qfabric-admin* or the *qfabric-operator* class to a user, the QFabric system maps the user to a list of authorized users who are permitted to access components. To facilitate ease of use, the QFabric system uses the component password you specified during the initial setup of the Director group. When users assigned the *qfabric-admin* or the *qfabric-operator* class log in to a component by issuing the **request component login** operational mode command, the QFabric system verifies the class and sends the username and password to the component. The component accepts these credentials and permits access.

**NOTE:**

- The three QFabric system login classes give access to the components only. To provide access to the QFabric system as a whole through the default partition command-line interface (CLI), you must configure the usual Junos OS login classes or permissions (such as the *super-user* class). For more information about login classes, see [“Junos OS Login Classes Overview” on page 1203](#).
- If you have completed the QFabric system initial setup and the system is operational, you can change the component password by issuing the **device-authentication** statement at the **[edit system]** hierarchy level in the QFabric default partition CLI.

### Topology

This example defines three users: Adam, Oscar, and Ulf. Adam needs to manage QFabric system components, Oscar needs read-only access, and Ulf should not have access to the components. As a result, assign the qfabric-admin class to Adam, the qfabric-operator class to Oscar, and the qfabric-user class to Ulf. However, all three users should have all permissions to access the QFabric system CLI.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login class all-qfabric permissions all
set system login user Adam class all-qfabric
set system login user Adam authentication encrypted-password
"$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
set system login user Adam authentication remote-debug-permission qfabric-admin
set system login user Oscar class all-qfabric
set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrZV0.efdRbk.ZJncKm0"
set system login user Oscar authentication remote-debug-permission qfabric-operator
set system login user Ulf class all-qfabric
set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
set system login user Ulf authentication remote-debug-permission qfabric-user
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the CLI User Guide.

To provide the same access to the QFabric system CLI for all users, but different QFabric system component-level access to different users:

1. Define and provide all-qfabric access and passwords to all three users. This administrator-defined class provides full permissions, enabling the users to log in to the QFabric system default partition and use the CLI. Alternatively, you can assign the super-user class to these users to accomplish the same goal.

```
[edit]
user@qfabric# set system login class all-qfabric permissions all
user@qfabric# set system login user Adam class all-qfabric
user@qfabric# set system login user Adam authentication encrypted-password
"$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
user@qfabric# set system login user Oscar class all-qfabric
user@qfabric# set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrZV0.efdRbk.ZJncKm0"
user@qfabric# set system login user Ulf class all-qfabric
user@qfabric# set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
```

2. Provide qfabric-admin component access to Adam so he can manage QFabric system components.

```
[edit]
user@qfabric# set system login user Adam authentication remote-debug-permission
qfabric-admin
```

3. Provide qfabric-operator component access to Oscar so he can view the CLI at the QFabric system components.

```
[edit]
user@qfabric# set system login user Oscar authentication remote-debug-permission
qfabric-operator
```

4. Assign qfabric-user component restrictions to Ulf to prevent him from accessing the QFabric system components.

```
[edit]
user@qfabric# set system login user Ulf authentication remote-debug-permission
qfabric-user
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example.

```
[edit]
system {
  login {
    class all-qfabric {
      permissions all;
    }
    user Adam {
      class all-qfabric;
      authentication {
        encrypted-password "$1$aoYSFkVE$G/dYqsTV5iSvVW2sND69U."; ##
        SECRET-DATA
        remote-debug-permission qfabric-admin;
      }
    }
    user Oscar {
      class all-qfabric;
      authentication {
        encrypted-password "$1$3e.3wJQ8$31SrZVO.efdBk.ZJncKm0"; ## SECRET-DATA
        remote-debug-permission qfabric-operator;
      }
    }
    user Ulf {
      class all-qfabric;
      authentication {
        encrypted-password "$1$qt9Ncm0o$okNYSN8O4fvITE/SHBdYj0"; ##
        SECRET-DATA
        remote-debug-permission qfabric-user;
      }
    }
  }
}
```

```

    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the QFabric system and component-level access configuration is working properly for all three users. Adam, Oscar, and Ulf should have equivalent, full-permission access to the QFabric system CLI. Adam should have management-level access to components. Oscar should have read-only access to components. Ulf should have no component-level access.

- [Verifying qfabric-admin Access on page 1257](#)
- [Verifying qfabric-operator Access on page 1259](#)
- [Verifying qfabric-user Access on page 1260](#)

#### *Verifying qfabric-admin Access*

**Purpose** Verify that Adam can access the QFabric system CLI at the default partition and manage QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Adam to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Adam has permission to use on the QFabric system default partition.

```

> ssh Adam@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Adam@qfabric.network.net's password:
Last login: Sun Nov 20 14:12:29 2011 from 192.168.28.19
Juniper QFabric Director 11.3.5510 2011-10-21 16:31:44 UTC

```

```

RUNNING ON DIRECTOR DEVICE : dg0
Adam@qfabric>

```

```

Adam@qfabric> ?

```

Possible completions:

| restart   | Restart software process                               |
| save      | Save information to file                               |
| set       | Set CLI properties, date/time, craft interface message |
| show      | Show system information                                |
| telnet    | Telnet to another host                                 |

|            |                              |
|------------|------------------------------|
| test       | Perform diagnostic debugging |
| traceroute | Trace route to remote host   |

Issue the **request component login ?** command to view the components that Adam can access. Next, issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Adam@qfabric> request component login ?
Possible completions:
<[Enter]>          Execute this command
<node-name>       Inventory name for the remote node
BBAK0372          Node device
BBAK0394          Node device
DRE-0             Diagnostic routing engine
EE3093            Node device
FC-0              Fabric control
FC-1              Fabric control
FM-0              Fabric manager
NW-NG-0           Node group
WS001/RE0         Interconnect device control board
WS001/RE1         Interconnect device control board
|                 Pipe through a command
```

```
Adam@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Adam has the permission to use on the Node device. Notice that the CLI prompt now indicates Adam's component access level (**qfabric-admin**) as the username and the Node device identifier (**EE3093**) as the host.

```
qfabric-admin@EE3093> ?
Possible completions:
clear              Clear information in the system
file               Perform file operations
help               Provide help information
load               Load information from file
monitor            Show real-time debugging information
mtrace             Trace multicast path from source to receiver
op                 Invoke an operation script
ping               Ping remote target
quit               Exit the management session
request            Make system-level requests
restart            Restart software process
save               Save information to file
set                Set CLI properties, date/time, craft interface message
show               Show system information
ssh                Start secure shell on another host
start              Start shell
telnet             Telnet to another host
test               Perform diagnostic debugging
traceroute         Trace route to remote host
```

**Meaning** The output shows that Adam has received the proper permissions to access the QFabric system CLI and log in to individual components with management-level access.

**Verifying qfabric-operator Access**

**Purpose** Verify that Oscar can access the QFabric system CLI at the default partition and view the CLI on the QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Oscar to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam.

```
> ssh Oscar@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Oscar@qfabric.network.net's password:
Last login: Sun Nov 19 19:21:29 2011 from 192.168.28.14

| start   | Start shell                                            |
| test    | Perform diagnostic debugging                           |

**Meaning** The output shows that Oscar has full permissions to access the QFabric system CLI, but only read-only access when he logs in to individual components. Oscar's permissions on the QFabric system are the same as Adam's, but Oscar has fewer permissions than Adam on the Node device.

### *Verifying qfabric-user Access*

**Purpose** Verify that Ulf has full access to the QFabric system CLI at the default partition but cannot access the QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Ulf to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Ulf has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam and Oscar.

```
> ssh Ulf@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Ulf@qfabric.network.net's password:

| telnet     | Telnet to another host                                 |
| test       | Perform diagnostic debugging                           |
| traceroute | Trace route to remote host                             |

When Ulf issues the **request component login *component-name*** command, the Node device denies his access attempt.

```
Ulf@qfabric> request component login EE3093
error: User Ulf does not have sufficient permissions to login to device EE3093
```

**Meaning** The output shows that Ulf has full permissions to access the QFabric system CLI in the same way as Adam and Oscar. However, unlike Adam and Oscar, Ulf cannot access individual components because of the qfabric-user login class assigned to him.

## Example: Configuring User Login Accounts

The following example shows how to configure the local administrator account (**user admin**). If RADIUS fails or becomes unreachable, the login process reverts to password authentication on the local accounts on the router or switch.

```
[edit]
system {
  login {
    user admin {
      uid 1000;
      class engineering;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}
```

- Related Documentation**
- [Configuring Junos OS User Accounts](#)

## Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]
system {
  login {
    user observation {
      uid 1001;
      class observation;
    }
    user operation {
```

```
        uid 1002;
        class operation;
    }
    user engineering {
        uid 1003;
        class engineering;
    }
}
```

## Defining Access Privileges Using allow/deny-configuration Statements

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@switch# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

```
}
```

### Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
    password {
    }
  }
}
```

**NOTE:** This sample only shows the portion off the [edit system login] hierarchy level being modified.

## Configuration Statements

### access

**Syntax**

```
access {
  address-assignment
  pool pool-name
  address-pool pool-name
  profile profile-name {
    accounting {
      accounting-stop-on-access-deny;
      accounting-stop-on-failure;
      (authentication-order (ldap radius | none);
      order (radius | none);
    }
    radius {
      accounting-server [server-addresses];
      authentication-server [server-addresses];
    }
  }
}
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure authentication, authorization, and accounting (AAA) services.  
  
The statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Default** Not enabled

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                          |
| <b>Description</b>         | Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached. |
| <b>Default</b>             | Not enabled                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <i>server-addresses</i> —One or more addresses of RADIUS authentication servers.                                                                                                                                                                                                                                                                   |

NOTE: The [edit access] hierarchy is not available on QFabric systems.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                             |
| <b>Description</b>         | For MX Series and T Series routers, configure an interval for LLDP advertisement.<br><br>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.<br><br>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration. |

**NOTE:** The default value of **transmit-delay** is 2 seconds. If you configure the **advertisement-interval** as less than 8 seconds and you do not configure a value for **transmit-delay**, the default value of **transmit-delay** is automatically changed to 1 second in order to satisfy the requirement that the **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value.

| <b>Description</b>         | <p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example,</p> <p><b>"scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</b></p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails. The format for the destination filename is</p> <p><b>router-name_juniper.conf[.gz]_YYYYMMDD_HHMMSS.</b></p> <div style="margin-top: 20px;">  <p><b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="margin-top: 20px;">  <p><b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div> |
| <b>Options</b>             | <p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p> <p><b>scp://</b> —transfer to a known host using background SCP file transfers</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## configuration

---

**Syntax**    configuration {  
              transfer-interval *interval*;  
              transfer-on-commit;  
              archive-sites {  
                  file://<path>/<filename>;  
                  ftp://username@host:<port>url-path password password;  
                  http://username@host:<port>url-path password password;  
                  pasvftp://username@host:<port>url-path password password;  
                  scp://username@host:<port>url-path password password;  
              }  
          }

**Hierarchy Level**    [edit system archival]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

.....  
**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.  
.....

**Options**    The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

## lldp

```
Syntax  lldp {
    advertisement-interval seconds;
    disable;
    hold-multiplier number;
    interface (all | [interface-name]) {
        disable;
        power-negotiation {
            disable;
        }
    }
    lldp-configuration-notification-interval seconds;
    management-address ip-management-address;
    netbios-snooping;
    ptopo-configuration-maximum-hold-time seconds;
    ptopo-configuration-trap-interval seconds;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>
        <no-stamp> <replace>;
        flag flag <disable>;
    }
    transmit-delay seconds;
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for QFX Series.

**Description** Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

**NOTE:** The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

**Default** LLDP is enabled.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## profile

**Syntax**    `profile profile-name {  
                   accounting {  
                     accounting-stop-on-access-deny;  
                     accounting-stop-on-failure;  
                     order ( radius | [ accounting-order-data-list ] );  
                   }  
                   authentication-order [ authentication-method ];  
                   radius {  
                     accounting-server [ server-addresses ];  
                     authentication-server [ server-addresses ];  
                   }  
                 }`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

**Default**    Not enabled

**Options**    *profile-name*—Profile name of up to 32 characters.  
                   The remaining statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                       admin-control—To add this statement to the configuration.

**Related Documentation**    • Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch  
                                       • Configuring 802.1X RADIUS Accounting (CLI Procedure)

## radius

---

**Syntax**    radius {  
              [accounting-server](#) [*server-addresses*];  
              [authentication-server](#) [*server-addresses*];  
              }

**Hierarchy Level**    [edit access profile *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The statements are explained separately.

---

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

## radius-server

---

**Syntax**    `radius-server server-address {  
                  accounting-port port-number;  
                  port number;  
                  retry number;  
                  secret password;  
                  source-address source-address;  
                  timeout seconds;  
                  }`

**Hierarchy Level**    [edit system]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure a RADIUS server for Point-to-Point Protocol (PPP).

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

**Options**    **server-address**—Address of the RADIUS authentication server.

The remaining statements are explained separately.

.....  
**NOTE:** The **accounting-port** and **source-address** options are not available on QFabric systems.  
.....

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

## services (Switches)

---

**Syntax**

```
services {  
  service-deployment {  
    servers address {  
      port-number port-number;  
    }  
    source-address address;  
  }  
  ssh {  
    connection-limit limit;  
    protocol-version [v1 v2];  
    rate-limit limit;  
    root-login (allow | deny | deny-password);  
  }  
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>address</b>—Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b>.</p> <p><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.)</p> |
| <b>Required Privilege Level</b> | <p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                             |

## traceoptions (LLDP)

**Syntax** `traceoptions {  
     file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>  
     <replace>;  
     flag flag <disable>;  
}`

**Hierarchy Level** [edit protocols [lldp](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

**NOTE:** The `traceoptions` statement is not supported on the QFX3000 QFabric system.

**Default** Tracing operations are disabled.

**Options** **file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.

- **vlan**—Trace VLAN update events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending output to it.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

.....  
**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.  
.....

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                 routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series. |
| <b>Description</b>         | Configure the router or switch to periodically transfer its currently active configuration to an archive site.                                                                                 |

**NOTE:** The `edit system archival` hierarchy is not available on QFabric systems.

**Options** *interval*—Interval at which to transfer the current configuration to an archive site.  
**Range:** 15 through 2880 minutes

**NOTE:** The `[edit system archival]` hierarchy is not available on QFabric systems.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## Routine Monitoring

---

- [Monitoring SNMP on page 1341](#)

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

| Alarm |                                                                              |       |        |  |
|-------|------------------------------------------------------------------------------|-------|--------|--|
| Index | Variable description                                                         | Value | State  |  |
| 32768 | Health Monitor: root file system utilization<br>jnxHrStoragePercentUsed.1    | 58    | active |  |
| 32769 | Health Monitor: /config file system utilization<br>jnxHrStoragePercentUsed.2 | 0     | active |  |
| 32770 | Health Monitor: RE 0 CPU utilization<br>jnxOperatingCPU.9.1.0.0              | 0     | active |  |
| 32773 | Health Monitor: RE 0 Memory utilization<br>jnxOperatingBuffer.9.1.0.0        | 35    | active |  |
| 32775 | Health Monitor: jkernel daemon CPU utilization<br>Init daemon                | 0     | active |  |

|                  |           |
|------------------|-----------|
| Chassis daemon   | 50 active |
| Firewall daemon  | 0 active  |
| Interface daemon | 5 active  |
| SNMP daemon      | 11 active |
| MIB2 daemon      | 42 active |
| ...              |           |

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U
sysObjectID.0 = jnxProductQFX3500
sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

SNMP statistics:

Input:

```
Packets: 0, Bad versions: 0, Bad community names: 0,
Bad community uses: 0, ASN parse errors: 0,
Too bigs: 0, No such names: 0, Bad values: 0,
Read onlys: 0, General errors: 0,
Total request varbinds: 0, Total set varbinds: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0,
Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,
Throttle drops: 0, Duplicate request drops: 0
```

Output:

```
Packets: 0, Too bigs: 0, No such names: 0,
Bad values: 0, General errors: 0,
Get requests: 0, Get nexts: 0, Set requests: 0,
Get responses: 0, Traps: 0
```

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | (QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the <b>request component login</b> command, you must first provide the <b>qfabric-admin</b> or <b>qfabric-operator</b> class privilege to your user (for more information, see: <a href="#">remote-debug-permission</a> ). |
| <b>Options</b>                  | <b><i>component-name</i></b> —Specify the QFabric system component to which you wish to log in.                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | admin                                                                                                                                                                                                                                                                                                                                     |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring QFabric System Login Classes on page 1253</a></li> <li>• <a href="#">remote-debug-permission on page 1320</a></li> <li>• <a href="#">Understanding QFabric System Login Classes on page 1204</a></li> </ul>                                                     |
| <b>List of Sample Output</b>    | <a href="#">request component login (with qfabric-admin Privileges) on page 1345</a><br><a href="#">request component login (with qfabric-operator Privileges) on page 1346</a><br><a href="#">request component login (with qfabric-user Privileges) on page 1346</a>                                                                    |

## Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

**request component login (with**

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.
```

**qfabric-admin  
Privileges)**

```

| LLDP                   | LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .<br><br><b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> .                                                                                                  | All levels      |
| Advertisement interval | Frequency, in seconds, at which LLDP advertisements are sent.<br><br>This value is set by the <b>advertisement-interval</b> configuration statement.                                                                                                                                                                                                                                                               | All levels      |
| Transmit delay         | Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.<br><br>This value is set by the transmit-delay configuration statement. | All levels      |
| Hold timer             | Multiplier used in combination with the <b>advertisement-interval</b> value to determine the length of time LLDP information is held before it is discarded.<br><br>This value is set by the <b>hold-multiplier</b> configuration statement.                                                                                                                                                                       | All levels      |
| Notification interval  | How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications of database changes are disabled.<br><br>This value is set by the <b>lldp-configuration-notification-interval</b> configuration statement.                                                                                                                               | All levels      |
| Config Trap Interval   | How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications of topology changes are disabled.<br><br>This value is set by the <b>ptopo-configuration-trap-interval</b> configuration statement.                                                                                  | All levels      |
| Connection Hold timer  | Amount of time the system maintains dynamic topology entries.<br><br>This value is set by the <b>ptopo-configuration-maximum-hold-time</b> configuration statement.                                                                                                                                                                                                                                                | All levels      |
| LLDP-MED               | LLDP-MED operating state. The state can be <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                     | All levels      |
| MED fast start count   | Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.<br><br>This value is set by the <b>fast-start</b> configuration statement.                                   | All levels      |
| Interface              | Name of the interface for which LLDP configuration information is being reported.                                                                                                                                                                                                                                                                                                                                  | All levels      |
| Parent Interface       | Name of the aggregated Ethernet interface, if any, to which the interface belongs.                                                                                                                                                                                                                                                                                                                                 | All levels      |

Table 97: show lldp Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>LLDP</b>                      | LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Power Negotiation</b>         | LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Neighbor count</b>            | Total number of new LLDP neighbors detected since the last switch reboot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Interface</b>                 | Name of the interface that is advertising VLAN information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Vlan-id</b>                   | VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Vlan-name</b>                 | VLAN name associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>LLDP basic TLVs supported</b> | <p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul> | <b>detail</b>   |
| <b>Supported LLDP 802 TLVs</b>   | <p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>MAC/PHY configuration status</b>—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable.</li> <li>• <b>Power via MDI</b>—TLV that advertises MDI power support, PSE power pair, and power class information.</li> <li>• <b>Link aggregation</b>—TLV that advertises if the interface is aggregated and its aggregated interface ID.</li> <li>• <b>Maximum frame size</b>—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.</li> <li>• <b>Port VLAN tag</b>—TLV that advertises the VLAN tag configured on the interface.</li> <li>• <b>Port VLAN name</b>—TLV that advertises the VLAN name configured on the interface.</li> </ul>                                                     | <b>detail</b>   |

Table 97: show lldp Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Supported LLDP MED TLVs</b> | <p>LLDP-MED TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>LLDP MED capabilities</b>—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15: <ul style="list-style-type: none"> <li>• 0—Capabilities</li> <li>• 1—Network Policy</li> <li>• 2—Location Identification</li> <li>• 3—Extended Power via MDI-PSE</li> <li>• 4—Inventory</li> <li>• 5–15—Reserved</li> </ul> </li> <li>• <b>Network policy</b>—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.</li> <li>• <b>Endpoint location</b>—TLV that advertises the physical location of the endpoint.</li> <li>• <b>Extended power Via MDI</b>—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.</li> </ul> | <b>detail</b>   |

## Sample Output

### show lldp

```
user@switch> show lldp
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 4 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds

LLDP MED : Disabled
MED fast start count : 3 Packets
```

| Interface | Parent Interface | LLDP    | LLDP-MED | Power Negotiation |
|-----------|------------------|---------|----------|-------------------|
| all       | -                | Enabled | Enabled  | Enabled           |

### show lldp detail

```

#### LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

#### Supported LLDP 802 TLVs:

MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

#### Supported LLDP MED TLVs:

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

| xe-3/0/7.0     | ae31.0           | 581        | xe-3/0/7.0            | Up     | Disabled  |

## show lldp neighbors

**Syntax** <show lldp *neighbors*>  
<interface *interface-ids*>

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

**Options** **none**—Display learned LLDP information on all neighboring interfaces and devices.

**interface *interface-ids***—(Optional) Display learned LLDP information on the selected interfaces or devices.

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

**Output Fields** [Table 99 on page 1359](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 99: show lldp neighbors Output Fields**

| Field Name       | Field Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------|
| Local Interface  | List of local interfaces for which neighbor information is available.                                    |
| Parent Interface | List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.                    |
| Chassis ID       | List of chassis identifiers for neighbors.                                                               |
| Port info        | List of port information gathered from neighbors. This could be the port identifier or port description. |
| System name      | List of system names gathered from neighbors.                                                            |

Table 99: show lldp neighbors Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LLDP Neighbor Information</b> | Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                       |
| <b>Local Information</b>         | Information about the local system (appears when the <b>interface</b> option is used).                                                                                                                                                                                |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                                                                                                                                                                             |
| <b>Time to live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).                                                                                                                                                             |
| <b>Time mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                                                                                                                                                                 |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                                                                                                                                                                              |
| <b>Parent Interface</b>          | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).                                                                                                                                 |
| <b>Local Port ID</b>             | Local interface SNMP index (appears when the <b>interface</b> option is used).                                                                                                                                                                                        |
| <b>Ageout Count</b>              | Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the <b>interface</b> option is used). |
| <b>Neighbor Information</b>      | Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                              |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).                                                                                                                                                   |
| <b>Chassis ID</b>                | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                     |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>locally assigned</b> (appears when the <b>interface</b> option is used).                                                                                                                                                 |
| <b>Port ID</b>                   | Port identifier of the port type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                           |
| <b>Port description</b>          | Port description (appears when the <b>interface</b> option is used).                                                                                                                                                                                                  |
| <b>System name</b>               | Name supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                      |
| <b>System Description</b>        | Description supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                               |

Table 99: show lldp neighbors Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System capabilities | Capabilities (such as <b>Bridge</b> , <b>Router</b> , and <b>Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Management Info     | <p>Details of management information: <b>Type</b> (such as <b>ipv4</b> or <b>ipv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>— IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul> |
| Media Info          | Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , or <b>MED Model name</b> .                                                                                                                                                                                                                                                             |
| Organization Info   | One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Age                 | How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Local Interface     | Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Parent Interface    | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Chassis ID          | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Port description    | Port description (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| System name         | NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Sample Output

### show lldp neighbors

```
user@switch> show lldp neighbors
```

| Local Interface | Parent Interface | Chassis Id        | Port info  | System Name |
|-----------------|------------------|-------------------|------------|-------------|
| xe-3/0/4.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/0.0 | newyork31   |
| xe-3/0/5.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/1.0 | newyork31   |
| xe-3/0/6.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/2.0 | newyork31   |
| xe-3/0/7.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/3.0 | newyork31   |
| xe-3/0/0.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/0.0 | newyork31   |
| xe-3/0/1.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/1.0 | newyork31   |
| xe-3/0/2.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/2.0 | newyork31   |
| xe-3/0/3.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/3.0 | newyork31   |

### show lldp neighbors interface

```
user@switch> show lldp neighbors interface ge-0/0/2
```

```
LLDP Neighbor Information:
Local Information:
Index: 1 Time to live: 240 Time mark: Wed Dec 1 10:23:24 2010 Age: 29 secs
Local Interface   : ge-0/0/2.0
Parent Interface  : -
Local Port ID     : 507
Ageout Count      : 0

Neighbour Information:
Chassis type      : Mac address
Chassis ID       : 00:1f:12:38:7f:c0
Port type        : Locally assigned
Port ID          : 507
Port description  : ge-0/0/2.0
System name      : bng-148p5-dev

System Description : Juniper Networks, Inc. ex4200-48p , version 10.4I0 Build
date: 2010-11-30 09:32:17 UTC

System capabilities
Supported  : Bridge Router
Enabled   : Bridge Router

Management Info
Type       : IPv4
Address    : 10.204.96.235
Port ID    : 34
Subtype    : 1
Interface Subtype : ifIndex(2)
OID        : 1.3.6.1.2.1.31.1.1.1.34
Media endpoint class: Network Connectivity

Organization Info
OUI        : 0.12.f
Subtype    : 1
Index      : 1
Info       : 22A8360000

Organization Info
OUI        : 0.12.f
Subtype    : 2
Index      : 2
```

Info : 030100

## show lldp statistics

|                                 |                                                                                                                                                                                     |

| <b>Output Fields</b>            | <a href="#">Table 100 on page 1364</a> lists the output fields for the <b>show lldp statistics</b> command. Output fields are listed in the approximate order in which they appear. |

Table 100: show lldp statistics Output Fields

| Field Name            | Field Description                                                | Level of Output |
|-----------------------|------------------------------------------------------------------|-----------------|
| <b>Interface</b>      | Name of an interface.                                            | All levels      |
| <b>Received</b>       | Total number of LLDP frames received on an interface.            | All levels      |
| <b>Unknown-TLVs</b>   | Number of unrecognized LLDP TLVs received on an interface.       | All levels      |
| <b>With Errors</b>    | Number of LLDP frames received that contain errors.              | All levels      |
| <b>Discarded TLVs</b> | Number of LLDP TLVs received and then discarded on an interface. | All levels      |
| <b>Transmitted</b>    | Total number of LLDP frames transmitted on an interface.         | All levels      |
| <b>Untransmitted</b>  | Total number of LLDP frames not transmitted on an interface.     | All levels      |

## Sample Output

show lldp statistics

user@switch> show lldp statistics

| Interface  | Received | Unknown TLVs | With Errors | Discarded TLVs | Transmitted |
|------------|----------|--------------|-------------|----------------|-------------|
| me0.0      | 0        | 0            | 0           | 0              | 8003        |
| ge-0/0/0.0 | 8002     | 0            | 0           | 0              | 8003        |
| ge-0/0/1.0 | 8002     | 0            | 0           | 0              | 8003        |

## show route instance

| <b>Description</b>                                  | Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the <b>ssh</b> command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:<br><br><pre>ssh address 'cli-command1 ; cli-command2 '</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                      | <b>host</b> —Name or address of the remote system.<br><br><b>bypass-routing</b> —(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.<br><br><b>inet   inet6</b> —(Optional) Create an IPv4 or IPv6 connection, respectively.<br><br><b>interface interface-name</b> —(Optional) Interface name for the SSH session. (This option does not work when <b>default-address-selection</b> is configured at the <b>[edit system]</b> hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)<br><br><b>logical-system logical-system-name</b> —(Optional) Name of a particular logical system for the SSH attempt.<br><br><b>routing-instance routing-instance-name</b> —(Optional) Name of the routing instance for the SSH attempt. |

**source address**—(Optional) Source address of the SSH connection.

**v1 | v2**—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

**Additional Information** To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. For details, see the .

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

## Overview of Layer 2 Networking

Layer 2, also known as the Data Link Layer, is the second level in the seven-layer OSI reference model for network protocol design. Layer 2 is equivalent to the link layer (the lowest layer) in the TCP/IP network model. Layer 2 is the network layer used to transfer data between adjacent network nodes in a wide area network or between nodes on the same local area network.

A *frame* is a protocol data unit, the smallest unit of bits on a Layer 2 network. Frames are transmitted to and received from devices on the same local area network (LAN). Unlike bits, frames have a defined structure and can be used for error detection, control plane activities and so forth. Not all frames carry user data. The network uses some frames to control the data link itself..

At Layer 2, *unicast* refers to sending frames from one node to a single other node, whereas *multicast* denotes sending traffic from one node to multiple nodes, and *broadcasting* refers to the transmission of frames to all nodes in a network. A *broadcast domain* is a logical division of a network in which all nodes of that network can be reached at Layer 2 by a broadcast.

Segments of a LAN can be linked at the frame level using *bridges*. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN.

*Forwarding* is the relaying of packets from one network segment to another by nodes in the network. On a VLAN, a frame whose origin and destination are in the same VLAN are forwarded only within the local VLAN. A network segment is a portion of a computer network wherein every device communicates using the same physical layer.

Layer 2 contains two sublayers:

- Logical link control (LLC) sublayer, which is responsible for managing communications links and handling frame traffic.
- Media access control (MAC) sublayer, which governs protocol access to the physical network medium. By using the MAC addresses that are assigned to all ports on a switch, multiple devices on the same physical link can uniquely identify one another.

The ports, or interfaces, on a switch operate in either access mode, tagged-access, or trunk mode:

- *Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode.
- *Tagged-Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:
- *Trunk mode* ports handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to other devices or switches.

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's port (which is in access mode) as a native VLAN. The switch's trunk port will then treat

those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag). There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Including the sublayers, Layer 2 on the QFX Series supports the following functionality:

- Unicast, multicast, and broadcast traffic.
- Bridging.
- VLAN 802.1Q—Also known as *VLAN tagging*, this protocol allows multiple bridged networks to transparently share the same physical network link by adding VLAN tags to an Ethernet frame.
- Extension of Layer 2 VLANs across multiple switches using Spanning Tree Protocol (STP) prevents looping across the network.
- *MAC learning*, including per-VLAN MAC learning and Layer 2 learning suppression—This process obtains the MAC addresses of all the nodes on a network
- Link aggregation—This process groups of Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or LAG bundle
- Storm control on the physical port for unicast, multicast, and broadcast
- STP support, including 802.1d, RSTP, MSTP, and Root Guard

## Understanding Bridging

*Bridging* is a frame-forwarding technique used in Layer 2. With bridging, there are no assumptions about where a particular address is located in a network, so a mixed collection of interface types and speeds can be logically grouped together.

Layer 2 on a switch uses the *transparent bridging* protocol. This protocol enables a node to learn information about all the nodes on the LAN, including nodes on all the different VLANs. This information is used to create address-lookup tables, called *Ethernet switching tables*. The switch uses these tables when forwarding traffic to or toward a destination on the LAN.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the node:

- *Learning* is the process used to obtain the MAC addresses of all the nodes on a network. When a node is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. To learn MAC addresses, a node reads all detected packets on the LAN or on the local VLAN, looking for the MAC addresses of sending nodes. These addresses are added to the Ethernet switching table, along with the interface (or port) on which the traffic was received and the time when the address was learned.
- *Forwarding* describes how traffic passes from an incoming to an outgoing interface that leads to or toward the destination. To forward frames, the Ethernet switching table is read to determine if the table contains the MAC address corresponding to the frame destination. If the Ethernet switching table contains an entry for the desired destination address, the traffic is sent out to the interface associated with the MAC address. The Ethernet switching table is read in the same way when frames are transmitted that originate on nodes connected directly to the initiating node.
- *Flooding* is the mechanism by which a node learns about destinations not in its Ethernet switching table. If the table has no entry for a particular destination MAC address, traffic floods out to all interfaces except the interface on which it was received. (If traffic originates on the node, the device floods it out all interfaces.) When the destination node receives the flooded traffic, it returns an acknowledgment packet, allowing the node to learn the MAC address and add it to its Ethernet switching table.
- *Filtering* refers to the limiting of traffic to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, an increasingly complete picture of the VLAN and the larger LAN is built, showing which nodes are in the local VLAN and which are on other network segments. This information is used to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents traffic forwarding to other network segments.
- *Aging* keeps the entries in the Ethernet switching table current. For each MAC address in the table, a timestamp shows when the information about the network node was learned. Each time traffic from a MAC address is detected, the timestamp is updated. A timer on the node periodically checks the timestamp, and if it is older than a user-configured value, that MAC address is removed from the Ethernet switching table. This aging process ensures that the device tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

## Understanding Unicast

*Unicasting* is the act of sending data from one node of the network to another. In contrast, multicast transmissions send traffic from one data node to multiple other data nodes.

*Unknown unicast* traffic consists of unicast frames with unknown destination MAC addresses. By default, the switch floods these unicast frames that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward any unknown unicast traffic to a specific trunk interface. (This channels the unknown unicast traffic to a single interface.)

## Introduction to the Media Access Control (MAC) Layer 2 Sublayer

This topic provides an introduction to the MAC sublayer of the data link layer (Layer 2).

In Layer 2 of a network, the Media Access Control (MAC) sublayer provides addressing and channel access control mechanisms that enable several terminals or network nodes to communicate in a network.

The MAC sublayer acts as an interface between the logical link control (LLC) Ethernet sublayer and Layer 1 (the physical layer). The MAC sublayer emulates a full-duplex logical communication channel in a multipoint network. This channel may provide unicast, multicast, or broadcast communication service. The MAC sublayer uses MAC protocols to prevent collisions.

In Layer 2, multiple devices on the same physical link can uniquely identify one another at the data link layer, by using the MAC addresses that are assigned to all ports on a switch. A MAC algorithm accepts as input a secret key and an arbitrary-length message to be authenticated, and outputs a MAC address.

A MAC address is a 12-digit hexadecimal number (48 bits in long). MAC addresses are usually written in one of these formats:

- MM:MM:MM:SS:SS:SS
- MM-MM-MM-SS-SS-SS

The first half of a MAC address contains the ID number of the adapter manufacturer. These IDs are regulated by an Internet standards body. The second half of a MAC address represents the serial number assigned to the adapter by the manufacturer.

Contrast MAC addressing, which works at Layer 2, with IP addressing, which runs at Layer 3 (networking and routing). One way to remember the difference is that the MAC addresses apply to a physical or virtual node, whereas IP addresses apply to the software implementation of that node. MAC addresses are typically fixed on a per-node basis, whereas IP addresses change when the node moves from one part of the network to another.

IP networks maintain a mapping between the IP and MAC addresses of a node using the Address Resolution Protocol (ARP) table. DHCP also typically uses MAC addresses when assigning IP addresses to nodes.

## Understanding Layer 2 Broadcasting

In a Layer 2 network, *broadcasting* refers to sending traffic to all nodes on a network.

Layer 2 broadcast traffic stays within a local area network (LAN) boundary; known as the *broadcast domain*. Broadcasting can be compared to unicasting (sending traffic to a single node) or multicasting (delivering traffic to a group of nodes simultaneously).

**NOTE:** In Layer 2, the MAC address for broadcasting is FF:FF:FF:FF:FF:FF.

Excessive broadcast traffic can sometimes create a broadcast storm. A broadcast storm occurs when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses that create a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

Broadcasting is used for a number of purposes in the data link layer, one of the primary ones being the manner in which VLANs utilize broadcast domains.

## Understanding VLANs

A virtual local area network (virtual LAN, or *VLAN*) is a collection of network nodes that are grouped together to form separate *broadcast domains*.

### Introduction to VLANs

On an Ethernet network that is a single LAN, all traffic is forwarded to all nodes on the LAN. A VLAN has the same attributes as a physical LAN, but allows end stations to be grouped together. An advantage to a VLAN is that you can perform network reconfiguration through the software rather than having to physically relocate a device.

On VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN. Frames that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. VLANs limit the amount of traffic flowing across the entire LAN, reducing the number of possible collisions and packet retransmissions within a VLAN and on the LAN as a whole.

On an Ethernet LAN, all network nodes must be physically connected to the same network. On VLANs, the physical location of the nodes is not important, so you can group network nodes in any way that makes sense for your organization, such as by department or business function, types of network nodes, or even physical location. Each VLAN is identified by a single IP subnetwork and by standardized IEEE 802.1Q encapsulation.

In networks that use Fibre Channel over Ethernet (FCoE), a VLAN that uses FCoE frames must be dedicated to FCoE traffic only; you cannot mix standard Ethernet and FCoE traffic on the same VLAN.

QFX Series systems support a maximum of 4089 VLANs, which includes the default VLAN. You can assign a VLAN ID in the range of 1 to 4094.

**NOTE:** You cannot mix Fibre Channel and Ethernet ports on the same VLAN. For further information about VLANs and Fibre Channel, see “[Example: Setting Up Fibre Channel and FCoE VLAN Interfaces in an FCoE-FC Gateway Fabric](#)” on page 4495.

## VLAN Tagging

---

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with. For a simple network that has only a single VLAN, all traffic has the same 802.1Q tag.

## Assigning Traffic to a VLAN

---

You can assign traffic to a VLAN in one of the following ways:

- *Interface (port)*—You can specify that all traffic received on a particular interface is assigned to a specific VLAN. By default, all traffic received on an access interface is untagged. This traffic is part of a default VLAN, but does not have an 802.1Q tag. During configuration, you specify which VLAN to assign the traffic to. You configure the VLAN either by using a VLAN ID number or by using a name, which is translated into a numeric VLAN ID.
- *MAC address*—You can specify that all traffic received from a specific MAC address be forwarded to a specific egress port (the next hop port). This method is cumbersome to configure manually, but it can be useful when you are using automated databases to manage the devices on your network.

## Ethernet Switching Tables

---

Learned MAC addresses on local VLANs are stored in a “bridge” on page 1381. With each MAC address, the Ethernet switching table stores and associates the name of the learned port address. The information in this table is used when packets are forwarded toward their destination.

## Layer 2 and Layer 3 Forwarding of VLAN Traffic

---

To pass traffic within a VLAN, Layer 2 forwarding protocols are used, including IEEE 802.1Q and Spanning Tree Protocol (STP),

To pass traffic between two VLANs, standard Layer 3 routing protocols are used, such as static routing. On the QFX Series, the same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

## Understanding Routed VLAN Interfaces

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). VLANs limit the amount of traffic flowing across the entire LAN, reducing

the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you normally need a router that connects the VLANs. However, you can accomplish this forwarding on a switch without using a router by configuring a routed VLAN interface (RVI). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

An RVI is a special type of Layer 3 virtual interface named **vlan**. Like normal Layer 3 interfaces, the **vlan** interface needs a logical unit number with an IP address. In fact, to be useful an RVI needs at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two VLANs (for example, VLAN **red** and VLAN **blue**) with corresponding subnets, your RVI must have a logical unit with an address in the subnet for **red** and a logical unit with an address in the subnet for **blue**. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs. [Table 103 on page 1387](#) shows values you might use when configuring an RVI:

**Table 103: Sample RVI Values**

| Property                      | Settings                                                                                                                                        |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN names and tags (IDs)     | <b>blue</b> , ID 100<br><b>red</b> , ID 200                                                                                                     |
| Subnets associated with VLANs | <b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| RVI name                      | interface <b>vlan</b>                                                                                                                           |
| RVI units and addresses       | logical unit 100: 192.0.2.1/25<br>logical unit 200: 192.0.2.129/25                                                                              |

For the sake of consistency and to avoid confusion, [Table 103 on page 1387](#) shows RVI logical unit numbers that match the IDs of the corresponding VLANs. However, you do not have to assign logical unit numbers that match the VLAN IDs—you can use any values for the units. To bind the logical units of the RVI to the appropriate VLANs, you use the **l3-interface** statement.

Because RVIs operate at Layer 3, you can use Layer 3 services such as firewall filters or CoS rewriting with them. RVIs are similar to integrated routing and bridging (IRB) interfaces supported on Juniper routers and switch virtual interfaces (SVIs) and bridge-group virtual interfaces (BVI) supported on other vendors' devices.

[Table 104 on page 1388](#) shows the number of RVIs that each QFX platform supports.

Table 104: Number of Supported RVIs by Platform

| Platform  | Number of Supported RVIs |
|-----------|--------------------------|
| QFX3500   | 1200                     |
| QFX3000-G | 2000                     |
| QFX3000-M | 2000                     |

**Related Documentation** • [Example: Configuring Routing Between VLANs on One Switch on page 1481](#)

## Understanding MAC Learning

*MAC learning* is the process of obtaining the MAC addresses of all the nodes on a network.

When a node is first connected to an Ethernet LAN or VLAN, it has no information about the other nodes on the network. As data is sent through the network, data packets include a data frame listing their source and destination MAC addresses. The data frame is forwarded to a target port, which is connected to the second device. The MAC address is learned locally at the target port, which facilitates communications for frames that later enter the target port and contain addresses previously learned from a received frame.

MAC learning can also be enabled on a per-VLAN basis. See [“Example: Disabling MAC Learning in a VLAN” on page 1508](#) for further information.

By default, MAC learning is enabled on the QFX Series.

## Understanding Reflective Relay for Use with VEPA Technology

Virtual Ethernet Port Aggregator (VEPA) technology aggregates packets generated by virtual machines located on the same server and relays them to a physical switch. The physical switch then provides connectivity between the virtual machines located on the server, so the virtual machines do not communicate with one another. Offloading switching activities from a virtual switch to a physical switch reduces the computing overhead on the virtual servers and takes advantage of the security, filtering, and management features of the physical switch. Reflective relay, also known as “hairpin turn,” enables the physical switch to receive aggregated packets from the virtual machines hosted on the server through the VEPA on the downstream port and send those packets out the same downstream port from which the physical switch received them.

- [VEPA on page 1389](#)
- [Reflective Relay on page 1389](#)

## VEPA

Even though virtual machines are capable of sending packets directly to one another, it is more efficient to pass these aggregated packets from the VEPA to a physical switch. The switch can then send any packets destined for a virtual machine located on the same server to the VEPA.

## Reflective Relay

Reflective relay, also known as a “hairpin turn” or “hairpin mode,” returns aggregated packets to the VEPA by using the same downstream port that initially delivered the aggregated packets from the VEPA to the switch. Reflective relay must be configured on the interface located on the physical switch that receives aggregated packets, such as VEPA packets, because some of these packets might need to be sent back to the server if they are destined for another virtual machine on the same server.

Reflective relay only occurs in two situations:

- When the destination address of the packet was learned on that downstream port
- When the destination has not yet been learned

Reflective relay does not otherwise change the operation of the switch. If the interface to which the virtual machine is connected and the MAC address of the virtual machine packet are not yet included in the Ethernet switching table for the virtual machine's associated VLAN, an entry is added. If the source MAC address of an incoming packet under the respective VLAN is not yet present in the Ethernet switching table, the switch floods the packet on all the other ports that are members of the same VLAN, including the port on which the packet arrived.

## Understanding Private VLANs

VLANs limit broadcasts to specified users. Private VLANs (PVLANS) take this concept a step further by splitting the broadcast domain into multiple isolated broadcast subdomains and essentially putting secondary VLANs inside a primary VLAN. PVLANS restrict traffic flows through their member switch ports (called “private ports”) so that these ports communicate only with a specified uplink trunk port or with specified ports within the same VLAN. The uplink trunk port is usually connected to a router, firewall, server, or provider network. Each PVLAN typically contains many private ports that communicate only with a single uplink, thereby preventing the ports from communicating with each other.

Just like regular VLANs, PVLANS are isolated on Layer 2 and require that a Layer 3 device be used to route traffic among them. PVLANS are useful for restricting the flow of broadcast and unknown unicast traffic and for limiting the communication between

known hosts. Service providers use PVLANS to keep their customers isolated from one another.

This topic explains the following concepts regarding PVLANS on the QFX Series:

- [Typical Structure and Primary Application of PVLANS on page 1390](#)
- [Using 802.1Q Tags to Identify Packets on page 1392](#)
- [Efficient Use of IP Addresses on page 1393](#)
- [PVLAN Port Types on page 1393](#)
- [Limitations of Private VLANs on page 1395](#)

### **[Typical Structure and Primary Application of PVLANS](#)**

---

A PVLAN can be created on a single switch or can be configured to span multiple switches. The PVLAN shown in [Figure 18 on page 1391](#) includes two switches, with a primary PVLAN domain and various subdomains.

Figure 18: Subdomains in a PVLAN

As shown in [Figure 18 on page 1391](#), a PVLAN has only one primary domain and multiple secondary domains. The types of domains are:

- Primary VLAN—VLAN used to forward frames downstream to isolated and community VLANs.
- Secondary isolated VLAN—VLAN that receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.
- Secondary interswitch isolated VLAN—VLAN used to forward isolated VLAN traffic from one switch to another through PVLAN trunk ports. 802.1Q tags are required for interswitch isolated VLANs because IEEE 802.1Q uses an internal tagging mechanism

by which a trunking device inserts a 4-byte VLAN frame identification tab into the packet header.

- Secondary community VLAN—VLAN used to transport frames among members of a community (a subset of users within the VLAN) and to forward frames upstream to the primary VLAN.

Figure 19 on page 1392 shows a PVLAN spanning multiple switches, where the primary VLAN (100) contains two community domains (300 and 400) and one interswitch isolated domain.

Figure 19: PVLAN Spanning Multiple Switches

**NOTE:** Primary and secondary VLANs count against the limit of 4089 VLANs supported on the QFX Series. For example, each VLAN in Figure 19 on page 1392 counts against this limit.

### Using 802.1Q Tags to Identify Packets

When packets are marked with a customer-specific 802.1Q tag, that tag identifies ownership of the packets for any switch or router in the network. Sometimes, 802.1Q tags are needed within PVLANS to keep track of packets from different subdomains. Table 105 on page 1393 indicates when a VLAN 802.1Q tag is needed on the primary VLAN or on secondary VLANs.

Table 105: PVLAN Requirements for 802.1Q Tags

|                | On a Single Switch                          | On Multiple Switches                                                                                                                                                                                                               |
|----------------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary VLAN   | Specify an 802.1Q tag by setting a VLAN ID. | Specify an 802.1Q tag by setting a VLAN ID.                                                                                                                                                                                        |
| Secondary VLAN | No tag needed on VLANs.                     | VLANs need 802.1Q tags: <ul style="list-style-type: none"> <li>Specify an 802.1Q tag for each community VLAN by setting a VLAN ID.</li> <li>Specify the 802.1Q tag for an isolation VLAN ID by setting an isolation ID.</li> </ul> |

### Efficient Use of IP Addresses

PVLANS provide IP address conservation and efficient allocation of IP addresses. In a typical network, VLANs usually correspond to a single IP subnet. In PVLANS, the hosts in all secondary VLANs belong to the same IP subnet because the subnet is allocated to the primary VLAN. Hosts within the secondary VLAN are assigned IP addresses based on IP subnets associated with the primary VLAN, and their IP subnet masking information reflects that of the primary VLAN subnet. However, each secondary VLAN is a separate broadcast domain.

### PVLAN Port Types

PVLANS can use six different port types. The network depicted in [Figure 19 on page 1392](#) uses a promiscuous port to transport information to the router, community ports to connect the finance and HR communities to their respective switches, isolated ports to connect the servers, and a PVLAN trunk port to connect the two switches. PVLAN ports have different restrictions:

- Promiscuous trunk port—A promiscuous port is an upstream trunk port connected to a router, firewall, server, or provider network. A promiscuous trunk port can communicate with all interfaces, including the isolated and community ports within a PVLAN.
- PVLAN trunk port—A PVLAN trunk port is required in multiswitch PVLAN configurations to span the switches. The PVLAN trunk port is a member of all VLANs within the PVLAN (that is, the primary VLAN, the community VLANs, and the interswitch isolated VLAN), and it carries traffic from the primary VLAN and all secondary VLANs. It can communicate with all ports.

Communication between a PVLAN trunk port and an isolated port is usually unidirectional. A PVLAN trunk port's membership in the interswitch isolated VLAN is egress-only, meaning that an isolated port can forward packets to a PVLAN trunk port, but a PVLAN trunk port does not forward packets to an isolated port (unless the packets ingressed on a promiscuous access port and are therefore being forwarded to all the secondary VLANs in the same primary VLAN as the promiscuous port).

- Secondary VLAN trunk port (not shown)—Secondary trunk ports carry secondary VLAN traffic. For a given private VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different

primary VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN pvlan100 and also carry traffic for an isolated VLAN that is part of primary VLAN pvlan400.

- **Community port**—Community ports communicate among themselves and with their promiscuous ports. Community ports serve only a select group of users. These interfaces are separated at Layer 2 from all other interfaces in other communities or isolated ports within their PVLAN.
- **Isolated access port**—Isolated ports have Layer 2 connectivity only with promiscuous ports and PVLAN trunk ports—an isolated port cannot communicate with another isolated port even if these two ports are members of the same isolated VLAN (or interswitch isolated VLAN) domain. Typically, a server, such as a mail server or a backup server, is connected on an isolated port. In a hotel, each room would typically be connected on an isolated port, meaning that room-to-room communication is not possible, but each room can access the Internet on the promiscuous port.
- **Promiscuous access port (not shown)**—These ports carry untagged traffic. Traffic that ingresses on a promiscuous access port is forwarded to all secondary VLAN ports on the device. If traffic ingresses into the device on a VLAN-enabled port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

Table 106 on page 1394 summarizes whether Layer 2 connectivity exists between the different types of ports.

**Table 106: PVLAN Ports and Layer 2 Connectivity**

| Port Type          | Promiscuous Trunk | PVLAN Trunk             | Secondary Trunk | Community               | Isolated Access | Promiscuous access |
|--------------------|-------------------|-------------------------|-----------------|-------------------------|-----------------|--------------------|
| Promiscuous trunk  | Yes               | Yes                     | Yes             | Yes                     | Yes             | Yes                |
| PVLAN trunk        | Yes               | Yes                     | Yes             | Yes—same community only | Yes             | Yes                |
| Secondary Trunk    | Yes               | Yes                     | No              | Yes                     | No              | Yes                |
| Community          | Yes               | Yes                     | Yes             | Yes—same community only | No              | Yes                |
| Isolated access    | Yes               | Yes—unidirectional only | No              | No                      | No              | Yes                |
| Promiscuous access | Yes               | Yes                     | Yes             | Yes                     | Yes             | No                 |

**NOTE:** If you enable the `no-mac-learning` statement on a primary VLAN, all isolated VLANs in the PVLAN inherit that setting. However, if you want to disable MAC address learning on any community VLANs, you must configure the `no-mac-learning` statement on each of those VLANs.

### Limitations of Private VLANs

---

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

#### Related Documentation

- [Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS on page 1399](#)
- [Creating a Private VLAN on a Single Switch on page 1560](#)
- [Creating a Private VLAN Spanning Multiple Switches on page 1561](#)

### Understanding PVLAN Traffic Flows Across Multiple Switches

This topic illustrates and explains three different traffic flows on a sample multiswitch network configured with a private VLAN (PVLAN). PVLANS restrict traffic flows through their member switch ports (which are called “private ports”) so that they communicate only with a specific uplink trunk port or with specified ports within the same VLAN.

This topic describes:

- [Community VLAN Sending Untagged Traffic on page 1395](#)
- [Isolated VLAN Sending Untagged Traffic on page 1396](#)
- [PVLAN Tagged Traffic Sent on a Promiscuous Port on page 1397](#)

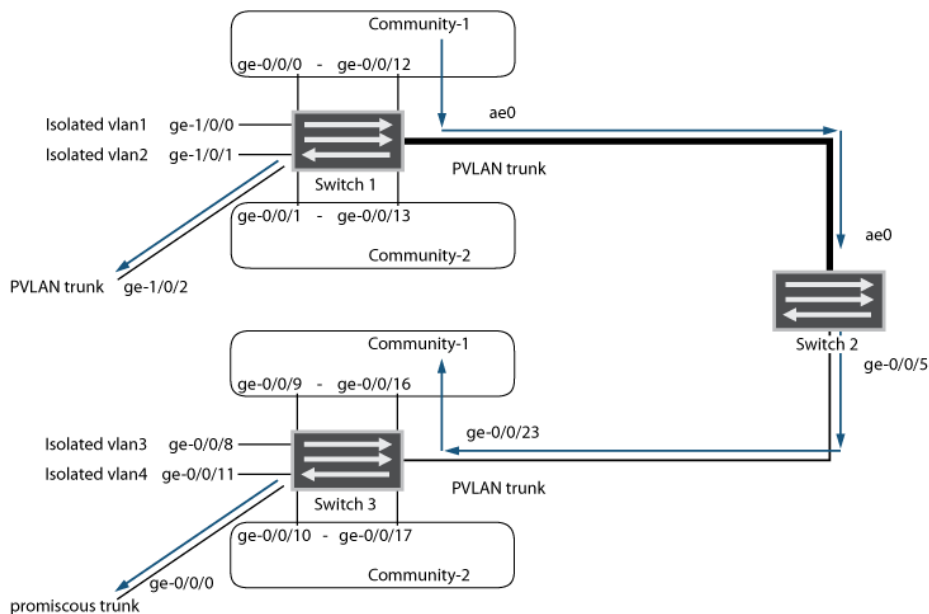

#### Community VLAN Sending Untagged Traffic

---

In this scenario, a VLAN in Community-1 of Switch 1 at interface ge-0/0/0 sends untagged traffic. The arrows in [Figure 20 on page 1396](#) represent this traffic flow.

Figure 20: Community VLAN Sends Untagged Traffic

In this scenario, the following activity takes place on Switch 1:

- Community-1 VLAN on interface ge-0/0/0: Learning
- pvlan100 on interface ge-0/0/0: Replication
- Community-1 VLAN on interface ge-0/0/12: Receives traffic
- PVLAN trunk port: Traffic exits from ge-1/0/2 and from ae0 with tag 10
- Community-2: Interface receives no traffic
- Isolated VLANs: Interfaces receive no traffic

In this scenario, this activity takes place on Switch 3:

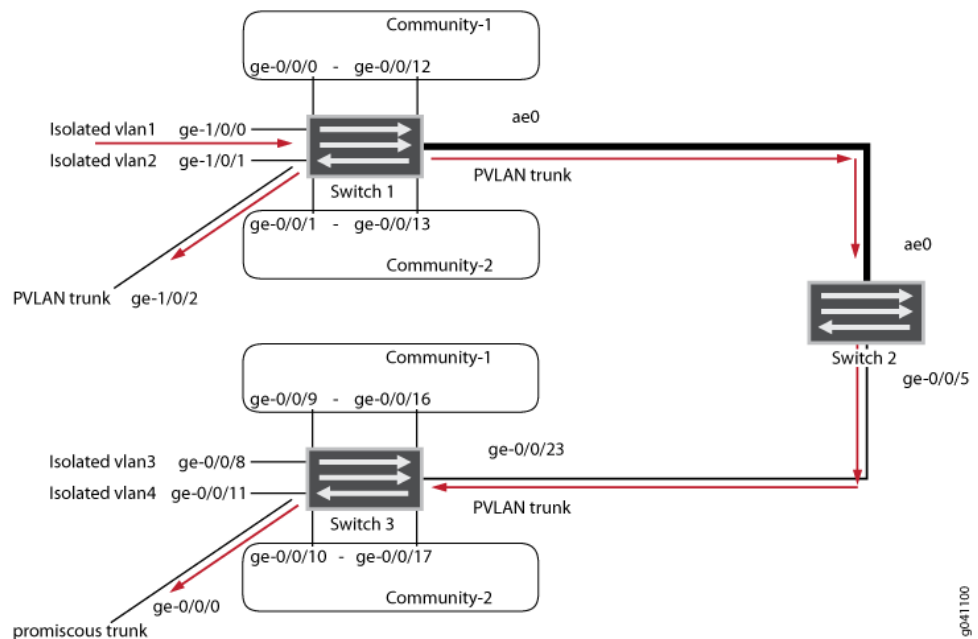

- Community-1 VLAN on interface ge-0/0/23 (PVLAN trunk): Learning
- pvlan100 on interface ge-0/0/23: Replication
- Community-1 VLAN on interface ge-0/0/9 and ge-0/0/16: Receives traffic
- Promiscuous trunk port: Traffic exits from ge-0/0/0 with tag 100
- Community-2: Interface receives no traffic
- Isolated VLANs: Interfaces receive no traffic

### Isolated VLAN Sending Untagged Traffic

In this scenario, isolated VLAN1 on Switch 1 at interface ge-1/0/0 sends untagged traffic. The arrows in Figure 21 on page 1397 represent this traffic flow.

Figure 21: Isolated VLAN Sends Untagged Traffic

In this scenario, the following activity takes place on Switch 1:

- Isolated VLAN1 on interface ge-1/0/0: Learning
- pvlan100 on interface ge-1/0/0: Replication
- Traffic exits from pvlan-trunk ge-1/0/2 and ae0 with tag 50
- Community-1 and Community-2: Interfaces receive no traffic
- Isolated VLANs: Interfaces receive no traffic

In this scenario, this activity takes place on Switch 3:

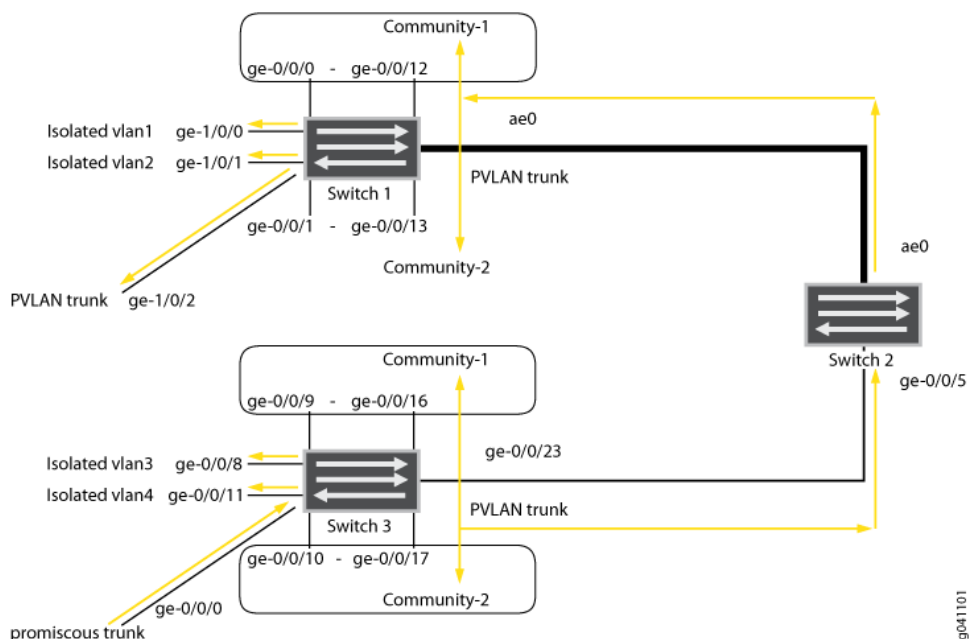

- VLAN on interface ge-0/0/23 (PVLAN trunk port): Learning
- pvlan100 on interface ge0/0/23: Replication
- Promiscuous trunk port: Traffic exits from ge-0/0/0 with tag 100
- Community-1 and Community-2: Interfaces receive no traffic
- Isolated VLANs: Receive no traffic

### PVLAN Tagged Traffic Sent on a Promiscuous Port

In this scenario, PVLAN tagged traffic is sent on a promiscuous port. The arrows in [Figure 22 on page 1398](#) represent this traffic flow.

Figure 22: PVLAN Tagged Traffic Sent on a Promiscuous Port

In this scenario, the following activity takes place on Switch 1:

- pvlan100 VLAN on interface ae0 (PVLAN trunk): Learning
- Community-1, Community-2, and all isolated VLANs on interface ae0: Replication
- VLAN on interface ae0: Replication
- Traffic exits from pvlan-trunk ge-1/0/2 with tag 100
- Community-1 and Community-2: Interfaces receive traffic
- Isolated VLANs: Receive traffic

In this scenario, this activity takes place on Switch 3:

- pvlan100 on interface ge-0/0/0: Learning
- Community-1, Community-2 and all isolated VLANs on interface ge-0/0/0: Replication
- VLAN on interface ge-0/0/0: Replication
- Community-1 and Community-2: Interfaces receive traffic
- Isolated VLANs: Receive traffic

## Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS

VLANs limit broadcasts to specified users. Private VLANs (PVLANS) take this concept a step further by splitting a VLAN into multiple broadcast subdomains and essentially putting secondary VLANs inside a primary VLAN. PVLANS restrict traffic flows through their member ports so that these ports communicate only with a specified uplink trunk port or with specified ports within the same VLAN. The uplink trunk port is usually connected to a router, firewall, server, or provider network. A PVLAN typically contains many private ports that communicate only with a single uplink, thereby preventing the ports from communicating with each other.

Secondary trunk ports and promiscuous access ports extend the functionality of PVLANS for use in complex deployments, such as:

- Enterprise VMWare Infrastructure environments
- Multitenant cloud services with VM management
- Web hosting services for multiple customers

For example, you can use secondary VLAN trunk ports to connect QFX devices to VMware servers that are configured with private VLANs. You can use promiscuous access ports to connect QFX devices to systems that do not support trunk ports but do need to participate in private VLANs.

This topic explains the following concepts regarding PVLANS on the QFX Series:

- [PVLAN Port Types on page 1399](#)
- [Secondary VLAN Trunk Port Details on page 1400](#)
- [Use Cases on page 1401](#)

### PVLAN Port Types

PVLANS can use the following different port types:

- Promiscuous trunk port—A promiscuous port is an upstream trunk port connected to a router, firewall, server, or provider network. A promiscuous trunk port can communicate with all interfaces, including the isolated and community ports within a PVLAN.
- PVLAN trunk port—A PVLAN trunk port is required in multiswitch PVLAN configurations to span the switches. The PVLAN trunk port is a member of all VLANs within the PVLAN (that is, the primary VLAN, the community VLANs, and the interswitch isolated VLAN), and it carries traffic from the primary VLAN and all secondary VLANs. It can communicate with all ports.

Communication between a PVLAN trunk port and an isolated port is usually unidirectional. A PVLAN trunk port's membership in the interswitch isolated VLAN is egress-only, meaning that an isolated port can forward packets to a PVLAN trunk port, but a PVLAN trunk port does not forward packets to an isolated port (unless the packets ingressed on a promiscuous access port and are therefore being forwarded to all the secondary VLANs in the same primary VLAN as the promiscuous port).

- Secondary VLAN trunk port—Secondary VLAN trunk ports carry secondary VLAN traffic. For a given private (primary) VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different primary VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN pvlan100 and also carry traffic for an isolated VLAN that is part of primary VLAN pvlan400.

**NOTE:** When traffic egresses from a secondary VLAN trunk port, it normally carries the tag of the primary VLAN that the secondary port is a member of. If you want traffic that egresses from a secondary VLAN trunk port to retain its secondary VLAN tag, use the [extend-secondary-vlan-id](#) statement.

- Community port—Community ports communicate among themselves and with their promiscuous ports. Community ports serve only a select group of users. These interfaces are separated at Layer 2 from all other interfaces in other communities or isolated ports within their PVLAN.
- Isolated access port—Isolated ports have Layer 2 connectivity only with promiscuous ports and PVLAN trunk ports. An isolated access port cannot communicate with another isolated port even if these two ports are members of the same isolated VLAN.
- Promiscuous access port—These ports carry untagged traffic and can be a member of only one primary VLAN. Traffic that ingresses on a promiscuous access port is forwarded to the ports of the secondary VLANs that are members of the primary VLAN that the promiscuous access port is a member of. In this case, the traffic carries the appropriate secondary VLAN tag when it egresses from the secondary VLAN port if the secondary VLAN port is a trunk port. If traffic ingresses on a secondary VLAN port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

---

### Secondary VLAN Trunk Port Details

---

When using a secondary VLAN trunk port, be aware of the following:

- You must configure an isolation VLAN ID for each primary VLAN that the secondary VLAN trunk port will participate in. This is true even if the secondary VLANs that the secondary VLAN trunk port will carry are confined to a single device.
- If you configure a port to be a secondary VLAN trunk port for a given primary VLAN, you can also configure the same physical port to be any of the following:

- Secondary VLAN trunk port for another primary VLAN
- PVLAN trunk for another primary VLAN
- Promiscuous trunk port
- Access port for a non-private VLAN
- Traffic that ingresses on a secondary VLAN trunk port (with a secondary VLAN tag) and egresses on a PVLAN trunk port retains the secondary VLAN tag on egress.
- Traffic that ingresses on a secondary VLAN trunk port and egresses on a promiscuous trunk port has the appropriate primary VLAN tag on egress.
- Traffic that ingresses on a secondary VLAN trunk port and egresses on a promiscuous access port is untagged on egress.
- Traffic that ingresses on a promiscuous trunk port with a primary VLAN tag and egresses on a secondary VLAN trunk port carries the appropriate secondary VLAN tag on egress. For example, assume that you have configured the following on a switch:
  - Primary VLAN 100
  - Community VLAN 200 as part of the primary VLAN
  - Promiscuous trunk port
  - Secondary trunk port that carries community VLAN 200

If a packet ingresses on the promiscuous trunk port with primary VLAN tag 100 and egresses on the secondary VLAN trunk port, it carries tag 200 on egress.

### Use Cases

On the same physical interface, you can configure multiple secondary VLAN trunk ports (in different primary VLANs) or combine a secondary VLAN trunk port with other types of VLAN ports. The following use cases provide examples of doing this and show how traffic would flow in each case:

- [Secondary VLAN Trunks In Two Primary VLANs on page 1401](#)
- [Secondary VLAN Trunk and Promiscuous Trunk on page 1403](#)
- [Secondary VLAN Trunk and PVLAN Trunk on page 1404](#)
- [Secondary VLAN Trunk and Non-Private VLAN Interface on page 1406](#)
- [Traffic Ingressing on Promiscuous Access Port on page 1407](#)

#### **Secondary VLAN Trunks In Two Primary VLANs**

For this use case, assume you have two switches with the following configuration:

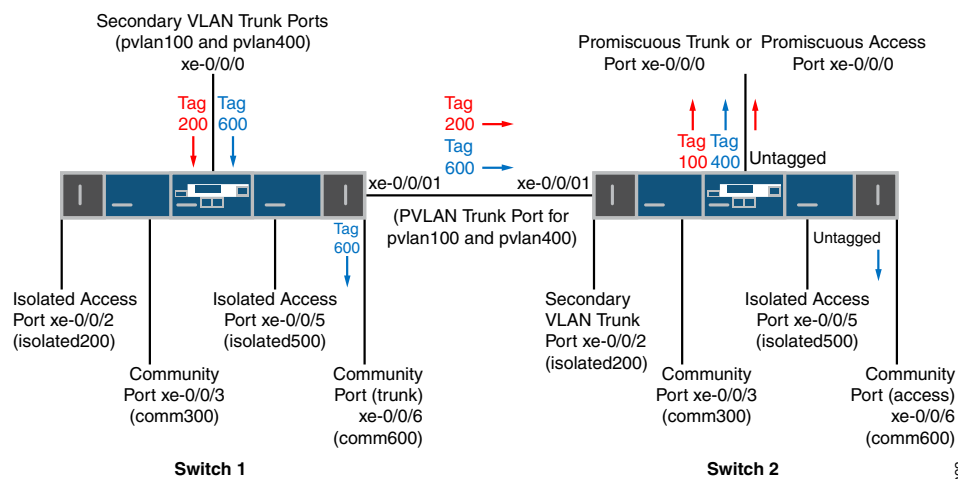

- Primary VLAN pvlan100 with tag 100.
  - Isolated VLAN isolated200 with tag 200 is a member of pvlan100.
  - Community VLAN comm300 with tag 300 is a member of pvlan100.
- Primary VLAN pvlan400 with tag 400.

- Isolated VLAN isolated500 with tag 500 is a member of pvlan400.
- Community VLAN comm600 with tag 600 is a member of pvlan400.
- Interface xe-0/0/0 on Switch 1 connects to a VMware server (not shown) that is configured with the private VLANs used in this example. This interface is configured with secondary VLAN trunk ports to carry traffic for secondary VLAN comm600 and the isolated VLAN (tag 200) that is a member of pvlan100.
- Interface xe-0/0/0 on Switch 2 is shown configured as a promiscuous trunk port or promiscuous access port. In the latter case, you can assume that it connects to a system (not shown) that does not support trunk ports but is configured with the private VLANs used in this example.
- On Switch 1, xe-0/0/6 is a member of comm600 and is configured as a trunk port.
- On Switch 2, xe-0/0/6 is a member of comm600 and is configured as an access port.

Figure 23 on page 1402 shows this topology and how traffic for isolated200 and comm600 would flow after ingressing on xe-0/0/0 on Switch 1. Note that traffic would flow only where the arrows indicate. For example, there are no arrows for interfaces xe-0/0/2, xe-0/0/3, and xe-0/0/5 on Switch 1 because no packets would egress on those interfaces.

**Figure 23: Two Secondary VLAN Trunk Ports on One Interface**

Here is the traffic flow for VLAN isolated200:

1. After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (200) when egressing.
2. After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).

- If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.

Note that traffic for VLAN isolated200 does not egress on isolated access port xe-0/0/2 on Switch 1 or secondary VLAN trunk port xe-0/0/2 on Switch 2 even though these two ports are members of the same isolated VLAN.

Here is the traffic flow for VLAN comm600:

1. After traffic for comm600 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.
2. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 1. The traffic is tagged because the port is configured as a trunk.
3. After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port.

**NOTE:** If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the port can participate in only one primary VLAN. In this case, the promiscuous access port is part of pvlan100, so traffic for comm600 does not egress from it

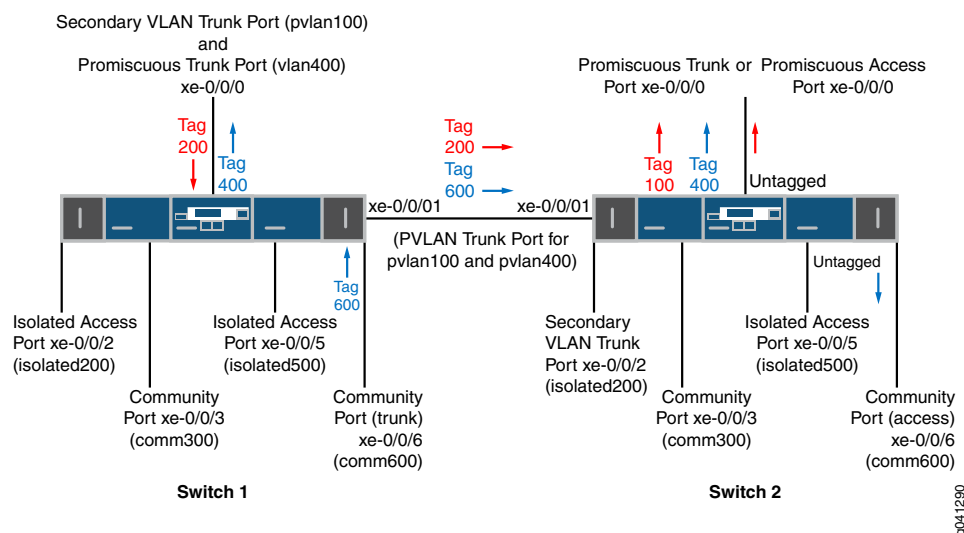

4. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2. In this case, the traffic is untagged because the port mode is access.

### ***Secondary VLAN Trunk and Promiscuous Trunk***

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use case, with one exception: In this case, xe-0/0/0 on Switch 1 is configured as a secondary VLAN trunk port for VLAN pvlan100 and is also configured as a promiscuous trunk port for pvlan400.

Figure 24 on page 1404 shows this topology and how traffic for isolated200 (member of pvlan100) and comm600 (member of pvlan400) would flow after ingressing on Switch 1.

**Figure 24: Secondary VLAN Trunk and Promiscuous Trunk on One Interface**

The traffic flow for VLAN isolated200 is the same as in the previous use case, but the flow for comm600 is different. Here is the traffic flow for VLAN comm600:

1. After traffic for comm600 ingresses on community VLAN port xe-0/0/6 on Switch 1, it egresses on promiscuous trunk port xe-0/0/0 on Switch 1. In this case it carries the primary VLAN tag (400).
2. Traffic for comm600 also egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.
3. After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port. It does not egress on xe-0/0/0 if this interface is configured as a promiscuous access port because the port can participate only in pvlan100.
4. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2.

### **Secondary VLAN Trunk and PVLAN Trunk**

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use cases except that xe-0/0/0 on Switch 1 is configured as a secondary VLAN trunk port for VLAN pvlan100 and is also configured as a PVLAN trunk port for pvlan400.

Figure 25 on page 1405 shows this topology and how traffic for comm300 (member of pvlan100) and comm600 (member of pvlan400) would flow after ingressing on Switch 1.

Figure 25: Secondary VLAN Trunk and PVLAN Trunk on One Interface

Here is the traffic flow for VLAN comm300:

1. After traffic for comm300 ingresses on community port xe-0/0/3 on Switch 1, it egresses on PVLAN trunk port xe-0/0/1 because that PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (300) when egressing.

**NOTE:** Traffic for comm300 does not egress on xe-0/0/0 because the secondary VLAN trunk port on this interface carries isolated200, not comm300.

2. After traffic for comm300 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.
3. Traffic for comm300 also egresses on community port xe-0/0/3 on Switch 2.

Here is the traffic flow for VLAN comm600:

1. After traffic for comm600 ingresses on the PVLAN port xe-0/0/0 on Switch 1, it egresses on the community port xe-0/0/6 on Switch 1. The packets keep the secondary VLAN tag (600) when egressing because xe-0/0/6 is a trunk port.
2. Traffic for comm600 also egresses on PVLAN trunk port xe-0/0/1 because that PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.

- After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port.

It does not egress on xe-0/0/0 if this interface is configured as a promiscuous access port because the port can participate only in pvlan100.

- Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2. This traffic is untagged on egress because xe-0/0/6 is an access port.

### Secondary VLAN Trunk and Non-Private VLAN Interface

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use cases except for these differences:

- Configuration for xe-0/0/0 on Switch 1:
  - Secondary VLAN trunk port for VLAN pvlan100
  - Access port for vlan700
- Port xe-0/0/6 on both switches is an access port for vlan700.

Figure 26 on page 1406 shows this topology and how traffic for isolated200 (member of pvlan100) and vlan700 would flow after ingressing on Switch 1.

**Figure 26: Secondary VLAN Trunk and Non-Private VLAN Port on One Interface**

Here is the traffic flow for VLAN isolated200:

- After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port. The packets keep the secondary VLAN tag (200) when egressing.
- After traffic for isolated200 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.

- If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).
- If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.

Note that traffic for VLAN isolated200 does not egress on isolated access port xe-0/0/2 on Switch 1 or secondary VLAN trunk port xe-0/0/2 on Switch 2 even though these two ports are members of the same isolated VLAN.

After traffic for vlan700 ingresses on the access port configured on xe-0/0/0 on Switch 1, it egresses on access port xe-0/0/6 because that port is a member of the same VLAN. Traffic for vlan700 is not forwarded to Switch 2 (even though xe-0/0/6 on Switch 2 is a member of vlan700) because the PVLAN trunk on xe-0/0/1 does not carry this VLAN.

### *Traffic Ingressing on Promiscuous Access Port*

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use case except that xe-0/0/0 on Switch 1 is configured as a promiscuous access port and is a member of pvlan100. Figure 27 on page 1407 shows this topology and how untagged traffic would flow after ingressing through this interface on Switch 1.

**Figure 27: Traffic Ingressing on Promiscuous Access Port**

g041288

As the figure shows, untagged traffic that ingresses on a promiscuous access port is forwarded to all the secondary VLAN ports that are members of the same primary VLAN that the promiscuous access port is a member of. The traffic is untagged when it egresses from access ports and tagged on egress from a trunk port (xe-0/0/2 on Switch 2).

## Understanding Egress Firewall Filters with PVLANS

If you apply firewall filters to private VLANs in the output direction, the behavior of the filters might be unexpected. This topic explains how egress filters behave when applied to private VLANs.

If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

### Overview of Spanning-Tree Protocols

QFX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default spanning-tree protocol on the QFX Series is RSTP. RSTP provides faster convergence times than STP. However, some legacy networks require the slower convergence times of basic STP.

The STP support provided for the QFX Series includes:

- IEEE 802.1d
- 802.1w RSTP
- 802.1s MSTP

If your network includes IEEE 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. See [“Configuring STP” on page 1556](#). When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP. If you use virtual LANs (VLANs), you should enable VSTP and use it on your network. See [“Understanding VSTP” on page 1412](#).

You can use the same operational commands (**show spanning-tree bridge** and **show spanning-tree interface**) to check the status of your spanning-tree configuration, regardless of which spanning-tree protocol has been configured.

STP uses bridge protocol data unit (BPDU) packets to exchange information with other switches. BPDUs send hello packets out at regular intervals to exchange information across bridges and detect loops in a network topology. There are two types of BPDUs:

- Configuration BPDUs—These BPDUs contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost.

- Topology change notification (TCN) BPDUs—When a bridge needs to signal a topology change, it starts to send TCNs on its root port. The designated bridge receives the TCN, acknowledges it, and generates another one for its own root port. The process continues until the TCN reaches the root bridge.

STP uses the information provided by the BPDUs to elect a root bridge, identify root ports for each switch, identify designated ports for each physical LAN segment, and prune specific redundant links to create a loop-free tree topology. All leaf devices calculate the best path to the root device and place their ports in blocking or forwarding states based on the best path to the root. The resulting tree topology provides a single active Layer 2 data path between any two end stations.

### Understanding Spanning Tree Protocols on a QFabric System

Although there is no need to run STP in a QFabric system, you can connect a QFabric system to another Layer 2 device and use STP. STP traffic can only be processed on network Node groups. Other Node groups, such as redundant server Node groups and server Node groups, discard the STP bridge protocol data units (BPDUs) traffic and disable the interface automatically. Server Node groups only process host-facing protocols, whereas Network Node groups process all supported protocols.

- [Understanding MSTP on page 1410](#)
- [Understanding RSTP on page 1411](#)
- [Understanding VSTP on page 1412](#)

## Understanding MSTP

Although RSTP provides faster convergence time than STP does, it still does not solve a problem inherent in STP: all VLANs within a LAN must share the same spanning tree. To solve this problem, the QFX Series products use Multiple Spanning Tree Protocol (MSTP) to create a loop-free topology in networks with multiple spanning-tree regions.

An MSTP region allows a group of bridges to be modeled as a single bridge. An MSTP region contains multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

An MSTP region can support up to 64 MSTIs, and each instance can support from 1 through 4094 VLANs.

- [Example: Configuring Network Regions for VLANs with MSTP on page 1441](#)

## Understanding RSTP

Juniper Networks QFX Series products use Rapid Spanning Tree Protocol (RSTP) on the network side of the QFX Series to provide quicker convergence time than the base Spanning Tree Protocol (STP) does. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state, which speeds up convergence.

Although STP provides basic loop prevention functionality, it does not provide fast network convergence when there are topology changes. The STP process to determine network state transitions is slower than the RSTP process because it is timer-based. A device must reinitialize every time a topology change occurs. The device must start in the listening state and transition to the learning state and eventually to a forwarding or blocking state. When default values are used for the maximum age (20 seconds) and forward delay (15 seconds), it takes 50 seconds for the device to converge. RSTP converges faster because it uses a handshake mechanism based on point-to-point links instead of the timer-based process used by STP.

For networks with virtual LANs (VLANs), you can use VLAN Spanning Tree Protocol (VSTP), which takes the paths of each VLAN into account when calculating routes. VSTP uses RSTP by default.

An RSTP domain running from the edge outward on a QFX Series product has the following components:

- A *root port*, which is the “best path” to the root device.
- A *designated port*, which indicates that the switch is the designated bridge for the other switch connecting to this port.
- An *alternate port*, which provides an alternate root port.
- A *backup port*, which provides an alternate designated port.

Port assignments change through messages exchanged throughout the domain. An RSTP device generates configuration messages once per hello time interval. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines that the connection with the neighbor is lost. When a *root port* or a *designated port* fails on a device, the device generates a configuration message with the proposal bit set. Once its neighbor device receives this message, it verifies that this configuration message is valid for that port and starts a *synchronizing* operation to ensure that all of its ports are in sync with the new information.

Similar sets of messages propagate through the network, restoring the connectivity very quickly after a topology change (in a well-designed network that uses RSTP, network convergence can take as little as 0.5 seconds). If a device does not receive an agreement to a proposal message it has sent, it returns to the original IEEE 802.D convention.

RSTP was originally defined in the IEEE 802.1w draft specification and later incorporated into the IEEE 802.1D-2004 specification.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on the QFX Series.

- [Understanding MSTP on page 1410](#)
- [Understanding VSTP on page 1412](#)
- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428](#)

## Understanding VSTP

VLAN Spanning Tree Protocol (VSTP) enables Juniper Networks switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

You can configure VSTP for a maximum of 253 VLANs.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on a switch.

**NOTE:** We recommend that you enable VSTP on all VLANs that could receive VSTP bridge protocol data units (BPDUs).

## Understanding BPDU Protection for STP, RSTP, and MSTP

**NOTE:** You can disable BPDU protection on interfaces by issuing the `set ethernet-switching-options bpdu-block interface-name disable` command.

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Bridge protocol data unit (BPDU) protection can help prevent STP misconfigurations that can lead to network outages.

A loop-free network is supported through the exchange of a special type of frame called a BPDU. Receipt of BPDUs on certain interfaces in an STP, RSTP, VSTP, or MSTP topology, however, can lead to network outages. Enable BPDU protection on those interfaces to prevent these outages.

Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a user bridge application running on a device connected to the switch can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If BPDUs are received on a protected interface, the interface is disabled and stops forwarding frames.

Not only can you configure BPDU protection on a switch with a spanning tree, but also on a switch without a spanning tree. This type of topology typically consists of a non-STP switch connected to an STP switch through a trunk interface.

To configure BPDU protection on a switch with a spanning tree, include the **bpdu-block-on-edge** statement at the `[edit protocols (stp | mstp | rstp)]` hierarchy level. To configure BPDU protection on a switch without a spanning tree, include the **bpdu-block** statement at the `[edit ethernet-switching-options interface interface-name]` hierarchy level.

If BPDUs are sent to an interface (indicating that the misconfiguration has been corrected), the interface can be unblocked in one of two ways:

- If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.
- Use the operational mode command **clear ethernet-switching bpdu-error**.

Disabling the BPDU protection configuration does not unblock the interface.

## Understanding Loop Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from entering a forwarding state that would cause a loop to open in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can mistakenly transition to the forwarding state if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and ensures that both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It does not transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**alarm**, **block**, or both).

An interface can be configured for either loop protection or root protection, but not for both.

## Understanding Root Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks QFX Series product provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive higher-priority BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives more STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state), and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving more STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

## Q-in-Q Tunneling

---

- [Understanding Q-in-Q Tunneling and VLAN Translation on page 1416](#)

### Understanding Q-in-Q Tunneling and VLAN Translation

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling and VLAN translation to isolate customer traffic within a single site or to enable customer traffic flows between cloud data centers in different geographic locations.

Q-in-Q tunneling adds a service VLAN tag before the customer's 802.1Q VLAN tags. The Juniper Networks Junos operating system implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

All of the VLANs in an implementation can be service VLANs. That is, if the total number of supported VLANs is 4090, all of them can be service VLANs.

This topic describes:

- [How Q-in-Q Tunneling Works on page 1416](#)
- [How VLAN Translation Works on page 1417](#)
- [Mapping C-VLANs to S-VLANs on page 1417](#)
- [Routed VLAN Interfaces on Q-in-Q VLANs on page 1418](#)
- [Constraints for Q-in-Q Tunneling and VLAN Translation on page 1418](#)

#### How Q-in-Q Tunneling Works

---

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to a service provider's or data center VLAN (S-VLAN), another 802.1Q tag for the appropriate S-VLAN is added before the C-VLAN tag. The C-VLAN tag remains and is transmitted through the network. As the packet leaves the S-VLAN in the downstream direction, the S-VLAN 802.1Q tag is removed.

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN or multiple C-VLANs to one S-VLAN. C-VLAN and S-VLAN tags use separate name spaces, so you can have both a C-VLAN 101 and an S-VLAN 101, for example. You can limit the set of accepted customer tags to a range of tags or to discrete values.

When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network. Access interfaces are assumed to be customer-facing and accept both tagged and untagged frames. When using many-to-one bundling or mapping a specific interface, you must use the **native** option to specify an S-VLAN for untagged and priority tagged packets if you want to accept these packets. (Priority tagged packets have their VLAN ID set to 0, and their priority code point bits might be configured with a CoS value.) If you do not specify an S-VLAN for them, untagged packets are discarded. The **native** option is not available for all-in-one bundling because there is no

need to specify untagged and priority tagged packets when all packets are mapped to an S-VLAN.

Q-in-Q tunneling does not affect any class-of-service (CoS) values that are configured on a C-VLAN. These settings are retained in the C-VLAN tag and can be used after a packet leaves an S-VLAN. CoS values are not copied from C-VLAN tags to S-VLAN tags.

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

**NOTE:** You can configure Q-in-Q tunneling only on access ports (not trunk ports).

### How VLAN Translation Works

VLAN translation replaces an incoming C-VLAN tag with an S-VLAN tag instead of adding an additional tag. The C-VLAN tag is therefore lost, so a single-tagged packet is normally untagged when it leaves the S-VLAN (at the other end of the link). If an incoming packet has had Q-in-Q tunneling applied in advance, VLAN translation replaces the outer tag and the inner tag is retained when the packet leaves the S-VLAN at the other end of the link.

To configure VLAN translation, use the **mapping swap** statement at the **[edit vlans interface]** hierarchy level.

**NOTE:** You can configure VLAN translation on access ports only. You cannot configure it on trunk ports, and you cannot configure Q-in-Q tunneling on the same access port.

### Mapping C-VLANs to S-VLANs

The three ways to map C-VLANs to an S-VLAN are:

- All-in-one bundling—Use the **edit vlans s-vlan-name dot1q-tunneling** statement without specifying customer VLANs. All packets received on all access interfaces (including untagged packets) are mapped to the S-VLAN.
- Many-to-one bundling—Use the **edit vlans s-vlan-name dot1q-tunneling customer-vlans** statement to specify which C-VLANs are mapped to the S-VLAN. Use this method when you want a subset of the C-VLANs to be part of the S-VLAN. If you want untagged or priority tagged packets to be mapped to the S-VLAN, use the **native** option with the

**customer-vlans** statement. (Priority tagged packets have their VLAN ID set to 0, and their priority code point bits might be configured with a CoS value.)

- Mapping a specific interface—Use the **edit vlans s-vlan-name interface interface-name mapping** statement to specify a C-VLAN for a given S-VLAN. This configuration applies to only one interface—not all access interfaces as with all-in-one and many-to-one bundling. If you want untagged or priority tagged packets to be mapped to the S-VLAN, use the **native** option with the **customer-vlans** statement.

This method has two options: swap and push. With the push option, a packet retains its tag and an additional VLAN tag is added. With the swap option, the incoming tag is replaced with an S-VLAN tag. (This is VLAN translation.)

- You can configure multiple push rules for a given S-VLAN and interface. That is, you can configure an interface so that the same S-VLAN tag is added to packets arriving from multiple C-VLANs.
- You can configure only one swap rule for a given S-VLAN and interface.

This functionality is typically used to keep traffic from different customers separate or to provide individualized treatment for traffic on a certain interface.

If you configure multiple methods, the switch prioritizes the mappings in the following order:

1. Specific interface mapping
2. Many-to-one bundling
3. All-in-one bundling

You cannot configure overlapping rules for the same C-VLAN using the same mapping method. For example, you cannot use many-to-one bundling to map C-VLAN 100 to two different S-VLANs.

### **Routed VLAN Interfaces on Q-in-Q VLANs**

---

Routed VLAN interfaces (RVIs) are supported on Q-in-Q VLANs. Packets arriving on an RVI that is using Q-in-Q VLANs are routed regardless of whether the packet is single-tagged or double-tagged. The original C-VLAN tag is dropped when a packet leaves the VLAN that it originated in. Outgoing routed packets retain any S-VLAN tag only when exiting a trunk interface—S-VLAN tags are dropped when traffic exits an access interface.

### **Constraints for Q-in-Q Tunneling and VLAN Translation**

---

Be aware of the following constraints when configuring Q-in-Q tunneling and VLAN translation:

- Most access port security features are not supported with Q-in-Q tunneling and VLAN translation.
- Configuring Q-in-Q tunneling and VLAN translation on the same port is not supported.

- You can configure at most one VLAN translation for a given VLAN and interface. For example, you can create no more than one translation for VLAN 100 on interface xe-0/0/0.
- The combined total of VLANs and rules for Q-in-Q tunneling and VLAN translation cannot exceed 6000. For example, you can configure and commit 4000 VLANs and 2000 rules for Q-in-Q tunneling and VLAN translation. However, you cannot configure 4000 VLANs and 2500 rules for Q-in-Q tunneling and VLAN translation. If you try to commit a configuration that exceeds the limit, you see CLI and syslog errors that inform you about the problem.
- MAC addresses are learned from S-VLANs, not C-VLANs.
- Broadcast, unknown unicast, and multicast traffic is forwarded to all members in the S-VLAN.
- The following features are not supported with Q-in-Q tunneling:
  - DHCP relay
  - Fibre Channel over Ethernet
  - IP Source Guard
- The following features are not supported with VLAN translation:
  - Fibre Channel over Ethernet
  - Firewall filter applied to a port or VLAN in the output direction
  - Private VLANs
  - VLAN Spanning Tree Protocol
  - Reflective relay

## Layer 2 Protocol Tunneling

- [Understanding Layer 2 Protocol Tunneling on page 1419](#)

### Understanding Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows service providers or data centers to send customer Layer 2 protocol data units (PDUs) across a cloud. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

For example, a customer might want to run STP between remote sites that are connected by a service provider network. In this case, the STP PDUs sent by the customer equipment

must be tunneled through the service provider network. Otherwise, the customer STP PDUs would be processed by the STP protocol running on the service provider switches.

This topic includes:

- [Layer 2 Protocols Supported by L2PT on page 1420](#)
- [How L2PT Works on page 1421](#)
- [L2PT Basics on page 1423](#)

---

### Layer 2 Protocols Supported by L2PT

---

L2PT supports the following Layer 2 protocols:

- 802.1X authentication
- 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

**NOTE:** If you enable L2PT for untagged OAM LFM (Operation, Administration, and Maintenance of link fault management) packets, do not configure link fault management (LFM) on the corresponding access interface.

---

- Cisco Discovery Protocol (CDP)
- Ethernet local management interface (E-LMI)
- MVRP VLAN Registration Protocol (MVRP)
- Link Aggregation Control Protocol (LACP)

**NOTE:** If you enable L2PT for untagged LACP packets, do not configure Link Aggregation Control Protocol (LACP) on the corresponding access interface.

---

- Link Layer Discovery Protocol (LLDP)
- Multiple MAC Registration Protocol (MMRP)
- Multiple VLAN Registration Protocol (MVRP)
- Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP)
- Unidirectional Link Detection (UDLD)
- VLAN Spanning Tree Protocol (VSTP)
- VLAN Trunking Protocol (VTP)

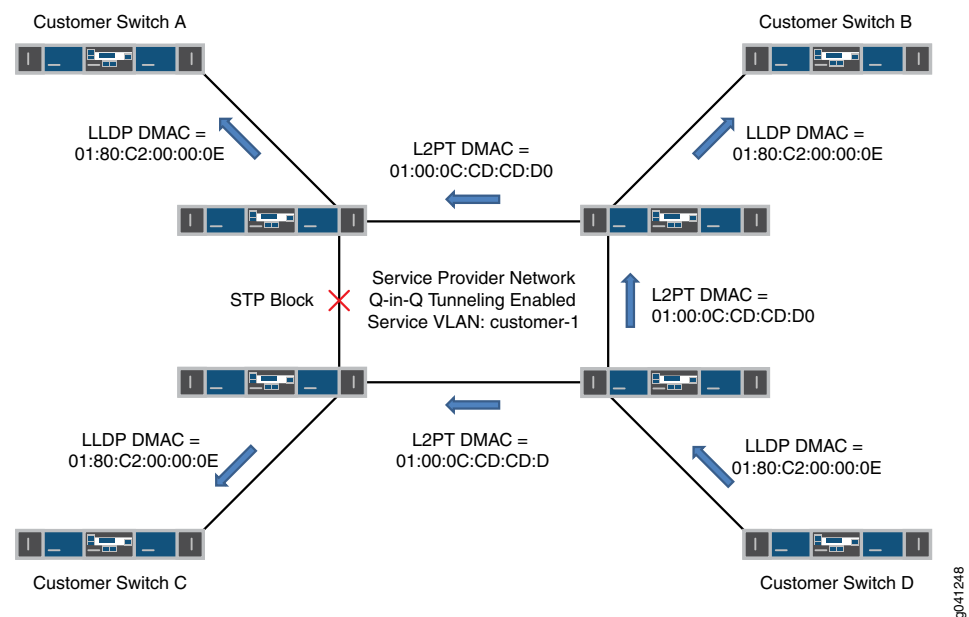

**NOTE:** You cannot configure all of these protocols on QFX Series devices. However, you can tunnel all of them through a QFX Series switch using L2PT.

### How L2PT Works

L2PT works by encapsulating Layer 2 PDUs, tunneling them across a service provider network, and de-encapsulating them for delivery to their destination switches. L2PT encapsulates Layer 2 PDUs by enabling the ingress provider edge (PE) device to rewrite the PDUs' destination media access control (DMAC) addresses before forwarding them onto the service provider network. The devices in the service provider network treat these encapsulated PDUs as multicast Ethernet packets. Upon receipt of these PDUs, the egress PE devices de-encapsulate them by replacing the DMAC addresses with the addresses of the Layer 2 protocol that is being tunneled before forwarding the PDUs to their destination switches.

This process is illustrated in [Figure 28 on page 1421](#):

**Figure 28: L2PT Example**

1. Customer Switch D sends to the service provider network an LLDP PDU that is ultimately intended for the other switches in the customer network.
2. The receiving provider switch adds the L2PT DMAC and sends the frame with the encapsulated LLDP PDU to the other switches in the service provider network.
3. When the other service provider switches receive the frame, they restore the LLDP DMAC and send it to Customer Switches A, B, and C.

[Table 107 on page 1422](#) lists the destination MAC addresses of the supported Layer 2 protocols:

Table 107: Protocol Destination MAC Addresses

| Protocol                                                                                                      | Ethernet Encapsulation | MAC Address       |
|---------------------------------------------------------------------------------------------------------------|------------------------|-------------------|
| 802.1X                                                                                                        | Ether-II               | 01:80:C2:00:00:03 |
| 802.3ah                                                                                                       | Ether-II               | 01:80:C2:00:00:02 |

| Link Layer Discovery Protocol (LLDP)                                                                          | Ether-II               | 01:80:C2:00:00:0E |
| Multiple MAC Registration Protocol (MMRP)                                                                     | Ether-II               | 01:80:C2:00:00:20 |
| Unidirectional Link Detection (UDLD)                                                                          | SNAP                   | 01:00:0C:CC:CC:CC |
| VLAN Spanning Tree Protocol (VSTP)                                                                            | SNAP                   | 01:00:0C:CC:CC:CD |
| VLAN Trunking Protocol (VTP)                                                                                  | SNAP                   | 01:00:0C:CC:CC:CC |

When a PE device receives a Layer 2 control PDU from any of the customer PE devices, it changes the destination MAC address to 01:00:0C:CD:CD:D0. The modified packet is then sent to the provider network. All devices on the provider network treat these packets as multicast Ethernet packets and deliver them to all PE devices in the VLAN. The egress PE devices receive all the control PDUs with the same MAC address (01:00:0C:CD:CD:D0). Then they identify the packet type by doing deeper packet inspection and replace the destination MAC address 01:00:0C:CD:CD:D0 with the appropriate destination address. The modified PDUs are sent out to the customer PE devices so that the Layer 2 control PDUs are delivered, in their original state, across the provider network. The L2PT protocol is valid for all types of packets (untagged, tagged, and Q-in-Q tagged).

**NOTE:** VLAN translation is not compatible with L2PT. (You configure VLAN translation with the `mapping swap` statement at the [edit vlans interface] hierarchy level.)

## L2PT Basics

L2PT is enabled on a per-VLAN basis. When you enable L2PT on a VLAN, all access interfaces are considered to be customer-facing interfaces, all trunk interfaces are considered to be service provider network-facing interfaces, and the specified Layer 2 protocol is disabled on the access interfaces. L2PT acts only on logical interfaces of the family **ethernet-switching**. L2PT PDUs are flooded to all trunk and access ports within a given service VLAN.

**NOTE:** Access interfaces in an L2PT-enabled VLAN should not receive L2PT-tunneled PDUs. If an access interface does receive L2PT-tunneled PDUs, it might mean that there is a loop in the network. As a result, the interface is shut down.

You configure L2PT at the `[edit vlans vlan-name dot1q-tunneling]` hierarchy level, meaning Q-in-Q tunneling is (and must be) enabled.

**NOTE:** If you want to tunnel untagged or priority-tagged Layer 2 control PDUs, then you must configure the switch to map untagged and priority-tagged packets to an L2PT-enabled VLAN. For more information about assigning untagged and priority-tagged packets to VLANs, see [“Understanding Q-in-Q Tunneling and VLAN Translation” on page 1416](#).

## Proxy ARP

- [Understanding Proxy ARP on page 1424](#)

## Understanding Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- [What Is ARP? on page 1424](#)
- [Proxy ARP Overview on page 1424](#)
- [Best Practices for Proxy ARP on page 1425](#)

---

### What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

---

### Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

QFX Series devices support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.

- Unrestricted—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

---

### Best Practices for Proxy ARP

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

## Example: Configuring Faster Convergence and Improving Network Stability with RSTP

The QFX Series products use Rapid Spanning Tree Protocol (RSTP) to provide a loop-free topology. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state. RSTP provides quicker reconvergence time than original STP because it uses protocol handshake messages rather than fixed timeouts. Eliminating the need to wait for timers to expire makes RSTP more efficient than STP.

This example describes how to configure RSTP on four QFX3500 switches:

- [Requirements on page 1428](#)
- [Overview and Topology on page 1428](#)
- [Configuring RSTP on Switch 1 on page 1430](#)
- [Configuring RSTP on Switch 2 on page 1432](#)
- [Configuring RSTP on Switch 3 on page 1434](#)
- [Configuring RSTP on Switch 4 on page 1437](#)
- [Verification on page 1439](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

---

### Overview and Topology

In this example, QFX3500 switches are connected in the topology displayed in [Figure 29 on page 1429](#) to create a loop-free topology.

Figure 29: Network Topology for RSTP

The interfaces shown in [Table 108 on page 1429](#) will be configured for RSTP.

**NOTE:** You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 108: Topology for Configuring RSTP on the QFX Series

| Components | Settings                                                                                                                                                                                                                                             |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1   | <p>The following ports on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/9 is connected to Switch 2</li> <li>• xe-0/0/13 is connected to Switch 4</li> <li>• xe-0/0/11 is connected to Switch 3</li> </ul>  |
| Switch 2   | <p>The following ports on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/14 is connected to Switch 1</li> <li>• xe-0/0/18 is connected to Switch 3</li> </ul>                                               |
| Switch 3   | <p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/26 is connected to Switch 1</li> <li>• xe-0/0/28 is connected to Switch 2</li> <li>• xe-0/0/24 is connected to Switch 4</li> </ul> |

Table 108: Topology for Configuring RSTP on the QFX Series (*continued*)

| Components             | Settings                                                                                                                                                                                                             |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 4               | <p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/19</b> is connected to Switch 1</li> <li>• <b>xe-0/0/23</b> is connected to Switch 3</li> </ul> |
| VLAN names and tag IDs | <p><b>sales-vlan</b>, tag 10</p> <p><b>engineering-vlan</b>, tag 20</p> <p><b>publications-vlan</b>, tag 30</p> <p><b>support-vlan</b>, tag 40</p>                                                                   |

This configuration example creates a loop-free topology between four switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

### Configuring RSTP on Switch 1

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/13.0 cost 1000
set protocols rstp interface xe-0/0/13.0 mode point-to-point
set protocols rstp interface xe-0/0/9.0 cost 1000
set protocols rstp interface xe-0/0/9.0 mode point-to-point
set protocols rstp interface xe-0/0/11.0 cost 1000
set protocols rstp interface xe-0/0/11.0 mode point-to-point
```

**Step-by-Step Procedure** To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs **sales-vlan**, **engineering-vlan** and **publications-vlan**, and **support-vlan**:
 

```
[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30
```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:
 

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
```
3. Configure the port mode for the interfaces:
 

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
```
4. Configure RSTP on the switch:
 

```
[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface xe-0/0/13.0 cost 1000
user@switch1# rstp interface xe-0/0/13.0 mode point-to-point
user@switch1# rstp interface xe-0/0/9.0 cost 1000
user@switch1# rstp interface xe-0/0/9.0 mode point-to-point
user@switch1# rstp interface xe-0/0/11.0 cost 1000
user@switch1# rstp interface xe-0/0/11.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
```

```
    }
  }
}
xe-0/0/11 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members [10 20 30 40];
      }
    }
  }
}
}
protocols {
  rstp {
    bridge-priority 16k;
    interface xe-0/0/13.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/9.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/11.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
vlands {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
  publications-vlan {
    vlan-id 30;
  }
  support-vlan {
    vlan-id 40;
  }
}
```

---

### Configuring RSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
```

```

set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface xe-0/0/14.0 cost 1000
set protocols rstp interface xe-0/0/14.0 mode point-to-point
set protocols rstp interface xe-0/0/18.0 cost 1000
set protocols rstp interface xe-0/0/18.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan` and `publications-vlan`, and `support-vlan`:  
  

```

[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40

```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:  
  

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]

```
3. Configure the port mode for the interfaces:  
  

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk

```
4. Configure RSTP on the switch:  
  

```

[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface xe-0/0/14.0 cost 1000
user@switch2# rstp interface xe-0/0/14.0 mode point-to-point
user@switch2# rstp interface xe-0/0/18.0 cost 1000
user@switch2# rstp interface xe-0/0/18.0 mode point-to-point

```

**Results** Check the results of the configuration:

```

user@switch2> show configuration
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;

```

```
        vlan {
            members [10 20 30 40];
        }
    }
}
xe-0/0/18 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members [10 20 30 40];
            }
        }
    }
}
}
protocols {
    rstp {
        bridge-priority 32k;
        interface xe-0/0/14.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/18.0 {
            cost 1000;
            mode point-to-point;
        }
    }
}
vlangs {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
```

---

### Configuring RSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
```

```

set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface xe-0/0/26.0 cost 1000
set protocols rstp interface xe-0/0/26.0 mode point-to-point
set protocols rstp interface xe-0/0/28.0 cost 1000
set protocols rstp interface xe-0/0/28.0 mode point-to-point
set protocols rstp interface xe-0/0/24.0 cost 1000
set protocols rstp interface xe-0/0/24.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface xe-0/0/26.0 cost 1000
user@switch3# rstp interface xe-0/0/26.0 mode point-to-point
user@switch3# rstp interface xe-0/0/28.0 cost 1000
user@switch3# rstp interface xe-0/0/28.0 mode point-to-point
user@switch3# rstp interface xe-0/0/24.0 cost 1000
user@switch3# rstp interface xe-0/0/24.0 mode point-to-point

```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
  xe-0/0/26 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/28 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/24 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 8k;
    interface xe-0/0/26.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/28.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/24.0 {
      cost 1000;
      mode point-to-point;
    }
  }
  bridge-priority 8k;
}
vllans {
```

```

sales-vlan {
  vlan-id 10;
}
engineering-vlan {
  vlan-id 20;
}
publications-vlan {
  vlan-id 30;
}
support-vlan {
  vlan-id 40;
}
}

```

### Configuring RSTP on Switch 4

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/23.0 cost 1000
set protocols rstp interface xe-0/0/23.0 mode point-to-point
set protocols rstp interface xe-0/0/19.0 cost 1000
set protocols rstp interface xe-0/0/19.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface xe-0/0/23.0 cost 1000
user@switch4# rstp interface xe-0/0/23.0 mode point-to-point
user@switch4# rstp interface xe-0/0/19.0 cost 1000
user@switch4# rstp interface xe-0/0/19.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  xe-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
    interface xe-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
vllans {
  sales-vlan {
    vlan-id 10;
  }
}
```

```

}
engineering-vlan {
  vlan-id 20;
}
publications-vlan {
  vlan-id 30;
}
support-vlan {
  vlan-id 40;
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying RSTP Configuration on Switch 1 on page 1439](#)
- [Verifying RSTP Configuration on Switch 2 on page 1439](#)
- [Verifying RSTP Configuration on Switch 3 on page 1440](#)
- [Verifying RSTP Configuration on Switch 4 on page 1440](#)

#### *Verifying RSTP Configuration on Switch 1*

**Purpose** Verify that the RSTP configuration on Switch 1 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | BLK   | ALT  |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 29 on page 1429](#). The operational mode command **show spanning-tree interface** shows that **xe-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocked.

#### *Verifying RSTP Configuration on Switch 2*

**Purpose** Verify that the RSTP configuration on Switch 2 is correct.

**Action** In operational mode issue the **show spanning-tree interface** command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/14.0 | 128:513 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | DESC |
| xe-0/0/18.0 | 128:519 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 29 on page 1429](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/18.0** is in a forwarding state and the root port. The other interface on Switch 2 is blocked.

#### *Verifying RSTP Configuration on Switch 3*

**Purpose** Verify that the RSTP configuration on Switch 3 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/26.0 | 128:513 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/28.0 | 128:515 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/24.0 | 128:517 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | DESC |

**Meaning** See the topology in [Figure 29 on page 1429](#). The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

#### *Verifying RSTP Configuration on Switch 4*

**Purpose** Verify the RSTP configuration on Switch 4.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch4> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/23.0 | 128:523 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |
| xe-0/0/19.0 | 128:525 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | DESC |

**Meaning** See the topology in [Figure 29 on page 1429](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/23.0** is the root interface and is in the forwarding state.

  - [Understanding RSTP on page 1411](#)

## Example: Configuring Network Regions for VLANs with MSTP

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning-tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

You can create up to 64 MSTI instances for QFX Series products, and each MSTI supports up to 4094 VLANs.

This example describes how to configure MSTP on four QFX3500 switches:

- [Requirements on page 1441](#)
- [Overview and Topology on page 1441](#)
- [Configuring MSTP on Switch 1 on page 1444](#)
- [Configuring MSTP on Switch 2 on page 1446](#)
- [Configuring MSTP on Switch 3 on page 1449](#)
- [Configuring MSTP on Switch 4 on page 1452](#)
- [Verification on page 1454](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

### Overview and Topology

---

When the number of VLANs grows in a network, MSTP provides a more faster way of creating a loop-free topology using MSTIs. Each MSTI in the spanning-tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 30: Network Topology for MSTP

The interfaces shown in [Table 109 on page 1442](#) will be configured for MSTP.

**NOTE:** You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 109: Topology for Configuring MSTP on the QFX Series

| Components | Settings                                                                                                                                                                                                                                            |

The topology in [Figure 30 on page 1442](#) shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **sales-vlan** supports sales traffic and has a VLAN tag identifier of 10.
- The **engineering-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **publications-vlan** supports publications VLAN traffic (for supplicants that fail 802.1X authentication) and has a VLAN tag identifier of 30.
- The **support-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

## Configuring MSTP on Switch 1

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/13.0 cost 1000
set protocols mstp interface xe-0/0/13.0 mode point-to-point
set protocols mstp interface xe-0/0/9.0 cost 1000
set protocols mstp interface xe-0/0/9.0 mode point-to-point
set protocols mstp interface xe-0/0/11.0 cost 1000
set protocols mstp interface xe-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface xe-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30
user@switch1# set support-vlan description "Support VLAN"
user@switch1# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
```

```

user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
4. Configure MSTP on the switch, including the two MSTIs:

[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface xe-0/0/13.0 cost 1000
user@switch1# mstp interface xe-0/0/13.0 mode point-to-point
user@switch1# mstp interface xe-0/0/9.0 cost 1000
user@switch1# mstp interface xe-0/0/9.0 mode point-to-point
user@switch1# mstp interface xe-0/0/11.0 cost 4000
user@switch1# mstp interface xe-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface xe-0/0/11.0 cost 4000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]

```

**Results** Check the results of the configuration:

```

user@switch1> show configuration
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  xe-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;

```

```
        members 30;
        members 40;
    }
}
}
}
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 16k;
        interface xe-0/0/13.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/9.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/11.0 {
            cost 4000;
            mode point-to-point;
        }
    }
    msti 1 {
        bridge-priority 16k;
        vlan [ 10 20 ];
        interface xe-0/0/11.0 {
            cost 4000;
        }
    }
    msti 2 {
        bridge-priority 8k;
        vlan [ 30 40 ];
    }
}
vlands {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
```

---

### Configuring MSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

[edit]

```

set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface xe-0/0/14.0 cost 1000
set protocols mstp interface xe-0/0/14.0 mode point-to-point
set protocols mstp interface xe-0/0/18.0 cost 1000
set protocols mstp interface xe-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]

```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk

```

4. Configure MSTP on the switch, including the two MSTIs:

```

[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface xe-0/0/14.0 cost 1000
user@switch2# mstp interface xe-0/0/14.0 mode point-to-point
user@switch2# mstp interface xe-0/0/18.0 cost 1000
user@switch2# mstp interface xe-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]

```

```
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  xe-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 32k;
    interface xe-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/18.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 32k;
      vlan [ 10 20 ];
    }
    msti 2 {
      bridge-priority 4k;
      vlan [ 30 40 ];
    }
  }
}
```

```

vlangs {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
  publications-vlan {
    vlan-id 30;
  }
  support-vlan {
    vlan-id 40;
  }
}

```

### Configuring MSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface xe-0/0/26.0 cost 1000
set protocols mstp interface xe-0/0/26.0 mode point-to-point
set protocols mstp interface xe-0/0/28.0 cost 1000
set protocols mstp interface xe-0/0/28.0 mode point-to-point
set protocols mstp interface xe-0/0/24.0 cost 1000
set protocols mstp interface xe-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]

```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface xe-0/0/26.0 cost 1000
user@switch3# mstp interface xe-0/0/26.0 mode point-to-point
user@switch3# mstp interface xe-0/0/28.0 cost 1000
user@switch3# mstp interface xe-0/0/28.0 mode point-to-point
user@switch3# mstp interface xe-0/0/24.0 cost 1000
user@switch3# mstp interface xe-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
  xe-0/0/26 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
```

```

    }
  }
  vlans {
    sales-vlan {
      vlan-id 10;
    }
    engineering-vlan {
      vlan-id 20;
    }
    publications-vlan {
      vlan-id 30;
    }
    support-vlan {
      vlan-id 40;
    }
  }
}

```

### Configuring MSTP on Switch 4

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/23.0 cost 1000
set protocols mstp interface xe-0/0/23.0 mode point-to-point
set protocols mstp interface xe-0/0/19.0 cost 1000
set protocols mstp interface xe-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]

```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface xe-0/0/23.0 cost 1000
user@switch4# mstp interface xe-0/0/23.0 mode point-to-point
user@switch4# mstp interface xe-0/0/19.0 cost 1000
user@switch4# mstp interface xe-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  xe-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  xe-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
```

```
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 16k;
    interface xe-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 16k;
      vlan [ 10 20 ];
    }
    msti 2 {
      bridge-priority 32k;
      vlan [ 30 40 ];
    }
  }
}
vlands {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
  publications-vlan {
    vlan-id 30;
  }
  support-vlan {
    vlan-id 40;
  }
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying MSTP Configuration on Switch 1 on page 1454](#)
- [Verifying MSTP Configuration on Switch 2 on page 1456](#)
- [Verifying MSTP Configuration on Switch 3 on page 1458](#)
- [Verifying MSTP Configuration on Switch 4 on page 1460](#)

### *Verifying MSTP Configuration on Switch 1*

**Purpose** Verify the MSTP configuration on Switch 1.

**Action** Use the operational mode commands:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 4000         | BLK   | ALT  |

Spanning tree interface parameters for instance 1

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16385.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32769.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 4097.0019e25051e0       | 4000         | BLK   | ALT  |

Spanning tree interface parameters for instance 2

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:527               | 8194.0019e25044e0       | 1000         | FWD   | DESG |
| xe-0/0/9.0  | 128:529 | 128:513               | 4098.0019e2503d20       | 1000         | FWD   | ROOT |
| xe-0/0/11.0 | 128:531 | 128:531               | 8194.0019e25044e0       | 1000         | FWD   | DESG |

```
user@switch1> show spanning-tree bridge
```

STP bridge parameters

```
Context ID           : 0
Enabled protocol     : MSTP
```

STP bridge parameters for CIST

```
Root ID              : 8192.00:19:e2:50:51:e0

Hello time                  : 2 seconds
Maximum age                 : 20 seconds
Forward delay               : 15 seconds
Hop count                   : 19
Local parameters
  Bridge ID                 : 8194.00:19:e2:50:44:e0
  Extended system ID        : 0
  Internal instance ID      : 2
```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

#### *Verifying MSTP Configuration on Switch 2*

**Purpose** Verify the MSTP configuration on Switch 2.

**Action** Use the operational mode commands:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/14.0 | 128:513 | 128:513               | 32768.0019e2503d20      | 1000         | FWD   | DESC |
| xe-0/0/18.0 | 128:519 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

Spanning tree interface parameters for instance 1

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/14.0 | 128:513 | 128:513               | 32769.0019e2503d20      | 1000         | FWD   | DESC |
| xe-0/0/18.0 | 128:519 | 128:515               | 4097.0019e25051e0       | 1000         | FWD   | ROOT |

### Example: Configuring Reflective Relay for Use with VEPA Technology

Reflective relay must be configured on a switch that receives virtual machine aggregated packets, such as Virtual Ethernet Port Aggregator (VEPA) packets, because some of these packets might be sent back to the server destined for another virtual machine on the same server. Reflective relay returns those packets to the original device using the same downstream port that delivered the packets to the switch.

This example shows how to configure a switch port interface to return packets sent by VEPA on the downstream interface back to the server using the same downstream interface:

- [Requirements on page 1463](#)
- [Overview and Topology on page 1463](#)
- [Configuration on page 1465](#)
- [Verification on page 1466](#)

## Requirements

---

This example uses the following hardware and software components:

- One QFX3500 switch
- One server
- Junos OS Release 12.1 or later for the QFX Series

Before you configure reflective relay on a switch port, be sure you have:

- Configured a server with six virtual machines, VM 1 through VM 6.
- Configured the server with three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue and added two virtual machines to each VLAN.
- Configured the same three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue on one interface.
- Installed and configured VEPA to aggregate the virtual machine packets.

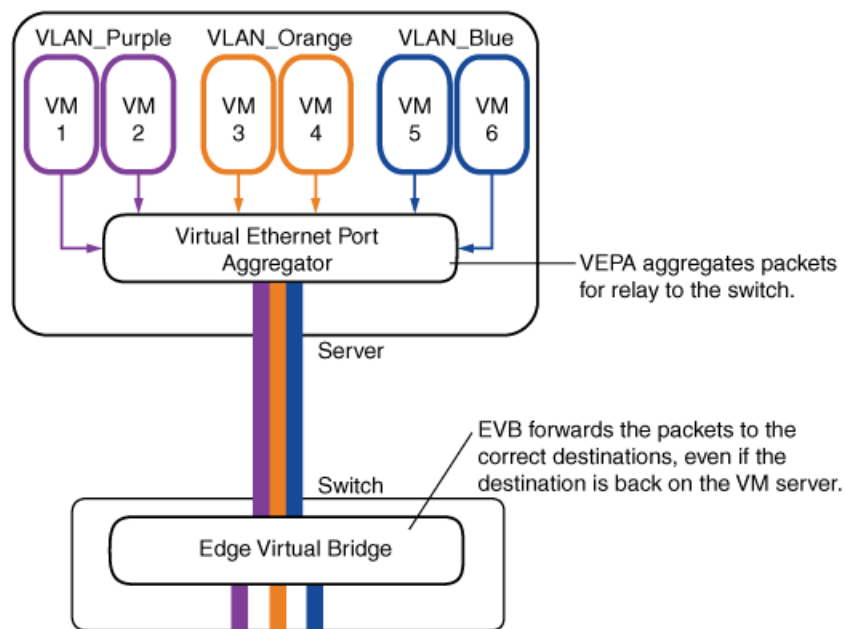

## Overview and Topology

---

In this example, illustrated in [Figure 31 on page 1464](#), a switch is connected to one server that is hosting six virtual machines and is configured with a VEPA for aggregating packets. The server's six virtual machines are VM1 through VM 6, and each virtual machine belongs to one of the three server VLANs, VLAN\_Purple, VLAN\_Orange, or VLAN\_Blue. Instead of the server directly passing packets between virtual machines, packets from any of the three VLANs that are destined for another one of the three VLANs are aggregated using VEPA technology and passed to the switch for processing. You must configure the switch port to accept these aggregated packets on the downstream interface and to return appropriate packets to the server on the same downstream interface after they are processed. [Figure 31 on page 1464](#) shows the topology for this example.

Figure 31: Reflective Relay Topology

g020996

In this example, you configure the physical Ethernet switch port interface for tagged-access port mode and reflective relay. Configuring tagged-access port mode allows the interface to accept VLAN tagged packets. Configuring reflective relay allows the downstream port to return those packets on the same interface. [Table 110 on page 1464](#) shows the components used in this example.

Table 110: Components of the Topology for Configuring Reflective Relay

| Component        | Description                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFX3500 switch   | Switch that supports reflective relay. For a list of switches that support this feature, see " <a href="#">QFX Series Software Features Overview</a> " on page 15. |
| xe-0/0/2         | Switch interface to the server.                                                                                                                                    |
| Server           | Server with virtual machines and VEPA technology.                                                                                                                  |
| Virtual machines | Six virtual machines located on the server: V1, V2, V3, V4, V5, and V6.                                                                                            |
| VLANs            | Three VLANs: VLAN_Purple, VLAN_Orange, and VLAN_Blue. Each VLAN has two virtual machine members.                                                                   |
| VEPA             | Virtual Ethernet port aggregator that aggregates virtual machine packets on the server before the resulting single stream is transmitted to the switch.            |

## Configuration

To configure reflective relay, perform these tasks:

- [Configuring Reflective Relay on the Port on page 1465](#)

### Configuring Reflective Relay on the Port

#### CLI Quick Configuration

To quickly configure reflective relay, copy the following commands and paste them into the switch window:

```
[edit]
set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members [VLAN_Blue VLAN_Orange VLAN_Purple]
```

#### Step-by-Step Procedure

To configure reflective relay:

1. Configure the tagged-access port mode on the interface:

**NOTE:** Configure the port mode as tagged-access otherwise you will receive an error when you commit the configuration.

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode tagged-access
```

2. Configure reflective relay on the interface to allow it to both accept and send packets:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the three VLANs on the server:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members [VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Results

Check the results of the configuration:

```
[edit interfaces xe-0/0/2]
user@switch# show
unit 0 {
  family ethernet-switching {
    port-mode tagged-access;
    reflective-relay;
    vlan {
      members [ VLAN_Purple VLAN_Orange VLAN_Blue ];
    }
  }
}
```

## Verification

---

To confirm that reflective relay is enabled and working correctly, perform these tasks:

- [Verifying That Reflective Relay Is Enabled and Working Correctly on page 1466](#)

### *Verifying That Reflective Relay Is Enabled and Working Correctly*

**Purpose** Verify that reflective relay is enabled and working correctly.

**Action** Use the **show ethernet-switching interfaces detail** command to display the reflective relay status:

```
user@switch> show ethernet-switching interfaces xe-0/0/2 detail
Interface: xe-0/0/2, Index: 66, State: down, Port mode: Tagged-access
Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
  VLAN_Purple, 802.1Q Tag: 450, tagged, unblocked
  VLAN_Orange, 802.1Q Tag: 460, tagged, unblocked
  VLAN_Blue, 802.1Q Tag: 470, tagged, unblocked
Number of MACs learned on IFL: 0
```

Confirm that reflective relay is working by sending a Layer 2 broadcast message from one virtual machine to another virtual machine located on the same VLAN. Check the switch to verify that the switch sends the packets back on the same interface on which they were received. One way to check this is to set up port mirroring on the switch interface, connect a traffic generator to the mirrored interface, and use the traffic generator to examine packets.

Alternatively, if you do not have a traffic generator available, you can send traffic between two virtual machines with FTP, Telnet, or SSH, while running the **tcpdump** utility on the receiver virtual machine port to capture reflected packets.

**Meaning** The reflective relay status is **Enabled**, meaning that interface **xe-0/0/2** is configured for the tagged-access port mode, which accepts VLAN-tagged packets, and for reflective relay, which accepts and returns packets on the same interface.

When the traffic generator shows packets arriving at the switch and returning to the server on the same interface, reflective relay is working.

## Example: Setting Up Basic Bridging and a VLAN on the QFX Series

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices—storage devices, file servers, and other LAN components—in a LAN and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure basic bridging and VLANs for the QFX Series:

- [Requirements on page 1467](#)
- [Overview and Topology on page 1467](#)
- [Configuration on page 1468](#)
- [Verification on page 1474](#)

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX Series
- A configured and provisioned QFX Series product

### Overview and Topology

To use a switch to connect network devices on a LAN, you must at a minimum configure bridging and VLANs. By default, bridging is enabled on all switch interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **blue**, which is automatically configured. When you plug in access devices—such as desktop computers, file servers, printers, and wireless access points—they are joined immediately into the **blue** VLAN, and the LAN is up and running.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.) You use the ports to connect devices that have their own power sources. Table 1 details the topology used in this configuration example.

**Table 111: Components of the Basic Bridging Configuration Topology**

| Property        | Settings                                        |
|-----------------|-------------------------------------------------|
| Switch hardware | QFX 3500 switch, with 48 10-Gbps Ethernet ports |
| VLAN name       | <b>blue</b>                                     |

Table 111: Components of the Basic Bridging Configuration Topology (*continued*)

| Property                    | Settings                                                    |
|-----------------------------|-------------------------------------------------------------|
| Connections to file servers | xe-0/0/17 and xe-0/0/18                                     |
| Unused ports                | xe-0/0/0 through xe-0/0/16, and xe-0/0/19 through xe-0/0/47 |

### Configuration

#### CLI Quick Configuration

By default, after you perform the initial configuration on the switch:

- Switching is enabled on all interfaces.
- A VLAN named **blue** is created.
- All interfaces are placed into this VLAN.

You do not need to perform any other configuration on the switch to set up bridging and VLANs. To use the switch, simply connect the servers to the ports **xe-0/0/17** and **xe-0/0/18**.

#### Step-by-Step Procedure

To configure bridging and VLANs:

1. Make sure the switch is powered on.
2. Connect the two file servers to ports **xe-0/0/17** and **xe-0/0/18**.

#### Results

Check the results of the configuration:

```

## Verification

To verify that switching is operational and that a VLAN has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 1474](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 1474](#)

### *Verifying That the VLAN Has Been Created*

**Purpose** Verify that the VLAN named **blue** has been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
```

| Name | Tag | Interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| mgmt |     | me0.0*                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Meaning** The **show vlans** command lists the VLANs configured on the switch. This output shows that the VLAN **blue** has been created.

### *Verifying That Interfaces Are Associated with the Proper VLANs*

**Purpose** Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

**Action** List all interfaces on which switching is enabled:

```
user@switch> show ethernet-switching interfaces
```

| Interface   | State | VLAN members | Blocking                     |
|-------------|-------|--------------|------------------------------|
| xe-0/0/0.0  | up    | blue         | unblocked                    |
| xe-0/0/1.0  | down  | blue         | blocked - blocked by STP/RTG |

| xe-0/1/2.0  | up    | blue         | unblocked                    |
| xe-0/1/3.0  | up    | blue         | unblocked                    |
| me0.0       | up    | mgmt         | unblocked                    |

**Meaning** The `show ethernet-switching interfaces` command lists all interfaces on which switching

is enabled (in the Interfaces column), along with the VLANs that are active on the interfaces (in the VLAN members column). Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows **xe-0/0/0.0** instead of **xe-0/0/0**. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

## Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

- [Requirements on page 1476](#)
- [Overview and Topology on page 1476](#)
- [Configuration on page 1477](#)
- [Verification on page 1479](#)

### Requirements

---

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

---

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group,

and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.)

**Table 112: Components of the Multiple VLAN Topology**

| Property                          | Settings                                                                                                                                             |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware                   | QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47)                                                                |
| VLAN names and tag IDs            | <b>sales</b> , tag 100<br><b>support</b> , tag 200                                                                                                   |
| VLAN subnets                      | <b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| Interfaces in VLAN <b>sales</b>   | File servers: xe-0/0/20 and xe-0/0/21                                                                                                                |
| Interfaces in VLAN <b>support</b> | File servers: xe-0/0/46 and xe-0/0/47                                                                                                                |
| Unused interfaces                 | xe-0/0/2 and xe-0/0/25                                                                                                                               |

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

### Configuration

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
```

```

set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface vlan.1

```

**Step-by-Step Procedure** Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:  

```

[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales

```
2. Configure the interface for the file server in the **support** VLAN:  

```

[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support

```
3. Create the subnet for the **sales** broadcast domain:  

```

[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25

```
4. Create the subnet for the **support** broadcast domain:  

```

[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25

```
5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:  

```

[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200

```
6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:  

```

[edit vlans]
user@switch# set sales l3-interface vlan.0
user@switch# set support l3-interface vlan.1

```

Display the results of the configuration:

```

user@switch> show configuration
interfaces {
  xe-0/0/20 {
    unit 0 {
      description "Sales file server port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  xe-0/0/46 {
    unit 0 {
      description "Support file server port";
      family ethernet-switching {
        vlan members support;
      }
    }
  }
}

```

```

    }
    vlans {
        unit 0 {
            family inet address 192.0.2.1/25;
        }
        unit 1 {
            family inet address 192.0.2.129/25;
        }
    }
}
}
vlans {
    sales {
        vlan-id 100;
        interface xe-0/0/0.0;
        interface xe-0/0/3.0;
        interface xe-0/0/20.0;
        interface xe-0/0/22.0;
        l3-interface vlan 0;
    }
    support {
        vlan-id 200;
        interface xe-0/0/24.0;
        interface xe-0/0/26.0;
        interface xe-0/0/44.0;
        interface xe-0/0/46.0;
        l3-interface vlan 1;
    }
}
}

```

**TIP:** To quickly configure the sales and support VLAN interfaces, issue the `load merge terminal` command. Then copy the hierarchy and paste it into the switch terminal window.

## Verification

Verify that the **sales** and **support** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1479](#)
- [Verifying That Traffic Is Being Routed Between the Two VLANs on page 1480](#)
- [Verifying That Traffic Is Being Switched Between the Two VLANs on page 1480](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** To list all VLANs configured on the switch, use the **show vlans** command:

```
user@switch> show vlans
Name      Tag      Interfaces
default
xe-0/0/1.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/5.0,
xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0,
xe-0/0/10.0*, xe-0/0/11.0, xe-0/0/12.0, xe-0/0/13.0*,
xe-0/0/14.0, xe-0/0/15.0, xe-0/0/16.0, xe-0/0/17.0,
xe-0/0/18.0, xe-0/0/19.0, xe-0/0/21.0, xe-0/0/23.0*,
xe-0/0/25.0, xe-0/0/27.0, xe-0/0/28.0, xe-0/0/29.0,
xe-0/0/30.0, xe-0/0/31.0, xe-0/0/32.0, xe-0/0/33.0,
xe-0/0/34.0, xe-0/0/35.0, xe-0/0/36.0, xe-0/0/37.0,
xe-0/0/38.0, xe-0/0/39.0, xe-0/0/40.0, xe-0/0/41.0,
xe-0/0/42.0, xe-0/0/43.0, xe-0/0/45.0, xe-0/0/47.0,
xe-0/1/0.0*, xe-0/1/1.0*, xe-0/1/2.0*, xe-0/1/3.0*

sales      100
xe-0/0/0.0*, xe-0/0/3.0, xe-0/0/20.0, xe-0/0/22.0

support     200
xe-0/0/0.24, xe-0/0/26.0, xe-0/0/44.0, xe-0/0/46.0*

mgmt
me0.0*
```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/0.0**, **xe-0/0/3.0**, **xe-0/0/20.0**, and **xe-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **xe-0/0/24.0**, **xe-0/0/26.0**, **xe-0/0/44.0**, and **xe-0/0/46.0**.

#### *Verifying That Traffic Is Being Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** List the Layer 3 routes in the switch Address Resolution Protocol (ARP) table:

```
user@switch> show arp
MAC Address      Address      Name      Flags
00:00:0c:06:2c:0d 192.0.2.3    vlan.0    None
00:13:e2:50:62:e0 192.0.2.11   vlan.1    None
```

**Meaning** Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

#### *Verifying That Traffic Is Being Switched Between the Two VLANs*

**Purpose** Verify that learned entries are being added to the Ethernet switching table.

**Action** List the contents of the Ethernet switching table:

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 8 entries, 5 learned
```

| VLAN    | MAC address       | Type  | Age | Interfaces    |
|---------|-------------------|-------|-----|---------------|
| default | *                 | Flood |     | - All-members |
| default | 00:00:05:00:00:01 | Learn |     | - xe-0/0/10.0 |
| default | 00:00:5e:00:01:09 | Learn |     | - xe-0/0/13.0 |
| default | 00:19:e2:50:63:e0 | Learn |     | - xe-0/0/23.0 |
| sales   | *                 | Flood |     | - All-members |
| sales   | 00:00:5e:00:07:09 | Learn |     | - xe-0/0/0.0  |
| support | *                 | Flood |     | - All-members |
| support | 00:00:5e:00:01:01 | Learn |     | - xe-0/0/46.0 |

**Meaning** The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **xe-0/0/0.0** and **xe-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

- [Understanding Bridging on page 1381](#)

## Example: Configuring Routing Between VLANs on One Switch

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs you normally you need a router that connects the VLANs. However, you can accomplish this on a Juniper Networks switch without using a router by configuring a routed VLAN interface (RVI). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

- [Requirements on page 1481](#)
- [Overview and Topology on page 1482](#)
- [Configure Layer 2 switching for two VLANs on page 1483](#)
- [Verification on page 1485](#)

### Requirements

This example uses the following hardware and software components:

- One switch
- Junos OS Release 11.1 or later

## Overview and Topology

This example uses an RVI to route traffic between two VLANs on the same switch. The topology is shown in [Figure 32 on page 1482](#).

**Figure 32: RVI with One Switch**

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch and configuring an RVI to enable routing between the VLANs. One VLAN, called **blue**, is for the sales and marketing group, and a second, called **red**, is for the customer support team. The sales and support groups each have their own file servers and wireless access points. Each VLAN must have a unique name, tag (VLAN ID), and distinct IP subnet. [Table 113 on page 1482](#) lists the components of the sample topology.

**Table 113: Components of the Multiple VLAN Topology**

| Property                       | Settings                                                                                                                                        |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN names and tag IDs         | <b>blue</b> , ID 100<br><b>red</b> , ID 200                                                                                                     |
| Subnets associated with VLANs  | <b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| Interfaces in VLAN <b>blue</b> | Sales server port: <b>xe-0/0/4</b><br>Sales wireless access points: <b>xe-0/0/6</b>                                                             |
| Interfaces in VLAN <b>red</b>  | Support server port: <b>xe-0/0/0</b><br>Support wireless access points: <b>xe-0/0/2</b>                                                         |
| RVI name                       | interface <b>vlan</b>                                                                                                                           |
| RVI units and addresses        | logical unit 100: <b>192.0.2.1/25</b><br>logical unit 200: <b>192.0.2.129/25</b>                                                                |

This configuration example creates two IP subnets, one for the blue VLAN and the second for the red VLAN. The switch bridges traffic within the VLANs. For traffic passing between two VLANs, the switch routes the traffic using an RVI on which you have configured addresses in each IP subnet.

To keep the example simple, the configuration steps show only a few interfaces and VLANs. Use the same configuration procedure to add more interfaces and VLANs. By default, all interfaces are in access mode, so you do not have to configure the port mode.

### Configure Layer 2 switching for two VLANs

**CLI Quick Configuration** To quickly configure Layer 2 switching for the two VLANs (**blue** and **red**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/4 unit 0 description "Sales server port"
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/6 unit 0 description "Sales wireless access point port"
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/0 unit 0 description "Support servers"
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members red
set interfaces xe-0/0/2 unit 0 description "Support wireless access point port"
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members red
set interfaces vlan unit 100 family inet address 192.0.2.1/25
set interfaces vlan unit 200 family inet address 192.0.2.129/25
set vlans blue l3-interface vlan.100
set vlans blue vlan-id 100
set vlans red vlan-id 200
set vlans red l3-interface vlan.200
```

**Step-by-Step Procedure** To configure the switch interfaces and the VLANs to which they belong:

1. Configure the interface for the sales server in the blue VLAN:  

```
[edit interfaces xe-0/0/4 unit 0]
user@switch# set description "Sales server port"
user@switch# set family ethernet-switching vlan members blue
```
2. Configure the interface for the wireless access point in the blue VLAN:  

```
[edit interfaces xe-0/0/6 unit 0]
user@switch# set description "Sales wireless access point port"
user@switch# set family ethernet-switching vlan members blue
```
3. Configure the interface for the support server in the red VLAN:  

```
[edit interfaces xe-0/0/0 unit 0]
user@switch# set description "Support server port"
user@switch# set family ethernet-switching vlan members red
```
4. Configure the interface for the wireless access point in the red VLAN:  

```
[edit interfaces xe-0/0/2 unit 0]
user@switch# set description "Support wireless access point port"
user@switch# set family ethernet-switching vlan members red
```

**Step-by-Step Procedure** Now create the VLANs and the RVI. The RVI will have logical units in the broadcast domains of both VLANs.

1. Create the red and blue VLANs by configuring the VLAN IDs for them:  

```
[edit vlans]
user@switch# set blue vlan-id 100
user@switch# set red vlan-id 200
```
2. Create the interface named **vlan** with a logical unit in the sales broadcast domain (blue VLAN):  

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 192.0.2.1/25
```

The unit number is arbitrary and does not have to match the VLAN tag ID. However, configuring the unit number to match the VLAN ID can help avoid confusion.

3. Add a logical unit in the support broadcast domain (red VLAN) to the **vlan** interface:

```
[edit interfaces]
user@switch# set vlan unit 200 family inet address 192.0.2.129/25
```

4. Complete the RVI configuration by binding the red and blue VLANs (Layer 2) with the appropriate logical units of the **vlan** interface (Layer 3):

```
[edit vlans]
user@switch# set blue l3-interface vlan.100
user@switch# set red l3-interface vlan.200
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  xe-0/0/4 {
    unit 0 {
      description "Sales server port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/6 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/0 {
    unit 0 {
      description "Support server port";
      family ethernet-switching {
        vlan members red;
      }
    }
  }
  xe-0/0/2 {
    unit 0 {
      description "Support wireless access point port";
      family ethernet-switching {
        vlan members red;
      }
    }
  }
  vlan {
    unit 100 {
      family inet address 192.0.2.1/25;
    }
    unit 200 {
      family inet address 192.0.2.129/25;
    }
  }
}
```

```

    }
  }
}
vllans {
  blue {
    vlan-id 100;
    interface xe-0/0/4.0;
    interface xe-0/0/6.0;
    l3-interface vlan 100;
  }
  red {
    vlan-id 200;
    interface xe-0/0/0.0;
    interface xe-0/0/2.0;
    l3-interface vlan 200;
  }
}
}

```

**TIP:** To quickly configure the blue and red VLAN interfaces, issue the **load merge terminal** command, copy the hierarchy, and paste it into the switch terminal window.

## Verification

To verify that the **blue** and **red** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1485](#)
- [Verifying That Traffic Can Be Routed Between the Two VLANs on page 1486](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the VLANs **blue** and **red** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** List all VLANs configured on the switch:

```

user@switch> show vlans
Name      Tag      Interfaces
default   100      xe-0/0/0.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/6.0,
blue      100      xe-0/0/4.0, xe-0/0/6,
red       200      xe-0/0/0.0, xe-0/0/2.0, *
mgmt      me0.0*

```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **blue** and **red** VLANs have been created. The **blue** VLAN has a tag ID of 100 and is associated with interfaces

**xe-0/0/4.0** and **xe-0/0/6.0**. VLAN **red** has a tag ID of 200 and is associated with interfaces **xe-0/0/0.0** and **xe-0/0/2.0**.

### *Verifying That Traffic Can Be Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** Verify that the RVI logical units are up:

```
user@switch> show interfaces terse
vlan.100          up    up    inet    192.0.2.1/25
vlan.200          up    up    inet    192.0.2.129/25
```

**NOTE:** At least one port (access or trunk) with an appropriate VLAN assigned to it must be up for the vlan interface to be up.

Verify that switch has created routes that use the RVI logical units:

```
user@switch> show route
192.0.2.0/25      *[Direct/0] 1d 03:26:45
                  > via vlan.100
192.0.2.1/32      *[Local/0] 1d 03:26:45
                  Local via vlan.100
192.0.2.128/25    *[Direct/0] 1d 03:26:45
                  > via vlan.200
192.0.2.129/32    *[Local/0] 1d 03:26:45
                  Local via vlan.200
```

List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```
user@switch> show arp
```

| MAC Address       | Address     | Name     | Flags |
|-------------------|-------------|----------|-------|
| 00:00:0c:06:2c:0d | 192.0.2.7   | vlan.100 | None  |
| 00:13:e2:50:62:e0 | 192.0.2.132 | vlan.200 | None  |

**Meaning** The output of the **show interfaces** and **show route** commands show that the Layer 3 RVI logical units are working and the switch has used them to create direct routes that it will use to forward traffic between the VLAN subnets. The **show arp** command displays the mappings between the IP addresses and MAC addresses for devices on both **vlan.100** (associated with VLAN **blue**) and **vlan.200** (associated with VLAN **red**). These two devices can communicate.

## Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

- [Requirements on page 1487](#)
- [Overview and Topology on page 1487](#)
- [Configuring the Access Switch on page 1488](#)
- [Configuring the Distribution Switch on page 1492](#)
- [Verification on page 1494](#)

### Requirements

This example uses the following hardware and software components:

- For the distribution switch, one EX 4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an EX-UM-2XFP uplink module with two 10-Gigabit Ethernet XFP ports.
- For the access switch, one EX 3200-24P, which has twenty-four 1-Gigabit Ethernet ports, all of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.
- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

[Table 114 on page 1487](#) explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

**Table 114: Components of the Topology for Connecting an Access Switch to a Distribution Switch**

| Property               | Settings                                                                                                                                                         |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access switch hardware | EX 3200-24P, 24 1-Gigabit Ethernet ports, all PoE-enabled ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 4-port 1-Gigabit Ethernet uplink module (EX-UM-4SFP) |

**Table 114: Components of the Topology for Connecting an Access Switch to a Distribution Switch** (*continued*)

|                                                                  |                                                                                                                                                                                                                               |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Configuring the Access Switch

To configure the access switch:

#### CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description "Sales Wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/26 unit 0 description "Support phone port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description "Support printer port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
```

```

set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description "Sales VLAN"
set vlans support interface ge-0/0/24.0
set vlans support interface ge-0/0/26.0
set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
set vlans support vlan-description "Support VLAN"

```

### Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:
 

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set description "Uplink module port connection to distribution switch"
user@access-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:
 

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching vlan-members [ sales support ]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):
 

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:
 

```
[edit vlans sales]user@access-switch# set vlan-description "Sales VLAN"
user@access-switch# set vlan-id (VLANs) 100
user@access-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:
 

```
[edit vlans support]user@access-switch# set vlan-description "Support VLAN"
user@access-switch# set vlan-id (VLANs) 200
user@access-switch# set l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:
 

```
[edit interfaces]user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25
```
7. Create the subnet for the support broadcast domain:
 

```
[edit interfaces]user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25
```
8. Configure the interfaces in the sales VLAN:
 

```
[edit interfaces]user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless access point port"
user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/3 unit 0 description "Sales phone port"
user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/20 unit 0 description "Sales file server port"
user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/22 unit 0 description "Sales printer port"
user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members sales
```
9. Configure the interfaces in the support VLAN:
 

```
[edit interfaces]user@access-switch# set ge-0/0/24 unit 0 description "Support wireless access point port"
user@access-switch# set ge-0/0/24 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/26 unit 0 description "Support phone port"
user@access-switch# set ge-0/0/26 unit 0 family
```

```
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/44 unit 0
description "Support printer port"user@access-switch# set ge-0/0/44 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/46 unit 0
description "Support file server port"user@access-switch# set ge-0/0/46 unit 0 family
ethernet-switching vlan members support
```

10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]user@access-switch# set sales vlan-description "Sales
VLAN"user@access-switch# set sales vlan-id 100user@access-switch# set support
vlan-description "Support VLAN"user@access-switch# set support vlan-id 200
```

11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:

```
[edit vlans]user@access-switch# set sales l3-interface vlan.0user@access-switch#
set support l3-interface vlan.1
```

**Results** Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description "Sales phone port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description "Sales file server port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/22 {
    unit 0 {
      description "Sales printer port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/24 {
    unit 0 {
      description "Support wireless access point port";
      family ethernet-switching {
        vlan members support;
      }
    }
  }
}
```

```

    }
  }
}
ge-0/0/26 {
  unit 0 {
    description "Support phone port";
    family ethernet-switching {
      vlan members support;
    }
  }
}
ge-0/0/44 {
  unit 0 {
    description "Support printer port";
    family ethernet-switching {
      vlan members sales;
    }
  }
}
ge-0/0/46 {
  unit 0 {
    description "Support file server port";
    family ethernet-switching {
      vlan members support;
    }
  }
}
ge-0/1/0 {
  unit 0 {
    description "Uplink module port connection to distribution switch";
    family ethernet-switching {
      port-mode trunk;
      vlan members [ sales support ];
      native-vlan-id 1;
    }
  }
}
vlan {
  unit 0 {
    family inet address 192.0.2.1/25;
  }
  unit 1 {
    family inet address 192.0.2.129/25;
  }
}
vlands {
  sales {
    vlan-id 100;
    vlan-description "Sales VLAN";
    l3-interface vlan.0;
  }
  support {
    vlan-id 200;
    vlan-description "Support VLAN";
    l3-interface vlan.1;
  }
}

```

```
}
}
```

**TIP:** To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

## Configuring the Distribution Switch

To configure the distribution switch:

### CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 description "Connection to access switch"
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces ge-0/0/0 ethernet-switching native-vlan-id 1
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description "Sales VLAN"
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

### Step-by-Step Procedure

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set description "Connection to access switch"
user@distribution-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set ethernet-switching vlanmembers [ sales support ]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):  

```
[edit interfaces]user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:  

```
[edit vlans sales]user@distribution-switch# set vlan-description "Sales VLAN"
user@distribution-switch# set vlan-id (VLANs) 100
user@distribution-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:  

```
[edit vlans support]user@distribution-switch# set vlan-description "Support VLAN"
user@distribution-switch# set vlan-id (VLANs) 200
user@distribution-switch# set l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:

```
[edit interfaces]user@distribution-switch# set vlan unit 0 family inet address
192.0.2.2/25
```

7. Create the subnet for the support broadcast domain:

```
[edit interfaces] user@distribution-switch# set vlan unit 1 family inet address
192.0.2.130/25
```

**Results** Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
  ge-0/0/0 {
    description "Connection to access switch";
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
}
vlan {
  unit 0 {
    family inet address 192.0.2.2/25;
  }
  unit 1 {
    family inet address 192.0.2.130/25;
  }
}
vpls {
  sales {
    vlan-id 100;
    vlan-description "Sales VLAN";
    l3-interface vlan.0;
  }
  support {
    vlan-id 200;
    vlan-description "Support VLAN";
    l3-interface vlan.1;
  }
}
```

**TIP:** To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the VLAN Members and Interfaces on the Access Switch on page 1494](#)
- [Verifying the VLAN Members and Interfaces on the Distribution Switch on page 1494](#)

### *Verifying the VLAN Members and Interfaces on the Access Switch*

**Purpose** Verify that the **sales** and **support** have been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
```

| Name    | Tag | Interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

This example describes how to configure BPDU protection on access interfaces in QFX Series products in an RSTP topology:

- [Requirements on page 1495](#)
- [Overview and Topology on page 1496](#)
- [Configuration on page 1497](#)
- [Verification on page 1497](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Two edged-linked switches in an RSTP topology

**NOTE:** By default, RSTP is enabled on the QFX Series.

## Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, receipt of BPDUs on certain interfaces in an STP, RSTP, or MSTP topology. It can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on those interfaces that should not receive BPDUs.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If a BPDU is received on a BPDU-protected interface, the interface is disabled and stops forwarding frames.

Two switches are displayed in [Figure 33 on page 1496](#). In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are access ports.

This example shows you how to configure interface **xe-0/0/5** and interface **xe-0/0/6** as edge ports and how to configure BPDU protection. When BPDU protection is enabled, the interfaces transition to a blocking state when they receive BPDUs.

**Figure 33: BPDU Protection Topology**

[Table 115 on page 1497](#) shows the components that will be configured for BPDU protection.

Table 115: Components of the Topology for Configuring BPDU Protection on the QFX Series

| Component                     | Settings                                                                                                                                       |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1 (Distribution Layer) | Switch 1 is connected to Switch 2 on a trunk interface.                                                                                        |
| Switch 2 (Access Layer)       | Switch 2 has these access ports that require BPDU protection: <ul style="list-style-type: none"> <li>• xe-0/0/5</li> <li>• xe-0/0/6</li> </ul> |

This configuration example uses an RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

**CLI Quick Configuration** To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/5 edge
set protocols rstp interface xe-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

**Step-by-Step Procedure** To configure BPDU protection:

1. Configure interface `xe-0/0/5` and interface `xe-0/0/6` on Switch 2 as edge ports:

```
[edit protocols rstp]
user@switch# set interface xe-0/0/5 edge
user@switch# set interface xe-0/0/6 edge
```

2. Configure BPDU protection on all edge ports:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/5.0 {
    edge;
}
interface xe-0/0/6.0 {
    edge;
}
bpdu-block-on-edge;
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 1498](#)
- [Verifying That BPDU Protection Is Working Correctly on page 1498](#)

**Displaying the Interface State Before BPDU Protection Is Triggered**

**Purpose** Before BPDUs are being received from the devices connected to interface **xe-0/0/5** and interface **xe-0/0/6**, confirm the interface state.

**Action** You can verify the interface state using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/6.0 | 128:519 | 128:519               | 32768.0019e2503f00      | 20000        | FWD   | DESG |

[output truncated]

**Meaning** The output shows that interface **xe-0/0/5.0** and interface **xe-0/0/6.0** are designated ports in a forwarding state.

**Verifying That BPDU Protection Is Working Correctly**

**Purpose** In this example, the devices connected to Switch 2 start sending BPDUs to interface **xe-0/0/5.0** and interface **xe-0/0/6.0**. Verify that BPDU protection is configured on the interfaces.

**Action** You can verify that BPDU protection is configured on the interfaces by using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface                  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |

[output truncated]

**Meaning** When BPDUs are sent from the devices to interface **xe-0/0/5.0** and interface **xe-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface**

shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state blocks the interfaces and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the `disable-timeout` statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command `clear ethernet-switching bpd-error` to unblock the interface.

If the devices connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the devices that is triggering the sending of BPDUs to Switch 2.

### Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees

QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to enforce the root bridge placement in the network manually.

This example describes how to configure root protection on an interface for the QFX Series.

- [Requirements on page 1499](#)
- [Overview and Topology on page 1500](#)
- [Configuration on page 1502](#)
- [Verification on page 1502](#)

#### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Four switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on the QFX Series.

---

## Overview and Topology

---

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

To prevent this from happening, enable root protection on interfaces that should not receive more BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

**NOTE:** An interface can be configured for either root protection or loop protection, but not for both.

Four switches are displayed in [Figure 34 on page 1501](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **xe-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **xe-0/0/7** to prevent it from transitioning to become the root port.

Figure 34: Network Topology for Root Protection

Table 116 on page 1501 shows the components that will be configured for root protection.

Table 116: Topology for Configuring Root Protection on the QFX Series

| Component | Settings                                                                                                                                                                                    |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1  | Switch 1 is connected to Switch 4 through interface <b>xe-0/0/7</b> .                                                                                                                       |
| Switch 2  | Switch 2 is connected to Switch 1 and Switch 3. Interface <b>xe-0/0/4</b> is the alternate port in the RSTP topology.                                                                       |
| Switch 3  | Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.                                                                                                                      |
| Switch 4  | Switch 4 is connected to Switch 1. After loop protection is configured on interface <b>xe-0/0/7</b> , Switch 4 sends more BPDUs that trigger loop protection on interface <b>xe-0/0/7</b> . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.

- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure root protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

---

### Configuration

**CLI Quick Configuration** To quickly configure root protection on interface `xe-0/0/7`, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/7 no-root-port
```

**Step-by-Step Procedure** To configure root protection:

1. Configure interface `xe-0/0/7`:  

```
[edit protocols rstp]
user@switch#
set interface xe-0/0/7 no-root-port
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/7.0 {
  no-root-port;
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Root Protection Is Triggered on page 1502](#)
- [Verifying That Root Protection Is Working on the Interface on page 1503](#)

#### *Displaying the Interface State Before Root Protection Is Triggered*

**Purpose** Before root protection is triggered on interface `xe-0/0/7`, confirm the interface state.

**Action** Confirm the state of the interfaces before root protection is configured:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| xe-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | FWD   | DESG |

[output truncated]

**Meaning** The output from the operational mode command `show spanning-tree interface` shows that **xe-0/0/7.0** is a designated port in a forwarding state.

#### *Verifying That Root Protection Is Working on the Interface*

**Purpose** A configuration change takes place on Switch 4. A lower bridge priority on Switch 4 causes it to send more BPDUs to interface **xe-0/0/7**. Receipt of more BPDUs on interface **xe-0/0/7** triggers root protection. Verify that root protection is operating on interface **xe-0/0/7**.

**Action** Verify that root protection has been configured and is operating correctly:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| xe-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Root-Incon)  
[output truncated]

**Meaning** The operational mode command `show spanning-tree interface` shows that interface **xe-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state blocks the interface and prevents it from becoming a candidate for the root port. When the root bridge no longer receives more STP BPDUs from the interface, the interface recovers and transitions back to a forwarding state. Recovery is automatic.

## Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would create a loop in the network.

This example describes how to configure loop protection for an interface for the QFX Series in an RSTP topology:

- [Requirements on page 1504](#)
- [Overview and Topology on page 1504](#)
- [Configuration on page 1506](#)
- [Verification on page 1506](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Three switches in an RSTP topology

**NOTE:** By default, RSTP is enabled for the QFX Series.

---

### Overview and Topology

---

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop appears in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a

looped network, its resources become depleted, and the ultimate result is a network outage.

**NOTE:** An interface can be configured for either loop protection or root protection, but not for both.

Three switches are displayed in [Figure 35 on page 1505](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **xe-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **xe-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

Figure 35: Network Topology for Loop Protection

[Table 117 on page 1505](#) shows the components that will be configured for loop protection.

Table 117: Topology for Configuring Loop Protection on the QFX Series

| Components | Settings                                                              |
|------------|-----------------------------------------------------------------------|
| Switch 1   | Switch 1 is the root bridge.                                          |
| Switch 2   | Switch 2 has the root port <b>xe-0/0/7</b> .                          |
| Switch 3   | Switch 3 is connected to Switch 1 through interface <b>xe-0/0/6</b> . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure loop protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

---

### Configuration

#### CLI Quick Configuration

To quickly configure loop protection on interface **xe-0/0/6**:

```
[edit]
set protocols rstp interface xe-0/0/6 bpdu-timeout-action block
```

#### Step-by-Step Procedure

To configure loop protection:

1. Configure interface **xe-0/0/6** on Switch 3:  

```
[edit protocols rstp]
user@switch# set interface xe-0/0/6 bpdu-timeout-action block
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Loop Protection Is Triggered on page 1506](#)
- [Verifying That Loop Protection Is Working on an Interface on page 1507](#)

#### *Displaying the Interface State Before Loop Protection Is Triggered*

#### Purpose

Before loop protection is triggered on interface **xe-0/0/6**, confirm that the interface is blocked.

**Action** Display the interface state and role before applying root protection:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/6.0 | 128:519 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/6.0** is the alternate port and is blocked.

#### *Verifying That Loop Protection Is Working on an Interface*

**Purpose** Verify that the loop protection configuration on interface **xe-0/0/6**. RSTP has been disabled on interface **xe-0/0/4** on Switch 1. This stops BPDUs from being sent to interface **xe-0/0/6** and triggering loop protection on that interface.

**Action** Display the interface state and role after applying root protection:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/6.0 | 128:519 | 128:519               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Loop-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

## Example: Disabling MAC Learning

By default, MAC learning is enabled on the QFX Series. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning on the QFX Series. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning.

- To disable MAC learning in a VLAN:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# set no-mac-learning
```

- To reenable MAC learning:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# delete no-mac-learning
```

- To verify the status of MAC learning on the QFX Series:

```
user@switch> show ethernet-switching table
Learning stats: 10 learn msg rcvd, 2 error, 0 forced update
Interface           Local pkts      Transit pkts      Error
xe-0/0/0.0           0                6                1
xe-0/0/22.0          0                0                0
xe-0/0/1.0           0                4                1
xe-0/0/2.0           0                0                0
xe-0/0/3.0           0                0                0
xe-0/0/4.0           0                0                0
xe-0/0/19.0          0                0                0
xe-0/0/18.0          0                0                0
xe-0/0/9.0           0                0                0
```

### Related Documentation

- [Understanding MAC Learning on page 1388](#)
- [Disabling MAC Learning on page 1558](#)
- [no-mac-learning \(Per VLAN\) on page 1618](#)

## Example: Disabling MAC Learning in a VLAN

When MAC learning is enabled, a MAC address is learned dynamically from a packet's source MAC address. By default, MAC learning is enabled on a VLAN. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning in a VLAN. Disabling dynamic MAC learning in a VLAN on a QFX Series product prevents a node from learning source and destination MAC addresses. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning. This example uses a VLAN named *blue*.

- To disable MAC learning in a VLAN:

```
[edit vlans vlan-name]
user@switch# set no-mac-learning
```

For example:

```
[edit vlans blue]
user@switch# set no-mac-learning
```

- To verify that you have disabled MAC learning, issue the **show ethernet-switching table** command:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 2 learned
```

| VLAN    | MAC address       | Type   | Age  | Interfaces    |
|---------|-------------------|--------|------|---------------|
| blue    | *                 | Flood  |      | - All-members |
| blue    | 00:1f:12:39:90:80 | Static |      | - Router      |
| default | *                 | Flood  |      | - All-members |
| default | 00:1f:12:39:90:89 | Learn  | 3:15 | ge-0/0/1.0    |
| default | 00:1f:12:39:a3:81 | Learn  | 0    | ge-0/0/1.0    |

The CLI output shows that the VLAN named *blue* is not configured for MAC learning. The **Type** column includes only **static** (MAC address that are manually created) and **flood** (MAC addresses that are unknown and flooded to all members of the VLAN) entries.

- To reenable MAC learning in a VLAN, issue either of the following two commands::

```
[edit vlans vlan-name]
user@switch delete no-mac-learning
user@switch# deactivate no-mac-learning
```

For example:

```
[edit vlans blue]
user@switch delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify that you have enabled MAC learning, issue the **show ethernet-switching table** command:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 6 entries, 3 learned
```

| VLAN    | MAC address       | Type   | Age | Interfaces    |
|---------|-------------------|--------|-----|---------------|
| blue    | *                 | Flood  |     | - All-members |
| blue    | 00:1f:12:39:90:80 | Static |     | - Router      |
| blue    | 00:1f:12:39:a3:80 | Learn  | 0   | ge-0/0/9.0    |
| default | *                 | Flood  |     | - All-members |
| default | 00:1f:12:39:90:89 | Learn  | 0   | ge-0/0/1.0    |
| default | 00:1f:12:39:a3:81 | Learn  | 0   | ge-0/0/1.0    |

The CLI output shows that the VLAN named *blue* is configured for MAC learning. The **Type** column includes **static** (MAC address that are manually created), **flood** (MAC addresses that are unknown and flooded to all members of the VLAN), and **Learn** (MAC addresses that are earned dynamically from a packet's source MAC address) entries.

- [Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports on page 1529](#)

### Example: Configuring a Private VLAN on a Single Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and even to limit the communication between known hosts. The private VLAN (PVLAN) feature allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN.

This example describes how to create a PVLAN on a single switch:

- [Requirements on page 1510](#)
- [Overview and Topology on page 1510](#)
- [Configuration on page 1511](#)
- [Verification on page 1514](#)

#### Requirements

This example uses the following hardware and software components:

- One QFX3500 device
- Junos OS Release 12.1 or later for the QFX Series

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See [“Configuring VLANs” on page 1553](#).

#### Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows a simple topology to illustrate how to create a PVLAN with one primary VLAN and two community VLANs, one for HR and one for finance, as well as two isolated ports—one for the mail server and the other for the backup server.

[Table 118 on page 1510](#) lists the settings for the sample topology.

**Table 118: Components of the Topology for Configuring a PVLAN**

| Interface   | Description                                      |
|-------------|--------------------------------------------------|
| ge-0/0/0.0  | Primary VLAN ( <b>pvlan100</b> ) trunk interface |
| ge-0/0/11.0 | User 1, HR Community ( <b>hr-comm</b> )          |

Table 118: Components of the Topology for Configuring a PVLAN (*continued*)

| Interface   | Description                                       |
|-------------|---------------------------------------------------|
| ge-0/0/12.0 | User 2, HR Community ( <b>hr-comm</b> )           |
| ge-0/0/13.0 | User 3, Finance Community ( <b>finance-comm</b> ) |
| ge-0/0/14.0 | User 4, Finance Community ( <b>finance-comm</b> ) |
| ge-0/0/15.0 | Mail server, Isolated ( <b>isolated</b> )         |
| ge-0/0/16.0 | Backup server, Isolated ( <b>isolated</b> )       |
| ge-1/0/0.0  | Primary VLAN ( <b>pvlan100</b> ) trunk interface  |

### Configuration

#### CLI Quick Configuration

To quickly create and configure a PVLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans pvlan100 vlan-id 100
set interfaces ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/15 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/16 unit 0 family ethernet-switching port-mode access
set vlans pvlan100 pvlan
set vlans pvlan100 interface ge-0/0/0.0
set vlans pvlan100 interface ge-1/0/0.0
set vlans hr-comm interface ge-0/0/11.0
set vlans hr-comm interface ge-0/0/12.0
set vlans finance-comm interface ge-0/0/13.0
set vlans finance-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans finance-comm primary-vlan pvlan100
set pvlan100 interface ge-0/0/15.0 isolated
set pvlan100 interface ge-0/0/16.0 isolated
```

#### Step-by-Step Procedure

To configure the PVLAN:

1. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
user@switch# set pvlan vlan-id 100
```

2. Set the interfaces and port modes:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
user@switch# set ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan
```

```

user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/15 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/16 unit 0 family ethernet-switching port-mode access

```

3. Set the primary VLAN to have no local switching:

**NOTE:** The primary VLAN must be a tagged VLAN.

[edit vlans]

```
user@switch# set pvlan100 pvlan
```

4. Add the trunk interfaces to the primary VLAN:

[edit vlans]

```
user@switch# set pvlan100 interface ge-0/0/0.0
```

```
user@switch# set pvlan100 interface ge-1/0/0.0
```

5. For each secondary VLAN, configure access interfaces:

**NOTE:** We recommend that the secondary VLANs be untagged VLANs. It does not impair functioning if you tag the secondary VLANs. However, the tags are not used when a secondary VLAN is configured on a single switch.

[edit vlans]

```
user@switch# set hr-comm interface ge-0/0/11.0
```

```
user@switch# set hr-comm interface ge-0/0/12.0
```

```
user@switch# set finance-comm interface ge-0/0/13.0
```

```
user@switch# set finance-comm interface ge-0/0/14.0
```

6. For each community VLAN, set the primary VLAN:

[edit vlans]

```
user@switch# set hr-comm primary-vlan pvlan100
```

```
user@switch# set finance-comm primary-vlan pvlan100
```

7. Configure the isolated interfaces in the primary VLAN:

[edit vlans]

```
user@switch# set pvlan100 interface ge-0/0/15.0 isolated
```

```
user@switch# set pvlan100 interface ge-0/0/16.0 isolated
```

## Results

Check the results of the configuration:

[edit]

```
user@switch# show
```

```
interfaces {
```

```
  ge-0/0/0 {
```

```
    unit 0 {
```

```
      family ethernet-switching {
```

```
        port-mode trunk;
```

```
        vlan {
```

```
          members pvlan100;
```

```

    }
  }
}
ge-1/0/0 {
  unit 0 {
    family ethernet-switching;
  }
}
ge-0/0/11 {

    family ethernet-switching {
      port-mode access;
    }
  }
}
ge-0/0/14 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
vpls {
  finance-comm {
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
    }
  }
}

```

```
        ge-0/0/16.0;  
        ge-0/0/0.0;  
        ge-1/0/0.0;  
    }  
    pvlan;  
}  
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Private VLAN and Secondary VLANs Were Created on page 1514](#)

### *Verifying That the Private VLAN and Secondary VLANs Were Created*

**Purpose** Verify that the primary VLAN and secondary VLANs were properly created on the switch.

**Action** Use the `show vlans` command:

```
user@switch> show vlans pvlan100 extensive  
VLAN: pvlan100, Created at: Tue Sep 16 17:59:47 2008

  - [Understanding PVLAN Traffic Flows Across Multiple Switches on page 1395](#)
  - [Creating a Private VLAN on a Single Switch on page 1560](#)

## Example: Configuring a Private VLAN Spanning Multiple Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and even to limit the communication between known hosts. The private VLAN (PVLAN) feature allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. A PVLAN can span multiple switches.

This example describes how to create a PVLAN spanning multiple switches. The example creates one primary PVLAN, containing multiple secondary VLANs:

- [Requirements on page 1515](#)
- [Overview and Topology on page 1516](#)
- [Configuring a PVLAN on Switch 1 on page 1519](#)
- [Configuring a PVLAN on Switch 2 on page 1521](#)
- [Configuring a PVLAN on Switch 3 on page 1524](#)
- [Verification on page 1525](#)

### Requirements

This example uses the following hardware and software components:

- Three QFX3500 devices
- Junos OS Release 12.1 or later for the QFX Series

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See [“Configuring VLANs” on page 1553](#).

### Overview and Topology

---

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows how to create a PVLAN spanning multiple QFX devices, with one primary VLAN containing two community VLANs (one for HR and one for Finance), and an interswitch isolated VLAN (for the mail server, the backup server, and the CVS server). The PVLAN comprises three switches, two access switches and one distribution switch. The PVLAN is connected to a router through a promiscuous port, which is configured on the distribution switch.

**NOTE:** The isolated ports on Switch 1 and on Switch 2 do not have Layer 2 connectivity with one another even though they are included within the same domain. See [“Understanding Private VLANs” on page 1389](#).

[Figure 36 on page 1517](#) shows the topology for this example—two access switches connecting to a distribution switch, which has a connection (through a promiscuous port) to the router.

Figure 36: PVLAN Topology Spanning Multiple Switches

Table 119 on page 1518, Table 120 on page 1518, and Table 121 on page 1519 list the settings for the example topology.

**Table 119: Components of Switch 1 in the Topology for Configuring a PVLAN Spanning Multiple Devices**

| Promiscuous port       | <b>ge-0/0/2</b> , connects the PVLAN to the router<br><br><b>NOTE:</b> You must configure the trunk port that connects the PVLAN to another switch or router outside the PVLAN as a member of the PVLAN, which implicitly configures it as a promiscuous port. |

### Configuring a PVLAN on Switch 1

When configuring a PVLAN on multiple switches, these rules apply:

- The primary VLAN must be a tagged VLAN. We recommend that you configure the primary VLAN first.
- If you are going to configure a community VLAN ID, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolation VLAN ID, you must first configure the primary VLAN and the PVLAN trunk port.

#### CLI Quick Configuration

To quickly create and configure a PVLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 1:

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/15.0
set vlans pvlan100 interface ge-0/0/16.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
set pvlan100 interface ge-0/0/15.0 isolated
set pvlan100 interface ge-0/0/16.0 isolated
```

**Step-by-Step  
Procedure**

1. Set the VLAN ID for the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 vlan-id 100
```
2. Set the PVLAN trunk interfaces to connect this VLAN across neighboring switches:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```
3. Set the primary VLAN to be private and have no local switching:  

```
[edit vlans]
user@switch# set pvlan100 pvlan
```
4. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set finance-comm vlan-id 300
```
5. Configure access interfaces for the **finance-comm** VLAN:  

```
[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0
user@switch# set finance-comm interface ge-0/0/12.0
```
6. Set the primary VLAN of this secondary community VLAN, **finance-comm** :  

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```
7. Set the VLAN ID for the HR community VLAN that spans the switches.  

```
[edit vlans]
user@switch# set hr-comm vlan-id 400
```
8. Configure access interfaces for the **hr-comm** VLAN:  

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0
user@switch# set hr-comm interface ge-0/0/14.0
```
9. Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```
10. Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50
```
11. Configure the isolated interfaces in the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/15.0 isolated
user@switch# set pvlan100 interface ge-0/0/16.0 isolated
```

**NOTE:** When you configure an isolated port, include it as a member of the primary VLAN, but do not configure it as a member of any community VLAN.

**Results**

Check the results of the configuration:

```
[edit]
user@switch# show
vlangs {
  finance-comm {
    vlan-id 300;
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/5.0 {
        pvlan-trunk;
      }
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

### Configuring a PVLAN on Switch 2

#### CLI Quick Configuration

To quickly create and configure a private VLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 2:

**NOTE:** The configuration of Switch 2 is the same as the configuration of Switch 1 except for the interface in the interswitch isolated domain. For Switch 2, the interface is ge-0/0/17.0.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
```

```

set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/17.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
set pvlan100 interface ge-0/0/17.0 isolated

```

### Step-by-Step Procedure

To configure a PVLAN on Switch 2 that will span multiple switches:

1. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```

[edit vlans]
user@switch# set finance-comm vlan-id 300

```
2. Configure access interfaces for the **finance-comm** VLAN:  

```

[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0
user@switch# set finance-comm interface ge-0/0/12.0

```
3. Set the primary VLAN of this secondary community VLAN, **finance-comm**:  

```

[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100

```
4. Set the VLAN ID for the HR community VLAN that spans the switches.  

```

[edit vlans]
user@switch# set hr-comm vlan-id 400

```
5. Configure access interfaces for the **hr-comm** VLAN:  

```

[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0
user@switch# set hr-comm interface ge-0/0/14.0

```
6. Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```

[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100

```
7. Set the VLAN ID for the primary VLAN:  

```

[edit vlans]
user@switch# set pvlan100 vlan-id 100

```
8. Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:  

```

[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk

```
9. Set the primary VLAN to be private and have no local switching:  

```

[edit vlans]
user@switch# set pvlan100 pvlan

```
10. Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```

[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50

```

**NOTE:** To configure an isolated port, include it as one of the members of the primary VLAN, but do not configure it as belonging to one of the community VLANs.

11. Configure the isolated interface in the primary VLAN:

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/17.0 isolated
```

### Results

Check the results of the configuration:

```
[edit]
user@switch# show
vlans {
  finance-comm {
    vlan-id 300;
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/5.0 {
        pvlan-trunk;
      }
      ge-0/0/17.0;
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

### Configuring a PVLAN on Switch 3

**CLI Quick Configuration** To quickly configure Switch 3 to function as the distribution switch of this PVLAN, copy the following commands and paste them into the terminal window of Switch 3:

**NOTE:** Interface ge-0/0/2.0 is a trunk port connecting the PVLAN to a router.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/1.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
```

**Step-by-Step Procedure** To configure Switch 3 to function as the distribution switch for this PVLAN, use the following procedure:

- Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set vlans finance-comm vlan-id 300
```
- Set the primary VLAN of this secondary community VLAN, **finance-comm**:  

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```
- Set the VLAN ID for the HR community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set vlans hr-comm vlan-id 400
```
- Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```
- Set the VLAN ID for the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 vlan-id 100
```
- Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```
- Set the primary VLAN to be private and have no local switching:  

```
[edit vlans]
user@switch# set pvlan100 pvlan
```
- Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50
```

**NOTE:** To configure an isolated port, include it as one of the members of the primary VLAN, but do not configure it as belonging to one of the community VLANs.

## Results

Check the results of the configuration:

```
[edit]
user@switch# show
vlands {
  finance-comm {
    vlan-id 300;
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/1.0 {
        pvlan-trunk;
      }
      ge-0/0/2.0;
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1 on page 1525](#)
- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2 on page 1527](#)
- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3 on page 1528](#)

### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 1:

**Action** Use the **show vlans extensive** command:

```

user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/15.0__, Created at: Thu Sep 16 23:15:27 2010
Internal index: 5, Admin State: Enabled, Origin: Static

ge-0/0/12.0*, untagged, access
ge-0/0/13.0*, untagged, access
ge-0/0/14.0*, untagged, access
ge-0/0/15.0*, untagged, access
ge-0/0/16.0*, untagged, access
Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1
Isolated VLANs :
__pvlan_pvlan100_ge-0/0/15.0__
__pvlan_pvlan100_ge-0/0/16.0__
Community VLANs :
  finance-comm
  hr-comm
Inter-switch-isolated VLAN :
__pvlan_pvlan100_isiv__

```

**Meaning** The output shows that a PVLAN was created on Switch 1 and shows that it includes two isolated VLANs, two community VLANs, and an interswitch isolated VLAN. The presence of the pvlan-trunk and Inter-switch-isolated fields indicates that this PVLAN is spanning more than one switch.

#### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 2:

**Action** Use the `show vlans extensive` command:

```

user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/17.0__, Created at: Thu Sep 16 23:19:22 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 1 (Active = 1)
  ge-0/0/0.0*, tagged, trunk, pvlan-trunk
  ge-0/0/5.0*, tagged, trunk, pvlan-trunk
  ge-0/0/17.0*, untagged, access

VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:19:22 2010

    ge-0/0/17.0*, untagged, access
Secondary VLANs: Isolated 1, Community 2, Inter-switch-isolated 1
Isolated VLANs :
    __pvlan_pvlan100_ge-0/0/17.0__
Community VLANs :
    finance-comm
    hr-comm
Inter-switch-isolated VLAN :
    __pvlan_pvlan100_isiv__
```

**Meaning** The output shows that a PVLAN was created on Switch 2 and shows that it includes one isolated VLAN, two community VLANs, and an interswitch isolated VLAN. The presence of the pvlan-trunk and Inter-switch-isolated fields indicates that this PVLAN is spanning more than one switch. When you compare this output to the output of Switch 1, you can see that both switches belong to the same PVLAN (**pvlan100**).

### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 3:

**Action** Use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 50, Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged 0 (Active = 0)
```

```

VLAN: finance-comm, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 300, Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: hr-comm, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 400, Internal index: 7, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: pvlan100, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk
Secondary VLANs: Isolated 0, Community 2, Inter-switch-isolated 1
Community VLANs :
    finance-comm
    hr-comm
Inter-switch-isolated VLAN :
    __pvlan_pvlan100_isiv__

```

**Meaning** The output shows that the PVLAN (**pvlan100**) is configured on Switch 3 and that it includes no isolated VLANs, two community VLANs, and an interswitch isolated VLAN. But Switch 3 is functioning as a distribution switch, so the output does not include access interfaces within the PVLAN. It shows only the **pvlan-trunk** interfaces that connect **pvlan100** from Switch 3 to the other switches (Switch 1 and Switch 2) in the same PVLAN.

**Related Documentation**

- [Example: Configuring a Private VLAN on a Single Switch on page 1510](#)

## Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports

This example shows how to configure secondary VLAN trunk ports and promiscuous access ports as part of a private VLAN configuration. Secondary VLAN trunk ports carry secondary VLAN traffic.

For a given private VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different private (primary) VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN **pvlan100** and also carry traffic for an isolated VLAN that is part of primary VLAN **pvlan400**.

To configure a trunk port to carry secondary VLAN traffic, use the **isolated** and **interface** statements, as shown in steps 12 and 13 of the example configuration for Switch 1.

**NOTE:** When traffic egresses from a secondary VLAN trunk port, it normally carries the tag of the primary VLAN that the secondary port is a member of. If you want traffic that egresses from a secondary VLAN trunk port to retain its secondary VLAN tag, use the **extend-secondary-vlan-id** statement.

A promiscuous access port carries untagged traffic and can be a member of only one primary VLAN. Traffic that ingresses on a promiscuous access port is forwarded to the ports of the secondary VLANs that are members of the primary VLAN that the promiscuous access port is a member of. This traffic carries the appropriate secondary VLAN tags when it egresses from the secondary VLAN ports if the secondary VLAN port is a trunk port.

To configure an access port to be promiscuous, use the **promiscuous** statement, as shown in step Figure 27 on page 1407 of the example configuration for Switch 2.

If traffic ingresses on a secondary VLAN port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

---

## Requirements

This example uses the following hardware and software components:

- Two QFX devices
- Junos OS Release 12.2 or later for the QFX Series

---

## Overview and Topology

Figure 37 on page 1531 shows the topology used in this example. Switch 1 includes several primary and secondary private VLANs and also includes two secondary VLAN trunk ports configured to carry secondary VLANs that are members of primary VLANs pvlan100 and pvlan400.

Switch 2 includes the same private VLANs. The figure shows xe-0/0/0 on Switch 2 as configured with promiscuous access ports or promiscuous trunk ports. The example configuration included here configures this port as a promiscuous access port.

The figure also shows how traffic would flow after ingressing on the secondary VLAN trunk ports on Switch 1.

**Figure 37: PVLAN Topology with Secondary VLAN Trunk Ports and Promiscuous Access Port**

Table 122 on page 1531 and Table 123 on page 1532 list the settings for the example topology on both switches.

**Table 122: Components of the Topology for Configuring a Secondary VLAN Trunk on Switch 1**

| Component             | Description                                                       |
|-----------------------|-------------------------------------------------------------------|
| pvlan100, ID 100      | Primary VLAN                                                      |
| pvlan400, ID 400      | Primary VLAN                                                      |
| comm300, ID 300       | Community VLAN, member of pvlan100                                |
| comm600, ID 600       | Community VLAN, member of pvlan400                                |
| isolation-vlan-id 200 | VLAN ID for isolated VLAN, member of pvlan100                     |
| isolation-vlan-id 500 | VLAN ID for isolated VLAN, member of pvlan400                     |
| xe-0/0/0.0            | Secondary VLAN trunk port for primary VLANs pvlan100 and pvlan400 |
| xe-0/0/1.0            | PVLAN trunk port for primary VLANs pvlan100 and pvlan400          |
| xe-0/0/2.0            | Isolated access port for pvlan100                                 |
| xe-0/0/3.0            | Community access port for comm300                                 |
| xe-0/0/5.0            | Isolated access port for pvlan400                                 |
| xe-0/0/6.0            | Community trunk port for comm600                                  |

Table 123: Components of the Topology for Configuring a Secondary VLAN Trunk on Switch 2

| Component             | Description                                                |
|-----------------------|------------------------------------------------------------|
| pvlan100, ID 100      | Primary VLAN                                               |
| pvlan400, ID 400      | Primary VLAN                                               |
| comm300, ID 300       | Community VLAN, member of pvlan100                         |
| comm600, ID 600       | Community VLAN, member of pvlan400                         |
| isolation-vlan-id 200 | VLAN ID for isolated VLAN, member of pvlan100              |
| isolation-vlan-id 500 | VLAN ID for isolated VLAN, member of pvlan400              |
| xe-0/0/0.0            | Promiscuous access port for primary VLANs pvlan100         |
| xe-0/0/1.0            | PVLAN trunk port for primary VLANs pvlan100 and pvlan400   |
| xe-0/0/2.0            | Secondary trunk port for isolated VLAN, member of pvlan100 |
| xe-0/0/3.0            | Community access port for comm300                          |
| xe-0/0/5.0            | Isolated access port for pvlan400                          |
| xe-0/0/6.0            | Community access port for comm600                          |

### Configuring the PVLANS on Switch 1

#### CLI Quick Configuration

To quickly create and configure the PVLANS on Switch 1, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/3 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/5 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode trunk
set vlans pvlan100 vlan-id 100
set vlans pvlan400 vlan-id 400
set vlans pvlan100 pvlan
set vlans pvlan400 pvlan
set vlans pvlan100 interface xe-0/0/1.0 pvlan-trunk
set vlans pvlan400 interface xe-0/0/1.0 pvlan-trunk
set vlans comm300 vlan-id 300
set vlans comm300 primary-vlan pvlan100
set vlans comm300 interface xe-0/0/3.0
set vlans comm600 vlan-id 600
set vlans comm600 primary-vlan pvlan400
set vlans comm600 interface xe-0/0/6.0
set vlans pvlan100 pvlan isolation-vlan-id 200
```

```

set vlans pvlan400 pvlan isolation-vlan-id 500
set vlans pvlan100 interface xe-0/0/0.0 isolated
set vlans pvlan400 interface xe-0/0/0.0 isolated
set vlans comm600 interface xe-0/0/0.0
set vlans pvlan100 interface xe-0/0/2.0 isolated
set vlans pvlan400 interface xe-0/0/5.0 isolated

```

### Step-by-Step Procedure

To configure the private VLANs and secondary VLAN trunk ports:

1. Configure the interfaces and port modes:

[edit interfaces]

```

user@switch# set xe-0/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
user@switch# set xe-0/0/2 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/3 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/5 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode access

```

2. Create the primary VLANs:

[edit vlans]

```

user@switch# set pvlan100 vlan-id 100
user@switch# set pvlan400 vlan-id 400

```

**NOTE:** Primary VLANs must always be tagged VLANs, even if they exist on only one device.

3. Configure the primary VLANs to be private:

[edit vlans]

```

user@switch# set pvlan100 pvlan
user@switch# set pvlan400 pvlan

```

4. Configure the PVLAN trunk port to carry the private VLAN traffic between the switches:

[edit vlans]

```

user@switch# set pvlan100 interface xe-0/0/1.0 pvlan-trunk
user@switch# set pvlan400 interface xe-0/0/1.0 pvlan-trunk

```

5. Create secondary VLAN comm300 with VLAN ID 300:

[edit vlans]

```

user@switch# set comm300 vlan-id 300

```

6. Configure the primary VLAN for comm300:

[edit vlans]

```

user@switch# set comm300 primary-vlan pvlan100

```

7. Configure the interface for comm300:

[edit vlans]

```

user@switch# set comm300 interface xe-0/0/3.0

```

8. Create secondary VLAN comm600 with VLAN ID 600:

[edit vlans]

```

user@switch# set comm600 vlan-id 600

```

9. Configure the primary VLAN for comm600:

- ```
[edit vlans]
user@switch# set comm600 primary-vlan pvlan400
```
10. Configure the interface for comm600:
- ```
[edit vlans]
user@switch# set comm600 interface xe-0/0/6.0
```
11. Configure the interswitch isolated VLANs:
- ```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 200
user@switch# set pvlan400 pvlan isolation-vlan-id 500
```

**NOTE:** When you configure a secondary VLAN trunk port to carry an isolated VLAN, you must also configure an **isolation-vlan-id**. This is true even if the isolated VLAN exists only on one switch.

12. Enable trunk port xe-0/0/0 to carry secondary VLANs for the primary VLANs:
- ```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/0.0 isolated
user@switch# set pvlan400 interface xe-0/0/0.0 isolated
```
13. Configure trunk port xe-0/0/0 to carry comm600 (member of pvlan400):
- ```
[edit vlans]
user@switch# set comm600 interface xe-0/0/0.0
```

**NOTE:** You do not need to explicitly configure xe-0/0/0 to carry the isolated VLAN traffic (tags 200 and 500) because all the isolated ports in pvlan100 and pvlan400—including xe-0/0/0.0—are automatically included in the isolated VLANs created when you configured **isolation-vlan-id 200** and **isolation-vlan-id 500**.

14. Configure xe-0/0/2 and xe-0/0/6 to be isolated:
- ```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/2.0 isolated
user@switch# set pvlan400 interface xe-0/0/5.0 isolated
```

## Results

Check the results of the configuration on Switch 1:

```
[edit]
user@switch# show
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan100;
          members pvlan400;
        }
      }
    }
  }
}
```

```

    }
  }
}
xe-0/0/1 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members pvlan100;
        members pvlan400;
      }
    }
  }
}
xe-0/0/2 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/3 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/5 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/6 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
    }
  }
}
}
vllans {
  comm300 {
    vlan-id 300;
    interface {
      xe-0/0/3.0;
    }
    primary-vlan pvlan100;
  }
  comm600 {
    vlan-id 600;
    interface {
      xe-0/0/6.0;
    }
  }
}

```

```
        primary-vlan pvlan400;
    }
    pvlan100 {
        vlan-id 100;
        interface {
            xe-0/0/0.0;
            xe-0/0/2.0;
            xe-0/0/3.0;
            xe-0/0/1.0 {
                pvlan-trunk;
            }
        }
        no-local-switching;
        isolation-id 200;
    }
    pvlan400 {
        vlan-id 400;
        interface {
            xe-0/0/0.0;
            xe-0/0/5.0;
            xe-0/0/6.0;
            xe-0/0/1.0 {
                pvlan-trunk;
            }
        }
        no-local-switching;
        isolation-id 500;
    }
}
```

---

### Configuring the PVLANS on Switch 2

The configuration for Switch 2 is almost identical to the configuration for Switch 1. The most significant difference is that xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port or a promiscuous access port, as [Figure 37 on page 1531](#) shows. In the following configuration, xe-0/0/0 is configured as a promiscuous access port for primary VLAN pvlan100.

If traffic ingresses on VLAN-enabled port and egresses on a promiscuous access port, the VLAN tags are dropped on egress and the traffic is untagged at that point. For example, traffic for comm600 ingresses on the secondary VLAN trunk port configured on xe-0/0/0.0 on Switch 1 and carries tag 600 as it is forwarded through the secondary VLAN. When it egresses from xe-0/0/0.0 on Switch 2, it will be untagged if you configure xe-0/0/0.0 as a promiscuous access port as shown in this example. If you instead configure xe-0/0/0.0 as a promiscuous trunk port (port-mode trunk), the traffic for comm600 carries its primary VLAN tag (400) when it egresses.

#### CLI Quick Configuration

To quickly create and configure the PVLANS on Switch 2, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
```

```

set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/3 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/5 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode access
set vlans pvlan100 vlan-id 100
set vlans pvlan400 vlan-id 400
set vlans pvlan100 pvlan
set vlans pvlan400 pvlan
set vlans pvlan100 interface xe-0/0/1.0 pvlan-trunk
set vlans pvlan400 interface xe-0/0/1.0 pvlan-trunk
set vlans comm300 vlan-id 300
set vlans comm300 primary-vlan pvlan100
set vlans comm300 interface xe-0/0/3.0
set vlans comm600 vlan-id 600
set vlans comm600 primary-vlan pvlan400
set vlans comm600 interface xe-0/0/6.0
set vlans pvlan100 pvlan isolation-vlan-id 200
set vlans pvlan400 pvlan isolation-vlan-id 500
set vlans pvlan100 interface xe-0/0/0.0 promiscuous
set vlans pvlan100 interface xe-0/0/2.0 isolated
set vlans pvlan400 interface xe-0/0/5.0 isolated

```

#### Step-by-Step Procedure

To configure the private VLANs and secondary VLAN trunk ports:

1. Configure the interfaces and port modes:
 

```

[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
user@switch# set xe-0/0/2 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/3 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/5 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode access

```
2. Create the primary VLANs:
 

```

[edit vlans]
user@switch# set pvlan100 vlan-id 100
user@switch# set pvlan400 vlan-id 400

```
3. Configure the primary VLANs to be private:
 

```

[edit vlans]
user@switch# set pvlan100 pvlan
user@switch# set pvlan400 pvlan

```
4. Configure the PVLAN trunk port to carry the private VLAN traffic between the switches:
 

```

[edit vlans]
user@switch# set pvlan100 interface xe-0/0/1.0 pvlan-trunk
user@switch# set pvlan400 interface xe-0/0/1.0 pvlan-trunk

```
5. Create secondary VLAN comm300 with VLAN ID 300:
 

```

[edit vlans]
user@switch# set comm300 vlan-id 300

```
6. Configure the primary VLAN for comm300:
 

```

[edit vlans]
user@switch# set comm300 primary-vlan pvlan100

```
7. Configure the interface for comm300:

- ```
[edit vlans]
user@switch# set comm300 interface xe-0/0/3.0
```
8. Create secondary VLAN comm600 with VLAN ID 600:
 

```
[edit vlans]
user@switch# set comm600 vlan-id 600
```
  9. Configure the primary VLAN for comm600:
 

```
[edit vlans]
user@switch# set comm600 primary-vlan pvlan400
```
  10. Configure the interface for comm600:
 

```
[edit vlans]
user@switch# set comm600 interface xe-0/0/6.0
```
  11. Configure the interswitch isolated VLANs:
 

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 200
user@switch# set pvlan400 pvlan isolation-vlan-id 500
```
  12. Configure access port xe-0/0/0 to be promiscuous for pvlan100:
 

```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/0.0 promiscuous
```

**NOTE:** A promiscuous access port can be a member of only one primary VLAN.

13. Configure xe-0/0/2 and xe-0/0/6 to be isolated:
 

```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/2.0 isolated
user@switch# set pvlan400 interface xe-0/0/5.0 isolated
```

### Results

Check the results of the configuration on Switch 2:

```
[edit]
user@switch# show
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members pvlan100;
        }
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan100;
        }
      }
    }
  }
}
```

```

        members pvlan400;
    }
}
}
xe-0/0/2 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
        }
    }
}
xe-0/0/3 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
xe-0/0/5 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
xe-0/0/6 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
vlands {
    comm300 {
        vlan-id 300;
        interface {
            xe-0/0/3.0;
        }
        primary-vlan pvlan100;
    }
    comm600 {
        vlan-id 600;
        interface {
            xe-0/0/6.0;
        }
        primary-vlan pvlan400;
    }
    pvlan100 {
        vlan-id 100;
        interface {
            xe-0/0/0.0;
            xe-0/0/2.0;
            xe-0/0/3.0;
            xe-0/0/1.0 {
                pvlan-trunk;
            }
        }
    }
}

```

```

    }
  }
  no-local-switching;
  isolation-id 200;
}
pvlan400 {
  vlan-id 400;
  interface {
    xe-0/0/5.0;
    xe-0/0/6.0;
    xe-0/0/1.0 {
      pvlan-trunk;
    }
  }
  no-local-switching;
  isolation-id 500;
}
}

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Private VLAN and Secondary VLANs Were Created on page 1540](#)
- [Verifying The Ethernet Switching Table Entries on page 1540](#)

### *Verifying That the Private VLAN and Secondary VLANs Were Created*

**Purpose** Verify that the primary VLAN and secondary VLANs were properly created on Switch 1.

**Action** Use the `show vlans` command:

```
user@switch> show vlans private-vlan
```

Name	Role	Tag	Interfaces
pvlan100	Primary	100	xe-0/0/0.0, xe-0/0/1.0, xe-0/0/2.0,
xe-0/0/3.0			
__iso_pvlan100__	Isolated	200	xe-0/0/2.0

comm600	Community	600	xe-0/0/6.0

**Meaning** The output shows that the private VLANs were created and identifies the interfaces and secondary VLANs associated with them.

### *Verifying The Ethernet Switching Table Entries*

**Purpose** Verify that the Ethernet switching table entries were created for primary VLAN pvlan100.

**Action** Show the Ethernet switching table entries for pvlan100.

```
user@switch> show ethernet-switching table vlan pvlan100 private-vlan
```

```

Ethernet-switching table: 0 unicast entries
pvlan100          *          Flood          - All-members

## Q-in-Q Tunneling Configuration Example

- [Example: Setting Up Q-in-Q Tunneling on page 1541](#)

### Example: Setting Up Q-in-Q Tunneling

Service providers can use Q-in-Q tunneling to transparently pass Layer 2 VLAN traffic between customer sites without removing or changing the customer VLAN tags or class-of-service (CoS) settings. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

This example describes how to set up Q-in-Q tunneling:

- [Requirements on page 1541](#)
- [Overview and Topology on page 1541](#)
- [Configuration on page 1542](#)
- [Verification on page 1543](#)

#### Requirements

This example requires one QFX Series device with Junos OS Release 12.1 or later.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 1553](#).

#### Overview and Topology

In this service provider network, there are multiple customer VLANs mapped to one service VLAN.

[Table 124 on page 1542](#) lists the settings for the sample topology.

Table 124: Components of the Topology for Setting Up Q-in-Q Tunneling

Interface	Description
xe-0/0/11.0	Tagged S-VLAN trunk port
xe-0/0/12.0	Untagged customer-facing access port
xe-0/0/13.0	Untagged customer-facing access port
xe-0/0/14.0	Tagged S-VLAN trunk port

### Configuration

#### CLI Quick Configuration

To quickly create and configure Q-in-Q tunneling, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans service-vlan vlan-id 1000
set vlans service-vlan dot1q-tunneling customer-vlans 1-100
set vlans service-vlan dot1q-tunneling customer-vlans 201-300
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members 1000
set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

#### Step-by-Step Procedure

To configure Q-in-Q tunneling:

1. Set the VLAN ID for the S-VLAN:

```
[edit vlans]
user@switch# set service-vlan vlan-id (Layer 3 Subinterfaces) 1000
```

2. Enable Q-in-Q tunneling and specify the customer VLAN ranges:

```
[edit vlans]
user@switch# set service-vlan dot1q-tunneling customer-vlans 1-100
user@switch# set service-vlan dot1q-tunneling customer-vlans 201-300
```

3. Set the port mode and VLAN information for the interfaces:

```
[edit interfaces]
user@switch# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members 1000
```

4. Set the Q-in-Q Ethertype value (optional):

```
[edit]
user@switch# set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

## Results

Check the results of the configuration:

```

user@switch> show configuration vlans service-vlan
vlan-id 1000 {
  dot1q-tunneling {
    customer-vlans [ 1-100 201-300 ];
  }
}
user@switch> show configuration interfaces
xe-0/0/11 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan members 1000;
    }
  }
}
xe-0/0/12 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
      vlan members 1000;
    }
  }
}
xe-0/0/13 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
      vlan members 1000;
    }
  }
}
xe-0/0/14 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan members 1000;
    }
  }
}
user@switch> show ethernet-switching-options
dot1q-tunneling {
  ether-type 0x9100;
}

```

## Verification

Confirm that the configuration is working properly.

### *Verifying That Q-in-Q Tunneling Was Enabled*

**Purpose** Verify that Q-in-Q tunneling was properly enabled.

**Action** Use the **show vlans** command:

```
user@switch> show vlans service-vlan extensive
VLAN: service-vlan, Created at: Wed Mar 14 07:17:53 2012
802.1Q Tag: 1000, Internal index: 18, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
    1-100
    201-300
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 2 (Active = 0)
    xe-0/0/11.0, tagged, trunk
    xe-0/0/14.0, tagged, trunk
    xe-0/0/12.0, untagged, access
    xe-0/0/13.0, untagged, access
```

**Meaning** The output indicates that Q-in-Q tunneling is enabled and that the VLAN is tagged and shows the associated customer VLANs.

## Configuring the Interface Address

You assign an address to an interface by specifying the address when configuring the protocol family. For the **inet** or **inet6** family, configure the interface IP address. For the **iso** family, configure one or more addresses for the loopback interface. For the **ccc**, **ethernet-switching**, **tcc**, **mpls**, **tnp**, and **vpls** families, you never configure an address.

**NOTE:** The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, include the **address** statement:

```
address address {
  broadcast address;
  destination address;
  destination-profile name;
  eui-64;
  preferred;
  primary;
}
```

You can include these statements at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]**

In the **address** statement, specify the network address of the interface.

For each address, you can optionally configure one or more of the following:

- Broadcast address for the interface subnet—Specify this in the **broadcast** statement; this applies only to Ethernet interfaces, such as the management interface **fxp0**, **em0**, or **me0** the Fast Ethernet interface, and the Gigabit Ethernet interface.
- Address of the remote side of the connection (for point-to-point interfaces only)—Specify this in the **destination** statement.
- PPP properties to the remote end—Specify this in the **destination-profile** statement. You define the profile at the **[edit access group-profile *name* ppp]** hierarchy level (for point-to-point interfaces only).
- Whether the router or switch automatically generates the host number portion of interface addresses—The **eui-64** statement applies only to interfaces that carry IPv6 traffic, in which the prefix length of the address is 64 bits or less, and the low-order 64 bits of the address are zero. This option does not apply to the loopback interface (**lo0**)

because IPv6 addresses configured on the loopback interface must have a 128-bit prefix length.

- Whether this address is the preferred address—Each subnet on an interface has a preferred local address. If you configure more than one address on the same subnet, the preferred local address is chosen by default as the source address when you originate packets to destinations on the subnet.

By default, the preferred address is the lowest-numbered address on the subnet. To override the default and explicitly configure the preferred address, include the **preferred** statement when configuring the address.

- Whether this address is the primary address—Each interface has a primary local address. If an interface has more than one address, the primary local address is used by default as the source address when you send packets from an interface where the destination provides no information about the subnet (for example, some **ping** commands).

By default, the primary address on an interface is the lowest-numbered non-127 (in other words, non-loopback) preferred address on the interface. To override the default and explicitly configure the preferred address, include the **primary** statement when configuring the address.

- [Configuring Interface IPv4 Addresses on page 1546](#)
- [Configuring Interface IPv6 Addresses on page 1546](#)

---

### Configuring Interface IPv4 Addresses

---

You can configure router or switch interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a *subnet mask*. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, **192.16.1.1**). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, **192.16.1.1/30**).

To configure an IPv4 address on routers and switches running Junos OS, use the **edit interface *interface-name* unit *number* family inet address *a.b.c.d/nn*** statement at the **[edit interfaces]** hierarchy level.

**NOTE:** Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.

---

### Configuring Interface IPv6 Addresses

---

**NOTE:** IPv6 is not currently supported for the QFX Series.

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values.

You assign a 128-bit IPv6 address to an interface by including the **address** statement:

```
address aaaa:bbbb:...:zzzz/nn;
```

**NOTE:** You cannot configure a subnet zero IPv6 address because RFC 2461 reserves the subnet-zero address for anycast addresses, and Junos OS complies with the RFC.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet6]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6]

The double colon (::) represents all bits set to 0, as shown in the following example:

```
interfaces fe-0/0/1 {
  unit 0 {
    family inet6 {
      address fec0:1:1::2/64;
    }
  }
}
```

**NOTE:** You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

## Configuring MAC Notification

When a MAC address is learned or unlearned, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as *MAC notification*.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- [Enabling MAC Notification on page 1548](#)
- [Disabling MAC Notification on page 1548](#)
- [Setting the MAC Notification Interval on page 1548](#)

---

### Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit ethernet-switching-options]
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, 60 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 60
```

---

### Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit ethernet-switching-options]
user@switch# delete mac-notification
```

---

### Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit ethernet-switching-options]
user@switch# set mac-notification notification-interval 5
```

#### Related Documentation

- [Verifying That MAC Notification Is Working Properly on page 1675](#)

## Configuring MAC Table Aging

MAC table aging ensures that a switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the MAC address table before it is deleted because it has reached its maximum age.

You can use the **set-mac-table-aging-time** command to configure how long entries remain in the Ethernet switching table before expiring. Here the VLAN is **employee-vlan**:

```
[edit vlans employee-vlan]
user@switch# set mac-table-aging-time 200
```

### Related Documentation

- [Example: Connecting an Access Switch to a Distribution Switch on page 1487](#)

## Configuring Reflective Relay

Configure reflective relay when a switch port must return packets on a downstream port. For example, configure reflective relay when a switch port receives aggregated virtual machine packets from a technology such as virtual Ethernet port aggregator (VEPA). When these packets are passed through the switch, reflective relay allows the switch to send those packets back on the same interface that was used for delivery.

Before you begin configuring reflective relay, ensure that you have:

- Configured packet aggregation on the server connected to the port. See your server documentation.
- Configured the port for all VLANs that could be included in aggregated packets..

To configure reflective relay:

1. Configure an Ethernet interface with a port mode of **tagged-access**:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type port-mode
tagged-access
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure the interface for reflective relay:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type reflective-relay
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the VLANs that exist on the VM server:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type vlan members
vlan-names
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members
[VLAN_Purple VLAN_Orange VLAN_Blue]
```

- Related Documentation**
- [Example: Configuring Reflective Relay for Use with VEPA Technology on page 1462](#)
  - [Understanding Reflective Relay for Use with VEPA Technology on page 1388](#)

## Configuring Static ARP Entries

You can create static ARP table entries, which are explicit mappings between IP addresses and MAC addresses.

- To configure a static ARP entry:

```
[edit interfaces interface-name unit logical-unit-number family inet address
address]
user@switch# set arp ip-address (mac | multicast-mac) mac-address
```

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, use the **multicast-mac** statement.

Specify the MAC address as 6 hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

- Related Documentation**
- [Understanding Static ARP Entries on page 4124](#)
  - [arp on page 1580](#)

## Configuring Reflective Relay

Configure reflective relay when a switch port must return packets on a downstream port. For example, configure reflective relay when a switch port receives aggregated virtual machine packets from a technology such as virtual Ethernet port aggregator (VEPA). When these packets are passed through the switch, reflective relay allows the switch to send those packets back on the same interface that was used for delivery.

Before you begin configuring reflective relay, ensure that you have:

- Configured packet aggregation on the server connected to the port. See your server documentation.
- Configured the port for all VLANs that could be included in aggregated packets..

To configure reflective relay:

1. Configure an Ethernet interface with a port mode of **tagged-access**:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type port-mode
tagged-access
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure the interface for reflective relay:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type reflective-relay
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the VLANs that exist on the VM server:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type vlan members
vlan-names
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members
[VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Related Documentation

## Configuring Routed VLAN Interfaces

Routed VLAN interfaces (RVIs) enable a switch to recognize which packets are being sent to local addresses so that they are bridged whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address look-ups.

To configure the routed VLAN interface:

1. Create the VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@switch# set vlans support vlan-id 111
```

2. Assign an interface to the VLAN by specifying the logical interface (with the **unit** statement) and specifying the VLAN name as the member:

```
[edit]
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
support
```

3. Create the subnet for the VLAN's broadcast domain:

```
[edit]
```

```
user@switch# set interfaces vlan unit 111 family inet address 111.111.111.1/24
```

4. Bind a Layer 3 interface with the VLAN:

```
[edit]
```

```
user@switch# set vlans support l3-interface vlan.111
```

**NOTE:** Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces vlan terse
```

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
vlan.111	up	up	inet	111.111.111.1/24	

```
user@switch> show vlans
```

Name	Tag	Interfaces
default		None
employee-vlan	20	ge-1/0/0.0, ge-1/0/1.0, ge-1/0/2.0
marketing	40	ge-1/0/10.0, ge-1/0/20.0, ge-1/0/30.0
support	111	ge-0/0/18.0
mgmt		bme0.32769, bme0.32771*

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 1 entries, 0 learned
```

VLAN	MAC address	Type	Age	Interfaces
support	00:19:e2:50:95:a0	Static		- Router

## Related Documentation

### Configuring the Native VLAN Identifier

Switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. The logical interface on which untagged packets are received must have the same native VLAN ID as that on the physical interface.

To configure the native VLAN ID using the CLI:

1. Configure the port mode as **trunk** so that the interface is on multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
```

```
user@switch# set port-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
```

```
user@switch# set native-vlan-id 3
```

## Related Documentation

- [Understanding Bridging on page 1381](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 1476](#)
- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467](#)

## Configuring VLANs

Switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Specify the description of the VLAN:

```
[edit interfaces xe-chassis/pic/port unit 0]
user@switch# set description vlan-description
```

2. Specify the unique name of the VLAN:

**NOTE:** In a QFabric system, do not configure “default” as the name of a VLAN. Though the QFabric system will allow you to configure and commit a VLAN with the name “default” in the current software with no commit errors, it will not work. Junos OS 12.2 and onwards will not allow you to commit a VLAN with the name “default.”

```
[edit interfaces xe-chassis/pic/port unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID range for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number

or
```

```
[edit vlans]
user@switch# set vlan-name vlan-range vlan-id-low-vlan-id-high
```

5. Specify the maximum time that an entry can remain in the forwarding table before it ages out:

```
[edit vlans]
user@switch# set vlan-name mac-table-aging-time time
```

6. Specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

## Related Documentation

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467](#)
- [Configuring Routed VLAN Interfaces on page 1551](#)
- [Creating a Series of Tagged VLANs on page 1555](#)

- [Understanding Bridging on page 1381](#)

## Creating a Series of Tagged VLANs

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with.

Instead of configuring VLANs and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames can detect which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10 through 12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag 10
- VLAN **employee-11**, tag 11
- VLAN **employee-12**, tag 12

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-range 120-130
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlanmembers employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlan members 120-130
```

Associating a series of tagged VLANs to an interface by name or by VLAN range has the same result: VLANs **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_** are created.

**NOTE:** When a series of VLANs is created using the `vlan-range` command, the VLAN names are preceded and followed by a double underscore.

**Related  
Documentation**

## Configuring STP

The default spanning-tree protocol on the QFX Series is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP) does. However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface (here, the interface is **xe-0/0/5**):

```
[edit]
user@switch# delete protocols rstp interface xe-0/0/5
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface xe-0/0/5
```

3. Commit the configuration:

```
[edit]
user@switch# commit
```

**Related  
Documentation**

## Unblocking an Interface That Receives BPDUs in Error

**NOTE:** BPDU block protection is disabled on Node devices.

QFX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After you fix the misconfiguration that triggered the sending of BPDUs to an interface, you can unblock the interface and return it to service.

To unblock an interface after fixing the misconfiguration that triggered the BPDUs and return it to service using the CLI:

- Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpdublockdisable-timeout 30 interface xe-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpdublock interface xe-0/0/6
```

## Configuring VLAN Spanning Tree Protocol

VLAN Spanning Tree Protocol (VSTP) enables the QFX Series to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining the best paths within the VLANs instead of within the entire network.

To configure VSTP:

- (Optional) Enable Rapid Spanning Tree Protocol (RSTP):

```
[edit protocols]
user@switch# set rstp
```

VSTP can run on a maximum of 253 VLANs; RSTP runs on the remaining VLANs if configured. Enabling RSTP ensures that a spanning-tree protocol runs on all VLANs.

- Enable VSTP.

- To enable VSTP on multiple VLANs using a VLAN group:

```
[edit protocols]
user@switch# set vstp vlan-group group group-name vlan vlan-id-range
```

- To enable VSTP on all VLANs:

```
[edit protocols]
user@switch# set vstp vlan all
```

**NOTE:** You must enable RSTP if you used the `set vstp vlan all` statement to enable VSTP and if the switch has more than 253 VLANs. If you use the `set vstp vlan all` statement to enable VSTP on a switch with more than 253 VLANs, the configuration cannot be committed.

- To enable VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vstp vlan vlan-id
```

- To enable VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vstp vlan vlan-name
```

## Disabling MAC Learning

By default, MAC learning is globally enabled on all nodes in a QFX Series product. This topic describes how to disable MAC learning, as well as how to reenable and verify that MAC learning has been enabled or disabled.

Disabling dynamic MAC learning on the QFX Series prevents a node from learning source and destination MAC addresses.

- To disable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
user@switch# set no-mac-learning
```

- To enable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
user@switch# delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning on the QFX Series, view the Ethernet MAC learning statistics in operational mode.

```
user@switch> show ethernet-switching statistics mac-learning
Ethernet-switching table: 2 entries, 1 learned
  VLAN      MAC address      Type      Age  Interfaces
  default   *                Flood     -    All-members
  default   00:1f:12:39:90:80 Learn     29   xe-/0/0.0
```

#### Related Documentation

## Creating a Private VLAN on a Single Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN on a single switch.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

Keep these rules in mind when configuring a PVLAN:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN on a single switch:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure isolated ports:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name isolated
```

## Creating a Private VLAN Spanning Multiple Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN to span multiple switches.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

The following rules apply to creating PVLANS:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the `pvlan` statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN to span multiple switches:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
```

```
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
```

```
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure an isolated VLAN ID to create an interswitch isolated domain that spans the switches:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name isolation-vlan-id number
```

9. Configure isolated ports:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name interface interface-name isolated
```

## Configuring Q-in-Q Tunneling

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 1553](#).

To configure Q-in-Q tunneling:

1. Create the service VLAN (S-VLAN) and configure an ID for it:

```
[edit vlans]
```

```
user@switch# set s-vlan-name vlan-id s-vlan-ID
```

2. Enable Q-in-Q tunneling on the S-VLAN:

```
[edit vlans]
```

```
user@switch# set s-vlan-name dot1q-tunneling
```

3. Set the allowed customer VLANs (C-VLANs) on the S-VLAN (optional). Here, the C-VLANs are identified by a range:

```
[edit vlans]
```

```
user@switch# set s-vlan-name dot1q-tunneling customer-vlans range
```

4. Configure a global value for the tag protocol identifier (EtherType) of the service VLAN tags (optional):

```
[edit]
```

```
user@switch# set ethernet-switching-options dot1q-tunneling ether-type ether-type-value
```

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

## Configuring Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.

**NOTE:** L2PT and VLAN translation configured with the [mapping](#) statement cannot both be configured on the same switch.

**NOTE:** If the switch receives untagged Layer 2 control PDUs to be tunneled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see [“Understanding Q-in-Q Tunneling and VLAN Translation” on page 1416](#).

To configure L2PT:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling
```

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

- To enable L2PT for a specific protocol (here, STP):

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
```

- To enable L2PT for all supported protocols:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all
```

3. (Optional) Configure the drop threshold:

**NOTE:** If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration changes, the commit operation fails.

```
[edit]
```

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
drop-threshold 50
```

4. (Optional) Configure the shutdown threshold:

**NOTE:** If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you try to commit the configuration changes, the commit operation fails.

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
shutdown-threshold 100
```

**NOTE:** Once an interface is disabled, you must explicitly reenabling it using the `clear ethernet-switching layer2-protocol-tunneling error` command. Otherwise, the interface remains disabled.

## Creating a Private VLAN on a Single Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN on a single switch.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

Keep these rules in mind when configuring a PVLAN:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN on a single switch:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure isolated ports:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name isolated
```

## Creating a Private VLAN Spanning Multiple Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN to span multiple switches.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

The following rules apply to creating PVLANS:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the `pvlan` statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN to span multiple switches:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
```

```
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
```

```
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure an isolated VLAN ID to create an interswitch isolated domain that spans the switches:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name isolation-vlan-id number
```

9. Configure isolated ports:

```
[edit vlans]
```

```
user@switch# set primary-vlan-name interface interface-name isolated
```

## Configuring Q-in-Q Tunneling

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 1553](#).

To configure Q-in-Q tunneling:

1. Create the service VLAN (S-VLAN) and configure an ID for it:

```
[edit vlans]
```

```
user@switch# set s-vlan-name vlan-id s-vlan-ID
```

2. Enable Q-in-Q tunneling on the S-VLAN:

```
[edit vlans]
```

```
user@switch# set s-vlan-name dot1q-tunneling
```

3. Set the allowed customer VLANs (C-VLANs) on the S-VLAN (optional). Here, the C-VLANs are identified by a range:

```
[edit vlans]
```

```
user@switch# set s-vlan-name dot1q-tunneling customer-vlans range
```

4. Configure a global value for the tag protocol identifier (EtherType) of the service VLAN tags (optional):

```
[edit]
```

```
user@switch# set ethernet-switching-options dot1q-tunneling ether-type ether-type-value
```

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

## Configuring Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.

**NOTE:** L2PT and VLAN translation configured with the **mapping** statement cannot both be configured on the same switch.

**NOTE:** If the switch receives untagged Layer 2 control PDUs to be tunneled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see [“Understanding Q-in-Q Tunneling and VLAN Translation” on page 1416](#).

To configure L2PT:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling
```

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

- To enable L2PT for a specific protocol (here, STP):

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
```

- To enable L2PT for all supported protocols:

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all
```

3. (Optional) Configure the drop threshold:

**NOTE:** If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration changes, the commit operation fails.

```
[edit]
```

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
drop-threshold 50
```

4. (Optional) Configure the shutdown threshold:

**NOTE:** If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you try to commit the configuration changes, the commit operation fails.

```
[edit]
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
shutdown-threshold 100
```

**NOTE:** Once an interface is disabled, you must explicitly reenable it using the `clear ethernet-switching layer2-protocol-tunneling error` command. Otherwise, the interface remains disabled.

#### Related Documentation

- [Understanding Layer 2 Protocol Tunneling on page 1419](#)
- [Understanding Q-in-Q Tunneling and VLAN Translation on page 1416](#)
- [Example: Setting Up Q-in-Q Tunneling on page 1541](#)

## Q-in-Q Tunneling Configuration Tasks

- [Configuring Q-in-Q Tunneling on page 1571](#)
- [Configuring Layer 2 Protocol Tunneling on page 1572](#)

### Configuring Q-in-Q Tunneling

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 1553](#).

To configure Q-in-Q tunneling:

1. Create the service VLAN (S-VLAN) and configure an ID for it:

```
[edit vlans]
user@switch# set s-vlan-name vlan-id s-vlan-ID
```

2. Enable Q-in-Q tunneling on the S-VLAN:

[edit vlans]

user@switch# **set s-vlan-name** dot1q-tunneling

3. Set the allowed customer VLANs (C-VLANs) on the S-VLAN (optional). Here, the C-VLANs are identified by a range:

[edit vlans]

user@switch# **set s-vlan-name** dot1q-tunneling **customer-vlans** range

4. Configure a global value for the tag protocol identifier (EtherType) of the service VLAN tags (optional):

[edit]

user@switch# **set ethernet-switching-options** dot1q-tunneling **ether-type** ether-type-value

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

## Configuring Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because

of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.

**NOTE:** L2PT and VLAN translation configured with the **mapping** statement cannot both be configured on the same switch.

**NOTE:** If the switch receives untagged Layer 2 control PDUs to be tunneled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see “[Understanding Q-in-Q Tunneling and VLAN Translation](#)” on page 1416.

To configure L2PT:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling
```

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

- To enable L2PT for a specific protocol (here, STP):

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
```

- To enable L2PT for all supported protocols:

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all
```

3. (Optional) Configure the drop threshold:

**NOTE:** If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration changes, the commit operation fails.

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp  
drop-threshold 50
```

4. (Optional) Configure the shutdown threshold:

**NOTE:** If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you try to commit the configuration changes, the commit operation fails.

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp  
shutdown-threshold 100
```

**NOTE:** Once an interface is disabled, you must explicitly reenable it using the `clear ethernet-switching layer2-protocol-tunneling error` command. Otherwise, the interface remains disabled.

## Proxy ARP Configuration Task

- [Configuring Proxy ARP on page 1574](#)

### Configuring Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

[edit interfaces]

```
user@switch# set xe-0/0/3 unit 0 proxy-arp restricted
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch is not a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

To configure proxy ARP on a routed VLAN interface (RVI):

```
[edit interfaces]  
user@switch# set vlan unit 100 proxy-arp restricted
```

<b>Syntax</b>	<code>bridge-priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">mstp</a> <i>msti-id</i> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <i>vlan</i> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.
<b>Options</b>	<b><i>priority</i></b> —Bridge priority. It can be set only in increments of 4096. <b>Range:</b> 0 through 61,440 <b>Default:</b> 32,768
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## broadcast

<b>Syntax</b>	<code>broadcast address;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> <b>address</b> <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0, nor can you specify a broadcast address.
<b>Default</b>	The default broadcast address has a host portion of all ones.
<b>Options</b>	<b>address</b> —Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255.

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Interface Address on page 1545</a></li> </ul>

## ccc

<b>Syntax</b>	<code>ccc;</code>
<b>Hierarchy Level</b>	[edit <b>interfaces</b> <i>ge-fpc/slot/ port unit</i> <i>logical-unit-number</i> family]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the logical interface as a circuit cross-connect (CCC).
<b>Default</b>	You must configure a logical interface to be able to use the physical device.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## cost (STP)

<b>Syntax</b>	<code>cost cost;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti</a> <i>msti-id</i> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols rstp (Spanning Trees) <a href="#">interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface.
<b>Default</b>	Link cost is determined by the link speed.
<b>Options</b>	<b>cost</b> —Link cost associated with the port. <b>Range:</b> 1 through 200,000,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## configuration-name (MSTP)

---

<b>Syntax</b>	configuration-name <i>configuration-name</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Understanding MSTP on page 1410</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## connections (Circuits)

**Syntax**

```
connections {
  interface-switch connection-name {
    interface interface-name.unit-number;
  }
  lsp-switch connection-name {
    transmit-lsp label-switched-path;
    receive-lsp label-switched-path;
  }
  p2mp-receive-switch {
    output-interface [ interface-name.unit-number ];
    receive-p2mp-lsp receiving-point-to-multipoint-lsp;
  }
  p2mp-transmit-switch {
    input-interface interface-name.unit-number;
    transmit-p2mp-lsp transmitting-point-to-multipoint-lsp;
  }
  remote-interface-switch connection-name {
    interface interface-name.unit-number;
    receive-lsp label-switched-path;
    transmit-lsp label-switched-path;
  }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols],  
[edit protocols]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define the connection between two circuits in a CCC connection.

**Options** The statements are explained separately.

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- Configuring Layer 2 Switching Cross-Connects Using CCC
- Configuring MPLS LSP Tunnel Cross-Connects Using CCC
- Configuring LSP Stitching Cross-Connects Using CCC
- Configuring TCC
- Configuring CCC Switching for Point-to-Multipoint LSPs

## cut-through

---

<b>Syntax</b>	cut-through;
<b>Hierarchy Level</b>	[edit forwarding-options]
<b>Description</b>	Configures all the interfaces in the QFX series switch or QFabric to use cut-through forwarding mode instead of store-and-forward mode.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Forwarding Mode on page 1565</a></li></ul>

## description (VLAN)

---

<b>Syntax</b>	description <i>text-description</i> ;
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Provide a textual description for the VLAN. The text has no effect on the operation of the VLAN or switch.
<b>Options</b>	<b>text-description</b> —Text to describe the interface. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. If the text includes spaces, enclose the entire text in quotation marks.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</a></li><li>• <a href="#">Understanding Bridging on page 1381</a></li><li>• <a href="#">show vlans on page 1752</a></li></ul>

## disable (STP)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">mstp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">mstp</a> <a href="#">msti</a> <i>msti-id</i> <a href="#">vlan</a> ( <i>vlan-id</i>   <i>vlan-name</i> ) <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">rstp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">stp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">vstp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable STP, MSTP, RSTP, or VSTP on the switch or on a specific interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## disable-timeout (BPDU)

---

<b>Syntax</b>	<code>disable-timeout <i>timeout</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options bpd-block</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.
<b>Default</b>	The disable timeout is not enabled.
<b>Options</b>	<b>timeout:</b> Length of time, in seconds, that the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service. <b>Range:</b> 10 through 3600 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1495</a></li><li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1413</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface on page 1741</a></li></ul>

## drop-threshold

<b>Syntax</b>	<code>drop-threshold <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit vlans <i>vlan-name</i> dot1q-tunneling layer2-protocol-tunneling (all   <i>protocol-name</i>)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.</p> <p>L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.</p>
	<div>  <p><b>NOTE:</b> If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.</p> </div>
	You can specify a drop threshold value without specifying a shutdown threshold value.
<b>Default</b>	No drop threshold is specified.
<b>Options</b>	<p><b><i>number</i></b>—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs.</p> <p><b>Range:</b> 1 through 1000</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li> <li>• <a href="#">shutdown-threshold on page 1670</a></li> </ul>

## edge (STP)

---

<b>Syntax</b>	edge;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti</a> <i>msti-id</i> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.
<b>Default</b>	Edge interfaces are not enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Understanding MSTP on page 1410</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li><li>• <a href="#">Understanding VSTP on page 1412</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## eui-64

---

<b>Syntax</b>	eui-64;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>number</i> family inet6 address <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	For interfaces that carry IP version 6 (IPv6) traffic, automatically generate the host number portion of interface addresses. Not supported on QFX Series switches.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Interface Address on page 1545</a></li> </ul>

## filter (VLANs)

---

<b>Syntax</b>	filter (input   output) <i>filter-name</i> ;
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Apply a firewall filter to traffic ingressing or egressing a VLAN.
<b>Default</b>	All incoming traffic is accepted unmodified to a VLAN, and all outgoing traffic is sent unmodified from a VLAN.
<b>Options</b>	<b><i>filter-name</i></b> —Name of a firewall filter defined at the [edit firewall family <i>family-name</i> filter] hierarchy level.  <b>input</b> —Apply a firewall filter to VLAN ingress traffic.  <b>output</b> —Apply a firewall filter to VLAN egress traffic.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Firewall Filters on page 4177</a></li><li>• <a href="#">Overview of Firewall Filters on page 4071</a></li></ul>

## force-version

---

<b>Syntax</b>	force-version stp;
<b>Hierarchy Level</b>	[edit protocols <b>vstp</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Force VLAN Spanning Tree Protocol (VSTP) to use the STP protocol instead of the default protocol, RSTP.
<b>Options</b>	<b>stp</b> —Spanning Tree Protocol
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• show spanning-tree interface</li><li>• <a href="#">Understanding VSTP on page 1412</a></li></ul>

## forward-delay

<b>Syntax</b>	<code>forward-delay <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify how long a bridge interface remains in the listening and learning states before transitioning to the forwarding state.
<b>Options</b>	<p><b><i>seconds</i></b>—Number of seconds the bridge interface remains in the listening and learning states.</p> <p><b>Range:</b> 4 through 30 seconds</p> <p><b>Default:</b> 15 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## group-limit

---

<b>Syntax</b>	<code>group-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (IGMP Snooping) <i>vlan-id</i>   <i>vlan-number</i> interface (IGMP Snooping) <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a limit for the number of multicast groups allowed on the specified interface. After this limit is reached, new reports are ignored and related flows are not flooded on the interface.
<b>Default</b>	No group limits are configured.
<b>Options</b>	<b>limit</b> —Number that represents the maximum number of multicast groups allowed on the specified interface. <b>Range:</b> 0 through 65535
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Example: Configuring IGMP Snooping on EX Series Switches</li><li>• Configuring IGMP Snooping (CLI Procedure)</li><li>• Configuring IGMP Snooping (J-Web Procedure)</li><li>• group (IGMP Snooping)</li></ul>

## hello-time

---

<b>Syntax</b>	<code>hello-time seconds;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the time interval at which the root bridge transmits configuration BPDUs.
<b>Options</b>	<b>seconds</b> —Number of seconds between transmissions of configuration BPDUs. <b>Range:</b> 1 through 10 seconds <b>Default:</b> 2 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## interface (BPDU)

---

<b>Syntax</b>	interface (all   <i>interface-name</i> );
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options bpd-block</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Apply BPDU protection to all interfaces or one or more interfaces.
<b>Options</b>	<p><b>all</b>—All interfaces.</p> <p><b><i>interface-name</i></b>—Name of the interface.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1413</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface on page 1741</a></li></ul>

## interface (Spanning Trees)

<b>Syntax</b>	<pre> interface <i>interface-name</i> {   arp-on-stp;   bpdu-timeout-action     block;     log;   cost <i>cost</i>;   disable;   edge;   mode <i>mode</i>;   no-root-port;   priority <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<pre> [edit protocols mstp], [edit protocols mstp msti <i>msti-id</i>], [edit protocols rstp], [edit protocols stp], [edit protocols vstp vlan (all   <i>vlan-id</i>   <i>vlan-name</i>)]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.</p> <p>The <b>edge</b>, <b>mode</b>, and <b>no-root-port</b> options are not available at the <code>[edit protocols mstp msti <i>msti-id</i>]</code> hierarchy level.</p>
<b>Options</b>	<p><b><i>interface-name</i></b>—Name of an interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>show spanning-tree bridge</li> <li>show spanning-tree interface</li> <li>Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches</li> <li>Example: Configuring Faster Convergence and Improving Network Stability with RSTP on EX Series Switches</li> <li><a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li><a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>Configuring VSTP (CLI Procedure)</li> </ul>

## interface (Storm Control)

---

<b>Syntax</b>	<pre>interface (all   <i>interface-name</i>) {     <i>bandwidth</i> <i>bandwidth</i>;     no-broadcast;     no-multicast;     no-unknown-unicast; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options storm-control</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Apply storm control to all interfaces or to the specified interface.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	Storm control is disabled.
<b>Options</b>	<p><b>all</b>—Apply storm control to all interfaces.</p> <p><b><i>interface-name</i></b>—Apply storm control to the specified interface.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Storm Control on page 4125</a></li><li>• <a href="#">Example: Configuring Storm Control on page 4143</a></li></ul>

## interface (STP)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     disable;     cost <i>cost</i>;     edge;     mode <i>mode</i>;     no-root-port;     priority <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit protocols <a href="#">mstp</a>], [edit protocols <a href="#">mstp msti</a>], [edit protocols <a href="#">rstp</a>], [edit protocols <a href="#">stp</a>], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i>]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.
<b>Options</b>	<p><i>interface-name</i>—Name of a Gigabit Ethernet interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding RSTP on page 1411</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## interface (VLANs)

---

<b>Syntax</b>	<code>interface <i>interface-name</i> {     <b>mapping</b> (native (push   swap)   tag (push   swap)); }</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For a specific VLAN, configure an interface.
<b>Options</b>	<i>interface-name</i> —Name of the interface.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</a></li><li>• <a href="#">Configuring VLANs on page 1553</a></li><li>• <a href="#">Understanding Bridging on page 1381</a></li></ul>

## interfaces

---

<b>Syntax</b>	<code>interfaces <i>interface-name</i> {     <b>no-mac-learning</b>; }</code>
<b>Hierarchy Level</b>	[edit <b>ethernet-switching-options</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure settings for interfaces that have been assigned to family <b>ethernet-switching</b> .
<b>Options</b>	<i>interface-name</i> —Name of an interface that is configured for family <b>ethernet-switching</b> .  The remaining statement is explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## l3-interface (VLAN)

<b>Syntax</b>	<code>l3-interface vlan.logical-interface-number;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between VLANs. Traffic between VLANs must be routed, which requires a common Layer 3 interface.
<b>Default</b>	No Layer 3 (routing) interface is associated with the VLAN.
<b>Options</b>	<code>vlan.logical-interface-number</code> —Number of the logical interface defined with a <b>set interfaces vlan unit</b> command. For the logical interface number, use the same number you configure in the <b>unit</b> statement.

**NOTE:** This statement is not supported on QFabric systems.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching interfaces on page 1347</a></li> <li>• <a href="#">show vlans on page 1752</a></li> </ul>

## mac-limit

---

<b>Syntax</b>	<code>mac-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">vlans</a> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the number of MAC addresses allowed on a VLAN.
<b>Default</b>	MAC limit is disabled.
<b>Options</b>	<i>number</i> —Maximum number of MAC addresses. <b>Range:</b> 1 through 32768

NOTE: This statement is not supported on QFabric systems.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show vlans on page 1752</a></li><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</a></li><li>• <a href="#">Configuring MAC Table Aging on page 1549</a></li><li>• <a href="#">Understanding Bridging on page 1381</a></li></ul>

---

## mac-notification

---

<b>Syntax</b>	<pre>mac-notification {   notification-interval <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Enable MAC notification for a switch. If you configure this statement without setting a notification interval, MAC notification is enabled with the default MAC notification interval of 30 seconds.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	MAC notification is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MAC Notification on page 1547</a></li></ul>

## mac-table-aging-time

---

<b>Syntax</b>	<code>mac-table-aging-time seconds;</code>
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options</a> ], [edit <a href="#">vlans</a> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced for specific VLANs in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Define how long entries remain in the Ethernet switching table before expiring:</p> <ul style="list-style-type: none"><li>• If you specify this statement at the <b>[ethernet-switching-options]</b> hierarchy level, it applies to all VLANs on the switch.</li><li>• If you specify this statement at the <b>[vlans]</b> hierarchy level, it applies to the specified VLAN.</li></ul>
<b>Default</b>	300 seconds
<b>Options</b>	<p><b>seconds</b>—Time that entries remain in the Ethernet switching table before being removed.</p> <ul style="list-style-type: none"><li>• <b>Range</b>—60 to 1,000,000 seconds.</li><li>• <b>Default</b>—300 seconds.</li></ul>
<div> <b>NOTE:</b> The <code>vlans</code> hierarchy is not available on QFabric systems.</div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</a></li><li>• <a href="#">Configuring MAC Table Aging on page 1549</a></li><li>• <a href="#">Understanding Bridging on page 1381</a></li><li>• <a href="#">show ethernet-switching statistics aging on page 1705</a></li></ul>

## max-age

---

<b>Syntax</b>	<code>max-age seconds;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the maximum age of received protocol BPDUs.
<b>Options</b>	<b>seconds</b> —Maximum age of received protocol BPDUs. <b>Range:</b> 6 through 40 seconds <b>Default:</b> 20 seconds
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> </ul>

## max-hops

---

<b>Syntax</b>	<code>max-hops hops;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Multiple Spanning Tree Protocol (MSTP), configure the maximum number of hops that a BPDU can be forwarded in the MSTP region.
<b>Options</b>	<p><i>hops</i> — Number of hops the BPDU can be forwarded.</p> <p><b>Range:</b> 1 through 255 hops</p> <p><b>Default:</b> 20 hops</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Understanding MSTP on page 1410</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface on page 1741</a></li></ul>

## members

<b>Syntax</b>	<code>members [(all   <i>names</i>   <i>vlan-ids</i>)];</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>ge-fpc/pic/port</i> unit 0 <a href="#">ethernet-switching</a> <i>vlan</i> ] [edit <a href="#">interfaces</a> <i>xe-fpc/pic/port</i> unit 0 <a href="#">ethernet-switching</a> <i>vlan</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For trunk interfaces, configure the VLANs for which the interface can carry traffic.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after *vlan* or *vlangs* in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

<b>Options</b>	<b>all</b> —Specify that this trunk interface be a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.
----------------	--

**NOTE:** Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, *all* cannot be the name of a VLAN on the switch.

***names***—Names of one or more VLANs.

***vlan-ids***—Numeric identifiers of one or more VLANs.

<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
---------------------------------	---

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</a></li> <li>• <a href="#">Understanding Bridging on page 1381</a></li> <li>• <a href="#">show ethernet-switching interfaces on page 1347</a></li> <li>• <a href="#">show vlans on page 1752</a></li> </ul>
------------------------------	---

## mode (STP)

---

<b>Syntax</b>	<code>mode mode;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti msti-id interface interface-name</a> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan vlan-id interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.
<b>Default</b>	For a full-duplex link, the default link mode is <b>point-to-point</b> . For a half-duplex link, the default link mode is <b>shared</b> .
<b>Options</b>	<i>mode</i> —Link mode: <ul style="list-style-type: none"><li>• <b>point-to-point</b>—Link is point to point.</li><li>• <b>shared</b>—Link is shared media.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Understanding MSTP on page 1410</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li><li>• <a href="#">Understanding VSTP on page 1412</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface on page 1741</a></li></ul>

## msti

<b>Syntax</b>	<pre> msti <i>msti-id</i> {   vlan (<i>vlan-id</i>   <i>vlan-name</i>);   interface <i>interface-name</i> {     disable;     cost <i>cost</i>;     edge;     mode <i>mode</i>;     priority <i>priority</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Multiple Spanning Tree Instance (MSTI) identifier for Multiple Spanning Tree Protocol (MSTP). MSTI IDs are local to each region, so you can reuse the same MSTI ID in different regions.
<b>Default</b>	MSTI is disabled.
<b>Options</b>	<p><i>msti-id</i> —MSTI identifier.</p> <p><b>Range:</b> 1 through 4094. The Common Instance Spanning Tree (CIST) is always MSTI 0.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> </ul>

## mstp

---

**Syntax**    mstp {  
              disable;  
              bpdu-timeout-action;  
              bridge-priority *priority*;  
              configuration-name (MSTP) *name*;  
              forward-delay *seconds*;  
              hello-time *seconds*;  
              interface (all | *interface-name*) {  
                  bpdu-timeout-action {  
                      block;  
                      alarm;  
                  }  
                  disable;  
                  cost *cost*;  
                  edge;  
                  mode *mode*;  
                  no-root-port;  
                  priority *priority*;  
              }  
              max-age *seconds*;  
              max-hops *hops*;  
              msti *msti-id* {  
                  vlan (*vlan-id* | *vlan-name*);  
                  interface *interface-name* {  
                      disable;  
                      cost *cost*;  
                      edge;  
                      mode *mode*;  
                      priority *priority*;  
                  }  
              }  
              traceoptions {  
                  file *name* <replace> <size *size*> <files *number*> <no-stamp>  
                      <(world-readable | no-world-readable)>;  
                  flag *flag* <*flag-modifier*> <disable>;  
              }  
              revision-level *revision-level*;  
          }

**Hierarchy Level**    [edit protocols]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning-tree regions.

The statements are explained separately.

**Default**    MSTP is disabled.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> </ul>

## native-vlan-id

---

<b>Syntax</b>	native-vlan-id <i>vlan-id</i> ;
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> ge- <i>fpc/pic/port</i> unit 0 <a href="#">ethernet-switching</a> ], [edit <a href="#">interfaces</a> xe- <i>fpc/pic/port</i> unit 0 <a href="#">ethernet-switching</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the VLAN identifier to associate with untagged packets received on the interface.
<b>Options</b>	<i>vlan-id</i> —Numeric identifier of the VLAN. <b>Range:</b> 1 through 4094
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Junos OS Network Interfaces Configuration Guide</a></li> <li>• <a href="#">Understanding Bridging on page 1381</a></li> <li>• <a href="#">show ethernet-switching interfaces on page 1347</a></li> <li>• <a href="#">show vlans on page 1752</a></li> </ul>

## no-mac-learning (Global)

---

<b>Syntax</b>	no-mac-learning;
<b>Hierarchy Level</b>	[edit ethernet-switching-options <a href="#">interfaces</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable MAC address learning for the specified interface. Disabling MAC address learning on an interface disables learning for all the VLANs of which that interface is a member.
<b>Default</b>	MAC learning is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>•</li></ul>

## no-mac-learning (Per VLAN)

---

<b>Syntax</b>	no-mac-learning;
<b>Hierarchy Level</b>	[edit <a href="#">vlans</a> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disables MAC address learning for the specified VLAN.
<b>Default</b>	MAC learning is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## no-root-port

<b>Syntax</b>	no-root-port;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an interface to be a spanning tree designated port. If the bridge receives more STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving more STP BPDUs on the root-protected interface, interface traffic is no longer blocked.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1499</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li> <li>• <a href="#">Understanding VSTP on page 1412</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> </ul>

## notification-interval

---

<b>Syntax</b>	notification-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options</a> mac-notification]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the MAC notification interval for a switch.</p> <p>The MAC notification interval is the amount of time the switch waits before sending learned or unlearned MAC address SNMP notifications to the network management server. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications are sent to the network management system every 10 seconds.</p>
<b>Options</b>	<p><i>seconds</i>—The MAC notification interval, in seconds.</p> <p><b>Range:</b> 1 through 60</p> <p><b>Default:</b> 30</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MAC Notification on page 1547</a></li></ul>

## port-mode

<b>Syntax</b>	<code>port-mode (access   tagged-access   trunk);</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> family <a href="#">ethernet-switching</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure whether an interface on the switch operates in access, tagged access, or trunk mode.
<b>Default</b>	All switch interfaces are in access mode.
<b>Options</b>	<p><b>access</b>—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>tagged-access</b>—Have the interface operate in access mode. In this mode, the interface can be in multiple VLANs. Access interfaces typically connect to network devices such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>trunk</b>—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Reflective Relay on page 1549</a></li> <li>• <a href="#">Example: Configuring Reflective Relay for Use with VEPA Technology on page 1462</a></li> </ul>

## preferred

---

<b>Syntax</b>	preferred;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure this address to be the preferred address on the interface. If you configure more than one address on the same subnet, the preferred source address is chosen by default as the source address when you initiate frame transfers to destinations on the subnet.
	<div> <b>NOTE:</b> The edit logical-systems hierarchy is not available on QFabric systems.</div>
<b>Default</b>	The lowest-numbered address on the subnet is the preferred address.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interface Address on page 1545</a></li></ul>

## primary (Address on Interface)

<b>Syntax</b>	primary;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure this address to be the primary address of the protocol on the interface. If the logical unit has more than one address, the primary address is used by default as the source address when packet transfer originates from the interface and the destination address does not indicate the subnet.
<div>  <p><b>NOTE:</b> The edit logical-systems hierarchy is not available on QFabric systems.</p> </div>	
<b>Default</b>	For unicast traffic, the primary address is the lowest non-127 (in other words, non-loopback) preferred address on the unit.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Interface Address on page 1545</a></li> </ul>

## priority (STP)

---

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti</a> <i>msti-id</i> <a href="#">interface interface-name</a> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.
<b>Options</b>	<b>priority</b> —Interface priority. The interface priority must be set in increments of 16. <b>Range:</b> 0 through 240 <b>Default:</b> 128
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1428</a></li><li>• <a href="#">Understanding MSTP on page 1410</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li><li>• <a href="#">Understanding VSTP on page 1412</a></li><li>• <a href="#">show spanning-tree bridge on page 1736</a></li><li>• <a href="#">show spanning-tree interface on page 1741</a></li></ul>

## proxy-arp

---

<b>Syntax</b>	proxy-arp (restricted   unrestricted);
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.6 for EX Series switches. <b>restricted</b> added in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 12.2 for the QFX Series..
<b>Description</b>	For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.
<b>Default</b>	Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>none</b>—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.</li><li>• <b>restricted</b>—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.</li><li>• <b>unrestricted</b>—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.</li></ul>
<b>Default: unrestricted</b>	
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Restricted and Unrestricted Proxy ARP</li><li>• Configuring Proxy ARP (CLI Procedure)</li><li>• Example: Configuring Proxy ARP on an EX Series Switch</li><li>• Configuring Gratuitous ARP</li></ul>

## reflective-relay

<b>Syntax</b>	reflective-relay;
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> <a href="#">family</a> ethernet-switching]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure a switch interface to return packets back to a device on the same interface that was used to deliver the packets.
<b>Default</b>	Switch interfaces are not configured for reflective relay.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Reflective Relay for Use with VEPA Technology on page 1462</a></li> <li>• <a href="#">Configuring Reflective Relay on page 1549</a></li> </ul>

## revision-level

<b>Syntax</b>	revision-level <i>revision-level</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Multiple Spanning Tree Protocol (MSTP), set the revision number of the MSTP configuration.
<b>Default</b>	The revision number is disabled.
<b>Options</b>	<i>revision-level</i> —Revision number of the MSTP region configuration. <b>Range:</b> 0 through 65535
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1441</a></li> <li>• <a href="#">Understanding MSTP on page 1410</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> </ul>

## rstp

---

**Syntax**    `rstp {  
    disable;  
    bpdu-block-on-edge;  
    bridge-priority priority;  
    forward-delay seconds;  
    hello-time seconds;  
    interface (all | interface-name) {  
        bpdu-timeout-action {  
            block;  
            alarm;  
        }  
        disable;  
        cost cost;  
        edge;  
        mode mode;  
        no-root-port;  
        priority priority;  
    }  
    max-age seconds;  
    traceoptions {  
        file name <replace> <size size> <files number> <no-stamp>  
        <(world-readable | no-world-readable)>;  
        flag flag <flag-modifier> <disable>;  
    }  
}`

**Hierarchy Level**    [edit protocols]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, providing shorter convergence times than those provided with basic STP.

The statements are explained separately.

**Default**    RSTP is enabled on all Ethernet switching interfaces.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**

- [show spanning-tree interface on page 1741](#)

## storm-control

**Syntax**

```
storm-control {
  action-shutdown;
  interface (all | interface-name) {
    bandwidth bandwidth;
    no-broadcast;
    no-multicast;
    no-unknown-unicast;
  }
}
```

**Hierarchy Level** [edit [ethernet-switching-options](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Apply storm control to all interfaces or to the specified interfaces.

The statements are explained separately.

**NOTE:** The **no-multicast** option is not supported on QFabric systems.

**Default** By default, storm control is enabled on all switch interfaces at a level of 80 percent of the combined broadcast and unknown unicast streams. You can change the storm control level by configuring it as a specific bandwidth value.

When you configure storm control bandwidth on an aggregated Ethernet interface, each member of the aggregated interface is assigned that bandwidth. For example, if you configure 7000000 Kbps on aggregated interface **ae1**, and **ae1** has two members, **xe-2:0/0/0** and **xe-2:0/0/1**, each member is allowed a bandwidth level of 7000000 Kbps. Thus, the storm control bandwidth on **ae1** could be as much as 14000000 Kbps of combined broadcast and unknown unicast traffic.

**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

**Related Documentation**

## stp

<b>Syntax</b>	<pre> stp {   disable;   bridge-priority <i>priority</i>;   forward-delay <i>seconds</i>;   hello-time <i>seconds</i>;   interface (all   <i>interface-name</i>) {     disable;     bpdu-timeout-action {       block;       alarm;     }     cost <i>cost</i>;     edge;     mode <i>mode</i>;     no-root-port;     priority <i>priority</i>;   }   max-age <i>seconds</i>;   traceoptions {     file <i>name</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;       &lt;(world-readable   no-world-readable)&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;;   } } </pre>
<b>Hierarchy Level</b>	[edit protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>When you explicitly configure STP, a switch uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	STP is disabled; by default, RSTP is enabled on all Ethernet switching ports.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1495</a></li> <li>• <a href="#">Configuring STP on page 1556</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1409</a></li> <li>• <a href="#">show spanning-tree bridge on page 1736</a></li> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> </ul>

## traceoptions (Ethernet Switching Options)

**Syntax** `traceoptions {  
     file filename <files number> <no-stamp> <replace> <size size> <world-readable |  
     no-world-readable>;  
     flag flag <disable>;  
}`

**Hierarchy Level** [edit [ethernet-switching-options](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**NOTE:** The `traceoptions` statement is not supported on the QFX3000 QFabric system.

**Description** Define global tracing operations for access security features on Ethernet switches.

**Default** The `traceoptions` feature is disabled by default.

**Options** **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached ( **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **analyzer**—Trace analyzer events.
- **config-internal**—Trace internal configuration operations.
- **filter**—Trace filter transaction events.
- **forwarding-database**—Trace forwarding database events.

- **general**—Trace general events.
- **interface**—Trace interface events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **nexthop**—Trace next-hop events.
- **normal**—Trace normal events.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vlan**—Trace VLAN events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending to it.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size** —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes

**Range:** 10 KB through 1 gigabyte

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## traceoptions (STP)

---

Syntax	<pre>traceoptions {   file <i>name</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;     &lt;(world-readable   no-world-readable)&gt;;   flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
Hierarchy Level	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.
	<div> <b>NOTE:</b> traceoptions is not support on QFabric systems.</div>
Description	Set STP protocol-level tracing options.
Default	Traceoptions is disabled.
Options	<p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b> —Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file <code>/var/log/stp-log</code>.</p> <p><b>files <i>number</i></b> —(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. These are the STP-specific tracing options:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>all-failures</b>—Trace all failure conditions.</li><li>• <b>bpdu</b>—Trace BPDU reception and transmission.</li></ul>

- **bridge-detection-state-machine**—Trace the bridge detection state machine.
- **events**—Trace events of the protocol state machine.
- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **ppmd**—Trace the state and events for the ppm process.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.O**. When the **trace-file** again reaches its maximum size, **trace-file.O** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.O**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## unknown-unicast-forwarding

**Syntax** `unknown-unicast-forwarding {  
    vlan (all | vlan-name){  
        interface interface-name;  
    }  
}`

**Hierarchy Level** [edit [ethernet-switching-options](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the switch to forward all unknown unicast packets in a VLAN or on all VLANs to a particular interface.

**NOTE:** Before you can configure unknown unicast forwarding within a VLAN, you must first configure that VLAN.

The remaining statements are explained separately.

**Default** Unknown unicast packets are flooded to all interfaces that belong to the same VLAN.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## vlan (Ethernet)

---

<b>Syntax</b>	<code>vlan {     members [ (all   names   vlan-ids) ]; }</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> ge-chassis/slot/port <a href="#">unit</a> logical-unit-number <a href="#">ethernet-switching</a> ], [edit <a href="#">interfaces</a> xe-chassis/slot/port <a href="#">unit</a> logical-unit-number <a href="#">ethernet-switching</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>For Gigabit Ethernet and aggregated Ethernet interfaces, assign an 802.1Q VLAN tag ID to a logical interface.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Bridging with Multiple VLANs on page 1476</a></li><li>• <a href="#">Junos OS Network Interfaces Configuration Guide</a></li></ul>

## vlan (STP)

```
Syntax  vlan (vlan-id | vlan-name) {
        bridge-priority priority;
        forward-delay seconds;
        hello-time seconds;
        interface (all | interface-name) {
            bpdu-timeout-action {
                block;
                alarm;
            }
            cost cost;
            disable;
            edge;
            mode mode;
            no-root-port;
            priority priority;
        }
        max-age seconds;
        traceoptions {
            file filename <files number > <size size> <no-stamp | world-readable |
            no-world-readable>;
            flag flag;
        }
    }
```

**Hierarchy Level** [edit protocols **mstp** **msti** *msti-id*],  
[edit protocols **vstp**]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the VLANs for a Multiple Spanning Tree Instance (MSTI).

The remaining statements are explained separately.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Default** Not enabled.

**Options** *vlan-id*—Numeric VLAN identifier.

*vlan-name*—Name of the VLAN.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## vlan (Unknown Unicast)

---

**Syntax**     `vlan (all | vlan-name) {  
                  interface interface-name;  
                  }`

**Hierarchy Level**     [\[edit ethernet-switching-options unknown-unicast-forwarding\]](#)

**Release Information**     Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**     Specify a VLAN from which unknown unicast packets will be forwarded, or specify that the packets should be forwarded from *all* VLANs. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The remaining statement is explained separately.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlangs` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

---

**Options**     `all`—All VLANs.

***vlan-name***—Name of a VLAN.

**Required Privilege Level**     `routing`—To view this statement in the configuration.  
                                      `routing-control`—To add this statement to the configuration.

## vlan-id (VLANs)

<b>Syntax</b>	<code>vlan-id <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an 802.1Q tag to apply to all traffic that originates on the VLAN.
<b>Default</b>	If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.
<b>Options</b>	<i>number</i> —VLAN tag identifier. <b>Range:</b> 0 through 4093.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Bridging with Multiple VLANs on page 1476</a></li> <li>• <a href="#">Understanding Bridging on page 1381</a></li> </ul>

## vlan-range

<b>Syntax</b>	<code>vlan-range <i>vlan-id-low-vlan-id-high</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure multiple VLANs. Each VLAN is assigned a VLAN ID number from the range.
<b>Default</b>	None.
<b>Options</b>	<i>vlan-id-low-vlan-id-high</i> —Specify the first and last VLAN ID number for the group of VLANs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VLANs on page 1553</a></li> <li>• <a href="#">Configuring Routed VLAN Interfaces on page 1551</a></li> <li>• <a href="#">Understanding Bridging on page 1381</a></li> </ul>

## vlan

<b>Syntax</b>	<pre> vlan {   vlan-name {     description text-description;     dot1q-tunneling {       customer-vlans (id   range);     }     filter input filter-name;     filter output filter-name;     interface interface-name {       isolated;       mapping (policy   tag push   native push);       promiscuous;     }     isolation-vlan-id;     l3-interface vlan.logical-interface-number;     mac-limit number;     mac-table-aging-time seconds;     no-local-switching;     no-mac-learning;     primary-vlan vlan-name;     pvlan extend-secondary-vlan-id vlan-id;     vlan-id number;     vlan-range vlan-id-low-vlan-id-high;   } } </pre>
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure VLAN properties on the QFX Series.
<b>Default</b>	If you use the default factory configuration, all switch interfaces become part of the VLAN default.
<b>Options</b>	<p><b>vlan-name</b>—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.</p> <p>The remaining statements are described separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VLANs on page 1553</a></li> <li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li> <li>• <a href="#">Creating a Series of Tagged VLANs on page 1555</a></li> </ul>

## [vlan-tagging](#)

---

<b>Syntax</b>	<code>vlan-tagging;</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> ] [edit <a href="#">interfaces</a> <a href="#">interface-range</a> <i>interface-range-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.
<b>Default</b>	VLAN tagging is disabled by default.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">vlan-id on page 2118</a></li><li>• <a href="#">Configuring a Layer 3 Logical Interface on page 2033</a></li></ul>

## vstp

---

```
Syntax  vstp {
        disable;
        bpdu-block-on-edge;
        force-version stp;
        vlan (vlan-id | vlan-name) {
            bridge-priority priority;
            forward-delay seconds;
            hello-time seconds;
            interface (all | interface-name) {
                disable;
                bpdu-timeout-action {
                    alarm;
                    block;
                }
                cost cost;
                edge;
                mode mode;
                no-root-port;
                priority priority;
            }
            max-age seconds;
            traceoptions {
                file name <replace> <size size> <files number> <no-stamp>
                  <world-readable | no-world-readable>;
                flag flag <flag-modifier> <disable>;
            }
        }
    }
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## Private VLAN Configuration Statements

### extend-secondary-vlan-id

<b>Syntax</b>	<code>extend-secondary-vlan-id <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> <b>pvlan</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Configure traffic that egresses from a secondary VLAN trunk port to retain its secondary VLAN tag instead of getting the tag of the primary VLAN that the secondary port is a member of.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS on page 1399</a></li> <li>• <a href="#">Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports on page 1529</a></li> </ul>

### isolated

<b>Syntax</b>	<code>isolated;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an access or trunk port to be isolated. You configure a trunk port to be isolated so that it can be a secondary VLAN trunk port—that is, it can carry secondary VLAN traffic.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li> <li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li> <li>• <a href="#">Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS on page 1399</a></li> <li>• <a href="#">Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports on page 1529</a></li> </ul>

## isolation-vlan-id

---

<b>Syntax</b>	<code>isolation-vlan-id <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> <b>pvlan</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an interswitch isolated VLAN within a private VLAN that spans multiple switches.
<b>Options</b>	<i>number</i> —VLAN tag identifier. <b>Range:</b> 0 through 4093
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li><li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li></ul>

## primary-vlan

---

<b>Syntax</b>	<code>primary-vlan <i>vlan-name</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure the primary VLAN for this community VLAN. The primary VLAN must be tagged, and the community VLAN must be untagged.</p> <p>If you want to create a community VLAN, you must configure the primary VLAN to be private using the <b>pvlan</b> statement.</p>
	<div><div><p><b>TIP:</b> To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.</p></div></div>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li><li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li></ul>

## pvlan

---

<b>Syntax</b>	private-vlan;
<b>Hierarchy Level</b>	[edit <a href="#">vlans</a> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify that the VLAN is private and access ports in the VLAN do not forward packets to each other. You use this statement with primary VLANs and isolated secondary VLANs.
<b>Options</b>	none
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li> <li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li> </ul>

## promiscuous

---

<b>Syntax</b>	promiscuous;
<b>Hierarchy Level</b>	[edit <a href="#">vlans</a> <i>vlan-name</i> <a href="#">interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an access or trunk port to be promiscuous.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li> <li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li> </ul>

## pvlan-trunk

---

<b>Syntax</b>	pvlan-trunk;
<b>Hierarchy Level</b>	[edit <a href="#">vlans</a> <i>vlan-name</i> <a href="#">interface</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an interface to be a private VLAN trunk port.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li><li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li></ul>

## vlan

<b>Syntax</b>	<pre> vlan {   vlan-name {     description text-description;     dot1q-tunneling {       customer-vlans (id   range);     }     filter input filter-name;     filter output filter-name;     interface interface-name {       isolated;       mapping (policy   tag push   native push);       promiscuous;     }     isolation-vlan-id;     l3-interface vlan.logical-interface-number;     mac-limit number;     mac-table-aging-time seconds;     no-local-switching;     no-mac-learning;     primary-vlan vlan-name;     pvlan extend-secondary-vlan-id vlan-id;     vlan-id number;     vlan-range vlan-id-low-vlan-id-high;   } } </pre>
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure VLAN properties on the QFX Series.
<b>Default</b>	If you use the default factory configuration, all switch interfaces become part of the VLAN default.
<b>Options</b>	<p><b>vlan-name</b>—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.</p> <p>The remaining statements are described separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## Q-in-Q Tunneling Configuration Statements

---

### customer-vlans

---

<b>Syntax</b>	<code>customer-vlans (<i>id</i>   <i>native</i>   <i>range</i>);</code>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> <a href="#">dot1q-tunneling</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3 for EX Series switches. Option <b>native</b> introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Limit the set of accepted customer VLAN tags to a range or to discrete values when mapping customer VLANs to service VLANs.
<b>Options</b>	<p><b><i>id</i></b>—Numeric identifier for a VLAN.</p> <p><b><i>native</i></b>—Accepts untagged and priority-tagged packets from access interfaces and assigns the configured S-VLAN to the packet.</p> <p><b><i>range</i></b>—Range of numeric identifiers for VLANs. On the QFX series, you can include as many as eight separate customer VLAN ranges for a given service VLAN. Do not configure more than this number of ranges.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">dot1q-tunneling (Ethernet Switching) on page 1663</a></li><li>• ether-type</li><li>• Example: Setting Up Q-in-Q Tunneling on EX Series Switches</li><li>• Configuring Q-in-Q Tunneling (CLI Procedure)</li><li>• Understanding Q-in-Q Tunneling on EX Series Switches</li><li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li><li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li><li>• <a href="#">dot1q-tunneling (Ethernet Switching) on page 1663</a></li><li>• <a href="#">ether-type on page 1665</a></li></ul>

---

## dot1q-tunneling (Ethernet Switching)

---

<b>Syntax</b>	<pre>dot1q-tunneling {     ether-type (0x8100   0x88a8   0x9100); }</pre>
<b>Hierarchy Level</b>	[edit ethernet-switching-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Set a global value for the EtherType for Q-in-Q tunneling.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">dot1q-tunneling on page 1664</a></li><li>• Example: Setting Up Q-in-Q Tunneling on EX Series Switches</li><li>• Configuring Q-in-Q Tunneling (CLI Procedure)</li><li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li><li>• Example: Setting Up Q-in-Q Tunneling on page 1541</li><li>• <a href="#">dot1q-tunneling on page 1664</a></li></ul>

## dot1q-tunneling (VLANs)

<b>Syntax</b>	<pre>dot1q-tunneling {     customer-vlans (id   native   range);     layer2-protocol-tunneling all   protocol-name {         drop-threshold number;         shutdown-threshold number;     } }</pre>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Option <b>native</b> introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Options <b>layer2-protocol-tunneling</b>, <b>drop-threshold</b>, and <b>shutdown-threshold</b> introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Enable Q-in-Q tunneling on the specified VLAN.

### NOTE:

- The VLAN on which you enable Q-in-Q tunneling must be a tagged VLAN.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

The remaining statements are explained separately.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Q-in-Q Tunneling (CLI Procedure)</a></li> <li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li> <li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li> <li>• <a href="#">dot1q-tunneling (Ethernet Switching) on page 1663</a></li> </ul>
------------------------------	--

---

## ether-type

---

<b>Syntax</b>	ether-type (0x8100   0x88a8   0x9100)
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options dot1q-tunneling</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure a global value for the tag protocol identifier (EtherType) of the service VLAN tags (outer tags) in Q-in-Q tunneling. Only one EtherType value is supported at a time.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li><li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li></ul>

## layer2-protocol-tunneling

**Syntax** `layer2-protocol-tunneling all | protocol-name {  
     drop-threshold number;  
     shutdown-threshold number;  
 }`

**Hierarchy Level** `[edit vlans vlan-name dot1q-tunneling]`

**Release Information** Statement introduced in Junos OS Release 10.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Enable Layer 2 protocol tunneling (L2PT) on the VLAN.  
 The remaining statements are explained separately.

**Default** L2PT is not enabled.

**Options** `all`—Enable all supported Layer 2 protocols.

*protocol-name*—Name of the Layer 2 protocol. Values are:

- `802.1x`—IEEE 802.1X authentication
- `802.3ah`—IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

**NOTE:** If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- `cdp`—Cisco Discovery Protocol
- `e-lmi`—Ethernet local management interface
- `gvrp`—GARP VLAN Registration Protocol
- `lACP`—Link Aggregation Control Protocol

**NOTE:** If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- `lldp`—Link Layer Discovery Protocol
- `mmp`—Multiple MAC Registration Protocol
- `mvrp`—Multiple VLAN Registration Protocol
- `stp`—Spanning Tree Protocol, Rapid Spanning Tree Protocol, and Multiple Spanning Tree Protocol

- **udld**—Unidirectional Link Detection (UDLD)
- **vstp**—VLAN Spanning Tree Protocol
- **vtp**—VLAN Trunking Protocol

**Required Privilege Level**    system—To view this statement in the configuration.  
   system-control—To add this statement to the configuration.

## mapping

---

<b>Syntax</b>	mapping (native (push   swap)   tag (push   swap));
<b>Hierarchy Level</b>	[edit <b>vlangs</b> <i>vlan-name</i> <b>interface</b> <i>interface-name</i> egress], [edit <b>vlangs</b> <i>vlan-name</i> <b>interface</b> <i>interface-name</i> ingress], [edit <b>vlangs</b> <i>vlan-name</i> <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Map a specific C-VLAN to an S-VLAN. By default, the received incoming or outgoing tag is replaced with the new tag.
<b>Options</b>	<p><b>native</b>—Map untagged and priority-tagged packets to an S-VLAN.</p> <p><b>push</b>—Retain the incoming tag (as an inner tag) and adds an additional VLAN tag. When you use this option, the TPID of the outer tag is set as follows:</p> <ul style="list-style-type: none"><li>• If Q-in-Q tunneling is not enabled in the VLAN, then the Ethertype for outer tag is set to 0x8100.</li><li>• If Q-in-Q tunneling is enabled in the VLAN and a packet is egressing from a trunk port, then the Ethertype is set to 0x88a8 (or as configured by an <b>ether-type</b> statement).</li></ul> <p><b>swap</b>—Replaces the incoming VLAN tag with the VLAN ID tag of the S-VLAN. Using this option is also referred to as VLAN ID translation. When you use this option on a trunk port for which Q-in-Q tunneling is enabled, use the <b>ether-type</b> statement to set the Ethertype.</p> <p><b>tag</b>—Original VLAN tag that will be replaced (with <b>swap</b>) or that will become an inner tag (with <b>push</b>).</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li><li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li></ul>

## mapping-range

<b>Syntax</b>	<code>mapping-range C-VLAN-range (push   swap) &lt;vlan-id-start S-VLAN-ID&gt;;</code>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> interface (VLANs) <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an access interface to map a range of C-VLANs to a range of S-VLANs. Use this statement instead of using multiple <b>set vlans <i>VLAN-name</i> interface <i>interface-name</i> mapping (push   swap)</b> statements to configure Q-in-Q tunneling or VLAN translation on a per-VLAN basis. This statement is particularly useful if you have used the <b>vlan-range</b> statement to create multiple VLANs.
<b>Options</b>	<p><b>push</b>—Retain the incoming tag and adds an additional VLAN tag (Q-in-Q tunneling).</p> <p><b>swap</b>—Swap the incoming VLAN tag with the VLAN ID tag of the S-VLAN (VLAN translation).</p> <p><b>vlan-ID-start <i>S-VLAN-ID</i></b>—(Optional) Set the start of the S-VLAN range that the C-VLANs will be mapped to. If you omit this option, mapping begins with the first ID in the range of S-VLAN IDs (which you configure using the <b>set vlans <i>vlan-range</i></b> statement).</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li> <li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li> <li>• <a href="#">vlan-range on page 1653</a></li> </ul>

## no-local-switching

<b>Syntax</b>	<code>no-local-switching;</code>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify that access ports in this VLAN domain do not forward packets to one another. You use this statement with primary VLANs and isolated secondary VLANs.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating a Private VLAN on a Single Switch on page 1560</a></li> <li>• <a href="#">Creating a Private VLAN Spanning Multiple Switches on page 1561</a></li> </ul>

## shutdown-threshold

---

<b>Syntax</b>	<code>shutdown-threshold <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit vlans <i>vlan-name</i> dot1q-tunneling layer2-protocol-tunneling (all   <i>protocol-name</i>)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled. Once an interface is disabled, you must explicitly reenable it using the <b>clear ethernet-switching layer2-protocol-tunneling error</b> command. Otherwise, the interface remains disabled.</p> <p>The shutdown threshold value must be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value, the drop threshold value has no effect.</p> <p>You can specify a shutdown threshold value without specifying a drop threshold value.</p>
<b>Default</b>	No shutdown threshold is specified.
<b>Options</b>	<p><b><i>number</i></b>—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled.</p> <p><b>Range:</b> 1 through 1000</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">drop-threshold on page 1593</a></li><li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li><li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li><li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li></ul>

## vlan-id-start

---

<b>Syntax</b>	<code>vlan-id-start S-VLAN-ID;</code>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> interface (VLANs) <i>interface-name</i> mapping-range <i>C-VLAN-range</i> (push   swap)]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure an access interface to map a range of C-VLANs to a range of S-VLANs. Use this statement instead of using multiple <b>set vlans <i>VLAN-name</i> interface <i>interface-name</i> mapping (push   swap)</b> statements to configure Q-in-Q tunneling or VLAN translation on a per-VLAN basis. This statement sets the start of the S-VLAN range that the C-VLANs are mapped to. If you omit this option, mapping begins with the first ID in the range of S-VLAN IDs (which you configure using the <b>set vlans <i>vlan-range</i></b> statement).
<b>Options</b>	None
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li> <li>• <a href="#">Example: Setting Up Q-in-Q Tunneling on page 1541</a></li> </ul>

## vlan

<b>Syntax</b>	<pre> vlan {   vlan-name {     description text-description;     dot1q-tunneling {       customer-vlans (id   range);     }     filter input filter-name;     filter output filter-name;     interface interface-name {       isolated;       mapping (policy   tag push   native push);       promiscuous;     }     isolation-vlan-id;     l3-interface vlan.logical-interface-number;     mac-limit number;     mac-table-aging-time seconds;     no-local-switching;     no-mac-learning;     primary-vlan vlan-name;     pvlan extend-secondary-vlan-id vlan-id;     vlan-id number;     vlan-range vlan-id-low-vlan-id-high;   } } </pre>
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure VLAN properties on the QFX Series.
<b>Default</b>	If you use the default factory configuration, all switch interfaces become part of the VLAN default.
<b>Options</b>	<p><b>vlan-name</b>—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.</p> <p>The remaining statements are described separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VLANs on page 1553</a></li> <li>• <a href="#">Configuring Q-in-Q Tunneling on page 1562</a></li> <li>• <a href="#">Creating a Series of Tagged VLANs on page 1555</a></li> </ul>

## CHAPTER 17

# Administration

- [Routine Monitoring on page 1675](#)
- [Monitoring Commands on page 1684](#)

## Routine Monitoring

---

- [Verifying That MAC Notification Is Working Properly on page 1675](#)
- [Verifying That a Series of Tagged VLANs Has Been Created on page 1675](#)
- [Verifying That Q-in-Q Tunneling Is Working on page 1677](#)
- [Verifying That a Private VLAN Is Working on page 1678](#)
- [Verifying That Proxy ARP Is Working Correctly on page 1683](#)

### Verifying That MAC Notification Is Working Properly

**Purpose** Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

**Action** To verify that MAC notification is enabled or disabled and also to verify the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 30
```

**Meaning** The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 30 seconds.

**Related Documentation** • [Configuring MAC Notification on page 1547](#)

### Verifying That a Series of Tagged VLANs Has Been Created

**Purpose** Verify that a series of tagged VLANs has been created on the switch.

- Action** 1. Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

2. Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch> show vlans sort-by name
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

3. Display the VLANs by specifying the VLAN range name (here, the VLAN range name is **employee**):

```
user@switch> show vlans employee
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

**Meaning** The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_**. Each of the tagged VLANs is configured on the trunk interface **xe-0/0/22.0**. The asterisk (\*) next to the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the **vlan-range** statement, the VLAN names are preceded and followed by a double underscore.

**Related Documentation**

- [Creating a Series of Tagged VLANs on page 1555](#)

## Verifying That Q-in-Q Tunneling Is Working

**Purpose** After creating a Q-in-Q VLAN, verify that it is set up properly.

**Action** 1. Use the **show configuration vlans** command to determine if you successfully created the primary and secondary VLAN configurations:

```
user@switch> show configuration vlans
svlan {
  vlan-id 300;
  dot1q-tunneling {
    customer-vlans [ 101-200 ];
  }
}
```

2. Use the **show vlans** command to view VLAN information and link status:

```
user@switch> show vlans s-vlan-name extensive
VLAN: svlan, Created at: Thu Oct 23 16:53:20 2008
802.1Q Tag: 300, Internal index: 2, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
```

```
Customer VLAN ranges:
                        101-200
Protocol: Port Mode
Number of interfaces: Tagged 1 (Active = 0), Untagged 1 (Active = 0)
                    xe-0/0/1, tagged, trunk
                    xe-0/0/2, untagged, access
```

**Meaning** The output confirms that Q-in-Q tunneling is enabled and that the VLAN is tagged, and lists the customer VLANs that are associated with the tagged VLAN.

**Related Documentation**

- Configuring Q-in-Q Tunneling (CLI Procedure)
- Example: Setting Up Q-in-Q Tunneling on EX Series Switches

## Verifying That a Private VLAN Is Working

**Purpose** After creating and configuring private VLANs (PVLANS), verify that they are set up properly.

**Action** 1. To determine whether you successfully created the primary and secondary VLAN configurations:

- For a PVLAN on a single switch, use the **show configuration vlans** command:

```
user@switch> show configuration vlans
community1 {
    interface {
        interface a;
        interface b;
    }
    primary-vlan pvlan;
}
community2 {
    interface {
        interface d;
        interface e;
    }
    primary-vlan pvlan;
}
pvlan {
    vlan-id 1000;
    interface {
        isolated1;
        isolated2;
        trunk1;
        trunk2;
    }
    no-local-switching;
}
```

- For a PVLAN spanning multiple switches, use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: COM1, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 1 (Active = 1)
                    ge-0/0/20.0*, tagged, trunk
```

```

ge-0/0/22.0*, tagged, trunk, pvlan-trunk
ge-0/0/23.0*, tagged, trunk, pvlan-trunk
ge-0/0/7.0*, untagged, access

```

```

VLAN: __pvlan_primary_ge-0/0/0.0__, Created at: Tue May 11 18:16:05 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 1 (Active = 1)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/0.0*, untagged, access

```

```

VLAN: __pvlan_primary_ge-0/0/2.0__, Created at: Tue May 11 18:16:05 2010

Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 2 (Active = 2)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, untagged, access
    ge-1/0/6.0*, untagged, access

```

```

VLAN: primary, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 10, Internal index: 2, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 5 (Active = 4)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/0.0*, untagged, access
    ge-0/0/1.0*, untagged, access
    ge-0/0/2.0, untagged, access
    ge-0/0/7.0*, untagged, access
    ge-1/0/6.0*, untagged, access

```

```

Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1
Isolated VLANs :
  __pvlan_primary_ge-0/0/0.0__
  __pvlan_primary_ge-0/0/2.0__
Community VLANs :
  COM1
  community2
Inter-switch-isolated VLAN :
  __pvlan_primary_isiv__

```

2. Use the **show vlans extensive** command to view VLAN information and link status for a PVLAN on a single switch or for a PVLAN spanning multiple switches.

- For a PVLAN on a single switch:

```

user@switch> show vlans pvlan extensive
VLAN: pvlan, Created at: time
802.1Q Tag: vlan-id, Internal index: index-number, Admin State: Enabled,
Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 6 (Active = 0)
  trunk1, tagged, trunk
  interface a, untagged, access
  interface b, untagged, access
  interface c, untagged, access
  interface d, untagged, access
  interface e, untagged, access
  interface f, untagged, access
  trunk2, tagged, trunk
Secondary VLANs: Isolated 2, Community 2
Isolated VLANs :
  __pvlan_pvlan_isolated1__
  __pvlan_pvlan_isolated2__
Community VLANs :
  community1
  community2

```

- For a PVLAN spanning multiple switches:

```

user@switch> show vlans extensive
VLAN: COM1, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static

 Protocol: Port Mode, Mac aging time: 300 seconds  
 Number of interfaces: Tagged 3 (Active = 3), Untagged 5 (Active = 4)  
     ge-0/0/20.0\*, tagged, trunk  
     ge-0/0/22.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/23.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/0.0\*, untagged, access  
     ge-0/0/1.0\*, untagged, access  
     ge-0/0/2.0, untagged, access  
     ge-0/0/7.0\*, untagged, access  
     ge-1/0/6.0\*, untagged, access

Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1  
 Isolated VLANs :  
     \_\_pvlan\_primary\_ge-0/0/0.0\_\_  
     \_\_pvlan\_primary\_ge-0/0/2.0\_\_  
 Community VLANs :  
     COM1  
     community2  
 Inter-switch-isolated VLAN :  
     \_\_pvlan\_primary\_isiv\_\_

3. Use the **show ethernet-switching table** command to view logs for MAC learning on the VLANs:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 8 entries, 1 learned
```

VLAN	MAC address	Type	Age	Interfaces
default	*	Flood	-	All-members
pvlan	*	Flood	-	All-members
pvlan	MAC1	Replicated	-	interface a
pvlan	MAC2	Replicated	-	interface c
pvlan	MAC3	Replicated	-	isolated2
pvlan	MAC4	Learn	0	trunk1
__pvlan_pvlan_isolated1__	*	Flood	-	All-members
__pvlan_pvlan_isolated1__	MAC4	Replicated	-	trunk1
__pvlan_pvlan_isolated2__	*	Flood	-	All-members
__pvlan_pvlan_isolated2__	MAC3	Learn	0	isolated2
__pvlan_pvlan_isolated2__	MAC4	Replicated	-	trunk1
community1	*	Flood	-	All-members
community1	MAC1	Learn	0	interface a
community1	MAC4	Replicated	-	trunk1
community2	*	Flood	-	All-members
community2	MAC2	Learn	0	interface c
community2	MAC4	Replicated	-	trunk1

**NOTE:** If you have configured a PVLAN spanning multiple switches, you can use the same command on all the switches to check the logs for MAC learning on those switches.

**Meaning** In the output displays for a PVLAN on a single switch, you can see that the primary VLAN contains two community domains (**community1** and **community2**), two isolated ports, and two trunk ports. The PVLAN on a single switch has only one tag (1000), which is for the primary VLAN.

The PVLAN that spans multiple switches contains multiple tags:

- The community domain **COM1** is identified with tag **100**.
- The community domain **community2** is identified with tag **20**.
- The interswitch isolated domain is identified with tag **50**.
- The primary VLAN **primary** is identified with tag **10**.

Also, for the PVLAN that spans multiple switches, the trunk interfaces are identified as **pvlan-trunk**.

## Verifying That Proxy ARP Is Working Correctly

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
198319 datagrams received
45 ARP requests received
12 ARP replies received
2 resolution requests received
2 unrestricted proxy requests
0 restricted proxy requests
0 received proxy requests
0 proxy requests not proxied
0 restricted-proxy requests not proxied
0 with bogus interface
0 with incorrect length
0 for non-IP protocol
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
0 with multicast target address
0 with my own hardware address
168705 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29555 which were not for me
0 packets discarded waiting for resolution
4 packets sent after waiting for resolution
27 ARP requests sent
47 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
```

0 replies for from unnumbered interfaces  
0 requests on unnumbered interface with non-subnetted donor  
0 replies from unnumbered interface with non-subnetted donor

**Meaning** The statistics show that two proxy ARP requests were received, and the **proxy requests not proxied** field indicates that all the unproxied ARP requests received have been proxied by the switch.

## Monitoring Commands

---

## clear ethernet-switching bpdu-error

---

<b>Syntax</b>	<code>clear ethernet-switching bpdu-error interface <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1 for EX Series switches. Command updated in Junos OS Release 11.1 for EX Series switches—a BPDU error shuts down the interface and this command brings the interface back up. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear bridge protocol data unit (BPDU) errors from an interface and bring up the interface.
<b>Options</b>	<i>interface-name</i> —Clear BPDU errors on the specified interface.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show spanning-tree interface on page 1741</a></li> <li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches</a></li> <li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1413</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear ethernet-switching bpdu-error interface on page 1685</a>

### Sample Output

```
clear
ethernet-switching
bpdu-error interface
```

```
user@switch> clear ethernet-switching bpdu-error interface xe-0/0/1.0
```

## clear ethernet-switching layer2-protocol-tunneling error

---

<b>Syntax</b>	clear ethernet-switching layer2-protocol-tunneling error <interface <i>interface-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Clear Layer 2 protocol tunneling (L2PT) errors on one or more interfaces. If an interface has been disabled because the amount of Layer 2 protocol traffic exceeded the shutdown threshold or because the switch has detected an error in the network topology or configuration, use this command to reenable the interface.
<b>Options</b>	<b>none</b> —Clears L2PT errors on all interfaces.  <b>interface <i>interface-name</i></b> —(Optional) Clear L2PT errors on the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</li><li>• Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</li><li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear ethernet-switching layer2-protocol-tunneling error on page 1686</a> <a href="#">clear ethernet-switching layer2-protocol-tunneling error interface xe-0/0/1.0 on page 1686</a>

### Sample Output

```
clear  
ethernet-switching  
layer2-protocol-tunneling  
error
```

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error
```

```
clear

error vlan v2
```

```
user@switch> clear ethernet-switching layer2-protocol-tunneling statistics vlan v2
```

## clear ethernet-switching table

<b>Syntax</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <management-vlan> <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Syntax (QFX Series)</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	 <p><b>NOTE:</b> On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</p> <p>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</p>
<b>Options</b>	<p><b>none</b>—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p><b>mac <i>mac-address</i></b>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p><b>management-vlan</b>—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p><b>persistent-mac &lt;<i>interface</i>   <i>mac-address</i>&gt;</b>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the <b>interface</b> option to clear all MAC addresses on an interface, or use the <b>mac-address</b> option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p>

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

**vlan *vlan-name***—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

**Required Privilege Level**

## show ethernet-switching layer2-protocol-tunneling interface

<b>Syntax</b>	<code>show ethernet-switching-layer2-protocol-tunneling interface</code> <code>&lt;interface-name&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display information about Layer 2 protocol tunneling (L2PT) on interfaces that have been configured for L2PT.
<b>Options</b>	<b>none</b> —Display L2PT information about all interfaces on which L2PT is enabled. <b>interface-name</b> —(Optional) Display L2PT information for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1697</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1700</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1697</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1700</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1696</a> <a href="#">show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0 on page 1696</a>
<b>Output Fields</b>	Table 126 on page 1695 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 126: show ethernet-switching layer2-protocol-tunneling interface Output Fields

Field Name	Field Description
<b>Interface</b>	Name of an interface on the switch.
<b>Operation</b>	Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .
<b>State</b>	State of the interface. Values are <b>active</b> and <b>shutdown</b> .
<b>Description</b>	If the interface state is <b>shutdown</b> , displays why the interface is shut down. If the description says <b>Loop detected</b> , it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network.

## Sample Output

show  
ethernet-switching  
layer2-protocol-tunneling  
interface

user@switch> show ethernet-switching layer2-protocol-tunneling interface

Layer2 Protocol Tunneling information:

Interface	Operation	State	Description
xe-0/0/0.0	Encapsulation	Shutdown	Shutdown threshold exceeded
xe-0/0/1.0	Decapsulation	Shutdown	Loop detected
xe-0/0/2.0	Decapsulation	Active	

show  
ethernet-switching  
layer2-protocol-tunneling  
interface xe-0/0/0.0

user@switch> show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0

Layer2 Protocol Tunneling information:

Interface	Operation	State	Description
xe-0/0/0.0	Encapsulation	Shutdown	Shutdown threshold exceeded

## show ethernet-switching layer2-protocol-tunneling statistics

<b>Syntax</b>	show ethernet-switching-layer2-protocol-tunneling statistics <interface <i>interface-name</i> > <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display Layer 2 protocol tunneling (L2PT) statistics for Layer 2 PDU packets received by the switch.
	 <p><b>NOTE:</b> The <code>show ethernet-switching-layer2-protocol-tunneling statistics</code> command does not display L2PT statistics for Layer 2 PDU packets transmitted from the switch.</p>
<b>Options</b>	<p><b>none</b>—Display L2PT statistics for all interfaces on which you enabled L2PT.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display L2PT statistics for the specified interface.</p> <p><b>vlan <i>vlan-name</i></b>—(Optional) Display L2PT statistics for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear ethernet-switching layer2-protocol-tunneling statistics on page 1687</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1695</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1700</a></li> <li>• <a href="#">show vlans</a></li> <li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">show vlans on page 1752</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li> </ul>

<b>Output Fields</b>	Table 127 on page 1698 lists the output fields for the <code>show ethernet-switching layer2-protocol-tunneling statistics</code> command. Output fields are listed in the approximate order in which they appear.

Table 127: show ethernet-switching layer2-protocol-tunneling statistics Output Fields

VLAN	Field Description
VLAN	Name of a VLAN on which L2PT has been configured.
Interface	Name of an interface on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lACP</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>udld</b> , <b>vstp</b> , and <b>vtp</b> .
Operation	Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .
Packets	Number of packets that have been encapsulated or de-encapsulated.
Drops	Number of packets that have exceeded the drop threshold and have been dropped.
Shutdowns	Number of times that packets have exceeded the shutdown threshold and the interface has been shut down.

## Sample Output

show  
ethernet-switching  
layer2-protocol-tunneling  
statistics

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics
```

```
Layer2 Protocol Tunneling Statistics:
VLAN  Interface  Protocol  Operation  Packets  Drops  Shutdowns

## show ethernet-switching layer2-protocol-tunneling vlan

<b>Syntax</b>	show ethernet-switching-layer2-protocol-tunneling vlan <vlan-name>
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display information about Layer 2 protocol tunneling (L2PT) on VLANs that have been configured for L2PT.
<b>Options</b>	<b>none</b> —Display information about L2PT for the VLANs on which you have configured L2PT. <b>vlan-name</b> —(Optional) Display information about L2PT for the specified VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1695</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1697</a></li> <li>• <a href="#">show vlans</a></li> <li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">show vlans on page 1752</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on page 1563</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1701</a> <a href="#">show ethernet-switching layer2-protocol-tunneling vlan v2 on page 1701</a>
<b>Output Fields</b>	Table 128 on page 1700 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling vlan</b> command. Output fields are listed in the approximate order in which they appear.

Table 128: show ethernet-switching layer2-protocol-tunneling vlan Output Fields

Field Name	Field Description
VLAN	Name of the VLAN on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lACP</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>vstp</b> , and <b>vtp</b> .
Drop Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the switch begins dropping the Layer 2 PDUs.
Shutdown Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the interface is disabled.

## Sample Output

show  
ethernet-switching  
layer2-protocol-tunneling  
vlan

user@switch> show ethernet-switching layer2-protocol-tunneling vlan

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v1             mvrp          100           200
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

show  
ethernet-switching  
layer2-protocol-tunneling  
vlan v2

user@switch> show ethernet-switching layer2-protocol-tunneling vlan v2

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

## show ethernet-switching mac-learning-log

<b>Syntax</b>	show ethernet-switching mac-learning-log
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Displays the event log of learned MAC addresses.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching table on page 1711</a></li> <li>• <a href="#">show ethernet-switching interfaces on page 1347</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching mac-learning-log on page 1703</a>
<b>Output Fields</b>	Table 129 on page 1702 lists the output fields for the <b>show ethernet-switching mac-learning-log</b> command. Output fields are listed in the approximate order in which they appear.

Table 129: show ethernet-switching mac-learning-log Output Fields

Field Name	Field Description
<b>Date and Time</b>	Timestamp when the MAC address was added or deleted from the log.
<b>vlan_name</b>	VLAN name. A value defined by the user for all user-configured VLANs.
<b>MAC</b>	Learned MAC address.
<b>Deleted   Added</b>	MAC address deleted from or added to the MAC learning log.
<b>Blocking</b>	Forwarding state of the interface: <ul style="list-style-type: none"> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> </ul>

## Sample Output

show  
ethernet-switching  
mac-learning-log

```
user@switch> show ethernet-switching mac-learning-log
Mon Feb 25 08:07:05 2008
  vlan_name v1 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v9 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name HR_vlan mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v3 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v12 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008

Mon Feb 25 08:07:05 2008
  vlan_name employee1 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name employee2 mac 00:00:00:00:00:00 was deleted
Mon Feb 25 08:07:05 2008
  vlan_name v3 mac 00:00:00:00:00:00 was added
Mon Feb 25 08:07:05 2008
  vlan_name HR_vlan mac 00:00:00:00:00:00 was added
Mon Feb 25 08:07:05 2008
  vlan_name employee2 mac 00:00:00:00:00:00 was added
Mon Feb 25 08:07:05 2008
  vlan_name employee1 mac 00:00:00:00:00:00 was added
Mon Feb 25 08:07:05 2008
  vlan_name employee2 mac 00:00:05:00:00:05 was learned
Mon Feb 25 08:07:05 2008
  vlan_name employee1 mac 00:30:48:90:54:89 was learned
Mon Feb 25 08:07:05 2008
  vlan_name HR_vlan mac 00:00:5e:00:01:00 was learned
Mon Feb 25 08:07:05 2008
  vlan_name sales_vlan mac 00:00:5e:00:01:08 was learned
[output truncated]
```

## show ethernet-switching mac-notification

<b>Syntax</b>	show ethernet-switching mac-notification
<b>Release Information</b>	Command introduced in Junos OS Release 9.6 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about MAC notification.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Verifying That MAC Notification Is Working Properly</li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching mac-notification (MAC Notification Enabled) on page 1704</a> <a href="#">show ethernet-switching mac-notification (MAC Notification Disabled) on page 1704</a>
<b>Output Fields</b>	Table 130 on page 1704 lists the output fields for the <b>show ethernet-switching mac-notification</b> command. Output fields are listed in the order in which they appear.

Table 130: show ethernet-switching mac-notification Output Fields

Field Name	Field Description
<b>Notification Status</b>	MAC notification status: <ul style="list-style-type: none"> <li><b>Enabled</b>—MAC notification is enabled.</li> <li><b>Disabled</b>—MAC notification is disabled.</li> </ul>
<b>Notification Interval</b>	MAC notification interval in seconds.

### Sample Output

```
show ethernet-switching mac-notification (MAC Notification Enabled)
user@switch> show ethernet-switching mac-notification
Notification Status           : Enabled
Notification Interval         : 30
```

### Sample Output

```
show ethernet-switching mac-notification (MAC Notification Disabled)
user@switch> show ethernet-switching mac-notification
Notification Status           : Disabled
Notification Interval         : 0
```

## show ethernet-switching statistics aging

<b>Syntax</b>	show ethernet-switching statistics aging <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display media access control (MAC) aging statistics.
<b>Options</b>	<b>none</b> —(Optional) Display MAC aging statistics. <b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching statistics mac-learning on page 1707</a></li> <li>• <a href="#">mac-table-aging-time on page 1610</a></li> <li>• <a href="#">Configuring MAC Table Aging on page 1549</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching statistics aging on page 1706</a>
<b>Output Fields</b>	<a href="#">Table 131 on page 1705</a> lists the output fields for the <b>show ethernet-switching statistics aging</b> command. Output fields are listed in the approximate order in which they appear.

**Table 131: show ethernet-switching statistics aging Output Fields**

Field Name	Field Description	Level of Output
<b>Total age messages received</b>	Total number of aging messages received from the hardware.	All levels
<b>Immediate aging</b>	Aging message indicating that the entry should be removed immediately.	All levels
<b>MAC address seen</b>	Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped.	All levels
<b>MAC address not seen</b>	Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started.	All levels
<b>Error age messages</b>	The received aging message contains the following errors: <ul style="list-style-type: none"> <li>• <b>Invalid VLAN</b>—The VLAN of the packet does not exist.</li> <li>• <b>No such entry</b>—The MAC address and VLAN pair provided by the aging message does not exist.</li> <li>• <b>Static entry</b>—An unsuccessful attempt was made to age out a static MAC entry.</li> </ul>	All levels

## Sample Output

show  
ethernet-switching  
statistics aging

```
user@switch> show ethernet-switching statistics aging
```

```
Total age messages received: 0
```

```
  Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
```

```
Error age messages: 0
```

```
  Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

## show ethernet-switching statistics mac-learning

<b>Syntax</b>	show ethernet-switching statistics mac-learning <brief   detail> <interface <i>interface-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display media access control (MAC) learning statistics.
<b>Options</b>	<p><b>none</b>—(Optional) Display MAC learning statistics for all interfaces.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output. The default is <b>brief</b>.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display MAC learning statistics for the specified interface.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• show ethernet-switching statistics aging</li> <li>• show ethernet-switching mac-learning-log</li> <li>• show ethernet-switching table</li> <li>• show ethernet-switching interfaces</li> <li>• Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch</li> <li>• Example: Setting Up Bridging with Multiple VLANs for EX Series Switches</li> <li>• <a href="#">show ethernet-switching statistics aging on page 1705</a></li> <li>• <a href="#">show ethernet-switching mac-learning-log on page 1702</a></li> <li>• <a href="#">show ethernet-switching table on page 1711</a></li> <li>• <a href="#">show ethernet-switching interfaces on page 1347</a></li> <li>• Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1467</li> <li>• Example: Setting Up Bridging with Multiple VLANs on page 1476</li> </ul>

<b>Output Fields</b>	<a href="#">Table 133 on page 1711</a> lists the output fields for the <b>show ethernet-switching table</b> command. Output fields are listed in the approximate order in which they appear.

**Table 133: show ethernet-switching table Output Fields**

Field Name	Field Description	Level of Output
VLAN	Name of a VLAN.	All levels

Table 133: show ethernet-switching table Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>MAC address</b>	MAC address associated with the VLAN.	All levels
<b>Type</b>	Type of MAC address: <ul style="list-style-type: none"> <li>• <b>static</b>—The MAC address is manually created.</li> <li>• <b>learn</b>—The MAC address is learned dynamically from a packet's source MAC address.</li> <li>• <b>flood</b>—The MAC address is unknown and flooded to all members.</li> </ul>	All levels
<b>Age</b>	Time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
<b>Interfaces</b>	Interface associated with learned MAC addresses or with the <b>All-members</b> option (flood entry).	All levels
<b>Learned</b>	For learned entries, the time at which the entry was added to the Ethernet switching table.	<b>detail, extensive</b>

## Sample Output

show  
ethernet-switching  
table

```
user@switch> show ethernet-switching table

## show interfaces xe

---

<b>Syntax</b>	<code>show interfaces <i>device-name:type-fpc/pic/port</i></code> <code>&lt;brief   detail   extensive   terse&gt;</code> <code>&lt;descriptions&gt;</code> <code>&lt;media&gt;</code> <code>&lt;routing-instance (all   <i>instance-name</i>)&gt;</code> <code>&lt;snmp-index <i>snmp-index</i>&gt;</code> <code>&lt;statistics&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display status information about the specified 10-Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces.
<b>Options</b>	<p><b><i>device-name:type-fpc/pic/port</i></b>—(QFabric systems only) The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name must contain a maximum of 128 characters and not contain any colons.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>routing-instance (all   <i>instance-name</i>)</b>—(Optional) Display the name of an individual routing instance or display all routing instances.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p>

**Output Fields** Table 134 on page 1719 lists the output fields for the **show interfaces xe** command. Output fields are listed in the approximate order in which they appear.

**Table 134: show interfaces xe Output Fields**

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface.	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	All levels
<b>MTU</b>	Maximum transmission unit size on the physical interface.	All levels
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>Duplex</b>	Duplex mode of the interface, either <b>Full-Duplex</b> or <b>Half-Duplex</b> .	All levels
<b>Loopback</b>	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
<b>Source filtering</b>	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>LAN-PHY mode</b>	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
<b>Unidirectional</b>	Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.	All levels
<b>Flow control</b>	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>NOTE:</b> This field is only displayed if asymmetric flow control is not configured.		

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Configured-flow-control</b>	<p>Configured flow control for the interface transmit buffers (<b>tx-buffers</b>) and receive buffers (<b>rx-buffers</b>):</p> <ul style="list-style-type: none"> <li><b>tx-buffers</b>—<b>On</b> if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer. <b>Off</b> if the interface is not configured to respond to received PAUSE messages.</li> <li><b>rx-buffers</b>—<b>On</b> if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer. <b>Off</b> if the interface is not configured to generate and send PAUSE messages.</li> </ul> <p><b>NOTE:</b> This field is only displayed if asymmetric flow control is configured.</p>	All levels
<b>Auto-negotiation</b>	Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Remote-fault</b>	<p>Remote fault status:</p> <ul style="list-style-type: none"> <li><b>Online</b>—Autonegotiation is manually configured as online.</li> <li><b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
<b>Device flags</b>	Information about the physical device.	All levels
<b>Interface flags</b>	Information about the interface.	All levels
<b>Link flags</b>	Information about the link.	All levels
<b>Wavelength</b>	Configured wavelength, in nanometers (nm).	All levels
<b>Frequency</b>	Frequency associated with the configured wavelength, in terahertz (THz).	All levels
<b>CoS queues</b>	Number of CoS queues configured.	<b>detail extensive none</b>
<b>Schedulers</b>	Number of CoS schedulers configured.	<b>extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive none</b>
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive none</b>
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago)</b> .	<b>detail extensive none</b>
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps).	None specified
<b>Output Rate</b>	Output rate in bps and pps.	None specified
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled.</p>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Egress queues</b>	Total number of egress queues supported on the specified interface.	<b>detail extensive</b>
<b>Queue counters (Egress)</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>
<b>Queue Number</b>	The CoS queue number and the forwarding classes mapped to the queue number. The <b>Mapped forwarding class</b> column lists the forwarding classes mapped to each CoS queue.	<b>detail extensive</b>
<b>Ingress queues</b>	Total number of ingress queues supported on the specified interface.	<b>extensive</b>
<b>Queue counters (Ingress)</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>extensive</b>

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Active alarms and Active defects</b>	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	<b>detail extensive none</b>
<b>PCS statistics</b>	Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.	<b>detail extensive</b>
<b>MAC statistics</b>	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	<b>extensive</b>
<b>Filter statistics</b>	Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.	<b>extensive</b>

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive). For asymmetric <b>PAUSE</b>, shows if the <b>PAUSE</b> transmit and <b>PAUSE</b> receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul>	extensive

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Packet Forwarding Engine configuration</b>	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li><b>Destination slot</b>—FPC slot number.</li> <li><b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li><b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li><b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li><b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li><b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li><b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li><b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	<b>extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface.	All levels
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Protocol</b>	Protocol family.	<b>detail extensive none</b>
<b>Traffic statistics</b>	Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	If IPv6 statics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.	<b>extensive</b>
<b>Local statistics</b>	Number and rate of bytes and packets destined to and from the switch.	<b>extensive</b>
<b>Transit statistics</b>	Number and rate of bytes and packets transiting the switch.	<b>extensive</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.	<b>detail extensive none</b>

Table 134: show interfaces xe Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Input Filters</b>	Names of any input filters applied to this interface.	<b>detail extensive</b>
<b>Output Filters</b>	Names of any output filters applied to this interface.	<b>detail extensive</b>
<b>Flags</b>	Information about protocol family flags.  If unicast Reverse Path Forwarding (uRPF) is explicitly configured on the specified interface, the uRPF flag appears. If uRPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag does not appear even though uRPF is enabled.	<b>detail extensive</b>
<b>Addresses, Flags</b>	Information about the address flags.	<b>detail extensive none</b>
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>Flags</b>	Information about the address flag.	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>
<b>Broadcast</b>	Broadcast address of the logical interlace.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

## Sample Output

### show interfaces

```
user@switch> show interfaces xe-0/0/1
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled,
    Flow control: Disabled
    Device flags   : Present Running
    Interface flags: SNMP-Traps Internal: 0x0

## show spanning-tree bridge

<b>Syntax</b>	show spanning-tree bridge <brief   detail> <msti <i>msti-id</i> > <routing-instance <i>routing-instance-name</i> > <vlan-id <i>vlan-id</i> >
<b>Syntax (QFX Series)</b>	show spanning-tree bridge <brief   detail> <msti <i>msti-id</i> > <vlan-id <i>vlan-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the configured or calculated Spanning Tree Protocol (STP) parameters.
<b>Options</b>	<p><b>none</b>—(Optional) Display brief STP bridge information for all multiple spanning-tree instances (MSTIs).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>msti <i>msti-id</i></b>—(Optional) Display STP bridge information for the specified MSTI.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display STP bridge information for the specified routing instance.</p> <p><b>vlan-id <i>vlan-id</i></b>—(Optional) Display STP bridge information for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show spanning-tree bridge routing-instance on page 1738</a> <a href="#">show spanning-tree bridge msti on page 1738</a> <a href="#">show spanning-tree bridge vlan-id (MSTP) on page 1739</a> <a href="#">show spanning-tree bridge (RSTP) on page 1739</a> <a href="#">show spanning-tree bridge vlan-id (RSTP) on page 1740</a>
<b>Output Fields</b>	Table 135 on page 1736 lists the output fields for the <b>show spanning-tree bridge</b> command. Output fields are listed in the approximate order in which they appear.

**Table 135: show spanning-tree bridge Output Fields**

Field Name	Field Description
Routing instance name	Name of the routing instance under which the bridge is configured.
Enabled protocol	Spanning Tree Protocol type enabled.
Root ID	Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.

Table 135: show spanning-tree bridge Output Fields (*continued*)

Field Name	Field Description
<b>Root cost</b>	Calculated cost to reach the root bridge from the bridge where the command is entered.
<b>Root port</b>	Interface that is the current elected root port for this bridge.
<b>CIST regional root</b>	Bridge ID of the elected MSTP regional root bridge.
<b>CIST internal root cost</b>	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
<b>Hello time</b>	Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs).
<b>Maximum age</b>	Configured maximum expected arrival time of hello bridge protocol data units (BPDUs).
<b>Forward delay</b>	How long an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
<b>Hop count</b>	Configured maximum number of hops a BPDUs can be forwarded in the MSTP region.
<b>Message age</b>	Number of elapsed seconds since the most recent BPDUs was received.
<b>Number of topology changes</b>	Total number of STP topology changes detected since the routing device last booted.
<b>Time since last topology change</b>	Number of elapsed seconds since the most recent topology change.
<b>Bridge ID (Local)</b>	Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
<b>Extended system ID</b>	System identifier.
<b>MSTI regional root</b>	Bridge ID of the elected MSTP regional root bridge.

## Sample Output

## show spanning-tree interface

<b>Syntax</b>	show spanning-tree interface <brief   detail> <msti <i>msti-id</i> > <routing-instance <i>routing-instance-name</i> > <vlan-id <i>vlan-id</i> >
<b>Syntax (EX Series Switches and the QFX Series)</b>	show spanning-tree interface <brief   detail> <msti <i>msti-id</i> > <vlan-id <i>vlan-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the configured or calculated interface-level STP parameters.
<b>Options</b>	<p><b>none</b>—Display brief STP interface information.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>msti <i>msti-id</i></b>—(Optional) Display STP interface information for the specified MST instance.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display STP interface information for the specified routing instance.</p> <p><b>vlan-id <i>vlan-id</i></b>—(Optional) Display STP interface information for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show spanning-tree interface on page 1743</a> <a href="#">show spanning-tree interface (QFX Series) on page 1743</a> <a href="#">show spanning-tree interface detail on page 1744</a> <a href="#">show spanning-tree interface msti on page 1745</a> <a href="#">show spanning-tree interface vlan-id on page 1746</a> <a href="#">show spanning-tree interface (VSTP) on page 1746</a> <a href="#">show spanning-tree interface vlan-id (VSTP) on page 1746</a>
<b>Output Fields</b>	Table 136 on page 1741 lists the output fields for the <b>show spanning-tree interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 136: show spanning-tree Interface Output Fields**

Field Name	Field Description
<b>Interface name</b>	Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance.

Table 136: show spanning-tree Interface Output Fields (*continued*)

Field Name	Field Description
<b>Port ID</b>	Logical interface identifier configured to participate in the MSTP or VSTP instance.
<b>Designated port ID</b>	Port ID of the designated port for the LAN segment to which this interface is attached.
<b>Designated bridge ID</b>	Bridge ID of the designated bridge for the LAN segment to which this interface is attached.
<b>Port Cost</b>	Configured cost for the interface.
<b>Port State</b>	STP port state: forwarding ( <b>FWD</b> ), blocking ( <b>BLK</b> ), listening, learning, or disabled.
<b>Port Role</b>	MSTP, VSTP, or RSTP port role: designated ( <b>DESG</b> ), backup ( <b>BKUP</b> ), alternate ( <b>ALT</b> ), ( <b>ROOT</b> ), or Root Prevented ( <b>Root-Prev</b> ).
<b>Link type</b>	MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.
<b>Alternate</b>	Identifies the interface as an MSTP, VSTP, or RSTP alternate root port ( <b>Yes</b> ) or nonalternate root port ( <b>No</b> ).
<b>Boundary Port</b>	Identifies the interface as an MSTP regional boundary port ( <b>Yes</b> ) or nonboundary port ( <b>No</b> ).

## Sample Output

### show spanning-tree interface

```

## show spanning-tree statistics

<b>Syntax</b>	show spanning-tree statistics <brief   detail> <interface <i>interface-name</i> > <routing-instance <i>routing-instance-name</i> >
<b>Syntax (EX Series Switch and the QFX Series)</b>	show spanning-tree statistics <brief   detail> <interface <i>interface-name</i>   vlan <i>vlan-id</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Display STP statistics.
<b>Options</b>	<p><b>none</b>—Display brief STP statistics.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display STP statistics for the specified interface.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display STP statistics for the specified routing instance.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show spanning-tree statistics routing-instance on page 1750</a> <a href="#">show spanning-tree statistics interface routing-instance detail on page 1750</a>
<b>Output Fields</b>	Table 138 on page 1749 lists the output fields for the <b>show spanning-tree statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 138: show spanning-tree statistics Output Fields**

Field Name	Field Description
<b>Message type</b>	Type of message being counted.
<b>BPDUs sent</b>	Total number of BPDUs sent.
<b>BPDUs received</b>	Total number of BPDUs received.
<b>BPDUs sent in last 5 secs</b>	Number of BPDUs sent in the most recent 5-second period.
<b>BPDUs received in last 5 secs</b>	Number of BPDUs received in the most recent 5-second period.
<b>Interface</b>	Interface for which the statistics are being displayed.

Table 138: show spanning-tree statistics Output Fields (*continued*)

Field Name	Field Description
Next BPDU transmission	Number of seconds until the next BPDU is scheduled to be sent.

## Sample Output

**show spanning-tree  
statistics  
routing-instance**

```
user@host> show spanning-tree statistics routing-instance vs1 detail
Routing instance level STP statistics
Message type           : bpdus
BPDUs sent             : 121
BPDUs received         : 537
BPDUs sent in last 5 secs : 5
BPDUs received in last 5 secs : 27
```

**show spanning-tree  
statistics interface  
routing-instance detail**

```
user@host> show spanning-tree statistics interface ge-11/1/4 routing-instance vs1 detail
Interface  BPDUs sent  BPDUs received  Next BPDU
              transmission
ge-11/1/4      7           190             0
```

## show system statistics arp

<b>Syntax</b>	show system statistics arp
<b>Release Information</b>	Command introduced in Junos OS Release 9.6 for EX Series switches.
<b>Description</b>	Display system-wide Address Resolution Protocol (ARP) statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Proxy ARP on an EX Series Switch</a></li> <li>• <a href="#">Verifying That Proxy ARP Is Working Correctly on page 1683</a></li> </ul>

## Sample Output

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    0 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length
    0 datagrams with multicast source address
    0 datagrams with multicast source address
    0 datagrams with my own hardware address
    0 datagrams for an address not on the interface
    0 datagrams with a broadcast source address
    294 datagrams with source address duplicate to mine
    89113 datagrams which were not for me
    0 packets discarded waiting for resolution
    0 packets sent after waiting for resolution
    309 ARP requests sent
    35 ARP replies sent
    0 requests for memory denied
    0 requests dropped on entry
    0 requests dropped during retry
    0 requests dropped due to interface deletion
    0 requests on unnumbered interfaces
    0 new requests on unnumbered interfaces
    0 replies for from unnumbered interfaces
    0 requests on unnumbered interface with non-subnetted donor
    0 replies from unnumbered interface with non-subnetted donor

```

## show vlans

**Syntax** `show vlans`  
`<brief | detail | extensive>`  
`<dot1q-tunneling>`  
`<sort-by (tag | name)>`  
`<vlan-range-name>`

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.  
Option **dot1q-tunneling** added in Junos OS Release 12.1 for the QFX Series.

**Description** Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a VoIP VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

**NOTE:** When a series of VLANs is created using the `vlan-range` statement, such VLAN names are preceded and followed by a double underscore. For example, a series of VLANs using the VLAN range 1 through 3 and the base VLAN name `marketing` would be displayed as `__marketing_1__`, `__marketing_2__`, and `__marketing_3__`.

**NOTE:** To display an 802.1X supplicant successfully authenticated in multiple-suppliant mode with dynamic VLAN movement, use the `show vlans vlan-name extensive` operational mode command, where `vlan-name` is the dynamic VLAN.

**Options** **none**—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**sort-by (tag | name)**—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

**vlan-range-name**—(Optional) Display VLANs in ascending order of VLAN range names.

**Required Privilege Level** `view`

**Output Fields** [Table 100 on page 1364](#) lists the output fields for the **show vlans** command. Output fields are listed in the approximate order in which they appear.

**Table 139: show vlans Output Fields**

Field Name	Field Description	Level of Output
<b>Name</b>	Name of a VLAN.	none, <b>brief</b>
<b>Tag</b>	802.1Q tag applied to this VLAN. If <b>none</b> is displayed, no tag is applied.	All levels
<b>Interfaces</b>	Interface associated with learned MAC addresses or <b>All-members</b> option (flood entry). An asterisk (*) beside the interface indicates that the interface is <b>UP</b> .	All levels
<b>Address</b>	IP address.	none, <b>brief</b>
<b>Ports Active /Total</b>	Number of interfaces associated with a VLAN: <b>Active</b> indicates interfaces that are <b>UP</b> , and <b>Total</b> indicates interfaces that are active and inactive.	<b>brief</b>
<b>VLAN</b>	Name of a VLAN.	<b>detail, extensive</b>
<b>Admin state</b>	State of the interface. Values are:  <b>enabled</b> —The interface is turned on, and the physical link is operational and can pass packets.	<b>detail,extensive</b>
<b>MAC learning Status</b>	Indicates if MAC learning is disabled.	<b>detail, extensive</b>
<b>Description</b>	Description for the VLAN.	<b>detail,extensive</b>
<b>Primary IP</b>	Primary IP address associated with a VLAN.	<b>detail</b>
<b>Number of interfaces</b>	Number of interfaces associated with a VLAN. Both the total number of interfaces and the number of active interfaces associated with a VLAN are displayed.	<b>detail, extensive</b>
<b>STP</b>	Spanning tree associated with a VLAN.	<b>detail,extensive</b>
<b>Tagged interfaces</b>	Tagged interfaces with which a VLAN is associated.	<b>detail,extensive</b>

Table 139: show vlans Output Fields (*continued*)

Field Name	Field Description	Level of Output
Untagged interfaces	Untagged interfaces with which a VLAN is associated.	detail, extensive
Dot1q Tunneling Status	Indicates if Q-in-Q tunneling is enabled.	extensive
Customer VLAN ranges	List of customer VLAN (C-VLAN) ranges associated with this service VLAN (S-VLAN).	extensive
Private VLAN Mode	The private VLAN mode for this VLAN. Values include <b>Primary</b> , <b>Isolated</b> , and <b>Community</b> .	extensive
Primary VLAN	Primary VLAN tag for this secondary VLAN.	extensive
Internal Index	VLAN index internal to Junos OS software.	extensive
Origin	Manner in which the VLAN was created: <b>static</b> or <b>learn</b> .	extensive
Protocol	Port-based VLAN or MAC-based VLAN. MAC-based protocol is displayed when VLAN assignment is done either statically or dynamically through 802.1X,	extensive
IP addresses	IP address associated with a VLAN.	extensive
Number of MAC entries	For MAC-based VLANs created either statically or dynamically, the MAC addresses associated with an interface.	extensive
Number of mapping rules	Number of mapping rules for Q-in-Q tunneling ( <b>Push</b> ) and VLAN translation ( <b>Swap</b> ).	
Secondary VLANs	Secondary VLANs associated with a primary VLAN.	extensive
Isolated VLANs	Isolated VLANs associated with a primary VLAN.	extensive
Community VLANs	Community VLANs associated with a primary VLAN.	extensive
VLANs summary	VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of VLANs on the switch.</li> <li>• <b>Configured VLANs</b>—Number of VLANs that are based on user-configured settings.</li> <li>• <b>Internal VLANs</b>—Number of VLANs created by the system with no explicit configuration or protocol—for example, the <b>default</b> VLAN and the VLAN created when a trunk interface is not configured with native VLAN membership.</li> <li>• <b>Temporary VLANs</b>—Number of VLANs from the previous configuration that the system retains for a limited time after restart. Temporary VLANs are converted into one of the other types of VLAN, or are removed from the system if the current configuration does not require them.</li> </ul>	All levels

Table 139: show vlans Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Dot1q VLANs summary</b>	802.1Q VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of 802.1Q-tagged and untagged VLANs on the switch.</li> <li>• <b>Tagged VLANs</b>—Number of 802.1Q-tagged VLANs.</li> <li>• <b>Untagged VLANs</b>—Number of untagged 802.1Q VLANs.</li> <li>• <b>Private VLAN</b>—Counts of the following kinds of 802.1Q private VLANs (PVLANS):               <ul style="list-style-type: none"> <li>• <b>Primary VLANs</b>—Number of primary forwarding private VLANs.</li> <li>• <b>Community VLANs</b>—Number of community transporting and forwarding private VLANs.</li> <li>• <b>Isolated VLANs</b>—Number of isolated receiving and forwarding private VLANs.</li> <li>• <b>Inter-switch-isolated VLANs</b>—Number of inter-switch isolated receiving and forwarding private VLANs.</li> </ul> </li> </ul>	All levels
<b>Dot1q Tunneled VLANs summary</b>	Q-in-Q-tunneled VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of Q-in-Q-tunneled VLANs on the switch.</li> <li>• <b>Private VLAN</b>—Counts of primary, community, and isolated Q-in-Q-tunneled private VLANs (PVLANS).</li> </ul>	All levels

## Troubleshooting Ethernet Switching

**Problem** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution** Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

  - [mac-table-aging-time on page 1610](#)

## Troubleshooting Layer 2 Protocol Tunneling

- [Drop Threshold Statistics Might Be Incorrect on page 1762](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 1762](#)

### Drop Threshold Statistics Might Be Incorrect

**Problem** L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

**Solution** This is expected behavior.

### Egress Filtering of L2PT Traffic Not Supported

**Problem** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

- Related Documentation**
- [Understanding Layer 2 Protocol Tunneling on page 1419](#)
  - [Configuring Layer 2 Protocol Tunneling on page 1563](#)

## Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

- [Limitations of Private VLANs on page 1763](#)
- [Forwarding with Private VLANs on page 1763](#)
- [Egress Firewall Filters with Private VLANs on page 1764](#)

### Limitations of Private VLANs

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

### Forwarding with Private VLANs

- Problem**
- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the `show ethernet-switching table` command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
  - If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
  - If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
    - The packet has a community VLAN tag.
    - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
  - If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
    - The packet has an isolated VLAN tag.
    - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.
  - If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
  - If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
    - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.

- Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
- Primary VLAN pvlan100 exists on both switches.

If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

**Solution** These are expected behaviors.

---

### Egress Firewall Filters with Private VLANs

---

**Problem** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

## Troubleshooting Q-in-Q and VLAN Translation Configuration

- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 1765](#)
- [Egress Port Mirroring with VLAN Translation on page 1765](#)

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same EtherType.

### Egress Port Mirroring with VLAN Translation

**Problem** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

- [Understanding VRRP on page 1774](#)

### Graceful Restart Concepts

With routing protocols, any service interruption requires that an affected router recalculate adjacencies with neighboring routers, restore routing table entries, and update other protocol-specific information. An unprotected restart of a router can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Three main types of graceful restart are available on Juniper Networks routing platforms:

- Graceful restart for aggregate and static routes and for routing protocols—Provides protection for aggregate and static routes and for Border Gateway Protocol (BGP), End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), next-generation RIP (RIPng), and Protocol Independent Multicast (PIM) sparse mode routing protocols.
- Graceful restart for MPLS-related protocols—Provides protection for Label Distribution Protocol (LDP), Resource Reservation Protocol (RSVP), circuit cross-connect (CCC), and translational cross-connect (TCC).
- Graceful restart for virtual private networks (VPNs)—Provides protection for Layer 2 and Layer 3 VPNs.

Graceful restart works similarly for routing protocols and MPLS protocols and combines components of these protocol types to enable graceful restart in VPNs. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of

all routing protocol updates. Graceful restart thus enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Most graceful restart implementations define two types of routers—the restarting router and the helper router. The restarting router requires rapid restoration of forwarding state information so it can resume the forwarding of network traffic. The helper router assists the restarting router in this process. Graceful restart configuration statements typically affect either the restarting router or the helper router.

## Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

**TIP:** Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the **request system software add component all** command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and expediently, but this type of upgrade does not provide resiliency or switchover capabilities.

- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (`request system software nonstop-upgrade` `director-group` | `fabric` | `node-group`) described in this topic in the correct order.

NOTE:

- Before you begin a nonstop software upgrade, issue the `request system software download` command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see [“Verifying Nonstop Software Upgrade for QFabric Systems” on page 1868](#).
- Issue the `show fabric administration inventory` command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **`request system software nonstop-upgrade director-group`** command. The key actions that occur during a Director group upgrade are:
  1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
  2. The QFabric system downloads and installs the new software in both Director devices.
  3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.
  4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.

5. The backup Director device reboots to activate the new software.
6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.
8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

**NOTE:** After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

**TIP:**

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see [“Configuring Graceful Restart for QFabric Systems” on page 1777](#).
  - Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric upgrade. You can verify the operational status of both Director devices by issuing the `show fabric administration inventory director-group status` command. Also, issue the `show fabric administration inventory infrastructure` command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).
- 
- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:

1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
2. One fabric control Routing Engine reboots and comes back online.
3. The other fabric control Routing Engine reboots and comes back online.
4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

**NOTE:**

- If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
- If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.

- **Node group**—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

The key actions that occur during a network Node group upgrade are:

1. The QFabric system copies the new software to each Node device one at a time.
2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
3. The system copies the software to the network Node group Routing Engines.
4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.
5. The backup network Node group Routing Engine reboots and comes back online.
6. The supporting Node devices reboot and come back online one at a time.

**NOTE:** To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

The key actions that occur during a redundant server Node group upgrade are:

1. The QFabric system copies the new software to the backup Node device, then the master Node device.
2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.
3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

**NOTE:** For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

## Understanding VRRP

The Juniper Networks QFX Series supports the Virtual Router Redundancy Protocol (VRRP). This topic covers:

- [Overview of VRRP on page 1774](#)
- [Sample VRRP Topology on page 1775](#)

### Overview of VRRP

---

Configuring end hosts on your network with static default routes minimizes configuration effort and complexity and reduces processing overhead on the end hosts. When hosts are configured with static routes, the failure of the default gateway normally results in a

catastrophic event, isolating all hosts that are unable to detect available alternate paths to their gateway. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for end hosts if the primary gateway fails.

VRRP (defined in RFC 3768) provides dynamic failover of IP addresses from one router to another in the event of failure. You can implement VRRP to provide a highly available default path to a gateway without needing to configure dynamic routing or router discovery protocols on end hosts.

Switches configured with VRRP share a virtual IP address, which is the address you configure as the default route on the hosts. At any time, one of the switches is the VRRP master, meaning that it owns the virtual IP address and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure (**1 through 255**). If the master fails, the backup switch with the highest priority becomes the master within a few seconds. This is done without any interaction with the hosts.

In VRRP operation, the master sends advertisements to the backup switches at regular intervals. The default interval is 1 second. If the backup switches do not receive an advertisement for a set period, the backup with the highest priority takes over as master within a few seconds and begins forwarding packets. This is done without any interaction with the hosts.

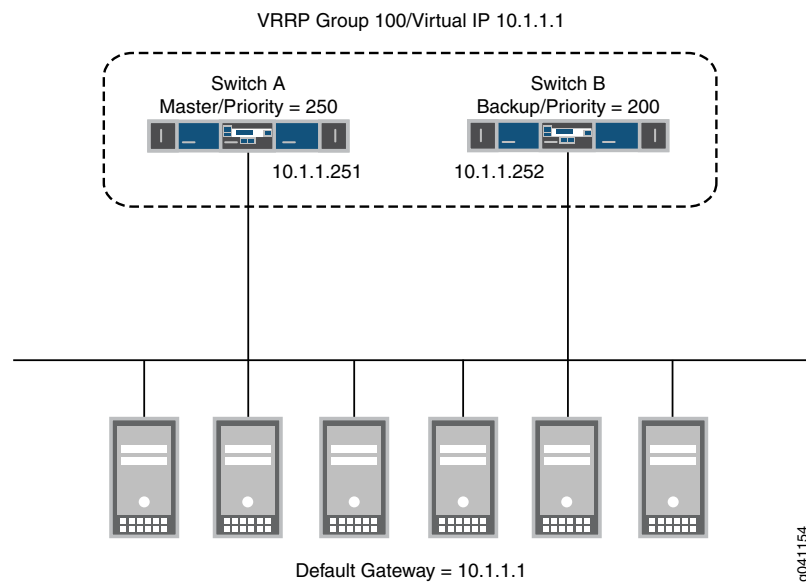

**NOTE:** Priority 255 cannot be set for routed VLAN interfaces (RVIs).

### Sample VRRP Topology

Figure 38 on page 1776 illustrates a basic VRRP topology. In this example, switches A, B, and C are running VRRP and share the virtual IP address 10.1.1.1. The default gateway for each of the clients is 10.1.1.1.

Figure 38: Basic VRRP Topology

## Configuration Tasks for Graceful Restart

---

- [Configuring Graceful Restart for QFabric Systems on page 1777](#)
- [Configuring Routing Protocols Graceful Restart on page 1781](#)

### Configuring Graceful Restart for QFabric Systems

When you configure graceful restart in the QFabric CLI, the QFabric system applies the configuration to the network Node group to participate in graceful restart operations with devices external to the QFabric system. Such configuration preserves routing table state and helps neighboring routing devices to resume routing operations more quickly after a system restart. This also enables the network Node group to resume routing operations rapidly if there is a restart in the QFabric system (such as a software upgrade). As a result, we recommend enabling graceful restart for routing protocols in the QFabric CLI.

**NOTE:** The QFabric system also uses graceful restart internally within the fabric to facilitate interfabric resiliency and recovery. This internal feature is enabled by default with no configuration required.

- [Enabling Graceful Restart on page 1778](#)
- [Configuring Graceful Restart Options for BGP on page 1778](#)
- [Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1779](#)
- [Tracking Graceful Restart Events on page 1780](#)

## Enabling Graceful Restart

---

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
  graceful-restart;  
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]  
routing-options {  
  graceful-restart {  
    disable;  
    restart-duration seconds;  
  }  
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

## Configuring Graceful Restart Options for BGP

---

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]  
protocols {  
  bgp {  
    graceful-restart {  
      disable;
```

```

        restart-time seconds;
        stale-routes-time seconds;
    }
}
routing-options {
    graceful-restart;
}

```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```

[edit]
protocols {
    ospf | ospfv3 {
        graceful-restart {
            disable;
            helper-disable
            no-strict-lsa-checking;
            notify-duration seconds;
            restart-duration seconds;
        }
    }
}
routing-options {
    graceful-restart;
}

```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
 graceful-restart {
   helper-disable <both | restart-signaling | standard>
 }
```

To reenble the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

TIP: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospfv3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1780](#).

NOTE: If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

---

## Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols protocol traceoptions flag]** hierarchy level:

```
[edit protocols]
 isis {
   traceoptions {
     flag graceful-restart;
   }
 }
```

```

}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}

```

## Configuring Routing Protocols Graceful Restart

This topic includes the following sections:

- [Enabling Graceful Restart on page 1781](#)
- [Configuring Graceful Restart Options for BGP on page 1782](#)
- [Configuring Graceful Restart Options for ES-IS on page 1783](#)
- [Configuring Graceful Restart Options for IS-IS on page 1783](#)
- [Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1784](#)
- [Configuring Graceful Restart Options for RIP and RIPng on page 1785](#)
- [Configuring Graceful Restart Options for PIM Sparse Mode on page 1785](#)
- [Tracking Graceful Restart Events on page 1787](#)

### Enabling Graceful Restart

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```

routing-options {
  graceful-restart;
}

```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```

[edit]
routing-options {
  graceful-restart {
    disable;
    restart-duration seconds;
  }
}

```

```
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

### Configuring Graceful Restart Options for BGP

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]
protocols {
  bgp {
    graceful-restart {
      disable;
      restart-time seconds;
      stale-routes-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for ES-IS

On J Series Services Routers, to configure the duration of the ES-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

```
[edit]
protocols {
  esis {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable ES-IS graceful restart capability, include the **disable** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

### Configuring Graceful Restart Options for IS-IS

To configure the duration of the IS-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

```
[edit]
protocols {
  isis {
    graceful-restart {
      disable;
      helper-disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable IS-IS graceful restart helper capability, include the **helper-disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level. To disable IS-IS graceful restart capability, include the **disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

**NOTE:** If you configure Bidirectional Forwarding Detection (BFD) and graceful restart for IS-IS, graceful restart might not work as expected.

**NOTE:** You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols isis]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1780](#).

## Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
graceful-restart {
  helper-disable <both | restart-signaling | standard>
}
```

To reenabling the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

**NOTE:**

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the `helper-disable` statement at the `[edit protocols ospfv3 graceful-restart]` hierarchy level.

**TIP:** You can also track graceful restart events with the `traceoptions` statement at the `[edit protocols (ospf | ospf3)]` hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1780](#).

**NOTE:** You cannot enable OSPFv3 graceful restart between a routing platform running Junos OS Release 7.5 and earlier and a routing platform running Junos OS Release 7.6 or later. As a workaround, make sure both routing platforms use the same Junos OS version.

**NOTE:** If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

### Configuring Graceful Restart Options for RIP and RIPng

To configure the duration of the RIP or RIPng graceful restart period, include the `restart-time` statement at the `[edit protocols (rip | ripng) graceful-restart]` hierarchy level.

```
[edit]
protocols {
  (rip | ripng) {
    graceful-restart {
      disable;
      restart-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable RIP or RIPng graceful restart capability, include the `disable` statement at the `[edit protocols (rip | ripng) graceful-restart]` hierarchy level.

### Configuring Graceful Restart Options for PIM Sparse Mode

PIM sparse mode continues to forward existing multicast packet streams during a graceful restart, but does not forward new streams until after the restart is complete. After a restart, the routing platform updates the forwarding state with any updates that were received from neighbors and occurred during the restart period. For example, the routing

platform relearns the join and prune states of neighbors during the restart, but does not apply the changes to the forwarding table until after the restart.

PIM sparse mode-enabled routing platforms generate a unique 32-bit random number called a generation identifier. Generation identifiers are included by default in PIM hello messages, as specified in the IETF Internet draft *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When a routing platform receives PIM hellos containing generation identifiers on a point-to-point interface, Junos OS activates an algorithm that optimizes graceful restart.

Before PIM sparse mode graceful restart occurs, each routing platform creates a generation identifier and sends it to its multicast neighbors. If a PIM sparse mode-enabled routing platform restarts, it creates a new generation identifier and sends it to its neighbors. When a neighbor receives the new identifier, it resends multicast updates to the restarting router to allow it to exit graceful restart efficiently. The restart phase completes when either the PIM state becomes stable or when the restart interval timer expires.

If a routing platform does not support generation identifiers or if PIM is enabled on multipoint interfaces, the PIM sparse mode graceful restart algorithm does not activate, and a default restart timer is used as the restart mechanism.

To configure the duration of the PIM graceful restart period, include the **restart-duration** statement at the **[edit protocols pim graceful-restart]** hierarchy level:

```
[edit]
protocols {
  pim {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable PIM sparse mode graceful restart capability, include the **disable** statement at the **[edit protocols pim graceful-restart]** hierarchy level.

**NOTE:** Multicast forwarding can be interrupted in two ways. First, if the underlying routing protocol is unstable, multicast reverse-path-forwarding (RPF) checks can fail and cause an interruption. Second, because the forwarding table is not updated during the graceful restart period, new multicast streams are not forwarded until graceful restart is complete.

---

### Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols *protocol* traceoptions flag]** hierarchy level:

```
[edit protocols]
isis {
  traceoptions {
    flag graceful-restart;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}
```

### Configuration Example for VRRP

- [Example: Configuring VRRP for Load Sharing on page 1787](#)

#### Example: Configuring VRRP for Load Sharing

If you do not want to dedicate a switch to be a VRRP backup (and therefore leave it idle unless the master fails), you can create a load-sharing configuration in which each participating switch simultaneously acts as a master and a backup.

One reason to use a load-sharing (active-active) configuration is that you are more likely to actively monitor and maintain both switches and notice if a problem occurs on either of them. If you use a configuration in which one switch is only a backup (an active-backup configuration), you might be less likely to pay attention to the backup switch while it is idle. In the worst case, this could lead to the backup switch developing an undetected problem and not being able to perform adequately when a failover occurs.

- [Requirements on page 1788](#)
- [Overview and Topology on page 1788](#)
- [Configuring VRRP on Both Switches on page 1789](#)
- [Verification on page 1791](#)

Requirements

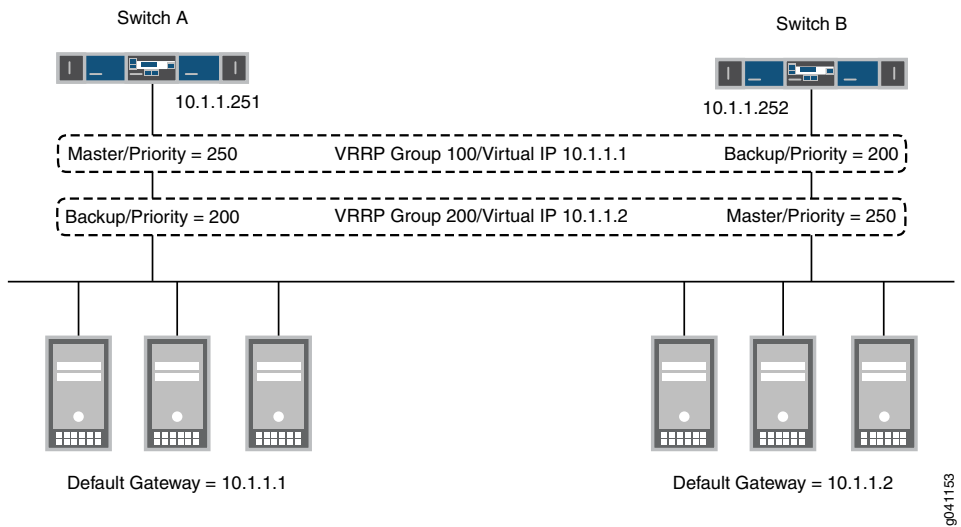

This example uses the following hardware and software components:

- Two QFX3500 switches
- Junos OS Release 11.3 or later
- Static routing or a dynamic routing protocol enabled on both switches.

Overview and Topology

This example uses two VRRP groups, each of which has its own virtual IP address. Devices on the LAN use one of these virtual IP addresses as their default gateway. If one of the switches fails, the other switch takes over for it. In the topology shown in [Figure 39 on page 1788](#), for example, Switch A is the master for VRRP group 100. If Switch A fails, Switch B takes over and forwards traffic that the end devices send to the default gateway address 10.1.1.1.

Figure 39: VRRP Load-Sharing Configuration

This example shows a simple configuration to illustrate the basic steps for configuring two switches running VRRP to back each other up. [Table 140 on page 1788](#) lists VRRP settings for each switch.

Table 140: Settings for VRRP Load-Sharing Example

Switch A	Switch B
VRRP Group 100:	VRRP Group 100:
<ul style="list-style-type: none"><li>• Interface address: 10.1.1.251</li><li>• VIP: 10.1.1.1</li><li>• Priority: 250</li></ul>	<ul style="list-style-type: none"><li>• Interface address: 10.1.1.252</li><li>• VIP: 10.1.1.1</li><li>• Priority: 200</li></ul>

Table 140: Settings for VRRP Load-Sharing Example (*continued*)

Switch A	Switch B
VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.251</li> <li>VIP: 10.1.1.2</li> <li>Priority: 200</li> </ul>	VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.252</li> <li>VIP: 10.1.1.2</li> <li>Priority: 250</li> </ul>

In addition to configuring the two switches as shown, you must configure your end devices so that some of them use one of the virtual IP addresses as their default gateway and the remaining end devices use the other virtual IP address as their default gateway.

Note that if a failover occurs, the remaining switch might be unable to handle all of the traffic, depending on the demand.

### Configuring VRRP on Both Switches

#### CLI Quick Configuration

Enter the following on Switch A:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 priority 200
```

Enter the following on Switch B:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 priority 250
```

#### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch A:

- Create VRRP group 100 on Switch A and configure the virtual IP address for the group:
 

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```
- Assign the VRRP priority for this interface in this group:
 

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```
- Create VRRP group 200 on Switch A and configure the virtual IP address for the group:
 

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```
- Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
100 priority 200
```

### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch B:

1. Create VRRP group 100 on Switch B and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
100 priority 200
```

Switch A remains the master for group 100 because it has the highest priority for this group.

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
100 priority 250
```

Switch B becomes the master for group 200 because it has the highest priority for this group.

**Results** Display the results of the configuration on Switch A:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.251 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 250
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 200
          }
        }
      }
    }
  }
}
```

Display the results of the configuration on Switch B:

```

user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.252 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 200
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 250
          }
        }
      }
    }
  }
}

```

### Verification

- [Verifying that VRRP is Working on Switch A on page 1791](#)
- [Verifying that VRRP is Working on Switch B on page 1791](#)

#### *Verifying that VRRP is Working on Switch A*

**Purpose** Verify that VRRP is active on Switch A and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch A and that the switch is master for group 100 and backup for group 200.

```

user@switch> show vrrp

```

Interface Address	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	master	A .0327 1c1 10.1.1.251 vip 10.1.1.1	
xe-0/0/0.0	up	200	backup	A .0327 1c1 10.1.1.251 vip 10.1.1.2	

**Meaning** The `show vrrp` command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The `1c1` address is the physical address of the interface and the `vip` address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 200 does not arrive before the timer expires, Switch A asserts itself as the master for this group.

#### *Verifying that VRRP is Working on Switch B*

**Purpose** Verify that VRRP is active on Switch B and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch B and that the switch is backup for group 100 and master for group 200.

```
user@switch> show vrrp
```

Interface	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	backup	A .0327 lcl 10.1.1.252 vip 10.1.1.1	
xe-0/0/0.0	up	200	master	A .0327 lcl 10.1.1.252 vip 10.1.1.2	

**Meaning** The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 100 does not arrive before the timer expires, Switch B asserts itself as the master for this group.

- [Configuring Inheritance for a VRRP Group on page 1801](#)

### Configuring Basic VRRP Support

To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {
    priority number;
    virtual-address [ addresses ];
}
```

An interface can be a member of multiple VRRP groups.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

For each interface, you must configure the following:

- Group identifier—Assign a value from 0 through 255. You must use the same identifier for each switch in the VRRP group.
- Priority—Assign a value from 1 through 255. The switch with the highest priority becomes the VRRP master. Assign different priorities to each switch in the VRRP group. If there are two or more switches with the same priority, the switch with the VRRP interface that has the highest IP address becomes the master.
- Virtual IP address—Normally, you configure only one address per group, but you can configure as many as eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
  - You must configure the same address on all the switches in the VRRP group.
  - If you configure a virtual IP address to be the same as a physical interface address, the switch with that interface becomes the master for the group. You must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
  - If the virtual IP address is not the same as the physical interface address, you must ensure that the address does not appear anywhere else in the switch configuration. For example, verify that you do not use this address for another interface (including an aggregated Ethernet interface) or for a static ARP entry.

**NOTE:** If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement at the **[edit interfaces *interface-name*]** hierarchy. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

#### Related Documentation

- [Understanding VRRP on page 1774](#)
- [Configuring the Startup Period for VRRP Operations on page 1794](#)
- [Configuring VRRP Authentication \(IPv4 Only\) on page 1793](#)

## Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted switches participate in a VRRP group. By default, VRRP authentication is disabled. You can configure one of the following authentication methods for a group, and each switch in the same group must use the same method:

- Simple authentication—Uses a text password included in the transmitted packet. The receiving switch uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Adds an authentication header (AH) to the IP packet that encapsulates the VRRP packet. You create an authentication key that is used to create a hash of the packet, and the hash is stored in the AH. A receiving switch recalculates the hash on the incoming packet and compares the hashes. If they are identical, the packet is valid and is accepted. Otherwise the switch drops the incoming packet.

To enable authentication and specify an authentication method, include the **authentication-type** statement.

**authentication-type** *authentication*;

**authentication** can be **simple** or **md5**. The authentication type must be the same for all the switches in the VRRP group.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

**authentication-key** *key*;

**key** (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").

**NOTE:** The key must be the same for all switches in the VRRP group.

---

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

- [Configuring Basic VRRP Support on page 1792](#)

## Configuring the Startup Period for VRRP Operations

Configure the startup-silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets while an interface is coming online. The period starts when the state of a VRRP interface is changed from down to up. During this period, Master Down Events are ignored.

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
  startup-silent-period seconds;
```

- [Example: Configuring VRRP for Load Sharing on page 1787](#)

## Configuring the Advertisement Interval for the VRRP Master

By default, the master switch sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master switch is still operational. If the master switch fails or becomes unreachable, the backup switch with the highest priority value becomes the new master switch.

You can modify the advertisement interval in seconds or in milliseconds; the interval must be the same for all routing platforms in the VRRP group.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 1795](#)
- [Modifying the Advertisement Interval in Milliseconds on page 1795](#)

### Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

```
advertise-interval seconds;
```

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

### Modifying the Advertisement Interval in Milliseconds

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the **fast-interval** statement:

```
fast-interval milliseconds;
```

The interval can be from 100 through 999 milliseconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

**NOTE:** Junos OS sets the advertisement interval to 0 in VRRP packets. When you configure VRRP with other vendors' equipment, the *fast-interval* statement works correctly only when the other equipment also has the advertisement interval set to 0 in the VRRP packet. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

## Configuring VRRP Preemption and Hold Time

- [Configuring VRRP Preemption on page 1796](#)
- [Configuring the Preemption Hold Time on page 1796](#)
- [Overriding the Hold Time on page 1797](#)

### Configuring VRRP Preemption

---

By default, a higher-priority VRRP backup switch preempts a lower-priority master switch. To explicitly enable this behavior, include the following statement:

```
preempt;
```

To prohibit a higher-priority VRRP backup switch from preempting a lower-priority master switch, include the following statement on the lower-priority switch:

```
no-preempt;
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

### Configuring the Preemption Hold Time

---

You can also configure a preemption hold time, which is the number of seconds a higher-priority backup router that has just started up waits before preempting the master router. You might want to configure a hold time so that routing protocols or other Junos OS components converge before preemption occurs.

The hold time is applied only on startup. By default, the hold-time value is 0 seconds, meaning that preemption can occur immediately after the backup router starts up.

To modify the preemption hold-time value, configure the following statement:

```
hold-time seconds;
```

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address vrrp-group *group-id*] preempt**

### Overriding the Hold Time

You can use the **asymmetric-hold-time** statement to configure a VRRP master to fail over to the backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.

When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.

You can include this statement at the following hierarchy level:

- **[edit protocols vrrp]**

## Configuring a Route to Be Tracked

A VRRP master can track a route and dynamically trigger a new master router election if the route becomes unreachable. To enable this behavior, you must configure a cost that will be subtracted from the priority of the master if the tracked route becomes unreachable. The new priority must be less than the priority of one of the backups so that the backup becomes the new master.

To configure a route to be tracked, include the following statements:

```
track {
  priority-hold-time seconds;
  route prefix/prefix-length routing-instance default priority-cost priority;
}
```

You can include these statements at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

The **prefix** and **prefix-length** values specify the route to be tracked. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority of the master changes because of a tracking event, the priority hold timer

begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **priority-cost** option is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

**Related  
Documentation**

- [Understanding VRRP on page 1774](#)
- [Configuring Basic VRRP Support on page 1792](#)
- [Example: Configuring VRRP for Load Sharing on page 1787](#)
- [Configuring a Logical Interface to Be Tracked on page 1798](#)

## Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can change the priority of the switch based on the state of the interface, which might trigger a new master election. VRRP can also track the operational speed of a logical interface and update the priority of the switch when the speed crosses a configured threshold. For each VRRP group, you can track as many as 10 logical interfaces.

When interface tracking is enabled on a switch, you cannot assign the switch a priority of 255 to make it the master for the group.

To configure a logical interface to be tracked, include the following statements:

```
track {  
  interface interface-name {  
    bandwidth-threshold bits-per-second priority-cost priority;  
    priority-cost priority;  
  }  
  priority-hold-time seconds;  
}
```

You can include these statements at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

The interface specified is the interface to be tracked for the VRRP group. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **bandwidth-threshold** statement specifies a threshold for the tracked interface. If the bandwidth of the tracked interface drops below the threshold value, the system subtracts

the bandwidth threshold **priority-cost** value from the VRRP priority for the switch. You can create as many as five **bandwidth-threshold** statements for each tracked interface.

The interface **priority-cost** statement is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

If you configure tracking for more than one interface, Junos OS subtracts the sum of the priority costs for the tracked interfaces from the VRRP priority if all the tracked interfaces fail. However, if you configure the interface **priority-cost** statement and the bandwidth threshold **priority-cost** statement, they are not added together. The switch uses only one priority cost for a tracked interface, as indicated in [Table 141 on page 1799](#):

**Table 141: Interface State and Priority Cost Usage**

Tracked Interface State	Priority Cost Usage
Down	<b>priority cost</b> <i>priority</i>
Not down; media speed below one or more bandwidth thresholds	Priority-cost of the lowest applicable bandwidth threshold

You must configure an interface priority cost only if you do not configure any bandwidth thresholds. If you do not configure an interface **priority-cost** value and the interface fails, Junos OS subtracts the bandwidth threshold **priority-cost** value of the lowest bandwidth threshold from the priority of the switch.

## Configuring a Backup to Accept Packets Destined for the Virtual IP Address

By default, a switch configured to be a VRRP backup but acting as the master does not process packets sent to the virtual IP address—that is, packets in which the destination address is the virtual IP address. To configure a backup switch to process packets sent to the virtual IP address while it is acting as the master, include the **accept-data** statement on the backup:

```
accept-data;
```

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group] *group-id***

To explicitly prohibit the backup from accepting packets destined for the virtual IP address while acting as master, include the **no-accept-data** statement:

```
no-accept-data;
```

If you include the **accept-data** statement, configure the connected hosts so that they:

- Process gratuitous ARP requests.
- Do not use packets other than ARP replies to update their ARP cache.

This statement is disabled by default. If you enable it, your configuration does not comply with RFC 3768.

To restrict incoming IP packets to ICMP only, you must configure firewall filters to accept only ICMP packets.

- [Configuring Basic VRRP Support on page 1792](#)
- [Example: Configuring VRRP for Load Sharing on page 1787](#)

## Configuring Passive ARP Learning for VRRP Backups

By default, VRRP backup switches drop ARP requests for the MAC address of the VRRP IP. This means that backups do not learn the ARP mappings (IP address to MAC address mappings) for the hosts sending the requests. If it becomes the master, the configured backup must learn all the entries that were present in the ARP cache of the original master. In environments with many directly attached hosts, the number of ARP entries to learn can be very large. This can cause a significant delay while the backup transitions to the master state, during which traffic transmitted to some of the hosts might be dropped.

Passive ARP learning enables the ARP cache in the backup to learn approximately the same contents as the ARP cache in the master, thus preventing the problem of needing to learn many ARP entries quickly. To enable passive ARP learning, include the **passive-learning** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]  
passive-learning;
```

We recommend setting passive learning on both the backup and master VRRP switches. Doing so prevents the need to manually configure a master that fails and becomes a backup. While a switch operates as the master, the passive learning configuration has no impact. The configuration takes effect only when a switch operates as a backup.

## Configuring the Silent Period

When the state of a VRRP interface changes from down to up, a silent period begins. During this period, any master down events are ignored. Configure the silent period interval to avoid problems that can be caused if incoming VRRP advertisement packets are delayed or interrupted while an interface starts up.

To configure the silent period, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
  startup-silent-period seconds;
```

## Configuring Inheritance for a VRRP Group

Junos OS enables you to configure VRRP groups on the various subnets of a VLAN to inherit the state and configuration of one of the groups, which is known as the *active VRRP group*. By configuring inheritance, you can prevent VRRP groups other than the active group from sending out VRRP advertisements. When the **vrrp-inherit-from** configuration statement is included in the configuration, only the active VRRP group from which the other VRRP groups are inheriting the state sends out VRRP advertisements; the groups inheriting the state do not send any VRRP advertisements, because the state is maintained only on the group from which the state is inherited.

If the **vrrp-inherit-from** statement is not configured, each of the VRRP master groups in the various subnets on the VLAN sends out separate VRRP advertisements and adds to the traffic on the VLAN.

To configure inheritance for a VRRP group, include the **vrrp-inherit-from** statement at the **[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id]**:

```
[edit interfaces interface-name unit logical-unit-number family inet address address
  vrrp-group group-id]
  vrrp-inherit-from vrrp-group;
```

When you configure a group to inherit a state from another group, note the following conditions:

- Both inheriting groups and active groups must be on the same physical interface and logical system. However, the groups need not necessarily be on the same VLAN or logical interface.

- Both inheriting groups and active groups must be on the same routing instances; however, this limitation does not apply for groups on the integrated routing and bridging (IRB) interfaces.

When you include the **vrrp-inherit-from** statement for a VRRP group, the VRRP group inherits the following parameters from the active group:

- **advertise-interval**
- **authentication-key**
- **authentication-type**
- **fast-interval**
- **preempt | no-preempt**
- **priority**
- **track interfaces**
- **track route**

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

## graceful-restart (Enabling Globally)

<b>Syntax</b>	<pre> graceful-restart {   disable;   helper-disable;   maximum-helper-recovery-time <i>seconds</i>;   maximum-helper-restart-time <i>seconds</i>;   notify-duration <i>seconds</i>;   recovery-time <i>seconds</i>;   restart-duration <i>seconds</i>;   stale-routes-time <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally.</p> <p>For VPNs, the <b>graceful-restart</b> statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.</p> <p>For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p>
<b>Default</b>	Graceful restart is disabled by default.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Enabling Graceful Restart</li> <li><a href="#">Configuring Routing Protocols Graceful Restart on page 1781</a></li> <li>Configuring Graceful Restart for MPLS-Related Protocols</li> <li>Configuring VPN Graceful Restart</li> <li>Configuring Logical System Graceful Restart</li> <li>Graceful Restart Configuration Statements</li> <li><a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li> </ul>

## graceful-restart (Protocols BGP)

<b>Syntax</b>	<pre>graceful-restart {   disable;   restart-time seconds;   stale-routes-time seconds; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems logical-system-name protocols bgp], [edit logical-systems logical-system-name protocols bgp group group-name], [edit logical-systems logical-system-name protocols bgp group group-name   neighbor address], [edit protocols bgp], [edit protocols bgp group group-name], [edit protocols bgp group group-name neighbor address]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Enable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level.</p>

**NOTE:** If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

For graceful restart to function properly, graceful restart must be enabled at the **[edit routing-instance instance-name routing-options]** or **[edit routing-options]** hierarchy level as well as in the protocol level.

For example:

```
protocols {
  bgp {
    group ext {
      graceful-restart;
    }
  }
}
routing-options {
  graceful-restart;
}
```

Graceful restart is enabled both at the **[edit routing-options]** hierarchy level, as well as at the routing protocol level. If graceful restart is not configured in both sections, the peer might have its route removed after a restart, which is not the intended behavior.

The remaining statements are explained separately.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for BGP on page 1781</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li><li>• Junos OS High Availability Configuration Guide</li></ul>

## graceful-restart (Protocols OSPF)

<b>Syntax</b>	<pre> graceful-restart {   disable;   helper-disable (standard   restart-signaling   both);   no-strict-lsa-checking;   notify-duration <i>seconds</i>;   restart-duration <i>seconds</i>; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)], [edit protocols (<b>ospf</b>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the <b>no-strict-lsa-checking</b> statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the helper mode <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the <b>[edit routing-options]</b> hierarchy level.</p>
<b>Options</b>	<p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p>

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

------------------------------	---

## helper-disable (OSPF)

---

<b>Syntax</b>	helper-disable < both   restart-signaling   standard >;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf <a href="#">graceful-restart</a> ], [edit protocols ospf <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols ospf <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Options <b>both</b> , <b>restart-signaling</b> , and <b>standard</b> introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable helper mode for graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart. The last committed statement takes precedence over the previously configured statement.
<b>Default</b>	Helper mode is enabled by default for OSPF.
<b>Options</b>	<b>both</b> —(Optional) Disable helper mode for both standard and restart signaling-based graceful restart.  <b>restart-signaling</b> —(Optional) Disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813).  <div> <b>NOTE:</b> Restart signaling-based helper mode is not supported for OSPFv3 configurations.</div>  <b>standard</b> —(Optional) Disable helper mode for standard graceful restart (based on RFC 3623).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Routing Protocols Graceful Restart on page 1781</a></li><li>• <a href="#">Configuring Graceful Restart for MPLS-Related Protocols</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li></ul>

---

## no-strict-lsa-checking

---

<b>Syntax</b>	no-strict-lsa-checking;
<b>Hierarchy Level</b>	[edit protocols (ospf   ospf3) graceful-restart]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router.
<b>Default</b>	By default, LSA checking is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1781</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li><li>• maximum-neighbor-recovery-time</li><li>• recovery-time</li></ul>

## notify-duration

---

<b>Syntax</b>	notify-duration <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit routing-instances <i>instance-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the length of time the router notifies helper OSPF routers that it has completed graceful restart.
<b>Options</b>	<b><i>seconds</i></b> —Length of time in the router notifies helper OSPF routers that it has completed graceful restart. <b>Range:</b> 1 through 3600 <b>Default:</b> 30
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1781</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li><li>• <a href="#">restart-duration on page 1813</a></li></ul>

## restart-duration

<b>Syntax</b>	<code>restart-duration <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (isis   ospf   ospf3   pim) <a href="#">graceful-restart</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3   pim) <a href="#">graceful-restart</a>],</p> <p>[edit protocols (esis   isis   ospf   ospf3   pim) <a href="#">graceful-restart</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3   pim) <a href="#">graceful-restart</a>],</p> <p>[edit routing-options <a href="#">graceful-restart</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the grace period for graceful restart globally.</p> <p>Additionally, you can individually configure the duration of the graceful restart period for the End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), and OSPFv3 protocols and for Protocol Independent Multicast (PIM) sparse mode.</p>
<b>Options</b>	<p><b><i>seconds</i></b>—Time for the graceful restart period.</p> <p><b>Range:</b></p> <p>The range of values varies according to whether the graceful restart period is being set globally or for a particular protocol:</p> <ul style="list-style-type: none"> <li>• <b>[edit routing-options graceful-restart]</b> (global setting)—120 through 900</li> <li>• ES-IS—30 through 300</li> <li>• IS-IS—30 through 300</li> <li>• OSPF/OSPFv3—1 through 3600</li> <li>• PIM—30 through 300</li> </ul> <p><b>Default:</b></p> <p>The default value varies according to whether the graceful restart period is being set globally or for a particular protocol:</p> <ul style="list-style-type: none"> <li>• <b>[edit routing-options graceful-restart]</b> (global setting)—300</li> <li>• ES-IS—180</li> <li>• IS-IS—210</li> <li>• OSPF/OSPFv3—180</li> <li>• PIM—60</li> </ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## restart-time (BGP Graceful Restart)

---

<b>Syntax</b>	<code>restart-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols (bgp   rip   ripng) <a href="#">graceful-restart</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols (bgp   rip   ripng) <a href="#">graceful-restart</a></code> <code>  (<a href="#">Enabling Globally</a>)],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  bgp <a href="#">graceful-restart</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the duration of the BGP, RIP, or next-generation RIP (RIPng) graceful restart period.
<b>Options</b>	<b><i>seconds</i></b> —Length of time for the graceful restart period. <b>Range:</b> 1 through 600 seconds <b>Default:</b> Varies by protocol: <ul style="list-style-type: none"><li>• BGP—120 seconds</li><li>• RIP and RIPng—60 seconds</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for BGP on page 1781</a></li><li>• <a href="#">Configuring Graceful Restart Options for RIP and RIPng on page 1785</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li><li>• <a href="#">stale-routes-time on page 1815</a></li></ul>

## stale-routes-time

<b>Syntax</b>	<code>stale-routes-time</code> <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-routing-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-routing-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit protocols bgp <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the maximum time that stale routes are kept during a restart. The <b>stale-routes-time</b> statement allows you to set the length of time the routing device waits to receive messages from restarting neighbors before declaring them down.
<b>Options</b>	<b>seconds</b> —Time the router waits to receive messages from restarting neighbors before declaring them down. <b>Range:</b> 1 through 600 seconds <b>Default:</b> 300 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 1781</a></li> <li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1777</a></li> <li>• <a href="#">restart-time (BGP Graceful Restart) on page 1814</a></li> </ul>

## Configuration Statements for VRRP

### accept-data

<b>Syntax</b>	(accept-data   no-accept-data);
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a router that is acting as the master router accepts all packets destined for the virtual IP address.</p> <ul style="list-style-type: none"> <li>• <b>accept-data</b>—Enable the master router to accept all packets destined for the virtual IP address.</li> <li>• <b>no-accept-data</b>—Prevent the master router from accepting packets other than the ARP packets destined for the virtual IP address.</li> </ul>
<b>Default</b>	<p>If the router acting as the master router is the IP address owner or has its priority set to 255, the master router, by default, responds to all packets sent to the virtual IP address. However, if the router acting as the master router does not own the IP address or has its priority set to a value less than 255, the master router responds only to ARP requests.</p>
<div>  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>• If you want to restrict the incoming IP packets to ICMP packets only, you must configure firewall filters to accept only ICMP packets.</li> <li>• If you include the <b>accept-data</b> statement, your routing platform configuration does not comply with RFC 3768 (see section 6.4.3 of RFC 3768, <i>Virtual Router Redundancy Protocol (VRRP)</i>).</li> </ul> </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Configuring an Interface to Accept Packets Destined for the Virtual IP Address</li> </ul>

## advertise-interval

<b>Syntax</b>	<code>advertise-interval seconds;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Configure the interval between Virtual Router Redundancy Protocol (VRRP) IPv4 advertisement packets.  All routers in the VRRP group must use the same advertisement interval.
<div>  <p><b>NOTE:</b> When VRRPv3 is enabled, the <code>advertise-interval</code> statement cannot be used to configure advertisement intervals. Instead, use the <code>fast-interval</code> statement to configure advertisement intervals.</p> </div>	
<b>Options</b>	<p><b>seconds</b>—Interval between advertisement packets.</p> <p><b>Range:</b> 1 through 255 seconds</p> <p><b>Default:</b> 1 second</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring the Advertisement Interval for the VRRP Master Router</li> <li><a href="#">fast-interval on page 1823</a></li> <li>inet6-advertise-interval</li> <li>version-3</li> </ul>

## asymmetric-hold-time

---

<b>Syntax</b>	asymmetric-hold-time;
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	<p>Configure a VRRP master to fail over to a backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.</p> <p>When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.</p>
<b>Default</b>	asymmetric-hold-time is disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring VRRP Preemption and Hold Time on page 1796</a></li></ul>

## authentication-key

<b>Syntax</b>	<code>authentication-key key;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	<p>Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 authentication key. You also must specify a VRRP authentication scheme by including the <b>authentication-type</b> statement.</p> <p>All routers in the VRRP group must use the same authentication scheme and password.</p>
	<div>  <p><b>NOTE:</b> When VRRPv3 is enabled, the <b>authentication-type</b> and <b>authentication-key</b> statements cannot be configured for any VRRP groups.</p> </div>
<b>Options</b>	<b>key</b> —Authentication password. For simple authentication, it can be 1 through 8 characters long. For Message Digest 5 (MD5) authentication, it can be 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring VRRP Authentication (IPv4 Only)</li> <li><a href="#">Configuring VRRP Authentication (IPv4 Only) on page 1793</a></li> <li><a href="#">authentication-type on page 1820</a></li> <li>version-3</li> </ul>

## authentication-type

<b>Syntax</b>	<code>authentication-type authentication;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the <b>authentication-key</b> statement.  All routers in the VRRP group must use the same authentication scheme and password.

**NOTE:** When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups.

<b>Options</b>	<p><b>authentication</b>—Authentication scheme:</p> <ul style="list-style-type: none"> <li><b>simple</b>—Use a simple password. The password is included in the transmitted packet, so this method of authentication is relatively insecure.</li> <li><b>md5</b>—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing platform uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.</li> </ul> <p><b>Default:</b> none (no authentication is performed).</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring VRRP Authentication (IPv4 Only)</li> <li><a href="#">Configuring VRRP Authentication (IPv4 Only) on page 1793</a></li> <li><a href="#">authentication-key on page 1819</a></li> <li>version-3</li> </ul>

## bandwidth-threshold

<b>Syntax</b>	<code>bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> <b>track interface</b> <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Specify the bandwidth threshold for Virtual Router Redundancy Protocol (VRRP) logical interface tracking.
<b>Options</b>	<p><b><i>bits-per-second</i></b>—Bandwidth threshold for the tracked interface. When the bandwidth of the tracked interface drops below the specified value, the VRRP group uses the bandwidth threshold priority cost value. You can include up to five bandwidth threshold statements for each interface you track.</p> <p><b>Range:</b> 1 through 10000000000000 bits per second</p> <p><b><i>priority-cost priority</i></b>—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring a Logical Interface to Be Tracked</li> <li><a href="#">Configuring a Logical Interface to Be Tracked on page 1798</a></li> </ul>

## failover-delay

---

<b>Syntax</b>	<code>failover-delay <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).</p> <p>If you configure a failover delay, the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.</p>
<b>Options</b>	<p><i>milliseconds</i>—Specify the failover delay time, in milliseconds.</p> <p><b>Range:</b> 50 through 2000</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## fast-interval

<b>Syntax</b>	<code>fast-interval milliseconds;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the interval, in milliseconds, between Virtual Router Redundancy Protocol (VRRP) advertisement packets.</p> <p>All routers in the VRRP group must use the same advertisement interval.</p>
<b>Options</b>	<p><i>milliseconds</i>—Interval between advertisement packets.</p> <p><b>Range:</b> 10 through 40,950 milliseconds (range extended from 100–999 to 10–40,950 in Junos OS Release 12.2).</p>
<div>  <p><b>NOTE:</b> When configuring VRRP for IPv4, if you have chosen not to enable VRRPv3, you cannot set a value less than 100 for <i>fast-interval</i>. Commit check fails if a value less than 100 is configured.</p> </div>	
<b>Default:</b> 1 second	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring the Advertisement Interval for the VRRP Master Router</li> <li><a href="#">Configuring the Advertisement Interval for the VRRP Master on page 1795</a></li> <li><a href="#">advertise-interval on page 1817</a></li> <li><a href="#">advertise-interval on page 1817</a></li> <li>inet6-advertise-interval</li> <li>version-3</li> </ul>

## hold-time (VRRP)

---

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id preempt</i>],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id preempt</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id preempt</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id preempt</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	In a Virtual Router Redundancy Protocol (VRRP) configuration, set the hold time before a higher-priority backup router preempts the master router.
<b>Default</b>	VRRP preemption is not timed.
<b>Options</b>	<b>seconds</b> —Hold-time period. <b>Range:</b> 0 through 3600 seconds <b>Default:</b> 0 seconds (VRRP preemption is not timed.)
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring a Backup Router to Preempt the Master Router</li><li><a href="#">Configuring VRRP Preemption and Hold Time on page 1796</a></li></ul>

## interface (VRRP Group)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     <b>bandwidth-threshold</b> <i>bits-per-second</i> <i>priority-cost</i> <i>priority</i>;     <b>priority-cost</b> <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <b>vrrp-inet6-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <b>vrrp-inet6-group</b> <i>group-id</i> <b>track</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>bandwidth-threshold</b> statement added in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Enable logical interface tracking for a Virtual Router Redundancy Protocol (VRRP) group.
<b>Options</b>	<p><b><i>interface-name</i></b>—Interface to be tracked for this VRRP group.</p> <p><b>Range:</b> 1 through 10 interfaces</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring a Logical Interface to Be Tracked</li> <li><a href="#">Configuring a Logical Interface to Be Tracked on page 1798</a></li> <li>Junos Services Interfaces Configuration Release 11.2</li> </ul>

## preempt (VRRP)

<b>Syntax</b>	(preempt   no-preempt) { hold-time seconds; }
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i> ], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> vrrp-group <i>group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> vrrp-inet6-group <i>group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a backup router can preempt a master router: <ul style="list-style-type: none"> <li>• <b>preempt</b>—Allow the master router to be preempted.</li> </ul> <div style="margin-top: 10px;">  <p><b>NOTE:</b> By default, a higher-priority backup router can preempt a lower-priority master router.</p> </div> <ul style="list-style-type: none"> <li>• <b>no-preempt</b>—Prohibit the preemption of the master router. When <b>no-preempt</b> is configured, the backup router cannot preempt the master router even if the backup router has a higher priority.</li> </ul> <p>The remaining statement is explained separately.</p>
<b>Default</b>	By default the <b>preempt</b> statement is enabled, and a higher-priority backup router preempts a lower-priority master router even if the <b>preempt</b> statement is not explicitly configured.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Backup Router to Preempt the Master Router</a></li> <li>• <a href="#">Configuring VRRP Preemption and Hold Time on page 1796</a></li> </ul>

## priority (Protocols VRRP)

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) router's priority for becoming the master default router. The router with the highest priority within the group becomes the master.
<b>Options</b>	<p><b>priority</b>—Router's priority for being elected to be the master router in the VRRP group. A larger value indicates a higher priority for being elected.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 100 (for backup routers)</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Basic VRRP Support</li> <li><a href="#">Configuring Basic VRRP Support on page 1792</a></li> </ul>

## priority-cost (VRRP)

---

<b>Syntax</b>	<code>priority-cost priority;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track interface interface-name],</code> <code>[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track interface interface-name],</code> <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track interface interface-name],</code> <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track interface interface-name]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.2 for ACX2000 Universal Access Routers.
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) router's priority cost for becoming the master default router. The router with the highest priority within the group becomes the master.
<b>Options</b>	<b>priority</b> —The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group. <b>Range:</b> 1 through 254
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring a Logical Interface to Be Tracked</li><li><a href="#">Configuring a Logical Interface to Be Tracked on page 1798</a></li></ul>

## priority-hold-time

<b>Syntax</b>	<code>priority-hold-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure a Virtual Router Redundancy Protocol (VRRP) router's priority hold time to define the minimum length of time that must elapse between dynamic priority changes. If the dynamic priority changes because of a tracking event, the priority hold timer begins running. If another tracking event or manual configuration change occurs while the timer is running, the new dynamic priority update is postponed until the timer expires.</p>
<div>  <p><b>NOTE:</b> When the track feature is configured, and if VRRP should pre-empt due to the tracking interface or route transition, any configured pre-empt hold time will be ignored. VRRP master will pre-empt according to the configuration of the priority-hold time.</p> </div>	
<b>Options</b>	<p><b>seconds</b>—Minimum length of time that must elapse between dynamic priority changes.</p> <p><b>Range:</b> 0through 3600 seconds</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring a Logical Interface to Be Tracked</li> <li><a href="#">Configuring a Logical Interface to Be Tracked on page 1798</a></li> </ul>

## route (Interfaces)

---

<b>Syntax</b>	<code>route <i>prefix</i> routing-instance <i>instance-name</i> priority-cost <i>priority</i>;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS 11.3 for QFX Series. Statement introduced in Junos OS 12.1 for EX Series switches.
<b>Description</b>	Enable route tracking for a Virtual Router Redundancy Protocol (VRRP) group.
<b>Options</b>	<p><b><i>prefix</i></b>—Route to be tracked for this VRRP group.</p> <p><b><i>priority-cost priority</i></b>—The value subtracted from the configured VRRP priority when the tracked interface or route is down, forcing a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p> <p><b><i>routing-instance instance-name</i></b>—Routing instance in which the route is to be tracked. If the route is in the default, or global, routing instance, the value for <b><i>instance-name</i></b> must be <b>default</b>.</p>
<b>Required Privilege Level</b>	<b>interface</b> —To view this statement in the configuration. <b>interface-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring a Route to Be Tracked</li><li><a href="#">Configuring a Route to Be Tracked on page 1797</a></li></ul>

---

## startup-silent-period

---

<b>Syntax</b>	<code>startup-silent-period <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Instruct the system to ignore the Master Down Event when an interface transitions from the down state to the up state. This statement is used to avoid incorrect error alarms caused by the delay or interruption of incoming Virtual Router Redundancy Protocol (VRRP) advertisement packets during the interface startup phase.
<b>Options</b>	<b><i>seconds</i></b> —Number of seconds for the startup period. <b>Default:</b> 4 seconds <b>Range:</b> 1 through 2000 seconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring the Startup Period for VRRP Operations</li><li><a href="#">Configuring the Startup Period for VRRP Operations on page 1794</a></li></ul>

## traceoptions

**Syntax** traceoptions {  
     file <filename> <files number> <match regular-expression> <microsecond-stamp>  
         <size size> <world-readable | no-world-readable>;  
     flag flag;  
     no-remote-trace;  
 }

**Hierarchy Level** [edit protocols vrrp]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple **flag** statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

**NOTE:** The traceoptions statement is not supported on a QFabric system.

**Default** If you do not include this statement, no VRRP-specific tracing operations are performed.

**Options** **filename filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

**files number**—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

**Range:** 0 through 4,294,967,296 files

**Default:** 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events
- **interfaces**—Interface changes

- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

**match *regex***—(Optional) Refine the output to include only those lines that match the given regular expression.

**microsecond-stamp**—(Optional) Provide a timestamp with microsecond granularity.

**no-world-readable**—Restrict users from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your routing platform

**Default:** 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**world-readable**—Allow users to read the log file.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• Tracing VRRP Operations</li> </ul>

## track (VRRP)

---

<b>Syntax</b>	<pre>track {     interface <i>interface-name</i> {         bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;         priority-cost <i>priority</i>;     }     priority-hold-time <i>seconds</i>;     route <i>prefix/prefix-length</i> routing-instance <i>instance-name</i> priority-cost <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>priority-hold-time</b> statement added in Junos OS Release 8.1.</p> <p><b>route</b> statement added in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Enable logical interface tracking, route tracking, or both, for a Virtual Router Redundancy Protocol (VRRP) group.
<b>Options</b>	The remaining statements are described separately.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring a Logical Interface to Be Tracked</li><li>Configuring a Route to Be Tracked</li><li><a href="#">Configuring a Logical Interface to Be Tracked on page 1798</a></li><li><a href="#">Configuring a Route to Be Tracked on page 1797</a></li></ul>

## virtual-address

---

<b>Syntax</b>	<code>virtual-address [ <i>addresses</i> ];</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv4 or IPv6 group. You can configure up to eight addresses.
<b>Options</b>	<b><i>addresses</i></b> —Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Basic VRRP Support</li> <li><a href="#">Configuring Basic VRRP Support on page 1792</a></li> </ul>

## vrrp-group

<b>Syntax</b>	<pre> vrrp-group group-id {   (accept-data   no-accept-data);   advertise-interval seconds;   authentication-key key;   authentication-type authentication;   fast-interval milliseconds;   (preempt   no-preempt) {     hold-time seconds;   }   priority number;   track {     interface interface-name {       bandwidth-threshold bits-per-second priority-cost priority;       priority-cost priority;     }     priority-hold-time seconds;     route prefix/prefix-length routing-instance instance-name priority-cost priority;   }   virtual-address [ addresses ];   vrrp-inherit-from vrrp-group; } </pre>
<b>Hierarchy Level</b>	<pre> [edit interfaces interface-name unit logical-unit-number family inet address address], [edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 group.
<b>Options</b>	<p><b>group-id</b>—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the <b>source-address-filter</b> statement. MAC addresses ranging from <b>00:00:5e:00:01:00</b> through <b>00:00:5e:00:01:ff</b> are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p><b>Range:</b> 0 through 255</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Basic VRRP Support</li> <li>Example: Configuring VRRP</li> <li><a href="#">Configuring Basic VRRP Support on page 1792</a></li> <li><a href="#">Example: Configuring VRRP for Load Sharing on page 1787</a></li> </ul>

- [Operational Mode Commands for Nonstop Software Upgrade on page 1863](#)
- [Operational Mode Commands for VRRP on page 1895](#)

## Operational Mode Commands for Graceful Restart

---

- [Verifying Graceful Restart Operation on page 1839](#)

### Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 1839](#)
- [Verifying BGP Graceful Restart on page 1840](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 1840](#)
- [Verifying CCC and TCC Graceful Restart on page 1841](#)

### Graceful Restart Operational Mode Commands

---

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)
- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)
- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the Junos OS Operational Mode Commands.

### Verifying BGP Graceful Restart

---

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.255.10.1
Peer: 192.255.10.1+179 AS 64595 Local: 192.255.5.1+1106 AS 64595
  Type: Internal   State: Established   Flags: <>
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ static ]
  Options:<Preference LocalAddress HoldTime GracefulRestart Damping PeerAS Refresh>

  Local Address: 192.255.5.1 Holdtime: 90 Preference: 170
  IPsec SA Name: hope
  Number of flaps: 0
  Peer ID: 192.255.10.1      Local ID: 192.255.5.1      Active Holdtime: 90
  Keepalive Interval: 30
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Restart time configured on the peer: 180
  Stale routes from peer are kept for: 180
  Restart time requested by this peer: 300
  NLRI that peer supports restart for: inet-unicast
  NLRI that peer saved forwarding for: inet-unicast
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Table inet.0 Bit: 10000
  RIB State: restart is complete
  Send state: in sync
  Active prefixes: 0
  Received prefixes: 0
  Suppressed due to damping: 0
  Last traffic (seconds): Received 19   Sent 19   Checked 19
  Input messages: Total 2      Updates 1      Refreshes 0      Octets 42
  Output messages: Total 3      Updates 0      Refreshes 0      Octets 116
  Output Queue[0]: 0
```

### Verifying IS-IS and OSPF Graceful Restart

---

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 1781](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct  8 05:20:12 Restart mode - sending grace lsas
Oct  8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct  8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct  8 05:20:14 Helper mode for neighbor 192.255.5.1
Oct  8 05:20:14 Received multiple grace lsa from 192.255.5.1
```

### Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP
```

#### CCC Graceful restart : Restarting

Connection/Circuit	Type	St	Time last up	# Up trans
CE1-CE2-0	rmt-if	Restart	-----	0
fe-1/1/0.0	intf	Up		
PE1-PE2-0	tlsp	Up		
PE2-PE1-0	rlsp	Up

[show bgp neighbor neighbor-address on page 1854](#)  
[show bgp neighbor orf neighbor-address detail on page 1855](#)

**Output Fields** [Table 142 on page 1843](#) describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 142: show bgp neighbor Output Fields**

Field Name	Field Description
<b>Peer</b>	Address of the BGP neighbor. The address is followed by the neighbor port number.
<b>AS</b>	AS number of the peer.
<b>Local</b>	Address of the local routing device. The address is followed by the peer port number.
<b>Type</b>	Type of peer: <b>Internal</b> or <b>External</b> .
<b>State</b>	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>
<b>Flags</b>	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> <li>• <b>Aggregate Label</b>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</li> <li>• <b>CleanUp</b>—The peer session is being shut down.</li> <li>• <b>Delete</b>—This peer has been deleted.</li> <li>• <b>Idled</b>—This peer has been permanently idled.</li> <li>• <b>ImportEval</b>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</li> <li>• <b>Initializing</b>—The peer session is initializing.</li> <li>• <b>SendRtn</b>—Messages are being sent to the peer.</li> <li>• <b>Sync</b>—This peer is synchronized with the rest of the peer group.</li> <li>• <b>TryConnect</b>—Another attempt is being made to connect to the peer.</li> <li>• <b>Unconfigured</b>—This peer is not configured.</li> <li>• <b>WriteFailed</b>—An attempt to write to this peer failed.</li> </ul>

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Last state</b>	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>
<b>Last event</b>	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Closed</b>—The BGP session closed.</li> <li>• <b>ConnectRetry</b>—The transport protocol connection failed, and BGP is trying again to connect.</li> <li>• <b>HoldTime</b>—The session ended because the hold timer expired.</li> <li>• <b>KeepAlive</b>—The local routing device sent a BGP keepalive message to the peer.</li> <li>• <b>Open</b>—The local routing device sent a BGP open message to the peer.</li> <li>• <b>OpenFail</b>—The local routing device did not receive an acknowledgment of a BGP open message from the peer.</li> <li>• <b>RecvKeepAlive</b>—The local routing device received a BGP keepalive message from the peer.</li> <li>• <b>RecvNotify</b>—The local routing device received a BGP notification message from the peer.</li> <li>• <b>RecvOpen</b>—The local routing device received a BGP open message from the peer.</li> <li>• <b>RecvUpdate</b>—The local routing device received a BGP update message from the peer.</li> <li>• <b>Start</b>—The peering session started.</li> <li>• <b>Stop</b>—The peering session stopped.</li> <li>• <b>TransportError</b>—A TCP error occurred.</li> </ul>
<b>Last error</b>	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Cease</b>—An error occurred, such as a version mismatch, that caused the session to close.</li> <li>• <b>Finite State Machine Error</b>—In setting up the session, BGP received a message that it did not understand.</li> <li>• <b>Hold Time Expired</b>—The session's hold time expired.</li> <li>• <b>Message Header Error</b>—The header of a BGP message was malformed.</li> <li>• <b>Open Message Error</b>—A BGP open message contained an error.</li> <li>• <b>None</b>—No errors occurred in the BGP session.</li> <li>• <b>Update Message Error</b>—A BGP update message contained an error.</li> </ul>
<b>Export</b>	Name of the export policy that is configured on the peer.
<b>Import</b>	Name of the import policy that is configured on the peer.

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Options</b>	Configured BGP options: <ul style="list-style-type: none"> <li>• <b>AddressFamily</b>—Configured address family: <b>inet</b> or <b>inet-vpn</b>.</li> <li>• <b>AuthKeyChain</b>—Authentication key change is enabled.</li> <li>• <b>DropPathAttributes</b>—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</li> <li>• <b>GracefulRestart</b>—Graceful restart is configured.</li> <li>• <b>HoldTime</b>—Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.</li> <li>• <b>IgnorePathAttributes</b>—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</li> <li>• <b>Local Address</b>—Address configured with the <b>local-address</b> statement.</li> <li>• <b>Multihop</b>—Allow BGP connections to external peers that are not on a directly connected network.</li> <li>• <b>NLRI</b>—Configured MBGP state for the BGP group: <b>multicast</b>, <b>unicast</b>, or both if you have configured <b>nlri any</b>.</li> <li>• <b>Peer AS</b>—Configured peer autonomous system (AS).</li> <li>• <b>Preference</b>—Preference value configured with the <b>preference</b> statement.</li> <li>• <b>Refresh</b>—Configured to refresh automatically when the policy changes.</li> <li>• <b>Rib-group</b>—Configured routing table group.</li> </ul>
<b>Path-attributes dropped</b>	Path attribute codes that are dropped from neighbor updates.
<b>Path-attributes ignored</b>	Path attribute codes that are ignored during neighbor updates.
<b>Authentication key change</b>	(appears only if the <b>authentication-keychain</b> statement has been configured) Name of the authentication keychain enabled.
<b>Authentication algorithm</b>	(appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .
<b>Address families configured</b>	Names of configured address families for the VPN.
<b>Local Address</b>	Address of the local routing device.
<b>Remove-private options</b>	Options associated with the <b>remove-private</b> statement.
<b>Holdtime</b>	Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.
<b>Flags for NLRI inet-label-unicast</b>	Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Traffic statistics</b>	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul>
<b>Traffic Statistics Interval</b>	Time between sample periods for labeled-unicast traffic statistics, in seconds.
<b>Preference</b>	Preference value configured with the <b>preference</b> statement.
<b>Outbound Timer</b>	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <b>out-delay</b> parameter is configured to a non-zero value.
<b>Number of flaps</b>	Number of times the BGP session has gone down and then come back up.
<b>Peer ID</b>	Router identifier of the peer.
<b>Group index</b>	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.
<b>Peer index</b>	Index that is unique within the BGP group to which the peer belongs.
<b>Local ID</b>	Router identifier of the local routing device.
<b>Local Interface</b>	Name of the interface on the local routing device.
<b>Active holdtime</b>	Hold time that the local routing device negotiated with the peer.
<b>Keepalive Interval</b>	Keepalive interval, in seconds.
<b>BFD</b>	Status of BFD failure detection.
<b>Local Address</b>	Name of directly connected interface over which direct EBGP peering is established.
<b>NLRI for restart configured on peer</b>	Names of address families configured for restart.
<b>NLRI advertised by peer</b>	Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .
<b>NLRI for this session</b>	Address families being used for this session.
<b>Peer supports Refresh capability</b>	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .
<b>Restart time configured on peer</b>	Configured time allowed for restart on the neighbor.

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as 1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.  Possible value is <b>inet-unicast</b> .
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.  Possible value is <b>inet-unicast</b> .

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Table inet.number	<p>Information about the routing table:</p> <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul>
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	<p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Input ignored path attributes	<p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates recv	<p>(orf option only) Number of outbound-route filters received for each configured address family.</p> <p><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.</p>

Table 142: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Immediate</b>	( <b>orf</b> option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.  <b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
<b>Filter</b>	( <b>orf</b> option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .
<b>Received filter entries</b>	( <b>orf</b> option only) List of received filters displayed.
<b>seq</b>	( <b>orf</b> option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
<b>prefix</b>	( <b>orf</b> option only) Address for the prefix entry that matches the filter.
<b>minlength</b>	( <b>orf</b> option only) Minimum prefix length, in bits, required to match this prefix.
<b>maxlength</b>	( <b>orf</b> option only) Maximum prefix length, in bits, required to match this prefix.
<b>match</b>	( <b>orf</b> option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.

## Sample Output

## show log

---

<b>Syntax</b>	<code>show log</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Syntax (QFabric System)</b>	<code>show log &lt;filename&gt;</code>
<b>Syntax (TX Matrix Routers)</b>	<code>show log</code> <code>&lt;all-lcc   lcc <i>number</i>   scc&gt;</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	List log files, display log file contents, or display information about users who have logged in to the router or switch.
<b>Options</b>	<b>none</b> —List all log files.  <b>&lt;all-lcc   lcc <i>number</i>   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from <b>0</b> through <b>3</b> ) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).  <b>filename</b> —(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.  <b>user &lt;username&gt;</b> —(Optional) Display logging information about users who have recently logged in to the router or switch. If you include <i>username</i> , display logging information about the specified user.
<b>Required Privilege Level</b>	trace

## show (ospf | ospf3) overview

<b>Syntax</b>	show (ospf   ospf3) overview <brief   extensive> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )> <realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)>
<b>Syntax (EX Series Switch and QFX Series)</b>	show (ospf   ospf3) overview <brief   extensive> <instance <i>instance-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>realm</b> option introduced in Junos OS Release 9.2. Database protection introduced in Junos 10.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display Open Shortest Path First (OSPF) overview information.
<b>Options</b>	<p><b>none</b>—Display standard information about all OSPF neighbors for all routing instances.</p> <p><b>brief   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display all OSPF interfaces under the named routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)</b>—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the <b>realm</b> option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ospf overview on page 1862</a> <a href="#">show ospf overview (With Database Protection) on page 1862</a> <a href="#">show ospf3 overview (With Database Protection) on page 1862</a> <a href="#">show ospf overview extensive on page 1863</a>
<b>Output Fields</b>	<a href="#">Table 143 on page 1859</a> lists the output fields for the <b>show ospf overview</b> command. Output fields are listed in the approximate order in which they appear.

Table 143: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels

Table 143: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
<b>Router ID</b>	Router ID of the routing device.	All levels
<b>Route table index</b>	Route table index.	All levels
<b>Configured overload</b>	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
<b>Topology</b>	Topology identifier.	All levels
<b>Prefix export count</b>	Number of prefixes exported into OSPF.	All levels
<b>Full SPF runs</b>	Number of complete Shortest Path First calculations.	All levels
<b>SPF delay</b>	Delay before performing consecutive Shortest Path First calculations.	All levels
<b>SPF holddown</b>	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
<b>SPF rapid runs</b>	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
<b>LSA refresh time</b>	Refresh period for link-state advertisement (in minutes).	All levels
<b>Database protection state</b>	Current state of database protection.	All levels
<b>Warning threshold</b>	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
<b>Non self-generated LSAs</b>	Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .	All levels
<b>Ignore time</b>	How long the database has been in the ignore state.	All levels
<b>Reset time</b>	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
<b>Ignore count</b>	Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .	All levels
<b>Restart</b>	Graceful restart capability: <b>enabled</b> or <b>disabled</b> .	All levels
<b>Restart duration</b>	Time period for complete reacquisition of OSPF neighbors.	All levels
<b>Restart grace period</b>	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels

Table 143: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .	All levels
Trace options	OSPF-specific trace options.	<b>extensive</b>
Trace file	Name of the file to receive the output of the tracing operation.	<b>extensive</b>
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .	All levels
Authentication Type	Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .  <b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <b>[edit protocols ospf area area-id]</b> level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

## Operational Mode Commands for Nonstop Software Upgrade

- [Performing a Nonstop Software Upgrade on the QFabric System on page 1863](#)
- [Verifying Nonstop Software Upgrade for QFabric Systems on page 1868](#)

### Performing a Nonstop Software Upgrade on the QFabric System

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device

- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

**NOTE:** Before you install the software, we recommend that you back up your current configuration files by issuing the `request system software configuration-backup` command.

**NOTE:** Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the `request system software add component all` command.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 1864](#)
- [Downloading Software Files Using a Browser on page 1865](#)
- [Retrieving Software Files for Download on page 1866](#)
- [Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 1866](#)

### Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabric> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabric> request system software configuration-backup/media/USB/
```

---

## Downloading Software Files Using a Browser

---

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

---

To download the software package:

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.  
The Junos Platforms Download Software page appears.
2. In the QFX Series section, select the Qfabric system for which you want to download software.  
The Software Download page for the selected QFabric system appears.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
4. Select the **Software** tab and then select the install package you want to download in the Install Package section.  
A login screen appears.
5. Select the **Software** tab and then select the complete install package you want to download in the QFabric System Install Package and Media section.  
A login screen appears.
6. Enter your user ID and password and press **Enter**.
7. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
8. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

---

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@qfabric> request system software download /path/package-name
```

For example:

```
user@qfabric> request system software download  
ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Director Devices in a Director Group

---

**NOTE:** If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

---

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade director-group  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

---

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade fabric  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### (Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

**NOTE:** If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group node-group-name nssu upgrade-group upgrade-group-name node-devices** command at the [edit chassis] hierarchy.

For example:

```
user@qfabric# set chassis node-group nodegroup1 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
```

### Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

**NOTE:** You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group node-group-name package-name** command.

To perform a nonstop upgrade on one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group nodegroup1
jinstall-qfabric-12.2X50-D10.3.rpm
```

To perform a nonstop upgrade on more than one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
```

## Verifying Nonstop Software Upgrade for QFabric Systems

This topic discusses how you can monitor the progress of each of the three steps in a nonstop software upgrade. By identifying the key actions and events that define this process, you can track the status of the upgrade with confidence.

**TIP:** When performing a nonstop software upgrade, open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected.

- [Verifying a Director Group Nonstop Software Upgrade on page 1868](#)
- [Verifying a Fabric Nonstop Software Upgrade on page 1881](#)
- [Verifying a Redundant Server Node Group Nonstop Software Upgrade on page 1882](#)
- [Verifying a Network Node Group Nonstop Software Upgrade on page 1885](#)

### Verifying a Director Group Nonstop Software Upgrade

**Purpose** During the Director group portion of a nonstop software upgrade, you should expect to see the Director device that hosts the CLI session selected as the master device. When mastership of all processes moves to the master, the QFabric system upgrades the backup Director device and this Director device reboots. After the backup Director device comes back online, the master Director device suspends CLI operations for 15 minutes, upgrades itself, and reboots. At this point, the backup becomes the new master Director device and you can issue CLI operational commands. Finally, the former master comes back online as a backup and both devices are operational once again.

**Action** 1. In one SSH session to the QFabric CLI, verify the current status of the QFabric system by issuing the **show fabric administration inventory**, **show fabric administration inventory director-group status**, and **show fabric session-host** commands. In this case, Director device DG0 is the master device but DG1 hosts the CLI session.

```
session1@qfabric> show fabric administration inventory
```

```

```
session1@qfabric> show fabric session-host
```

```
Identifier: 0281052011000032
```

- In a second SSH session to the QFabric CLI, issue the request for the Director group nonstop software upgrade.

```

root@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm

```

- If the CLI session is being hosted by the master Director device, skip to step 4. However, if the CLI session is hosted by the backup Director device, the Director group mastership switches to the backup device after you issue the nonstop software upgrade command. In this example, mastership switches to Director device DG1.

5. When the system upgrades and reboots the backup Director device DG0, notice how this device is not displayed in the output of the **show fabric administration inventory director-group status** command. Because Director device DG1 appears, this means that the DG1 is operational and acts as the master device.

**NOTE:** If your second SSH session is being hosted by the rebooting Director device, your session terminates and you need to log back in to establish a new session running on the active Director device.

```
session1@qfabric> show fabric administration inventory director-group status
```

```
Director Group Status Tue Jun 5 15:41:14 UTC 2012

### Verifying a Network Node Group Nonstop Software Upgrade

**Purpose** During the network Node group portion of a nonstop software upgrade, you should expect to see the backup network Node group Routing Engine upgrade first, followed by the Node devices within the network Node group upgrading one at a time, and ending with the upgrade of the master network Node group Routing Engine.

**NOTE:** If you configure an upgrade group for Node groups containing 2 or more Node devices, all Node devices within the upgrade group reboot at the same time.

- Action**
- In an SSH session to the QFabric CLI, issue the request for the network Node group nonstop software upgrade.

```
root@qfabric> request system software nonstop-upgrade node-group NW-NG-0
jinstall-qfabric-12.2X50-D10.3.rpm
Upgrading target(s): NW-NG-0
```

```

```

- Verify the progress of the upgrade by issuing the **show chassis nonstop-upgrade node-group**, **show fabric administration inventory**, **show fabric administration inventory infrastructure**, and **show fabric administration inventory node-groups NW-NG-0** commands. You should see the backup network Node group Routing Engine reboot first, followed by each Node device within the network Node group, and ending with the reboot of master network Node group Routing Engine. Restarting devices appear as **Disconnected** in the output of the **show fabric administration inventory** command

and restarting Routing Engines do not appear in output of the **show fabric administration inventory infrastructure** command until they return to service.

## request system software nonstop-upgrade

---

<b>Syntax</b>	<code>request system software nonstop-upgrade <i>package-name</i></code> <code>&lt;fabric &gt;</code> <code>&lt;director-group&gt;</code> <code>&lt;node-group <i>name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.
<b>Options</b>	<p><b><i>package-name</i></b>—Location from which the software is to be installed. For example:</p> <ul style="list-style-type: none"><li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following:<ul style="list-style-type: none"><li>• <b>ftp</b>—File Transfer Protocol. Use <b><i>ftp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li><li>• <b>http</b>—Hypertext Transfer Protocol. Use <b><i>http://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>http://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>. If a password is required and you omit it, you are prompted for it.</li><li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version). Use <b><i>scp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>.</li></ul></li></ul>

---

**NOTE:**

- The ***pathname*** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- 

**director-group**—Install software package on the Director group and Fabric managers.

**fabric**—Install software package on the Interconnect devices and Fabric controls.

**node-group *name*** —Install software package on the redundant server Node group, server Node group, or network Node group.

<b>Required Privilege Level</b>	maintenance

## show chassis nonstop-upgrade node-group

<b>Syntax</b>	<b>show chassis nonstop-upgrade node-group <i>node-group-name</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2 for the QFX Series.
<b>Description</b>	Display the status of the Node group after the most recent nonstop software upgrade (NSSU).
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Performing a Nonstop Software Upgrade on the QFabric System on page 80</a></li> <li>• <a href="#">request system software nonstop-upgrade on page 363</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show chassis nonstop-upgrade node-group on page 1895</a>
<b>Output Fields</b>	Table 53 on page 767 lists the output fields for the <b>show chassis nonstop-upgrade node-group</b> command. Output fields are listed in the approximate order in which they appear.

**Table 144: show chassis nonstop-upgrade node-group Output Fields**

Field Name	Field Description
<b>Item</b>	Node device slot number.
<b>Status</b>	State of Node device: <ul style="list-style-type: none"> <li>• <b>Error</b>—Node device is in an error state.</li> <li>• <b>Offline</b>—Node device is powered down.</li> <li>• <b>Online</b>—Node device is online and running.</li> </ul>
<b>Reason</b>	Reason for the state (if the line card is offline).

## Sample Output

```
show chassis
nonstop-upgrade
node-group
```

```
user@qfabric> show chassis nonstop-upgrade node-group NW-NG-0
Item           Status      Reason
P1550-C       Online
```

## Operational Mode Commands for VRRP

## show vrrp

<b>Syntax</b>	<pre>show vrrp &lt;brief   detail   extensive   summary&gt; &lt;interface <i>interface-name</i>&gt; &lt;track interfaces&gt;</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display information and status about VRRP groups.
<b>Options</b>	<p><b>none</b>—(Same as brief) Display brief status information about all VRRP interfaces.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display information and status about the specified VRRP interface.</p> <p><b>track interfaces</b>—(Optional) Display information and status about VRRP track interfaces.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring VRRP for IPv6 (CLI Procedure)</li> </ul>
<b>List of Sample Output</b>	<a href="#">show vrrp on page 1902</a> <a href="#">show vrrp brief on page 1902</a> <a href="#">show vrrp detail (IPv6) on page 1902</a> <a href="#">show vrrp detail (Route Track) on page 1902</a> <a href="#">show vrrp extensive on page 1903</a> <a href="#">show vrrp interface on page 1904</a> <a href="#">show vrrp summary on page 1905</a> <a href="#">show vrrp track detail on page 1905</a> <a href="#">show vrrp track summary on page 1905</a>
<b>Output Fields</b>	<a href="#">Table 145 on page 1896</a> lists the output fields for the <b>show vrrp</b> command. Output fields are listed in the approximate order in which they appear.

**Table 145: show vrrp Output Fields**

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the logical interface.	<b>none, brief, extensive, summary</b>
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.	<b>extensive</b>
<b>Groups</b>	Total number of VRRP groups configured on the interface.	<b>extensive</b>

Table 145: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Active</b>	Total number of VRRP groups that are active (that is, whose interface state is either up or down).	<b>extensive</b>
<b>Interface VRRP PDU statistics</b>	Nonerrored statistics for the logical interface: <ul style="list-style-type: none"> <li>• <b>Advertisement sent</b>—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted.</li> <li>• <b>Advertisement received</b>—Number of VRRP advertisement PDUs received by the interface.</li> <li>• <b>Packets received</b>—Number of VRRP packets received for VRRP groups on the interface.</li> <li>• <b>No group match received</b>—Number of VRRP packets received for VRRP groups that do not exist on the interface.</li> </ul>	<b>extensive</b>
<b>Interface VRRP PDU error statistics</b>	Errored statistics for the logical interface: <ul style="list-style-type: none"> <li>• <b>Invalid IPAH next type received</b>—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets.</li> <li>• <b>Invalid VRRP ttl value received</b>—Number of packets received whose IP time-to-live (TTL) value is not 255.</li> <li>• <b>Invalid VRRP version received</b>—Number of packets received whose VRRP version is not 2.</li> <li>• <b>Invalid VRRP pdu type received</b>—Number of packets received whose VRRP PDU type is not 1.</li> <li>• <b>Invalid VRRP authentication type received</b>—Number of packets received whose VRRP authentication is not none, simple, or md5.</li> <li>• <b>Invalid VRRP IP count received</b>—Number of packets received whose VRRP IP count exceeds 8.</li> <li>• <b>Invalid VRRP checksum received</b>—Number of packets received whose VRRP checksum does not match the calculated value.</li> </ul>	<b>extensive</b>
<b>Physical interface</b>	Name of the physical interface.	<b>detail, extensive</b>
<b>Unit</b>	Logical unit number.	All levels
<b>Address</b>	Address of the physical interface.	<b>none, brief, detail, extensive</b>
<b>Index</b>	Physical interface index number, which reflects its initialization sequence.	<b>detail, extensive</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail, extensive</b>
<b>VRRP-Traps</b>	Status of VRRP traps: <b>Enabled</b> or <b>Disabled</b> .	<b>detail, extensive</b>

Table 145: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Type and Address</b>	Identifier for the address and the address itself: <ul style="list-style-type: none"> <li><b>lcl</b>—Configured local interface address.</li> <li><b>mas</b>—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router.</li> <li><b>vip</b>—Configured virtual IP addresses.</li> </ul>	none, brief, summary
<b>Interface state or Int state</b>	State of the physical interface: <ul style="list-style-type: none"> <li><b>down</b>—The device is present and the link is unavailable.</li> <li><b>not present</b>—The interface is configured, but no physical device is present.</li> <li><b>unknown</b>—The VRRP process has not had time to query the kernel about the state of the interface.</li> <li><b>up</b>—The device is present and the link is established.</li> </ul>	none, brief, extensive, summary
<b>Group</b>	VRRP group number.	none, brief, extensive, summary
<b>State</b>	VRRP state: <ul style="list-style-type: none"> <li><b>backup</b>—The interface is acting as the backup router interface.</li> <li><b>bringup</b>—VRRP is just starting, and the physical device is not yet present.</li> <li><b>idle</b>—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</li> <li><b>initializing</b>—VRRP is initializing.</li> <li><b>master</b>—The interface is acting as the master router interface.</li> <li><b>transition</b>—The interface is changing between being the backup and being the master router.</li> </ul>	extensive
<b>Priority</b>	Configured VRRP priority for the interface.	detail, extensive
<b>Advertisement interval</b>	Configured VRRP advertisement interval.	detail, extensive
<b>Authentication type</b>	Configured VRRP authentication type: <b>none</b> , <b>simple</b> , or <b>md5</b> .	detail, extensive
<b>Preempt</b>	Whether preemption is allowed on the interface: <b>yes</b> or <b>no</b> .	detail, extensive
<b>Accept-data mode</b>	Whether the interface is configured to accept packets destined for the virtual IP address: <b>yes</b> or <b>no</b> .	detail, extensive
<b>VIP count</b>	Number of virtual IP addresses that have been configured on the interface.	detail, extensive
<b>VIP</b>	List of virtual IP addresses configured on the interface.	detail, extensive
<b>Advertisement timer</b>	Time until the advertisement timer expires.	detail, extensive

Table 145: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Master router	IP address of the interface that is acting as the master. If the VRRP interface is down, the output is <b>N/A</b> .	detail, extensive
Virtual router uptime	Time that the virtual router has been up.	detail, extensive
Master router uptime	Time that the master router has been up.	detail, extensive
Virtual MAC	MAC address associated with the virtual IP address.	detail, extensive
Tracking	Whether tracking is <b>enabled</b> or <b>disabled</b> .	detail, extensive
Current priority	Current operational priority for being the VRRP master.	detail, extensive
Configured priority	Configured base priority for being the VRRP master.	detail, extensive
Priority hold-time	Minimum time interval, in seconds, between successive changes to the current priority. <b>Disabled</b> indicates no minimum interval.	detail, extensive
Remaining-time	( <b>track</b> option only) Displays the time remaining in the priority hold-time interval.	detail
Interface tracking	Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.	detail extensive
Interface/Tracked interface	Name of the tracked interface.	detail extensive
Int state/Interface state	Current operational state of the tracked interface: <b>up</b> or <b>down</b> .	detail, extensive
Int speed/Speed	Current operational speed, in bits per second, of the tracked interface.	detail, extensive
Incurred priority cost	Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.	detail, extensive
Threshold	Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.  An entry of <b>down</b> means that the corresponding priority cost is incurred when the interface is down.	detail, extensive
Route tracking	Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.	detail, extensive
Route count	The number of routes being tracked.	detail, extensive

Table 145: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Route</b>	The IP address of the route being tracked.	<b>detail, extensive</b>
<b>VRF name</b>	The VPN routing and forwarding (VRF) routing instance that the tracked route is in.	<b>detail, extensive</b>
<b>Route state</b>	The state of the route being tracked: <b>up</b> , <b>down</b> , or <b>unknown</b> .	<b>detail, extensive</b>
<b>Priority cost</b>	Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.	<b>detail, extensive</b>
<b>Active</b>	Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.	<b>detail, extensive</b>
<b>Group VRRP PDU statistics</b>	Number of VRRP advertisements sent and received by the group.	<b>extensive</b>
<b>Group VRRP PDU error statistics</b>	<p>Errored statistics for the VRRP group:</p> <ul style="list-style-type: none"> <li>• <b>Bad authentication type received</b>—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be <b>none</b>, <b>simple</b>, or <b>md5</b> and must be the same for all routers in the VRRP group.</li> <li>• <b>Bad password received</b>—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group.</li> <li>• <b>Bad MD5 digest received</b>—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router.</li> <li>• <b>Bad advertisement timer received</b>—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group.</li> <li>• <b>Bad VIP count received</b>—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance.</li> <li>• <b>Bad VIPADDR received</b>—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.</li> </ul>	<b>extensive</b>
<b>Group state transition statistics</b>	<p>State transition statistics for the VRRP group:</p> <ul style="list-style-type: none"> <li>• <b>Idle to master transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the master state.</li> <li>• <b>Idle to backup transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the backup state.</li> <li>• <b>Backup to master transitions</b>—Number of times that the VRRP instance transitioned from the backup state to the master state.</li> <li>• <b>Master to backup transitions</b>—Number of times that the VRRP instance transitioned from the master state to the backup state.</li> </ul>	<b>extensive</b>
<b>Vlan-id</b>	ID of Vlan	<b>detail</b>

Table 145: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
VR state	<p>VRRP information:</p> <ul style="list-style-type: none"><li>• <b>backup</b>—The interface is acting as the backup router interface.</li><li>• <b>bringup</b>—VRRP is just starting, and the physical device is not yet present.</li><li>• <b>idle</b>—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</li><li>• <b>initializing</b>—VRRP is initializing.</li><li>• <b>master</b>—The interface is acting as the master router interface.</li><li>• <b>transition</b>—The interface is changing between being the backup and being the master router.</li></ul>	<b>none, brief</b>
Timer	<p>VRRP timer information:</p> <ul style="list-style-type: none"><li>• <b>A</b>—Time, in seconds, until the advertisement timer expires.</li><li>• <b>D</b>—Time, in seconds, until the Master is Dead timer expires.</li></ul>	<b>none, brief</b>

## Sample Output

### show vrrp

```

user@host> show vrrp
Interface      State      Group  VR state  Timer  Type  Address
ge-0/0/0.121   up         1      master    A 1.052 1c1  gec0::12:1:1:1
                                     vip  gec80::12:1:1:99
                                     vip  gec0::12:1:1:99
ge-0/0/2.131   up         1      master    A 0.364 1c1  gec0::13:1:1:1
                                     vip  gec80::13:1:1:99
                                     vip  gec0::13:1:1:99

```

### show vrrp brief

The output for the **show vrrp brief** command is identical to that for the **show vrrp** command. For sample output, see [show vrrp on page 1902](#).

### show vrrp detail (IPv6)

```

user@host> show vrrp detail

## Troubleshooting VRRP

**Problem** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution** Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

## Interfaces Overview

Juniper Networks QFX Series products have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the Junos® OS Network Interfaces.

- [Network Interfaces on page 1911](#)
- [Special Interfaces on page 1912](#)

## Network Interfaces

---

Network interfaces connect to the network and carry network traffic. [Table 146 on page 1911](#) lists the types of network interfaces supported on the QFX Series.

**Table 146: Network Interface Types and Purposes**

Type	Purpose
Aggregated Ethernet interfaces	You can group Ethernet interfaces at the physical layer to form a single link-layer interface, also known as a <i>link aggregation group (LAG)</i> or <i>bundle</i> . These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth.

Table 146: Network Interface Types and Purposes (*continued*)

Type	Purpose
Fibre Channel interfaces	You can use Fibre Channel interfaces to connect the switch to a Fibre Channel over Ethernet (FCoE) forwarder or a Fibre Channel switch in a storage area network (SAN). You can configure Fibre Channel interfaces only on ports 0 through 5 and 42 through 47 on QFX3500 devices. Fibre Channel interfaces do not forward Ethernet traffic.
LAN access interfaces	You can use these interfaces to connect to other servers, storage, and switches. When you power on a QFX Series product and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports.
Multichassis aggregated Ethernet (MC-AE) interfaces	You can group a LAG on one QFX3500 standalone switch with a LAG on another QFX3500 standalone switch to create a MC-AE. The MC-AE provides load balancing and redundancy across the two QFX3500 standalone switches.
Tagged-access mode interfaces	You can use tagged-access interfaces to connect a switch to an access layer device. Tagged-access interfaces can accept VLAN-tagged packets from multiple VLANs.
Trunk interfaces	You can use trunk interfaces to connect to other switches or routers. To use a port for this type of connection, you must explicitly configure the port interface for trunk mode. The interfaces from the switches or routers must also be configured for trunk mode. In this mode, the interface can be in multiple VLANs and accept tagged packets from multiple devices. Trunk interfaces typically connect to other switches and to routers on the LAN.

### Special Interfaces

Table 147 on page 1912 lists the types of special interfaces supported on the QFX Series.

Table 147: Special Interface Types and Purposes

Type	Purpose
Console port	Each QFX Series product has a serial port, labeled <b>CON</b> or <b>CONSOLE</b> , for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch.
Ethernet Interfaces	You can configure Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet interfaces to connect to other servers, storage, and switches. You can configure 40-Gigabit data plane uplink ports to connect a Node device to an Interconnect device.
Loopback interface	All QFX Series products have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.
Management interface	The Juniper Networks Junos OS for the QFX Series includes management Ethernet interfaces. The management Ethernet interface provides an out-of-band method for connecting to a standalone switch and QFabric system.
Routed VLAN interface (RVI)	<p>QFX Series products use a Layer 3 routed VLAN interface (RVI) named <b>vlan</b> to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network.</p> <p>The RVI functions as a logical router, eliminating the need for having both a switch and a router. The RVI (the <b>vlan</b> interface) must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it.</p>

## Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single, aggregated Ethernet interface, also known as a *link aggregation group (LAG)* or *bundle*.

Link aggregation is used to aggregate Ethernet interfaces between two devices. You can create a LAG between a QFX Series product and a router, switch, aggregation switch, server, or other devices. The aggregated Ethernet interfaces that participate in a LAG are called member links. Because a LAG is composed of multiple member links, even if one member link fails, the LAG continues to carry traffic over the remaining links.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard and is used as a discovery protocol.

- [Link Aggregation Group on page 1913](#)
- [Link Aggregation Control Protocol \(LACP\) on page 1914](#)

### Link Aggregation Group

---

To create a LAG:

1. Create a logical aggregated Ethernet interface.
2. Define the parameters associated with the logical aggregated Ethernet interface, such as a logical unit, interface properties, and Link Aggregation Control Protocol (LACP).
3. Define the member links to be contained within the aggregated Ethernet interface—for example, two 10-Gigabit Ethernet interfaces.
4. Configure LACP for link detection.

Keep in mind these hardware and software guidelines:

- Up to 32 Ethernet interfaces can be grouped to form a LAG on a QFX3500 switch, a redundant server Node group, a server Node group, and a network Node group on a QFabric system.

**NOTE:** If you try to commit a configuration containing more than 32 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 32 has been exceeded, and the configuration checkout has failed.

- Up to 63 LAGs are supported on a QFX3500 switch.
- Up to 48 LAGs are supported on redundant server Node groups and server Node groups on a QFabric system, and up to 128 LAGs are supported on network Node groups on a QFabric system. You can configure LAGs across Node devices in redundant server Node groups, server Node groups, and network Node groups.
- The LAG must be configured on both sides of the link.
- The interfaces on either side of the link must be set to the same speed and be in full-duplex mode.

**NOTE:** Junos OS for the QFX Series assigns a unique ID and port priority to each port. The ID and priority are not configurable.

---

### Link Aggregation Control Protocol (LACP)

---

LACP is one method of bundling several physical interfaces to form one logical aggregated Ethernet interface. The LACP mode can be active or passive. The transmitting link is known as the *actor*, and the receiving link is known as the *partner*. If the actor and partner are both in passive mode, they do not exchange LACP packets, and the aggregated Ethernet links do not come up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is in passive mode on aggregated Ethernet interfaces. To initiate transmission of LACP packets and response to LACP packets, you must enable LACP active mode. You can configure Ethernet links to actively transmit protocol data units (PDUs), or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. You can configure both VLAN-tagged and untagged aggregated Ethernet interfaces without LACP enabled. LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the LAG without user intervention.
- Link monitoring to check whether both ends of the bundle are connected to the correct group.

When a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server may not be able to exchange LACP PDUs. In such a situation you can configure an interface to be in the **up** state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when

the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When there are no received PDUs, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

## Understanding Interface Naming Conventions

The QFX Series use a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos OS. This topic provides brief information about the naming conventions used for interfaces on the QFX Series.

This topic describes:

- [Physical Part of an Interface Name on page 1915](#)
- [Logical Part of an Interface Name on page 1927](#)
- [Wildcard Characters in Interface Names on page 1928](#)

### Physical Part of an Interface Name

Interfaces in Junos OS are specified as follows:

*device-name:type-fpc/pic/port*

QFX Series products apply this convention as follows:

- *device-name*—(QFabric systems only) The *device-name* is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.
- *type*—The QFX Series interfaces use the following media types:
  - **fc**—Fibre Channel interface
  - **ge**—Gigabit Ethernet interface
  - **xe**—10-Gigabit Ethernet interface
  - **xle**—40-Gigabit Ethernet interface

- **fte**—40-Gigabit data plane uplink interface
- **me**—Management interface
- **fpc**—Flexible PIC Concentrator. QFX Series interfaces use the following convention for the FPC number in interface names:
